&\xrightarrow{7.3.1.22.1} \mathbb{R}\underset{\leftarrow}{l}_{X,\mathbb{N}_{\geq i}*}\left(\mathcal{M}^\bullet_i \overset{\mathbb{L}}{\otimes}_{\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}\mathcal{D}_i} \underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes^{\mathbb{L}}_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet\right)\\
&\xrightarrow{\sim} \mathbb{R}\underset{\leftarrow}{l}_{X,\mathbb{N}_{\geq i}*}\left(\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{M}^\bullet_i)\otimes^{\mathbb{L}}_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet\right).
\end{aligned}$$

When $\mathcal{M}^\bullet_i$ has coherent cohomology, the morphism 7.3.1.22.1 is an isomorphism and we are done.

□

7.3.2 Equivalence of categories between both notions of quasi-coherence

Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ satisfying the following conditions.

(a) On any affine open $\mathfrak{U} \subseteq \mathfrak{X}$, the ideal $\mathcal{I}$ has a family of generators with image in the center of $\mathcal{D}$.

(b) The canonical homomorphism $\mathcal{D} \to \varprojlim_i \mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}$ is an isomorphism.

(c) For any affine open $\mathfrak{U} \subseteq \mathfrak{X}$, the ring $\Gamma(\mathfrak{U}, \mathcal{D})$ is left and right noetherian.

(d) The projective system $\mathcal{D}_\bullet = (\mathcal{D}_i)_{i\in\mathbb{N}}$ with $\mathcal{D}_i := \mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}$ is left and right quasi-coherent in the sense of 7.3.1.10.

It follows from 7.2.3.3 that $\mathcal{D}$ is a coherent sheaf of rings.

Examples 7.3.2.1. We will use essentially in this book the following cases. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension.

(a) Let $m \in \mathbb{N}$. Let $\mathcal{B}_{\mathfrak{X}}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible structure of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module and satisfying the hypotheses of 7.3.2. Since $\mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is $\mathcal{B}_{\mathfrak{X}}$-flat (for both structures), then $\mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ satisfies also 7.3.2.

(b) Suppose $\mathfrak{X}$ is moreover p-torsion free (see 3.3.1.12 for some example). Let Z be a divisor of $\mathfrak{X}^\sharp \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi\mathcal{V})$. Let $m, r \in \mathbb{N}$ be two integers such that p^{m+1} divides r. Then following 8.7.4.2 the sheaves $\mathcal{B}_{\mathfrak{X}}(Z, r)$ and $\mathcal{B}_{\mathfrak{X}}(Z, r)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ satisfies 7.3.2.

7.3.2.2. We denote by $\underset{\leftarrow}{l}_X : (X_\bullet, \mathcal{D}_\bullet) \to (|\mathcal{X}|, \mathcal{D})$ the morphism of ringed topoi. From [Sta22, 07A6], this yields the functors $\mathbb{R}\underset{\leftarrow}{l}_{X*} : D(\mathcal{D}_\bullet) \to D(\mathcal{D})$ and $\mathbb{L}\underset{\leftarrow}{l}^*_X : D(\mathcal{D}) \to D(\mathcal{D}_\bullet)$ which are adjoint:

$$\mathrm{Hom}_{D(\mathcal{D}_\bullet)}(\mathbb{L}\underset{\leftarrow}{l}^*_X(\mathcal{E}^\bullet), \mathcal{F}^\bullet_\bullet) = \mathrm{Hom}_{D(\mathcal{D})}(\mathcal{E}^\bullet, \mathbb{R}\underset{\leftarrow}{l}_{X*}(\mathcal{F}^\bullet_\bullet)) \qquad (7.3.2.2.1)$$

for any $\mathcal{E}^\bullet \in D(\mathcal{D})$ and any $\mathcal{F}^\bullet_\bullet \in D(\mathcal{D}_\bullet)$. Remark that following 7.3.2.3.d just below, the functors $\mathbb{L}\underset{\leftarrow}{l}^*_X$ when $\underset{\leftarrow}{l}_X$ is either the morphism of ringed topoi $(X_\bullet, \mathcal{O}_{X_\bullet}) \to (|\mathcal{X}|, \mathcal{O}_{\mathfrak{X}})$ or $(X_\bullet, \mathcal{D}_\bullet) \to (|\mathcal{X}|, \mathcal{D})$ are canonically isomorphic. So this is harmless to switch from one to the other.

7.3.2.3. We have the following properties.

(a) Since $\mathcal{D}_\bullet$ is ML-flasque (see definition 7.3.1.3), then the canonical map $\mathcal{D} \to \mathbb{R}\underset{\leftarrow}{l}_{X*}(\mathcal{D}_\bullet)$ is an isomorphism.

(b) By using 7.3.1.23 in the case where $\mathcal{D} = \mathcal{O}_{\mathfrak{X}}$, for any $i \in \mathbb{N}$ we get the canonical isomorphism

$$\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathbb{R}\varprojlim_{j \geq i} \mathcal{D}_j \xrightarrow{\sim} \mathbb{R}\varprojlim_{j \geq i} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_j}} \mathcal{D}_j). \tag{7.3.2.3.1}$$

Since $\mathcal{D}_\bullet$ is left quasi-coherent and $\mathcal{D} \xrightarrow{\sim} \mathbb{R}\varprojlim_{j\geq i} \mathcal{D}_j$, this means that the canonical morphism $\mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D} \to \mathcal{D}_\bullet$ is an isomorphism. This yields the canonical isomorphism of functors $D(\mathcal{O}_{\mathcal{D}}) \to D(\mathcal{D}_\bullet)$ and $\mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathfrak{X}} - \xrightarrow{\sim} \mathcal{D}_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} -$, the isomorphism of functors $D(\mathcal{O}_{\mathcal{D}}) \to D(\mathcal{D}_i)$ of the form $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} - \xrightarrow{\sim} \mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} -$, and both isomorphisms of functors $D(\mathcal{O}_{\mathfrak{X}}) \to D(\mathcal{D})$ of the form $- \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}_\bullet \xrightarrow{\sim} - \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}$ and $- \otimes_{\mathcal{O}_{X_i}} \mathcal{D}_i \xrightarrow{\sim} - \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}$.

Similarly, we check the canonical morphism $\mathcal{D} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{X_\bullet} \to \mathcal{D}_\bullet$ is an isomorphism.

(c) It follows from (a) and (b) that the sheaf $\mathcal{D}$ is left and right quasi-coherent in the sense of 7.3.1.5.

(d) For any $\mathcal{E}^\bullet \in D^-({}^{\mathrm{l}}\mathcal{D})$, following (b), the canonical morphism $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\bullet \to \mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet$ is an isomorphism and similarly for complexes of right $\mathcal{D}$-modules. Let $* \in \{\mathrm{l}, \mathrm{r}\}$. With notation 7.3.1.12, this yields the canonical morphism $\mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\underset{\leftarrow}{l}^{-1}_X \mathcal{O}_{\mathfrak{X}}} \underset{\leftarrow}{l}^{-1}_X(-) \to \mathcal{D}_\bullet \otimes^{\mathbb{L}}_{\underset{\leftarrow}{l}^{-1}_X \mathcal{D}} \underset{\leftarrow}{l}^{-1}_X(-)$ is an isomorphism of functors. Hence, we get $\mathbb{L}\underset{\leftarrow}{l}^*_X : D^-_{\mathrm{qc}}({}^*\mathcal{D}) \to D^-_{\mathrm{qc}}({}^*\mathcal{D}_\bullet)$.

(e) By applying the functor $- \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}$ to the exact sequence $0 \to \mathcal{I}^n/\mathcal{I}^{n+1} \to \mathcal{O}_{X_n} \to \mathcal{O}_{X_{n-1}} \to 0$, since we have also the exact sequence $0 \to \mathcal{I}^n\mathcal{D}/\mathcal{I}^{n+1}\mathcal{D} \to \mathcal{D}_n \to \mathcal{D}_{n-1} \to 0$, then we get the first isomorphism $\mathcal{I}^n\mathcal{D}/\mathcal{I}^{n+1}\mathcal{D} \xrightarrow{\sim} \mathcal{I}^n/\mathcal{I}^{n+1} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D} \xrightarrow{\sim} \mathcal{I}^n/\mathcal{I}^{n+1} \otimes_{\mathcal{O}_{X_0}} \mathcal{D}_0$, the second one is checked at (b).

Similarly, we get $\mathcal{D}_0 \otimes_{\mathcal{O}_{X_0}} \mathcal{I}^n/\mathcal{I}^{n+1} \xrightarrow{\sim} \mathcal{I}^n\mathcal{D}/\mathcal{I}^{n+1}\mathcal{D}$.

7.3.2.4. Suppose $\mathfrak{X}$ is affine and keep notation 7.2.3.8, e.g. $\varpi_X : |\mathfrak{X}| \to \{*\}$ is the continuous morphism from the topological space of $\mathfrak{X}$ to a punctual set. Let $E^\bullet_\bullet \in D^-(D_\bullet)$. Following [BO78, B.4], we say $E^\bullet_\bullet$ is *$D_\bullet$-quasi-consistent* if and only if the canonical morphisms

$$D_i \otimes^{\mathbb{L}}_{D_{i+1}} E^\bullet_{i+1} \to E^\bullet_i \tag{7.3.2.4.1}$$

are isomorphisms for all $i \in \mathbb{N}$. We denote by $D^-_{\mathrm{qc}}(D_\bullet)$ the full subcategory of $D^-(D_\bullet)$ consisting of quasi-consistent complexes. Moreover, this is straightforward by definition that $D^-_{\mathrm{qc}}(D_\bullet)$ is a triangulated subcategory of $D^-(D_\bullet)$.

7.3.2.5. We keep notation 7.3.2.4. Let $E^\bullet_\bullet$ be a complex of $D^-({}^{\mathrm{l}}D_\bullet)$. Since D is noetherian, then similarly to 7.3.1.15 $E^\bullet_\bullet$ is an object of $D^-_{\mathrm{coh}}({}^{\mathrm{l}}D_\bullet)$ (resp. $D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}D_\bullet)$) if and only if the following conditions hold.

(a) The complex $E^\bullet_0$ is in $D^-_{\mathrm{coh}}({}^{\mathrm{l}}D_0)$ (resp. $D_{\mathrm{perf}}({}^{\mathrm{l}}D_0)$).

(b) $E^\bullet_\bullet$ is quasi-consistent.

Proposition 7.3.2.6. *With notations and hypotheses of 7.3.2.4, the functors $\mathbb{R}\varpi_{X_\bullet *}$ and $\varpi^*_{X_\bullet}$ induce canonically quasi-inverse equivalences of categories between $D^-_{\mathrm{qc}}(D_\bullet)$ and $D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$ (resp. $D^-_{\mathrm{coh}}(D_\bullet)$ and $D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$).*

Proof. I) Let us check the quasi-coherent case. 1) Let $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$. We prove in this step that the canonical morphism $\varpi^*_{X,\bullet}\mathbb{R}\varpi_{X,\bullet*}(\mathcal{E}^\bullet_\bullet) \to \mathcal{E}^\bullet_\bullet$ is an isomorphism.

It follows from 7.1.3.16 there exist a complex $\mathcal{I}^\bullet_\bullet \in K^-(\mathcal{D}_\bullet)$ consisting of $\varpi_{X,\bullet*}$-acyclic $\mathcal{D}_\bullet$-modules and a quasi-isomorphism $\mathcal{E}^\bullet_\bullet \xrightarrow{\sim} \mathcal{I}^\bullet_\bullet$. We get the isomorphism $\varpi_{X,\bullet*}(\mathcal{I}^\bullet_\bullet) \xrightarrow{\sim} \mathbb{R}\varpi_{X,\bullet*}(\mathcal{I}^\bullet_\bullet)$ of $D^-(\mathcal{D}_\bullet)$.

Since $\mathcal{I}^\bullet_\bullet \in D^-(\mathcal{D}_\bullet)$ then $I^\bullet_\bullet := \varpi_{X,\bullet *}(\mathcal{I}^\bullet_\bullet) \in D^-(D_\bullet)$. Since $\varpi_{X,\bullet *}$ has bounded cohomological dimension, then following 4.6.1.6.1 we have the spectral sequence $E_2^{r,s} = R^r\varpi_{X,\bullet *}(H^s(\mathcal{I}^\bullet_\bullet)) \Rightarrow H^{r+s}\mathbb{R}\varpi_{X,\bullet *}(\mathcal{I}^\bullet_\bullet)$. Since $H^s(\mathcal{I}^\bullet_i)$ is $\mathcal{O}_{X_i}$-quasi-coherent for all $s \in \mathbb{Z}$ and $i \in \mathbb{N}$, then $H^s(\mathcal{I}^\bullet_\bullet)$ is $\varpi_{X,\bullet *}$-acyclic (see 7.1.3.15.2). Hence, the canonical map $H^n(I^\bullet_\bullet) = H^n\varpi_{X,\bullet *}(\mathcal{I}^\bullet_\bullet) \to \varpi_{X,\bullet *}H^n(\mathcal{I}^\bullet_\bullet)$ (coming from the above spectral sequence) is an isomorphism. This yields that the canonical map $\mathcal{D}_\bullet \otimes_{D_\bullet} I^\bullet_\bullet \to \mathcal{I}^\bullet_\bullet$ is a quasi-isomorphism and we are done.

2) Let $E^\bullet_\bullet \in D^-(D_\bullet)$. We check in this step that $E^\bullet_\bullet \in D^-_{\mathrm{qc}}(D_\bullet)$ if and only if $\mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$.

Choose a complex $P^\bullet_\bullet \in K^-(D_\bullet)$ consisting of flat $D_\bullet$-modules together with a quasi-isomorphism $P^\bullet_\bullet \to E^\bullet_\bullet$ of $K^-(D_\bullet)$. Then $E^\bullet_\bullet$ is quasi-consistent if and only if the canonical morphism

$$D_i \otimes_{D_{i+1}} P^\bullet_{i+1} \to P^\bullet_i \tag{7.3.2.6.1}$$

is a quasi-isomorphism of $K^-(D_i)$ for all $i \in \mathbb{N}$. Set $\mathcal{P}^\bullet_\bullet := \mathcal{D}_\bullet \otimes_{D_\bullet} P^\bullet_\bullet$. Then $\mathcal{P}^\bullet_\bullet$ is a complex of $K^-(\mathcal{D}_\bullet)$ consisting of flat $\mathcal{D}_\bullet$-modules together with a quasi-isomorphism $\mathcal{P}^\bullet_\bullet \to \mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet$ of $K^-(\mathcal{D}_\bullet)$. Moreover, $\mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet$ is quasi-coherent if and only if the canonical morphism

$$\mathcal{D}_i \otimes_{\mathcal{D}_{i+1}} \mathcal{P}^\bullet_{i+1} \to \mathcal{P}^\bullet_i \tag{7.3.2.6.2}$$

is a quasi-isomorphism of $K^-(\mathcal{D}_i)$ for all i. By applying the functor $\mathcal{D}_i \otimes_{D_i} -$ to 7.3.2.6.1 we get the second morphism:

$$\mathcal{D}_i \otimes_{\mathcal{D}_{i+1}} \mathcal{P}^\bullet_{i+1} \xrightarrow{\sim} \mathcal{D}_i \otimes_{D_i} (D_i \otimes_{D_{i+1}} P^\bullet_{i+1}) \to \mathcal{D}_i \otimes_{D_i} P^\bullet_i = \mathcal{P}^\bullet_i, \tag{7.3.2.6.3}$$

whose composition is 7.3.2.6.2. If 7.3.2.6.1 is a quasi-isomorphism, then so is 7.3.2.6.2. Conversely, following 4.6.1.7.c, the functor $\mathcal{D}_i \otimes_{D_i} -\colon D^-(D_i) \to D^-_{\mathrm{qc}}(\mathcal{D}_i)$ is fully faithful which implies the following property: if 7.3.2.6.2 is an isomorphism of $D^-(\mathcal{D}_i)$, then 7.3.2.6.1 is an isomorphism of $D^-(D_i)$. Hence, we are done.

3) Since $\varpi^*_{X,\bullet} = \mathcal{D}_\bullet \otimes_{D_\bullet} -$, then it follows from 1) and 2) that the functor $\mathbb{R}\varpi_{X_\bullet *}$ factors through $D^-_{\mathrm{qc}}(\mathcal{D}_\bullet) \to D^-_{\mathrm{qc}}(D_\bullet)$.

4) Let $E^\bullet_\bullet \in D^-(D_\bullet)$. Similarly to the step 1), since $\mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet$ is a complex of $\varpi_{X,\bullet *}$-acyclic modules, we can check that the canonical map $E^\bullet_\bullet \to \mathbb{R}\varpi_{X_\bullet *}(\mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet)$ is a quasi-isomorphism.

II) Let $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$. It follows from 7.1.3.15.2, that we have the isomorphism $(\mathbb{R}\varpi_{X,\bullet *}(\mathcal{E}^\bullet_\bullet))_0 \xrightarrow{\sim} \mathbb{R}\varpi_{X*}(\mathcal{E}^\bullet_0)$. It follows from 4.6.1.7 that $\mathbb{R}\varpi_{X*}(\mathcal{E}^\bullet_0) = \mathbb{R}\Gamma(X, \mathcal{E}_0) \in D^-_{\mathrm{coh}}(D_0)$. By using 7.3.2.5, this yields $\mathbb{R}\varpi_{X,\bullet *}(\mathcal{E}^\bullet_\bullet) \in D^-_{\mathrm{coh}}(D_\bullet)$. Moreover, since the pseudo-coherence is stable under derived pullbacks (see [Sta22, 08H4-21.42.3]), then for any $E^\bullet_\bullet \in D^-_{\mathrm{coh}}(D_\bullet)$, we have $\varpi^*_{X_\bullet}(E^\bullet_\bullet) \in D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$. Hence, we get the quasi-inverse equivalence for coherent complexes from the part I) of the proof.

□

Proposition 7.3.2.7. *Let $\mathcal{E}^\bullet_\bullet \in D^-(\mathcal{D}_\bullet)$. The following conditions are equivalent:*

(a) $\mathcal{E}^\bullet_\bullet$ is quasi-coherent ;

(b) For any affine open set $\mathfrak{U} = \mathrm{Spf}\, A \subset \mathfrak{X}$, there exists an inverse system of complexes $P^\bullet_\bullet \in C^-(\Gamma(\mathfrak{U}, \mathcal{D}_\bullet))$, endowed with an isomorphism $\mathcal{D}_\bullet|_{\mathfrak{U}} \otimes_{\Gamma(\mathfrak{U},\mathcal{D}_\bullet)} P^\bullet_\bullet \xrightarrow{\sim} \mathcal{E}^\bullet_\bullet|_{\mathfrak{U}}$ in $D^-(\mathcal{D}_\bullet|_{\mathfrak{U}})$, such that P^n_i is a free left $\Gamma(\mathfrak{U}, \mathcal{D}_i)$-module, the transition maps $P^n_{i+1} \to P^n_i$ are surjective, and the canonical morphisms

$$\Gamma(\mathfrak{U}, \mathcal{D}_i) \otimes_{\Gamma(\mathfrak{U},\mathcal{D}_{i+1})} P^\bullet_{i+1} \to P^\bullet_i \tag{7.3.2.7.1}$$

are quasi-isomorphisms.

(c) The complex $\mathcal{E}^\bullet_0$ belongs to $D^-_{\mathrm{qc}}(\mathcal{D}_0)$, and the canonical morphism

$$\mathbb{L}\underleftarrow{l}^*_X \circ \mathbb{R}\underleftarrow{l}_{X*}\mathcal{E}^\bullet_\bullet \to \mathcal{E}^\bullet_\bullet \tag{7.3.2.7.2}$$

is an isomorphism.

Proof. Let us check $(c) \Rightarrow (a)$. Suppose $\mathcal{E}^\bullet_\bullet$ satisfies the conditions of (c). First remark that for any $\mathcal{F}^\bullet \in D^-(\mathcal{D})$ and $\mathcal{F}^\bullet_\bullet := \mathbb{L}\underleftarrow{l}^*_X(\mathcal{F}^\bullet)$, the canonical morphism

$$\mathcal{D}_i \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_{i+1}} \mathcal{F}^\bullet_{i+1} \to \mathcal{F}^\bullet_i \tag{7.3.2.7.3}$$

is an isomorphism. Hence, the condition 7.3.1.10.b holds for $\mathcal{E}^\bullet_\bullet$ (use 7.3.1.14).

Now let us check $(a) \Rightarrow (b)$. Suppose $\mathcal{E}^\bullet_\bullet$ is quasi-coherent. We can suppose $\mathfrak{X}$ is affine. It follows from 7.3.2.6 that we reduce to the case where there exists $E^\bullet_\bullet \in D^-_{\mathrm{qc}}(D_\bullet)$ such that $\mathcal{E}^\bullet_\bullet = \mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet$. Following 7.3.1.18, there exists $P^\bullet_\bullet \in C^-(D_\bullet)$, such that each P^n_i is a free left D_i-module and each map $P^n_i \to P^n_{i-1}$ is surjective, and an isomorphism of $D^-(D_\bullet)$ of the form $P^\bullet_\bullet \xrightarrow{\sim} E^\bullet_\bullet$. Hence, $\mathcal{D}_\bullet \otimes_{D_\bullet} P^\bullet_\bullet \xrightarrow{\sim} \mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet$. is quasi-coherent. Since P^n_i are flat left D_i-modules, then it follows the part 2) of the proof of 7.3.2.6, that the canonical morphisms 7.3.2.7.1 are isomorphisms.

It remains to check $(b) \Rightarrow (c)$. Since this is local, we can suppose $\mathfrak{X}$ affine and $\mathcal{E}^\bullet_\bullet = \mathcal{D}_\bullet \otimes_{D_\bullet} P^\bullet_\bullet$, with $P^\bullet_\bullet \in C^-(D_\bullet)$, such that each P^n_i is a free left D_i-module and each map $P^n_i \to P^n_{i-1}$ is surjective and such that the homomorphism 7.3.2.7.1 are isomorphisms. Following 7.3.1.23.1, we have the canonical isomorphism $\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}^\bullet_\bullet) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X,\mathbb{N}_{\geq i}*}(\underleftarrow{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i) \otimes^{\mathbb{L}}_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet)$. Since the morphisms 7.3.2.7.1 are isomorphism, then so are the canonical morphisms $\mathcal{D}_j \otimes_{\mathcal{D}_{j+1}} \mathcal{E}^\bullet_{j+1} \to \mathcal{E}^\bullet_j$ for any $j \geq i$. Since $\mathcal{E}^\bullet_\bullet$ is a flat $\mathcal{D}_\bullet$-module, this implies that the canonical morphism $\underleftarrow{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i) \otimes^{\mathbb{L}}_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet \to \underleftarrow{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{E}^\bullet_i)$ is an isomorphism. Since $\mathbb{R}\underleftarrow{l}_{X,\mathbb{N}_{\geq i}*}(\underleftarrow{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{E}^\bullet_i)) \xrightarrow{\sim} \mathcal{E}^\bullet_i$, this yields the canonical isomorphism $\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}^\bullet_\bullet) \xrightarrow{\sim} \mathcal{E}^\bullet_i$. We conclude by using 7.3.1.14.

□

Lemma 7.3.2.8. *Suppose $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has right tor dimension $\leq d$ on $\mathcal{D}$ (resp. $\mathcal{D}_0$) for some integer d.*

(a) Then $\mathcal{D}_\bullet$ has right tor dimension $\leq 2d$ on $\underleftarrow{l}^{-1}_X\mathcal{D}$.

(b) Suppose either $\mathcal{D}$ is commutative or $\mathcal{O}_{X_0}$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{O}_{\mathfrak{X}}$) has right tor dimension $\leq d$ on $\mathcal{O}_{\mathfrak{X}}$ (resp. $\mathcal{O}_{X_0}$). Then $\mathcal{D}_j$ has right tor dimension $\leq 2d$ on $\mathcal{D}_i$, for any integers $0 \leq j \leq i$.

Proof. a) Let $\mathcal{E}$ be a left $\mathcal{D}$-module. We have the exact sequence of $\mathcal{D}_i$-bimodules $0 \to \mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \to \mathcal{D}_i \to \mathcal{D}_{i-1} \to 0$ which yields the exact triangle of left $\mathcal{D}_i$-modules

$$\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_0} \left(\mathcal{D}_0 \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}\right) \to \mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E} \to \mathcal{D}_{i-1} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E} \to +1. \tag{7.3.2.8.1}$$

For any $i \in \mathbb{N}$, the term $\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_0} \left(\mathcal{D}_0 \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}\right)$ has tor-amplitude in $[-2d, 0]$. Hence, we prove by induction on $i \in \mathbb{N}$ that $\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}$ has tor-amplitude in $[-2d, 0]$.

b) By using 7.3.1.14.1, we reduce to the case where $\mathcal{D}$ is commutative (and then we do not have to bother with solving rings to be able to get derived tensor products in the derived categories of bimodules). Let $0 \leq j \leq i$ be two integers and $\mathcal{E}_i$ be a left $\mathcal{D}_i$-module. The canonical morphism $\mathcal{D}_i \to \mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{D}_i$ has the retractation $\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{D}_i \to \mathcal{D}_i$. Hence, $\mathcal{D}_j \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}_i$ is a direct summand of $\mathcal{D}_j \otimes^{\mathbb{L}}_{\mathcal{D}_i} (\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}_i \xrightarrow{\sim} \mathcal{D}_j \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}_i$, which has tor-amplitude in $[-2d, 0]$. □

Corollary 7.3.2.9. *Suppose $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has right finite tor dimension on $\mathcal{D}$ (resp. $\mathcal{D}_0$). Then $\mathbb{L}\underleftarrow{l}^*_X$ preserves the boundedness, i.e. we get the functor $\mathbb{L}\underleftarrow{l}^*_X \colon D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}) \to D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_\bullet)$.*

Proof. This is straightforward from 7.3.2.8. □

Corollary 7.3.2.10. *The functors $\mathbb{R}\underleftarrow{l}_{X*}$ and $\mathbb{L}\underleftarrow{l}^*_X$ induce canonically quasi-inverse equivalences of categories between $D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$ and $D^-_{\mathrm{qc}}(\mathcal{D})$.*

Moreover if $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has right finite tor dimension on $\mathcal{D}$ (resp. $\mathcal{D}_0$) then the functors $\mathbb{R}\underleftarrow{l}_{X*}$ and $\mathbb{L}\underleftarrow{l}^*_X$ induce canonically quasi-inverse equivalences of categories between $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_\bullet)$ and $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D})$.

Proof. This is straightforward that we have the functor $\mathbb{L}\underleftarrow{l}^*_X \colon D^-_{\mathrm{qc}}(\mathcal{D}) \to D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$. Let $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$. Then following 7.3.2.7, we have the canonical morphism $\mathbb{L}\underleftarrow{l}^*_X \circ \mathbb{R}\underleftarrow{l}_{X*}\mathcal{E}^\bullet_\bullet \to \mathcal{E}^\bullet_\bullet$ is an isomorphism. Hence, the canonical morphism $\mathbb{R}\underleftarrow{l}_{X*}\mathcal{E}^\bullet_\bullet \to \mathbb{R}\underleftarrow{l}_{X*} \circ \mathbb{L}\underleftarrow{l}^*_X \circ \mathbb{R}\underleftarrow{l}_{X*}\mathcal{E}^\bullet_\bullet$ is an isomorphism (similarly to the proof of 7.2.1.5). Both isomorphisms imply that $\mathbb{R}\underleftarrow{l}_{X*}\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$, and we get the first assertion.

We get the second one from the boundedness of the cohomological functor $\mathbb{R}\underleftarrow{l}_{X*}$ (see 7.3.1.2) and of $\mathbb{L}\underleftarrow{l}^*_X$ (see 7.3.2.9). □

Examples 7.3.2.11. Let us give an example when we can apply 7.3.2.10. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension.

(a) Let $\mathcal{B}_{\mathfrak{X}}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible structure of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module and satisfying the hypotheses of 7.3.2. We suppose $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}})/\mathfrak{S}^\sharp$ is strongly quasi-flat, i.e., by definition (see 4.4.1.3.b), there exists a morphism $\mathfrak{S} \to \mathfrak{T}$ of $\mathcal{V}$-formal schemes such that the induced morphism of ringed spaces $(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}}) \to \mathfrak{T}$ is flat and such that, denoting by $\mathcal{I}_{\mathfrak{T}} = \pi\mathcal{O}_{\mathfrak{T}}$ an ideal of definition of $\mathfrak{T}$, the sheaf $\mathcal{O}_{T_0}$ (resp. $gr^\bullet_{\mathcal{I}_{\mathfrak{T}}}\mathcal{O}_{\mathfrak{T}}$) has finite tor dimension on $\mathcal{O}_{\mathfrak{T}}$ (resp. $\mathcal{O}_{T_0}$).

Following 4.4.1.5.b, this yields $\mathcal{B}_{X_0}$ (resp. $gr^\bullet_{\mathfrak{m}}\mathcal{B}_{\mathfrak{X}}$) has finite tor dimension on $\mathcal{B}_{\mathfrak{X}}$ (resp. $\mathcal{B}_{X_0}$). Moreover, since $\mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is $\mathcal{B}_{\mathfrak{X}}$-flat (for the left and the right structures), then $\mathcal{D} := \mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ satisfies 7.3.2 and also $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has left and right finite tor dimension on $\mathcal{D}$ (resp. $\mathcal{D}_0$).

(b) When $\mathfrak{X}$ is moreover p-torsion free (see 3.3.1.12 for some example) and Z be a divisor of $\mathfrak{X}^\sharp \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi\mathcal{V})$, then following 8.7.4.2 the sheaf $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$ satisfies 7.3.2. Moreover, $(\mathfrak{X}^\sharp, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z))/\mathfrak{S}^\sharp$ is strongly quasi-flat.

Corollary 7.3.2.12. *Suppose $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has right finite tor dimension on $\mathcal{D}$ (resp. $\mathcal{D}_0$). Let $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{D})$. Then $\mathcal{E}^\bullet \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D})$ if and only if $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_\bullet)$.*

Proof. This is a consequence of 7.3.2.10. □

Corollary 7.3.2.13. *With notations and hypotheses of 7.3.2.4, for any $E^\bullet_\bullet \in D^-_{\mathrm{qc}}(D_\bullet)$, $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{D})$, the canonical base change morphisms (relative to the diagram 7.2.3.8.1)*

$$\mathbb{L}\underleftarrow{l}^* \circ \mathbb{R}\varpi_{X*}(\mathcal{E}^\bullet) \to \mathbb{R}\varpi_{X_\bullet *} \circ \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet), \quad \varpi^*_X \circ \mathbb{R}\underleftarrow{l}_*(E^\bullet_\bullet) \to \mathbb{R}\underleftarrow{l}_{X,*} \circ \varpi^*_{X_\bullet}(E^\bullet_\bullet) \tag{7.3.2.13.1}$$

are isomorphism.

Proof. This is a consequence of 7.3.2.6 and 7.3.2.10. □

Corollary 7.3.2.14. *We have the following properties.*

(a) Let $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$. Then $\mathcal{E}^\bullet_\bullet = 0$ if and only if $\mathcal{E}^\bullet_0 = 0$.

(b) Let $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$. Then $\mathcal{E}^\bullet = 0$ if and only if $\mathcal{D}_0 \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet = 0$.

(c) A morphism $f_\bullet$ of $D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$ is an isomorphism if and only if so is f_0.

(d) A morphism f of $D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$ is an isomorphism if and only if so is $\mathcal{D}_0 \otimes^{\mathbb{L}}_{\mathcal{D}} f$.

Proof. Let us check (a). Suppose $\mathcal{E}^\bullet_0 = 0$. By induction on $i \in \mathbb{N}$, we prove that $\mathcal{E}^\bullet_i = 0$. Let us suppose $i \geq 1$ and $\mathcal{E}^\bullet_j = 0$ for $j < i$. We have the exact sequence of $\mathcal{D}_i$-bimodules $0 \to \mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \to \mathcal{D}_i \to \mathcal{D}_{i-1} \to 0$, which yields the exact triangle of left $\mathcal{D}_i$-modules

$$\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to \mathcal{E}^\bullet_i \to \mathcal{E}^\bullet_{i-1} \to +1. \tag{7.3.2.14.1}$$

By induction hypothesis, $\mathcal{E}^\bullet_{i-1} = 0$. We conclude with the vanishing

$$\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \xrightarrow{\sim} \mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_0} \left(\mathcal{D}_0 \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i\right) \xrightarrow{\sim} \mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_0} \mathcal{E}^\bullet_0 = 0.$$

Let us check (b). Following 7.3.2.3.d, $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) = \mathcal{D}_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$. Hence, it follows from theorem 7.3.2.10 that (a) implies (b). The statement (c) and (d) are obvious consequences of respectively (a) and (b). □

Theorem 7.3.2.15. *The functors $\mathbb{R}\underleftarrow{l}_{X*}$ and $\mathbb{L}\underleftarrow{l}^*_X$ induce canonically quasi-inverse equivalences of categories between $D_{\mathrm{qc,tdf}}(\mathcal{D}_\bullet)$ and $D_{\mathrm{qc,tdf}}(\mathcal{D})$.*

More precisely let $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{D})$ (resp. $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$). Then $\mathcal{E}^\bullet$ (resp. $\mathcal{E}^\bullet_\bullet$) has tor amplitude in $[a, b]$ if and only if $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet)$ (resp. $\mathbb{R}\underleftarrow{l}_{X*}\mathcal{E}^\bullet_\bullet$) has tor amplitude in $[a, b]$.

Proof. If $\mathcal{E}^\bullet \in D_{\mathrm{qc,tdf}}(\mathcal{D})$ has tor amplitude in $[a, b]$, then it is well known that $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) \in D_{\mathrm{qc,tdf}}(\mathcal{D}_\bullet)$ has tor amplitude in $[a, b]$. Conversely, let $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}_\bullet)$ and suppose $\mathcal{E}^\bullet_\bullet$ has tor-amplitude in $[a, b]$. We can replace $\mathcal{E}^\bullet_\bullet$ by $\tau_{\leq b}\mathcal{E}^\bullet_\bullet$. The fact that $\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}^\bullet_\bullet)$ has tor-amplitude in $[a, b]$ is local. Hence, we can suppose $\mathfrak{X}$ affine and, following 7.3.2.7, there exists a complex $P^\bullet_\bullet \in C^-(D_\bullet)$ such that $P^n_\bullet = 0$ if $n \geq b+1$, endowed with an isomorphism $\mathcal{P}^\bullet_\bullet := \mathcal{D}_\bullet \otimes_{\mathcal{D}_\bullet} P^\bullet_\bullet \xrightarrow{\sim} \mathcal{E}^\bullet_\bullet$ in $D^-(\mathcal{D}_\bullet)$, such that P^n_i is a free left D_i-module, the transition maps $P^n_{i+1} \to P^n_i$ are surjective, and the canonical morphisms $D_i \otimes_{D_{i+1}} P^\bullet_{i+1} \to P^\bullet_i$ are quasi-isomorphisms. Let $F^\bullet_\bullet := \tau_{\geq a} P^\bullet_\bullet$ and $\mathcal{F}^\bullet_\bullet := \mathcal{D}_\bullet \otimes_{\mathcal{D}_\bullet} F^\bullet_\bullet$. Then $\mathcal{P}^\bullet_\bullet \to \mathcal{F}^\bullet_\bullet$ is a quasi-isomorphism. By construction, we remark that $F^n_{i+1} \to F^n_i$ are surjective for any $n \in \mathbb{Z}$ and any $i \in \mathbb{N}$. Hence, for any integer n the left $\mathcal{D}_\bullet$-module $\mathcal{F}^n_\bullet$ is ML-flasque (see 7.3.1.3). Hence, we get the first isomorphism $\underleftarrow{l}_{X*} \mathcal{F}^\bullet_\bullet \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*} \mathcal{F}^\bullet_\bullet \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*} \mathcal{E}^\bullet_\bullet$. Since $\mathcal{F}^n = 0$ for any $n \notin [a, b]$, since $\mathcal{F}^n_\bullet$ is $\mathcal{D}_\bullet$-flat for any $n \neq a$, since $\mathcal{F}^\bullet_\bullet$ has tor-amplitude in $[a, b]$, then it follows from [SGA6, Lemma I.5.1.1] that $\mathcal{F}^a_\bullet$ is $\mathcal{D}_\bullet$-flat. It follows from 7.3.1.20 that $\underleftarrow{l}_{X*} \mathcal{F}^\bullet_\bullet$ is a complex of flat left $\mathcal{D}$-modules of tor-amplitude in $[a, b]$. □

Corollary 7.3.2.16. *Let $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{D})$. Then $\mathcal{E}^\bullet \in D_{\mathrm{qc,tdf}}(\mathcal{D})$ if and only if $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) \in D_{\mathrm{qc,tdf}}(\mathcal{D}_\bullet)$.*

Proof. This is a consequence of 7.3.2.10 and 7.3.2.15. □

7.3.3 Coherent complexes

Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ satisfying the hypotheses of 7.3.2.

Proposition 7.3.3.1. *Let $\mathcal{E}^\bullet_\bullet \in D^-(\mathcal{D}_\bullet)$. The following conditions are equivalent:*

(a) $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$;

(b) For any affine open set $\mathfrak{U} = \mathrm{Spf}\, A \subset \mathfrak{X}$, there exists an inverse system of complexes $P^\bullet_\bullet \in C^-(\Gamma(\mathfrak{U}, \mathcal{D}_\bullet))$, endowed with an isomorphism $\mathcal{D}_\bullet|_{\mathfrak{U}} \otimes_{\Gamma(\mathfrak{U}, \mathcal{D}_\bullet)} P^\bullet_\bullet \xrightarrow{\sim} \mathcal{E}^\bullet_\bullet|_{\mathfrak{U}}$ in $D^-(\mathcal{D}_\bullet|_{\mathfrak{U}})$, such that P^n_i is a free of finite type left $\Gamma(\mathfrak{U}, \mathcal{D}_i)$-module, the transition maps $P^n_{i+1} \to P^n_i$ are surjective, and the canonical morphisms

$$\Gamma(\mathfrak{U}, \mathcal{D}_i) \otimes_{\Gamma(\mathfrak{U}, \mathcal{D}_{i+1})} P^\bullet_{i+1} \to P^\bullet_i \tag{7.3.3.1.1}$$

are quasi-isomorphisms.

Proof. It is clear that $(b) \Rightarrow (a)$. Now let us check $(a) \Rightarrow (b)$. Let $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$. We can suppose $\mathfrak{X}$ is affine. Hence, it follows from 7.3.2.6 that we can suppose there exists $E^\bullet_\bullet \in D^-_{\mathrm{coh}}(D_\bullet)$ such that $\mathcal{E}^\bullet_\bullet = \mathcal{D}_\bullet \otimes_{D_\bullet} E^\bullet_\bullet$. Following 7.3.1.18, there exists $P^\bullet_\bullet \in C^-(D_\bullet)$, such that each P^n_i is a free left D_i-module of finite type and each map $P^n_i \to P^n_{i-1}$ is surjective, and an isomorphism of $D^-(\mathcal{D}_\bullet)$ of the form $P^\bullet_\bullet \xrightarrow{\sim} E^\bullet_\bullet$. Since P^n_i are flat left D_i-modules, then it follows the part 2) of the proof of 7.3.2.6, that the canonical morphisms 7.3.3.1.1 are isomorphisms. □

7.3.3.2. With notations and hypotheses of 7.3.2.4, let $P^\bullet_\bullet \in C^-(D_\bullet)$ such that P^n_i is a free of finite type left D_i-module, the transition maps $P^n_{i+1} \to P^n_i$ are surjective, and the canonical morphisms

$$D_i \otimes_{D_{i+1}} P^\bullet_{i+1} \to P^\bullet_i \tag{7.3.3.2.1}$$

are quasi-isomorphisms. Let $\mathcal{P}^\bullet_\bullet := \mathcal{D}_\bullet \otimes_{D_\bullet} P^\bullet_\bullet$. It follows from 7.3.3.2.1 that $H^s(P^\bullet_\bullet)$ is ML. Hence $H^s(\mathcal{P}^\bullet_\bullet) \xrightarrow{\sim} \mathcal{D}_\bullet \otimes_{D_\bullet} H^s(P^\bullet_\bullet)$ is ML-flasque. By considering the spectral sequence $R^r \underleftarrow{l}_{X*}(H^s(\mathcal{P}^\bullet_\bullet)) \Rightarrow H^n(\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{P}^\bullet_\bullet))$, this yields that the natural map

$$H^n(\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{P}^\bullet_\bullet)) \to \underleftarrow{l}_{X*}(H^n(\mathcal{P}^\bullet_\bullet)).$$

(coming from the above spectral sequence) is an isomorphism. It follows that $\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{P}^\bullet_\bullet) \in D^-_{\mathrm{coh}}(\mathcal{D})$.

Corollary 7.3.3.3. *We have the following properties.*

(a) The functors $\mathbb{R}\underleftarrow{l}_{X*}$ and $\mathbb{L}\underleftarrow{l}^*_X$ induce canonically quasi-inverse equivalences of categories between $D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$ (resp. $D_{\mathrm{perf}}(\mathcal{D}_\bullet)$) and $D^-_{\mathrm{coh}}(\mathcal{D})$ (resp. $D_{\mathrm{perf}}(\mathcal{D})$).

(b) Suppose $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has right finite tor dimension on $\mathcal{D}$ (resp. $\mathcal{D}_0$). Then the functors $\mathbb{R}\underleftarrow{l}_{X*}$ and $\mathbb{L}\underleftarrow{l}^*_X$ induce canonically quasi-inverse equivalences of categories between $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_\bullet)$ and $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D})$.

Proof. 0) The statement (b) follows from (a) and from the boundedness of the cohomological functor $\mathbb{R}\underleftarrow{l}_{X*}$ (see 7.3.1.2) and of $\mathbb{L}\underleftarrow{l}^*_X$ (see 7.3.2.9).

1) Let us check the non-respective case of (a). Since the pseudo-coherence is stable under derived pullbacks (see [Sta22, 08H4-21.42.3]), then we get the functor $\mathbb{L}\underleftarrow{l}^*_X \colon D^-_{\mathrm{coh}}(\mathcal{D}) \to D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$. Let $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{coh}}(\mathcal{D}_\bullet)$. Let us check that $\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}^\bullet_\bullet) \in D^-_{\mathrm{coh}}(\mathcal{D})$. Since this is local, then this follows from 7.3.3.1 and 7.3.3.2. Hence, thanks to 7.3.1.16 and the first part of 7.3.2.10 we are done.

2) We check the respective cases by using the second part of 7.3.2.10 and furthermore 7.3.2.15 (and 7.1.3.12). □

Corollary 7.3.3.4. *Let $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{D})$ and $\mathcal{E}^\bullet_\bullet := \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet)$.*

(a) Then $\mathcal{E}^\bullet \in D_{\mathrm{perf}}(\mathcal{D})$ (resp. $\mathcal{E}^\bullet \in D^-_{\mathrm{coh}}(\mathcal{D})$) if and only if $\mathcal{E}^\bullet_0 \in D_{\mathrm{perf}}(\mathcal{D}_0)$ (resp. $\mathcal{E}^\bullet \in D^-_{\mathrm{coh}}(\mathcal{D}_0)$).

(b) Suppose $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has right finite tor dimension on $\mathcal{D}$ (resp. $\mathcal{D}_0$). Then $\mathcal{E}^\bullet \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D})$ if and only if $\mathcal{E}^\bullet_0 \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_0)$.

Proof. This is a consequence of 7.3.1.15, 7.3.2.10 and of 7.3.3.3. □

7.3.4 Derived completed tensor products and derived completed homomorphisms of complexes of (bi)modules

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. Let $\mathcal{D}, \mathcal{D}', \mathcal{D}'', \mathcal{D}'''$ be four sheaves of rings on $\mathfrak{X}$ satisfying the hypotheses of 7.3.2 (or only 7.2.3 when the notion of quasi-coherence is not involved).

7.3.4.1 (Independence of $\mathbb{R}\underleftarrow{l}_{X*}$ and $\mathbb{L}\underleftarrow{l}^*_X$)**.** We have the topoi morphisms $\underleftarrow{l}_X \colon (X_\bullet, \mathcal{D}_\bullet) \to (|\mathcal{X}|, \mathcal{D})$ and $\underleftarrow{l}_X \colon (X_\bullet, \mathbb{Z}_{X_\bullet}) \to (|\mathcal{X}|, \mathbb{Z}_{\mathfrak{X}})$.

(a) Both functors $\mathbb{R}\underleftarrow{l}_{X*}$ can be computed by taking the same flasque resolution (see 7.1.3.14) and therefore we have the canonical commutative diagram

$$\begin{array}{ccc} D^-(\mathcal{D}_\bullet) & \xrightarrow{\mathbb{R}\underleftarrow{l}_{X*}} & D^-(\mathcal{D}) \\ \downarrow & & \downarrow \\ D^-(\mathbb{Z}_{X_\bullet}) & \xrightarrow{\mathbb{R}\underleftarrow{l}_{X*}} & D^-(\mathbb{Z}_{\mathfrak{X}}), \end{array} \tag{7.3.4.1.1}$$

where the vertical maps are the forgetful functors. We have obviously the same property for the exact functor $\underleftarrow{l}^{-1}_X$.

(b) Following 7.3.2.3.d, the canonical morphism

$$\mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\underleftarrow{l}^{-1}_X \mathcal{O}_{\mathfrak{X}}} \underleftarrow{l}^{-1}_X(\mathcal{E}^\bullet) \to \mathcal{D}_\bullet \otimes^{\mathbb{L}}_{\underleftarrow{l}^{-1}_X \mathcal{D}} \underleftarrow{l}^{-1}_X(\mathcal{E}^\bullet) =: \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet)$$

is an isomorphism for any $\mathcal{E}^\bullet \in D^-({}^l\mathcal{D})$, and similarly for right modules. Hence, the functor $\mathbb{L}\underleftarrow{l}^*_X$ does not depend, up to canonical forgetful functor, to the choice of such $\mathcal{D}$.

7.3.4.2. Let $\mathcal{E}^\bullet \in D^-({}^l\mathcal{D})$, $\mathcal{M}^\bullet \in D^-({}^r\mathcal{D})$ be two complexes of $\mathcal{D}$-modules, respectively to the left, to the right. Following 7.3.2.3.d, $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) = \mathcal{D}_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \in D^-({}^l\mathcal{D}_\bullet)$ and similarly for right modules. Hence, we can define their *completed tensor product* by setting

$$\mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet := \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{L}\underleftarrow{l}^*_X \mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathbb{L}\underleftarrow{l}^*_X \mathcal{E}^\bullet) \in D^-(\mathbb{Z}_{\mathfrak{X}}), \tag{7.3.4.2.1}$$

where $\mathbb{R}\underleftarrow{l}_{X*} \colon D^-(\mathbb{Z}_{X_\bullet}) \to D^-(\mathbb{Z}_{\mathfrak{X}})$ is the derived pushforward given by the topoi morphism $\underleftarrow{l}_X \colon (X_\bullet, \mathbb{Z}_{X_\bullet}) \to (|\mathcal{X}|, \mathbb{Z}_{\mathfrak{X}})$ and $\mathbb{L}\underleftarrow{l}^*_X \colon D^-({}^l\mathcal{D}) \to D^-({}^l\mathcal{D}_\bullet)$ is the derived pullback given by the topoi morphism $\underleftarrow{l}_X \colon (X_\bullet, \mathcal{D}_\bullet) \to (|\mathcal{X}|, \mathcal{D})$.

Lemma 7.3.4.3. *Let $\mathcal{E}^\bullet \in D^-({}^l\mathcal{D})$, $\mathcal{M}^\bullet \in D^-({}^r\mathcal{D})$.*

(a) We have the morphism

$$\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \to \mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \tag{7.3.4.3.1}$$

which is an isomorphism when one of the two complexes belongs to $D^-_{\mathrm{coh}}(\mathcal{D})$ and the other to $D^-_{\mathrm{qc}}(\mathcal{D})$.

(b) When $\mathcal{D}$ is commutative, then we get the isomorphism of $D^-(\mathcal{D})$:

$$\mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*} \circ \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet), \tag{7.3.4.3.2}$$

where $\underleftarrow{l}_X$ is here the topoi morphism $\underleftarrow{l}_X \colon (X_\bullet, \mathcal{D}_\bullet) \to (|\mathcal{X}|, \mathcal{D})$. Hence, we can consider $\mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet$ as an object of $D^-(\mathcal{D})$ and then the map 7.3.4.3.1 is the adjunction morphism.

Proof. a) Since $\mathbb{L}\underset{\leftarrow X}{l}^{-1}(\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet) \xrightarrow{\sim} \mathbb{L}\underset{\leftarrow X}{l}^{-1}(\mathcal{M}^\bullet) \otimes^{\mathbb{L}}_{\underset{\leftarrow X}{l}^{-1}(\mathcal{D})} \mathbb{L}\underset{\leftarrow X}{l}^{-1}(\mathcal{E}^\bullet)$, then we get by adjunction the canonical morphism

$$\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \to \mathbb{R}\underset{\leftarrow X*}{l} \left(\underset{\leftarrow X}{l}^{-1}(\mathcal{M}^\bullet) \otimes^{\mathbb{L}}_{\underset{\leftarrow X}{l}^{-1}(\mathcal{D})} \underset{\leftarrow X}{l}^{-1}(\mathcal{E}^\bullet) \right) \tag{7.3.4.3.3}$$

By applying the functor $\mathbb{R}\underset{\leftarrow X*}{l}$ to the following canonical morphism

$$\underset{\leftarrow X}{l}^{-1}(\mathcal{M}^\bullet) \otimes^{\mathbb{L}}_{\underset{\leftarrow X}{l}^{-1}(\mathcal{D})} \underset{\leftarrow X}{l}^{-1}(\mathcal{E}^\bullet) \to \mathbb{L}\underset{\leftarrow X}{l}^{*} \mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathbb{L}\underset{\leftarrow X}{l}^{*} \mathcal{E}^\bullet \tag{7.3.4.3.4}$$

and by composing this latter with 7.3.4.3.3, we get 7.3.4.3.1. By using [Har66, I.7.1], when $\mathcal{M}^\bullet \in D^-_{\mathrm{coh}}(\mathcal{D})$ and $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{D})$, to check that 7.3.4.3.1 is an isomorphism, we reduce to the case where $\mathcal{M}^\bullet = \mathcal{D}$, which follows from 7.3.2.10.

The part b) is obvious (use 7.3.4.1). □

7.3.4.4. Suppose there exists a homomorphism of sheaves of rings on $\mathfrak{X}$ of the form $\mathcal{D} \to \mathcal{D}'$ such that the composition of $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ with $\mathcal{D} \to \mathcal{D}'$ gives $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}'$.

(a) Let $* \in \{\mathrm{l}, \mathrm{r}\}$ and $\star \in \{-, \mathrm{b}\}$. By definition (see 7.3.1.12), the forgetful functor $D^\star({}^*\mathcal{D}') \to D^\star({}^*\mathcal{D})$ preserve the quasi-coherence, i.e. induces the functor

$$forg_{\mathcal{D},\mathcal{D}'} \colon D^\star_{\mathrm{qc}}({}^*\mathcal{D}') \to D^\star_{\mathrm{qc}}({}^*\mathcal{D}). \tag{7.3.4.4.1}$$

(b) With notation 7.3.1.12, since $\mathcal{D}_\bullet$ satisfied the condition 7.3.2.d for the left structure, then it follows from 7.3.1.14 that the functor $\mathcal{D}'_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} -$ preserves the quasi-coherence, i.e., induces the functor

$$\mathcal{D}'_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} - \colon D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}_\bullet) \to D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'_\bullet). \tag{7.3.4.4.2}$$

(c) Let $\mathcal{E}^\bullet \in D^-({}^{\mathrm{l}}\mathcal{D})$. Since $\mathcal{D}'_\bullet \xrightarrow{\sim} \mathbb{L}\underset{\leftarrow X}{l}^{*}\mathcal{D}'$ (see 7.3.2.3.b), then we get

$$\mathcal{D}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \xleftarrow{\sim} \mathbb{R}\underset{\leftarrow X*}{l}(\mathcal{D}'_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathbb{L}\underset{\leftarrow X}{l}^{*}\mathcal{E}^\bullet). \tag{7.3.4.4.3}$$

Using the preservation of the quasi-coherence under the functors $\mathbb{L}\underset{\leftarrow X}{l}^{*}$ and $\mathbb{R}\underset{\leftarrow X*}{l}$ of 7.3.2.10, the property 7.3.4.4.2 and the isomorphism 7.3.4.4.3, we get that the functor $\mathcal{D}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} -$ preserves the quasi-coherence, i.e. induces the functor

$$\mathcal{D}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} - \colon D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}) \to D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'). \tag{7.3.4.4.4}$$

In order to derive complexes of bimodules, we need further hypotheses on $\mathcal{D}$.

Definition 7.3.4.5. Let us introduce the following definition (compare with 4.6.3.2.b). A pair $(\mathcal{R}, \mathcal{K})$ consisting of a sheaf $\mathcal{R}$ of commutative rings on $\mathfrak{X}$ and an ideal $\mathcal{K}$ of $\mathcal{R}$ is said to be solving $(\mathcal{D}, \mathcal{D}', \mathcal{I})$ if it satisfies the following conditions:

(i) $\mathcal{R}$ is separated complete for the $\mathcal{K}$-adic topology and $\mathcal{O}_{\mathfrak{X}}$ is an $\mathcal{R}$-algebra such that $\mathcal{K}\mathcal{O}_{\mathfrak{X}} = \mathcal{I}$,

(ii) $\mathcal{R}$ is sent to the center of $\mathcal{D}$ and of $\mathcal{D}'$ via the composite ring homomorphisms $\mathcal{R} \to \mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ and $\mathcal{R} \to \mathcal{O}_{\mathfrak{X}} \to \mathcal{D}'$;

(iii) $\mathcal{D}$ and $\mathcal{D}'$ are flat on $\mathcal{R}$.

In that case, we say that $(\mathcal{D}, \mathcal{D}', \mathcal{I})$ is solvable by $(\mathcal{R}, \mathcal{K})$. We remark that if $(\mathcal{R}, \mathcal{K})$ a (left or right) solving pair of $(\mathcal{D}, \mathcal{D}', \mathcal{I})$, then $\mathcal{R}_\bullet$ is a (left or right) solving ring of $(\mathcal{D}_\bullet, \mathcal{D}'_\bullet)$ (see Definition 4.6.3.2.b), where $\mathcal{R}_\bullet := (\mathcal{R}/\mathcal{K}^{i+1}\mathcal{R})_{i \in \mathbb{N}}$, $\mathcal{D}_\bullet := (\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D})_{i \in \mathbb{N}}$ and $\mathcal{D}'_\bullet := (\mathcal{D}'/\mathcal{I}^{i+1}\mathcal{D}')_{i \in \mathbb{N}}$. Finally, $(\mathcal{R}, \mathcal{K})$ (left or right) solves $(\mathcal{D}, \mathcal{I})$ means by definition that $(\mathcal{R}, \mathcal{K})$ (left or right) solves $(\mathcal{D}, \mathcal{D}, \mathcal{I})$.

Example 7.3.4.6. We will use essentially in this book the following cases. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension and is p-torsion free (see 3.3.1.12 for some example). For any integer $i \geq 0$, set $X_i^\sharp := X^\sharp \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$. Let Z be a divisor of X_0. Then it follows from 8.7.4.2 that we can choose $\mathcal{R} = \mathcal{V}, \mathcal{K} = \mathfrak{m}$, $\mathcal{I} = \mathfrak{m}\mathcal{O}_{\mathfrak{X}}$ and $\mathcal{D} = \varprojlim_i \mathcal{B}_{X_i}(Z, r) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$.

Notation 7.3.4.7. Suppose $(\mathcal{D}, \mathcal{D}', \mathcal{I})$ is solved by $(\mathcal{R}, \mathcal{K})$. Let $\mathcal{E}^\bullet \in K({}^{\mathrm{l}}\mathcal{D}', \mathcal{D}^{\mathrm{r}})$. The following condition

(iv) The structure of $\mathcal{R}$-modules induced on the $(\mathcal{D}', \mathcal{D})$-bimodules $\mathcal{E}^n$ by the structure of left $\mathcal{D}'$-module and of right $\mathcal{D}$-module coincide for any $n \in \mathbb{Z}$;

is equivalent to saying that $\mathcal{E}^\bullet \in K({}^{\mathrm{l}}\mathcal{D}' \otimes_{\mathcal{R}} \mathcal{D}^{\mathrm{o}})$.

We denote by $D({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$ (resp. $D({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet \mathcal{D}_\bullet{}^{\mathrm{r}})$) the strictly full subcategory of $D({}^{\mathrm{l}}\mathcal{D}', {}^{\mathrm{r}}\mathcal{D})$ (resp. $D({}^{\mathrm{l}}\mathcal{D}'_\bullet, {}^{\mathrm{r}}\mathcal{D}_\bullet)$) consisting of complexes isomorphic to an object of $K({}^{\mathrm{l}}\mathcal{D}' \otimes_{\mathcal{R}} \mathcal{D}^{\mathrm{o}})$ (resp. $K({}^{\mathrm{l}}\mathcal{D}'_\bullet \otimes_{\mathcal{R}_\bullet} \mathcal{D}^{\mathrm{o}}_\bullet)$).

7.3.4.8. Suppose $(\mathcal{D}, \mathcal{D}', \mathcal{I})$ is solved by $(\mathcal{R}, \mathcal{K})$. The functor $\underset{\leftarrow}{l}_X^* = -\otimes_{\mathcal{R}} \mathcal{R}_\bullet \colon \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}', \mathcal{D}^{\mathrm{r}}) \to \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}'_\bullet, {}^{\mathrm{r}}\mathcal{D}_\bullet)$ is canonically isomorphic (modulo forgetful functors) to $-\otimes_{\mathcal{D}} \mathcal{D}_\bullet \colon \mathrm{Mod}(\mathcal{D}^{\mathrm{r}}) \to \mathrm{Mod}({}^{\mathrm{r}}\mathcal{D}_\bullet)$ and $\mathcal{D}'_\bullet \otimes_{\mathcal{D}'} - \colon \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}') \to \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}'_\bullet)$. Let $\star \in \{\emptyset, -\}$. Since $\mathcal{D}' \otimes_{\mathcal{R}} \mathcal{D}^{\mathrm{o}}$ is flat over $\mathcal{D}$, $\mathcal{D}'$ and $\mathcal{R}$, then by using resolutions by flat left $\mathcal{D}' \otimes_{\mathcal{R}} \mathcal{D}^{\mathrm{o}}$-modules we get the functor

$$\mathbb{L}\underset{\leftarrow}{l}_X^* \colon D^\star({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}}) \to D^\star({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}}) \tag{7.3.4.8.1}$$

which is canonically isomorphic (modulo some forgetful functors) to $\underset{\leftarrow}{l}_X^{-1}(-) \otimes^{\mathbb{L}}_{\underset{\leftarrow}{l}_X^{-1}(\mathcal{D})} \mathcal{D}_\bullet \colon D^\star(\mathcal{D}^{\mathrm{r}}) \to D^\star(\mathcal{D}_\bullet{}^{\mathrm{r}})$ and $\mathcal{D}'_\bullet \otimes^{\mathbb{L}}_{\underset{\leftarrow}{l}_X^{-1}(\mathcal{D}')} \underset{\leftarrow}{l}_X^{-1}(-) \colon D^\star({}^{\mathrm{l}}\mathcal{D}') \to D^\star({}^{\mathrm{l}}\mathcal{D}'_\bullet)$. Similarly, by using resolutions by K-injective complexes of left $\mathcal{D}' \otimes_{\mathcal{R}} (\mathcal{D})^o$-modules, we get the functor

$$\mathbb{R}\underset{\leftarrow}{l}_{X*} \colon D^\star({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}}) \to D^\star({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}}) \tag{7.3.4.8.2}$$

which is canonically isomorphic to the functors $\mathbb{R}\underset{\leftarrow}{l}_{X*} \colon D^\star(\mathcal{D}_\bullet{}^{\mathrm{r}}) \to D^\star(\mathcal{D}^{\mathrm{r}})$ and $\mathbb{R}\underset{\leftarrow}{l}_{X*} \colon : D^\star({}^{\mathrm{l}}\mathcal{D}_\bullet) \to D^\star({}^{\mathrm{l}}\mathcal{D}')$.

Let $\mathcal{E}_\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$. The property $\mathcal{E}_\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'_\bullet)$ (resp. $\mathcal{E}_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}_\bullet{}^{\mathrm{r}})$) is satisfied if and only if both conditions hold:

(a) The image via the forgetful functor $D^-({}^{\mathrm{l}}\mathcal{D}'_0, \mathcal{D}_0{}^{\mathrm{r}}) \to D^-({}^{\mathrm{l}}\mathcal{D}'_0) \to D^-(\mathcal{O}_{X_0})$ (resp. $D^-({}^{\mathrm{l}}\mathcal{D}'_0, \mathcal{D}_0{}^{\mathrm{r}}) \to D^-(\mathcal{D}_0{}^{\mathrm{r}}) \to D^-(\mathcal{O}_{X_0})$)) of the complex $\mathcal{E}_0^\bullet$ is in $D^-_{\mathrm{qc}}(\mathcal{O}_{X_0})$.

(b) The canonical map

$$\mathcal{R}_i \overset{\mathbb{L}}{\otimes}_{\mathcal{R}_{i+1}} \mathcal{E}_{i+1}^\bullet \to \mathcal{E}_i^\bullet \tag{7.3.4.8.3}$$

is an isomorphism.

Indeed, following 7.3.1.14 and the flatness of $\mathcal{R} \to \mathcal{D}$ or of $\mathcal{R} \to \mathcal{D}'$, the condition 7.3.4.8.3 is equivalent to the condition 7.3.1.10.b.

Let $? \in \{\mathrm{qc}, \mathrm{coh}, \mathrm{tdf}, \mathrm{perf}\}$. Let $\sharp \in \{\emptyset, \mathrm{b}, +, -\}$. We denote respectively by $D^\sharp_{?,.}({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$ and $D^\sharp_{.,?}({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$ the full subcategory of $D^\sharp({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$ consisting of complexes $\mathcal{E}_\bullet$ which belongs to $\mathcal{E}_\bullet \in D^\sharp_?({}^{\mathrm{l}}\mathcal{D}'_\bullet)$ (resp. $\mathcal{E}_\bullet \in D^\sharp_?(\mathcal{D}_\bullet{}^{\mathrm{r}})$). Beware that the property 7.3.4.7.(iv) is not necessarily satisfied for $\mathcal{O}_{\mathfrak{X}}$ (which is involved in the condition (a)) instead of $\mathcal{R}$, so we do have to distinguish the categories $D^\sharp_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$ and $D^\sharp_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$.

Similarly, we denote by $D^\sharp_{?,.}({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$ and $D^\sharp_{.,?}({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$ the full subcategory of $D^\sharp({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$ consisting of complexes $\mathcal{E}$ which belongs to $\mathcal{E} \in D^\sharp_?({}^{\mathrm{l}}\mathcal{D}')$ (resp. $\mathcal{E} \in D^\sharp_?(\mathcal{D}^{\mathrm{r}})$). The functors $\mathbb{L}\underset{\leftarrow}{l}_X^*$ of 7.3.4.8.1 and $\mathbb{R}\underset{\leftarrow}{l}_{X*}$ induce quasi-inverse equivalences of categories between $D^\sharp_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$ and $D^\sharp_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$ and between $D^\sharp_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$ and $D^\sharp_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$.

7.3.4.9. Suppose $(\mathcal{D}, \mathcal{D}', \mathcal{I})$ and $(\mathcal{D}, \mathcal{D}'', \mathcal{I})$ are solved by $(\mathcal{R}, \mathcal{K})$. Let $*, ** \in \{r, l\}$. Following 4.6.3.2, we have the bifunctors

$$-\otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} - \colon D({}^*\mathcal{D}'_\bullet, \mathcal{R}, \mathcal{D}_\bullet{}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}, {}^{**}\mathcal{D}''_\bullet) \to D({}^*\mathcal{D}'_\bullet, \mathcal{R}, {}^{**}\mathcal{D}''_\bullet). \tag{7.3.4.9.1}$$

We have similar bifunctors by changing the indices l and r. With 7.3.4.8.1, we can check the bifunctor 7.3.4.2.1 induces

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} - \colon D({}^*\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{D}, \mathcal{R}, {}^{**}\mathcal{D}'') \to D({}^*\mathcal{D}', \mathcal{R}, {}^{**}\mathcal{D}''). \tag{7.3.4.9.2}$$

Let $\mathcal{M}^\bullet \in D({}^*\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$, $\mathcal{E}^\bullet \in D({}^{\mathrm{l}}\mathcal{D}, \mathcal{R}, {}^{**}\mathcal{D}'')$ be two complexes. Since $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}^\bullet) \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet)$ (remark we have three different functors $\mathbb{L}\underleftarrow{l}^*_X$ of the form 7.3.4.8.1), then we get by adjunction via the adjoint pair $(\mathbb{L}\underleftarrow{l}^*_X \dashv \mathbb{R}\underleftarrow{l}_{X*})$ (see the functors 7.3.4.8.1 and 7.3.4.8.2) the canonical morphism

$$\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \to \mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \tag{7.3.4.9.3}$$

which is an isomorphism when either $\mathcal{M}^\bullet \in D^-_{\mathrm{coh}}(\mathcal{D}^{\mathrm{r}})$ and $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$, or $\mathcal{M}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}^{\mathrm{r}})$ and $\mathcal{E}^\bullet \in D^-_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}')$. Indeed, for instance, suppose $\mathcal{M}^\bullet \in D^-_{\mathrm{coh}}(\mathcal{D}^{\mathrm{r}})$ and $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$. Then, since both functors $- \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet$ and $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet$ are way-out left (use 7.3.1.2 for the second functor), then following (the way-out left version of) [Har66, I.7.1 (ii) and (iv)], since this is local, we reduce to the case where $\mathcal{M}^\bullet = \mathcal{D}$, which is obvious.

Proposition 7.3.4.10. *Suppose $(\mathcal{D}, \mathcal{D}', \mathcal{I})$, $(\mathcal{D}, \mathcal{D}'', \mathcal{I})$ are solved by $(\mathcal{R}, \mathcal{K})$. Let $*, ** \in \{r, l\}$. The functors 7.3.4.9.2 and 7.3.4.9.1 preserve the quasi-coherence for bounded above complexes, i.e. they factor through the functor*

$$- \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} -\colon D_{\mathrm{qc},.}({}^*\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}}) \times D_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, {}^{**}\mathcal{D}''_\bullet) \to D_{\mathrm{qc},.}({}^*\mathcal{D}'_\bullet, \mathcal{R}_\bullet, {}^{**}\mathcal{D}''_\bullet), \tag{7.3.4.10.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} -\colon D^-_{\mathrm{qc},.}({}^*\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}}) \times D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}, \mathcal{R}, {}^{**}\mathcal{D}'') \to D^-_{\mathrm{qc},.}({}^*\mathcal{D}', \mathcal{R}, {}^{**}\mathcal{D}''), \tag{7.3.4.10.2}$$

and similarly replacing the indexes "$\mathrm{qc},.$" by "$.,\mathrm{qc}$".

Proof. Since the functors $\mathbb{L}\underleftarrow{l}^*_X$ and $\mathbb{R}\underleftarrow{l}_{X*}$ induce quasi-inverse equivalences of categories between $D^\star_{\mathrm{qc},.}({}^*\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$ and $D^\star_{\mathrm{qc},.}({}^*\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$ (see 7.3.4.8) and similarly for the other respective categories, then we reduce to check 7.3.4.10.1.

Let $\mathcal{M}^\bullet_\bullet \in D^-_{\mathrm{qc},.}({}^*\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$ and $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, {}^{**}\mathcal{D}''_\bullet)$. We have to check that $\mathcal{G}_\bullet := \mathcal{M}^\bullet_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}'_\bullet)$. Since the property $\mathcal{G}_0 = \mathcal{M}^\bullet_0 \otimes^{\mathbb{L}}_{\mathcal{D}_0} \mathcal{E}^\bullet_0 \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'_0)$ is local, we can suppose $\mathfrak{X}$ affine. By using [Har66, I.7.3.(iv)] (in fact, a left way-out version), since $\mathcal{M}^\bullet_0 \otimes^{\mathbb{L}}_{\mathcal{D}_0} -$ is way-out left, we reduce to the case where $\mathcal{E}^\bullet_0$ is a free left $\mathcal{D}_0$-module, which is obvious.

We conclude the proof via the isomorphisms (recall the computations of $\mathcal{E}^\bullet_\bullet$ and $\mathcal{M}^\bullet_\bullet$ to justify the associativity isomorphisms of the tensor products)

$$\begin{aligned} &\mathcal{D}'_i \otimes^{\mathbb{L}}_{\mathcal{D}'_{i+1}} \left(\mathcal{M}^\bullet_{i+1} \otimes^{\mathbb{L}}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1}\right) \xrightarrow{\sim} \left(\mathcal{D}'_i \otimes^{\mathbb{L}}_{\mathcal{D}'_{i+1}} \mathcal{M}^\bullet_{i+1}\right) \otimes^{\mathbb{L}}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1} \\ &\xrightarrow{\sim} \mathcal{M}^\bullet_i \otimes^{\mathbb{L}}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1} \xrightarrow{\sim} \mathcal{M}^\bullet_i \otimes^{\mathbb{L}}_{\mathcal{D}_i} \left(\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1}\right) \xrightarrow{\sim} \mathcal{M}^\bullet_i \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i. \end{aligned} \tag{7.3.4.10.3}$$

□

Example 7.3.4.11. When $\mathcal{D}$ is commutative, we get the factorisations

$$- \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} -\colon D_{\mathrm{qc}}(\mathcal{D}_\bullet) \times D_{\mathrm{qc}}(\mathcal{D}_\bullet) \to D_{\mathrm{qc}}(\mathcal{D}_\bullet), \tag{7.3.4.11.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} -\colon D^-_{\mathrm{qc}}(\mathcal{D}) \times D^-_{\mathrm{qc}}(\mathcal{D}) \to D^-_{\mathrm{qc}}(\mathcal{D}). \tag{7.3.4.11.2}$$

Proposition 7.3.4.12. *Suppose $(\mathcal{D}, \mathcal{D}', \mathcal{I})$, $(\mathcal{D}, \mathcal{D}'', \mathcal{I})$, $(\mathcal{D}'', \mathcal{D}''', \mathcal{I})$ are solved by $(\mathcal{R}, \mathcal{K})$. Let $*, ** \in \{r, l\}$. Let $\mathcal{E}^\bullet \in D^-_{\mathrm{qc},.}({}^*\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$, $\mathcal{F}^\bullet \in D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}, \mathcal{R}, {}^{\mathrm{r}}\mathcal{D}'')$, $\mathcal{G}^\bullet \in D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'', \mathcal{R}, {}^{**}\mathcal{D}''')$. The associativity isomorphism of the derived complete tensor product of quasi-coherent complexes holds, i.e. we have the isomorphism in $D^-_{\mathrm{qc},.}({}^*\mathcal{D}', \mathcal{R}, {}^{**}\mathcal{D}''')$:*

$$\left(\mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{F}^\bullet\right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''} \mathcal{G}^\bullet \xrightarrow{\sim} \mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \left(\mathcal{F}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''} \mathcal{G}^\bullet\right). \tag{7.3.4.12.1}$$

Proof. Since $\mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{F}^\bullet \in D^-_{\mathrm{qc},.}({}^*\mathcal{D}', \mathcal{R}, \mathcal{D}''^{\mathrm{r}})$ (see 7.3.4.10) then it follows from 7.3.4.8 that we have the canonical isomorphism

$$\mathbb{L}\underleftarrow{l}^*_X \left(\mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{F}^\bullet\right) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{F}^\bullet). \tag{7.3.4.12.2}$$

By associativity of the tensor product, we get the middle isomorphism:

$$\begin{aligned} \left(\mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{F}^\bullet\right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''} \mathcal{G}^\bullet &= \mathbb{R}\underleftarrow{l}_{X*} \left(\mathbb{L}\underleftarrow{l}^*_X \left(\mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{F}^\bullet\right) \otimes^{\mathbb{L}}_{\mathcal{D}''_\bullet} \mathbb{L}\underleftarrow{l}^*_X \mathcal{G}^\bullet\right) \\ &\underset{7.3.4.12.2}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{X*} \left(\left(\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{F}^\bullet)\right) \otimes^{\mathbb{L}}_{\mathcal{D}''_\bullet} \mathbb{L}\underleftarrow{l}^*_X \mathcal{G}^\bullet\right) \end{aligned} \tag{7.3.4.12.3}$$

$$\underset{4.6.3.5}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{X*} \left(\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \left(\mathbb{L}\underleftarrow{l}^*_X(\mathcal{F}^\bullet) \otimes^{\mathbb{L}}_{\mathcal{D}''_\bullet} \mathbb{L}\underleftarrow{l}^*_X \mathcal{G}^\bullet\right)\right) \underset{7.3.4.12.2}{\xrightarrow{\sim}} \mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \left(\mathcal{F}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''} \mathcal{G}^\bullet\right). \tag{7.3.4.12.4}$$

□

Remark 7.3.4.13. Without quasi-coherence hypotheses, the associativity isomorphism 7.3.4.12.1 is false. This is the main reason why Berthelot introduced his notion of quasi-coherence.

In the case of extension by ring homomorphisms, contrary to 7.3.4.12, the associativity becomes straightforward:

Proposition 7.3.4.14. *Suppose there exists a homomorphism of sheaf of rings on $\mathfrak{X}$ of the form $\mathcal{D} \to \mathcal{D}' \to \mathcal{D}''$ such that the composition of $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ with $\mathcal{D} \to \mathcal{D}'$ gives $\mathcal{O}_{\mathfrak{X}}^{\sharp} \to \mathcal{D}'$ and the composition of $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}'$ with $\mathcal{D}' \to \mathcal{D}''$ gives $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}''$.*

(a) For any Let $\mathcal{E}_\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$, we have the associativity isomorphism in $D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}''_\bullet)$:

$$\mathcal{D}''_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathcal{E}_\bullet \xrightarrow{\sim} \left(\mathcal{D}''_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}'_\bullet} \mathcal{D}'\right) \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathcal{E}_\bullet \xrightarrow{\sim} \mathcal{D}''_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}'_\bullet} \left(\mathcal{D}'_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathcal{E}_\bullet\right). \tag{7.3.4.14.1}$$

(b) For any $\mathcal{E} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$, we have the associativity isomorphism in $D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'')$:

$$\mathcal{D}''\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}\mathcal{E} \xrightarrow{\sim} \left(\mathcal{D}''\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}'}\mathcal{D}'\right)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}\mathcal{E} \xrightarrow{\sim} \mathcal{D}''\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}'}\left(\mathcal{D}'\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}\mathcal{E}\right). \tag{7.3.4.14.2}$$

Proof. By using a flat resolution of we get the isomorphism 7.3.4.14.1. By using Theorem 8.5.1.10, we get 7.3.4.14.2 from 7.3.4.14.1. □

7.3.4.15. Suppose $p\mathcal{O}_{\mathfrak{X}} \subset \mathcal{I}$. Suppose $(\mathcal{D}, \mathcal{D}', \mathcal{I})$, $(\mathcal{D}, \mathcal{D}'', \mathcal{I})$ are solved by $(\mathcal{R}, \mathcal{K})$. It follows from the universal properties of categories of fractions, that the functor 7.3.4.9.2 induces

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}-\colon D_{\mathbb{Q}}({}^*\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}}) \times D_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}, \mathcal{R}, {}^*\mathcal{D}'') \to D_{\mathbb{Q}}({}^*\mathcal{D}', \mathcal{R}, {}^*\mathcal{D}''). \tag{7.3.4.15.1}$$

7.3.4.16. Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet \in D^-({}^l\mathcal{D})$ be two complexes of left $\mathcal{D}$-modules. Following 7.3.2.3.d, $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) = \mathcal{D}_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}_\bullet)$ and similarly for right modules. Hence, we can define their *completed internal homomorphism* by setting

$$\mathbb{R}\widehat{\mathscr{H}om}_{\mathcal{D}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) := \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathbb{L}\underleftarrow{l}^*_X\mathcal{E}^\bullet, \mathbb{L}\underleftarrow{l}^*_X\mathcal{F}^\bullet)), \tag{7.3.4.16.1}$$

where $\mathbb{R}\underleftarrow{l}_{X*}\colon D(\mathbb{Z}_{X_\bullet}) \to D(\mathbb{Z}_{\mathfrak{X}})$ is the derived pushforward given by the topoi morphism $\underleftarrow{l}_X\colon (X_\bullet, \mathbb{Z}_{X_\bullet}) \to (|\mathcal{X}|, \mathbb{Z}_{\mathfrak{X}})$ and $\mathbb{L}\underleftarrow{l}^*_X\colon D({}^{\mathrm{l}}\mathcal{D}) \to D({}^{\mathrm{l}}\mathcal{D}_\bullet)$ is the derived pullback given by the topoi morphism $\underleftarrow{l}_X\colon (X_\bullet, \mathcal{D}_\bullet) \to (|\mathcal{X}|, \mathcal{D})$.

Suppose $(\mathcal{D}, \mathcal{D}, \mathcal{I})$ is solved by $(\mathcal{R}, \mathcal{K})$. Then we have the morphism we have the map of $D(\mathcal{R}_\bullet)$:

$$\underleftarrow{l}^{-1}_X\mathbb{R}\mathscr{H}om_{\mathcal{D}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) \overset{4.6.5.5.1}{\longrightarrow} \mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathbb{L}\underleftarrow{l}^*_X\mathcal{E}^\bullet, \mathbb{L}\underleftarrow{l}^*_X\mathcal{F}^\bullet)).$$

Hence, by adjunction we get the morphism of $D(\mathcal{R})$:

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) \to \mathbb{R}\widehat{\mathscr{H}om}_{\mathcal{D}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet). \tag{7.3.4.16.2}$$

Remark that if $\mathcal{D}$ is commutative, then $(\mathcal{D}, \mathcal{D}, \mathcal{I})$ is solved by $(\mathcal{D}, \mathcal{I})$ and the map 7.3.4.16.2 is a morphism of $D(\mathcal{D})$.

Proposition 7.3.4.17. *Suppose $\mathfrak{X}$ is quasi-compact. Suppose $(\mathcal{D}_\bullet, \mathcal{D}'_\bullet)$ and $(\mathcal{D}_\bullet, \mathcal{D}''_\bullet)$ are solved by $\mathcal{R}_\bullet$. Let $*, ** \in \{r, l\}$. Let $\star \in \{\mathrm{b}, -\}$. Let $\mathcal{E}^\bullet_\bullet \in D_{\mathrm{perf}}({}^*\mathcal{D}_\bullet)$, $\mathcal{F}^\bullet_\bullet \in D^\star_{\cdot,\mathrm{qc}}({}^*\mathcal{D}_\bullet, \mathcal{R}_\bullet, {}^{**}\mathcal{D}'_\bullet)$. Then $\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}^\bullet_\bullet, \mathcal{F}^\bullet_\bullet) \in D^\star_{\mathrm{qc}}({}^{**}\mathcal{D}'_\bullet)$. If moreover $\mathcal{F}^\bullet_\bullet \in D_{\mathrm{perf}}({}^{**}\mathcal{D}'_\bullet)$, then $\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}^\bullet_\bullet, \mathcal{F}^\bullet_\bullet) \in D_{\mathrm{perf}}({}^{**}\mathcal{D}'_\bullet)$.*

Proof. a) Suppose $\star = \mathrm{b}$. By using 7.1.3.23, we get $(\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}^\bullet_\bullet, \mathcal{F}^\bullet_\bullet))_0 \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}_0}(\mathcal{E}^\bullet_0, \mathcal{F}^\bullet_0) \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{**}\mathcal{D}'_0)$. Hence, by using loc. cit., we reduce to check that the morphism

$$\mathcal{R}_j \otimes^{\mathbb{L}}_{\mathcal{R}_i} \mathbb{R}\mathcal{H}om_{\mathcal{D}_i}(\mathcal{E}^\bullet_i, \mathcal{F}^\bullet_i) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}^\bullet_j, \mathcal{F}^\bullet_j). \tag{7.3.4.17.1}$$

induced by 7.1.3.19.2 is an isomorphism. This morphism is equal to the composition

$$\mathcal{R}_j \otimes^{\mathbb{L}}_{\mathcal{R}_i} \mathbb{R}\mathcal{H}om_{\mathcal{D}_i}(\mathcal{E}^\bullet_i, \mathcal{F}^\bullet_i) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{R}_j \otimes^{\mathbb{L}}_{\mathcal{R}_i} \mathcal{E}^\bullet_i, \mathcal{R}_j \otimes^{\mathbb{L}}_{\mathcal{R}_i} \mathcal{F}^\bullet_i) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}^\bullet_j, \mathcal{F}^\bullet_j).$$

Following 7.1.3.13, since $\mathcal{E}_i^\bullet \in D_{\mathrm{perf}}(\mathcal{D}_i)$, then we can check that the first morphism is an isomorphism. Since $\mathcal{E}_\bullet^\bullet$ and $\mathcal{F}_\bullet^\bullet$ are quasi-coherent, then so is the second morphism.

b) Let $\mathcal{F}_\bullet^\bullet \in D^-_{.,\mathrm{qc}}({}^*\mathcal{D}_\bullet, \mathcal{R}_\bullet, {}^{**}\mathcal{D}'_\bullet)$. Since the property $\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet^\bullet, \mathcal{F}_\bullet^\bullet) \in D^-_{\mathrm{qc}}({}^{**}\mathcal{D}'_\bullet)$ is Zariski local in $\mathfrak{X}$, we can suppose $\mathcal{E}_\bullet^\bullet \in C({}^*\mathcal{D}_\bullet)$ is a strictly perfect complex (see definition 7.1.3.10). Then this is checked similarly to the proof of a). □

7.3.4.18. Suppose $(\mathcal{D}, \mathcal{D}', \mathcal{I})$ and $(\mathcal{D}, \mathcal{D}'', \mathcal{I})$ are solved by $(\mathcal{R}, \mathcal{K})$. Since $(\mathcal{D}_\bullet, \mathcal{D}'_\bullet)$ and $(\mathcal{D}_\bullet, \mathcal{D}''_\bullet)$ are solved by $\mathcal{R}_\bullet$, then following 7.1.3.23.1, we get the bifunctor:

$$\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{D}_\bullet}(-,-)\colon D({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, \mathcal{D}'^{\mathrm{r}}_\bullet) \times D({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, \mathcal{D}''^{\mathrm{r}}_\bullet) \to D({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}''^{\mathrm{r}}_\bullet). \tag{7.3.4.18.1}$$

By setting $\mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{D}}(-,-) := \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathbb{L}\underleftarrow{l}^*_X -, \mathbb{L}\underleftarrow{l}^*_X -))$, this yields the bifunctor

$$\mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{D}}(-,-)\colon D({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, {}^{\mathrm{l}}\mathcal{D}) \times D({}^{\mathrm{l}}\mathcal{D}, \mathcal{R}, {}^{\mathrm{l}}\mathcal{D}'') \to D({}^{\mathrm{r}}\mathcal{D}', \mathcal{R}, {}^{\mathrm{l}}\mathcal{D}''). \tag{7.3.4.18.2}$$

Let $\mathcal{E}^\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}', \mathcal{R}, \mathcal{D}^{\mathrm{r}})$, $\mathcal{F}^\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}, \mathcal{R}, {}^{\mathrm{l}}\mathcal{D}'')$ be two complexes. Similarly to 7.3.4.16.2 , we construct the canonical morphism

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) \to \mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{D}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) \tag{7.3.4.18.3}$$

which is an isomorphism when $\mathcal{E}^\bullet \in D_{\mathrm{perf}}(\mathcal{D}^{\mathrm{r}})$ and $\mathcal{F}^\bullet \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$. Indeed, since this is local, we reduce to the case where $\mathcal{E}^\bullet = \mathcal{D}$, which is obvious.

7.4 Up to isogeny complexes

7.4.1 Quotient and localization of triangulated categories, general derived functors reminders

The purpose of this subsection is to fix some terminologies (which are not standard) and recall some properties.

Definition 7.4.1.1. Let $\mathfrak{D}$ be a pre-triangulated category. We say a full pre-triangulated subcategory $\mathfrak{D}'$ of $\mathfrak{D}$ is "saturated" if whenever $X \oplus Y$ is isomorphic to an object of $\mathcal{D}'$ then both X and Y are isomorphic to objects of $\mathfrak{D}'$. Recall that this notion is equivalent to that of "épaisse triangulated subcategory" but is more convenient to handle (see [Sta22, 05RB-13.6.1]).

7.4.1.2. Let $\mathfrak{D}$ be a triangulated category. Let S be a multiplicative systems in $\mathfrak{D}$ compatible with the triangulated structure. Then we have the localisation functor $Q_S\colon \mathfrak{C} \to S^{-1}\mathfrak{C}$ (see [Sta22, 05R6-13.5.5]). Let $\mathfrak{B}(S) := \ker(Q_S) := \{X \in \mathrm{Ob}(\mathfrak{D}) \mid Q_S(X) \xrightarrow{\sim} 0\}$. Then $\mathfrak{B}(S)$ is a strictly full saturated pre-triangulated subcategory of $\mathfrak{D}$ (see [Sta22, 05RC-13.6.2]).

Let us recall the following Lemma.

Lemma 7.4.1.3. *Let $\mathfrak{D}$ be a triangulated category. Let $\mathfrak{B} \subset \mathfrak{D}$ be a full triangulated subcategory. Let $S(\mathfrak{B})$ be the family of morphisms f of $\mathfrak{D}$ such that there exists a distinguished triangle of $\mathfrak{D}$ of the form (X, Y, Z, f, g, h) with Z isomorphic to an object of $\mathfrak{B}$.*

(i) Then $S(\mathfrak{B})$ is a multiplicative system compatible with the triangulated structure on $\mathfrak{D}$.

(ii) In this situation the following are equivalent

  (a) $S(\mathfrak{B})$ is a saturated multiplicative system,

  (b) $\mathfrak{B}$ is a saturated triangulated subcategory.

Proof. See [Sta22, 05RG-13.6.6]. □

Proposition 7.4.1.4. *Let $\mathfrak{D}$ be a triangulated category. The operations described above have the following properties*

(a) For any multiplicative system S in $\mathfrak{D}$ compatible with the triangulated structure, $S_{\mathrm{sat}} := S(\mathfrak{B}(S))$ is the "saturation" of S, i.e., it is the smallest saturated multiplicative system in $\mathfrak{D}$ containing S.

(b) *For any full triangulated subcategory $\mathfrak{B} \subset \mathfrak{D}$, $\mathfrak{B}_{\text{sat}} := \mathfrak{B}(S(\mathfrak{B}))$ is the "saturation" of $\mathfrak{B}$, i.e., it is the smallest strictly full saturated triangulated subcategory of $\mathfrak{D}$ containing $\mathfrak{B}$.*

In particular, the constructions define mutually inverse maps between the (partially ordered) set of saturated multiplicative systems in $\mathfrak{D}$ compatible with the triangulated structure on $\mathfrak{D}$ and the (partially ordered) set of strictly full saturated triangulated subcategories of $\mathfrak{D}$.

Proof. See [Sta22, 05RL]. □

Notation 7.4.1.5 (Quotient of triangulated category)**.** Let $\mathfrak{D}$ be a triangulated category.

Let $\mathfrak{B} \subset \mathfrak{D}$ be a full triangulated subcategory. We set $\mathfrak{D}/\mathfrak{B} := S(\mathfrak{B})^{-1}\mathfrak{D}$ and $Q_{\mathfrak{B}} : \mathfrak{D} \to \mathfrak{D}/\mathfrak{B}$ be the localization functor. Following [Sta22, 05RJ–13.6.8.(2)] the functor $Q_{\mathfrak{B}}$ satisfies the following universal property: for any exact functor of triangulated categories $F: \mathfrak{D} \to \mathfrak{D}'$ such that $\mathfrak{B} \subset \operatorname{Ker} F$, there exists a unique factorization $G: \mathfrak{D}/\mathfrak{B} \to \mathfrak{D}'$ such that $F = G \circ Q_{\mathfrak{B}}$. Since $\mathfrak{B} \subset \operatorname{Ker} Q_{\mathfrak{B}} = \mathfrak{B}_{\text{sat}} = \operatorname{Ker} Q_{\mathfrak{B}_{\text{sat}}}$, from this universal properties satisfies respectively by $Q_{\mathfrak{B}}$ and $Q_{\mathfrak{B}_{\text{sat}}}$, we can construct canonical quasi-inverse equivalences of categories $\mathfrak{D}/\mathfrak{B} \to \mathfrak{D}/\mathfrak{B}_{\text{sat}}$ and $\mathfrak{D}/\mathfrak{B}_{\text{sat}} \to \mathfrak{D}/\mathfrak{B}$.

Moreover, let S be a multiplicative systems in $\mathfrak{D}$ compatible with the triangulated structure. Since $S \subset S_{\text{sat}}$, by using the universal properties satisfied by $Q_{S_{\text{sat}}}$, we get the functor $S^{-1}\mathfrak{D} \to S_{\text{sat}}^{-1}\mathfrak{D}$. Since $S_{\text{sat}} = \{f \in \mathit{Arrow}(\mathfrak{D})$, such that $Q_S(f)$ is an isomorphism$\}$, then by using the universal properties satisfied respectively by Q_S we get the functor $S_{\text{sat}}^{-1}\mathfrak{D} \to S^{-1}\mathfrak{D}$, which is quasi-inverse to $S^{-1}\mathfrak{D} \to S_{\text{sat}}^{-1}\mathfrak{D}$. This yields $S^{-1}\mathfrak{D} \cong \mathfrak{D}/\mathfrak{B}(S)$. Hence, the difference between a localization of $\mathfrak{D}$ and a quotient of $\mathfrak{D}$ is just a matter of point of view. Moreover, both saturations appearing in 7.4.1.4 do not affect the associated quotient or localization of a triangulated category.

Lemma 7.4.1.6. *Let $\mathfrak{D}$ be a triangulated category. Let $\mathfrak{B}$ be a full triangulated subcategory of $\mathfrak{D}$ and $\mathfrak{B}'$ be a full triangulated subcategory of $\mathfrak{D}/\mathfrak{B}$. Then we have the equivalence of categories:*

$$\mathfrak{D}/\ker(Q_{\mathfrak{B}'} \circ Q_{\mathfrak{B}}) \cong (\mathfrak{D}/\mathfrak{B})/\mathfrak{B}'. \tag{7.4.1.6.1}$$

Proof. Since we are dealing with quotients, we can suppose that $\mathfrak{B} = \mathfrak{B}_{\text{sat}}$ and $\mathfrak{B}' = \mathfrak{B}'_{\text{sat}}$ (see 7.4.1.5). The, this can be easily checked by using the universal property of the quotient given at 7.4.1.5. □

Proposition 7.4.1.7. *Let $H: \mathfrak{D} \to \mathfrak{A}$ be a homological functor from a triangulated category $\mathfrak{D}$ to an abelian category $\mathfrak{A}$. The subcategory $Ker(H) := \{X \in \operatorname{Ob}(\mathfrak{D}) \mid H(X[n]) = 0$ for all $n \in \mathbb{Z}\}$ is a strictly full saturated triangulated subcategory of $\mathfrak{D}$ whose corresponding saturated multiplicative system (see Lemma 7.4.1.4) is the set $S = \{f \in \operatorname{Arrows}(\mathfrak{D}) \mid H^i(f)$ is an isomorphism for all $i \in Z\}$. The functor H factors through the quotient functor $Q: \mathfrak{D} \to \mathfrak{D}/Ker(H)$.*

Proof. See [Sta22, 05RM-13.6.11]. □

Definition 7.4.1.8. Let $\mathfrak{C}$ be a triangulated category. A null system in the sense of [KS06, 10.2.2] is a strictly full triangulated subcategories (beware in this latter book "saturatedness" means "strictness", i.e. the stability under isomorphisms property). Recall that when the null system is saturated (in the sense of 7.4.1.1) then it corresponds bijectively via 7.4.1.4 to a saturated multiplicative system of $\mathfrak{C}$.

Definition 7.4.1.9. Let $\mathfrak{C}$ be a category, S a right multiplicative system in $\mathfrak{C}$, $Q_S: \mathfrak{D} \to S^{-1}\mathfrak{D}$ be the localization functor and $F: \mathfrak{C} \to \mathfrak{A}$ be a functor.

(a) We say that F is "right localizable (with respect to S)" (in the sense of [KS06, 7.3.1]) if there exists a (unique up to isomorphism) functor $\mathbb{R}_S F: S^{-1}\mathfrak{C} \to \mathfrak{A}$ together with a morphism of functors $\tau: F \to \mathbb{R}_S F \circ Q_S$ such that for any functor $G: : S^{-1}\mathfrak{C} \to \mathfrak{A}$ the map induced by τ and the functor $\circ Q_S$
$$\operatorname{Hom}_{\operatorname{Fct}(S^{-1}\mathfrak{C},\mathfrak{A})}(\mathbb{R}_S F, G) \to \operatorname{Hom}_{\operatorname{Fct}(\mathfrak{C},\mathfrak{A})}(F, G \circ Q_S), \tag{7.4.1.9.1}$$
where $\operatorname{Fct}(S^{-1}\mathfrak{C}, \mathfrak{A})$ and $\operatorname{Fct}(\mathfrak{C}, \mathfrak{A})$ are the corresponding category of functors, is bijective.

(b) We say that F is "universally right localizable (with respect to S)" if for any functor $K: \mathfrak{A} \to \mathfrak{A}'$, the functor $K \circ F$ is localizable and $\mathbb{R}_S(K \circ F) \xrightarrow{\sim} K \circ \mathbb{R}_S F$.

(c) Let $X \in \mathfrak{C}$ and X/S be the filtered category of arrows $s\colon X \to X'$ in S with source X. Following definition [Sta22, 05S9-13.14.2] (or [KS06, 7.4.2]), we say the "right derived functor of F (with respect to S) is defined at X" if the ind-object

$$\alpha^X\colon (X/S) \to \mathfrak{A}, \qquad (s\colon X \to X') \mapsto F(X') \tag{7.4.1.9.2}$$

is essentially constant, i.e. "$\varinjlim$"α^X is representable by an object of $\mathfrak{A}$ which is denoted $\mathbb{R}_S F(X)$. The $\mathbb{R}F(X)$ is called the value of $\mathbb{R}_S F$ at X.

(d) Assume that for any $X \in \mathfrak{C}$, the category X/S is cofinally small. Following [KS06, 7.4.4], the two conditions below are equivalent (and both $\mathbb{R}_S F(X)$ coincide for each $X \in \mathfrak{C}$):

  (i) F is right localizable at each $X \in \mathfrak{C}$ (with respect to S),

  (ii) F is universally right localizable (with respect to S).

Definition 7.4.1.10. Let $F\colon \mathfrak{D} \to \mathfrak{D}'$ be a triangulated functor of triangulated categories. Let $\mathfrak{N}$ (resp. $\mathfrak{N}'$) be a null system of $\mathfrak{D}$ (resp. $\mathfrak{D}'$). We say that the functor F is "right localizable with respect to $(\mathfrak{N}, \mathfrak{N}')$" if $Q_{\mathfrak{N}'} \circ F$ is is universally right localizable with respect to the multiplicative system $S(\mathfrak{N})$ (see definition 7.4.1.9). When it exists, we denote the right localization with respect to $(\mathfrak{N}, \mathfrak{N}')$ by $\mathbb{R}^{\mathfrak{N}'}_{\mathfrak{N}} F\colon \mathfrak{D}/\mathfrak{N} \to \mathfrak{D}'/\mathfrak{N}'$. When $\mathfrak{N}' = 0$, we simply say F is "right localizable with respect to $\mathfrak{N}$" and we simply write $\mathbb{R}_{\mathfrak{N}} F$.

Remark 7.4.1.11. With notation 7.4.1.10, suppose there exists a functor $G\colon \mathfrak{D}/\mathfrak{N} \to \mathfrak{D}'/\mathfrak{N}'$ such that there exists an isomorphism of the form $\phi\colon Q_{\mathfrak{N}'} \circ F \xrightarrow{\sim} G \circ Q_{\mathfrak{N}}$. Remark that for any functors $G_i\colon \mathfrak{D}/\mathfrak{N} \to \mathfrak{D}'/\mathfrak{N}'$ pour $i = 1, 2$, the data of a functor $G_1 \to G_2$ is the same as the data of a functor $G_1 \circ Q_{\mathfrak{N}} \to G_2 \circ Q_{\mathfrak{N}}$. Using this remark, we can check the right localizable with respect to $(\mathfrak{N}, \mathfrak{N}')$ of F exists and we can choose $G = \mathbb{R}^{\mathfrak{N}'}_{\mathfrak{N}} F$ and the $Q_{\mathfrak{N}'} \circ F \to \mathbb{R}^{\mathfrak{N}'}_{\mathfrak{N}} F \circ Q_{\mathfrak{N}}$ equal to ϕ.

Remark 7.4.1.12. With notation 7.4.1.10, su suppose that $X/S(\mathfrak{N})$ is cofinally small, for any $X \in \mathfrak{D}$.

(a) Then if F is right localizable with respect to $(\mathfrak{N}, \mathfrak{N}')$, then $\mathbb{R}^{\mathfrak{N}'}_{\mathfrak{N}} F$ is a triangulated functor of triangulated categories. Indeed, following 7.4.1.9.d, this means that $Q_{\mathfrak{N}'} \circ F$ is right localizable with respect to $\mathfrak{N}$ at each $X \in \mathfrak{D}$ and we have $\mathbb{R}^{\mathfrak{N}'}_{\mathfrak{N}} F = \mathbb{R}_{S(\mathfrak{N})}(Q_{\mathfrak{N}'} \circ F)$. Hence, we conclude by using [Sta22, 05SE-13.14.8].

(b) It follows from a) that the triangulated functor $\mathbb{R}^{\mathfrak{N}'}_{\mathfrak{N}} F$ satisfies a similar universal property than 7.4.1.9.1 where we replace functors by triangulated functors. In the notion of "right localizable with respect to $(\mathfrak{N}, \mathfrak{N}')$" in the sense of [KS06, 10.3.1], the functor $\mathbb{R}^{\mathfrak{N}'}_{\mathfrak{N}} F$ is by definition a triangulated functor, i.e. F is "universally right localizable" in the sense that we restrict to triangulated functors. Since our functors will be right localizable with respect to $\mathfrak{N}$ at each $X \in \mathfrak{D}$, since we prefer to avoid confusion between two different notions of "universally right localizable", we stick with our definition 7.4.1.10 which is a priori stronger than [KS06, 10.3.1].

Lemma 7.4.1.13. *Let $\mathfrak{D}_1,\ \mathfrak{D}'_1,\ \mathfrak{D}$ be some triangulated categories endowed respectively with the null systems $\mathfrak{N}_1,\ \mathfrak{N}'_1, \mathfrak{N}$. Let $\mathfrak{N}_2,\ \mathfrak{N}'_2$ be some null systems of respectively $\mathfrak{D}_2 := \mathfrak{D}_1/\mathfrak{N}_1,\ \mathfrak{D}'_2 := \mathfrak{D}'_1/\mathfrak{N}'_1$ (see notations 7.4.1.5). Let $\mathfrak{N}_3,\ \mathfrak{N}'_3$ be some null systems of respectively $\mathfrak{D}_1,\ \mathfrak{D}'_1$ such that $\mathfrak{D}_1 \to \mathfrak{D}_2/\mathfrak{N}_2$ and $\mathfrak{D}'_1 \to \mathfrak{D}'_2/\mathfrak{N}'_2$ induce the equivalence of categories $\mathfrak{D}_1/\mathfrak{N}_3 \cong \mathfrak{D}_2/\mathfrak{N}_2$, $\mathfrak{D}'_1/\mathfrak{N}'_3 \cong \mathfrak{D}'_2/\mathfrak{N}'_2$.*

Let $F\colon \mathfrak{D}_1 \times \mathfrak{D}'_1 \to \mathfrak{D}$ a triangulated bifunctor. We assume that the right localization of F with respect to $(\mathfrak{N}_1 \times \mathfrak{N}'_1, \mathfrak{N})$ exists (see the definition 7.4.1.9) and is denoted by $\mathbb{R}^{\mathfrak{N}}_{\mathfrak{N}_1 \times \mathfrak{N}'_1} F$. If one of the following conditions:

(a) the right localization of F with respect to $(\mathfrak{N}_3 \times \mathfrak{N}'_3, \mathfrak{N})$ exists,

(b) the right localization of $\mathbb{R}^{\mathfrak{N}}_{\mathfrak{N}_1 \times \mathfrak{N}'_1} F$ with respect to $\mathfrak{N}_2 \times \mathfrak{N}'_2$ exists

is satisfied, then so is the second one and we have in this case the isomorphism of bifunctors

$$\mathbb{R}_{\mathfrak{N}_2 \times \mathfrak{N}'_2} \mathbb{R}^{\mathfrak{N}}_{\mathfrak{N}_1 \times \mathfrak{N}'_1} F \xrightarrow{\sim} \mathbb{R}^{\mathfrak{N}}_{\mathfrak{N}_3 \times \mathfrak{N}'_3} F. \tag{7.4.1.13.1}$$

Proof. This follows from the universal property of right localisations. □

7.4.2 Localising by isogenies, Serre subcategories

For any abelian sheaf $\mathcal{E}$, we write $\mathcal{E}_{\mathbb{Q}} = \mathcal{E} \otimes_{\mathbb{Z}} \mathbb{Q}$.

7.4.2.1. Let $\mathfrak{C}$ be an additive category.

(a) We denote by $\mathfrak{C}_{\mathbb{Q}}$ the category of objects of $\mathfrak{C}$ up to isogeny. By definition $\mathrm{Ob}(\mathfrak{C}_{\mathbb{Q}}) = \mathrm{Ob}(\mathfrak{C})$ and for any objects E, F of $\mathrm{Ob}(\mathfrak{C}_{\mathbb{Q}})$ we set

$$\mathrm{Hom}_{\mathfrak{C}_{\mathbb{Q}}}(E, F) := \mathrm{Hom}_{\mathfrak{C}}(E, F) \otimes_{\mathbb{Z}} \mathbb{Q}. \tag{7.4.2.1.1}$$

Via the maps $\mathrm{Hom}_{\mathfrak{C}}(E, F) \to \mathrm{Hom}_{\mathfrak{C}_{\mathbb{Q}}}(E, F)$ given by $f \mapsto f \otimes 1$ and the identities on the objects, we get a canonical functor $\mathfrak{C} \to \mathfrak{C}_{\mathbb{Q}}$ which essentially surjective but not faithful. Remark that if $\mathfrak{D}$ is a full subcategory of $\mathfrak{C}$ then $\mathfrak{D}_{\mathbb{Q}}$ is a full subcategory of $\mathfrak{C}_{\mathbb{Q}}$.

(b) When $\mathfrak{C}$ is a equal to a category of the form $D^*(\mathfrak{A})$ where $* \in \{\emptyset, -, +, \mathrm{b}\}$ and $\mathfrak{A}$ is an abelian category, we often write $D^*_{\mathbb{Q}}(\mathfrak{A})$ instead of $D^*(\mathfrak{A})_{\mathbb{Q}}$.

(c) Let $f \in \mathrm{Hom}_{\mathfrak{C}}(E, F)$. We say that f is an "n-isogeny" if $n \geq 1$ is an integer so that there exists and a morphism $g \in \mathrm{Hom}_{\mathfrak{C}}(F, E)$ such that $f \circ g = n\,\mathrm{id}_F$ and $g \circ f = n\,\mathrm{id}_E$. We say that f is an "isogeny" if there exists an integer $n \geq 1$ such that f is an n-isogeny. Let $\Sigma \subset \mathit{Arrows}(\mathfrak{C})$ be the family of isogenies of $\mathfrak{C}$.

Lemma 7.4.2.2. *The family Σ of isogenies is a saturated multiplicative system. A morphism f of $\mathfrak{C}$ is an isogeny if and only if it is an isomorphism of $\mathfrak{C}_{\mathbb{Q}}$. Moreover, if $\mathfrak{C}_{\Sigma} := \Sigma^{-1}\mathfrak{C}$ is the localization category (see [KS06, 7.1.16]), then the canonical functor $\mathfrak{C} \to \mathfrak{C}_{\mathbb{Q}}$ factors into the equivalence of categories $\mathfrak{C}_{\Sigma} \xrightarrow{\sim} \mathfrak{C}_{\mathbb{Q}}$.*

Proof. 1) i) Let us check that Σ is a right multiplicative system, i.e. the properties RMS1–3 hold (see [Sta22, 04VC-4.27.1].

RMS1: the identity is an isogeny.

RMS2 Let $f : E \to F$ be an isogeny of $\mathfrak{C}$ and $h \in \mathrm{Hom}_{\mathfrak{C}}(G, F)$. Let $n \geq 1$ be an integer, $g \in \mathrm{Hom}_{\mathfrak{C}}(F, E)$ such that $f \circ g = n\,\mathrm{id}_F$ and $g \circ f = n\,\mathrm{id}_E$. Then $g \circ h \in \mathrm{Hom}_{\mathfrak{C}}(G, E)$ and $n_G \in G \to G$ is an isogeny such that $h \circ n_G = f \circ (g \circ h)$.

RMS3 Let $f, g \in \mathrm{Hom}_{\mathfrak{C}}(E, F)$, $h : F \to G$ be an isogeny such that $h \circ f = h \circ g$. Then there exists an integer $n \geq 1$ such that $n_F \circ f = n_F \circ g$. Hence, $f \circ n_E = g \circ n_E$.

ii) We check similarly the dual properties, i.e. Σ is a left multiplicative system.

2) An isogeny of $\mathfrak{C}$ is an isomorphism in $\mathfrak{C}_{\mathbb{Q}}$. More precisely, let $n \geq 1$ be an integer, $f \in \mathrm{Hom}_{\mathfrak{C}}(F', F)$, $g \in \mathrm{Hom}_{\mathfrak{C}}(F, F')$ such that $f \circ g = n\,\mathrm{id}_F$ and $g \circ f = n\,\mathrm{id}_{F'}$. Then $f \otimes 1$, the image of f in $\mathrm{Hom}_{\mathfrak{C}}(F, F') \otimes_{\mathbb{Z}} \mathbb{Q}$, has the inverse $g \otimes \frac{1}{n}$.

Conversely, let $f \in \mathrm{Hom}_{\mathfrak{C}}(F', F)$ such that $f \otimes 1 \in \mathrm{Hom}_{\mathfrak{C}_{\mathbb{Q}}}(F', F)$ is an isomorphism. Then there exists an integer $n \geq 1$, there exists $g \in \mathrm{Hom}_{\mathfrak{C}}(F, F')$ such that $(f \otimes 1) \circ (g \otimes \frac{1}{n}) = \frac{1}{1}$ and $(g \otimes \frac{1}{n}) \circ (f \otimes 1) = \frac{1}{1}$, which yields, increasing n if necessary, $f \circ g = n\,\mathrm{id}_F$ and $g \circ f = n\,\mathrm{id}_{F'}$.

3) It follows from 2), that Σ is saturated.

4) By using the universal property on localisation functor, we get the factorization $\mathfrak{C}_{\Sigma} \to \mathfrak{C}_{\mathbb{Q}}$. Let $E, F \in \mathrm{Ob}(\mathfrak{C})$, it remains to check that the map $\mathrm{Hom}_{\mathfrak{C}_{\Sigma}}(E, F) \to \mathrm{Hom}_{\mathfrak{C}}(E, F) \otimes_{\mathbb{Z}} \mathbb{Q}$ is a bijection. Injectivity: If the equivalence class of $E \xrightarrow{\phi} F' \xleftarrow{f} F$ with f an isogeny is sent to zero, then ϕ is sent to zero. Hence, there exists $n \geq 1$ such that $n_{F'} \circ \phi = 0$, which implies that $E \xrightarrow{\phi} F' \xleftarrow{f} F$ is the class of zero. Surjectivity: the equivalence class of $E \xrightarrow{f} F \xleftarrow{n_F} F$ is sent to $f \otimes \frac{1}{n}$. ☐

7.4.2.3. Let F be an object of $\mathfrak{C}_{\mathbb{Q}}$. We denote by $\mathbb{N}^{\star}$ the category whose objects are the integers $n \geq 1$ and $\mathrm{Hom}_{\mathbb{N}^{\star}}(n, m)$ is empty if n do not divide m otherwise it is a singleton. Consider the functor $\chi_F : \mathbb{N}^{\star} \to \mathfrak{C}$ given for any integers $n, d \geq 1$ by $\chi_F(n) = F$ and $\chi_F(n \to nd)$ it the multiplication by d. We denote by $n^*F := \chi_F(n)$. For any objects E, F of $\mathfrak{C}_{\mathbb{Q}}$, we get from 7.4.2.2 the equality:

$$\mathrm{Hom}_{\mathfrak{C}_{\mathbb{Q}}}(E, F) = \mathrm{Hom}_{\mathfrak{C}_{\Sigma}}(E, F) = \varinjlim_{n \in \mathbb{N}^{\star}} \mathrm{Hom}_{\mathfrak{C}}(E, n^*F), \tag{7.4.2.3.1}$$

Proposition 7.4.2.4. *Let $\mathfrak{C}$ be a triangulated category. There exists on $\mathfrak{C}_{\mathbb{Q}}$ a unique triangulated structure such that the functor $Q : \mathfrak{C} \to \mathfrak{C}_{\mathbb{Q}}$ is an exact functor.*

Proof. We apply 7.4.1.7 to the family of functors $\mathrm{Hom}_{\mathfrak{C}}(E,-)\otimes\mathbb{Q}\colon \mathfrak{C}\to\mathfrak{Ab}$. □

Let us now consider the case of an abelian category. First, let us collect few facts on Serre subcategories and localisations.

7.4.2.5 (Serre subcategories)**.** Let $\mathfrak{A}$ be an abelian category. Let S be a multiplicative system of $\mathfrak{A}$. Then $S^{-1}\mathfrak{A}$ is an abelian category and the localisation functor $Q_S\colon \mathfrak{A}\to S^{-1}\mathfrak{A}$ is exact (see [Sta22, 05QG]). It follows from [Sta22, 02MQ] that $\mathfrak{B}(S) := \mathrm{Ker}\, Q_S$, where $\mathrm{Ker}\, Q_S$ is the full subcategory of objects X of $\mathfrak{A}$ such that $Q_S(X)=0$, forms a Serre subcategory of $\mathfrak{A}$.

Let $\mathfrak{B}\subset\mathfrak{A}$ be a Serre subcategory (see [Sta22, 02MO]). Consider the set of arrows of $\mathfrak{A}$ defined by the following formula

$$S(\mathfrak{B}) := \{f\in \mathit{Arrows}(\mathfrak{A}) \mid \mathrm{Ker}(f),\, \mathrm{Coker}(f)\in \mathit{Ob}(\mathfrak{B})\}.$$

Then $S(\mathfrak{B})$ is a saturated multiplicative system (see the proof of [Sta22, 02MS]) such that $\mathfrak{B}(S(\mathfrak{B}))=\mathfrak{B}$ (this is a consequence of [Sta22, 06XK]). We set $\mathfrak{A}/\mathfrak{B} := (S(\mathfrak{B}))^{-1}\mathfrak{A}$. Following [Sta22, 02MS], the category $\mathfrak{A}/\mathfrak{B}$ and the localisation functor $F\colon\mathfrak{A}\to\mathfrak{A}/\mathfrak{B}$ are characterized by the following universal property: for any exact functor $G\colon\mathfrak{A}\to\mathfrak{C}$ such that $\mathfrak{B}\subset\mathrm{Ker}(G)$, there exists a factorization $G=H\circ F$ for a unique exact functor $H\colon\mathfrak{A}/\mathfrak{B}\to\mathfrak{C}$.

Let S be a multiplicative system of $\mathfrak{A}$. Then we easily see that $S(\mathfrak{B}(S))$ is equal to $\widehat{S}=\{f\in \mathit{Arrows}(\mathfrak{A})\mid Q_S(f)$ is an isomorphism$\}$, which is also the smallest saturated multiplicative system containing S (see [Sta22, 05Q9]). Hence, $S\mapsto\mathfrak{B}(S)$ and $\mathfrak{B}\mapsto S(\mathfrak{B})$ are reciprocal bijections of each other between the set of saturated multiplicative systems of $\mathfrak{A}$ and Serre subcategories of $\mathfrak{A}$.

Lemma 7.4.2.6. *Let $\mathfrak{A}$ be an abelian category, $n,m\in\mathbb{N}\setminus\{0\}$.*

(a) Let $X\xrightarrow{f}Y\xrightarrow{g}Z$ be two morphisms of $\mathfrak{A}$. If f is an n-isogeny of $\mathfrak{A}$ and g is an m-isogeny of $\mathfrak{A}$, then $g\circ f$ is an nm-isogeny of $\mathfrak{A}$.

(b) Let $0\to X\xrightarrow{f}Y\xrightarrow{g}Z\to 0$ be an exact sequence of $\mathfrak{A}$. If X is killed by n then g is an n-isogeny of $\mathfrak{A}$. If Z is killed by n then f is an n-isogeny of $\mathfrak{A}$.

(c) Let $f\colon X\to Y$ be an n-isogeny of $\mathfrak{A}$. Then, $\mathrm{Ker}\, f$ *and* $\mathrm{Coker}\, f$ *are killed by n.*

(d) Let $f\colon X\to Y$ be a morphism of $\mathfrak{A}$ such that $\mathrm{Ker}\, f$ *is killed by n and* $\mathrm{Coker}\, f$ *is killed by n, then f is an nm-isogeny of $\mathfrak{A}$*

Proof. Exercice. □

7.4.2.7. Let $\mathfrak{A}$ be an abelian category. Let $\mathfrak{B}$ be the full subcategory of $\mathfrak{A}$ consisting of objects $X\in\mathrm{Ob}\,\mathfrak{A}$ such that there exists $n\in\mathbb{N}\setminus\{0\}$ so that X is killed by n. Let Σ be the class of isogenies of $\mathfrak{A}$. We easily check from 7.4.2.2, 8.1.5.4 and 7.4.2.6 the following facts.

(a) The category $\mathfrak{B}$ is a Serre subcategory of $\mathfrak{A}$.

(b) The saturated multiplicative system of $\mathfrak{A}$ associated to the Serre subcategory $\mathfrak{B}$ of $\mathfrak{A}$ is equal to Σ.

(c) We have $\mathfrak{A}/\mathfrak{B}\cong\mathfrak{A}_{\mathbb{Q}}$. In particular, $\mathfrak{A}_{\mathbb{Q}}$ is an abelian category.

7.4.3 Commutation with tensorisation by $\mathbb{Q}$

7.4.3.1. Let $\mathfrak{X}$ be a topological space. Let $\mathcal{G}$ be a complex of abelian sheaves. Let $(\mathcal{G}_n)_{n\geq 1}$ be the inductive system such that $\mathcal{G}_n=\mathcal{G}$ and the transition maps are the maps $\mathcal{G}_n\to\mathcal{G}_{dn}$ which are the multiplication by d. Then $\varinjlim_n \mathcal{G}_n \xrightarrow{\sim} \mathcal{G}_{\mathbb{Q}}$, where the inductive limit is computed in the category of complexes of abelian sheaves.

Suppose now in the rest of the paragraph that $\mathfrak{X}$ is a coherent topological space (see [FK18, 0.2.2.1]) and that $\mathcal{G}$ is an abelian sheaf. It follows from [FK18, 0.3.1.8] that for any quasi-compact open subset $\mathfrak{U}$ (hence $\mathfrak{U}$ is coherent following [FK18, 0.2.2.3]) the canonical map $\varinjlim_n\Gamma(\mathfrak{U},\mathcal{G}_n)\to\Gamma(\mathfrak{U},\varinjlim_n\mathcal{G}_n)$ is an isomorphism. Hence, the canonical map $\Gamma(\mathfrak{U},\mathcal{G})_{\mathbb{Q}}\to\Gamma(\mathfrak{U},\mathcal{G}_{\mathbb{Q}})$ is an isomorphism. In particular, when $\mathfrak{X}$ is noetherian, then this means that $\mathfrak{U}\in\mathfrak{X}_{\mathrm{zar}}\mapsto\Gamma(\mathfrak{U},\mathcal{G})_{\mathbb{Q}}$ is a sheaf canonically isomorphic to $\mathcal{G}_{\mathbb{Q}}$.

Moreover, similarly, by using [FK18, 0.3.1.16] (and [FK18, 0.2.2.3]), for any complex $\mathcal{G}$ of abelian sheaves, for any coherent open subset $\mathfrak{U}$, we can check the canonical map

$$\mathbb{R}\Gamma(\mathfrak{U}, \mathcal{G})_{\mathbb{Q}} \to \mathbb{R}\Gamma(\mathfrak{U}, \mathcal{G}_{\mathbb{Q}}). \tag{7.4.3.1.1}$$

is an isomorphism.

Lemma 7.4.3.2. *Let $\mathfrak{X}$ be a coherent topological space, $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$. For any $\mathcal{E} \in D^-_{\mathrm{coh}}(\mathcal{D})$, $\mathcal{F} \in D^+(\mathcal{D})$, the canonical morphisms*

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}}(\mathcal{E}, \mathcal{F})_{\mathbb{Q}} \to \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathbb{Q}}}(\mathcal{E}_{\mathbb{Q}}, \mathcal{F}_{\mathbb{Q}}), \tag{7.4.3.2.1}$$

$$\mathbb{R}\operatorname{Hom}_{\mathcal{D}}(\mathcal{E}, \mathcal{F})_{\mathbb{Q}} \to \mathbb{R}\operatorname{Hom}_{\mathcal{D}_{\mathbb{Q}}}(\mathcal{E}_{\mathbb{Q}}, \mathcal{F}_{\mathbb{Q}}), \tag{7.4.3.2.2}$$

are isomorphisms.

Proof. Since $\mathfrak{X}$ is coherent, it follows from 7.4.3.1.1 that the canonical morphism $\mathbb{R}\Gamma(\mathfrak{X}, \mathcal{G})_{\mathbb{Q}} \to \mathbb{R}\Gamma(\mathfrak{X}, \mathcal{G}_{\mathbb{Q}})$ is an isomorphism for any complex $\mathcal{G}$ of abelian sheaves. Hence, the isomorphism 7.4.3.2.2 is a consequence of 4.6.2.7.6 and 7.4.3.2.1. To check this latter one, it is sufficient to prove this is an n-isomorphism for any integer $n \in \mathbb{N}$, i.e. the cone of 7.4.3.2.1 is acyclic in degree $\geq n$. Let $n \in \mathbb{N}$. Since this is local on $\mathfrak{X}$ and $\mathcal{E}$ is n-pseudo-coherent, then we can suppose there exists an n-isomorphism of the form $\mathcal{L} \to \mathcal{E}$ with $\mathcal{L}$ being a strictly perfect complex of $\mathcal{D}$-modules. Since $\mathbb{R}\mathcal{H}om_{\mathcal{D}}(\mathcal{L}, \mathcal{F})_{\mathbb{Q}} \to \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathbb{Q}}}(\mathcal{L}_{\mathbb{Q}}, \mathcal{F}_{\mathbb{Q}})$ is an isomorphism (use [Har66, I.7.1.(i)]), then 7.4.3.2.1 is an n-isomorphism. □

7.4.4 Localisation by isogenies of derived categories of an abelian category

Let $\mathfrak{A}$ be an abelian category. Let $\mathfrak{B}$ be the full subcategory of $\mathfrak{A}$ consisting of objects $X \in \operatorname{Ob}\mathfrak{A}$ such that there exists $n \in \mathbb{N} \setminus \{0\}$ so that X is killed by n. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$. Let $S^\sharp$ be the class of isogenies of $D^\sharp_{\mathbb{Q}}(\mathfrak{A})$.

First, let us give below some link between isogenies and vanishing of the cone of the morphism. This will be useful later, e.g. at 9.1.2.1.

Lemma 7.4.4.1. *Let $n, m \in \mathbb{N} \setminus \{0\}$.*

(a) Let $X \xrightarrow{f} Y \xrightarrow{g} Z$ be two morphisms of $D(\mathfrak{A})$. If f is an n-isogeny of $D(\mathfrak{A})$ and g is an m-isogeny of $D(\mathfrak{A})$, then $g \circ f$ is an nm-isogeny of $D(\mathfrak{A})$.

(b) Let $X \xrightarrow{f} Y \xrightarrow{g} Z \xrightarrow{h} X[1]$ be a distinguished triangle of $D(\mathfrak{A})$ such that Z is killed by n, i.e. $n \cdot \mathrm{id}_Z \colon Z \to Z$ is null. Then f is an n^2-isogeny of $D(\mathfrak{A})$.

(c) Let $f \colon X \to Y$ be an n-isogeny of $D(\mathfrak{A})$. Then, the cone $C(f)$ of f is killed by n^2.

(d) Let $X \xrightarrow{f} Y \xrightarrow{g} Z \xrightarrow{h} X[1]$ be a distinguished triangle of $D(\mathfrak{A})$ such that X is killed by n and Y by m, then Z is killed by nm.

(e) Let $X \xrightarrow{f} Y \xrightarrow{g} Z$ be two morphisms of $D(\mathfrak{A})$. If f is an n-isogeny of $D(\mathfrak{A})$ and $g \circ f$ is an m-isogeny of $D(\mathfrak{A})$, then g is an n^2m-isogeny of $D(\mathfrak{A})$. If g is an n-isogeny of $D(\mathfrak{A})$ and $g \circ f$ is an m-isogeny of $D(\mathfrak{A})$, then f is an n^2m-isogeny of $D(\mathfrak{A})$.

(f) Let $\mathfrak{N}(\mathfrak{A})$ be the full subcategory of $D(\mathfrak{A})$ consisting in objects X which are killed by some integer $l \geq 1$. Then $\mathfrak{N}(\mathfrak{A})$ is a saturated triangulated subcategory of $D(\mathfrak{A})$ and the associated saturated multiplicative system $S(\mathfrak{N}(\mathfrak{A}))$ of $D(\mathfrak{A})$ (see notation of 7.4.1.3) consists of isogenies.

Proof. a) Straightforward: we compose the inverses up to isogeny.

b) Since (X, Y, Z, f, g, h) is a distinguished triangle, since $g \circ (n \cdot \mathrm{id}_Y) = (n \cdot \mathrm{id}_Z) \circ g = 0$, then there exists a morphism $\alpha \colon Y \to X$ of $D(\mathfrak{A})$ such that $f \circ \alpha = n \cdot \mathrm{id}_Y$. Since $(Z[-1], X, Y, -h[-1], f, g)$ is a distinguished triangle, since $f \circ (\alpha \circ f - n \cdot \mathrm{id}_X) = 0$, then $-h[-1] \circ \beta = \alpha \circ f - n \cdot \mathrm{id}_X$. Since $(n \cdot \mathrm{id}_X) \circ -h[-1] = -h[-1] \circ (n \cdot \mathrm{id}_{Z[-1]}) = 0$, then $(n \cdot \alpha) \circ f = n^2 \cdot \mathrm{id}_X$. Since $f \circ (n \cdot \alpha) = n^2 \cdot \mathrm{id}_Y$, then we are done.

c) We have the canonical distinguished triangle $(X, Y, C(f), f, g, h)$. Let $\alpha\colon Y \to X$ be a morphism of $D(\mathfrak{A})$ such that $f \circ \alpha = n \cdot \mathrm{id}_Y$ and $\alpha \circ f = n \cdot \mathrm{id}_X$. Since $h \circ n = n \circ h = \alpha[1] \circ f[1] \circ h = 0$, then there exits $\beta\colon Z \to Y$ a morphism of $D(\mathfrak{A})$ such that $g \circ \beta = n \cdot \mathrm{id}_Z$. Hence, $n^2 \cdot \mathrm{id}_Z = g \circ f \circ \alpha \circ \beta = 0$.

d) Since $h \circ n = n \circ h = 0$, then there exists $\alpha\colon Z \to Y$ such that $g \circ \alpha = n$. Hence, $mn \cdot \mathrm{id}_Z = m \cdot \mathrm{id}_Z \circ n \cdot \mathrm{id}_Z = m \cdot \mathrm{id}_Z \circ g \circ \alpha = g \circ m \cdot \mathrm{id}_Y \circ \alpha = 0$.

e) Since the second assertion is checked similarly, let us only treat the first one. By hypotheses, there exists $\alpha\colon Y \to X$ such that $f \circ \alpha = n$ and $\alpha \circ f = n$, there exists $\beta\colon Z \to X$ such that $g \circ f \circ \beta = m$ and $\beta \circ g \circ f = m$. Hence, $g \circ (n^2 \cdot f \circ \beta) = n^2 m$. We have the canonical distinguished triangle $(X, Y, C(f), f, a, b)$. Since $\beta \circ g \circ f = m$, then $(f \circ \beta \circ g) \circ f = m \circ f$. Hence, there exists $\gamma\colon C(f) \to Y$ such that $(f \circ \beta \circ g) - m = a \circ \gamma$. Since f is an n-isogeny, then $C(f)$ is killed by n^2. Hence, $(n^2 \cdot f \circ \beta) \circ g = n^2 m$.

f) This is a consequence of the previous statements. □

Lemma 7.4.4.2. *The canonical functor $\mathfrak{A}_{\mathbb{Q}} \to D_{\mathbb{Q}}(\mathfrak{A})$ is fully faithful.*

Proof. This comes from the fact that the application $\mathrm{Hom}_{\mathfrak{A}}(\mathcal{E}, n^*\mathcal{F}) \to \mathrm{Hom}_{D(\mathfrak{A})}(\mathcal{E}, n^*\mathcal{F})$ is bijective for any $n \in \mathbb{N}$ and that we have the equalities 7.4.2.3.1 for $\mathfrak{C} = \mathfrak{A}$ and $\mathfrak{C} = D(\mathfrak{A})$. □

7.4.4.3. Since the functor $\mathcal{H}^n$ carries isogenies to isogenies, then we get the functor $\mathcal{H}^n$ making commutative (up to canonical equivalence)

$$\begin{array}{ccc} D_{\mathbb{Q}}(\mathfrak{A}) & \overset{\mathcal{H}^n}{\dashrightarrow} & \mathfrak{A}_{\mathbb{Q}} \\ \uparrow & & \uparrow \\ D(\mathfrak{A}) & \xrightarrow{\mathcal{H}^n} & \mathfrak{A}, \end{array} \tag{7.4.4.3.1}$$

where the vertical arrows are the localization functors.

Lemma 7.4.4.4. *The functor $\mathcal{H}^n\colon D_{\mathbb{Q}}(\mathfrak{A}) \to \mathfrak{A}_{\mathbb{Q}}$ defined at 7.4.4.3 is a cohomological functor.*

Proof. By construction (see the proof of [Sta22, 05R6 Proposition 13.5.5]), a distinguished triangle of $D_{\mathbb{Q}}(\mathfrak{A})$ is isomorphic in $D_{\mathbb{Q}}(\mathfrak{A})$ to the image of a distinguished triangle of $K(\mathfrak{A})$ by the canonical localization functor $K(\mathfrak{A}) \to D_{\mathbb{Q}}(\mathfrak{A})$. Since $\mathcal{H}^n\colon K(\mathfrak{A}) \to \mathfrak{A}$ is a cohomological functor, since the localization functor $\mathfrak{A} \to \mathfrak{A}_{\mathbb{Q}}$ is an exact functor between abelian categories (it follows from the properties of localisations by a subcategory of Serre and of 8.1.5.5), this implies the result.

□

7.4.4.5. Denote by $D^0_{\mathbb{Q}}(\mathfrak{A})$ the strictly full sub-category of $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$ consisting of complexes $\mathcal{E}$ such that for any integer $n \neq 0$ we have $\mathcal{H}^n(\mathcal{E}) \xrightarrow{\sim} 0$ in $\mathfrak{A}_{\mathbb{Q}}$.

Remark 7.4.4.6. Let $\mathcal{E} \in D_{\mathbb{Q}}(\mathfrak{A})$ such that $\mathcal{H}^n(\mathcal{E}) \xrightarrow{\sim} 0$ in $\mathfrak{A}_{\mathbb{Q}}$ for any $n \in \mathbb{Z}$. Then it seems false that $\mathcal{E} \xrightarrow{\sim} 0$ in $D_{\mathbb{Q}}(\mathfrak{A})$. When $\mathcal{E} \in D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$, this property becomes true (see 7.4.4.7), which explains why we have defined $D^0_{\mathbb{Q}}(\mathfrak{A})$ as a the strictly full subcategory of $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$ and not $D_{\mathbb{Q}}(\mathfrak{A})$ in 7.4.4.5.

Lemma 7.4.4.7. *The canonical functor*

$$\mathfrak{A}_{\mathbb{Q}} \to D^0_{\mathbb{Q}}(\mathfrak{A}) \tag{7.4.4.7.1}$$

is an equivalence of categories with quasi-inverse $H^0\colon D^0_{\mathbb{Q}}(\mathfrak{A}) \to \mathfrak{A}_{\mathbb{Q}}$.

Proof. The proof is similar to that of 8.1.5.10. □

Corollary 7.4.4.8. *Let $\phi\colon \mathcal{E} \to \mathcal{F}$ be a morphism in $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$. The morphism ϕ is an isomorphism in $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$ if and only if, for any integer $n \in \mathbb{Z}$, the morphism $\mathcal{H}^n(\phi)\colon \mathcal{H}^n(\mathcal{E}) \to \mathcal{H}^n(\mathcal{F})$ is an isomorphism of $\mathfrak{A}_{\mathbb{Q}}$.*

Proof. There exists a distinguished triangle in $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$ of the form $\mathcal{E} \underset{\phi}{\longrightarrow} \mathcal{F} \to \mathcal{G} \to \mathcal{E}[1]$. Following the properties concerning the triangulated categories, ϕ is an isomorphism if and only if $\mathcal{G} \xrightarrow{\sim} 0$ in $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$. Following 7.4.4.7, this is equivalent to saying that, for any integer $n \in \mathbb{Z}$, we have $\mathcal{H}^n(\mathcal{G}) \xrightarrow{\sim} 0$ in $\mathfrak{A}_{\mathbb{Q}}$. The lemma 7.4.4.4 allows us to conclude. □

7.4.4.9. Let us denote by $D^{\sharp}_{\mathfrak{B}}(\mathfrak{A})$ the saturated (in the sense of 7.4.1.1) full triangulated subcategory of $D^{\sharp}(\mathfrak{A})$ consisting of complexes whose cohomology spaces are in $\mathfrak{B}$ i.e. $D^{\sharp}_{\mathfrak{B}}(\mathfrak{A})$ is the kernel of the canonical functor $D^{\sharp}(\mathfrak{A}) \to D^{\sharp}(\mathfrak{A}_{\mathbb{Q}})$ induced by the localization functor $\mathfrak{A} \to \mathfrak{A}_{\mathbb{Q}}$.

With notation 7.4.1.3, let $S^{\sharp}_{N} := S(D^{\sharp}_{\mathfrak{B}}(\mathfrak{A}))$ be the saturated multiplicative system compatible with the triangulation of $D^{\sharp}(\mathfrak{A})$ which corresponds to $D^{\sharp}_{\mathfrak{B}}(\mathfrak{A})$. We can deduce from the theorem [Miy91, 3.2] that the canonical functor $D^{\sharp}(\mathfrak{A}) \to D^{\sharp}(\mathfrak{A}_{\mathbb{Q}})$ induces canonically the equivalence of categories

$$D^{\sharp}(\mathfrak{A})/D^{\sharp}_{\mathfrak{B}}(\mathfrak{A}) := S^{\sharp -1}_{N} D^{\sharp}(\mathfrak{A}) \cong D^{\sharp}(\mathfrak{A}_{\mathbb{Q}}). \tag{7.4.4.9.1}$$

By definition, a morphism f of $D^{\sharp}(\mathfrak{A})$ belongs to $S^{\sharp}_{N}$ if and only if, for all distinguished triangle in $D^{\sharp}(\mathfrak{A})$ of the form $\mathcal{E} \xrightarrow{f} \mathcal{F} \to \mathcal{G} \to \mathcal{E}[1]$, for all integer $n \in \mathbb{Z}$, we have $\mathcal{H}^{n}(\mathcal{G}) \in \mathfrak{B}$).

Lemma 7.4.4.10. *With notation 7.4.4.9, we have $S^{\mathrm{b}} = S^{\mathrm{b}}_{N}$. For $\sharp \in \{+, -, \mathrm{b}, \emptyset\}$, we have $S^{\sharp} \subset S^{\sharp}_{N}$.*

Proof. 1) First we show $S^{\mathrm{b}}_{N} \subset S^{\mathrm{b}}$. Take $f \in S^{\mathrm{b}}_{N}$ and a distinguished triangle in $D^{\mathrm{b}}(\mathfrak{A})$ of the form $\mathcal{E} \xrightarrow{f} \mathcal{F} \to \mathcal{G} \to \mathcal{E}[1]$. By definition, for all integer $n \in \mathbb{Z}$, $\mathcal{H}^{n}(\mathcal{G}) \in \mathfrak{B}$. That is, for all integer $n \in \mathbb{Z}$, we have $\mathcal{H}^{n}(\mathcal{G}) \xrightarrow{\sim} 0$ in $\mathfrak{A}_{\mathbb{Q}}$. By 7.4.4.7, this implies that $\mathcal{G} \xrightarrow{\sim} 0$ in $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$. According to the properties of triangulated categories, f is an isomorphism in $D^{\mathrm{b}}_{\mathbb{Q}}(\mathfrak{A})$, i.e. $f \in S^{\mathrm{b}}$.

2) Next we show that $S^{\sharp} \subset S^{\sharp}_{N}$. Let $f \colon \mathcal{E} \to \mathcal{F}$ be a morphism of $D^{\sharp}(\mathfrak{A})$. Since the cohomology space functor $H^{0} \colon D^{\sharp}(\mathfrak{A}) \to \mathfrak{A}_{\mathbb{Q}}$ is a cohomological functor, then we get at a long exact sequence in $\mathfrak{A}_{\mathbb{Q}}$ from the distinguished triangle in $D^{\sharp}(\mathfrak{A})$ of the form $\mathcal{E} \xrightarrow{f} \mathcal{F} \to \mathcal{G} \to \mathcal{E}[1]$. Looking at this long exact sequence, we can check that $f \in S^{\sharp}_{N}$ if and only if, for all integer $n \in \mathbb{Z}$, $\mathcal{H}^{n}(f)$ is an isomorphism in $\mathfrak{A}_{\mathbb{Q}}$ (which is an abelian category). But, if $f \in S^{\sharp}$, then its image in $D^{\sharp}_{\mathbb{Q}}(\mathfrak{A})$ is an isomorphism. As the functor $\mathcal{H}^{n} \colon D^{\sharp}(\mathfrak{A}) \to \mathfrak{A}_{\mathbb{Q}}$ factors through $D^{\sharp}_{\mathbb{Q}}(\mathfrak{A}) \to \mathfrak{A}_{\mathbb{Q}}$, we deduce the required inclusion $S^{\sharp} \subset S^{\sharp}_{N}$. ☐

Proposition 7.4.4.11. *For $\sharp \in \{+, -, \mathrm{b}, \emptyset\}$, the canonical functor $D^{\sharp}(\mathfrak{A}) \to D^{\sharp}(\mathfrak{A}_{\mathbb{Q}})$ of triangulated categories induced by the functor of abelian categories $\mathfrak{A} \to \mathfrak{A}_{\mathbb{Q}}$ induces the morphism of triangulated categories*

$$\mathfrak{Q} \colon D^{\sharp}_{\mathbb{Q}}(\mathfrak{A}) \to D^{\sharp}(\mathfrak{A}_{\mathbb{Q}}) \tag{7.4.4.11.1}$$

making commutative the diagram

$$\begin{array}{ccccc} & & S^{\sharp -1}_{N} D^{\sharp}(\mathfrak{A}) & \xrightarrow[7.4.4.9.1]{\cong} & D^{\sharp}(\mathfrak{A}_{\mathbb{Q}}) \\ & \nearrow^{Q_{S^{\sharp}_{N}}} & \uparrow & & \uparrow \mathfrak{Q} \\ D^{\sharp}(\mathfrak{A}) & \xrightarrow{Q_{S^{\sharp}}} & S^{\sharp -1} D^{\sharp}(\mathfrak{A}) & = & D^{\sharp}_{\mathbb{Q}}(\mathfrak{A}) \end{array} \tag{7.4.4.11.2}$$

When $\sharp = \mathrm{b}$, the morphism $\mathfrak{Q}$ is an equivalence of categories.

Proof. The left vertical arrow comes from the inclusion $S^{\sharp} \subset S^{\sharp}_{N}$ (see 7.4.4.10). When $\sharp = \mathrm{b}$, since this inclusion becomes an equality, both vertical arrow are equivalences of categories. ☐

7.4.4.12. The morphism 7.4.4.11.1 commutes with cohomological functors, i.e. we have for any $n \in \mathbb{N}$ the commutative diagram

$$\begin{array}{ccccc} D^{\sharp}(\mathfrak{A}) & \longrightarrow & D^{\sharp}_{\mathbb{Q}}(\mathfrak{A}) & \xrightarrow{\mathfrak{Q}} & D^{\sharp}(\mathfrak{A}_{\mathbb{Q}}) \\ \downarrow H^{n} & & \downarrow H^{n} & & \downarrow H^{n} \\ \mathfrak{A} & \longrightarrow & \mathfrak{A}_{\mathbb{Q}} & = & \mathfrak{A}_{\mathbb{Q}} \end{array} \tag{7.4.4.12.1}$$

where the middle vertical arrow is the one making commutative by definition the left square (see 7.4.4.3). Indeed, since the canonical functor $\mathfrak{A} \to \mathfrak{A}_{\mathbb{Q}}$ is exact, the outer of the large rectangle is commutative.

7.4.4.13. We have the commutative diagram up to canonical isomorphism

$$\begin{array}{ccc} \mathfrak{A}_{\mathbb{Q}} & \xrightarrow{7.4.4.2} & D_{\mathbb{Q}}(\mathfrak{A}) \\ & \searrow & \wr\downarrow 7.4.4.11.1 \\ & & D(\mathfrak{A}_{\mathbb{Q}}). \end{array} \tag{7.4.4.13.1}$$

Indeed, by using the universal property of the localisation functor, we reduce to check it after applying the functor $\mathfrak{A} \to \mathfrak{A}_{\mathbb{Q}}$, which is easy.

7.4.5 Coherent $\mathcal{D}_{\mathbb{Q}}$-modules, Cartan's theorems A and B

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ satisfying the conditions of 7.2.3. Recall following 7.2.3.3, $\mathcal{D}$ is left coherent. We suppose $p\mathcal{O}_{\mathfrak{X}} \subset \mathcal{I}$.

Lemma 7.4.5.1. *Let $\mathcal{E}$ be a coherent $\mathcal{D}$-module, and $\mathcal{E}_t$ be the subsheaf of p-torsion sections of $\mathcal{E}$. Then $\mathcal{E}_t$ and $\mathcal{E}/\mathcal{E}_t$ are $\mathcal{D}$-coherent.*

Proof. Since this is local, we can suppose $\mathfrak{X}$ is affine. For any positif integer n, let $\mathcal{E}(n)$ be the coherent $\mathcal{D}$-module equal to the kernel of the multiplication by p^n on $\mathcal{E}$. It follows from 7.2.3.16.ii and the noetherianity of $\Gamma(\mathfrak{X}, \mathcal{D})$ that for n large enough, $\mathcal{E}_t = \mathcal{E}(n)$. Hence, we are done. □

Proposition 7.4.5.2. *Assume that $\mathfrak{X}$ is noetherian. The functor $\mathcal{M} \mapsto \mathcal{M}_{\mathbb{Q}}$ defines an equivalence of categories* $\mathrm{Coh}(\mathcal{D})_{\mathbb{Q}} \to \mathrm{Coh}(\mathcal{D}_{\mathbb{Q}})$.

Proof. See [Ber96c, 3.4.5]. □

Definition 7.4.5.3. Let $\mathcal{E}$ be a coherent $\mathcal{D}_{\mathbb{Q}}$-module. An integral model $\overset{\circ}{\mathcal{E}}$ of $\mathcal{E}$ is a coherent $\mathcal{D}$-module such that there exists an isomorphism of $\mathcal{D}_{\mathbb{Q}}$-modules of the form $\overset{\circ}{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$. We say that $\overset{\circ}{\mathcal{E}}$ is a lattice is $\overset{\circ}{\mathcal{E}}$ is a sub $\mathcal{D}$-module of $\mathcal{E}$ such the induced morphism $\overset{\circ}{\mathcal{E}}_{\mathbb{Q}} \to \mathcal{E}$ is an isomorphism. Following 7.4.5.1 and 7.4.5.2, there exists such a integral model.

Proposition 7.4.5.4. *Suppose that $\mathfrak{X}$ is affine and put $D = \Gamma(\mathfrak{X}, \mathcal{D})$, $D_{\mathbb{Q}} = D \otimes \mathbb{Q} \cong \Gamma(\mathfrak{X}, \mathcal{D}_{\mathbb{Q}})$.*

(a) Let $\mathcal{M}$ be a left $\mathcal{D}_{\mathbb{Q}}$-module. The left $\mathcal{D}_{\mathbb{Q}}$-module $\mathcal{M}$ is coherent if and only if $\Gamma(\mathfrak{X}, \mathcal{M})$ is a $D_{\mathbb{Q}}$-module of finite type and the canonical morphism

$$\mathcal{D}_{\mathbb{Q}} \otimes_{D_{\mathbb{Q}}} \Gamma(\mathfrak{X}, \mathcal{M}) \to \mathcal{M} \tag{7.4.5.4.1}$$

is an isomorphism.

(b) For any coherent left $\mathcal{D}_{\mathbb{Q}}$-module $\mathcal{M}$ we have $H^q(\mathfrak{X}, \mathcal{M}) = 0$ for all $q \geq 1$.

(c) The functors $\mathcal{D}_{\mathbb{Q}} \otimes_{D_{\mathbb{Q}}} -$ and $\Gamma(\mathfrak{X}, -)$ induce canonically exact quasi-inverse equivalences of categories between $\mathrm{Coh}({}^{1}D_{\mathbb{Q}})$ and $\mathrm{Coh}({}^{1}\mathcal{D}_{\mathbb{Q}})$.

Proof. This is a consequence of 7.2.3.16, 7.4.5.2 and 7.4.3.1.1. □

7.4.6 Quasi-coherent and coherent $\mathcal{D}_{\mathbb{Q}}$-complexes

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ satisfying the hypotheses of 7.3.2 and we suppose $p\mathcal{O}_{\mathfrak{X}} \subset \mathcal{I}$.

Definition 7.4.6.1. Let $\mathcal{E} \in D_{\mathbb{Q}}(\mathcal{D})$. The complex $\mathcal{E}$ is said to be quasi-coherent (resp. of finite tor dimension up, resp. perfect, resp. coherent) up to isogeny if there exists $\mathcal{F} \in D_{\mathrm{qc}}(\mathcal{D})$ (resp. $\mathcal{F} \in D_{\mathrm{perf}}(\mathcal{D})$, resp. $\mathcal{F} \in D_{\mathrm{coh}}(\mathcal{D})$) together with an isomorphism in $D_{\mathbb{Q}}(\mathcal{D})$ of the form $\mathcal{E} \xrightarrow{\sim} \mathcal{F}$. For $\star \in \{-, \mathrm{b}\}$, we denote by $D^{\star}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D})$ (resp $D^{\star}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D})$, resp $D^{\star}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D})$) the strictly full subcategory of $D_{\mathbb{Q}}(\mathcal{D})$ consisting quasi-coherent (resp. perfect, resp. coherent) up to isogeny.

It follows from the remark of 7.4.2.1.a that the natural functors $D^{\star}_{?}(\mathcal{D})_{\mathbb{Q}} \to D^{\star}_{\mathbb{Q},?}(\mathcal{D})$ with $? \in \{\mathrm{qc}, \mathrm{tdf}, \mathrm{perf}, \mathrm{coh}\}$ are equivalence of categories. Remark since we prefer to work with strict full subcategories, there is a slight difference with Berthelot's notation [Ber02, 3.3.2].

Proposition 7.4.6.2. *Suppose $\mathfrak{X}$ is affine and keep notation 7.2.3.8.*

a) The functors The functors $\mathcal{D}_{\mathbb{Q}} \otimes_{D_{\mathbb{Q}}} -$ and $\mathbb{R}\Gamma(\mathfrak{X}, -)$ induce canonically quasi-inverse equivalences of categories between $D^{-}_{\mathrm{coh}}(D_{\mathbb{Q}})$ and $D^{-}_{\mathrm{coh}}(\mathcal{D}_{\mathbb{Q}})$.

b) Let $\mathcal{E}^{\bullet} \in D^{-}(\mathcal{D}_{\mathbb{Q}})$. The following conditions are equivalent

(i) $H^n(\mathcal{E}^{\bullet})$ is a coherent left $\mathcal{D}_{\mathbb{Q}}$-module for any $n \in \mathbb{Z}$;

(ii) $\mathcal{E}^{\bullet}$ is pseudo-coherent ;

(iii) $\mathcal{E}^{\bullet}$ is quasi-isomorphic to a bounded above complex of finite free left $\mathcal{D}_{\mathbb{Q}}$-modules.

Proof. Since $\mathcal{D}_{\mathbb{Q}}$ satisfies Theorem A and B for coherent modules (see 7.4.5.4), than the proposition can be checked similarly to 4.6.1.7. □

Corollary 7.4.6.3. *Let $\mathcal{E}^{\bullet} \in D^{-}(\mathcal{D}_{\mathbb{Q}})$. The following conditions are equivalent*

(i) $H^n(\mathcal{E}^{\bullet})$ is a coherent left $\mathcal{D}_{\mathbb{Q}}$-module for any $n \in \mathbb{Z}$;

(ii) $\mathcal{E}^{\bullet}$ is pseudo-coherent.

Lemma 7.4.6.4. *Let $F \colon \mathfrak{C} \to \mathfrak{D}$ be an exact and full functor of triangulated categories. Then the essential image of F is a strictly full triangulated subcategory of $\mathfrak{D}$.*

Proof. Left to the reader. □

Notation 7.4.6.5. With notation 7.4.2.1.(b), we denote by $\mathbb{Q} \otimes - \colon D_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}) \to D({}^{\mathrm{l}}\mathcal{D}_{\mathbb{Q}})$ the natural functor given by $\mathcal{E} \mapsto \mathcal{E}_{\mathbb{Q}}$.

Proposition 7.4.6.6. *Suppose $\mathfrak{X}$ is noetherian of finite Krull dimension. With notation 1.4.3.27 and 7.4.6.1, the natural functor $\mathbb{Q} \otimes -$ (see 7.4.6.5) induces the equivalence of categories:*

$$\mathbb{Q} \otimes - \colon D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{\mathbb{Q}}). \tag{7.4.6.6.1}$$

Proof. Following 7.4.3.2.2, we already know that the functor is fully faithful. From 7.4.6.4, since the functor is exact and full, then its essential image is a full triangulated subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{\mathbb{Q}})$. Moreover, following 7.4.5.2, the essential image of the functor 7.4.6.6.1 contains coherent left $\mathcal{D}_{\mathbb{Q}}$-modules. Since the smallest strictly full triangulated subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{\mathbb{Q}})$ containing coherent left $\mathcal{D}_{\mathbb{Q}}$-modules is $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{\mathbb{Q}})$ we are done. □

7.4.7 Derived completed tensor products and derived completed homomorphisms of complexes of (bi)modules

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. Suppose $p\mathcal{O}_{\mathfrak{X}} \subset \mathcal{I}$. Let $\mathcal{D}, \mathcal{D}', \mathcal{D}'', \mathcal{D}'''$ be four sheaves of rings on $\mathfrak{X}$ satisfying the hypotheses of 7.3.2 (or only 7.2.3 when the notion of quasi-coherence is not involved).

7.4.7.1. We have the topoi morphisms $\underleftarrow{l}_X \colon (X_{\bullet}, \mathcal{D}_{\bullet}) \to (|\mathcal{X}|, \mathcal{D})$ and $\underleftarrow{l}_X \colon (X_{\bullet}, \mathbb{Z}_{X_{\bullet}}) \to (|\mathcal{X}|, \mathbb{Z}_{\mathfrak{X}})$.

(a) Both functors $\mathbb{R}\underleftarrow{l}_{X*}$ preserve isogenies and induce $\mathbb{R}\underleftarrow{l}_{X*} \colon D^{-}_{\mathbb{Q}}(\mathcal{D}_{\bullet}) \to D^{-}_{\mathbb{Q}}(\mathcal{D})$ and $\mathbb{R}\underleftarrow{l}_{X*} \colon D^{-}_{\mathbb{Q}}(\mathbb{Z}_{X_{\bullet}}) \to D^{-}_{\mathbb{Q}}(\mathbb{Z}_{\mathfrak{X}})$. We have obviously the same property for the exact functor $\underleftarrow{l}_X^{-1}$.

(b) Similarly, we get the functor

$$\mathbb{L}\underleftarrow{l}_X^{*} = \mathcal{D}_{\bullet} \otimes^{\mathbb{L}}_{\underleftarrow{l}_X^{-1}\mathcal{D}} \underleftarrow{l}_X^{-1} - \colon D^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}) \to D^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}_{\bullet}).$$

and similarly for right modules.

7.4.7.2. By preservation of the isogenies, we get the functor

$$-\otimes_{\mathcal{D}_\bullet}-\colon D^-_{\mathbb{Q}}({}^r\mathcal{D}_\bullet)\times D^-_{\mathbb{Q}}({}^l\mathcal{D}_\bullet)\to D^-_{\mathbb{Q}}(\mathbb{Z}_{X_\bullet}) \tag{7.4.7.2.1}$$

Since sends isogenies to isogenies, this induces the functor

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}-:=\mathbb{R}\underleftarrow{l}_{X*}\left(\mathbb{L}\underleftarrow{l}^*_X(-)\otimes^{\mathbb{L}}_{\mathcal{D}_\bullet}\mathbb{L}\underleftarrow{l}^*_X(-)\right):D^-_{\mathbb{Q}}({}^r\mathcal{D})\times D^-_{\mathbb{Q}}({}^l\mathcal{D})\to D^-_{\mathbb{Q}}(\mathbb{Z}_{\mathfrak{X}}). \tag{7.4.7.2.2}$$

which is also the functor induced by 7.3.4.2.1.

Lemma 7.4.7.3. *Let $\mathcal{E}^\bullet\in D^-_{\mathbb{Q}}({}^l\mathcal{D})$, $\mathcal{M}^\bullet\in D^-_{\mathbb{Q}}({}^r\mathcal{D})$.*

(a) We have the morphism

$$\mathcal{M}^\bullet\otimes^{\mathbb{L}}_{\mathcal{D}}\mathcal{E}^\bullet\to\mathcal{M}^\bullet\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}\mathcal{E}^\bullet \tag{7.4.7.3.1}$$

which is an isomorphism when one of the two complexes belongs to $D^-_{\mathbb{Q},\mathrm{coh}}(\mathcal{D})$ and the other to $D^-_{\mathbb{Q},\mathrm{qc}}(\mathcal{D})$.

(b) When $\mathcal{D}$ is commutative, then we get the isomorphism of $D^-_{\mathbb{Q}}(\mathcal{D})$:

$$\mathcal{M}^\bullet\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}\mathcal{E}^\bullet\xrightarrow{\sim}\mathbb{R}\underleftarrow{l}_{X*}\circ\mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}^\bullet\otimes^{\mathbb{L}}_{\mathcal{D}}\mathcal{E}^\bullet), \tag{7.4.7.3.2}$$

where $\underleftarrow{l}_X$ is here the topoi morphism $\underleftarrow{l}_X\colon(X_\bullet,\mathcal{D}_\bullet)\to(|\mathcal{X}|,\mathcal{D})$. Hence, we can consider $\mathcal{M}^\bullet\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}\mathcal{E}^\bullet$ as an object of $D^-_{\mathbb{Q}}(\mathcal{D})$ and then the map 7.4.7.3.1 is the adjunction morphism.

Proof. This follows from 7.3.4.3. □

7.4.7.4. Suppose there exists a homomorphism of sheaves of rings on $\mathfrak{X}$ of the form $\mathcal{D}\to\mathcal{D}'$ such that the composition of $\mathcal{O}_{\mathfrak{X}}\to\mathcal{D}$ with $\mathcal{D}\to\mathcal{D}'$ gives $\mathcal{O}_{\mathfrak{X}}\to\mathcal{D}'$.

(a) Let $*\in\{\mathrm{l},\mathrm{r}\}$ and $\star\in\{-,\mathrm{b}\}$. The functor 7.3.4.4.1 induces:

$$forg_{\mathcal{D},\mathcal{D}'}\colon D^\star_{\mathbb{Q},\mathrm{qc}}({}^*\mathcal{D}')\to D^\star_{\mathbb{Q},\mathrm{qc}}({}^*\mathcal{D}). \tag{7.4.7.4.1}$$

(b) With notation 7.3.1.12, we have from 7.3.4.4.2 the functor

$$\mathcal{D}'_\bullet\otimes^{\mathbb{L}}_{\mathcal{D}_\bullet}-\colon D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}_\bullet)\to D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'_\bullet). \tag{7.4.7.4.2}$$

(c) We have from 7.3.4.4.4 the functor:

$$\mathcal{D}'\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}-\colon D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})\to D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'). \tag{7.4.7.4.3}$$

7.4.7.5. Suppose $(\mathcal{D},\mathcal{D}',\mathcal{I})$ is solved by $(\mathcal{R},\mathcal{K})$ (see definition 7.3.4.5). Let $\star\in\{\emptyset,-\}$. We set $D^\star_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}}):=D^\star({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})_{\mathbb{Q}}$ and $D^\star_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}}):=D^\star({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})_{\mathbb{Q}}$ (see notation 7.3.4.7) etc. The functors 7.3.4.8.1 and 7.3.4.8.2 preserve isogenies and induce therefore:

$$\mathbb{L}\underleftarrow{l}^*_X\colon D^\star_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})\to D^\star_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}}), \tag{7.4.7.5.1}$$

$$\mathbb{R}\underleftarrow{l}_{X*}\colon D^\star_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})\to D^\star_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}}). \tag{7.4.7.5.2}$$

Let $\sharp\in\{\emptyset,+,-,\mathrm{b}\}$. Let $?\in\{\mathrm{qc},\mathrm{coh},\mathrm{tdf},\mathrm{perf}\}$. We denote respectively by $D^\sharp_{\mathbb{Q},?,.}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ and $D^\sharp_{\mathbb{Q},.,?}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ the strictly full subcategory of $D^\sharp_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ consisting of complexes $\mathcal{E}_\bullet$ which are isomorphic to an object of $D^\sharp_{?,.}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ and $D^\sharp_{.,?}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ (see notation 7.3.4.8). In other words, $D^\sharp_{\mathbb{Q},?,.}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ is the essential image of the full faithful functor $D^\sharp_{?,.}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})\to D^\sharp_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ etc.

Similarly, we denote by $D^\sharp_{\mathbb{Q},?,.}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$ and $D^\sharp_{\mathbb{Q},.,?}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$ the strictly full subcategory of $D^\sharp_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$ consisting of complexes $\mathcal{E}$ which are isomorphic to an object of $D^\sharp_{?,.}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$ and $D^\sharp_{.,?}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$. The functors $\mathbb{L}\underleftarrow{l}^*_X$ of 7.3.4.8.1 and $\mathbb{R}\underleftarrow{l}_{X*}$ induce quasi-inverse equivalences of categories between $D^\sharp_{\mathbb{Q},.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$ and $D^\sharp_{\mathbb{Q},.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$ and between $D^\sharp_{\mathbb{Q},\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$ and $D^\sharp_{\mathbb{Q},\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'_\bullet,\mathcal{R}_\bullet,\mathcal{D}_\bullet{}^{\mathrm{r}})$.

7.4.7.6. Suppose $(\mathcal{D},\mathcal{D}',\mathcal{I})$ and $(\mathcal{D},\mathcal{D}'',\mathcal{I})$ are solved by $(\mathcal{R},\mathcal{K})$. Let $*,** \in \{r,l\}$. The functors 7.3.4.9.1 and 7.3.4.9.2 preserve the isogenies and induce

$$-\otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} -\colon D_{\mathbb{Q}}({}^*\mathcal{D}'_\bullet,\mathcal{R},\mathcal{D}_\bullet{}^{\mathrm{r}}) \times D_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}_\bullet,\mathcal{R},{}^{**}\mathcal{D}''_\bullet) \to D_{\mathbb{Q}}({}^*\mathcal{D}'_\bullet,\mathcal{R},{}^{**}\mathcal{D}''_\bullet), \tag{7.4.7.6.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}}-\colon D_{\mathbb{Q}}({}^*\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}}) \times D_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D},\mathcal{R},{}^{**}\mathcal{D}'') \to D_{\mathbb{Q}}({}^*\mathcal{D}',\mathcal{R},{}^{**}\mathcal{D}''). \tag{7.4.7.6.2}$$

We have similar bifunctors by changing the indices l and r. Let $\mathcal{M}^\bullet \in D_{\mathbb{Q}}({}^*\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$, $\mathcal{E}^\bullet \in D_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D},\mathcal{R},{}^{**}\mathcal{D}'')$ be two complexes. The canonical morphism 7.3.4.9.3 induces

$$\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \to \mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet \tag{7.4.7.6.3}$$

which is an isomorphism when either $\mathcal{M}^\bullet \in D^-_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{\mathrm{r}})$ and $\mathcal{E}^\bullet \in D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$, or $\mathcal{M}^\bullet \in D^-_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{\mathrm{r}})$ and $\mathcal{E}^\bullet \in D^-_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}')$.

7.4.7.7. By adding some $\mathbb{Q}$ the properties of 7.3.4 are still valid. For instance, for any $\mathcal{E}^\bullet \in D^-_{\mathbb{Q},\mathrm{qc},.}({}^*\mathcal{D}',\mathcal{R},\mathcal{D}^{\mathrm{r}})$, $\mathcal{F}^\bullet \in D^-_{\mathbb{Q},\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D},\mathcal{R},{}^{\mathrm{r}}\mathcal{D}'')$, $\mathcal{G}^\bullet \in D^-_{\mathbb{Q},\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'',\mathcal{R},{}^{**}\mathcal{D}''')$, we have the associativity isomorphism in $D^-_{\mathbb{Q},\mathrm{qc},.}({}^*\mathcal{D}',\mathcal{R},{}^{**}\mathcal{D}''')$ of the form:

$$\left(\mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \mathcal{F}^\bullet\right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''} \mathcal{G}^\bullet \xrightarrow{\sim} \mathcal{E}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}} \left(\mathcal{F}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''} \mathcal{G}^\bullet\right). \tag{7.4.7.7.1}$$

7.5 Operations involving completed sheaves of differential operators of level m

7.5.1 Completed sheaves of differential operators of level m

Let $m \in \mathbb{N} \cup \{+\infty\}$. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is locally noetherian.

7.5.1.1. Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the following conditions.

(a) $\mathcal{B}$ is endowed with a structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra ;

(b) For any affine open $\mathfrak{U}$ of $\mathfrak{X}$, the ring $\Gamma(U,\mathcal{B})$ is noetherian ;

(c) For any $i \geq 0$, $\mathcal{B}/\mathfrak{m}^{i+1}\mathcal{B}$ is a quasi-coherent $\mathcal{O}_{X_i}$-module and the canonical homomorphism $\mathcal{B} \to \varprojlim_{i\in\mathbb{N}} \mathcal{B}/\mathfrak{m}^{i+1}\mathcal{B}$ is an isomorphism.

We remark that the conditions (b) and (c) are equal to that of 7.2.3 in the case where $\mathcal{I} = \mathfrak{m}$. Hence, for instance we get following 7.2.3.3 that for any open immersion $\mathfrak{V} \subset \mathfrak{U}$ of affine opens, the homomorphism $\Gamma(\mathfrak{U},\mathcal{B}) \to \Gamma(\mathfrak{V},\mathcal{B})$ is flat.

Example 7.5.1.2. The sheaf $\mathcal{O}_{\mathfrak{X}}$ is endowed with a canonical structure of left $\widehat{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module, which induces a structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\mathcal{O}_{\mathfrak{X}}$. The conditions of 7.5.1.1 are satisfied by $\mathcal{O}_{\mathfrak{X}}$. It follows from 3.1.4.5.1 and 3.2.3.5.1 that the induced structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\mathcal{O}_{\mathfrak{X}}$ is given via the formula

$$P(f) := P \circ p^n_{1(m)}(f). \tag{7.5.1.2.1}$$

7.5.1.3. Suppose $m \in \mathbb{N}$. We keep the notations and hypotheses of 7.5.1.1. By using 4.1.2.17, the ring $\mathcal{D} := \mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ satisfies the conditions of 7.2.2.3. Hence, with the remark 7.2.3.1, its p-adic completion denoted by $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \widehat{\mathcal{D}}$ satisfies the conditions of 7.2.3. For instance, we get the coherence of $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ as well as theorems of type A and B for the left or right coherent $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules (for more precisions, see 7.2.3.16). In the same way, it follows from 7.4.5.4 the coherence of $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} := (\widehat{\mathcal{D}})_{\mathbb{Q}}$ as well as theorems of type A and B for the left or right coherent $\mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules.

Proposition 7.5.1.4. *Let $\mathcal{B}$ be an $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the conditions of 7.5.1.1 for some $m \in \mathbb{N}$. Then the sheaf $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is right and left flat on $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and on $\mathcal{B}$.*

Proof. Following 4.1.2.17.(d), $\Gamma(\mathfrak{U}, \mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ is right and left noetherian for any affine open $\mathfrak{U}\subset\mathfrak{X}$. According to 7.2.2.2, $\Gamma(\mathfrak{U}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ is the p-adic completion of $\Gamma(\mathfrak{U}, \mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Hence, we are done. □

7.5.1.5 (Local description and notation)**.** Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the conditions of 7.5.1.1. Suppose in this paragraph that $\mathfrak{X}$ is an affine, noetherian formal scheme of finite Krull dimension and $\mathfrak{X}^\sharp\to\mathfrak{S}^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. Let $\mathfrak{Y}:=\mathfrak{X}^{\sharp*}$ be the open of $\mathfrak{X}$ where $M_{\mathfrak{X}^\sharp}$ is trivial and $j\colon\mathfrak{Y}\hookrightarrow\mathfrak{X}^\sharp$ be the canonical open immersion. Let $(t_\lambda)_{\lambda=1,\dots,r}$ be the induced coordinates of $\mathfrak{Y}/\mathfrak{S}$. Put $\tau_{\sharp\lambda(m)}:=\mu^n_{(m)}(u_\lambda)-1$ (or simply $\tau_{\sharp\lambda}$), where for any $a\in M_{\mathfrak{X}^\sharp}$ we denote $\mu^n_{(m)}(a)$ the unique section of $\ker(\mathcal{O}^*_{\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}}\to\mathcal{O}^*_{\mathfrak{X}})$ such that we get in $M^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}$ the equality $p_1^{n*}(a)=p_0^{n*}(a)\mu^n_{(m)}(a)$. We still denote by $\tau_{\sharp\lambda(m)}$ its image via the canonical morphism $\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}\to\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}$. The elements $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}\}_{|\underline{k}|\le n}$ form a $\mathcal{B}$-basis of $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}$. The corresponding dual basis of $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,n}$ is denoted by $\{\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}\}_{|\underline{k}|\le n}$. The $\mathcal{B}$-module $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is free and has the basis $\{\underline{\partial}^{\langle\underline{k}\rangle_{(m)}}\}_{\underline{k}\in\mathbb{N}^d}$. Let $\epsilon_1,\dots,\epsilon_r$ be the canonical basis of $\mathbb{N}^r$, i.e. the coordinates of ϵ_i are 0 except for the ith term which is 1. We put $\partial_{\sharp i}:=\underline{\partial}^{\langle\epsilon_i\rangle_{(m)}}$.

(a) A section $P\in\Gamma(\mathfrak{X}, \mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ can uniquely be written of the form

$$P=\sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}, \tag{7.5.1.5.1}$$

where $b_{\underline{k}}\in B$ and the sum is finite.

(b) A section $P\in\Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ can uniquely be written of the form

$$P=\sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}, \tag{7.5.1.5.2}$$

where $b_{\underline{k}}$ is a sequence of elements of $\Gamma(\mathfrak{X},\mathcal{B})$ converging to 0 for the p-adic topology when $|\underline{k}|$ goes to infinity.

(c) The ring $\Gamma(\mathfrak{X},\mathcal{B}_{\mathbb{Q}})=\Gamma(\mathfrak{X},\mathcal{B})_{\mathbb{Q}}$ (see 7.4.3.1.1) is a Tate algebra (i.e. is an Huber ring with a pseudo-uniformizer): a ring of definition is given by the image $\Gamma(\mathfrak{X},\mathcal{B})\to\Gamma(\mathfrak{X},\mathcal{B})_{\mathbb{Q}}$, the ring of definition is endowed with the p-adic topology and p is a pseudo-uniformizer (we will define in this context a p-adic norm later in 8.7.1.6). A section $P\in\Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ can uniquely be written of the form

$$P=\sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}, \tag{7.5.1.5.3}$$

where $b_{\underline{k}}$ is a sequence of elements of $\Gamma(\mathfrak{X},\mathcal{B}_{\mathbb{Q}})$ converging to 0 when $|\underline{k}|$ goes to infinity.

7.5.1.6 (Local description and notation: semi-nice coordinate)**.** Suppose $\mathfrak{X}\to\mathfrak{S}$ is a smooth morphism of $\mathcal{V}$-formal schemes and suppose there exists a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor $\mathfrak{D}$ such that $\mathfrak{X}^\sharp:=(\mathfrak{X},M(\mathfrak{D}))$. Let $f\colon X^\sharp\to X$ be the canonical morphism. Suppose there exist semi-nice coordinates $t_1,\dots,t_d$ of $\mathfrak{X}^\sharp/\mathfrak{S}$. Let $r\in\mathbb{N}$ be such that $\mathfrak{D}$ is empty (if $r=0$) or $\mathfrak{D}$ is cut out by $\prod_{1\le j\le r}t_j$ in $\mathfrak{X}$. With notation 4.5.1.4, we have the basis $\{\underline{\partial}_{(r)}^{\langle\underline{k}\rangle_{(m)}}:\underline{k}\in\mathbb{N}^d\}$ of $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}}$. Hence, we get the same description as 7.5.1.5.1, 7.5.1.5.2 and 7.5.1.5.3 by replacing $\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}$ by $\underline{\partial}_{(r)}^{\langle\underline{k}\rangle_{(m)}}$.

7.5.1.7 (p-adic norms)**.** Let M be a p-torsion free p-adically separated complete $\mathcal{V}$-module. We define on $M_K:=M\otimes_{\mathcal{V}}K$ the function $v_p\colon M_K\setminus\{0\}\setminus\to\mathbb{Z}$ by setting $v_p(x):=\max\{n\in\mathbb{Z}, x\in p^nM\}$ for any $x\in M_K$. This yields a norm on $\|-\|\colon M_K\to\mathbb{R}$ by setting $\|x\|:=p^{-v_p(x)}$. This norm is called the p-adic norm on M_K given by M.

When M is moreover a $\mathcal{V}$-algebra, then we have $\|xx'\| \leq \|x\|\|x'\|$ and then $v_p\colon M_K \to \mathbb{Z} \cup \{+\infty\}$ is a quasi-valuation. We call v_p to be the p-adic quasi-valuation of M_K induced by M. This yields a structure of Banach K-algebra on M_K.

7.5.1.8. Let $\mathfrak{U}^\sharp$ be an affine open of $\mathfrak{X}^\sharp$. For all $\in \mathbb{N}$, the p-free algebra $B = \Gamma(\mathfrak{U}, \mathcal{B})$ is naturally equipped with the p-adic topology, which defines the Tate algebra $\Gamma(\mathfrak{U}, \mathcal{B}_\mathbb{Q}) \xrightarrow{\sim} B_\mathbb{Q}$ (see 7.4.3.1.1): a ring of definition is given by B endowed with the p-adic topology and p is a pseudo-uniformizer. We get the Banach algebra $B_\mathbb{Q}$ (see 7.5.1.7). The topology obtained on this algebra is a Banach topology, because B is an algebra topologically of finite type, and $B_\mathbb{Q}$ can therefore be provided with a Banach norm which defines its topology. Likewise, if there exists a logarithmic coordinate system on $\mathfrak{U}^\sharp$, all operator $P \in \Gamma(\mathfrak{U}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$, can be written uniquely $P = \sum_{|\underline{k}|\leq n} b_{\underline{k}} \underline{\partial}_\sharp^{\langle \underline{k}\rangle}$, where the $b_{\underline{k}} \in B_\mathbb{Q}$ tend to 0 for $|\underline{k}| \to \infty$, and, choosing a Banach norm on $B_\mathbb{Q}$, we equip the algebra $D_\mathbb{Q} = \Gamma(\mathfrak{U}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ with a Banach norm defining its p-adic topology by setting $\| P \| = \sup_{\underline{k}} \| b_{\underline{k}} \|$. The ring of operator of $D_\mathbb{Q}$ of norm ≤ 1 is equal to D. Hence, a change of logarithmic coordinates does not change this norm. (Indeed, if $\underline{\partial}_\sharp'^{\langle \underline{k}\rangle}$ is the basis of $\Gamma(\mathfrak{U}, \mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ corresponding to another choice of logarithmic coordinates, the base change of $\Gamma(\mathfrak{U}, \mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ is given by a matrix with coefficients in $\Gamma(\mathfrak{U}, \mathcal{B})$.)

If $\mathcal{E}$ is a coherent $\mathcal{B}_\mathbb{Q}$-module (resp. a coherent $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module), then $E = \Gamma(\mathfrak{U}, \mathcal{E})$, is a finite type module on $B_\mathbb{Q}$ (resp. $D_\mathbb{Q}$) according to theorem A, and we equip E with a Banach norm by taking the quotient norm defined by any finite presentation ; as $B_\mathbb{Q}$ (resp. $D_\mathbb{Q}$) is a Noetherian Banach algebra, the norms defined by two presentations are equivalent (e.g. copy the proof of [BGR84, 3.7.3.3]). Denote by $\mathfrak{M}(D_\mathbb{Q})$ the category of all left $D_\mathbb{Q}$-modules of finite type endowed with a Banach norm given by a finite presentation with $D_\mathbb{Q}$-linear maps as morphisms. Any $D_\mathbb{Q}$-linear morphism between two objects of $\mathfrak{M}(D_\mathbb{Q})$ is strict and continuous (e.g. copy the proof of [BGR84, 3.7.3.3]). Moreover, any $D_\mathbb{Q}$-submodule of an object of $\mathfrak{M}(D_\mathbb{Q})$ is closed (e.g. copy the proof of [BGR84, 3.7.3.1])

7.5.1.9. Let $\mathcal{B}$ be a commutative $\mathcal{O}_\mathfrak{X}$-algebra satisfying the conditions of 7.5.1.1. Let $\mathcal{B}_t$ be the ideal of $\mathcal{B}$ consisting of p-torsion sections and $\mathcal{B}' := \mathcal{B}/\mathcal{B}_t$. Then $\mathcal{B}'$ is a coherent $\mathcal{B}$-module (see 7.4.5.1). With 7.2.3.16, this implies that $\mathcal{B}'$ satisfies the properties (b) and (c) of 7.5.1.1. Since p is in the center of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, then $\mathcal{B}_t$ is a sub-$\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module of $\mathcal{B}$ and then $\mathcal{B}'$ is endowed with a structure of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module such that the surjection $\mathcal{B} \to \mathcal{B}'$ is $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. Since this is a surjection, then the property (a) of 7.5.1.1 holds (check the Leibnitz formula). Moreover, with Lemma 4.1.2.2, we get the ring homomorphism $\mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{B}' \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. It follows from 7.2.3.16 (and 1.4.5.2) that $\mathcal{B}' \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is a coherent $\mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules (via the latter homomorphism).

Via 4.2.3.5, we get a structure of left $\mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\mathcal{B}_t \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \mathcal{B}_t \otimes_\mathcal{B} (\mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. By flatness of $\mathcal{O}_\mathfrak{X} \to \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, this yields the exact sequence of coherent $\mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules:

$$0 \to \mathcal{B}_t \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{B} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{B}' \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to 0.$$

By p-adic completion, this yields the exact sequence of coherent $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules:

$$0 \to \mathcal{B}_t\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{B}\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{B}'\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to 0. \tag{7.5.1.9.1}$$

The following lemma will be useful to check 7.5.3.1.

Lemma 7.5.1.10. *With notation 7.5.1.9, the canonical homomorphism*

$$\mathcal{B}\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \mathcal{B}'\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$$

is an isomorphism.

Proof. Since this is local, we can suppose $\mathfrak{X}$ is noetherian. Hence, there exists an integer N such that $p^N \mathcal{B}_t = 0$. This implies that the canonical morphism $\mathcal{B}_t \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{B}_t\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is an isomorphism. Since $\mathcal{B}_t \otimes \mathbb{Q} = 0$, using 7.5.1.9.1 we are done. □

7.5.1.11. Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the conditions of 7.5.1.1. By p-adic completion, it follows from 4.3.5.1 that the sheaf $\mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is endowed with a canonical right $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure extending its structure of $\mathcal{B}$-module. Suppose $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d \in M_{\mathfrak{X}^\sharp}$. With the local description 7.5.1.5.2, we can check the logarithmic adjoint operator (see 3.4.1.2.3) extends to a map $\Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to \Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ given by $P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}} \underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}} \mapsto \widetilde{P} := \sum_{\underline{k}} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k}\rangle_{(m)}} b_{\underline{k}}$, where $b_{\underline{k}}$ is a sequence of elements of $\Gamma(\mathfrak{X}, \mathcal{B})$ converging to 0 for the p-adic topology when $|\underline{k}|$ goes to infinity. Via the local description of 3.4.5.1.1, we can check the action of $P \in \Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ on the section $b\, d\log\, t_1 \wedge \cdots \wedge d\log\, t_d$, where b is section of $\mathcal{B}_X$ is given by the formula

$$(b\ d\log\, t_1 \wedge \cdots \wedge d\log\, t_d) \cdot P = \widetilde{P}(b) d\log\, t_1 \wedge \cdots \wedge d\log\, t_d. \tag{7.5.1.11.1}$$

7.5.1.12. Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the conditions of 7.5.1.1. Following 4.3.5.7, the functors $- \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} = \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -)$ and $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} -$ are exact and induce quasi-inverse equivalences between the category of (resp. coherent, resp. flat, resp. locally projective of finite type) left $\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules and that of (resp. coherent, resp. flat, resp. locally projective of finite type) right $\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules.

7.5.1.13. Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the conditions of 7.5.1.1. Set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

(a) By p-adic completion, we get from 4.3.5.7 a structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-bimodule on $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

(b) Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Via the canonical isomorphism of $\mathcal{B}$-modules:

$$\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E} \xrightarrow{\sim} \left(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\right) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E} \tag{7.5.1.13.1}$$

we get a structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E}$. Suppose $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d \in M_{\mathfrak{X}^\sharp}$. With the notation of 7.5.1.11, we compute the action of $P \in \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ on the section $d\log\, t_1 \wedge \cdots \wedge d\log\, t_d \otimes x$ of $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E}$, where x is a section of $\mathcal{E}$, is given by the formula

$$(d\log\, t_1 \wedge \cdots \wedge d\log\, t_d \otimes x) \cdot P = d\log\, t_1 \wedge \cdots \wedge d\log\, t_d \otimes \widetilde{P} \cdot x. \tag{7.5.1.13.2}$$

Hence, the structure of right $\mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E}$ given by 7.5.1.12 is equal to the one induced (via the canonical map $\mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$) by its structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module.

(c) Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Via the canonical isomorphism

$$\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M}) \xrightarrow{\sim} \mathscr{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M}), \tag{7.5.1.13.3}$$

we get a structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M})$. Suppose $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d \in M_{\mathfrak{X}^\sharp}$. With the notation of 7.5.1.5.2, we compute the action of $P \in \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ on the section $x \otimes (d\log\, t_1 \wedge \cdots \wedge d\log\, t_d)^*$ of $\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M})$, where x is section of $\mathcal{M}$, is given by the formula

$$P \cdot (x \otimes (d\log\, t_1 \wedge \cdots \wedge d\log\, t_d)^*) = x \cdot \widetilde{P} \otimes (d\log\, t_1 \wedge \cdots \wedge d\log\, t_d)^*. \tag{7.5.1.13.4}$$

Hence, the induced structure of left $\mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module corresponds to that of 7.5.1.12.

(d) Since $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is locally free (of rank one), the canonical $\mathcal{B}_{\mathfrak{X}}$-linear morphism, then we have the $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear isomorphism

$$\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},\mathcal{M}) \xrightarrow{\sim} (\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},\mathcal{M}) \xrightarrow{\sim} \mathcal{M}, \tag{7.5.1.13.5}$$

where the last isomorphism is the evaluation one. We have the canonical $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear isomorphism:

$$\mathcal{E} \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}\mathcal{E}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E}). \tag{7.5.1.13.6}$$

(e) Similarly to 4.3.5.6, this yields that for any left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\mathcal{E}$ (resp. $\mathcal{M}$) , we have the following isomorphism of $\mathcal{O}_{\mathfrak{S}}$-modules:

$$\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}\mathcal{E} \xrightarrow{\sim} (\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}(\mathcal{M}\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}). \tag{7.5.1.13.7}$$

(f) As for 4.3.5.7, using the above results, we can check that the functors $-\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}=\mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},-)$ and $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}-$ are exact and induce quasi-inverse equivalences between the category of (resp. coherent, resp. flat, resp. locally projective of finite type) left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules and that of (resp. coherent, resp. flat, resp. locally projective of finite type) right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules. Hence, for any $\star\in\{-,+,\mathrm{b},\emptyset\}$, the functors $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}-$ and $\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},-)$ induce quasi-inverse equivalences of categories between $D^\star({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $D^\star({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Moreover, these equivalences preserve K-flat complexes and K-injective complexes.

7.5.2 Topological nilpotence and $\mathcal{B}$-coherence

We keep notation of 7.5.1.1. Let us start by considering the case of $\mathcal{B}$-coherent $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules:

Proposition 7.5.2.1. *Let $\mathcal{E}$ be a left $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module, coherent as $\mathcal{B}$-module.*

(a) If $\mathfrak{X}$ is affine then $\mathcal{E}$ is globally of finite presentation on $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

(b) The sheaf $\mathcal{E}$ is coherent as $\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module.

(c) The canonical homomorphism $\mathcal{E}\to\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}\mathcal{E}$ is an isomorphism and the sheaf $\mathcal{E}$ is coherent as $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module.

Proof. Suppose that $\mathfrak{X}$ is affine. Let $B=\Gamma(\mathfrak{X},\mathcal{B})$, $\mathcal{D}:=\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, $D=\Gamma(\mathfrak{X},\mathcal{D})$. As $\mathcal{E}$ is $\mathcal{B}$-coherent, then following theorem of type A, there exists a surjective $\mathcal{B}$-linear homomorphism $\mathcal{B}^n\to\mathcal{E}$, and so a surjective $\mathcal{D}$-linear homomorphism $\mathcal{D}^n\to\mathcal{E}$; let $\mathcal{N}$ be its kernel. Let $\mathcal{L}_i:=(\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,i})^n$ be the filtration on $\mathcal{L}:=(\mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})^n$ induced by the order filtration of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Let $\mathcal{N}_i:=\mathcal{N}\cap\mathcal{L}_i$, which yields the exact sequence $0\to\mathcal{N}_i\to\mathcal{L}_i\to\mathcal{E}\to 0$. Since the kernel of an homomorphism between coherent modules is coherent, then the submodules $\mathcal{N}_i$ are $\mathcal{B}$-coherent. Since filtered inductive limits are exact, since $\mathcal{L}\xrightarrow{\sim}\varinjlim_i\mathcal{L}_i$ then $\mathcal{N}\xrightarrow{\sim}\varinjlim_i\mathcal{N}_i$. As the functor $\Gamma(\mathfrak{X},-)$ commutes with filtered inductive limits (see [SGA4.2, VI.5.3]), by using theorem of type A for coherent $\mathcal{B}$-modules, this yields that the canonical homomorphisms $\mathcal{B}\otimes_B D\to\mathcal{D}$ and $\mathcal{B}\otimes_B\Gamma(\mathfrak{X},\mathcal{N})\to\mathcal{N}$ are isomorphisms. Thus $\mathcal{D}\otimes_D\Gamma(\mathfrak{X},\mathcal{N})\to\mathcal{N}$ is also an isomorphism. Since D is noetherian, then $\Gamma(\mathfrak{X},\mathcal{N})$ is a D-module of finite type. The coherence of $\mathcal{E}$ over $\mathcal{D}$ follows from Theorem A (see 4.1.3.19) Hence, we have checked a and therefore b). Let us treat now c). As $\mathcal{E}$ is a coherent $\mathcal{B}$-module, it is canonically isomorphic to its p-adic completion. Moreover, as $\mathcal{E}$ is a coherent $\mathcal{D}$-module, its p-adic completion is canonically isomorphic to $\widehat{\mathcal{D}}\otimes_{\mathcal{D}}\mathcal{E}$. Hence we are done. □

Corollary 7.5.2.2. *Let $\mathcal{B}'$ be a commutative $\mathcal{B}$-algebra satisfying the conditions of 7.5.1.1 and such that $\mathcal{B} \to \mathcal{B}'$ is $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. Let $\mathcal{E}$ be a left $\mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module, coherent as $\mathcal{B}$-module. The canonical morphism*

$$\mathcal{B}' \otimes_{\mathcal{B}} \mathcal{E} \to (\mathcal{B}' \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \otimes_{\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E} \tag{7.5.2.2.1}$$

is an isomorphism.

Proof. It follows from 7.5.2.1 that both terms of 7.5.2.2.1 are p-adically separated and complete. Hence, we reduce to check the map 7.5.2.2.1 is an isomorphism after reduction modulo π^{i+1}, which is 4.3.4.6.1. □

We have the following criterium to get $\mathcal{B}$-coherence which will be useful in order to prove Theorem 11.2.1.12.

Proposition 7.5.2.3. *We suppose $\mathfrak{X}$ affine. Let $\mathcal{E}$ be a coherent $\mathcal{B}\widehat{\otimes}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Then $\mathcal{E}$ is $\mathcal{B}$-coherent if and only if $\Gamma(\mathfrak{X}, \mathcal{E})$ is a $\Gamma(\mathfrak{X}, \mathcal{B})$-module of finite type.*

Proof. Set $E := \Gamma(\mathfrak{X}, \mathcal{E})$, $B := \Gamma(\mathfrak{X}, \mathcal{B})$, $\mathcal{D} := \mathcal{B}\widehat{\otimes}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $D := \Gamma(\mathfrak{X}, \mathcal{D})$. For any $i \in \mathbb{N}$, set $\mathcal{B}_i := \mathcal{B}/\pi^{i+1}\mathcal{B}$,$B_i := B/\pi^{i+1}B$,$\mathcal{D}_i := \mathcal{D}/\pi^{i+1}\mathcal{D}$, $D_i := D/\pi^{i+1}D$. Since we have theorem of type A for coherent $\mathcal{B}$-modules (see 7.2.3.16), then the $\mathcal{B}$-coherence of $\mathcal{E}$ implies that E is a B-module of finite type.

Conversely, suppose E is a B-module of finite type. Since the canonical morphism $B_i \otimes_B D \to D_i$ is an isomorphism, then so is $B_i \otimes_B E \to D_i \otimes_D E$. Since the canonical morphism $\mathcal{B}_i \otimes_{B_i} D_i \to \mathcal{D}_i$ is an isomorphism, then so is $\mathcal{B}_i \otimes_{B_i} (B_i \otimes_B E) \to \mathcal{D}_i \otimes_{D_i} (D_i \otimes_D E)$. This yields the canonical morphism

$$\mathcal{B}_i \otimes_{\mathcal{B}} (\mathcal{B} \otimes_B E) \to \mathcal{D}_i \otimes_{\mathcal{D}} (\mathcal{D} \otimes_D E).$$

is an isomorphism. Since E is of finite type over D and over B, the canonical morphisms $\varprojlim_i \mathcal{B}_i \otimes_{\mathcal{B}} (\mathcal{B} \otimes_B E) \to \mathcal{B} \otimes_B E$ and $\varprojlim_i \mathcal{D}_i \otimes_{\mathcal{D}} (\mathcal{D} \otimes_D E) \to \mathcal{D} \otimes_D E$ are isomorphisms. Hence, the canonical morphism

$$\mathcal{B} \otimes_B E \to \mathcal{D} \otimes_D E.$$

is an isomorphism. Since we have theorem of type A for coherent $\mathcal{D}$-modules, then the canonical morphism

$$\mathcal{D} \otimes_D E \to \mathcal{E}$$

is an isomorphism. Moreover, $\mathcal{B} \otimes_B E$ is $\mathcal{B}$-coherent. Hence, we are done. □

Definition 7.5.2.4. Set $\widehat{\mathcal{D}} := \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

(a) Let $\mathfrak{U}$ be an affine open of $\mathfrak{X}$ on which there exists a system of logarithmic coordinates. Let E be a left $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}_{\mathbb{Q}})$-module of finite type. We say that E is "topologically nilpotent" if, for all $e \in E$, we have $\underline{\partial}_{\sharp}^{\langle \underline{k} \rangle_{(m)}}(e) \to 0$ (for the Banach topology on E defined in 7.5.1.8) when $|\underline{k}| \to +\infty$.

(b) A "topologically nilpotent left $\widehat{\mathcal{D}}_{\mathbb{Q}}$-module" is a left $\widehat{\mathcal{D}}_{\mathbb{Q}}$-module $\mathcal{E}$ so that there exists a basis $\mathfrak{B}$ of affine open sets having logarithmic coordinates, such that for all $\mathfrak{U} \in \mathfrak{B}$, $\Gamma(\mathfrak{U}, \mathcal{E})$ is of finite type on $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}_{\mathbb{Q}})$, and is topologically nilpotent.

Remark 7.5.2.5. With notation 7.5.2.4, suppose $\mathfrak{X}$ affine and endowed with logarithmic coordinates.

(a) If $\mathcal{E}$ is a topologically nilpotent left $\widehat{\mathcal{D}}_{\mathbb{Q}}$-module, then this is not clear that $\mathcal{E}$ is a coherent $\widehat{\mathcal{D}}_{\mathbb{Q}}$-module.

(b) Let E be a left $\Gamma(\mathfrak{X}, \widehat{\mathcal{D}}_{\mathbb{Q}})$-module of finite type. We get the coherent $\widehat{\mathcal{D}}_{\mathbb{Q}}$-modules $\mathcal{E} := \widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\Gamma(\mathfrak{X}, \widehat{\mathcal{D}}_{\mathbb{Q}})} E$. Then $\mathcal{E}$ is topologically nilpotent if and only if so is E. If $\mathring{\mathcal{E}}$ is a model of $\mathcal{E}$, and if $\mathring{\mathcal{E}}_i$ is the reduction of $\mathring{\mathcal{E}}$ module $\mathfrak{m}^{i+1}$, it amounts to the same thing to say that, for all $i \in \mathbb{N}$ $\mathcal{E}_i$ is nilpotent as left $(\mathcal{B}/\mathfrak{m}^{i+1}\mathcal{B}) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$-module (see definition 4.2.1.11) ; we thus see that this condition does not depend on logarithmic coordinates.

Lemma 7.5.2.6. *Let $\rho\colon A \to B$ be a continuous homomorphism between Noetherian Banach K-algebras, and E a left B-module which is of finite type on A. Then the Banach norms on E induced by its structure of finite type A-module and by its structure of finite type B-module are equivalent. In particular, the action of B over E is continuous for the topology of B-module and the topology of A-module of E.*

Proof. Let $\| - \|_A$ and $\| - \|_B$ be the norms of A and B. As ρ is continuous, there exists $c \in \mathbb{R}$ such that, for all $a \in A$, we have $\| \rho(a) \|_B \leq c \| a \|_A$. Let's fix a surjective A-linear map of the form $u\colon A^r \to E$; we deduce a quotient norm $\| - \|_1$ on E. Let $u'\colon B^r \to E$ be the B-linear factorization of u; as u' is surjective, we obtain another quotient norm $\| - \|_2$ on E. Thanks to the previous relation, we see that $\| x \|_2 \leq c \| x \|_1$ for all $x \in E$, so that the map $\mathrm{id}_E\colon (E, \| - \|_1) \to (E, \| - \|_2)$ is continuous. Both norms making E a Banach space on K, the Banach theorem results in them defining the same topology on E. The last assertion follows from this. □

Lemma 7.5.2.7. *Suppose $\mathcal{B}$ is endowed with a structure of left $\mathcal{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra. Set $\widehat{\mathcal{D}}^{(m)} := \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widehat{\mathcal{D}}^{(m+1)} := \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Let $\mathcal{E}$ be a left $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-module such that*

(a) there exists a basis $\mathfrak{B}$ of affine open sets having logarithmic coordinates, such that for all $\mathfrak{U} \in \mathfrak{B}$, $\Gamma(\mathfrak{U}, \mathcal{E})$ is of finite type on $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}})$

(b) and the structure of $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-module of $\mathcal{E}$ is induced by a structure of $\widehat{\mathcal{D}}^{(m+1)}_{\mathbb{Q}}$-module.

Then $\mathcal{E}$ is topologically nilpotent as left $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-module.

Proof. Let $\mathfrak{U} \in \mathfrak{B}$. Set $D^{(m)} := \Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)})$ and similarly for $m+1$. Then $E := \Gamma(\mathfrak{U}, \mathcal{E})$ is of finite type on $D^{(m)}_{\mathbb{Q}}$. Hence, E is also of finite type on $D^{(m+1)}_{\mathbb{Q}}$ Lemma 7.5.2.6 implies that the topologies defined by these two structures of modules are the same. Now the elements $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m+1)}}$ form a bounded family of $D^{(m+1)}_{\mathbb{Q}}$, therefore the $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m+1)}}(e)$ form a bounded family of E. The assertion then follows from $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}} = \frac{q^{(m)}_{\underline{k}}!}{q^{(m+1)}_{\underline{k}}!}\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m+1)}}$ and the fact that $\frac{q^{(m)}_{\underline{k}}!}{q^{(m+1)}_{\underline{k}}!} \to 0$ when $|\underline{k}| \to 0$. □

Proposition 7.5.2.8. *For any $0 \leq m' \leq m$, set $\mathcal{D}^{(m')} := \mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and its p-adic completion $\widehat{\mathcal{D}}^{(m')} := \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Let $\mathcal{E}$ be a topologically nilpotent $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-module which is coherent over $\mathcal{B}_{\mathbb{Q}}$.*

(a) There exists a p-torsion free $\widehat{\mathcal{D}}^{(m)}$-module $\mathring{\mathcal{E}}$, coherent over $\mathcal{B}$ together with an $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$;

(b) The canonical homomorphism $\mathcal{E} \to \widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{\mathbb{Q}}} \mathcal{E}$ is an isomorphism and the sheaf $\mathcal{E}$ is coherent as $\mathcal{D}^{(m)}_{\mathbb{Q}}$-module or as $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-module ;

(c) For any $0 \leq m' \leq m$, the canonical homomorphism

$$\mathcal{E} \to \widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m')}_{\mathbb{Q}}} \mathcal{E} \tag{7.5.2.8.1}$$

is an isomorphism.

(d) Let $\mathcal{B}'$ be a commutative $\mathcal{B}$-algebra satisfying the conditions of 7.5.1.1 and such that $\mathcal{B} \to \mathcal{B}'$ is $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. The canonical homomorphism

$$\mathcal{B}'_{\mathbb{Q}} \otimes_{\mathcal{B}_{\mathbb{Q}}} \mathcal{E} \to (\mathcal{B}'\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_{\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}} \mathcal{E} \tag{7.5.2.8.2}$$

is an isomorphism.

Proof. 1) Let us check (a). We suppose first that $\mathfrak{X}^\sharp$ is an affine open, endowed with logarithmic coordinates and such the nilpotence condition of 7.5.2.4.(a) holds. Let $A := \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$, $P_i := \Gamma(X_i, \mathcal{P}_{X_i^\sharp/S_i(m)})$, $B := \Gamma(\mathfrak{X}, \mathcal{B})$, $D^{(m')} := \Gamma(\mathfrak{X}, \mathcal{D}^{(m')})$, $E := \Gamma(\mathfrak{X}, \mathcal{E})$. We set $P' := \varprojlim_i B \otimes_A P_i$. Since $\mathcal{E}$ is coherent over $\mathcal{B}_{\mathbb{Q}}$, then E is a $B_{\mathbb{Q}}$-module of finite type. Let $E' \subset E$ be a sub B-module of finite type such that $E'_{\mathbb{Q}} \xrightarrow{\sim} E$. It follows from 7.2.1.4 that $E' \otimes_B P'$ is separated and complete for the p-adic topology. The nilpotence hypothesis means that, for any $e \in E$, $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(e) \to 0$ (for the Banach topology on E defined in 7.5.1.8 as $D^{(m)}_{\mathbb{Q}}$-module of finite type) when $|\underline{k}| \to +\infty$. It follows from 7.5.2.6 that $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(e) \to 0$ for the Banach topology on E defined as $B_{\mathbb{Q}}$-module of finite type. As the latter is none other than that defined by the p-adic topology of E', then $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(e) \otimes \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}} \to 0$ in $E \otimes_B P'$ for the topology given by the p-adic topology of $E' \otimes_B P'$. We can therefore define an application $\theta \colon E \to E \otimes_B P'$ by setting

$$\theta(e) := \sum_{\underline{k} \in \mathbb{N}^d} \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(e) \otimes \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}. \tag{7.5.2.8.3}$$

We have the algebra isomorphisms $B \otimes_A P_i \xrightarrow{\sim} P_i \otimes_A B$, which is given by the m-PD-stratification of $\mathcal{B}/\mathfrak{m}^{i+1}\mathcal{B}$. By p-adic completion, this yields the isomorphism $P' \xrightarrow{\sim} \varprojlim_i P_i \otimes_A B$, which gives a second B-module structure on P' by right multiplication. We then check easily that θ is B-linear for this B-module structure on P'. Hence, we get a p-torsion free B-module $\overset{\circ}{E} = \theta^{-1}(E' \otimes_B P')$ such that $\overset{\circ}{E} \otimes \mathbb{Q} = E$. Since $B \otimes_A P_i$ is free over $B/\mathfrak{m}^{i+1}B$ with the basis $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}\}_{\underline{k} \in \mathbb{N}^d}$. Hence, P' is the p-adic completion of a free B-module with the basis $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}\}_{\underline{k} \in \mathbb{N}^d}$. This yields that the canonical homomorphism

$$E' \otimes_B P' \to \left(\oplus_{\underline{k}} E'\right)^{\wedge}$$

is an isomorphism and any element $x \in E' \otimes_B P'$ can be written as a convergent series $x = \sum_{\underline{k}} e_{\underline{k}} \otimes \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}$, with $e_{\underline{k}} \in E'$ and $e_{\underline{k}} \to 0$ as $|\underline{k}| \to \infty$. Hence, it follows from (7.5.2.8.3) that we have

$$\overset{\circ}{E} = \{e \in E' : \forall\, \underline{k}, \partial^{\langle \underline{k} \rangle} e \in E'\}.$$

In particular, we get $\overset{\circ}{E} \subset E'$. As B is noetherian and E' is of finite type over B then $\overset{\circ}{E}$ is of finite type over B. Moreover, it follows from 1.4.2.7 that $\overset{\circ}{E}$ is a sub-$D^{(m)}$-module of E. We set $\overset{\circ}{\mathcal{E}} := \mathcal{B} \otimes_B \overset{\circ}{E}$. Then using 7.5.2.1 we can check $\overset{\circ}{\mathcal{E}}$ satisfies every required properties. Finally, we move from the affine case to the general case by reasoning as in [Ber96c, 3.4.3].

2) By using 7.5.2.1 (resp. 7.5.2.2.1) with the module $\overset{\circ}{\mathcal{E}}$ and then tensoring with $\mathbb{Q}$, we get the assertion (b) (resp. (d)).

3) Since $\mathcal{E}$ be also a topologically nilpotent $(\mathcal{B} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_{\mathbb{Q}}$-module (or remark we can use again $\overset{\circ}{\mathcal{E}}$), we get from (*b*) that the canonical homomorphism $\mathcal{E} \to \widehat{\mathcal{D}}^{(m')}_{\mathbb{Q}} \otimes_{\mathcal{D}^{(m')}_{\mathbb{Q}}} \mathcal{E}$ is an isomorphism for any $m' \leq m$. Since the canonical map $\mathcal{D}^{(m')}_{\mathbb{Q}} \to \mathcal{D}^{(m)}_{\mathbb{Q}}$ is an isomorphism, this implies 7.5.2.8.1. □

Corollary 7.5.2.9. *Set* $\widehat{\mathcal{D}} := \mathcal{B} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. *Let* $\mathcal{E}$ *be a topologically nilpotent* $\widehat{\mathcal{D}}_{\mathbb{Q}}$*-module which is coherent over* $\mathcal{B}_{\mathbb{Q}}$. *Let* $\overset{\circ}{\mathcal{E}}$ *be a p-torsion free coherent* $\widehat{\mathcal{D}}$*-module together with a* $\widehat{\mathcal{D}}_{\mathbb{Q}}$*-linear isomorphism of the form* $\mathcal{E} \xrightarrow{\sim} \overset{\circ}{\mathcal{E}}_{\mathbb{Q}}$. *Then* $\overset{\circ}{\mathcal{E}}$ *is* $\mathcal{B}$*-coherent and* $\overset{\circ}{\mathcal{E}}/\pi^{i+1}\overset{\circ}{\mathcal{E}}$ *is a nilpotent* $\mathcal{D}/\pi^{i+1}\mathcal{D} = (\mathcal{B}/\pi^{i+1}\mathcal{B}) \otimes_{\mathcal{O}_{X_i}} \widehat{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}$*-module (see definition 4.2.1.11).*

Proof. Since this is local, we can suppose $\mathfrak{X}$ affine and that $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ has logarithmic coordinates. Following 7.5.2.8.(a), there exists a p-torsion free $\widehat{\mathcal{D}}$-module $\mathcal{F}$, coherent over $\mathcal{B}$ together with an $\widehat{\mathcal{D}}_{\mathbb{Q}}$-linear isomorphism $\mathcal{F}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$. We get a homomorphism $\overset{\circ}{\mathcal{E}} \hookrightarrow \overset{\circ}{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{F}_{\mathbb{Q}}$. Multiplying this homomorphism by a power of p, we get the injective $\widehat{\mathcal{D}}$-linear homomorphism $\overset{\circ}{\mathcal{E}} \hookrightarrow \mathcal{F}$. Using 7.5.2.3, this yields the coherence of $\overset{\circ}{\mathcal{E}}$ over $\mathcal{B}$. Since $\mathcal{F}$ is $\mathcal{B}$-coherent, for r large enough we get $p^r\mathcal{F} \hookrightarrow \overset{\circ}{\mathcal{E}} \hookrightarrow \mathcal{F}$ whose composition is the canonical inclusion. For any $x \in \Gamma(\mathfrak{Y}, \overset{\circ}{\mathcal{E}})$, for any $\underline{k} \in \mathbb{N}^d$, we get in $\Gamma(\mathfrak{Y}, \mathcal{F})$ the formula

$$\underline{\partial}_{\sharp}^{\langle \underline{k} \rangle_{(m)}} x = \frac{q_{\underline{k}}^{(m)}!}{q_{\underline{k}}^{(m+1)}!} \underline{\partial}_{\sharp}^{\langle \underline{k} \rangle_{(m+1)}} x,$$

and $q_{\underline{k}}^{(m)}!/q_{\underline{k}}^{(m+1)}!$ converges p-adically to 0 when $|\underline{k}| \to \infty$. Hence, we are done. □

Corollary 7.5.2.10. *Set $\mathcal{D}^{(m)} := \mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Let $\mathcal{E}, \mathcal{F}$ be two topologically nilpotent left $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-modules which are coherent over $\mathcal{B}_{\mathbb{Q}}$. Then $\mathcal{E} \otimes_{\mathcal{B}_{\mathbb{Q}}} \mathcal{F}$ and $\mathcal{H}om_{\mathcal{B}_{\mathbb{Q}}}(\mathcal{E}, \mathcal{F})$ are both topologically nilpotent $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-modules and a coherent $\mathcal{B}_{\mathbb{Q}}$-module.*

Proof. The $\mathcal{B}_{\mathbb{Q}}$-coherent is obvious. Moreover, following 7.5.2.8.(a), there exists a p-torsion free $\widehat{\mathcal{D}}^{(m)}$-module $\overset{\circ}{\mathcal{E}}$ (resp. $\overset{\circ}{\mathcal{F}}$), coherent over $\mathcal{B}$ together with an $\widehat{\mathcal{D}}^{(m)}_{\mathbb{Q}}$-linear isomorphism $\overset{\circ}{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ (resp. $\overset{\circ}{\mathcal{F}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{F}$). Since $\overset{\circ}{\mathcal{E}} \otimes_{\mathcal{B}} \overset{\circ}{\mathcal{F}}$ and $\mathcal{H}om_{\mathcal{B}}(\overset{\circ}{\mathcal{E}}, \overset{\circ}{\mathcal{F}})$ are $\mathcal{B}$-coherent, then they are p-adically complete.

For any $i \in \mathbb{N}$, set $\mathcal{B}_i := \mathcal{B}/\pi^{i+1}\mathcal{B}$, $\mathcal{D}_i := \mathcal{D}/\pi^{i+1}\mathcal{D}$, $\overset{\circ}{\mathcal{E}}_i := \overset{\circ}{\mathcal{E}}_i \otimes_{\mathcal{B}} \mathcal{B}_i = \overset{\circ}{\mathcal{E}}_i/\pi^{i+1}\overset{\circ}{\mathcal{E}}_i$, and similarly for $\overset{\circ}{\mathcal{F}}_i$. We reduce to check that $(\overset{\circ}{\mathcal{E}} \otimes_{\mathcal{B}} \overset{\circ}{\mathcal{F}}) \otimes_{\mathcal{O}_{\mathcal{B}}} \mathcal{B}_i \xrightarrow{\sim} \overset{\circ}{\mathcal{E}}_i \widehat{\otimes}_{\mathcal{B}_i} \overset{\circ}{\mathcal{F}}_i$ and $\mathcal{H}om_{\mathcal{B}}(\overset{\circ}{\mathcal{E}}, \overset{\circ}{\mathcal{F}}) \otimes_{\mathcal{O}_{\mathcal{B}}} \mathcal{B}_i \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_I}(\overset{\circ}{\mathcal{E}}_i, \overset{\circ}{\mathcal{F}}_i)$ are nilpotent for any $i \in \mathbb{N}$, which follows from 4.2.3.6. □

7.5.3 Increasing the level: flatness with unchanged coefficients

Let $m \in \mathbb{N} \cup \{+\infty\}$. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is locally noetherian.

Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the following conditions.

(a) $\mathcal{B}$ is endowed with a structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra ;

(b) For any affine open $\mathfrak{U}$ of $\mathfrak{X}$, the ring $\Gamma(U, \mathcal{B})$ is noetherian ;

(c) For any $i \geq 0$, $\mathcal{B}/\mathfrak{m}^{i+1}\mathcal{B}$ is a quasi-coherent $\mathcal{O}_{X_i}$-module and the canonical homomorphism $\mathcal{B} \to \varprojlim_{i\in\mathbb{N}} \mathcal{B}/\mathfrak{m}^{i+1}\mathcal{B}$ is an isomorphism.

Recall both conditions b and c are equal to that of 7.2.3 in the case where $\mathcal{I} = \mathfrak{m}$. For an example, see 7.5.1.2.1.

Theorem 7.5.3.1. *Suppose $m \in \mathbb{N}$. Let $\mathcal{B}$ be an $\mathcal{O}_{\mathfrak{X}}$-algebra satisfying the conditions of 7.5.3 for $m+1$. The canonical homomorphism $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ is right and left flat.*

Proof. Since the check is the same for the right flatness, we will only prove the left flatness. The assertion is local. We can therefore suppose $\mathfrak{X}$ affine and $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ is endowed with logarithmic coordinates $b_1, \ldots, b_d$ and we use the notation of 7.5.1.5. We denote by $D^{(m)} := \Gamma(\mathfrak{X}, \mathcal{B}\otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $\widehat{D}^{(m)}$ its p-adic completion (which can be identified with $\Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and similarly for $m+1$. It is sufficient to prove that the extension $\widehat{D}^{(m)}_{\mathbb{Q}} \to \widehat{D}^{(m+1)}_{\mathbb{Q}}$ is flat. We put $A = \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}})$, $B = \Gamma(\mathfrak{U}, \mathcal{B})$. With 7.5.1.10, we can suppose $\mathcal{B}$ p-torsion free .

For any $\underline{k} \in \mathbb{N}^d$, for any $i = 1, \ldots, d$, with notation 1.2.1.2 we have $k_i = p^m q^{(m)}_{k_i} + r^{(m)}_{k_i} = p^{m+1} q^{(m+1)}_{k_i} + r^{(m+1)}_{k_i}$. We have the formula $\underline{\partial}_{\sharp}^{\langle \underline{k} \rangle_{(m)}} = \frac{q_{\underline{k}}^{(m)}!}{q_{\underline{k}}^{(m+1)}!} \underline{\partial}_{\sharp}^{\langle \underline{k} \rangle_{(m+1)}}$. So, with the uniqueness of the writing 7.5.1.5.2 and 7.5.1.5.3, the canonical homomorphisms $D^{(m)} \to \widehat{D}^{(m)} \to \widehat{D}^{(m)}_{\mathbb{Q}}$ and $D^{(m)} \to D^{(m+1)}$ are injective. Let us then denote by D' the subgroup of $\widehat{D}^{(m)}_{\mathbb{Q}}$ generated by $\widehat{D}^{(m)}$ and $D^{(m+1)}$.

1) We check in this step that D' is in fact a subring of $\widehat{D}^{(m)}_{\mathbb{Q}}$,

Let $P \in \widehat{D}^{(m)}$ and $Q \in D^{(m+1)}$. It is sufficient to check $PQ \in D'$ and $QP \in D'$. Since Q has finite order, then there exists an integer $r \geq 0$ such that $p^r Q \in D^{(m)}$. By using the description 7.5.1.5.1 and

7.5.1.5.2, we can write $P = P_1 + p^r P_2$ with $P_1 \in D^{(m)}$ and $P_2 \in \widehat{D}^{(m)}$. We get $PQ = P_1 Q + P_2(p^r Q)$ with $P_1 Q \in D^{(m+1)}$ and $P_2(p^r Q) \in \widehat{D}^{(m)}$; $QP = QP_1 + (p^r Q)P_2$ with $QP_1 \in D^{(m+1)}$ and $(p^r Q)P_2 \in \widehat{D}^{(m)}$.

2) We claim that $D^{(m+1)}/p^i D^{(m+1)} \to D'/p^i D'$ is an isomorphism for all integer $i \geq 1$.

i) First we show surjectivity. Let $R \in D'$. Choose $P \in \widehat{D}^{(m)}$, $Q \in D^{(m+1)}$ such that $R = P + Q$ We can write $P = P_1 + p^i P_2$ with $P_1 \in D^{(m)}$, $P_2 \in \widehat{D}^{(m)}$. Hence, $R = P_1 + Q + p^i P_2$ with $P_1 + Q \in D^{(m+1)}$ and $P_2 \in \widehat{D}^{(m)} \subset D'$.

ii) For injectivity, take $R \in D^{(m+1)} \cap p^i D'$. Put $R = p^i(P + Q)$ with $P \in \widehat{D}^{(m)}$ and $Q \in D^{(m+1)}$. Then for some n we can write in $\widehat{D}^{(m+1)}$

$$R = \sum_{|\underline{k}| \leq n} a_{\underline{k}} \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m+1)}}, \qquad Q = \sum_{|\underline{k}| \leq n} c_{\underline{k}} \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m+1)}},$$

$$P = \sum_{\underline{k} \in \mathbb{N}^d} b_{\underline{k}} \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}} = \sum_{\underline{k} \in \mathbb{N}^d} \frac{q_{\underline{k}}^{(m)}!}{q_{\underline{k}}^{(m+1)}!} b_{\underline{k}} \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m+1)}}$$

with $a_{\underline{k}}, b_{\underline{k}}, c_{\underline{k}} \in B$. Since $\mathcal{B}$ is p-torsion free we get $b_{\underline{k}} = 0$ for $|\underline{k}| \rangle n$. This yields $P \in D^{(m)}$ and therefore $R \in p^i D^{(m+1)}$.

3) It follows from 2) that $\widehat{D}^{(m+1)} \to \widehat{D'}$ is an isomorphism. This implies $\widehat{D}_{\mathbb{Q}}^{(m+1)} \xrightarrow{\sim} \widehat{D'}_{\mathbb{Q}}$. On the other hand $D_{\mathbb{Q}}^{(m+1)} = D_{\mathbb{Q}}^{(m)} \subset \widehat{D}_{\mathbb{Q}}^{(m)}$ and thus the inclusion $\widehat{D}_{\mathbb{Q}}^{(m)} \hookrightarrow D'_{\mathbb{Q}}$ is an equality. To end the proof, it is sufficient therefore to establish that D' is noetherian (because this yields that $\widehat{D'}$ is right and left flat on D' and then similarly with the index $\mathbb{Q}$).

By using 4.1.2.17.b), we can check that $D^{(m+1)}$ is generated as left $D^{(m)}$-modules by the operators $(\underline{\partial}_\sharp^{[p^{m+1}]})^{\underline{q}}$, for $\underline{q} \in \mathbb{N}^d$. This yields that D' is generated as left $\widehat{D}^{(m)}$-module by the operator $(\underline{\partial}_\sharp^{[p^{m+1}]})^{\underline{q}}$, for $\underline{q} \in \mathbb{N}^d$. Let $1 \leq j \leq d$ be an integer. The operator $\partial_{\sharp j}^{[p^{m+1}]} = \partial_{\sharp j}^{\langle p^{m+1} \rangle_{(m+1)}}$ commutes with $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m+1)}}$ for any $\underline{k} \in \mathbb{N}^d$. For any $b \in B$, in $D_{\mathbb{Q}}^{(m)}$ following 4.1.2.2.3 we have

$$[\partial_{\sharp j}^{[p^{m+1}]}, b] = \sum_{i < p^{m+1}} \partial_{\sharp j}^{[p^{m+1} - i]}(b) \otimes \partial_{\sharp j}^{[i]}.$$

For $i < p^{m+1}$, we have $q_i^{(m+1)} < p$. Thus $q_i^{(m+1)}! \in \mathbb{Z}_{(p)}^*$ and $\partial_{\sharp j}^{[i]} = (q_i^{(m+1)}!)^{-1} \partial_{\sharp j}^{\langle i \rangle_{(m)}} \in D^{(m)}$ (see 3.2.3.5.2). It follows $[\partial_{\sharp j}^{[p^{m+1}]}, b] \in D^{(m)}$. Passing to limit, we get $[\partial_{\sharp j}^{[p^{m+1}]}, P] \in \widehat{D}^{(m)}$, for all $P \in \widehat{D}^{(m)}$. Since $[(\partial_{\sharp j}^{[p^{m+1}]})^k, P] = \sum_{l=0}^{k-1} (\partial_{\sharp j}^{[p^{m+1}]})^{k-1-l} [\partial_{\sharp j}^{[p^{m+1}]}, P] (\partial_{\sharp j}^{[p^{m+1}]})^l$ for all integer $k \geq 1$ and $P \in \widehat{D}^{(m)}$, by iteration we get

$$[(\partial_{\sharp j}^{[p^{m+1}]})^k, P] \in \sum_{i < k} \widehat{D}^{(m)} (\partial_{\sharp j}^{[p^{m+1}]})^i. \qquad (7.5.3.1.1)$$

For $j = 0, \ldots, d$, let D'_j be the subring of D' generated by $\widehat{D}^{(m)}$ and the $\partial_{\sharp k}^{[p^{m+1}]}$ for $k \leq j$. Let us prove by induction on $j \geq 0$ that D'_j is noetherian. This is already known when $j = 0$. Suppose $j \geq 1$ and D'_{j-1} is noetherian. Let $I \subset D'_j$ be a left ideal. Write $\partial' = \partial_{\sharp j}^{[p^{m+1}]}$. An element $P \in I$ can be written as $P = \sum_{i \leq r} A_i \partial'^i$ with $A_i \in D'_{j-1}$. Let $J \subset D'_{j-1}$ be the set of elements A such that there is $P \in I$ which can be written of the form

$$P = A\partial'^r + \sum_{i < r} A_i \partial'^i,$$

with $A_i \in D'_{j-1}$. Then J is closed under addition: if $P' \in I$ can be written $P' = A\partial'^{r'} + \sum_{i < r'} A_i \partial'^i$ with $r \leq r'$, then $\partial'^{r'-r} P + P' \in I$ and can be written thanks to 7.5.3.1.1 of the form

$$\partial'^{r'-r} P + P' = (A + A')\partial'^{r'} + \sum_{i < r'} A''_i \partial'^i$$

with $A''_i \in \mathcal{D}'_{j-1}$. Hence, J is a left ideal of D'_{j-1}. By induction hypothesis, J has a finite set of generators $A_1, \ldots, A_s$. For $1 \leq k \leq s$ let $I \ni P_k = A_k \partial'^{r_k} + \sum_{i < r_k} A_{k,i} \partial'^i$ with $A_{k,i} \in D'_{j-1}$. Put $r = \sup r_k$. Let

$M \subset D'_j$ be the left D'_{j-1}-module generated by $1, \partial', \ldots, \partial'^r$. Then M is left noetherian and $I \cap M$ is a finitely generated submodule. If $Q_1, \ldots, Q_t$ is a set of generators of $I \cap M$ as left D'_{j-1}-module then we can check by using 7.5.3.1.1 that $\{P_1, \ldots, P_s, Q_1, \ldots, Q_t\}$ generates I. This completes the proof of theorem 7.5.3.1.

□

Corollary 7.5.3.2. *The canonical homomorphism* $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ *is right and left flat.*

7.5.4 Derived completed tensor products, derived completed internal homomorphisms, swapping left and the right modules

Let $m \in \mathbb{N}$. Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0,p)$ with maximal ideal $\mathfrak{m}$. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme, where $\mathfrak{X}^\sharp$ is a log smooth $\mathfrak{S}^\sharp$-log-formal scheme. Let $\mathcal{B}_{\mathfrak{X}}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible structure of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. We suppose moreover that $\mathcal{B}_{\mathfrak{X}}$ satisfies the hypotheses of 7.3.2 (remark when $\mathcal{X}$ is p-torsion free, the condition 7.3.2.d is equivalent to saying that $\mathcal{B}_{\mathfrak{X}}$ is p-torsion free). Recall following 7.3.2.3 that $\mathcal{B}_{\mathfrak{X}}$ is in particular quasi-coherent in the sense of 7.3.1.5.

We denote by $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Recall also, following 7.3.2.1, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ satisfies the conditions of 7.3.2, i.e. in particular the projective systems $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} := (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i})_{i \in \mathbb{N}}$ with $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i} := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is left and right quasi-coherent in the sense of 7.3.1.10. Let $\mathfrak{U} := \mathfrak{X}^{\sharp *}$ be the open of $\mathfrak{X}$ where $M_{\mathfrak{X}^\sharp}$ is trivial and $j_{\mathfrak{U}} \colon \mathfrak{U} \hookrightarrow \mathfrak{X}^\sharp$ be the canonical open immersion. Moreover, we suppose $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}})/\mathfrak{S}^\sharp$ is a strongly quasi-flat morphism of ringed $\mathcal{V}$-log formal schemes (see Definition 4.4.1.3.b).

7.5.4.1. Since $\widetilde{\mathfrak{X}}^\sharp/\mathfrak{S}^\sharp$ and $\widetilde{\mathfrak{Y}}^\sharp/\mathfrak{T}^\sharp$ are strongly quasi-flat morphisms of ringed $\mathcal{V}$-log formal schemes, then there exists some integer d such that $\mathcal{B}_{X_0} \otimes_{\mathcal{B}_{\mathfrak{X}}} -$ and $\oplus_{i \in \mathbb{N}} \mathcal{B}_{X_i}/\mathcal{B}_{X_{i+1}} \otimes_{\mathcal{B}_{X_0}} -$ have cohomological dimension $\leq d$. Hence, it follows from 7.3.2.8 that $\mathcal{B}_{X_\bullet}$ has right tor dimension $\leq 2d$ on $\underleftarrow{l}_{\mathfrak{X}}^{-1}\mathcal{B}_{\mathfrak{X}}$ and $\mathcal{B}_{X_j}$ has right tor dimension $\leq 2d$ on $\mathcal{B}_{X_i}$, for any integers $0 \leq j \leq i$.

7.5.4.2 (Adjunction)**.** Let $* \in \{r, l\}$. Let $\mathcal{D} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (resp. $\mathcal{D} := \mathcal{B}_{\mathfrak{X}}$) and $\mathcal{D}_\bullet = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ (resp. $\mathcal{D}_\bullet := \mathcal{B}_{X_\bullet}$). From [Sta22, 07A6], this yields the functors $\mathbb{R}\underleftarrow{l}_{X*} \colon D({}^*\mathcal{D}_\bullet) \to D({}^*\mathcal{D})$ and $\mathbb{L}\underleftarrow{l}^*_X \colon D({}^*\mathcal{D}) \to D({}^*\mathcal{D}_\bullet)$ which are adjoint, i.e., we have the bifunctorial bijections of the form

$$\mathrm{Hom}_{D({}^*\mathcal{D}_\bullet)}(\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet), \mathcal{F}^\bullet_\bullet) \xrightarrow{\sim} \mathrm{Hom}_{D({}^*\mathcal{D})}(\mathcal{E}^\bullet, \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{F}^\bullet_\bullet)) \tag{7.5.4.2.1}$$

for any $\mathcal{E}^\bullet \in D({}^*\mathcal{D})$ and any $\mathcal{F}^\bullet_\bullet \in D({}^*\mathcal{D}_\bullet)$. This is equivalent to saying that we have a morphism of functors $D({}^*\mathcal{D}_\bullet) \to D({}^*\mathcal{D}_\bullet)$ of the form $\mathrm{adj}_{RL} \colon \mathrm{id} \to \mathbb{R}\underleftarrow{l}_{X*} \circ \mathbb{L}\underleftarrow{l}^*_X$ and a morphism of functors $D({}^*\mathcal{D}) \to D({}^*\mathcal{D})$ of the form $\mathrm{adj}_{LR} \colon \mathbb{L}\underleftarrow{l}^*_X \circ \mathbb{R}\underleftarrow{l}_{X*} \to \mathrm{id}$ such that $(\mathrm{adj}_{LR} \circ \mathbb{L}\underleftarrow{l}^*_X) \circ (\mathbb{L}\underleftarrow{l}^*_X \circ \mathrm{adj}_{RL})$ is the identity $\mathbb{L}\underleftarrow{l}^*_X \to \mathbb{L}\underleftarrow{l}^*_X$ and $(\mathbb{R}\underleftarrow{l}_{X*} \circ \mathrm{adj}_{LR}) \circ (\mathrm{adj}_{RL} \circ \mathbb{R}\underleftarrow{l}_{X*})$ is the identity $\mathbb{R}\underleftarrow{l}_{X*} \to \mathbb{R}\underleftarrow{l}_{X*}$ (see notation [KS06, 1.3.4]).

We have the commutative up to canonical isomorphism diagram

$$\begin{array}{ccc} D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) & \xrightarrow{\mathbb{R}\underleftarrow{l}_{X*}} & D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \\ \downarrow & & \downarrow \\ D(\mathcal{B}_{X_\bullet}) & \xrightarrow{\mathbb{R}\underleftarrow{l}_{X*}} & D(\mathcal{B}_{\mathfrak{X}}) \end{array} , \qquad \begin{array}{ccc} D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) & \xrightarrow{\mathbb{L}\underleftarrow{l}^*_X} & D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \\ \downarrow & & \downarrow \\ D(\mathcal{B}_{\mathfrak{X}}) & \xrightarrow{\mathbb{L}\underleftarrow{l}^*_X} & D(\mathcal{B}_{X_\bullet}) \end{array} , \tag{7.5.4.2.2}$$

where the vertical maps are the forgetful functors. This yields that the adjunction morphisms adj_{LR} and adj_{RL} commute with the forgetful functors (indeed, the equalities satisfied by adj_{LR} and $\mathrm{adj}_{RL}$are still valid after applying the forgetful functors). This implies that we have the commutative square

$$\begin{array}{ccc} \mathrm{Hom}_{D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})}(\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet), \mathcal{F}^\bullet_\bullet) & \xrightarrow[7.5.4.2.1]{\sim} & \mathrm{Hom}_{D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})}(\mathcal{E}^\bullet, \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{F}^\bullet_\bullet)) \\ \downarrow & & \downarrow \\ \mathrm{Hom}_{D({}^*\mathcal{B}_{X_\bullet})}(\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet), \mathcal{F}^\bullet_\bullet) & \xrightarrow[7.5.4.2.1]{\sim} & \mathrm{Hom}_{D({}^*\mathcal{B}_{\mathfrak{X}})}(\mathcal{E}^\bullet, \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{F}^\bullet_\bullet)). \end{array} \tag{7.5.4.2.3}$$

7.5.4.3. Let $* \in \{\mathrm{l}, \mathrm{r}\}$ and $\star \in \{-, \mathrm{b}\}$. Let $\mathcal{D} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (resp. $\mathcal{D} := \mathcal{B}_{\mathfrak{X}}$) and $\mathcal{D}_\bullet = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ (resp. $\mathcal{D}_\bullet := \mathcal{B}_{X_\bullet}$). We have the morphism of ringed topoi $\underset{\leftarrow}{l}_X \colon (X_\bullet, \mathcal{D}_\bullet) \to (|\mathcal{X}|, \mathcal{D})$. Following 7.3.2.11.a, $\mathcal{D}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}$) has left and right finite tor dimension on $\mathcal{D}$ (resp. $\mathcal{D}_0$). Hence following 7.3.2.9 or 7.3.2.10, the functors $\mathbb{R}\underset{\leftarrow}{l}_{X*}$ and $\mathbb{L}\underset{\leftarrow}{l}^*_X$ induce canonically quasi-inverse equivalences of categories between $D^\star_{\mathrm{qc}}(^*\mathcal{D}_\bullet)$ and $D^\star_{\mathrm{qc}}(^*\mathcal{D})$. The adjunction morphisms adj_{LR} and adj_{RL} (of the paragraph 7.5.4.2) are isomorphisms when restricted to bounded above quasi-coherent complexes.

7.5.4.4. Let $\star \in \{-, \mathrm{b}\}$. Let $\mathcal{D}_\bullet = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ or $\mathcal{D}_\bullet := \mathcal{B}_{X_\bullet}$. Let $\mathcal{E}^\bullet_\bullet \in D^\star(^{\mathrm{l}}\mathcal{D}_\bullet)$, $\mathcal{M}^\bullet_\bullet \in D^\star(^{\mathrm{r}}\mathcal{D}_\bullet)$. Then via the beginning of the paragraph 7.3.1.14 (still valid for right modules), we get that the property $\mathcal{E}^\bullet_\bullet \in D^\star_{\mathrm{qc}}(^{\mathrm{l}}\mathcal{D}_\bullet)$ (resp. $\mathcal{M}^\bullet_\bullet \in D^\star_{\mathrm{qc}}(^{\mathrm{r}}\mathcal{D}_\bullet)$) is satisfied if and only if both conditions hold:

(a) The complex $\mathcal{E}^\bullet_0$ (resp. $\mathcal{M}^\bullet_0$) is in $D^-_{\mathrm{qc}}(\mathcal{O}_{X_0})$.

(b) The canonical left (resp. right) map

$$\mathcal{D}_i \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1} \to \mathcal{E}^\bullet_i, \qquad \mathcal{M}^\bullet_{i+1} \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_{i+1}} \mathcal{D}_i \to \mathcal{M}^\bullet_i \tag{7.5.4.4.1}$$

is an isomorphism.

7.5.4.5. Let $* \in \{r, l\}$.

(a) Since $\mathcal{B}_{X_\bullet} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ is flat, then a K-flat complex of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules is a K-flat complex of $\mathcal{B}_{X_\bullet}$-modules. Hence, similarly to 4.6.6.1.4, we get the top functor making commutative (up to a canonical isomorphism) the diagram:

$$\begin{array}{ccc} D(^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \times D(^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) & \xrightarrow{-\otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}}-} & D(^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \\ \downarrow & & \downarrow \\ D(\mathcal{B}_{X_\bullet}) \times D(\mathcal{B}_{X_\bullet}) & \xrightarrow{-\otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}}-} & D(\mathcal{B}_{X_\bullet}) \end{array} \tag{7.5.4.5.1}$$

where the vertical maps are the forgeful functors. Moreover, the top morphism of 7.5.4.5.1 preserves the quasi-coherence, i.e. we get

$$-\otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}} - \colon D(^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \times D(^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) D(^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}). \tag{7.5.4.5.2}$$

(b) Since $\mathcal{B}_{X_\bullet} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ is flat, then a K-injective complex of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules is a K-injective complex of $\mathcal{B}_{X_\bullet}$-modules. Hence, similarly to 4.6.6.1.4, we get the top functor making commutative (up to a canonical isomorphism) the diagram:

$$\begin{array}{ccc} D(^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \times D(^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) & \xrightarrow{\mathbb{R}\mathscr{H}om_{\mathcal{B}_{X_\bullet}}(-,-)} & D(^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \\ \downarrow & & \downarrow \\ D(\mathcal{B}_{X_\bullet}) \times D(\mathcal{B}_{X_\bullet}) & \xrightarrow{\mathbb{R}\mathscr{H}om_{\mathcal{B}_{X_\bullet}}(-,-)} & D(\mathcal{B}_{X_\bullet}) \end{array} \tag{7.5.4.5.3}$$

where the vertical maps are the forgeful functors. Suppose $\mathfrak{X}$ is quasi-compact. It follows from 7.3.4.17 that for any $\mathcal{E}_\bullet \in D(^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ such that $\mathcal{E}_\bullet \in D_{\mathrm{perf}}(\mathcal{B}_{X_\bullet})$, the functor $\mathbb{R}\mathscr{H}om_{\mathcal{B}_{X_\bullet}}(\mathcal{E}_\bullet, -)$ preserves the quasi-coherence and the perfectness.

7.5.4.6 (Swapping left and right $\mathcal{D}_\bullet$-module)**.** Following 7.5.1.13, the sheaf $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, is endowed with a canonical structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Moreover, $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ satisfies the conditions of 7.3.2, i.e. in particular the projective systems $\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} := (\widetilde{\omega}_{X^\sharp_i/S^\sharp_i})_{i\in\mathbb{N}}$ with $\widetilde{\omega}_{X^\sharp_i/S^\sharp_i} := \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is quasi-coherent in the sense of 7.3.1.10. Similarly to 4.3.5.7, we check that the functors $-\otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\omega}^{-1}_{X^\sharp_\bullet/S^\sharp_\bullet} = \mathscr{H}om_{\mathcal{B}_{X_\bullet}}(\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}, -)$ and $\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} -$ are exact and induce quasi-inverse equivalences between the category of (resp. coherent, resp. flat, resp. locally projective of finite type) left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules and that of (resp. coherent, resp. flat, resp. locally projective of finite type) right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules.

Since these functors preserve the quasi-coherence (see 7.5.4.5) and are exact, then for any $\star \in \{-, \mathrm{b}\}$, the functors $\mathscr{H}om_{\mathcal{B}_{X_\bullet}}(\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}, -)$ and $\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} -$ induce quasi-inverse equivalences between the categories $D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ and $D^\star_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$.

7.5.4.7. This paragraph is a variation of 7.3.4.2. Let $* \in \{r, l\}$. Let $\mathcal{E}^\bullet \in D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $\mathcal{M}^\bullet \in D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Following 7.3.2.3.d, $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^\bullet) \xrightarrow{\sim} \mathcal{B}_{X^\sharp_\bullet} \otimes^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}^\sharp}} \mathcal{E}^\bullet \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E}^\bullet \in D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ and similarly for right modules. Hence, we define an object of $D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ by setting

$$\mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}^\bullet := \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{L}\underleftarrow{l}^*_X \mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}} \mathbb{L}\underleftarrow{l}^*_X \mathcal{E}^\bullet), \tag{7.5.4.7.1}$$

which is called the *completed tensor product of $\mathcal{M}^\bullet$ over $\mathcal{B}_{\mathfrak{X}}$ of $\mathcal{E}^\bullet$.*

It follows from 7.3.4.11.1 and 7.5.4.5.1 that the functor 7.5.4.7.1 preserves the quasi-coherence and the isogenies, i.e., with notation 7.4.6.1 we get the functors

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} - \colon D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \times D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}), \tag{7.5.4.7.2}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} - \colon D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \times D^-_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D^-_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}). \tag{7.5.4.7.3}$$

Moreover, for any $\mathcal{E} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, for any $\mathcal{M} \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, by using a K-flat complex of left (resp. left or right according to the value of $*$), it follows from 7.5.4.3 that we get the bifunctorial canonical isomorphism of $D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ of the form

$$\mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E}) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}). \tag{7.5.4.7.4}$$

7.5.4.8. This paragraph is a variation of 7.3.4.18. Let $* \in \{r, l\}$. Let $\mathcal{E}^\bullet, \mathcal{F}^\bullet \in D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. We define an object of $D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ by setting

$$\mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet) := \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{R}\mathscr{H}om_{\mathcal{B}_{X_\bullet}}(\mathbb{L}\underleftarrow{l}^*_X\mathcal{E}^\bullet, \mathbb{L}\underleftarrow{l}^*_X\mathcal{F}^\bullet)). \tag{7.5.4.8.1}$$

which is called *completed internal homomorphism over $\mathcal{B}_{\mathfrak{X}}$ of $\mathcal{E}^\bullet$ and $\mathcal{F}^\bullet$.*

Suppose $\mathfrak{X}$ is quasi-compact. Let $\mathcal{E}^\bullet \in K({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ such that $\mathcal{E}^\bullet \in D_{\mathrm{perf}}(\mathcal{B}_{\mathfrak{X}})$. Let $\star \in \{\mathrm{b}, -\}$. Then it follows from 7.3.4.17 and 7.5.4.5.1 that 7.5.4.8.1 induces the functor:

$$\mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{E}^\bullet, -) \colon D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}), \tag{7.5.4.8.2}$$

$$\mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{E}^\bullet, -) \colon D^\star_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D^\star_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}). \tag{7.5.4.8.3}$$

Hence, for any $\mathcal{F} \in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, it follows from 7.5.4.3 that we get the canonical isomorphism of $D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ of the form

$$\mathbb{L}\underleftarrow{l}^*_X\mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{E}, \mathcal{F}) \xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{\mathcal{B}_{X_\bullet}}(\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}), \mathbb{L}\underleftarrow{l}^*_X(\mathcal{F}). \tag{7.5.4.8.4}$$

7.5.4.9. Following 4.6.6.1.4, we have the functors

$$- \otimes^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} - \colon D({}^{\mathrm{l}}\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \times D({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}), \tag{7.5.4.9.1}$$

$$\mathbb{R}\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(-,-) \colon D({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \times D({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}). \tag{7.5.4.9.2}$$

7.5.4.10. Let $\mathcal{E}^\bullet \in D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $\mathcal{M}^\bullet, \mathcal{N}^\bullet \in D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Since $\mathcal{B}_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ are flat morphisms, then a K-flat complex of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules is also a K-flat complex of left (resp. right) $\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules and a K-flat complex of $\mathcal{B}_{\mathfrak{X}}$-modules. We construct by adjunction (similarly to 7.3.4.3) the following morphism of $D^-({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$

$$\mathcal{M}^\bullet \otimes^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}^\bullet \to \mathcal{M}^\bullet \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}^\bullet. \tag{7.5.4.10.1}$$

By applying the forgetful functor $D^-({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D(\mathcal{B}_{\mathfrak{X}})$, we get the map 7.3.4.3. Hence, in the case where $\mathcal{M}^\bullet \in D^-_{\mathrm{coh}}(\mathcal{B}_{\mathfrak{X}})$ and $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, the map 7.5.4.10.1 is an isomorphism.

We construct (similarly to 7.3.4.16.2) the morphism of $D({}^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\mathbb{R}\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{M}^\bullet, \mathcal{N}^\bullet) \to \mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{M}^\bullet, \mathcal{N}^\bullet). \tag{7.5.4.10.2}$$

When $\mathcal{M}^\bullet \in D_{\mathrm{perf}}(\mathcal{B}_{\mathfrak{X}})$ and $\mathcal{N}^\bullet \in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ the map 7.5.4.10.2 is an isomorphism.

7.5.4.11 (Swapping left and right quasi-coherent complexes of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules)**.** Let $\star \in \{-, \mathrm{b}\}$. Since $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is a projective $\mathcal{B}_{\mathfrak{X}}$-module, by using 7.5.1.13.(f) we construct similarly to 7.5.4.10 the isomorphisms of functors:

$$\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -) \xrightarrow{\sim} \mathbb{R}\mathscr{H}\widehat{om}_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -) \colon D^\star_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}), \tag{7.5.4.11.1}$$

$$\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} - \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} - \colon D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D^\star_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}), \tag{7.5.4.11.2}$$

so that the functors $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} -$ and $\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -)$ induce quasi-inverse equivalences of categories between $D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $D^\star_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. These equivalences preserve K-flat complexes, K-injective complexes. Since these equivalences preserve also isogenies and coherence, they induce quasi-inverse equivalence between $D^\star_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $D^\star_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and between $D^\star_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $D^\star_{\mathrm{coh}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ etc.

7.5.4.12. Let $* \in \{r, l\}$. Let $\mathcal{E}_\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$. Let $\mathcal{M} \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. We get the isomorphisms in $D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$:

$$\mathbb{L}\underleftarrow{l}^*_X\left(\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}_\bullet)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}}\mathcal{M}\right) \xrightarrow[\sim]{7.5.4.7.4} \mathbb{L}\underleftarrow{l}^*_X \circ \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}_\bullet) \otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}) \xrightarrow[\sim]{7.5.4.3} \mathcal{E}_\bullet \otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}) \tag{7.5.4.12.1}$$

Since $\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}_\bullet)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}}\mathcal{M}$ is quasi-coherent (see 7.5.4.7.2), then we get from 7.5.4.3 the isomorphisms of $D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}_\bullet)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}}\mathcal{M} \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*}\mathbb{L}\underleftarrow{l}^*_X\left(\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}_\bullet)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}}\mathcal{M}\right) \xrightarrow[\sim]{7.5.4.12.1} \mathbb{R}\underleftarrow{l}_{X*}\left(\mathcal{E}_\bullet \otimes^{\mathbb{L}}_{\mathcal{B}_{X_\bullet}} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M})\right). \tag{7.5.4.12.2}$$

7.5.4.13. Since $\mathbb{L}\underleftarrow{l}^*_X(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}$, since $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is a locally free $\mathcal{B}_{\mathfrak{X}}$-module of rank one, then with 7.5.1.13, then for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ we get by using some K-flat representation of $\mathcal{E}$ the canonical $D({}^r\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$:

$$\mathbb{L}\underleftarrow{l}^*_X(\mathcal{E} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}) \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}. \tag{7.5.4.13.1}$$

Moreover, for any $\mathcal{E}_\bullet \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, by using some K-injective resolution of $\mathcal{E}_\bullet$ we get the isomorphism of $D({}^r\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}_\bullet) \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*}\left(\mathcal{E}_\bullet \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}\right). \tag{7.5.4.13.2}$$

For any $\mathcal{M} \in D({}^r\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, we get from 7.5.4.8.4 the isomorphism

$$\mathbb{L}\underleftarrow{l}^*_X(\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M})) \xrightarrow{\sim} \mathscr{H}om_{\mathcal{B}_{X_\bullet}}(\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}, \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}). \tag{7.5.4.13.3}$$

For any $\mathcal{M}_\bullet \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, by using K-injective representation of $\mathcal{M}_\bullet$, we construct the isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ of the form:

$$\mathbb{R}\underleftarrow{l}_{X*}\mathscr{H}om_{\mathcal{B}_{X_\bullet}}(\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}, \mathcal{M}^\bullet_\bullet) \xrightarrow{\sim} \mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{M}^\bullet_\bullet)). \tag{7.5.4.13.4}$$

In other words, the functors $\mathbb{L}\underleftarrow{l}^*_X$ and $\mathbb{R}\underleftarrow{l}_{X*}$ are compatible with the quasi-inverse equivalences of categories 7.5.4.6 and of 7.5.4.11 (or 7.5.1.13.(f)).

7.5.5 Extraordinary inverse images

Let $m \in \mathbb{N}$. Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0,p)$ with maximal ideal $\mathfrak{m}$. Let

$$\begin{array}{ccc} \mathfrak{X}^\sharp & \xrightarrow{f} & \mathfrak{Y}^\sharp \\ \downarrow{\scriptstyle p_{\mathfrak{X}^\sharp}} & & \downarrow{\scriptstyle p_{\mathfrak{Y}^\sharp}} \\ \mathfrak{S}^\sharp & \xrightarrow{\phi} & \mathfrak{T}^\sharp, \end{array} \tag{7.5.5.0.1}$$

be a commutative diagram where $\mathfrak{S}^\sharp$ and $\mathfrak{T}^\sharp$ are nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10, where $\mathfrak{X}^\sharp$ is a log smooth $\mathfrak{S}^\sharp$-log-formal scheme and $\mathfrak{Y}^\sharp$ is a log smooth $\mathfrak{T}^\sharp$-log formal scheme. Let $\mathcal{B}_{\mathfrak{X}}$ (resp. $\mathcal{B}_{\mathfrak{Y}}$) be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra (resp. $\mathcal{O}_{\mathfrak{Y}}$-algebra) endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. left $\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$-module) and satisfying the hypotheses of 7.3.2. Recall following 7.3.2.3 that $\mathcal{B}_{\mathfrak{X}}$ and $\mathcal{B}_{\mathfrak{Y}}$ are in particular quasi-coherent in the sense of 7.3.1.5. The action of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $f^*\mathcal{B}_{\mathfrak{Y}}$ is compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra (see 3.4.4.6). We suppose that we have a morphism of algebras $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ which is moreover $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. We denote by $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} := \mathcal{B}_{\mathfrak{Y}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}}\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$. Recall also, following 7.3.2.1, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$ satisfy the conditions of 7.3.2, i.e. in particular the projective systems $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} := (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i})_{i\in\mathbb{N}}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} := (\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})_{i\in\mathbb{N}}$) with $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$) is left and right quasi-coherent in the sense of 7.3.1.10.

We denote by $\widetilde{\mathfrak{X}}^\sharp$ (resp. $\widetilde{\mathfrak{Y}}^\sharp$) the ringed $\mathcal{V}$-log formal scheme $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}})$ (resp. $(\mathfrak{Y}^\sharp, \mathcal{B}_{\mathfrak{Y}})$), and by $\widetilde{f}\colon \widetilde{\mathfrak{X}}^\sharp/\mathfrak{S}^\sharp \to \widetilde{\mathfrak{Y}}^\sharp/\mathfrak{T}^\sharp$ the morphism of relative ringed $\mathcal{V}$-log formal schemes induced by the diagram 7.5.5.0.1 and by $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$. When $\mathfrak{S}^\sharp \to \mathfrak{T}^\sharp$ in understood, by abuse of notation, we also denote by $\widetilde{f}$ the induced morphism $\widetilde{\mathfrak{X}}^\sharp \to \widetilde{\mathfrak{Y}}^\sharp$ of ringed $\mathcal{V}$-log formal schemes.

Let $\mathfrak{U} := \mathfrak{X}^{\sharp *}$ be the open of $\mathfrak{X}$ where $M_{\mathfrak{X}^\sharp}$ is trivial and $j_{\mathfrak{U}}\colon \mathfrak{U} \hookrightarrow \mathfrak{X}^\sharp$ be the canonical open immersion. Let $\mathfrak{V} := \mathfrak{Y}^{\sharp *}$ be the open of $\mathfrak{Y}$ where $M_{\mathfrak{Y}^\sharp}$ is trivial and $j_{\mathfrak{V}}\colon \mathfrak{V} \hookrightarrow \mathfrak{Y}^\sharp$ be the canonical open immersion.

Moreover, we suppose $\widetilde{f}$ is a strongly quasi-flat morphism of relative ringed $\mathcal{V}$-log formal schemes (see Definition 4.4.1.3.d). The quasi-flatness will be useful to get Lemma 7.5.5.5. The strongly quasi-flatness of $\widetilde{f}$ implies that $\widetilde{\mathfrak{X}}^\sharp/\mathfrak{S}^\sharp$ and $\widetilde{\mathfrak{Y}}^\sharp/\mathfrak{T}^\sharp$ are strongly quasi-flat morphisms of ringed $\mathcal{V}$-log formal schemes (in the sense of 4.4.1.3.b). Hence, we get for instance the finite tor-dimensions of 7.5.4.1 and we can apply 7.5.4.3 for both.

Lemma 7.5.5.1. *Suppose $f^{-1}\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ has tor dimension $\leq d$ for some integer d, i.e. suppose the functor $\widetilde{f}^* = \mathcal{B}_{\mathfrak{X}} \otimes_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}-$ from the category of $\mathcal{B}_{\mathfrak{Y}}$-modules to that of $\mathcal{B}_{\mathfrak{X}}$-modules has cohomological dimension $\leq d$. Then the functor $\widetilde{f}^*_\bullet = \mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}-$ has cohomological dimension $\leq d$.*

Proof. Since $\widetilde{f}^*$ is quasi-flat, then there exists a morphism $\mathfrak{Y} \to \mathfrak{U}$ of $\mathcal{V}$-formal schemes such that both induced morphisms of ringed spaces $\widetilde{\mathfrak{X}}^\sharp \to \mathfrak{U}$ and $\widetilde{\mathfrak{Y}}^\sharp \to \mathfrak{U}$ are flat. Hence $\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{U}}} \mathcal{B}_{\mathfrak{X}} \xrightarrow{\sim} \mathcal{B}_{X_i}$ and $\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{U}}} \mathcal{B}_{\mathfrak{Y}} \xrightarrow{\sim} \mathcal{B}_{Y_i}$ for any integer $i \geq 0$. This yields the canonical isomorphism $\mathcal{B}_{\mathfrak{X}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\mathcal{B}_{Y_i} \xrightarrow{\sim} \mathcal{B}_{X_i}$, for any integer $i \geq 0$. Hence, for any $i \in \mathbb{N}$ and any $\mathcal{B}_{Y_i}$-module $\mathcal{M}_i$, the canonical morphism $\mathcal{B}_{\mathfrak{X}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\mathcal{M}_i \to \mathcal{B}_{X_i} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{Y_i}} f^{-1}\mathcal{M}_i$ is an isomorphism and we are done. $\square$

7.5.5.2. Let $\star \in \{-, \mathrm{b}\}$. In the case where $\star = \mathrm{b}$, we suppose moreover $f^{-1}\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ has finite tor dimension, and therefore following 7.5.5.1 that so is the functor $\widetilde{f}^*_\bullet = \mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}-$. Hence, we get the functors

$$\mathbb{L}\widetilde{f}^*_{\mathrm{alg}} = \mathcal{B}_{\mathfrak{X}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}-\colon D^\star(\mathcal{B}_{\mathfrak{Y}}) \to D^\star(\mathcal{B}_{\mathfrak{X}}), \qquad \mathbb{L}\widetilde{f}^*_\bullet = \mathcal{B}_{X_\bullet} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}-\colon D^\star(\mathcal{B}_{Y_\bullet}) \to D^\star(\mathcal{B}_{X_\bullet}). \tag{7.5.5.2.1}$$

Let $\mathcal{F}_\bullet \in D^\star(\mathcal{B}_{Y_\bullet})$. It follows from 7.1.3.6.1 that we have the isomorphism:

$$\left(\mathbb{L}\widetilde{f}^*_\bullet(\mathcal{F}_\bullet)\right)_i \xrightarrow{\sim} \mathbb{L}\widetilde{f}^*_i(\mathcal{F}_i). \tag{7.5.5.2.2}$$

Since $\mathcal{B}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{B}_{X_{i+1}}} \mathbb{L}\widetilde{f}^*_{i+1}(\mathcal{F}_{i+1}) \xrightarrow{\sim} \mathbb{L}\widetilde{f}^*_i(\mathcal{B}_{Y_i} \otimes^{\mathbb{L}}_{\mathcal{B}_{Y_{i+1}}} \mathcal{F}_{i+1})$, then it follows from 7.5.4.4 that the right functor of 7.5.5.2.1 preserves the quasi-coherence (in the sense of 7.3.1.10), i.e. induces the functor

$$\mathbb{L}\widetilde{f}^*_\bullet\colon D^\star_{\mathrm{qc}}(\mathcal{B}_{Y_\bullet}) \to D^\star_{\mathrm{qc}}(\mathcal{B}_{X_\bullet}). \tag{7.5.5.2.3}$$

Since $\mathcal{B}_{Y_\bullet} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}$ is flat, then a K-flat complex of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}$-modules is a K-flat complex of $\mathcal{B}_{Y_\bullet}$-modules. Hence, we get the functor $\mathbb{L}\widetilde{f}^*\colon D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}) \to D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ making commutative the diagram:

$$\begin{array}{ccc} D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}) & \xrightarrow{\mathbb{L}\widetilde{f}^*_\bullet} & D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \\ \downarrow & & \downarrow \\ D^\star_{\mathrm{qc}}(\mathcal{B}_{Y_\bullet}) & \xrightarrow{\mathbb{L}\widetilde{f}^*_\bullet} & D^\star_{\mathrm{qc}}(\mathcal{B}_{X_\bullet}) \end{array} \tag{7.5.5.2.4}$$

where the vertical functors are the forgetful ones.

7.5.5.3. Following 7.5.1.13, the sheaf $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (resp. $\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} := \mathcal{B}_{\mathfrak{Y}} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \omega_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$) is endowed with a canonical structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$-module). Moreover, $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$ satisfy the conditions of 7.3.2, i.e. in particular the projective systems $\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} := (\widetilde{\omega}_{X^\sharp_i/S^\sharp_i})_{i\in\mathbb{N}}$ (resp. $\widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet} := (\widetilde{\omega}_{Y^\sharp_i/T^\sharp_i})_{i\in\mathbb{N}}$) with $\widetilde{\omega}_{X^\sharp_i/S^\sharp_i} := \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (resp. $\widetilde{\omega}_{Y^\sharp_i/T^\sharp_i} := \widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$) is quasi-coherent in the sense of 7.3.1.10.

Notation 7.5.5.4. We deduce by functoriality from 7.5.5.2 that we get a structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$-bimodule on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet\to Y^\sharp_\bullet/T^\sharp_\bullet} := \widetilde{f}^*_\bullet\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} = \mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}$. When $\mathfrak{S} \to \mathfrak{T}$ is the identity, we can simply write $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet\to Y^\sharp_\bullet/S^\sharp_\bullet}$ and when moreover there is no doubt about S we write $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet\to Y^\sharp_\bullet}$. By functoriality from 7.5.5.2 and 7.5.4.6, we get a structure of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$-bimodule on

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet} := \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{f}^*_{\bullet r}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}\right),$$

where the index "r" means that we have chosen the right (i.e. the twisted) structure of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}$-module on $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}$ to compute the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module via the functor $\widetilde{f}^*_\bullet$.

When $\mathfrak{S} \to \mathfrak{T}$ is the identity, we can simply write $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$ and when moreover there is no doubt about S we write $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet\leftarrow X^\sharp_\bullet}$.

We have the isomorphism of left $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$-bimodules

$$\widetilde{f}^*_{\bullet r}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}\right) \underset{\widetilde{f}^*_\bullet(4.2.5.6.3)}{\xrightarrow{\sim}} \widetilde{f}^*_{\bullet l}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}\right),$$

where the index "l" (resp. "r ") means that we have chosen the left (resp. right) structure to compute $\widetilde{f}^*_\bullet$. By tensoring this latter isomorphism with $\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} -$, we get the isomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$-bimodules

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet\to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}\widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}. \tag{7.5.5.4.1}$$

Lemma 7.5.5.5. *Since $\widetilde{f}$ is quasi-flat (see Definition 4.4.1.3), then $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$) is solvable in the sense of 4.6.3.2.b as a complex of $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$ (resp. $D(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$).*

Proof. By definition, there exists a morphism of $\mathcal{V}$-formal schemes $\mathfrak{T} \to \mathfrak{U}$ such that both induced morphisms of ringed spaces $g\colon (\mathfrak{X}, \mathcal{B}_{\mathfrak{X}}) \to \mathfrak{U}$ and $h\colon (\mathfrak{Y}, \mathcal{B}_{\mathfrak{Y}}) \to \mathfrak{U}$ are flat. This yields that $g_\bullet\colon (X_\bullet, \mathcal{B}_{X_\bullet}) \to U_\bullet$ and $h_\bullet\colon (Y_\bullet, \mathcal{B}_{Y_\bullet}) \to U_\bullet$ are flat. Since $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}/\mathcal{B}_{Y_\bullet}$ is flat, since $h_\bullet$ is flat we get that $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}/h_\bullet^{-1}(\mathcal{O}_{U_\bullet})$ is flat. Moreover, $h_\bullet^{-1}(\mathcal{O}_{U_\bullet})$ is sent in the center of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}$. Hence, $f_\bullet^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}/g_\bullet^{-1}(\mathcal{O}_{U_\bullet})$ is flat and $g_\bullet^{-1}(\mathcal{O}_{U_\bullet})$ is sent in the center of $f_\bullet^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}$. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}/\mathcal{B}_{X_\bullet}$ is flat, since $g_\bullet$ is flat, we get that $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}/g_\bullet^{-1}(\mathcal{O}_{U_\bullet})$ is flat. Hence, $g_\bullet^{-1}(\mathcal{O}_{U_\bullet})$ is a solving ring of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet}$. Similarly, we check that $g_\bullet^{-1}(\mathcal{O}_{U_\bullet})$ is a solving ring of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$. □

Definition 7.5.5.6. We keep notation 7.5.5.4.

(a) The (left version of the) extraordinary inverse image functor of level m by $\widetilde{f}_\bullet$ is the functor $\widetilde{f}_\bullet^{(m)!}\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ which is defined by setting

$$\widetilde{f}_\bullet^{(m)!}(\mathcal{F}_\bullet) := \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes^{\mathbb{L}}_{f_\bullet^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f_\bullet^{-1}\mathcal{F}_\bullet\ [\delta_{X^\sharp_\bullet/S^\sharp_\bullet} - \delta_{Y^\sharp_\bullet/T^\sharp_\bullet} \circ f],$$

where $\mathcal{F}_\bullet \in D(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$, $\delta_{X^\sharp_\bullet/S^\sharp_\bullet}$, $\delta_{Y^\sharp_\bullet/T^\sharp_\bullet}$ are respectively the rank (as a locally constant function on X or Y respectively) of the locally free modules $\Omega_{X^\sharp_\bullet/S^\sharp_\bullet}$ and $\Omega_{Y^\sharp_\bullet/T^\sharp_\bullet}$.

(b) The (right version of the) extraordinary inverse image functor of level m by $\widetilde{f}$ is the functor $\widetilde{f}_\bullet^{(m)!}\colon D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}) \to D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ which is defined by setting

$$\widetilde{f}_\bullet^{(m)!}(\mathcal{M}_\bullet) := f_\bullet^{-1}\mathcal{M}_\bullet \otimes^{\mathbb{L}}_{f_\bullet^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}\ [\delta_{X^\sharp_\bullet/S^\sharp_\bullet} - \delta_{Y^\sharp_\bullet/T^\sharp_\bullet} \circ f],$$

where $\mathcal{M}_\bullet \in D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$.

(c) For any $* \in \{r, l\}$, the extraordinary inverse image functor $\widetilde{f}^{(m)!}\colon D({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \to D({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ of level m by $\widetilde{f}$ is defined by setting

$$\widetilde{f}^{(m)!}(\mathcal{F}) := \mathbb{R}\underleftarrow{l}_{X*} \circ \widetilde{f}_\bullet^{(m)!} \circ \mathbb{L}\underleftarrow{l}^*_Y(\mathcal{F}) \tag{7.5.5.6.1}$$

where $\mathcal{F} \in D({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$. Since the functor $\widetilde{f}^{(m)!}$ preserves isogenies, then we get with notation 7.4.2.1.(b) the extraordinary inverse image functor $\widetilde{f}^{(m)!}\colon D_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \to D_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

We set $\mathbb{L}\widetilde{f}_\bullet^{(m)*} := \widetilde{f}_\bullet^{(m)!}[-\delta_{X^\sharp_\bullet/S^\sharp_\bullet} + \delta_{Y^\sharp_\bullet/T^\sharp_\bullet} \circ f]$ and $\mathbb{L}\widetilde{f}^{(m)*}(\mathcal{F}) := \mathbb{R}\underleftarrow{l}_{X*} \circ \widetilde{f}_\bullet^{(m)*} \circ \mathbb{L}\underleftarrow{l}^*_Y(\mathcal{F})$. The functor $\mathbb{L}\widetilde{f}_\bullet^{(m)*}$ is isomorphic in $D(\mathcal{B}_{\mathfrak{X}})$ to the functor $\mathbb{L}\widetilde{f}_\bullet^{*}$ of 7.5.5.2.1. When complexes are coherent, the functor $\mathbb{L}\widetilde{f}^{(m)*}$ is a left derived functor of some functor $\widetilde{f}_\bullet^{*}$ (more precisely, see 7.5.5.13.(c) below). Beware that this is not a priori the case in general and the notation is a bit misleading. The functor $\mathbb{L}\widetilde{f}^{(m)*}$ is a p-adically separated complete of the functor $\mathbb{L}\widetilde{f}^{*}_{\mathrm{alg}}$ of 7.5.5.2.1, which explain why we have distinguished them with the index alg.

7.5.5.7 (Left to right)**.** For any $\mathcal{M}_\bullet \in D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$, by copying the proof of 5.1.1.5.1 (replace the use of 5.1.1.2.1 by that of 7.5.5.4.1), we get the canonical isomorphism:

$$\widetilde{f}_\bullet^{(m)!}(\mathcal{M}_\bullet \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}) \xrightarrow{\sim} \widetilde{f}_\bullet^{(m)!}(\mathcal{M}_\bullet) \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\omega}^{-1}_{X^\sharp_\bullet/S^\sharp_\bullet}. \tag{7.5.5.7.1}$$

For any $\mathcal{E}_\bullet \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$, this yields the isomorphism

$$\widetilde{f}_\bullet^{(m)!}(\mathcal{E}_\bullet \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet}) \xrightarrow{\sim} \widetilde{f}_\bullet^{(m)!}(\mathcal{E}_\bullet) \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}. \tag{7.5.5.7.2}$$

Hence, for any $\mathcal{E} \in D^-({}^l\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$ we get the isomorphisms

$$\widetilde{f}^{(m)!}(\mathcal{E} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \underset{7.5.4.13.1}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{X*} \circ \widetilde{f}^{(m)!}_\bullet(\mathbb{L}\underleftarrow{l}^*_Y(\mathcal{E}) \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet}) \underset{7.5.5.7.2}{\xrightarrow{\sim}}$$
$$\mathbb{R}\underleftarrow{l}_{X*}(\widetilde{f}^{(m)!}_\bullet \circ \mathbb{L}\underleftarrow{l}^*_Y(\mathcal{E}) \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}) \underset{7.5.4.13.2}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{X*} \circ \widetilde{f}^{(m)!}_\bullet \circ \mathbb{L}\underleftarrow{l}^*_Y(\mathcal{E}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} = \widetilde{f}^{(m)!}(\mathcal{E}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{7.5.5.7.3}$$

This yields

$$\widetilde{f}^{(m)!}(\widetilde{\omega}^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \mathcal{M}) \xrightarrow{\sim} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{f}^{(m)!}(\mathcal{M}). \tag{7.5.5.7.4}$$

Proposition 7.5.5.8. *Let $* \in \{r, l\}$, $\star \in \{-, \mathrm{b}\}$. In the case where $\star = \mathrm{b}$, we suppose moreover $f^{-1}\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ has finite tor dimension. For any $\mathcal{F}_\bullet \in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$, we have $\widetilde{f}^{(m)!}_\bullet(\mathcal{F}_\bullet) \in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$. For any $\mathcal{F} \in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$, we have $\widetilde{f}^{(m)!}(\mathcal{F}) \in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. For any $\mathcal{F} \in D^\star_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$, we have $\widetilde{f}^{(m)!}(\mathcal{F}) \in D^\star_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.*

Proof. By using the equivalence of categories 7.5.4.3 and the isomorphism 7.5.5.7.2, we reduce to check that for any $\mathcal{F}_\bullet \in D^\star_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$, we have $\widetilde{f}^{(m)!}_\bullet(\mathcal{F}_\bullet) \in D^\star_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$. Since the canonical morphism

$$\mathcal{B}_{X_\bullet} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet}$$

is an isomorphism, then so is the canonical morphism

$$\mathbb{L}\widetilde{f}^*_\bullet(\mathcal{F}_\bullet) = \mathcal{B}_{X_\bullet} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}\mathcal{F}_\bullet \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f^{-1}\mathcal{F}_\bullet. \tag{7.5.5.8.1}$$

Since the functor $\mathbb{L}\widetilde{f}^*_\bullet$ induces $\mathbb{L}\widetilde{f}^*_\bullet \colon D^\star_{\mathrm{qc}}(\mathcal{B}_{Y_\bullet}) \to D^\star_{\mathrm{qc}}(\mathcal{B}_{X_\bullet})$ (see 7.5.5.2.3), then we are done. □

Lemma 7.5.5.9. *For any $\mathcal{E}_\bullet, \mathcal{F}_\bullet \in D^-({}^l\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$, we have the isomorphism of $D^-({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$:*

$$\mathbb{L}\widetilde{f}^{(m)!}_\bullet(\mathcal{E}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^{(m)!}_\bullet(\mathcal{F}) \xrightarrow{\sim} \mathbb{L}\widetilde{f}^{(m)!}_\bullet(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathcal{F})[d_f]. \tag{7.5.5.9.1}$$

For any $\mathcal{E}, \mathcal{F} \in D^-_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$, we have the isomorphism of $D^-_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\mathbb{L}\widetilde{f}^{(m)!}(\mathcal{E}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} \mathbb{L}\widetilde{f}^{(m)!}(\mathcal{F}) \xrightarrow{\sim} \mathbb{L}\widetilde{f}^{(m)!}(\mathcal{E} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{Y}}} \mathcal{F})[d_f]. \tag{7.5.5.9.2}$$

Proof. We check 7.5.5.9.1 similarly to 7.5.5.9.1. Modulo the equivalence of categories 7.3.2.10 this yields 7.5.5.9.2. □

Notation 7.5.5.10. We have a structure of $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$-bimodule on

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} := \underleftarrow{l}_{X*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet}.$$

We get a structure of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$-bimodule on

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \underleftarrow{l}_{X*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet} \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}.$$

By applying $\underleftarrow{l}_{X*}$ to 7.5.5.4.1 we get:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \otimes_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\widetilde{\omega}^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}. \tag{7.5.5.10.1}$$

Lemma 7.5.5.11. *Let $\mathcal{F} \in D^-_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$. With notation 7.5.5.6, the canonical morphism*

$$\mathcal{B}_{\mathfrak{X}} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\mathcal{F} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F} = \mathbb{L}\widetilde{f}^{(m)*}(\mathcal{F}) \tag{7.5.5.11.1}$$

is an isomorphism.

Proof. This follows from 7.5.5.8.1. □

We will need later this following elementary lemma.

Lemma 7.5.5.12. *Let $\mathcal{F}$ be a pseudo-quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$-module (see definition 7.2.3.5) which is $\mathcal{B}_{\mathfrak{Y}}$-flat.*

(a) For all $r \neq 0$, $H^r(\mathbb{L}\widetilde{f}^{(m)*}(\mathcal{F})) = 0$. Setting $\widetilde{f}^{(m)*}(\mathcal{F}) := H^0(\mathbb{L}\widetilde{f}^{(m)*}(\mathcal{F}))$, $\widetilde{f}^{(m)*}(\mathcal{F})$ is $\mathcal{B}_{\mathfrak{X}}$-flat.

(b) Suppose $\mathfrak{Y}$ and $\mathfrak{X}$ are affine. We have the canonical isomorphism

$$\Gamma(\mathfrak{X}, \widetilde{f}^{(m)*}(\mathcal{F})) \xrightarrow{\sim} \Gamma(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}})\widehat{\otimes}_{\Gamma(\mathfrak{Y},\mathcal{B}_{\mathfrak{Y}})}\Gamma(\mathfrak{Y}, \mathcal{F}). \tag{7.5.5.12.1}$$

The module $\Gamma(\mathfrak{X}, \widetilde{f}^{(m)*}(\mathcal{F}))$ is $\Gamma(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}})$-flat and p-adically separated complete.

(c) If $\mathcal{F}$ is of the form $(\mathcal{B}^{(J)}_{\mathfrak{Y}})^\wedge$, i.e., is isomorphic to the p-adic completion of a free $\mathcal{B}_{\mathfrak{Y}}$-module, then $\widetilde{f}^{(m)*}(\mathcal{F})$ is isomorphic to $(\mathcal{B}^{(J)}_{\mathfrak{X}})^\wedge$.

Proof. a) As $\mathcal{F}$ is an $\mathcal{B}_{\mathfrak{Y}}$-flat module then $\mathcal{F}_\bullet := \mathbb{L}\underleftarrow{l}^*_Y(\mathcal{F}) \xrightarrow{\sim} \mathcal{B}_{Y_\bullet} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \mathcal{F}$ is $\mathcal{B}_{Y_\bullet}$-flat. Hence $\mathbb{L}\widetilde{f}^*_\bullet \circ \mathbb{L}\underleftarrow{l}^*_Y(\mathcal{F}) \xrightarrow{\sim} \mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\mathcal{F}_\bullet$, which is an ML-flasque $\mathcal{B}_{X_\bullet}$-module and via Mittag-Leffler we obtain therefore the last isomorphism (see 7.3.1.3.(c)):

$$\mathbb{L}\widetilde{f}^{(m)*}(\mathcal{F}) \overset{7.5.5.11.1}{\xleftarrow{\sim}} \mathbb{R}\underleftarrow{l}_{X*}\mathbb{L}\widetilde{f}^*_\bullet \circ \mathbb{L}\underleftarrow{l}^*_Y(\mathcal{F}) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*}\left(\mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\mathcal{F}\right) \xrightarrow{\sim} \underleftarrow{l}_{X*}\left(\mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\mathcal{F}\right). \tag{7.5.5.12.2}$$

Since $\mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{Y_\bullet}} f^{-1}\mathcal{F}_\bullet$ is $\mathcal{B}_{X_\bullet}$-flat, then if follows from 7.3.1.20 that $\widetilde{f}^{(m)*}(\mathcal{F})$ is $\mathcal{B}_{\mathfrak{X}}$-flat.

b) Suppose $\mathfrak{X}$ and $\mathfrak{Y}$ are affine. Set $F := \Gamma(\mathfrak{Y}, \mathcal{F})$, $E := \Gamma(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}}) \otimes_{\Gamma(\mathfrak{Y},\mathcal{B}_{\mathfrak{Y}})} \Gamma(\mathfrak{Y}, \mathcal{F})$. Following 7.2.3.13.1, we have the isomorphism $\Gamma(Y_i, \mathcal{B}_{Y_i} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \mathcal{F}) \xrightarrow{\sim} F/\pi^{i+1}F$. Since the $\mathcal{B}_{Y_i}$-module $\mathcal{B}_{Y_i} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \mathcal{F}$ is quasi-coherent, then this yields the canonical isomorphism $E/\pi^{i+1}E \xrightarrow{\sim} \Gamma(\mathfrak{X}, f_i^*(\mathcal{B}_{Y_i} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \mathcal{F}))$. By applying the functor $\Gamma(\mathfrak{X}, -)$ (which commutes to projective limits) to the isomorphism 7.5.5.12.2, we get the isomorphism 7.5.5.12.1. By using 7.2.1.4, it follows from 7.5.5.12.1 that $\Gamma(\mathfrak{X}, \widetilde{f}^{(m)*}(\mathcal{F}))$ is $\Gamma(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}})$-flat and p-adically separated complete.

c) If $\mathcal{F}$ is of the form $(\mathcal{B}^{(J)}_{\mathfrak{Y}})^\wedge$, then $\mathcal{B}_{X_\bullet} \otimes_{f^{-1}\mathcal{B}_{\mathfrak{Y}}} f^{-1}\mathcal{F} \xrightarrow{\sim} \mathcal{B}^{(J)}_{X_\bullet}$. Via 7.5.5.12.2, we are done. □

Proposition 7.5.5.13. *Set $d_{(f,\phi)} := \delta_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} - \delta_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \circ f$, where $\delta_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, $\delta_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$ are respectively the rank (as a locally constant function on X' or X respectively) of the locally free modules $\Omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\Omega_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$. By abuse of notation, we can simply write d_f. We have the following properties.*

(a) For any $\mathcal{F} \in D({}^l\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$, we have the canonical morphism

$$\widetilde{f}^{(m)!}(\mathcal{F})_{\mathrm{alg}} := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F}\,[d_f] \to \widetilde{f}^{(m)!}(\mathcal{F}). \tag{7.5.5.13.1}$$

(b) For any $\mathcal{F} \in D({}^r\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$, we have the canonical morphism

$$\widetilde{f}^{(m)!}(\mathcal{F})_{\mathrm{alg}} := f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\,[d_f] \to \widetilde{f}^{(m)!}(\mathcal{F}). \tag{7.5.5.13.2}$$

(c) For any $* \in \{r, l\}$, if $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$, then the morphism 7.5.5.13.1 or 7.5.5.13.2 is an isomorphism.

Proof. Let us construct 7.5.5.13.1. Denoting by $\mathcal{G}$ the left term of 7.5.5.13.1, we have the adjoint morphism $\mathcal{G} \to \mathbb{R}\underleftarrow{l}_{X*} \circ \mathbb{L}\underleftarrow{l}^*_X(\mathcal{G})$. Since $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{G})$ is isomorphic to $\widetilde{f}^{(m)!}_\bullet(\mathbb{L}\underleftarrow{l}^*_Y\mathcal{F})$, we are done. Similarly, we construct 7.5.5.13.2. Finally, to check the last statement, we reduce to the case where $\mathcal{F} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$, which is obvious. □

Definition 7.5.5.14. We keep notation 7.5.5.10.

(a) The (left version of the) extraordinary inverse image functor of level m by $\widetilde{f}$ is the functor of the form $\widetilde{f}^{(m)!}\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ which is defined for any $\mathcal{F} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ by setting

$$\widetilde{f}^{(m)!}(\mathcal{F}) := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}} f^{-1}(\mathcal{F})\,[d_f]. \tag{7.5.5.14.1}$$

(b) The (right version of the) extraordinary inverse image functor of level m by $\widetilde{f}$ is the functor of the form $\widetilde{f}^{(m)!}\colon D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ which is defined for any $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ by setting

$$\widetilde{f}^{(m)!}(\mathcal{M}) := f^{-1}(\mathcal{M}) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}\,[d_f]. \tag{7.5.5.14.2}$$

Remark 7.5.5.15. The functors of 7.5.5.14 might have been written $\widetilde{f}^{(m)!}_{\mathrm{alg}}$ similarly to 7.5.5.13, but since no confusion is possible over categories of the form $D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ then the indication alg is useless and we have removed it.

Proposition 7.5.5.16. *We have the following properties. Let* $* \in \{r, l\}$.

(a) With notation 7.4.6.5, we have the canonical morphism of functors $D_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ *of the form*

$$\widetilde{f}^{(m)!} \circ (\mathbb{Q} \otimes -) \to (\mathbb{Q} \otimes -) \circ \widetilde{f}^{(m)!}. \tag{7.5.5.16.1}$$

(b) For any $* \in \{r, l\}$*, the restriction to* $D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$ *of the morphism 7.5.5.16.1 is an isomorphism.*

Proof. This easily follows from 7.5.5.13. □

Remark 7.5.5.17. Suppose $\mathfrak{X}$ is noetherian of finite Krull dimension. Let $* \in \{r, l\}$ and $(\mathbb{Q}\otimes -)^{-1}\colon D^{\mathrm{b}}_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$ be a quasi-inverse functor of the natural equivalence of categories 7.4.6.6. Then the functor $(\mathbb{Q} \otimes -) \circ \widetilde{f}^{(m)!} \circ (\mathbb{Q} \otimes -)^{-1}\colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}) \to D^{\mathrm{b}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ is isomorphic to the functor $\widetilde{f}^{(m)!}$.

Proposition 7.5.5.18. *Let* $* \in \{\mathrm{r}, \mathrm{l}\}$*. Suppose one of the following conditions holds:*

(i) either $m = 0$,

(ii) or log-structures are trivial.

Then, we have the factorizations $\widetilde{f}^{(m)!}_{\bullet}\colon D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}) \to D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ *and* $\widetilde{f}^{(m)!}\colon D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \to D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

Proof. This is a consequence of 7.3.2.15 (and 7.1.3.6) and 5.3.2.6 (and the fact that the tor amplitude does not depend on i). □

7.5.5.19. It follows from 7.1.3.6.1 that we have the isomorphism for any $\mathcal{F}_\bullet \in D^\star({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$:

$$\left(\widetilde{f}^{(m)!}_{\bullet}(\mathcal{F}_\bullet)\right)_i \xrightarrow{\sim} \widetilde{f}^{(m)!}_i(\mathcal{F}_i). \tag{7.5.5.19.1}$$

By using the equivalences of categories 7.3.3.3, it follows from 7.5.5.8 that for any $\mathcal{F} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$, $\mathbb{L}\underleftarrow{l}^*_X \widetilde{f}^{(m)!}(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^{(m)!}_{\bullet}(\mathbb{L}\underleftarrow{l}^*_Y \mathcal{F})$. Since $(\mathbb{L}\underleftarrow{l}^*_Y \mathcal{F})_i \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/S^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}$ and since $\left(\mathbb{L}\underleftarrow{l}^*_X \widetilde{f}^{(m)!}(\mathcal{F})\right)_i \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{f}^{(m)!}(\mathcal{F})$, this yields

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{f}^{(m)!}(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^{(m)!}_i(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/S^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}), \tag{7.5.5.19.2}$$

and similarly for right modules.

7.5.5.20. To check that the extraordinary inverse image behaves well with respect to the composition, let

$$\begin{array}{ccc} \mathfrak{Y}^\sharp & \xrightarrow{g} & \mathfrak{Z}^\sharp \\ \downarrow & & \downarrow \\ \mathfrak{T}^\sharp & \longrightarrow & \mathfrak{U}^\sharp, \end{array} \tag{7.5.5.20.1}$$

be a commutative diagram where $\mathfrak{U}^\sharp$ is a nice fine $\mathcal{V}$-log formal scheme, where $\mathfrak{Z}^\sharp$ is a log smooth $\mathfrak{U}^\sharp$-log formal scheme. Moreover, let $\mathcal{B}_{\mathfrak{Z}}$ be an $\mathcal{O}_{\mathfrak{Z}}$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m}_{\mathfrak{Z}^\sharp/\mathfrak{U}^\sharp}$-module satisfying the hypotheses of 7.3.2 and with a morphism of algebras $g^*\mathcal{B}_{\mathfrak{Z}} \to \mathcal{B}_{\mathfrak{Y}}$ which is moreover $\mathcal{D}^{(m}_{\mathfrak{Z}^\sharp/\mathfrak{U}^\sharp}$-linear. We denote by $\widetilde{\mathfrak{Z}}^\sharp$ the ringed $\mathcal{V}$-log formal scheme $(\mathfrak{Z}^\sharp, \mathcal{B}_{\mathfrak{Z}})$, and by $\tilde{g}\colon \widetilde{\mathfrak{Y}}^\sharp/\mathfrak{T}^\sharp \to \widetilde{\mathfrak{Z}}^\sharp/\mathfrak{U}^\sharp$ the morphism of relative ringed $\mathcal{V}$-log formal schemes induced by the diagram 7.5.5.20.1 and by $g^*\mathcal{B}_{\mathfrak{Z}} \to \mathcal{B}_{\mathfrak{Y}}$. We suppose $\tilde{g}$ is a strongly quasi-flat morphism of relative ringed $\mathcal{V}$-log formal schemes.

Lemma 7.5.5.21. *We keep notation 7.5.5.20.*

(a) We have the canonical isomorphism of $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}, (g\circ f)^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet})$:

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes^{\mathbb{L}}_{f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \to Z^\sharp_\bullet/U^\sharp_\bullet} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Z^\sharp_\bullet/U^\sharp_\bullet}. \tag{7.5.5.21.1}$$

(b) We have the canonical isomorphism of $D((g\circ f)^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$:

$$f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet \leftarrow Y^\sharp_\bullet/T^\sharp_\bullet} \otimes^{\mathbb{L}}_{f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}. \tag{7.5.5.21.2}$$

Proof. By quasi-flatness of $\widetilde{f}$, it follows from 5.1.1.3 that the morphisms are well defined. a) Let us check 7.5.5.21.1. i) We have the isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \to Z^\sharp_\bullet/U^\sharp_\bullet} \xrightarrow{\sim} \widetilde{f}^*_\bullet \widetilde{g}^*_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \xrightarrow{\sim} (\widetilde{g}\circ \widetilde{f})^*_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet}$. Hence, it follows from 4.4.5.6 that we get the canonical isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \to Z^\sharp_\bullet/U^\sharp_\bullet} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Z^\sharp_\bullet/U^\sharp_\bullet}.$$

We obtain by functoriality the fact that this isomorphism is an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}, (g\circ f)^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet})$-bimodules.

ii) Moreover, since $\widetilde{g}^*_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet}$ is $\mathcal{B}_{Y_\bullet}$-flat then $\mathbb{L}\widetilde{f}^*_\bullet\left(\widetilde{g}^*_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet}\right) \xrightarrow{\sim} \widetilde{f}^*_\bullet\left(\widetilde{g}^*_\bullet \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet}\right)$. Hence, it follows from 7.5.5.8.1 the isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes^{\mathbb{L}}_{f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \to Z^\sharp_\bullet/U^\sharp_\bullet} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f^{-1}_\bullet \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \to Z^\sharp_\bullet/U^\sharp_\bullet}.$$

b) Finally, we get the isomorphism 7.5.5.21.2 from 7.5.5.21.1 by twisting (use 7.5.5.4.1 and 4.3.5.6.1). □

Proposition 7.5.5.22. *With notation 7.5.5.20, let* $* \in \{r, l\}$.

(a) For any $\mathcal{G}_\bullet \in D({}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet})$*, we have the canonical isomorphism*

$$\widetilde{f}^{(m)!}_\bullet \circ \widetilde{g}^{(m)!}_\bullet(\mathcal{G}_\bullet) \xrightarrow{\sim} (\widetilde{g\circ f})^{(m)!}_\bullet(\mathcal{G}_\bullet). \tag{7.5.5.22.1}$$

(b) Let $\star \in \{-, \mathrm{b}\}$*. In the case where* $\star = \mathrm{b}$*, we suppose moreover* $f^{-1}\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ *and* $g^{-1}\mathcal{B}_{\mathfrak{Z}} \to \mathcal{B}_{\mathfrak{Y}}$ *have finite tor dimension. For any* $\mathcal{G} \in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{U}^\sharp})$*, we have the canonical isomorphism*

$$\widetilde{f}^{(m)!} \circ \widetilde{g}^{(m)!}(\mathcal{G}) \xrightarrow{\sim} (\widetilde{g\circ f})^{(m)!}(\mathcal{G}). \tag{7.5.5.22.2}$$

Proof. By using the equivalence of categories 7.5.4.3, we reduce to check the isomorphism 7.5.5.22.1. This latter one can be checked similarly to 5.1.1.13 by using 7.5.5.21. ☐

7.5.5.23 (Non-lifted case notation)**.** To highlight the "crystalline nature" of the operations such as $f^!$ and f_+, we can extend the context of 7.5.5 to the non-lifted case as follows. Let $m \in \mathbb{N}$. Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0, p)$ with maximal ideal $\mathfrak{m}$. Let

$$\begin{array}{ccccc} X_0^\sharp & \longrightarrow & \mathfrak{X}^\sharp & \xrightarrow{p_{\mathfrak{X}^\sharp}} & \mathfrak{S}^\sharp \\ \downarrow{\scriptstyle f_0} & & & & \downarrow{\scriptstyle \phi} \\ Y_0^\sharp & \longrightarrow & \mathfrak{Y}^\sharp & \xrightarrow{p_{\mathfrak{Y}^\sharp}} & \mathfrak{T}^\sharp, \end{array} \tag{7.5.5.23.1}$$

be a commutative diagram where $\mathfrak{S}^\sharp$ and $\mathfrak{T}^\sharp$ are nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10, where $\mathfrak{X}^\sharp$ is a log smooth $\mathfrak{S}^\sharp$-log-formal scheme and $\mathfrak{Y}^\sharp$ is a log smooth $\mathfrak{T}^\sharp$-log formal scheme. Let $\mathcal{B}_{\mathfrak{X}}$ (resp. $\mathcal{B}_{\mathfrak{Y}}$) be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra (resp. $\mathcal{O}_{\mathfrak{Y}}$-algebra) endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. left $\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$-module) and satisfying the hypotheses of 7.3.2. We suppose that we have a morphism of algebras $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ which is moreover $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. We denote by $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} := \mathcal{B}_{\mathfrak{Y}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}} \mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$. Following 4.4.5.11, we have the $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}, f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$-bimodule by setting

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} := \widetilde{f}_0^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}. \tag{7.5.5.23.2}$$

By p-adic completion we get a $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$-bimodule by setting

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} := \underleftarrow{l}_{X*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet}. \tag{7.5.5.23.3}$$

According to 5.1.1.17.2, we get a structure of $(f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$-bimodule on

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet} := \widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{f}_{0r}^{*}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}\right), \tag{7.5.5.23.4}$$

where the index "r" means that we have chosen the right (i.e. the twisted) structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$ on $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{\omega}^{-1}_{Y^\sharp_\bullet/T^\sharp_\bullet}$ to compute structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ via the functor $\widetilde{f}_0^{*}$. This yields the $(f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$-bimodule by setting

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \underleftarrow{l}_{X*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}, \tag{7.5.5.23.5}$$

For any $* \in \{\mathrm{l}, \mathrm{r}\}$, via these above bimodules we can define the pullback $\widetilde{f}_0^{(m)!} \colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ as in 7.5.5.6. The properties of the subsection extends to this context.

7.5.6 Base change

We keep notation 7.5.5. Suppose the diagram 7.5.5.0.1 is cartesian and the morphism $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ is an isomorphism.

In that case, we say that $\tilde{f}^*$ is the base change by $\phi \colon \mathfrak{S}^\sharp \to \mathfrak{T}^\sharp$.

Proposition 7.5.6.1. *We have the following properties.*

(a) The canonical morphism

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}. \tag{7.5.6.1.1}$$

is an isomorphism.

(b) The composite map

$$\rho_{\widetilde{f}} \colon f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{7.5.6.1.2}$$

is a homomorphism of sheaves of rings which fits into the commutative diagram

$$\begin{array}{ccc} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} & \xrightarrow{7.5.6.1.2} & \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \\ \uparrow & & \uparrow \\ f^{-1}\mathcal{B}_{\mathfrak{Y}} & \longrightarrow & \mathcal{B}_{\mathfrak{X}}. \end{array} \qquad (7.5.6.1.3)$$

The canonical morphism of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$*-modules 7.5.6.1.1 is in fact an isomorphism of* $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$*-bimodules, where the structure of right* $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$*-module on* $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ *is given via 7.5.6.1.2.*

Proof. This follows by completion of 4.4.4.1. □

Lemma 7.5.6.2. *The canonical homomorphism of* $\mathcal{B}_{\mathfrak{X}}$*-modules:*

$$\widetilde{f}^*(\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \to \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \qquad (7.5.6.2.1)$$

is an isomorphism. Let us denote by $\rho^{\omega}_{\widetilde{f}}\colon f^{-1}(\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \to \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ *the canonical homomorphism. With 7.5.6.1.2, this yields the map*

$$f^{-1}\left(\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}\right) \to \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \qquad (7.5.6.2.2)$$

given by $\omega \otimes P \mapsto \rho^{\omega}_{\widetilde{f}}(\omega) \otimes \rho_{\widetilde{f}}(P)$*. The map 7.5.6.2.2 is a homomorphism of right* $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$*-bimodules, where the right structure (resp. the left structure i.e. the twisted one) of right* $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$*-module of* $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ *comes from its right structure (resp. left structure) of right* $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$*-module via the ring homomorphism 7.5.6.1.2.*

Proof. The lemma follows by p-adic completion from 4.4.4.2. □

7.5.6.3. By p-adic completion, we get from 4.2.5.5.1 the transposition isomorphism

$$\delta\colon \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \qquad (7.5.6.3.1)$$

exchanging the two structures of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules and such that, for each section x of $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, $\delta_{\mathcal{M}}(x \otimes 1) = x \otimes 1$. It follows by p-adic completion of 4.4.4.3.1 that we get the commutative diagram:

$$\begin{array}{ccc} f^{-1}\left(\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}\right) & \xrightarrow{7.5.6.2.2} & \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \\ \downarrow{\scriptstyle 7.5.6.3.1} & & \downarrow{\scriptstyle 7.5.6.3.1} \\ f^{-1}\left(\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}\right) & \xrightarrow{7.5.6.2.2} & \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \end{array} \qquad (7.5.6.3.2)$$

where the vertical maps are the transposition isomorphisms, is commutative. This yields the isomorphism of right $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$-bimodules

$$f^{-1}\left(\widetilde{\omega}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}\right)_l \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \qquad (7.5.6.3.3)$$

where the index l means that in the tensor product we use the left structure of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module, where the structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module) of $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is its left structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. comes from its structure of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module via the ring homomorphism $\rho_{\widetilde{f}}$ of 7.5.6.1.2).

7.5.6.4. Let $\mathcal{F} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$. By p-adic completion of 4.4.4.1.4, we get the canonical isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F} \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{F}), \tag{7.5.6.4.1}$$

where $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ the ring homomorphism of 7.5.6.1.2. Remark that if $p^{-1}_{X^\sharp_\bullet}\mathcal{O}_{S_\bullet}$ and $f^{-1}\mathcal{B}_{Y_\bullet}$ are tor independent over $f^{-1}p^{-1}_{Y^\sharp_\bullet}\mathcal{O}_{T_\bullet}$, then by p-adic completion of 5.1.1.15.3 we get the canonical morphism

$$p^{-1}_{\mathfrak{X}^\sharp}\mathcal{O}_{\mathfrak{S}}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}p^{-1}_{\mathfrak{Y}^\sharp}\mathcal{O}_{\mathfrak{T}}} f^{-1}\mathcal{F} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F} \tag{7.5.6.4.2}$$

is an isomorphism. By abuse of notation, under this flatness condition we can simply denote by $\mathcal{O}_{\mathfrak{S}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}}\mathcal{F} := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F}$.

Let $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$. It follows by p-adic completion from 5.1.1.15.4 that we have the canonical isomorphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$f^{-1}\mathcal{M}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{M}). \tag{7.5.6.4.3}$$

By functoriality, this implies that we have the canonical isomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$-bimodules of the form $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp\leftarrow\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. The isomorphism 7.5.5.7.4 applied in the case where $\mathcal{M} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$ gives the second isomorphism:

$$\begin{aligned}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{Y}}}\widetilde{\omega}^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})_{\mathrm{r}} &\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{Y}}}\widetilde{\omega}^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})_{\mathrm{r}}\\ \xrightarrow{\sim}\left(f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\right)\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} &\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\end{aligned} \tag{7.5.6.4.4}$$

where the index r means that we take the right structure of left $\mathcal{D}$-module.

As for the left case, when if $p^{-1}_{X^\sharp_\bullet}\mathcal{O}_{S_\bullet}$ and $f^{-1}\mathcal{B}_{Y_\bullet}$ are tor independent over $f^{-1}p^{-1}_{Y^\sharp_\bullet}\mathcal{O}_{T_\bullet}$, the canonical morphism

$$f^{-1}\mathcal{M}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}p^{-1}_{\mathfrak{Y}^\sharp}\mathcal{O}_{\mathfrak{T}}}p^{-1}_{\mathfrak{X}^\sharp}\mathcal{O}_{\mathfrak{T}} \to f^{-1}\mathcal{M}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$$

is an isomorphism and we can simply set in this case $\mathcal{O}_{\mathfrak{S}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}}\mathcal{M} := f^{-1}\mathcal{M}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

7.5.6.5 (Preservation of the coherence)**.** Let $\mathcal{F} \in D^-_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$. The canonical morphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F} \tag{7.5.6.5.1}$$

is an isomorphism. Hence, with 7.5.6.5.2 we get the isomorphism of $D^-_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}\mathcal{F} \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{F}). \tag{7.5.6.5.2}$$

Let $\mathcal{M} \in D^-_{\mathrm{coh}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$. We have the isomorphisms of $D^-_{\mathrm{coh}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$f^{-1}\mathcal{M}\otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} f^{-1}\mathcal{M}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \underset{7.5.6.4.3}{\xrightarrow{\sim}} \widetilde{f}^{(m)!}(\mathcal{M}). \tag{7.5.6.5.3}$$

By functoriality, this implies that we have the canonical isomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$-bimodules of the form $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp\leftarrow\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. The isomorphism 7.5.5.7.4 applied in the case where $\mathcal{M} =$

$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$ gives the second isomorphism:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \widetilde{\omega}^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})_{\mathrm{r}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Y}}} \widetilde{\omega}^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})_{\mathrm{r}}$$

$$\xrightarrow{\sim} \left(f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}) \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \right) \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \tag{7.5.6.5.4}$$

where the index r means that we take the right structure of left $\mathcal{D}$-module.

7.5.6.6 (Preservation of the coherence)**.** Let $\mathcal{G} \in D^-_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$. Tensoring with $\mathbb{Q}$ the results of the proposition 7.5.6.1, we can check we have the canonical isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}} f^{-1}\mathcal{G} \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{G}), \tag{7.5.6.6.1}$$

where the right term is defined at 7.5.5.14.

Let $\mathcal{M} \in D^-_{\mathrm{coh}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$. We have the isomorphisms of $D^-_{\mathrm{coh}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$:

$$f^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{M}). \tag{7.5.6.6.2}$$

Remark 7.5.6.7. We can split the diagram 5.1.1.1.1 as follows

$$\begin{array}{ccccc}
\mathfrak{X}^\sharp & \xrightarrow{g} & \mathfrak{Z}^\sharp & \xrightarrow{h} & \mathfrak{Y}^\sharp \\
\downarrow{\scriptstyle p_{\mathfrak{X}^\sharp}} & & \downarrow{\scriptstyle p_{\mathfrak{Z}^\sharp}} \ \square & & \downarrow{\scriptstyle p_{\mathfrak{Y}^\sharp}} \\
\mathfrak{S}^\sharp & = & \mathfrak{S}^\sharp & \longrightarrow & \mathfrak{T}^\sharp,
\end{array} \tag{7.5.6.7.1}$$

where the right square is cartesian. Let $\mathcal{B}_{\mathfrak{Z}} := h^*\mathcal{B}_{\mathfrak{Y}}$, $\widetilde{\mathfrak{Z}}^\sharp$ be the ringed logarithmic $\mathcal{V}$-formal scheme $(\mathfrak{Z}^\sharp, \mathcal{B}_{\mathfrak{Z}})$, and $\widetilde{h}\colon \widetilde{\mathfrak{Z}}^\sharp/\mathfrak{T}^\sharp \to \widetilde{\mathfrak{Y}}^\sharp/\mathfrak{T}^\sharp$ be the morphism of relative ringed logarithmic $\mathcal{V}$-formal schemes induced by the cartesian square of the diagram 7.5.6.7.1 and by $\mathcal{B}_{\mathfrak{Z}} = h^*\mathcal{B}_{\mathfrak{Y}}$. Hence, since $\widetilde{g}^{(m)!} \circ \widetilde{h}^{(m)!} \xrightarrow{\sim} \widetilde{f}^{(m)!}$ over quasi-coherent complexes, then to study the extraordinary pullback functor (for instance) over quasi-coherent complexes, we reduce to the case of the base change or to the case where $\phi = \mathrm{id}$.

7.5.7 Projection formula

We keep notation 7.5.5.

Proposition 7.5.7.1. Let $\mathcal{F}_\bullet \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$ and $\mathcal{G}_\bullet \in D({}^{\mathrm{l}}f_\bullet^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$.

(i) We have the canonical morphism in $D(\mathbb{Z}_{Y_\bullet})$:

$$\mathcal{F}_\bullet \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} \mathbb{R}f_{\bullet *}(\mathcal{G}_\bullet) \to \mathbb{R}f_{\bullet *}\left(f_\bullet^{-1}\mathcal{F}_\bullet \otimes^{\mathbb{L}}_{f_\bullet^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} \mathcal{G}_\bullet \right). \tag{7.5.7.1.1}$$

Let $\mathcal{D}_\bullet$ be a sheaf of rings on $Y_\bullet$ such that $(\mathcal{D}_\bullet, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$ is solvable by $\mathcal{R}_\bullet$ and $\mathcal{F}_\bullet \in D(\mathcal{D}_\bullet, \mathcal{R}_\bullet, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$ (see definition and notation 4.6.3.2). Then the morphism 7.5.7.1.1 can also be viewed as a morphism of $D(\mathcal{D}_\bullet)$.

(ii) Suppose f is quasi-compact and quasi-separated. Suppose moreover for any $i \in \mathbb{Z}$ one of the following conditions hold:

(a) either $\mathcal{F}_i \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$, and $\mathcal{G}_i \in D({}^{\mathrm{l}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$,

(b) or T_i is a noetherian scheme of finite Krull dimension, and $\mathcal{F}_i \in D^-_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$, and $\mathcal{G}_i \in D^-({}^{\mathrm{l}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$.

Then the morphism 7.5.7.1.1 is an isomorphism.

Proof. We construct 7.5.7.1.1 as 5.1.2.5.1. The second statement is a consequence of 5.1.2.5.1. □

Remark 7.5.7.2. Inverting r and l, we get the morphism

$$\mathbb{R}f_{\bullet *}(\mathcal{G}_\bullet) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} \mathcal{F}_\bullet \to \mathbb{R}f_{\bullet *}\left(\mathcal{G}_\bullet \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}} f^{-1}\mathcal{F}_\bullet\right), \tag{7.5.7.2.1}$$

which is an isomorphism when we invert the corresponding hypotheses.

Corollary 7.5.7.3. *Let* $*, ** \in \{\mathrm{l}, \mathrm{r}\}$ *such that both are not equal to* r. *Suppose* f *is quasi-compact and quasi-separated.*

(a) either $\mathcal{F}_i \in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$*, and* $\mathcal{G}_i \in D({}^{**}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$*,*

(b) or T_i *is a noetherian scheme of finite Krull dimension, and* $\mathcal{F}_i \in D^{-}_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$*, and* $\mathcal{G}_i \in D^{-}({}^{**}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$*.*

Then we have the following isomorphism of $D^{-}({}^{**}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i})$*:*

$$\mathcal{F}_\bullet \otimes^{\mathbb{L}}_{\mathcal{B}_{Y_\bullet}} \mathbb{R}f_{\bullet *}(\mathcal{G}_\bullet) \xrightarrow{\sim} \mathbb{R}f_{\bullet *}\left(f^{-1}\mathcal{F}_\bullet \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_{Y_\bullet}} \mathcal{G}_\bullet\right). \tag{7.5.7.3.1}$$

Proof. As 5.1.2.8, this is a consequence of 7.5.7.1. □

7.5.8 Direct image

We keep notation 7.5.5. Assume that S and T are noetherian scheme sof finite Krull dimension, f is quasi-compact and quasi-separated.

Definition 7.5.8.1. We keep notation 7.5.5.4.

(a) The (left version of the) direct image functor of level m by $\widetilde{f}_\bullet$ is the functor $\widetilde{f}^{(m)}_{\bullet +} \colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$ which is defined by setting

$$\widetilde{f}^{(m)}_{\bullet +}(\mathcal{E}_\bullet) := \mathbb{R}f_{\bullet *}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \mathcal{E}_\bullet\right),$$

where $\mathcal{E}_\bullet \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$.

(b) The (right version of the) direct image functor of level m by $\widetilde{f}_\bullet$ is the functor $\widetilde{f}^{(m)}_{\bullet +} \colon D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \to D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$ which is defined by setting

$$\widetilde{f}^{(m)}_{\bullet +}(\mathcal{M}_\bullet) := \mathbb{R}f_{\bullet *}\left(\mathcal{M}_\bullet \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet}\right),$$

where $\mathcal{M}_\bullet \in D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$.

(c) For any $* \in \{r, l\}$, the direct image functor of level m by $\widetilde{f}$ of the form $\widetilde{f}^{(m)}_{+} \colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$ is defined by setting

$$\widetilde{f}^{(m)}_{+}(\mathcal{E}) := \mathbb{R}\underset{\leftarrow}{l}_{Y*}(\widetilde{f}^{(m)}_{\bullet +}(\mathbb{L}\underset{\leftarrow}{l}^*_X\mathcal{E}))$$

where $\mathcal{E} \in D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Since this functor preserves the isogenies, this yields the functor $\widetilde{f}^{(m)}_{+} \colon D_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$.

If there is no ambiguity with the level, we might simply write $\widetilde{f}_{\bullet +}$ and $\widetilde{f}_{+}$.

Proposition 7.5.8.2. *We have the following properties.*

(a) For any $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, we have the canonical morphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$:

$$\mathbb{R}f_* \left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \right) \to \widetilde{f}^{(m)}_{+}(\mathcal{M}). \tag{7.5.8.2.1}$$

(b) For any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, we have the canonical morphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$

$$\mathbb{R}f_* \left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E} \right) \to \widetilde{f}^{(m)}_{+}(\mathcal{E}). \tag{7.5.8.2.2}$$

(c) For any $* \in \{r, l\}$, if $\mathcal{F} \in D^{-}_{\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, then the morphism 7.5.8.2.1 or respectively 7.5.8.2.2 is an isomorphism of $D({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$.

Proof. Let us construct the morphism 7.5.8.2.1. By adjointness, we get the first morphism:

$$\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \overset{7.3.4.9.3}{\longrightarrow} \mathbb{R}\underleftarrow{l}_{X*} \left(\mathbb{L}\underleftarrow{l}^*_{X}(\mathcal{M}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet} \right) \tag{7.5.8.2.3}$$

It follows from 7.1.3.15.3 that we have the canonical isomorphism $\mathbb{R}f_* \circ \mathbb{R}\underleftarrow{l}_{X*} \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{Y*} \circ \mathbb{R}f_{\bullet *}$. Hence, by applying the functor $\mathbb{R}f_*$ to 7.5.8.2.3, we get 7.5.8.2.1 up to canonical isomorphism.

Similarly, we construct 7.5.8.2.2. Finally, to check the last statement, follows from the fact that 7.5.8.2.3 becomes an isomorphism (see again 7.3.4.9.3). □

Definition 7.5.8.3. We keep notation 7.5.5.10.

(a) The (left version of the) direct image functor of level m by $\widetilde{f}$ of the form $\widetilde{f}^{(m)}_{+} \colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ which is defined by setting for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$

$$\widetilde{f}^{(m)}_{+}(\mathcal{E}) := \mathbb{R}f_* \left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} (\mathcal{E}) \right). \tag{7.5.8.3.1}$$

(b) The (right version of the) direct image functor of level m by $\widetilde{f}$ of the form $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ which is defined by setting for any $\mathcal{M} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$

$$\widetilde{f}^{(m)}_{+}(\mathcal{M}) := \mathbb{R}f_* \left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}} \right). \tag{7.5.8.3.2}$$

Proposition 7.5.8.4. *We have the following properties.*

(a) With notation 7.4.6.5, we have the canonical morphism of functors $D_{\mathbb{Q}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ of the form

$$\widetilde{f}^{(m)}_{+} \circ (\mathbb{Q} \otimes -) \to (\mathbb{Q} \otimes -) \circ \widetilde{f}^{(m)}_{+}. \tag{7.5.8.4.1}$$

(b) For any $* \in \{r, l\}$, the restriction to $D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ of the morphism 7.5.8.4.1 is an isomorphism.

Proof. This easily follows from 7.5.8.2. □

Remark 7.5.8.5. Let $* \in \{r, l\}$ and $(\mathbb{Q} \otimes -)^{-1} \colon D^{\mathrm{b}}_{\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ be a quasi-inverse functor of the natural equivalence of categories 7.4.6.6. Then the functor $(\mathbb{Q} \otimes -) \circ \widetilde{f}^{(m)}_{+} \circ (\mathbb{Q} \otimes -)^{-1} \colon D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ is isomorphic to $\widetilde{f}^{(m)}_{+}$.

7.5.8.6. We have the following boundedness preservation results.

(a) Since T is a noetherian scheme of finite Krull dimension, then it follows from 5.1.2.4.i that we get the factorization $\widetilde{f}^{(m)}_{\bullet +}\colon D^{-}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \to D^{-}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$.

(b) Suppose either $m=0$ or log-structures are trivial. Then, by copying the proof of 5.3.2.4 (remark the estimate is geometrical and do not depend on i or m), we can check the right (resp. left) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet \to Y^\sharp_\bullet/T^\sharp_\bullet}$) has finite tor-dimension. Hence, we get the induced functor

$$\widetilde{f}^{(m)}_{\bullet +}\colon D^{\mathrm{b}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \to D^{\mathrm{b}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}). \tag{7.5.8.6.1}$$

Proposition 7.5.8.7. *Let $* \in \{r,l\}$, and $\star \in \{-, \mathrm{b}\}$ such that one of the following conditions holds:*

(i) either $\star = -$,

(ii) or $m=0$,

(iii) or log structures are trivial.

Then, we have the following properties.

(a) For any $\mathcal{E}_\bullet \in D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, $\widetilde{f}^{(m)}_{\bullet +}(\mathcal{E}_\bullet) \in D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$.

(b) For any $\mathcal{E} \in D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $\widetilde{f}^{(m)}_{+}(\mathcal{E}) \in D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$. For any $\mathcal{E} \in D^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $\widetilde{f}^{(m)}_{+}(\mathcal{E}) \in D^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$.

Proof. By using the equivalences of categories 7.5.4.3, we reduce to check (a). It follows from 7.5.8.6.1 that we reduce to check the case (i). By similarity, we can suppose $* = l$. It follows from 5.1.3.5 that $\widetilde{f}^{(m)}_{0+}(\mathcal{E}_0) \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_0/T^\sharp_0})$. It follows from 7.5.4.1 that we can apply 5.3.3.3, i.e. we have the base change isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_{i+1}/T^\sharp_{i+1}}} \widetilde{f}^{(m)}_{i+1+}(\mathcal{E}_{i+1}) \xrightarrow{\sim} \widetilde{f}^{(m)}_{i+}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_{i+1}/S^\sharp_{i+1}}} \mathcal{E}_{i+1}).$$

Hence, we are done. □

7.5.8.8. For any $* \in \{r,l\}$, for any $\mathcal{E}_\bullet \in D({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, it follows from 7.1.3.15.2 and 7.1.3.6.1 that we have

$$\left(\widetilde{f}^{(m)}_{\bullet +}(\mathcal{E}_\bullet)\right)_i \xrightarrow{\sim} \widetilde{f}^{(m)}_{i+}(\mathcal{E}_i). \tag{7.5.8.8.1}$$

By using the equivalence of categories 7.3.3.3, it follows from 7.5.8.7 that, for any $\mathcal{E} \in D^{-}_{\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, we get

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/T^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m)}_{+}(\mathcal{E}) \xrightarrow{\sim} \widetilde{f}^{(m)}_{i+}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E}), \tag{7.5.8.8.2}$$

and similarly for right modules.

7.5.8.9. Suppose the bottom morphism ϕ of 7.5.5.0.1 is the identity and f is log-étale. Then, following 5.1.3.6, the canonical morphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet \to Y^\sharp_\bullet/S^\sharp_\bullet}$ is an isomorphism. Hence, $\widetilde{f}^{(m)}_{\bullet +}(\mathcal{M}_\bullet) \xrightarrow{\sim} \mathbb{R}f_{\bullet *}(\mathcal{M}_\bullet)$. Similarly, the canonical morphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$ is an isomorphism.

7.5.8.10. The functors of 7.5.8.1 are compatible with the quasi-inverse functors $-\otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp_\bullet/S^\sharp_\bullet}$ and $\widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} -$ exchanging left and right $\mathcal{D}^{(m)}_X$-module structures. More precisely, for any $\mathcal{E}_\bullet \in D({}^{1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ we have the canonical isomorphism

$$\widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet} \otimes_{\mathcal{B}_{Y_\bullet}} \widetilde{f}^{(m)}_{\bullet +}(\mathcal{E}_\bullet) \xrightarrow{\sim} \widetilde{f}^{(m)}_{\bullet +}(\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} \mathcal{E}_\bullet), \tag{7.5.8.10.1}$$

which is constructed as follows:

$$\widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet}\otimes_{\mathcal{B}_{Y_\bullet}}\mathbb{R}f_{\bullet*}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\mathcal{E}_\bullet\right)\underset{7.5.7.3.1}{\xrightarrow{\sim}}\mathbb{R}f_{\bullet*}\left(f^{-1}\widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet}\otimes_{f^{-1}\mathcal{B}_{Y_\bullet}}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\mathcal{E}_\bullet)\right)$$

$$\xrightarrow{\sim}\mathbb{R}f_{\bullet*}\left((f^{-1}\widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet}\otimes_{f^{-1}\mathcal{B}_{Y_\bullet}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet})\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\mathcal{E}_\bullet\right)$$

$$\overset{4.3.5.6.1}{\xrightarrow{\sim}}\mathbb{R}f_{\bullet*}\left((\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}\otimes_{\mathcal{B}_{X_\bullet}}\mathcal{E}_\bullet)\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}(f^{-1}\widetilde{\omega}_{Y^\sharp_\bullet/T^\sharp_\bullet}\otimes_{f^{-1}\mathcal{B}_{Y_\bullet}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet}\otimes_{\mathcal{B}_{X_\bullet}}\widetilde{\omega}^{-1}_{X^\sharp_\bullet/S^\sharp_\bullet})\right)$$

$$\underset{7.5.5.4.1}{\xrightarrow{\sim}}\mathbb{R}f_{\bullet*}\left((\widetilde{\omega}_{X^\sharp_\bullet/S^\sharp_\bullet}\otimes_{\mathcal{B}_{X_\bullet}}\mathcal{E}_\bullet)\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet\to Y^\sharp_\bullet/T^\sharp_\bullet}\right).$$

Proposition 7.5.8.11. *With notation 7.5.5.20, we suppose U is a noetherian scheme of finite Krull dimension and g is quasi-compact and quasi-separated. Let $*\in\{r,l\}$, and $\star\in\{-,\mathrm{b}\}$ such that one of the following conditions holds:*

(i) either $\star=-$

(ii) or $m=0$,

(iii) or log structures are trivial.

In each cases, we have the following properties.

1. *For any $\mathcal{E}_\bullet\in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, we have the canonical isomorphism of $D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/U^\sharp_\bullet})$:*

$$\tilde{g}^{(m)}_{\bullet+}\circ\tilde{f}^{(m)}_{\bullet+}(\mathcal{E}_\bullet)\xrightarrow{\sim}\widetilde{(g\circ f)}^{(m)}_{\bullet+}(\mathcal{E}_\bullet).\tag{7.5.8.11.1}$$

2. *For any $\mathcal{E}\in D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, we have the canonical isomorphism of $D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{U}^\sharp})$:*

$$\tilde{g}^{(m)}_{+}\circ\tilde{f}^{(m)}_{+}(\mathcal{E})\xrightarrow{\sim}\widetilde{(g\circ f)}^{(m)}_{+}(\mathcal{E}).\tag{7.5.8.11.2}$$

Proof. By using 7.5.7.1 and 7.5.5.21.2, we can check 7.5.8.11.1 by copying the proof of 5.1.3.8. By using the equivalence of categories 7.5.4.3, this yields 7.5.8.11.2. □

Proposition 7.5.8.12. *Suppose f is proper, $f^*\mathcal{B}_{\mathfrak{Y}}\to\mathcal{B}_{\mathfrak{X}}$ is an isomorphism. Suppose $\mathcal{B}_{Y_0}$ is an $\mathcal{O}_{Y_0}$-algebra of finite type. Let $\star\in\{-,\mathrm{b}\}$ and $*\in\{\mathrm{r},\mathrm{l}\}$. Suppose moreover one of the following conditions:*

(i) either $\star=-$,

(ii) or $m=0$,

(iii) or log structures are trivial.

In each cases we have the following properties.

(a) The functor $\widetilde{f}^{(m)}_{\bullet+}$ sends $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ to $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/S^\sharp_\bullet})$.

(b) The functor $\widetilde{f}^{(m)}_{+}$ sends $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ (resp. $D^\star_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, resp. $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$) to $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ (resp. $D^\star_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$, resp. $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$).

Proof. By using the equivalence of categories 7.3.3.3, we reduce to check (a). It follows from 5.3.2.11 that $\widetilde{f}^{(m)}_{0+}$ sends $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_0/S^\sharp_0})$ to $D^\star_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_0/S^\sharp_0})$. We conclude by using 7.3.3.4 and 7.5.8.7. □

Notation 7.5.8.13 (Varying m notation)**.** We keep notation and hypotheses 7.5.5. Fix $m \geq m' \geq 0$ a second integer. Let $\mathcal{B}'_{\mathfrak{X}}$ (resp. $\mathcal{B}'_{\mathfrak{Y}}$) be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra (resp. $\mathcal{O}_{\mathfrak{Y}}$-algebra) endowed with a compatible structure of left $\mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. left $\mathcal{D}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$-module) and satisfying the hypotheses of 7.3.2. We suppose that we have algebras morphisms $\mathcal{B}'_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}}$, $\mathcal{B}'_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{Y}}$, $f^*\mathcal{B}'_{\mathfrak{Y}} \to \mathcal{B}'_{\mathfrak{X}}$ which are respectively $\mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear (resp. $\mathcal{D}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$-linear, resp. $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear) and inducing the commutative diagram

$$\begin{array}{ccc} f^*\mathcal{B}_{\mathfrak{Y}} & \longrightarrow & \mathcal{B}_{\mathfrak{X}} \\ \uparrow & & \uparrow \\ f^*\mathcal{B}'_{\mathfrak{Y}} & \longrightarrow & \mathcal{B}'_{\mathfrak{X}}. \end{array}$$

We denote by $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}'_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} := \mathcal{B}'_{\mathfrak{Y}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}} \mathcal{D}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$. We keep similar to 7.5.5.4 or 7.5.5.10 notation by replacing m by m'.

Proposition 7.5.8.14. *With notation 7.5.8.13, $f^*\mathcal{B}'_{\mathfrak{Y}} \to \mathcal{B}'_{\mathfrak{X}}$ and $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ are isomorphism. Let $\star \in \{-, \mathrm{b}\}$ and $* \in \{\mathrm{r}, \mathrm{l}\}$. Suppose moreover one of the following conditions holds:*

(a) either $\star = -$,

(b) or log structures are trivial.

Suppose moreover either $\mathcal{B}'_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}}$ is an isomorphism or $f^{-1}\mathcal{O}_{Y_0}$ and $\mathcal{O}_{X_0}$ are tor independent over $f^{-1}\mathcal{B}_{Y_0}$. For any $\mathcal{F} \in D^{\star}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, we have in $D^{\star}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$ the canonical isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m')}_{+}(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^{(m)}_{+}\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right). \tag{7.5.8.14.1}$$

Proof. We construct the morphism 7.5.8.14.1 similarly to 5.3.2.15.1. To check that this is an isomorphism, since both terms of 7.5.8.14.1 are quasi-coherent, it follows from 7.3.2.14 that we reduce to check that the following induced morphism

$$\widetilde{\mathcal{D}}^{(m)}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m')}_{+}(\mathcal{F}) \to \widetilde{\mathcal{D}}^{(m)}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m)}_{+}\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right) \tag{7.5.8.14.2}$$

is an isomorphism. On one hand, we have the isomorphisms

$$\begin{aligned} \widetilde{\mathcal{D}}^{(m)}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m)}_{+}\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right) &\overset{7.5.8.8.2}{\xrightarrow{\sim}} \widetilde{f}^{(m)}_{0+}\left(\widetilde{\mathcal{D}}^{(m)}_{X_0^\sharp/S_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right) \\ &\xrightarrow{\sim} \widetilde{f}^{(m)}_{0+}\left(\widetilde{\mathcal{D}}^{(m)}_{X_0^\sharp/S_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right). \end{aligned} \tag{7.5.8.14.3}$$

On the other hand, we get:

$$\begin{aligned} \widetilde{\mathcal{D}}^{(m)}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m')}_{+}(\mathcal{F}) &\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{Y_0^\sharp/T_0^\sharp}} \widetilde{\mathcal{D}}^{(m')}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m')}_{+}(\mathcal{F}) \\ &\overset{7.5.8.8.2}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{Y_0^\sharp/T_0^\sharp}} \widetilde{f}^{(m')}_{0+}\left(\widetilde{\mathcal{D}}^{(m')}_{X_0^\sharp/S_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right). \end{aligned} \tag{7.5.8.14.4}$$

Hence, via 7.5.8.14.3 and 7.5.8.14.4, the morphism 7.5.8.14.2 is canonically isomorphic to

$$\widetilde{\mathcal{D}}^{(m)}_{Y_0^\sharp/T_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{Y_0^\sharp/T_0^\sharp}} \widetilde{f}^{(m')}_{0+}\left(\widetilde{\mathcal{D}}^{(m')}_{X_0^\sharp/S_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right) \to \widetilde{f}^{(m)}_{0+}\left(\widetilde{\mathcal{D}}^{(m)}_{X_0^\sharp/S_0^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right), \tag{7.5.8.14.5}$$

which is an isomorphism following 5.3.2.15.

□

Corollary 7.5.8.15. *With notation and hypotheses of 7.5.8.14, suppose moreover $\mathcal{B}_{Y_0}$ is an $\mathcal{O}_{Y_0}$-algebra of finite type, f is proper and $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ is an isomorphism. For any $\mathcal{F} \in D^{\star}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, we have in $D^{\star}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$ the canonical isomorphism*

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}} \widetilde{f}^{(m')}_{+}(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^{(m)}_{+}\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}\right). \tag{7.5.8.15.1}$$

For any $\mathcal{F} \in D^{\star}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$, we have in $D^{\star}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}})$ the canonical isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp,\mathbb{Q}}} \widetilde{f}^{(m')}_{+}(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^{(m)}_{+}\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{F}\right). \tag{7.5.8.15.2}$$

Proof. We get the isomorphism 7.5.8.15.1 from 7.5.8.12 and 7.5.8.14. Moreover, we construct the morphism 7.5.8.15.2 similarly to 5.3.2.15.1. To check that this is an isomorphism, since the both side functors are wayout left, then we reduce to the case where $\mathcal{F}$ is a coherent $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module. Since it has a coherent $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-model (see 7.4.5.2), then 7.5.8.15.2 is a consequence of 7.5.8.15.1 and 7.5.8.4. □

7.5.8.16 (Non-lifted case notation)**.** In the constext of 7.5.5.23, we can define as in 7.5.8.1 the functors $\widetilde{f}^{(m)}_{0+}\colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet})$ and $\widetilde{f}^{(m)}_{0+}\colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$ for any $* \in \{\mathrm{r}, \mathrm{l}\}$.

7.5.9 Exterior tensor products and commutation with pullbacks and push-forwards

Let $m \in \mathbb{N}$. Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0, p)$ with maximal ideal $\mathfrak{m}$. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10, let $\mathfrak{X}^\sharp$ and $\mathfrak{Y}^\sharp$ be two log smooth $\mathfrak{S}^\sharp$-log-formal scheme. Let $\mathcal{B}_{\mathfrak{X}}$ (resp. $\mathcal{B}_{\mathfrak{Y}}$) be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra (resp. $\mathcal{O}_{\mathfrak{Y}}$-algebra) endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. left $\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module) and satisfying the hypotheses of 7.3.2. Recall following 7.3.2.3 that $\mathcal{B}_{\mathfrak{X}}$ and $\mathcal{B}_{\mathfrak{Y}}$ are in particular quasi-coherent in the sense of 7.3.1.5. The action of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $f^*\mathcal{B}_{\mathfrak{Y}}$ is compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra (see 3.4.4.6). We suppose that we have a morphism of algebras $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ which is moreover $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. We denote by $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{Y}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}}\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$. Recall also, following 7.3.2.1, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ satisfy the conditions of 7.3.2, i.e. in particular the projective systems $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} := (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i})_{i\in\mathbb{N}}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/S^\sharp_\bullet} := (\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/S^\sharp_i})_{i\in\mathbb{N}}$) with $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_i/S^\sharp_i} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}/\mathfrak{m}^{i+1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$) is left and right quasi-coherent in the sense of 7.3.1.10.

Let $\mathfrak{Z}^\sharp := \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Y}^\sharp$, $p\colon \mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp$, $q\colon \mathfrak{Z}^\sharp \to \mathfrak{Y}^\sharp$ be the projections. Set $\mathcal{B}_{\mathfrak{Z}} := p^*\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{Z}}} q^*\mathcal{B}_{\mathfrak{Y}}$.

We denote by $\widetilde{\mathfrak{X}}^\sharp$ (resp. $\widetilde{\mathfrak{Y}}^\sharp$, resp. $\widetilde{\mathfrak{Z}}^\sharp$) the ringed $\mathcal{V}$-log formal scheme $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}})$ (resp. $(\mathfrak{Y}^\sharp, \mathcal{B}_{\mathfrak{Y}})$, resp. $(\mathfrak{Z}^\sharp, \mathcal{B}_{\mathfrak{Z}})$), and by $\tilde{p}\colon \widetilde{\mathfrak{Z}}^\sharp/\mathfrak{S}^\sharp \to \widetilde{\mathfrak{X}}^\sharp/\mathfrak{S}^\sharp$, $\tilde{q}\colon \widetilde{\mathfrak{Z}}^\sharp/\mathfrak{S}^\sharp \to \widetilde{\mathfrak{Y}}^\sharp/\mathfrak{S}^\sharp$ the induced morphism of relative ringed $\mathcal{V}$-log formal schemes. By abuse of notation, we also denote by $\tilde{p}, \tilde{q}$ the induced morphism of ringed $\mathcal{V}$-log formal schemes. We suppose that $\widetilde{\mathfrak{X}}^\sharp/\mathfrak{S}^\sharp$ and $\widetilde{\mathfrak{Y}}^\sharp/\mathfrak{T}^\sharp$ are strongly quasi-flat morphisms of ringed $\mathcal{V}$-log formal schemes (in the sense of 4.4.1.3.b). Hence, we get for instance the finite tor-dimensions of 7.5.4.1 and we can apply 7.5.4.3 for both.

7.5.9.1. Let $* \in \{\mathrm{l}, \mathrm{r}\}$. With the notation 7.5.5.6, we define the external tensor product

$$-\widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}}-\colon D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \times D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/S^\sharp_\bullet}) \to D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/S^\sharp_\bullet}), \tag{7.5.9.1.1}$$

defined as follows: for any $\mathcal{E}_\bullet \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, $\mathcal{F}_\bullet \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/S^\sharp_\bullet})$, we set

$$\mathcal{E}_\bullet\widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}}\mathcal{F}_\bullet := \mathbb{L}\widetilde{p}^{(m)!}_\bullet(\mathcal{E}_\bullet) \otimes^{\mathbb{L}}_{\mathcal{B}_{Z_\bullet}} \mathbb{L}\widetilde{q}^{(m)!}_\bullet(\mathcal{F}_\bullet)[d_Z].$$

When $* = \mathrm{l}$, using 5.1.5.4.3, this is compatible to the external tensor product defined at 5.1.5.4.5. By using 5.1.5.9 and 7.5.5.7, this yields when $* = \mathrm{r}$ that 7.5.9.1.1 is compatible to the external tensor product defined at 5.1.5.4.5. When $\mathcal{B}_{\mathfrak{X}} = \mathcal{O}_{\mathfrak{X}}$ and $\mathcal{B}_{\mathfrak{Y}} = \mathcal{O}_{\mathfrak{Y}}$, we simply write $-\boxtimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}}-$.

7.5.9.2. Let $* \in \{\mathrm{l}, \mathrm{r}\}$. Using the tensor product defined in 7.5.9.1.1, we get the bifunctor

$$- \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} - \colon D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \times D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}) \to D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}), \tag{7.5.9.2.1}$$

defined as follows: for any $\mathcal{E} \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $\mathcal{F} \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$, we set

$$\mathcal{E} \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{F} := \mathbb{R} \underleftarrow{l}_{Z*} \left(\mathbb{L} \underleftarrow{l}^{*}_{X}(\mathcal{E}) \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}} \mathbb{L} \underleftarrow{l}^{*}_{Y}(\mathcal{F}) \right) \xrightarrow{\sim} \widetilde{p}^{(m)!}(\mathcal{E}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{Z}}} \widetilde{q}^{(m)!}(\mathcal{F})[d_Z], \tag{7.5.9.2.2}$$

where the isomorphism is checked by using the definition 7.5.5.6 and the fact that $\mathbb{R}\underleftarrow{l}_{Z*}$ is an equivalence of categories between quasi-coherent complexes. When $\mathcal{B}_{\mathfrak{X}} = \mathcal{O}_{\mathfrak{X}}$ and $\mathcal{B}_{\mathfrak{Y}} = \mathcal{O}_{\mathfrak{Y}}$, we simply write $-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} -$.

Proposition 7.5.9.3. *Let $* \in \{\mathrm{l}, \mathrm{r}\}$. Suppose $? \in \{\mathrm{qc}, \mathrm{tdf}, \mathrm{perf}\}$ (resp. suppose $? = \mathrm{coh}$ and S is locally noetherian). The functor 7.5.9.2.1 preserves the finite tor-dimension and perfectness (resp. bounded above coherent complexes), i.e. induces*

$$- \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} - \colon D^{-}_{?}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \times D^{-}_{?}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}) \to D^{-}_{?}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}). \tag{7.5.9.3.1}$$

Proof. This is a consequence of 5.1.5.5.1 and of the equivalence of categories of 7.3.2.15 and 7.3.3.3. □

Proposition 7.5.9.4. *Let $f\colon \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ and $g\colon : \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ be two morphisms of log smooth $\mathfrak{S}^\sharp$-log formal schemes. Set $\mathfrak{Z}'^\sharp := \mathfrak{X}'^\sharp \times_{\mathfrak{S}'^\sharp} \mathfrak{Y}'^\sharp$ and $h = f \times g \colon \mathfrak{Z}'^\sharp \to \mathfrak{Z}^\sharp$ the induced morphism. Let $* \in \{\mathrm{l}, \mathrm{r}\}$. Let $\mathcal{E} \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $\mathcal{F} \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$. We have the canonical homomorphism of $D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}'^\sharp/\mathfrak{S}^\sharp})$:*

$$\widetilde{f}^{(m)!}(\mathcal{E}') \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \widetilde{g}^{(m)!}(\mathcal{F}') \to \widetilde{h}^{(m)!}(\mathcal{E}' \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{F}'). \tag{7.5.9.4.1}$$

Proof. This follows from 7.5.5.9.2. □

Theorem 7.5.9.5. *We suppose the underlying scheme $\mathfrak{S}$ is noetherian of finite Krull dimension. Let $f\colon \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ and $g\colon : \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ be two quasi-separated and quasi-compact morphisms of log smooth $\mathfrak{S}^\sharp$-log formal schemes. Set $\mathfrak{Z}'^\sharp := \mathfrak{X}'^\sharp \times_{\mathfrak{S}'^\sharp} \mathfrak{Y}'^\sharp$ and $h = f \times g \colon \mathfrak{Z}'^\sharp \to \mathfrak{Z}^\sharp$ the induced morphism. Let $* \in \{\mathrm{l}, \mathrm{r}\}$. Let $\mathcal{E}' \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp})$, $\mathcal{F}' \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$.*

(a) We have the canonical homomorphism of $D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{f}^{(m)}_{+}(\mathcal{E}') \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \widetilde{g}^{(m)}_{+}(\mathcal{F}') \to \widetilde{h}^{(m)}_{+}(\mathcal{E}' \widetilde{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{F}'). \tag{7.5.9.5.1}$$

(b) When $\mathcal{B}_{\mathfrak{X}} = \mathcal{O}_{\mathfrak{X}}$ and $\mathcal{B}_{\mathfrak{Y}} = \mathcal{O}_{\mathfrak{Y}}$, the homomorphism 7.5.9.5.1 is therefore an isomorphism.

Proof. This is a consequence of 5.3.5.13. □

7.5.10 Log smooth morphisms: Spencer resolutions, stability of the coherence and varying the level of pullbacks, pushforwards as relative de Rham complexes complexes

We keep notation and hypotheses 7.5.8.13. We suppose f is a log-smooth and $\phi = \mathrm{id}$. We suppose T is a noetherian scheme of finite Krull dimension.

We set $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ and $\widetilde{\omega}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} := \mathcal{B}'_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} := \mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} := \mathcal{B}'_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$.

Lemma 7.5.10.1. *We have the following properties.*

a) We have the canonical isomorphism

$$\mathcal{B}_{\mathfrak{X},\mathbb{Q}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp,\mathbb{Q}}} \mathcal{B}'_{\mathfrak{X}^\sharp,\mathbb{Q}}, \tag{7.5.10.1.1}$$

$$\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp,\mathbb{Q}} \xrightarrow{\sim} \widetilde{\omega}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp,\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp,\mathbb{Q}}. \tag{7.5.10.1.2}$$

b) We have the canonical isomorphisms

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}, \tag{7.5.10.1.3}$$

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp\leftarrow\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp\leftarrow\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}. \tag{7.5.10.1.4}$$

Proof. a) i) For all $m'' \in \{m', m\}$, since the morphism

$$\mathcal{B}_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m'')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}\otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m'')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}} \mathcal{B}_{\mathfrak{X}}$$

is an isomorphism (this is checked similarly to 11.1.1.5), since $(\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp})_{\mathbb{Q}} = (\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp})_{\mathbb{Q}}$ then we get the canonical morphism

$$\mathcal{B}_{\mathfrak{X},\mathbb{Q}} \to (\mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp})_{\mathbb{Q}} \otimes_{(\mathcal{B}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp})_{\mathbb{Q}}} \mathcal{B}_{\mathfrak{X},\mathbb{Q}}$$

is an isomorphism. Moreover, since the canonical morphism

$$\mathcal{B}_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{B}'_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}} \mathcal{B}'_{\mathfrak{X}}$$

is an is an isomorphism (use the arguments of the proof of [Ber96c, 4.4.8]: write the right version). Hence, we are done.

ii) We proceed similarly to check 7.5.10.1.2.

b) i) Let us prove 7.5.10.1.3. From 5.3.2.1.1, we get by projective limit the isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}} \mathcal{B}_{\mathfrak{X}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}, \qquad \widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}} \mathcal{B}'_{\mathfrak{X}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}. \tag{7.5.10.1.5}$$

Hence, using 7.5.10.1.1, we get the isomorphism 7.5.10.1.3.

ii) To check 7.5.10.1.4, we proceed similarly than i) by using this time the isomorphism 5.3.2.2.1 (resp. 7.5.10.1.2) instead of 5.3.2.1.1 (resp. 7.5.10.1.1). □

7.5.10.2. We suppose $m' = 0$ and $\mathcal{B}'_{\mathfrak{X}} = \mathcal{B}_{\mathfrak{X}}$. Since the extension $\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is flat, then by extension from 5.3.2.1.3 we get the exact sequence

$$0 \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \wedge^d \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \cdots \underset{\delta}{\longrightarrow} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \underset{\delta}{\longrightarrow} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \to 0. \tag{7.5.10.2.1}$$

Let us denote by $\widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ the complex of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules given by

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \wedge^d \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \cdots \underset{\delta}{\longrightarrow} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \underset{\delta}{\longrightarrow} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$$

whose maps are obtained from 7.5.10.2.1 by applying the functor $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} -$. When $\mathcal{B}_{\mathfrak{X}} = \mathcal{O}_{\mathfrak{X}}$, we simply write $\mathrm{Sp}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$. With 4.7.3.8.1, remark $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathrm{Sp}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$. We call it the *Spencer complex of level m with coefficient in $\mathcal{B}_{\mathfrak{X}}$.*

By taking projective limits, it follows from 5.3.2.7.a that $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ is a coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. By using 7.5.10.1.3 we get from 7.5.10.2.1 the morphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}. \tag{7.5.10.2.2}$$

Since the morphism $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ is flat (see 7.5.3.1), then, by applying the functor $\mathbb{Q} \otimes_{\mathbb{Z}} -$ to 7.5.10.2.2, we get the exact sequence of coherent left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules:

$$0 \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \wedge^d \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \cdots \underset{\delta}{\longrightarrow} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \underset{\delta}{\longrightarrow} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to 0. \tag{7.5.10.2.3}$$

is exact. Via the equivalence of categories of 7.4.6.6.1 of the form $D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$, the morphism 7.5.10.2.2 is therefore an isomorphism in $D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

Let $\mathcal{M} \in D^{-}_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. The canonical map

$$\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \to \mathcal{M} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \tag{7.5.10.2.4}$$

is an isomorphism and will be denoted by $\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}^{\bullet}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$.

7.5.10.3. We suppose $m' = 0$ and $\mathcal{B}'_{\mathfrak{X}} = \mathcal{B}_{\mathfrak{X}}$. Since the extension $\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is flat, then by extension from 5.3.2.2.3 we get the exact sequence of right $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules:

$$0 \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow[d]{} \Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow[d]{} \cdots \xrightarrow[d]{} \omega_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to 0. \tag{7.5.10.3.1}$$

Let us denote by $\widetilde{\mathrm{DR}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ the complex

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow[d]{} \Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow[d]{} \cdots \xrightarrow[d]{} \omega_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},$$

where $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is the 0th term. By using the similar to 7.5.10.2 arguments, we get by extension from 7.5.10.3.1 that the canonical isomorphism of $D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ of the form

$$\widetilde{\mathrm{DR}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}[d_f] \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{7.5.10.3.2}$$

Let $\mathcal{E} \in D^{-}_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. The canonical map

$$\widetilde{\mathrm{DR}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}'^\sharp}} \mathcal{E} \to \widetilde{\mathrm{DR}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}'^\sharp}} \mathcal{E} \tag{7.5.10.3.3}$$

is an isomorphism and will be denoted by $\Omega^{\bullet}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$.

Example 7.5.10.4. Suppose $\mathfrak{Y}^\sharp = \mathfrak{S}^\sharp$. Since in that case $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} = \mathcal{B}_{\mathfrak{X},\mathbb{Q}}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} = \widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$, then 7.5.10.2.3 and of 7.5.10.3.2 can be reformulated as follows.

(a) We have the exact sequence of coherent left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules:

$$0 \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \wedge^d \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \cdots \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \mathcal{B}_{\mathfrak{X},\mathbb{Q}} \to 0, \tag{7.5.10.4.1}$$

i.e. the canonical complex morphism

$$\widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \mathcal{B}_{\mathfrak{X},\mathbb{Q}}. \tag{7.5.10.4.2}$$

is a quasi-isomorphism. In particular, we get

$$\mathcal{B}_{\mathfrak{X},\mathbb{Q}} \in D^{\mathrm{b}}_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}). \tag{7.5.10.4.3}$$

(b) The map $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \xrightarrow{\beta} \widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ given by the structure of a right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module on $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ induces a $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-linear resolution $\mathrm{DR}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})[d_{\mathfrak{X}/\mathfrak{S}}] \xrightarrow{\sim} \widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ of $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$.

When $m = 0$, we can remove $\mathbb{Q}$, i.e. we have similar results by replacing $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ with $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

Proposition 7.5.10.5. *We suppose the rank of $\Omega^1_{X^\sharp/S^\sharp}$ is constant and equal to d.*

(a) We have $\mathcal{E}xt^i_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}}(\mathcal{B}_{\mathfrak{X},\mathbb{Q}}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) = 0$ for $i \neq d$.

(b) There is a canonical isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$*-modules*

$$\mathcal{E}xt^d_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}}(\mathcal{B}_{\mathfrak{X},\mathbb{Q}}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \xrightarrow{\sim} \widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}.$$

When $m = 0$*, we can remove* $\mathbb{Q}$*, i.e. we have similar results by replacing* $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ *with* $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$*,* $\mathcal{B}_{\mathfrak{X},\mathbb{Q}}$ *with* $\mathcal{B}_{\mathfrak{X}}$ *and* $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ *with* $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$*.*

Proof. By using the flatness of the extensions $\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$, we get the level m case from the level 0 one of 4.7.3.14. □

Proposition 7.5.10.6 (Berthelot)**.** *Let* $\mathfrak{S}^\sharp$ *be a nice fine* $\mathcal{V}$*-log formal scheme (see definition 3.3.1.10). Moreover, let* $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ *be a log smooth morphism of log formal schemes. We suppose* $\mathfrak{X}$ *is locally noetherian,* $\mathfrak{X}$ *is* $\mathcal{V}$*-flat,* S *is regular and the rank of* $\Omega^1_{X^\sharp/S^\sharp}$ *is constant and equal to* d*. Let* $r := \sup_{s\in f(X)} \dim \mathcal{O}_{S,s}$*. Set* $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ *and* $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} := \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$*.*

(a) The ring $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ *has homological global dimension equal to* $2d + r + 1$*.*

(b) Let E *be a p-torsion free left* $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$*-module of finite type. Then* E *admits a resolution by projective of finite type left* $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$*-modules of length* $\le 2d + r$*.*

(c) Let E *be a left* $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$*-module of finite type. Then* E *admits a resolution by projective of finite type left* $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$*-modules of length* $\le 2d + r$*.*

(d) We have the inequalities $d \le \mathrm{gl.dim}(\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \le 2d + r$*.*

Proof. 1) Let us exhibit a left $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module E such that $\mathrm{Ext}^{2d+r+1}_{\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}(E, \widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \ne 0$. We use more or less the same example than 2.3.4.5. Let $s \in f(X)$ such that $\dim \mathcal{O}_{S,s} = r$, $\overline{s}_1, \dots, \overline{s}_r \in \mathfrak{m}_{S,x} \subset \mathcal{O}_{S,s}$ be a regular sequence of generators and let $s_1, \dots, s_r \in\subset \mathcal{O}_{\mathfrak{S}}$ be some lifting. Since $\pi, s_1, \dots, s_r, t_1^p, \dots, t_d^p$ are in the center of $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ then the sub-$\mathcal{O}_{\mathfrak{X}}$-module of $\mathcal{O}_{\mathfrak{X}}$ generated by $(\pi, s_1, \dots, s_r, t_1^p, \dots, t_d^p)$ is in fact a sub-$\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module of $\mathcal{O}_{\mathfrak{X}}$. Hence, we get a left $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (resp. a left $\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module) by setting $\mathcal{E} := \mathcal{O}_{\mathfrak{X}}/(\pi, s_1, \dots, s_r, t_1^p, \dots, t_d^p)$ (resp. $E = \Gamma(X, \mathcal{E})$). By using the level 0 case (without $\mathbb{Q}$) of 7.5.10.5, we conclude similarly to 2.3.4.5 that $\mathrm{Ext}^{2d+r+1}_{\widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}(E, \widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \ne 0$.

2) The inequality $d \le \mathrm{gl.dim}\, \widehat{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ follows from 7.5.10.5.

3) By using 1.4.3.31 and 2.3.4.5, we get the rest of the proposition. □

Proposition 7.5.10.7. *Assume* f *is quasi-compact and quasi-separated morphism.*

(a) For any $\mathcal{E} \in D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$*, we have the isomorphism:*

$$f^{(m)}_+(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}f_*\left(\Omega^\bullet_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}\right)[d_f]; \tag{7.5.10.7.1}$$

For any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$*, we have the isomorphism:*

$$f_+(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}f_*\left(\Omega^\bullet_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}\right)[d_f]; \tag{7.5.10.7.2}$$

(b) For any $\mathcal{M} \in D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$*, we have the isomorphism:*

$$f^{(m)}_+(\mathcal{M}) \xrightarrow{\sim} \mathbb{R}f_*\left(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}^\bullet_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}\right). \tag{7.5.10.7.3}$$

For any $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$*, we have the isomorphism:*

$$f_+(\mathcal{M}) \xrightarrow{\sim} \mathbb{R}f_*\left(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}^\bullet_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}\right). \tag{7.5.10.7.4}$$

When $m=0$, we can remove $\mathbb{Q}$.

Proof. By using 9.2.4.2.1, the isomorphism 7.5.10.7.1 (resp. 7.5.10.7.3) is a consequence of 9.4.1.2.1 (resp. 7.5.10.3.2). Recalling the definition 7.5.8.3, we get the other isomorphisms by using the isomorphism equal to the image via $\underrightarrow{l}^*_{\mathbb{Q}}$ of 9.4.1.2.1 (resp. 7.5.10.3.2) □

Proposition 7.5.10.8. *Let $* \in \{\mathrm{l}, \mathrm{r}\}$.*

(a) For $\mathcal{E} \in D^-_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$, we have $\widetilde{f}^{(m)!}(\mathcal{E}) \in D^-_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

(b) For $\mathcal{E}' \in D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$, we have the isomorphism of $D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{f}^{!(m')}(\mathcal{E}') \xrightarrow{\sim} \widetilde{f}^{(m)!}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E}'),$$

and similarly for complexes of right modules.

(c) For $\mathcal{E}' \in D^-_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$, we have the isomorphism of $D^-_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \widetilde{f}^{!(m')}(\mathcal{E}') \xrightarrow{\sim} \widetilde{f}^{(m)!}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}'),$$

and similarly for complexes of right modules.

Proof. a) The first part is a consequence of 5.3.2.7.

b) We denote by $\widetilde{\mathrm{Sp}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ the Spencer complex of level m' with coefficient in $\mathcal{B}'_X$ and by $\widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ the Spencer complex of level m with coefficient in $\mathcal{B}_X$. We have the isomorphisms $D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{f}^{!(m')}(\mathcal{E}') \underset{7.5.10.2.2}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \left(\widetilde{\mathrm{Sp}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{E}' \right) [d_f]$$

The third and forth parts are a consequence of the previous ones. Since $\widetilde{\mathrm{Sp}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \in D^-_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, then we get the first isomorphism of $D^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathrm{Sp}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathrm{Sp}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \xrightarrow{\sim} \widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp},$$

the last isomorphism is a consequence of the fact that the terms of $\widetilde{\mathrm{Sp}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ are locally free left $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules. Hence,

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{f}^{!(m')}(\mathcal{E}') \xrightarrow{\sim} \widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{E}'[d_f]$$

$$\xrightarrow{\sim} \widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E}')[d_f] \xrightarrow{\sim} \widetilde{f}^{(m)!}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E}').$$

c) Follows from b). □

7.5.11 Pushforwards: way-out properties, stability of the coherence, tor dimension finiteness, perfectness

We keep notation and hypotheses 7.5.5. We prove in this subsection when log structure are not trivial and $m \neq 0$ the proposition 7.5.8.12 remains true up to isogeny (see 9.4.2.3).

Lemma 7.5.11.1. *We suppose f is a (not necessary exact) closed immersion and $\phi = \mathrm{id}$.*

(a) The left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet \to Y^\sharp_\bullet/S^\sharp_\bullet}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet \leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$) is locally free.

(b) The left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp \leftarrow \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$) is flat.

Proof. Since $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \mathbb{R}l_{\leftarrow\mathfrak{X}*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet\to Y^\sharp_\bullet/S^\sharp_\bullet}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp\leftarrow\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \mathbb{R}l_{\leftarrow\mathfrak{X}*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$, using 7.2.1.4, we reduce to check the first assertion. We can copy the proof of 5.2.3.1. □

Proposition 7.5.11.2. We have the following properties:

(a) We have $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet\to Y^\sharp_\bullet/T^\sharp_\bullet} \in D^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ and $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet} \in D^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$.

(b) We have $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \in D^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp\leftarrow\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \in D^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

Proof. 0) Since $\mathbb{L}l^*_{\leftarrow\mathfrak{X}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/T^\sharp_\bullet\to Y^\sharp_\bullet/S^\sharp_\bullet}$ and $\mathbb{L}l^*_{\leftarrow\mathfrak{X}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp\leftarrow\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet\leftarrow X^\sharp_\bullet/S^\sharp_\bullet}$, then by using 7.5.5.10.1, we reduce to check $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp} \in D^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

1) We prove in this step the proposition in the case where $\phi = \mathrm{id}$. Following 9.2.1.1, since the assertion is étale locally on X, we can suppose there exists an exact closed immersion $v\colon \mathfrak{X}^\sharp \hookrightarrow \mathfrak{Y}'^\sharp$ and a log etale morphism $\mathfrak{Y}'^\sharp \to \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Y}^\sharp$ whose composite map gives $\mathfrak{X}^\sharp \hookrightarrow \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Y}^\sharp$, the graph of f. Let g be the composite morphism $\mathfrak{Y}'^\sharp \to \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Y}^\sharp \to \mathfrak{Y}^\sharp$, $\mathcal{B}_{\mathfrak{Y}'} := g^*(\mathcal{B}_{\mathfrak{Y}})$ $\widetilde{g}\colon (\mathfrak{Y}', \mathcal{B}_{\mathfrak{Y}'}) \to \widetilde{\mathfrak{Y}}$ and $\widetilde{v}\colon \widetilde{\mathfrak{X}} \to (\mathfrak{Y}', \mathcal{B}_{\mathfrak{Y}'})$ be the induced morphisms. Set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} := \widetilde{v}^*(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} := \widetilde{g}^*(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$. It follows from 7.5.10.8.(a) and 7.5.5.13.(c) that we have the isomorphism of $D^{\mathrm{b}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, {}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{v^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}} v^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}.$$

Since g is log smooth, then following 7.5.10.2.a) we have the canonical isomorphism

$$\widetilde{\mathrm{Sp}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{Y}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$$

in $D^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$. Hence, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ is isomorphic in $D^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$ to a bounded complex whose terms are of the form $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes_{v^{-1}\mathcal{O}_{\mathfrak{Y}'}} v^{-1}\wedge^i \mathcal{T}_{\mathfrak{Y}'^\sharp/\mathfrak{Y}^\sharp}$. It follows from 7.5.11.1 that such terms are flat $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules. Hence, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ is bounded complex with up to isogeny tor amplitude in $[0, d_{p_{\mathfrak{X}^\sharp}}]$.

2) When the diagram 7.5.5.0.1 is cartesian and the morphism $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism (such case is called the base change one), $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}$ is an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$-bimodules (see 7.5.6.4).

3) Hence, by using the splitting of the remark 7.5.6.7, we conclude from the above cases 1) and 2) by using 7.5.5.13.(c). □

Corollary 7.5.11.3. *Let $* \in \{\mathrm{r}, \mathrm{l}\}$. Assume that S and T are noetherian schemes of finite Krull dimension, f is quasi-compact and quasi-separated.*

$$\widetilde{f}^{(m)}_{\bullet+}\colon D^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}) \to D^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/T^\sharp_\bullet}), \tag{7.5.11.3.1}$$

$$\widetilde{f}^{(m)}_{+}\colon D^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}) \to D^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}). \tag{7.5.11.3.2}$$

Proof. By hypotheses, the functor $\mathbb{R}f_{\bullet*}$ has finite cohomological dimension. Hence, the functor 7.5.11.3.1 is well defined thanks to 7.5.11.2.(a) (recall definition 7.5.8.1). By construction, since the functors of the form $\mathbb{L}l^*_{\leftarrow\mathfrak{X}}$ and $\mathbb{L}l_{\leftarrow\mathfrak{X}*}$ preserve bounded quasi-coherent complexes, then 7.5.11.3.2 is a consequence of 7.5.11.3.1. □

Proposition 7.5.11.4. *Suppose f is proper, $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ is an isomorphism and $\mathcal{B}_{Y_0}$ is an $\mathcal{O}_{Y_0}$-algebra of finite type. Let $\star \in \{-, \mathrm{b}\}$ and $* \in \{\mathrm{r}, \mathrm{l}\}$. The functor $f^{(m)}_{+}$ sends $D^{\star}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$ (resp. $D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$) to $D^{\star}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ (resp. $D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$).*

Proof. The non-respective case is a consequence of 7.5.8.12 and 7.5.11.3. The respective case follows from 7.4.6.6. □

Proposition 7.5.11.5. *Suppose $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ is an isomorphism and the bottom arrow of 7.5.5.0.1 is the identity. Suppose $f^{-1}\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ has finite tor dimension, S is a noetherian scheme of finite Krull dimension, f is quasi-compact and quasi-separated. Let $* \in \{\mathrm{r}, \mathrm{l}\}$. The functor $\widetilde{f}^{(m)}_{\bullet +}$ sends $D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ to $D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/S^\sharp_\bullet})$. The functor $\widetilde{f}^{(m)}_{+}$ sends $D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ to $D_{\mathrm{qc,tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$.*

Proof. This is a consequence of 7.3.2.15 (and 7.1.3.6) and 5.3.2.12 (and the fact that the tor amplitude does not depend on i). □

Proposition 7.5.11.6. *Suppose $f^*\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ is an isomorphism and the bottom arrow of 7.5.5.0.1 is the identity. Suppose $\mathcal{B}_Y$ is an $\mathcal{O}_Y$-algebra of finite type. Suppose $f^{-1}\mathcal{B}_{\mathfrak{Y}} \to \mathcal{B}_{\mathfrak{X}}$ has finite tor dimension, S is a noetherian scheme of finite Krull dimension, f is proper. Let $* \in \{\mathrm{r}, \mathrm{l}\}$. The functor $\widetilde{f}^{(m)}_{\bullet +}$ sends $D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ to $D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp_\bullet/S^\sharp_\bullet})$. The functor $\widetilde{f}^{(m)}_{+}$ sends $D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ to $D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$.*

Proof. Following [Sta22, 08G8], a complex is perfect if and only if it is pseudo-coherent and locally has finite tor dimension. Hence, this is a consequence of 7.5.11.4 and 7.5.11.5. □

Chapter 8

Localisation of derived categories of inductive systems of arithmetic $\mathcal{D}$-modules

8.1 Localisation of derived categories of inductive systems

8.1.1 Topos of inductive systems of sheaves on a topological space

Notation 8.1.1.1. Let I be a partially ordered set and let X be a topological space. An inductive system indexed by I can be viewed as a projective system indexed by I° the partially ordered set equal to I as a set but equipped with the ordering opposite to that of I (see 7.1.1.1). We set $X^{(I)} := \mathrm{Top}(X)_{I^{\circ}}$ the topos of inductive system indexed by I of sheaves on X.

8.1.1.2. Let I be a partially ordered set, $\{*\}$ be some one element set and let X be a topological space. The results of 7.1 can be translated for $X^{(I)}$. Let us fix some notations.

(a) Let $u\colon I \to I'$ be an increasing map of partially ordered sets. Following 7.1.2.4.1, since $(I^{\circ})_{i'} = (I^{i'})^{\circ}$, then we get the morphism of topos

$$\underrightarrow{u}_X := u^{\circ}_X \colon X^{(I)} \to X^{(I')} \tag{8.1.1.2.1}$$

given for any $\mathcal{F}'^{(\bullet)} \in X^{(I')}$ by $\underrightarrow{u}_X^{-1}(\mathcal{F}'^{(\bullet)})^{(i)} = \mathcal{F}'^{(u(i))}$ and for any $\mathcal{F}^{(\bullet)} \in X^{(I)}$ by

$$\underrightarrow{u}_{X*}(\mathcal{F}^{(\bullet)})^{(i')} = \varprojlim_{u(i)\geq i'} \mathcal{F}^{(i)},$$

where the projective limit indexed by $(I^{i'})^{\circ}$ is that of the functor $\mathrm{Cat}((I^{i'})^{\circ})^{\mathrm{op}} \to \mathrm{Sh}(X_{Zar})$ induced by $\mathcal{F}^{(\bullet)}$. Moreover, we have a left adjoint $\underrightarrow{u}_{X!}$ of $\underrightarrow{u}_X^{-1}$ which is given for any $\mathcal{F}^{(\bullet)} \in X^{(I)}$ by

$$\underrightarrow{u}_{X!}(\mathcal{F}^{(\bullet)})^{(i')} = \varinjlim_{u(i)\leq i'} \mathcal{F}^{(i)}, \tag{8.1.1.2.2}$$

where the inductive limit is that of the inductive system $\mathrm{Cat}(I_{i'}) \to \mathrm{Sh}(X_{Zar})$ induced by $\mathcal{F}^{(\bullet)}$.

(b) In the case where u is a map of the form $u\colon I \to \{*\}$, we get the morphism of topos

$$\underrightarrow{l}^{(I)}_X := \underrightarrow{u}_X = (\underrightarrow{u}_X^{-1} \dashv \underrightarrow{u}_{X*})\colon X^{(I)} \to X. \tag{8.1.1.2.3}$$

Suppose I is a filtered set. Then $u^{\circ}\colon I^{\circ} \to \{*\}^{\circ}$ is cofiltered (see definition 7.1.2.2). Hence, following 7.1.2.4.3, we get the morphism of topos

$$\underrightarrow{l}_{X,I} := (\underrightarrow{u}_{X!} \dashv \underrightarrow{u}_X^{-1})\colon X \to X^{(I)}. \tag{8.1.1.2.4}$$

Following 7.1.2.4.2, we have the formula $\underrightarrow{l}_{X,I}^{-1}(\mathcal{F}^{(\bullet)}) = \underrightarrow{u}_{X!}(\mathcal{F}^{(\bullet)}) = \varinjlim_{i\in I} \mathcal{F}^{(i)}$. Moreover, $\underrightarrow{l}_{X,I*}(\mathcal{F}) = \underrightarrow{u}_X^{-1}(\mathcal{F})$ is the constant inductive system with value $\mathcal{F}$.

(c) Fix $i \in I$ and let $i\colon \{*\} \to I$ be the map sending $*$ to i. The morphism of 8.1.1.2.1 is in this case

$$\underrightarrow{i}_X = (\underrightarrow{i}_X^{-1} \dashv \underrightarrow{i}_{X*})\colon X \to X^{(I)}, \tag{8.1.1.2.5}$$

where X means by abuse of notation $\mathrm{Top}(X)$. We have $\underrightarrow{i}_X^{-1}(\mathcal{F}^{(\bullet)}) = \mathcal{F}^{(i)}$ for any $\mathcal{F}^{(\bullet)} \in X^{(I)}$ and we compute

$$(\underrightarrow{i}_{X*}(\mathcal{F}))^{(j)} = \begin{cases} \mathcal{F} & \text{if } j \le i \\ e & \text{otherwise} \end{cases}, \qquad (\underrightarrow{i}_{X!}(\mathcal{F}))^{(j)} = \begin{cases} \mathcal{F} & \text{if } j \ge i \\ \emptyset & \text{otherwise} \end{cases} \tag{8.1.1.2.6}$$

where e (resp. $\emptyset$) is the final (resp. initial) object of $\mathrm{Top}(X)$ for any $\mathcal{F} \in \mathrm{Top}(X)$.

(d) For any continuous map $f\colon X \to X'$ of topological spaces, it follows from 7.1.2.9.1 we have the topos morphism

$$\underrightarrow{f}_I := f_{I^\circ} = (f_{I^\circ}^{-1} \dashv f_{I^\circ *})\colon X^{(I)} \to X'^{(I)} \tag{8.1.1.2.7}$$

defined by setting $\underrightarrow{f}_I^{-1}(\mathcal{G}^{(\bullet)})\colon I \to \mathrm{Top}(X)$ is the functor $i \mapsto f^{-1}\mathcal{G}^{(i)}$ and $\underrightarrow{f}_{I*}(\mathcal{F}^{(\bullet)})\colon I \to \mathrm{Top}(X)$ is the functor $i \mapsto f_*\mathcal{F}^{(i)}$.

Remark 8.1.1.3 (When I has a smallest element). Let I be a partially ordered set and let X be a topological space.

1. Following 8.1.1.2.5, we have the topoi morphism $\underrightarrow{i}_X\colon X \to X^{(I)}$, following 8.1.1.2.3 we have the topoi morphism $\underrightarrow{l}_X^{(I)}\colon X^{(I)} \to X$. When I has a smallest element i, we notice $(\underrightarrow{l}_X^{(I)})^{-1} = \underrightarrow{i}_{X!}$ and $(\underrightarrow{l}_X^{(I)})_* = \underrightarrow{i}_X^{-1}$. Hence, we get the adjoint functors $(\underrightarrow{l}_X^{(I)})^{-1} = \underrightarrow{i}_{X!} \dashv (\underrightarrow{l}_X^{(I)})_* = \underrightarrow{i}_X^{-1} \dashv \underrightarrow{i}_{X*}$.
2. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$. We have the ringed topoi morphism $\underrightarrow{i}_X\colon (X, \mathcal{D}^{(i)}) \to (X^{(I)}, \mathcal{D}^{(\bullet)})$. Suppose I has a smallest element i. Then we get the canonical adjunction ring morphism $(\underrightarrow{l}_X^{(I)})^{-1}(\mathcal{D}^{(i)}) \to \mathcal{D}^{(\bullet)}$ which induces the ringed topoi morphism $\underrightarrow{l}_X^{(I)}\colon (X^{(I)}, \mathcal{D}^{(\bullet)}) \to (X, \mathcal{D}^{(i)})$. Moreover, we have the equality of functors $(\underrightarrow{l}_X^{(I)})_* = \underrightarrow{i}_X^{-1} = \underrightarrow{i}_X^{*}\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(i)})$ given by $\mathcal{E}^{(\bullet)} \mapsto \mathcal{E}^{(i)}$. They have the left adjoint $(\underrightarrow{l}_X^{(I)})^* = \underrightarrow{i}_{X!}\colon \mathrm{Mod}(\mathcal{D}^{(i)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)})$ (beware there are two different functors $\underrightarrow{i}_{X!}$) given by $\mathcal{E}^{(i)} \mapsto \mathcal{D}^{(\bullet)} \otimes_{(\underrightarrow{l}_X^{(I)})^{-1}\mathcal{D}^{(i)}} (\underrightarrow{l}_X^{(I)})^{-1}\mathcal{E}^{(i)}$.

Notation 8.1.1.4. We suppose I has a smallest element i_0. Let $\mathcal{G}^{(i_0)}$ be a left $\mathcal{D}^{(i_0)}$-module and $\mathcal{F}^{(i_0)} \in D(\mathcal{D}^{(i_0)})$. We set

$$\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)} := \mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{(\underrightarrow{l}_X^{(I)})^{-1}\mathcal{D}^{(i_0)}} (\underrightarrow{l}_X^{(I)})^{-1}\mathcal{F}^{(i_0)}, \qquad \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{G}^{(i_0)} := \mathcal{D}^{(\bullet)} \otimes_{(\underrightarrow{l}_X^{(I)})^{-1}\mathcal{D}^{(i_0)}} (\underrightarrow{l}_X^{(I)})^{-1}\mathcal{G}^{(i_0)}, \tag{8.1.1.4.1}$$

Notation 8.1.1.5. Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$. A left $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)} = (\mathcal{E}^{(i)}, \alpha^{(j,i)})$ is the data for any $i \in I$ of some $\mathcal{D}^{(i)}$-module $\mathcal{E}^{(i)}$ equipped with transition morphisms $\alpha^{(j,i)}\colon \mathcal{E}^{(i)} \to \mathcal{E}^{(j)}$ which are semi-linear with respect to the homomorphism $\mathcal{D}^{(i)} \to \mathcal{D}^{(j)}$ for any elements $i \le j$ of I.

(a) The category of left $\mathcal{D}^{(\bullet)}$-modules will be denoted by $\mathrm{Mod}(\mathcal{D}^{(\bullet)})$ or simply by $M(\mathcal{D}^{(\bullet)})$.

(b) Let $\mathcal{E}^{(\bullet),\bullet} \in C(\mathcal{D}^{(\bullet)})$. We get

$$\cdots \mathcal{E}^{(\bullet)n-1} \to \mathcal{E}^{(\bullet)n} \to \mathcal{E}^{(\bullet)n+1} \cdots \tag{8.1.1.5.1}$$

the corresponding complexes of left $\mathcal{D}^{(\bullet)}$-modules. If no confusion is possible, we simply write $\mathcal{E}^{(\bullet)}$.

(c) Let U be an open subset of X and $j\colon U \hookrightarrow X$ is the induced open immersion. With notation 8.1.1.2.7 we set $\mathcal{D}^{(\bullet)}|U := \underrightarrow{j}_I^{-1}(\mathcal{D}^{(\bullet)})$. This yields the ringed topos morphism

$$\underrightarrow{j}_I =\colon (U^{(I)}, \mathcal{D}^{(\bullet)}|U) \to (X^{(I)}, \mathcal{D}^{(\bullet)}). \tag{8.1.1.5.2}$$

We denote by $\underrightarrow{j}_I^*\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)}|U)$ and $\underrightarrow{j}_{I*}\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}|U) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)})$ the induced morphism. We can also simply simply denote by $|U$ the functor $\underrightarrow{j}_I^*$. The functor $\underrightarrow{j}_I^*$ has a left adjoint that we denote by $\underrightarrow{j}_{I!}\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}|U) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)})$, which is defined by setting $\underrightarrow{j}_{I!}(\mathcal{G}^{(\bullet)})\colon I \to \mathrm{Top}(X)$ is the functor $i \mapsto j_!\mathcal{G}^{(i)}$ (the extension by zero functor) for any left $\mathcal{D}^{(\bullet)}$-module $\mathcal{G}^{(\bullet)}$.

(d) Let $i \in I$ and U be an open set of X. By definition, $X^{(I)} = \mathrm{Sh}((I^{\mathrm{o}})^{\natural} \times X_{Zar})$. For any $(i, U) \in (I^{\mathrm{o}})^{\natural} \times X_{Zar}$, from 7.1.2.18.1 we get,

$$\begin{array}{ccc} ((I_{\geq i})^{\mathrm{o}})^{\natural} \times U_{Zar} & \xrightarrow{\sim} & (I^{\mathrm{o}})^{\natural} \times X_{Zar}/(i, U) \\ & \searrow & \downarrow{\scriptstyle j_{(i,U)}} \\ & & (I^{\mathrm{o}})^{\natural} \times X_{Zar} \end{array} \tag{8.1.1.5.3}$$

where the top right term is the localization of the site $(I^{\mathrm{o}})^{\natural} \times X_{Zar}$ at the object (i, U), $j_{(i,U)}$ is the forgetful functor (see 4.6.2.3) and the horizontal morphism is an isomorphism of sites. Following 7.1.2.18.3, this yields the open immersion of topoi

$$j_{(i,U)} \colon U^{(I_{\geq i})} \to X^{(I)}. \tag{8.1.1.5.4}$$

We denote by $\mathcal{D}^{(\bullet)}|_{(i,U)} := j^{-1}_{(i,U)} \mathcal{D}^{(\bullet)}$ and by $\mathcal{D}^{(\bullet)}|_i := j^{-1}_{(i,X)} \mathcal{D}^{(\bullet)}$. This yields the ringed topoi morphism $j_{(i,U)} \colon (U^{(I_{\geq i})}, \mathcal{D}^{(\bullet)}|_{(i,U)}) \to (X^{(I)}, \mathcal{D}^{(\bullet)})$ which induces the exact functor $j^{-1}_{(i,U)} \colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)}|_{(i,U)})$. We get the functor $j^{-1}_{(i,U)} \colon D(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^{(\bullet)}|_{(i,U)})$ which will be simply denoted by $|_{(i,U)}$. Following 7.1.3.3.2, the functor $j^{-1}_{(i,U)} = j^{*}_{(i,U)} \colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)}|_{(i,U)})$ has a left adjoint $j_{(i,X)!} \colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}|_{(i,U)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)})$ which is such that for any $\mathcal{F}^{(\bullet)} \in \mathrm{Mod}(\mathcal{D}^{(\bullet)}|_{(i,U)})$ we have

$$(j_{(i,U)!}(\mathcal{F}^{(\bullet)}))^{(j)} = \begin{cases} j_{U!}(\mathcal{F}^{(j)}) & \text{if } j \leq i \\ 0 & \text{otherwise.} \end{cases} \tag{8.1.1.5.5}$$

Modulo the equivalence of topoi 7.1.2.13.1, the functor $j_{(i,U)!}$ corresponds to the extension by zero via the open immersion $I_{\geq i} \times U \subset I \times X$ (for the canonical topology).

The functor $|_{(i,X)}$ is equal to $\underset{\to}{u}_{i,X}$ where u_i is the inclusion $I_{\geq i} \subset I$ of 8.1.1.2.1. In this case, we simply write $|_i := |_{(i,X)}$. We remark that the functor $j_{(i,U)}$ is the composition of the functor $|_i$ with the functor $\underset{\to I}{j}$ where j is the inclusion $U \subset X$.

8.1.1.6. With notation 8.1.1.5, let $\mathcal{E}^{(\bullet)} \in K({}^{1}\mathcal{D}^{(\bullet)})$. Following 7.1.3.6, $\mathcal{E}^{(\bullet)}$ is a K-flat complex of $K(\mathcal{D}^{(\bullet)})$ if and only if $\mathcal{E}^{(i)}$ is a K-flat complex of $K(\mathcal{D}^{(i)})$ for any $i \in I$.

8.1.2 Ind-isogenies

Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.

Notation 8.1.2.1. Let $M(I)$ be the set of increasing maps $\chi \colon I \to \mathbb{N}$. It is endowed with the following order: $\chi \leq \chi'$ if and only if $\chi(i) \leq \chi'(i)$ for an $i \in I$. The partially ordered set $M(I)$ is filtered.

8.1.2.2. We have the following notations and definitions.

(a) For any map $\chi \in M(I)$, for any left $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)} = (\mathcal{E}^{(i)}, \alpha^{(j,i)})$ (also simply denoted by $\mathcal{E}$), we set

$$\chi^{*}(\mathcal{E}^{(\bullet)}) := (\mathcal{E}^{(i)}, p^{\chi(j)-\chi(i)} \alpha^{(j,i)}).$$

We obtain the functor $\chi^{*} \colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)})$ as follows: if $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ is a morphism of $\mathrm{Mod}(\mathcal{D}^{(\bullet)})$, then $\chi^{*}(f^{(\bullet)}) \colon \chi^{*}(\mathcal{E}^{(\bullet)}) \to \chi^{*}(\mathcal{F}^{(\bullet)})$ is the morphism of left $\mathcal{D}^{(\bullet)}$-modules such that $(\chi^{*}(f^{(\bullet)}))^{(i)} = f^{(i)}$. Since the functor $\chi^{*} \colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)})$ is exact, then this induces the functor $\chi^{*} \colon D^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\mathcal{D}^{(\bullet)})$.

(b) If $\chi_1, \chi_2 \in M(I)$, we compute $\chi_1^{*} \circ \chi_2^{*} = (\chi_1 + \chi_2)^{*}$, and in particular χ_1^{*} and χ_2^{*} commute.

(c) Let $\chi_1, \chi_2 \in M(I)$ such that $\chi_1 \leq \chi_2$. For any $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$, we denote by

$$\theta_{\mathcal{E},\chi_2,\chi_1} \colon \chi_1^{*}(\mathcal{E}^{(\bullet)}) \to \chi_2^{*}(\mathcal{E}^{(\bullet)}) \tag{8.1.2.2.1}$$

be the morphism defined by $p^{\chi_2(i)-\chi_1(i)} \colon \mathcal{E}^{(i)} \to \mathcal{E}^{(i)}$ for any $i \in I$.

(d) Let $\chi_1, \chi_2, \chi_3 \in M(I)$ such that $\chi_1 \leq \chi_2$. For any $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$, we have

$$\chi_3^*(\theta_{\mathcal{E},\chi_2,\chi_1}) = \theta_{\mathcal{E},\chi_3+\chi_2,\chi_3+\chi_1}. \tag{8.1.2.2.2}$$

If furthermore $\chi_2 \leq \chi_3$ then

$$\theta_{\mathcal{E},\chi_3,\chi_2} \circ \theta_{\mathcal{E},\chi_2,\chi_1} = \theta_{\mathcal{E},\chi_3,\chi_1}. \tag{8.1.2.2.3}$$

(e) For any $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$, it follows from 8.1.2.2.3 that we get a functor $\theta_{\mathcal{E}}\colon M(I) \to D(\mathcal{D}^{(\bullet)})$ given by $\chi \mapsto \chi^*(\mathcal{E}^{(\bullet)})$, where $M(I)$ is the category associated with its structure of partially ordered set (see 7.1.2.1). This gives a meaning of the notion of functoriality with respect to χ.

(f) For any map $\chi \in M(I)$, we write $\theta_{\mathcal{E},\chi} := \theta_{\mathcal{E},\chi,0}\colon \mathcal{E}^{(\bullet)} \to \chi(\mathcal{E}^{(\bullet)})$. For instance, when $\chi = n$ is the constant map with value n then $\theta_{\mathcal{E},\chi}$ is the multiplication by p^n on $\mathcal{E}^{(i)}$ for each $i \in I$.

(g) A morphism $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $D^\sharp(\mathcal{D}^{(\bullet)})$ is an "ind-isogeny of $D^\sharp(\mathcal{D}^{(\bullet)})$" if there exist $\chi \in M(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$. We denote by $\Xi(\mathcal{D}^{(\bullet)})$ the set of ind-isogenies of $D^\sharp(\mathcal{D}^{(\bullet)})$. If no confusion is possible with respect to $\mathcal{D}^{(\bullet)}$, we simply write $\Xi^\sharp := \Xi^\sharp(\mathcal{D}^{(\bullet)})$. For instance, the morphisms of the form 8.1.2.2.1 are ind-isogenies (see 8.1.4.11).

Lemma 8.1.2.3. *Let $\mathfrak{Ab}$ be the category of abelian groups. For any $\mathcal{G}^{(\bullet)} \in D^\sharp(\mathcal{D}^{(\bullet)})$, let $H_{\mathcal{G}^{(\bullet)}}\colon D^\sharp(\mathcal{D}^{(\bullet)}) \to \mathfrak{Ab}$ be the homological functor defined by setting for any $\mathcal{E}^{(\bullet)} \in D^\sharp(\mathcal{D}^{(\bullet)})$*

$$H_{\mathcal{G}^{(\bullet)}}(\mathcal{E}^{(\bullet)}) := \varinjlim_{\chi \in M(I)} \operatorname{Hom}_{D(\mathcal{D}^{(\bullet)})}(\mathcal{G}^{(\bullet)}, \chi^*\mathcal{E}^{(\bullet)}).$$

Let $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $D^\sharp(\mathcal{D}^{(\bullet)})$. The morphism $f^{(\bullet)}$ is an ind-isogeny if and only if $H_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$ is an isomorphism for any $\mathcal{G}^{(\bullet)} \in D^\sharp(\mathcal{D}^{(\bullet)})$.

Proof. 1) Suppose that $f^{(\bullet)} \in \Xi^\sharp$. Hence there exists $\chi_0 \in M(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi_0^*(\mathcal{E}^{(\bullet)})$ of $D(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi_0^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$

a) Let us check that $H_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$ is injective. Let $u^{(\bullet)}\colon \mathcal{G}^{(\bullet)} \to \chi^*(\mathcal{E}^{(\bullet)})$ be a morphism of $D^\sharp(\mathcal{D}^{(\bullet)})$ such that the image of $\chi^*(f^{(\bullet)}) \circ u^{(\bullet)}$ in $H_{\mathcal{G}^{(\bullet)}}(\mathcal{F}^{(\bullet)})$ is null. It is a question of checking that the image of $u^{(\bullet)}$ in $H_{\mathcal{G}^{(\bullet)}}(\mathcal{E}^{(\bullet)})$ is null. By increasing χ_0 and χ if necessary, we can suppose that $\chi = \chi_0$ and that $\chi^*(f^{(\bullet)}) \circ u^{(\bullet)} = 0$ in $D^\sharp(\mathcal{D}^{(\bullet)})$. By using the formula 8.1.2.2.2, we get the first equality $\theta_{\mathcal{E},2\chi,\chi} = \chi^*(\theta_{\mathcal{E},\chi}) = \chi^*(g^{(\bullet)}) \circ \chi^*(f^{(\bullet)})$. This yields $\theta_{\mathcal{E},2\chi,\chi} \circ u^{(\bullet)} = 0$. Hence, we are done.

b) Let us check the surjectivity of $H_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$. Let $v^{(\bullet)}\colon \mathcal{G}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$ be a morphism of $D^\sharp(\mathcal{D}^{(\bullet)})$. By increasing χ_0 and χ if necessary, we can suppose $\chi = \chi_0$. Set $u^{(\bullet)} := \chi^*(g^{(\bullet)}) \circ v^{(\bullet)}\colon \mathcal{G}^{(\bullet)} \to (2\chi)^*\mathcal{E}^{(\bullet)}$. We compute $(2\chi^*)(f^{(\bullet)}) \circ u^{(\bullet)} = \theta_{\mathcal{F},2\chi,\chi} \circ v^{(\bullet)}$. Hence, the class of $u^{(\bullet)}$ is sent to the class of $v^{(\bullet)}$ via $H_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$.

2) Suppose now that $H_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$ is an isomorphism for any $\mathcal{G}^{(\bullet)} \in D^\sharp(\mathcal{D}^{(\bullet)})$. Since $H_{\mathcal{F}^{(\bullet)}}(f^{(\bullet)})$ is in particular surjective, then there exist $\chi \in M(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$. The functor $H_{\mathcal{E}^{(\bullet)}}(f^{(\bullet)})$ sends the class of $g^{(\bullet)} \circ f^{(\bullet)}$ to the class of $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{F},\chi} \circ f^{(\bullet)}$, which is the class of $f^{(\bullet)}$. Since $H_{\mathcal{E}^{(\bullet)}}(f^{(\bullet)})$ is in particular injective, the class of $g^{(\bullet)} \circ f^{(\bullet)}$ is equal to the class of the identity of $\mathcal{E}^{(\bullet)}$. Increasing χ if necessary, this yields that the morphism $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$. □

Notation 8.1.2.4. The subset of ind-isogenies is a saturated multiplicative system compatible with its triangulated structure (this follows from Proposition 7.4.1.7 and Lemma 8.1.2.3). The localisation of $D^\sharp(\mathcal{D}^{(\bullet)})$ with respect to ind-isogenies is denoted by $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

8.1.2.5. A morphism $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ can be represented by a morphism $\phi^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$, i.e. by $\mathcal{E}^{(\bullet)} \stackrel{\phi^{(\bullet)}}{\to} \chi^*\mathcal{F}^{(\bullet)} \stackrel{\theta_{\mathcal{F},\chi}}{\leftarrow} \mathcal{F}^{(\bullet)}$ for some $\chi \in M(I)$. Moreover, two morphisms $\phi_1^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi_1^*\mathcal{F}^{(\bullet)}$ and $\phi_2^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi_2^*\mathcal{F}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ induce the same arrow $\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ if and only if there exists $\chi \geq \chi_1, \chi_2$, such that both composite arrows $\mathcal{E}^{(\bullet)} \stackrel{\phi_1^{(\bullet)}}{\longrightarrow} \chi_1^*\mathcal{F}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$ and $\mathcal{E}^{(\bullet)} \stackrel{\phi_2^{(\bullet)}}{\longrightarrow} \chi_2^*\mathcal{F}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$ are equal. To sum-up, for any $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, we have the formula

$$\operatorname{Hom}_{\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) = \varinjlim_{\chi \in M(I)} \operatorname{Hom}_{D(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \chi^*\mathcal{F}^{(\bullet)}). \tag{8.1.2.5.1}$$

Remark 8.1.2.6. Let a be an integer and $\chi \in M(I)$. The truncation functors $\tau^{\leq a}\colon D(\mathcal{D}^{(\bullet)}) \to D^{\leq a}(\mathcal{D}^{(\bullet)})$ and $\tau^{\geq a}\colon D(\mathcal{D}^{(\bullet)}) \to D^{\geq a}(\mathcal{D}^{(\bullet)})$ (we have chosen to use notation [KS06, 12.3.1], this is not the stupid truncation and we prefer to put the index above and not below contrary to for example [Sta22, 0118]) commute with the functors $\chi^*\colon D(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^{(\bullet)})$, i.e., we compute we have the equality

$$\chi^* \tau^{\leq a} \mathcal{E}^{(\bullet)} = \tau^{\leq a} \chi^* \mathcal{E}^{(\bullet)}. \tag{8.1.2.6.1}$$

Similarly, we have the equality

$$\tau^{\geq a} \chi^* \mathcal{E}^{(\bullet)} = \chi^* \tau^{\geq a} \mathcal{E}^{(\bullet)}. \tag{8.1.2.6.2}$$

Lemma 8.1.2.7. *The canonical functors $\underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ are fully faithful.*

Proof. The proof is divided into the following two (non-symmetric) parts. i) With the notation 8.1.1.5.1, let $a \leq b$ be two integers and let $f^{(\bullet)}\colon \mathcal{E}^{(\bullet),\bullet} \to \mathcal{F}^{(\bullet),\bullet}$ be a morphism of $D(\mathcal{D}^{(\bullet)})$ such that $\mathcal{E}^{(\bullet)n} = 0$ for any $n < a$ (resp. $\mathcal{F}^{(\bullet)n} = 0$ for any $n > b$ and $\mathcal{E}^{(\bullet)n} = 0$ for any $n \notin [a, b]$). Suppose there exist $\chi \in M(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi^* \mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$. We denote by $\phi^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \tau^{\geq a} \mathcal{F}^{(\bullet)}$ the composition of the canonical morphism $\mathcal{F}^{(\bullet)} \to \tau^{\geq a} \mathcal{F}^{(\bullet)}$ with $f^{(\bullet)}$. Since the canonical morphism $\chi^* \mathcal{E}^{(\bullet)} \to \tau^{\geq a} \chi^* \mathcal{E}^{(\bullet)}$ is an isomorphism, we get the morphism $\psi^{(\bullet)}\colon \tau^{\geq a} \mathcal{F}^{(\bullet)} \to \chi^* \mathcal{E}^{(\bullet)}$ whose composition with the canonical morphism $\mathcal{F}^{(\bullet)} \to \tau^{\geq a} \mathcal{F}^{(\bullet)}$ is $g^{(\bullet)}$. We get $\psi^{(\bullet)} \circ \phi^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi^*(\phi^{(\bullet)}) \circ \psi^{(\bullet)} = \theta_{\tau^{\leq a}\mathcal{F},\chi}$, i.e. $\phi^{(\bullet)}$ is an ind-isogeny. Hence, by using [Har66, I.3.3.(ii)], we get that the canonical functor $\underrightarrow{D}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ are fully faithful.

ii) Let $a \leq b$ be two integers and let $f^{(\bullet)}\colon \mathcal{E}^{(\bullet),\bullet} \to \mathcal{F}^{(\bullet),\bullet}$ be a morphism of $D(\mathcal{D}^{(\bullet)})$ such that $\mathcal{F}^{(\bullet)n} = 0$ for any $n \rangle b$ (resp. $\mathcal{E}^{(\bullet)n} = 0$ for any $n < a$ and $\mathcal{F}^{(\bullet)n} = 0$ for any $n \notin [a, b]$). Suppose there exist $\chi \in M(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi^* \mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$. We denote by $\phi^{(\bullet)}\colon \tau^{\leq b} \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ the composition of the canonical morphism $\tau^{\leq b} \mathcal{E}^{(\bullet)} \to \mathcal{E}^{(\bullet)}$ with $f^{(\bullet)}$. Since the canonical morphism $\tau^{\leq b} \chi^* \mathcal{F}^{(\bullet)} \to \chi^* \mathcal{F}^{(\bullet)}$ is an isomorphism, we get a (unique) morphism $\psi^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \tau^{\leq b} \chi^* \mathcal{E}^{(\bullet)} = \chi^* \tau^{\leq b} \mathcal{E}^{(\bullet)}$ whose composition with the canonical morphism $\tau^{\leq b} \chi^* \mathcal{E}^{(\bullet)} \to \chi^* \mathcal{E}^{(\bullet)}$ is $g^{(\bullet)}$. We compute $\psi^{(\bullet)} \circ \phi^{(\bullet)} = \theta_{\tau^{\leq a}\mathcal{E},\chi}$ and $\chi^*(\phi^{(\bullet)}) \circ \psi^{(\bullet)} = \theta_{\mathcal{F},\chi}$, i.e. $\phi^{(\bullet)}$ is an ind-isogeny. Hence, by using [Har66, I.3.3.(i)], we can prove that the canonical functor $\underrightarrow{D}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ are fully faithful. □

Remark 8.1.2.8. Beware that the images of the functors of 8.1.2.7 are not equal to the respective essential images, i.e. we do not have strictly full subcategories but only full subcategories.

8.1.2.9. Since the functor $- \otimes_{\mathbb{Z}} \mathbb{Q}\colon D^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\mathcal{D}^{(\bullet)}_{\mathbb{Q}})$ sends ind-isogenies to isomorphisms we get the factorization $- \otimes_{\mathbb{Z}} \mathbb{Q}\colon \underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\mathcal{D}^{(\bullet)}_{\mathbb{Q}})$.

8.1.3 Lim-isomorphisms

Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.

Notation 8.1.3.1. Let $L(I)$ be the set of increasing maps $\lambda\colon I \to I$ such that $\lambda(i) \geq i$. The set $L(I)$ is closed under composition and is endowed with the following order: $\lambda \leq \mu$ if and only if $\lambda(i) \leq \mu(i)$ for an $i \in I$. The partially ordered set $L(I)$ is filtered.

8.1.3.2. We have the following notations and definitions.

(a) For any map $\lambda \in L(I)$, for any left $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)} = (\mathcal{E}^{(i)}, \alpha^{(j,i)})$ (also simply denoted by $\mathcal{E}$), we set

$$\lambda^*(\mathcal{E}^{(\bullet)}) := (\mathcal{E}^{(\lambda(i))}, \alpha^{(\lambda(j),\lambda(i))})_{i \leq j}.$$

We obtain the functor $\lambda^*\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\lambda^*\mathcal{D}^{(\bullet)})$ as follows: if $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ is a morphism of $\mathrm{Mod}(\mathcal{D}^{(\bullet)})$, then $\lambda^*(f^{(\bullet)})\colon \lambda^*(\mathcal{E}^{(\bullet)}) \to \lambda^*(\mathcal{F}^{(\bullet)})$ is the morphism of left $\lambda^*\mathcal{D}^{(\bullet)}$-modules such that $(\lambda^*(f^{(\bullet)}))^{(i)} = f^{(\lambda(i))}$. Since the functor $\lambda^*\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\lambda^*\mathcal{D}^{(\bullet)})$ is exact, then this induces the functor $\lambda^*\colon D^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\lambda^*\mathcal{D}^{(\bullet)})$.

(b) When $\lambda_1, \lambda_2 \in L(I)$, we compute $\lambda_1^* \circ \lambda_2^* = (\lambda_2 \circ \lambda_1)^*$.

(c) Let $\chi \in M(I)$ and $\lambda \in L(I)$. The functors χ^* and λ^* defined respectively at 8.1.2.2.a and 8.1.3.2.a do not commute. However, we have $\chi \circ \lambda \in M(I)$ and for any $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$ we have the canonical equalities

$$\lambda^* \circ \chi^*(\mathcal{E}^{(\bullet)}) = (\chi \circ \lambda)^* \circ \lambda^*(\mathcal{E}^{(\bullet)}), \qquad \lambda^*(\theta_{\mathcal{E},\chi}) = \theta_{\lambda^*\mathcal{E},\chi\circ\lambda}. \tag{8.1.3.2.1}$$

This yields that the functor $\lambda^*\colon D^\sharp(\mathcal{D}^{(\bullet)}) \to D^\sharp(\lambda^*\mathcal{D}^{(\bullet)})$ the sends the ind-isogenies to the ind-isogenies. Hence, we get the δ-functor $\lambda^*\colon \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$.

(d) Let $\lambda_1, \lambda_2 \in L(I)$. When $\lambda_1 \leq \lambda_2$, for any left $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)} = (\mathcal{E}^{(i)}, \alpha^{(j,i)})$ we have the canonical morphism $\lambda_1^*(\mathcal{E}^{(\bullet)}) \to \lambda_2^*(\mathcal{E}^{(\bullet)})$ defined by the morphism $\alpha^{(\lambda_2(i),\lambda_1(i))}\colon \mathcal{E}^{(\lambda_1(i))} \to \mathcal{E}^{(\lambda_2(i))}$. The morphism $\lambda_1^*\mathcal{D}^{(\bullet)} \to \lambda_2^*\mathcal{D}^{(\bullet)}$ is in fact a ring homomorphism and the morphism $\lambda_1^*(\mathcal{E}^{(\bullet)}) \to \lambda_2^*(\mathcal{E}^{(\bullet)})$ is $\lambda_1^*\mathcal{D}^{(\bullet)}$-linear. This yields the morphisms of functors $\rho_{\lambda_1,\lambda_2}\colon D^\sharp(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\lambda_1^*\mathcal{D}^{(\bullet)})$ (resp. $\rho_{\lambda_2,\lambda_1}\colon \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\lambda_1^*\mathcal{D}^{(\bullet)})$) of the form $\lambda_1^* \to \lambda_2^*$. For any $\mathcal{E}^{(\bullet)} \in \operatorname{Ob} D^\sharp(\mathcal{D}^{(\bullet)}) = \operatorname{Ob} \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, we set $\rho_{\mathcal{E},\lambda_2,\lambda_1} := \rho_{\lambda_2,\lambda_1}(\mathcal{E}^{(\bullet)})\colon \lambda_1^*(\mathcal{E}^{(\bullet)}) \to \lambda_2^*(\mathcal{E}^{(\bullet)})$. When $\lambda_1 = \mathrm{id}$, we set $\rho_{\mathcal{E},\lambda_2} := \rho_{\mathcal{E},\lambda_2,\mathrm{id}}$.

(e) Let $\lambda_1, \lambda_2, \lambda_3 \in L(I)$ such that $\lambda_1 \leq \lambda_2$. For any $\mathcal{E}^{(\bullet)} \in \operatorname{Ob} \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, we have

$$\lambda_3^*(\rho_{\mathcal{E},\lambda_2,\lambda_1}) = \rho_{\mathcal{E},\lambda_2\circ\lambda_3,\lambda_1\circ\lambda_3}. \tag{8.1.3.2.2}$$

If furthermore $\lambda_2 \leq \lambda_3$ then

$$\rho_{\mathcal{E},\lambda_3,\lambda_2} \circ \rho_{\mathcal{E},\lambda_2,\lambda_1} = \rho_{\mathcal{E},\lambda_3,\lambda_1}. \tag{8.1.3.2.3}$$

(f) For any $\mathcal{E}^{(\bullet)} \in \operatorname{Ob} \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, it follows from 8.1.3.2.3 that we get a functor $\rho_{\mathcal{E}}\colon L(I) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ given by $\rho \mapsto \rho^*(\mathcal{E}^{(\bullet)})$, where $L(I)$ is the category associated with its structure of partially ordered set (see 7.1.2.1). This gives a meaning of the notion of functoriality with respect to λ.

(g) We denote by $\Lambda^\sharp(\mathcal{D}^{(\bullet)})$ the set of morphisms $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that there exist $\lambda \in L(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \rho_{\mathcal{E},\lambda}$ and $\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} = \rho_{\mathcal{F},\lambda}$ in $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. If no confusion is possible with respect to $\mathcal{D}^{(\bullet)}$, we simply write $\Lambda^\sharp := \Lambda^\sharp(\mathcal{D}^{(\bullet)})$. The morphisms belonging to Λ are called "lim-isomorphisms". For instance, the morphisms of the form $\rho_{\lambda_1,\lambda_2}$ are lim-isomorphisms (see 8.1.4.11).

Remark 8.1.3.3. Let $\lambda \in L(I)$. By definition, we have the equality of functors $\lambda^* = \underrightarrow{\lambda}_X^{-1}$ (see notation 8.1.1.2.1).

Lemma 8.1.3.4. *For any $\mathcal{G}^{(\bullet)} \in \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, let $I_{\mathcal{G}^{(\bullet)}}\colon \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \mathfrak{Ab}$ the cohomological functor with value in the category of abelian groups defined by setting for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$*

$$I_{\mathcal{G}^{(\bullet)}}(\mathcal{E}^{(\bullet)}) := \varinjlim_{\lambda \in L(I)} \operatorname{Hom}_{\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{G}^{(\bullet)}, \lambda^*\mathcal{E}^{(\bullet)}).$$

Let $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $D^\sharp(\mathcal{D}^{(\bullet)})$. The morphism $f^{(\bullet)}$ is a lim-isomorphism if and only if $I_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$ is an isomorphism for any $\mathcal{G}^{(\bullet)} \in \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

Proof. 1) Suppose that $f^{(\bullet)} \in \Lambda^\sharp$. Hence there exists $\lambda_0 \in L(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \lambda_0^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \rho_{\mathcal{E},\lambda_0}$ and $\lambda_0^*(f^{(\bullet)}) \circ g^{(\bullet)} = \rho_{\mathcal{F},\lambda_0}$.

a) Let us check that $I_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$ is injective. Let $\lambda \in L(I)$ and $u^{(\bullet)}\colon \mathcal{G}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ be a morphism of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that the image of $\lambda^*(f^{(\bullet)}) \circ u^{(\bullet)}$ in $I_{\mathcal{G}^{(\bullet)}}(\mathcal{F}^{(\bullet)})$ is 0. By increasing λ_0 and λ if necessary, we can suppose that $\lambda = \lambda_0$ and $\lambda^*(f^{(\bullet)}) \circ u^{(\bullet)} = 0$ in $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We have $\rho_{\mathcal{E},\lambda\circ\lambda,\lambda} \circ u^{(\bullet)} = \lambda^*(\rho_{\mathcal{E},\lambda}) \circ u^{(\bullet)} = \lambda^*(g^{(\bullet)}) \circ \lambda^*(f^{(\bullet)}) \circ u^{(\bullet)} = 0$. Hence, the image of $u^{(\bullet)}$ in $I_{\mathcal{G}^{(\bullet)}}(\mathcal{F}^{(\bullet)})$ is 0.

b) Let us check the surjectivity of $I_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$. Let $\lambda \in L(I)$ and $v^{(\bullet)}\colon \mathcal{G}^{(\bullet)} \to \lambda^*\mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. By increasing λ_0 or λ if necessary, we can suppose that $\lambda = \lambda_0$. Set $u^{(\bullet)} := \lambda^*(g^{(\bullet)}) \circ v^{(\bullet)}\colon \mathcal{G}^{(\bullet)} \to (\lambda \circ \lambda)^*\mathcal{E}^{(\bullet)}$. Then, the image of $u^{(\bullet)}$ in $I_{\mathcal{G}^{(\bullet)}}(\mathcal{E}^{(\bullet)})$ is sent to the image of $v^{(\bullet)}$ in $I_{\mathcal{G}^{(\bullet)}}(\mathcal{F}^{(\bullet)})$ via $I_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$.

2) Suppose now that $I_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$ is an isomorphism for any $\mathcal{G}^{(\bullet)} \in D^\sharp(\mathcal{D}^{(\bullet)})$. Since $I_{\mathcal{F}^{(\bullet)}}(f^{(\bullet)})$ is in particular surjective, then there exists $\lambda \in L(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such

that $\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} = \rho_{\mathcal{F},\lambda}$. The functor $I_{\mathcal{E}^{(\bullet)}}(f^{(\bullet)})$ sends the class of $g^{(\bullet)} \circ f^{(\bullet)}$ in $I_{\mathcal{G}^{(\bullet)}}(\mathcal{E}^{(\bullet)})$ to the class of $\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} \circ f^{(\bullet)} = \rho_{\mathcal{F},\lambda} \circ f^{(\bullet)}$ in $I_{\mathcal{G}^{(\bullet)}}(\mathcal{F}^{(\bullet)})$, which is also the class of $f^{(\bullet)}$. Since $I_{\mathcal{E}^{(\bullet)}}(f^{(\bullet)})$ is in particular injective, the class of $g^{(\bullet)} \circ f^{(\bullet)}$ is equal to the class of the identity of $\mathcal{E}^{(\bullet)}$. By increasing λ if necessary, this yields $g^{(\bullet)} \circ f^{(\bullet)} = \rho_{\mathcal{E},\lambda}$. □

Notation 8.1.3.5. It follows from Lemma 8.1.3.4 and Proposition 7.4.1.7 that $\Lambda^\sharp$ is a saturated multiplicative system of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ compatible with its triangulated structure. By localizing $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ with respect to lim-isomorphisms we get a category denoted by $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

Lemma 8.1.3.6. *The canonical functors $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ are fully faithful.*

Proof. We can copy the proof of 8.1.2.7. □

Remark 8.1.3.7. Beware that the images of the functors of 8.1.4.6 are not equal to the respective essential images, i.e. we do not have strictly full subcategories.

Definition 8.1.3.8. We have the following definitions.

(a) Given an increasing map $u\colon I \to I'$ of partially ordered sets, we say that u is an "L-equivalence" if there exists an increasing map $v\colon I' \to I$ such that $u \circ v \in L(I')$, $v \circ u \in L(I)$.

(b) We say a subset $J \subset I$ is "strictly cofinal" if the inclusion of J in I is an L-equivalence.

(c) We say I is "strictly filtered" if it is non-empty and if for all $i \in I$ the subset $I_{\geq i}$ of I is strictly cofinal.

Remark 8.1.3.9. (a) If I is strictly filtered then I is filtered, which justifies the terminology.

(b) Suppose I satisfies the following property: for any $i, j \in I$, the set $\{k \in I \text{ such that } i \leq k, j \leq k\}$ has a smallest element that we denote by $\sup\{i,j\}$ (i.e. I^o satisfies 7.1.2.15). Then I is strictly filtered. Indeed, for any $i \in I$ we get the map $\psi\colon I \to I_{\geq i}$ given by $j \mapsto \sup\{i,j\}$. Denoting by $\phi\colon I_{\geq i} \to I$ the inclusion, we get $\phi \circ \psi \in L(I)$, $\psi \circ \phi \in L(I_{\geq i})$.

(c) Let $u\colon I \to I'$ be an increasing map of partially ordered sets which is an L-equivalence. Then I is filtered if and only if I' is filtered.

8.1.3.10. Let $u\colon I \to I'$ be an increasing map of partially ordered sets. For any $\mathcal{F}'^{(\bullet)} \in X^{(I')}$, we have the canonical morphism

$$\varinjlim_{i \in I} \mathcal{E}^{(u(i))} \to \varinjlim_{i' \in I'} \mathcal{E}^{(i')} \tag{8.1.3.10.1}$$

induced by the functorial in $i \in I$ maps $\mathcal{E}^{(u(i))} \to \varinjlim_{i' \in I'} \mathcal{E}^{(i')}$.

Lemma 8.1.3.11. *When u is an L-equivalence then the morphism 8.1.3.10.1 is an isomorphism.*

Proof. a) Let $\lambda \in L(I)$. Since $\lambda(i) \geq i$ for any $i \in I$, we get the canonical morphism $\varinjlim_{i \in I} \mathcal{E}^{(i)} \to \varinjlim_{i \in I} \mathcal{E}^{(\lambda(i))}$ which is induced by the functorial in $i \in I$ maps $\mathcal{E}^{(i)} \to \mathcal{E}^{(\lambda(i))} \to \varinjlim_{i \in I} \mathcal{E}^{(\lambda(i))}$. By using the universal property of the inductive limits, we can check that this morphism $\varinjlim_{i \in I} \mathcal{E}^{(i)} \to \varinjlim_{i \in I} \mathcal{E}^{(\lambda(i))}$ is the inverse of 8.1.3.10.1 (when $u = \lambda$).

b) Let us check the general case. By hypothesis, there exists $v\colon I' \to I$ such that $u \circ v \in L(I')$, $v \circ u \in L(I)$. Since $u \circ v \in L(I')$, from the part a) of the proof, the canonical morphism $\varinjlim_{i' \in I'} \mathcal{E}^{(u \circ v(i'))} \to \varinjlim_{i' \in I'} \mathcal{E}^{(i')}$ of 8.1.3.10.1 is an isomorphism. We have the canonical morphism $\varinjlim_{i' \in I'} \mathcal{E}^{(u \circ v(i'))} \to \varinjlim_{i \in I} \mathcal{E}^{(u(i))}$ given by the functorial in $i' \in I'$ maps $\mathcal{E}^{(u \circ v(i'))} \to \varinjlim_{i \in I} \mathcal{E}^{(u(i))}$. This yields the morphism $\varinjlim_{i' \in I'} \mathcal{E}^{(i')} \xleftarrow{\sim} \varinjlim_{i' \in I'} \mathcal{E}^{(u \circ v(i'))} \to \varinjlim_{i \in I} \mathcal{E}^{(u(i))}$, which is the inverse of 8.1.3.10.1 (again use the universal property of the inductive limits). □

8.1.4 Lim-ind-isogenies

Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.

Notation 8.1.4.1. We endow the set $L(I) \times M(I)$ with the order product, i.e. $(\lambda_1, \chi_1) \leq (\lambda_2, \chi_2)$ in $L(I) \times M(I)$ if and only if $\chi_1 \leq \chi_2$ in $M(I)$ and $\lambda_1 \leq \lambda_2$ in $L(I)$. Let $(\lambda_1, \chi_1) \leq (\lambda_2, \chi_2)$ in $L(I) \times M(I)$. Let $\mathcal{E}^{(\bullet)} \in D^{\sharp}(\mathcal{D}^{(\bullet)})$. We get the canonical morphism $\chi_1^* \lambda_1^* \mathcal{E}^{(\bullet)} \to \chi_2^* \lambda_2^* \mathcal{E}^{(\bullet)}$ which is given by

$$\sigma_{\mathcal{E},(\lambda_2,\chi_2),(\lambda_1,\chi_1)} := \theta_{\lambda_2^*\mathcal{E},(\chi_2,\chi_1)} \circ \chi_1^*(\rho_{\mathcal{E},(\lambda_2,\lambda_1)}) = \chi_2^*(\rho_{\mathcal{E},(\lambda_2,\lambda_1)}) \circ \theta_{\lambda_1^*\mathcal{E},(\chi_2,\chi_1)} \tag{8.1.4.1.1}$$

We set $\sigma_{\mathcal{E},(\lambda_2,\chi_2)} := \sigma_{\mathcal{E},(\lambda_2,\chi_2),(\mathrm{id},0)}$. For any $(\lambda_1, \chi_1) \leq (\lambda_2, \chi_2) \leq (\lambda_3, \chi_3)$ in $L(I) \times M(I)$, using 8.1.2.2.3 and 8.1.3.2.3 we get

$$\sigma_{\mathcal{E},(\lambda_3,\chi_3),(\lambda_1,\chi_1)} = \sigma_{\mathcal{E},(\lambda_3,\chi_3),(\lambda_2,\chi_2)} \circ \sigma_{\mathcal{E},(\lambda_2,\chi_2),(\lambda_1,\chi_1)}. \tag{8.1.4.1.2}$$

For any $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$, it follows from 8.1.4.1.2 that we get a functor $\sigma_{\mathcal{E}} \colon L(I) \times M(I) \to D(\mathcal{D}^{(\bullet)})$ given by $(\lambda, \chi) \mapsto \chi^* \rho^* (\mathcal{E}^{(\bullet)})$, where $L(I) \times M(I)$ is the category associated with its structure of partially ordered set (see 7.1.2.1). This gives a meaning of the notion of functoriality with respect to (ρ, χ).

8.1.4.2. Let (λ_1, χ_1) and (λ_2, χ_2) be two elements of $L(I) \times M(I)$. Using 8.1.2.2.a and 8.1.3.2.c, we get the equalities

$$\chi_2^* \lambda_2^* \chi_1^* \lambda_1^* \mathcal{E}^{(\bullet)} = \chi_2^* (\chi_1 \circ \lambda_2)^* \lambda_2^* \lambda_1^* \mathcal{E}^{(\bullet)} = (\chi_2 + \chi_1 \circ \lambda_2)^* (\lambda_1 \circ \lambda_2)^* \mathcal{E}^{(\bullet)} \tag{8.1.4.2.1}$$

Via 8.1.4.2.1, the canonical morphism $\sigma_{\chi_1^*\lambda_1^*\mathcal{E},(\lambda_2,\chi_2)} \colon \chi_1^* \lambda_1^* \mathcal{E}^{(\bullet)} \to \chi_2^* \lambda_2^* \chi_1^* \lambda_1^* \mathcal{E}^{(\bullet)}$ satisfies the equality

$$\sigma_{\chi_1^*\lambda_1^*\mathcal{E},(\lambda_2,\chi_2)} = \sigma_{\mathcal{E},(\lambda_1\circ\lambda_2,\chi_2+\chi_1\circ\lambda_2),(\lambda_1,\chi_1)}. \tag{8.1.4.2.2}$$

Moreover, via 8.1.4.2.1, the canonical morphism $\chi_2^* \lambda_2^* \sigma_{\mathcal{E},(\lambda_1,\chi_1)} \colon \chi_2^* \lambda_2^* \mathcal{E}^{(\bullet)} \to \chi_2^* \lambda_2^* \chi_1^* \lambda_1^* \mathcal{E}^{(\bullet)}$ satisfies the equality

$$\chi_2^* \lambda_2^* \sigma_{\mathcal{E},(\lambda_1,\chi_1)} = \sigma_{\mathcal{E},(\lambda_1\circ\lambda_2,\chi_2+\chi_1\circ\lambda_2),(\lambda_2,\chi_2)}. \tag{8.1.4.2.3}$$

In particular, we see that the morphisms of the form 8.1.4.1.1 are closed under the functors of the form χ^* or λ^*.

Definition 8.1.4.3. Let $S^{\sharp}(\mathcal{D}^{(\bullet)})$ be the collection of morphisms $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $D^{\sharp}(\mathcal{D}^{(\bullet)})$ such that there exist $\chi \in M(I)$, $\lambda \in L(I)$ and a morphism $g^{(\bullet)} \colon \mathcal{F}^{(\bullet)} \to \chi^* \lambda^* \mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \sigma_{\mathcal{E},(\lambda,\chi)}$ and $\chi^* \lambda^* (f^{(\bullet)}) \circ g^{(\bullet)} = \sigma_{\mathcal{F},(\lambda,\chi)}$. If no confusion is possible with respect to $\mathcal{D}^{(\bullet)}$, we simply write $S^{\sharp} := S^{\sharp}(\mathcal{D}^{(\bullet)})$. The morphisms of $S^{\sharp}$ are called "lim-ind-isogenies". For instance, the morphisms of the form 8.1.4.1.1 are lim-ind-isomorphisms (see 8.1.4.11).

Lemma 8.1.4.4. *For any $\mathcal{G}^{(\bullet)} \in D^{\sharp}(\mathcal{D}^{(\bullet)})$, let $J_{\mathcal{G}^{(\bullet)}} \colon D^{\sharp}(\mathcal{D}^{(\bullet)}) \to \mathfrak{Ab}$ be the cohomological functor with value in the category of abelian groups defined by setting for any $\mathcal{E}^{(\bullet)} \in D^{\sharp}(\mathcal{D}^{(\bullet)})$*

$$J_{\mathcal{G}^{(\bullet)}}(\mathcal{E}^{(\bullet)}) := \varinjlim_{\lambda \in L} \varinjlim_{\chi \in M} \mathrm{Hom}_{D(\mathcal{D}^{(\bullet)})}(\mathcal{G}^{(\bullet)}, \chi^* \lambda^* \mathcal{E}^{(\bullet)}).$$

Let $f \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $D^{\sharp}(\mathcal{D}^{(\bullet)})$. The morphism $f^{(\bullet)}$ is a lim-ind-isogeny if and only if $J_{\mathcal{G}^{(\bullet)}}(f^{(\bullet)})$ is an isomorphism for any $\mathcal{G}^{(\bullet)} \in D^{\sharp}(\mathcal{D}^{(\bullet)})$.

Proof. By using 8.1.4.2, we can copy the proof of 8.1.3.4. □

8.1.4.5. It follows from 8.1.4.4 and 7.4.1.7 that $S^{\sharp}$ is a saturated multiplicative system of $D^{\sharp}(\mathcal{D}^{(\bullet)})$ compatible with the triangulated structure. We get the localised triangle category $(S^{\sharp})^{-1} D^{\sharp}(\mathcal{D}^{(\bullet)})$.

Lemma 8.1.4.6. *The canonical functors $(S^{\sharp})^{-1} D^{\sharp}(\mathcal{D}^{(\bullet)}) \to S^{-1} D(\mathcal{D}^{(\bullet)})$ and $(S^{\mathrm{b}})^{-1} D^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to (S^{\sharp})^{-1} D^{\sharp}(\mathcal{D}^{(\bullet)})$ are fully faithful.*

Proof. We can copy the proof of 8.1.2.7. □

8.1.4.7. A morphism $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $(S^\sharp)^{-1}D^\sharp(\mathcal{D}^{(\bullet)})$ can be represented by a morphism $\phi^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}$, i.e. by $\mathcal{E}^{(\bullet)} \overset{\phi^{(\bullet)}}{\to} \chi^*\lambda^* d\mathcal{F}^{(\bullet)} \overset{\sigma_{\mathcal{F},(\lambda,\chi)}}{\leftarrow} \mathcal{F}^{(\bullet)}$ for some $\chi \in M(I)$ and $\lambda \in L(I)$. Moreover, for any $\chi_1, \chi_2 \in M(I)$ and $\lambda_1, \lambda_2 \in L(I)$, two morphisms $\phi_1^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi_1^*\lambda_1^*\mathcal{F}^{(\bullet)}$ and $\phi_2^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi_2^*\lambda_2^*\mathcal{F}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ induce the same arrow $\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $(S^\sharp)^{-1}D^\sharp(\mathcal{D}^{(\bullet)})$ if and only if there exists $\chi \geq \chi_1, \chi_2$ and $\lambda \geq \lambda_1, \lambda_2$, such that both composite arrows $\mathcal{E}^{(\bullet)} \overset{\phi_1^{(\bullet)}}{\longrightarrow} \chi_1^*\lambda_1^*\mathcal{F}^{(\bullet)} \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}$ and $\mathcal{E}^{(\bullet)} \overset{\phi_2^{(\bullet)}}{\longrightarrow} \chi_2^*\lambda_2^*\mathcal{F}^{(\bullet)} \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}$ are equal. This yields the formula

$$\mathrm{Hom}_{S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) = \varinjlim_{(\lambda,\chi)\in L(I)\times M(I)} \mathrm{Hom}_{D^\sharp(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}). \quad (8.1.4.7.1)$$

Remark that for any $\chi \in M(I)$ and $\lambda \in L(I)$, $\mathcal{F}^{(\bullet)} \in D^\sharp(\mathcal{D}^{(\bullet)})$, since $\chi\circ\lambda \geq \chi$ in $M(I)$, we have the morphism $\sigma_{\mathcal{E},(\lambda,\chi\circ\lambda),(\lambda,\chi)}\colon \chi^*\lambda^*\mathcal{F}^{(\bullet)} \to (\chi\circ\lambda)^*\lambda^*\mathcal{F}^{(\bullet)} = \lambda^*\chi^*\mathcal{F}^{(\bullet)}$ (see the formula 8.1.3.2.c). This yields

$$\mathrm{Hom}_{S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) = \varinjlim_{(\lambda,\chi)\in L(I)\times M(I)} \mathrm{Hom}_{D^\sharp(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \lambda^*\chi^*\mathcal{F}^{(\bullet)}) \quad (8.1.4.7.2)$$

Lemma 8.1.4.8. *(a) Let $\chi_1 \in M(I)$ and $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi_1^*\mathcal{F}^{(\bullet)}$ be a morphism of $D(\mathcal{D}^{(\bullet)})$. If there exist $\chi_2 \in M(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi_2^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that we have the equalities in $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (not necessarily in $D(\mathcal{D}^{(\bullet)})$): $\chi_1^*(g^{(\bullet)}) \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi_2+\chi_1}$ and $\chi_2^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{E},\chi_2+\chi_1}$, then $f^{(\bullet)}$ is an ind-isogeny.*

(b) Let $\chi_1 \in M(I)$, $\lambda_1 \in L(I)$ and $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi_1^*\lambda_1^*\mathcal{F}^{(\bullet)}$ be a morphism of $D(\mathcal{D}^{(\bullet)})$. If there exist $\chi_2 \in M(I)$, $\lambda_2 \in L(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi_2^*\lambda_2^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that we have the equalities in $S^{-1}D(\mathcal{D}^{(\bullet)})$ (not necessarily in $D(\mathcal{D}^{(\bullet)})$): $\chi_1^*\lambda_1^*(g^{(\bullet)}) \circ f^{(\bullet)} = \sigma_{\mathcal{E},(\lambda_2\circ\lambda_1,\chi_1+\chi_2\circ\lambda_1)}$ and $\chi_2^*\lambda_2^*(f^{(\bullet)}) \circ g^{(\bullet)} = \sigma_{\mathcal{E},(\lambda_1\circ\lambda_2,\chi_2+\chi_1\circ\lambda_2)}$ (i.e. are the canonical morphisms following 8.1.4.2), then $f^{(\bullet)}$ is a lim-ind-isogeny.

Proof. Proof of (a). i) First we suppose that $\chi_1 = 0$, i.e. $\chi_1^* = \mathrm{id}$. By hypothesis, there exists $\chi \geq \chi_2$ such that $g^{(\bullet)} \circ f^{(\bullet)}$ composed with the canonical morphism $\chi_2^*\mathcal{E}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ is the canonical morphism in $D(\mathcal{D}^{(\bullet)})$ and such that $\chi_2^*(f^{(\bullet)}) \circ g^{(\bullet)}$ composed with the canonical morphism $\chi_2^*\mathcal{F}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$ is the canonical morphism in $D(\mathcal{D}^{(\bullet)})$. Let us write $h^{(\bullet)}$ for the composition of $g^{(\bullet)}$ with the canonical morphism $\chi_2^*\mathcal{E}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$, we then check that $h^{(\bullet)} \circ f^{(\bullet)}$ and $\chi^*(f^{(\bullet)}) \circ h^{(\bullet)}$ are the canonical morphisms in $D(\mathcal{D}^{(\bullet)})$.

ii) Now we deal with the general case. Composing two consecutive arrows of the sequence $\mathcal{E}^{(\bullet)} \underset{f^{(\bullet)}}{\longrightarrow} \chi_1^*\mathcal{F}^{(\bullet)} \underset{\chi_1^*(g^{(\bullet)})}{\longrightarrow} \chi_1^*\chi_2^*\mathcal{E}^{(\bullet)} \underset{\chi_1^*\chi_2^*(f^{(\bullet)})}{\longrightarrow} \chi_1^*\chi_2^*(\chi_1^*\mathcal{F}^{(\bullet)})$ we obtain the canonical morphisms in $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. This yields the result according to case a) treated above.

Proof of (b). We proceed in the analogius manner: first we treat the case where $\lambda_1 = \mathrm{id}$ and $\chi_1 = 0$, then we handle the general case (we replace χ_i^* by $\chi_i^*\lambda_i^*$ for $i = 1, 2$). □

Lemma 8.1.4.9. *We have the canonical equivalence of categories*

$$S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)}) \cong \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$$

which is the identity over the objects.

Proof. a) Since the canonical functor $D^\sharp(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ carries a lim-ind-isogeny to a lim-isomorphism, then the canonical functor $D^\sharp(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ factors canonically through the functor $S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

b) On the other hand, since an ind-isogeny is in particular a lim-ind-isogeny, then the canonical functor $D^\sharp(\mathcal{D}^{(\bullet)}) \to S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)})$ factors canonically through $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)})$. Let $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that there exist $\lambda_2 \in L(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \lambda_2^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \rho_{\mathcal{E},\lambda}$ and $\lambda_2^*(f^{(\bullet)}) \circ g^{(\bullet)} = \rho_{\mathcal{F},\lambda}$. There exists $\chi_1 \in M(I)$ such that $f^{(\bullet)}$ is represented by a morphism of $D^\sharp(\mathcal{D}^{(\bullet)})$ of the form $\phi^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi_1^*\mathcal{F}^{(\bullet)}$. There exists $\chi_2 \in M(I)$ such that $g^{(\bullet)}$ is represented by a morphism of $D^\sharp(\mathcal{D}^{(\bullet)})$ of the form $\psi^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi_2^*\lambda_2^*\mathcal{E}^{(\bullet)}$. We check therefore that $\chi_1^*(\psi^{(\bullet)}) \circ \phi^{(\bullet)}$ and $\chi_2^*\lambda_2^*(\phi^{(\bullet)}) \circ \psi^{(\bullet)}$ are the canonical morphisms in $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (and thus in $S^{-1}D^\sharp(\mathcal{D}^{(\bullet)})$). According to lemma 8.1.4.8.b, this implies that $\phi^{(\bullet)}$ is a lim-ind-isogeny. Hence, $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)})$ factors canonically through $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)})$ □

8.1.4.10. Let $\mathcal{D}'^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$.

A morphism $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $D^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ is an "ind-isogeny of $D^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$" if there exist $\chi \in M(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$. We denote by $\Xi^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ the set of ind-isogenies of $D^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$. The localisation of $D^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ with respect to ind-isogenies is denoted by $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$.

We denote by $\Lambda^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ the set of morphisms $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ such that there exist $\lambda \in L(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \rho_{\mathcal{E},\lambda}$ and $\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} = \rho_{\mathcal{F},\lambda}$ in $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$. The morphisms belonging to $\Lambda^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ are called "lim-isomorphisms". By localising $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ with respect to lim-isomorphisms, we get the category $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$.

Let $S^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ be the collection of morphisms $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $D^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ such that there exist $\chi \in M(I)$, $\lambda \in L(I)$ and a morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \sigma_{\mathcal{E},(\lambda,\chi)}$ and $\chi^*\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} = \sigma_{\mathcal{F},(\lambda,\chi)}$. The morphisms of $S^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ are called "lim-ind-isogenies". Similarly to 8.1.4.9, we have the canonical equivalence of categories

$$S^{\sharp-1}D^\sharp(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}) \cong \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$$

which is the identity over the objects. We define also the abelian category $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$. Similarly to 8.1.5.3 we establish that the canonical functor $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ is fully faithful.

Suppose $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ is left or right solved by $\mathcal{R}^{(\bullet)}$ (see definition 4.6.3.2). Then we denote by $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ (resp. $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$) the strictly full subcategory of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ (resp. $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$) consisting of complexes isomorphic to a complex of $K(\mathcal{D}^{(\bullet)} \otimes_{\mathcal{R}^{(\bullet)}} \mathcal{D}'^{(\bullet)})$.

8.1.4.11. We have the following properties.

(a) Let $\phi^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $D^\sharp(\mathcal{D}^{(\bullet)})$. Since $\Xi^\sharp$ (resp. $S^\sharp$) is saturated, then using [Sta22, 05Q9] the morphism $\phi^{(\bullet)}$ is an isomorphism in $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$) if and only if $\phi^{(\bullet)}$ is an ind-isogeny (resp. a lim-ind-isogeny).

(b) It follows from (a) that the morphisms of the form 8.1.2.2.1 (resp. 8.1.4.1.1) are ind-isogenies (resp. lim-ind-isomorphisms). Similarly, the morphisms of the form $\rho_{\lambda_2,\lambda_1}$ (see 8.1.3.2) are lim-isomorphisms.

(c) The part (a) implies also that a complex $\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ is isomorphic to 0 in $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$) if and only if there exists $\chi \in M(I)$ (resp. $\chi \in M(I)$ and $\lambda \in L(I)$) such that canonical map $\mathcal{E}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ (resp. $\mathcal{E}^{(\bullet)} \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}$) is the null morphism.

8.1.4.12. It follows from 8.1.4.7.1 and 8.1.4.9 that for any $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, we have the equality

$$\mathrm{Hom}_{\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) = \varinjlim_{\lambda \in L} \varinjlim_{\chi \in M} \mathrm{Hom}_{D^\sharp(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}). \qquad (8.1.4.12.1)$$

8.1.5 Point of view of a derived category of an abelian category

Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.

8.1.5.1. We denote by $M(\mathcal{D}^{(\bullet)})$ the category of $\mathcal{D}^{(\bullet)}$-modules. Replacing D by M in 8.1.2.2, 8.1.3.2 and 8.1.4.5, we define the notion of ind-isogenies (resp. of lim-ind-isogenies) of $M(\mathcal{D}^{(\bullet)})$ and we denote by $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $S^{-1}M(\mathcal{D}^{(\bullet)})$) the localization by ind-isogenies (resp. by lim-ind-isogenies). We define also the multiplicative system of lim-isomorphisms of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and we denote by $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ the corresponding localized category.

8.1.5.2. Since the functors of the form λ^* and χ^* are exact for any $\lambda \in L(I)$ and $\chi \in M(I)$, the previous results in the subsections 8.1.2, 8.1.3, 8.1.4 are still valid by replacing complexes by modules, i.e. by replacing the letter D (for derived categories) by M (for modules). For instance, similarly to 8.1.4.9, we can check the following canonical equivalence of categories

$$S^{-1}M(\mathcal{D}^{(\bullet)}) \cong \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}). \tag{8.1.5.2.1}$$

This yields, for any $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$

$$\mathrm{Hom}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) = \varinjlim_{\lambda \in L(I)} \varinjlim_{\chi \in M(I)} \mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}). \tag{8.1.5.2.2}$$

Lemma 8.1.5.3. *The canonical functors $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ are fully faithful.*

Proof. Since the check of the full faithfulness of the first functor is similar, let us prove it for the second one. This comes from the fact that the application $\mathrm{Hom}_{M(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \to \mathrm{Hom}_{D(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)})$ is bijective for any $\lambda \in L(I)$ and $\chi \in M(I)$ and that we have the equalities 8.1.4.12.1 and 8.1.5.2.2. □

8.1.5.4 (Serre subcategories)**.** Let us collect few facts on Serre subcategories and localisations. Let $\mathfrak{A}$ be an abelian category.

Let S be a multiplicative system of $\mathfrak{A}$. Then $S^{-1}\mathfrak{A}$ is an abelian category and the localisation functor $Q_S\colon \mathfrak{A} \to S^{-1}\mathfrak{A}$ is exact (see [Sta22, 05QG]). It follows from [Sta22, 02MQ] that $\mathfrak{B}(S) := \mathrm{Ker}\, Q_S$, where $\mathrm{Ker}\, Q_S$ is the full subcategory of objects X of $\mathfrak{A}$ such that $Q_S(X) = 0$, forms a Serre subcategory of $\mathfrak{A}$.

Let $\mathfrak{B} \subset \mathfrak{A}$ be a Serre subcategory (see [Sta22, 02MO]). Consider the set of arrows of $\mathfrak{A}$ defined by the following formula

$$S(\mathfrak{B}) := \{f \in \mathit{Arrows}(\mathfrak{A}) \mid \mathrm{Ker}(f), \mathrm{Coker}(f) \in \mathit{Ob}(\mathfrak{B})\}.$$

Then $S(\mathfrak{B})$ is a saturated multiplicative system (see the proof of [Sta22, 02MS]) such that $\mathfrak{B}(S(\mathfrak{B})) = \mathfrak{B}$ (this is a consequence of [Sta22, 06XK]). We set $\mathfrak{A}/\mathfrak{B} := (S(\mathfrak{B}))^{-1}\mathfrak{A}$. Following [Sta22, 02MS], the category $\mathfrak{A}/\mathfrak{B}$ and the localisation functor $F\colon \mathfrak{A} \to \mathfrak{A}/\mathfrak{B}$ are characterized by the following universal property: for any exact functor $G\colon \mathfrak{A} \to \mathfrak{C}$ such that $\mathfrak{B} \subset \mathrm{Ker}(G)$, there exists a factorization $G = H \circ F$ for a unique exact functor $H\colon \mathfrak{A}/\mathfrak{B} \to \mathfrak{C}$.

Let S be a multiplicative system of $\mathfrak{A}$. Then we easily see that $S(\mathfrak{B}(S))$ is equal to $\widehat{S} = \{f \in \mathit{Arrows}(\mathfrak{A}) \mid Q_S(f)$ is an isomorphism$\}$, which is also the smallest saturated multiplicative system containing S (see [Sta22, 05Q9]). Hence, $S \mapsto \mathfrak{B}(S)$ and $\mathfrak{B} \mapsto S(\mathfrak{B})$ are reciprocal bijections of each other between the set of saturated multiplicative systems of $\mathfrak{A}$ and Serre subcategories of $\mathfrak{A}$.

Lemma 8.1.5.5. *Let $N(\mathcal{D}^{(\bullet)})$ be the full subcategory of $M(\mathcal{D}^{(\bullet)})$ consisting of modules which are null in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.*

1. *The category $N(\mathcal{D}^{(\bullet)})$ is a Serre subcategory of $M(\mathcal{D}^{(\bullet)})$.*
2. *The multiplicative system associated to the Serre subcategory $N(\mathcal{D}^{(\bullet)})$ is equal to S. In particular, S is saturated.*
3. *We have $M(\mathcal{D}^{(\bullet)})/N(\mathcal{D}^{(\bullet)}) = S^{-1}M(\mathcal{D}^{(\bullet)}) \cong \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. In particular, $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is an abelian category.*

Proof. Apply 8.1.5.4.

□

8.1.5.6. For all $n \in \mathbb{Z}$, we have the n-th cohomology space functor $\mathcal{H}^n\colon D(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}^{(\bullet)})$ which is defined for $\mathcal{E}^{(\bullet)} = (\mathcal{E}^{(i)}, \alpha^{(j,i)}) \in D(\mathcal{D}^{(\bullet)})$ by $\mathcal{H}^n(\mathcal{E}^{(\bullet)}) = (\mathcal{H}^n(\mathcal{E}^{(i)}), \mathcal{H}^n(\alpha^{(j,i)}))$. We have the canonical isomorphism $\mathcal{H}^n\chi^*\lambda^*(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \chi^*\lambda^*\mathcal{H}^n(\mathcal{E}^{(\bullet)})$ which is right arrow of the commutative diagram

$$\begin{array}{ccc} \mathcal{H}^n(\mathcal{E}^{(\bullet)}) & \xrightarrow{\mathcal{H}^n(\sigma_{\mathcal{E},(\lambda,\chi)})} & \mathcal{H}^n\chi^*\lambda^*(\mathcal{E}^{(\bullet)}) \\ \| & & \downarrow\wr \\ \mathcal{H}^n(\mathcal{E}^{(\bullet)}) & \xrightarrow{\sigma_{\mathcal{H}^n\mathcal{E},(\lambda,\chi)}} & \chi^*\lambda^*\mathcal{H}^n(\mathcal{E}^{(\bullet)}) \end{array}$$

where the arrows of the form σ is the canonical arrow defined at 8.1.4.1.1. We deduce from this that $\mathcal{H}^n$ carries lim-ind-isogenies to lim-ind-isogenies. Then we get the functor $\mathcal{H}^n$ making commutative (up to canonical equivalence) the diagram

$$\begin{array}{ccc} \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \overset{\mathcal{H}^n}{\dashrightarrow} & \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \\ \uparrow & & \uparrow \\ D(\mathcal{D}^{(\bullet)}) & \xrightarrow{\mathcal{H}^n} & M(\mathcal{D}^{(\bullet)}), \end{array} \tag{8.1.5.6.1}$$

where the vertical arrows are the localization functors.

Likewise, replacing lim-ind-isogenies by ind-isogenies we get the functor $\mathcal{H}^n$ making commutative (up to canonical equivalence) the diagram

$$\begin{array}{ccc} \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \overset{\mathcal{H}^n}{\dashrightarrow} & \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \\ \uparrow & & \uparrow \\ D(\mathcal{D}^{(\bullet)}) & \xrightarrow{\mathcal{H}^n} & M(\mathcal{D}^{(\bullet)}), \end{array} \tag{8.1.5.6.2}$$

where the vertical arrows are the localization functors.

Lemma 8.1.5.7. *The functors* $\mathcal{H}^n : \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ *and* $\mathcal{H}^n : \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ *defined at 8.1.5.6 are cohomological functors.*

Proof. Let us treat the first functor. By construction (see the proof of [Sta22, 05R6 Proposition 13.5.5]), a distinguished triangle of $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is isomorphic in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ to the image of a distinguished triangle of $K(\mathcal{D}^{(\bullet)})$ by the canonical localization functor $K(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Since $\mathcal{H}^n : K(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}^{(\bullet)})$ is a cohomological functor, since the localization functor $M(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is an exact functor between abelian categories (it follows from the properties of localisations by a subcategory of Serre and of 8.1.5.5), this implies the result of the first functor. Likewise, we check the second one. ☐

8.1.5.8. Denote by $\underrightarrow{LD}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{D}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$) the strictly full sub-category of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$) consisting of complexes $\mathcal{E}^{(\bullet)}$ such that for any integer $n \neq 0$ we have $\mathcal{H}^n(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

Remark 8.1.5.9. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that $\mathcal{H}^n(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ for any $n \in \mathbb{Z}$. Then it seems false that $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} 0$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. When $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, this property becomes true (see 8.1.5.10), which explains why we have defined $\underrightarrow{LD}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ as a the strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and not $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ in 8.1.5.8. We have the same remark concerning $\underrightarrow{D}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

Lemma 8.1.5.10. *The canonical functors*

$$\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}), \qquad \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \tag{8.1.5.10.1}$$

is an equivalence of categories with respective quasi-inverse $H^0 : \underrightarrow{LD}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, $H^0 : \underrightarrow{D}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

Proof. Since the other case is similar, let us treat the first one. It follows from 8.1.5.3 that the functor 8.1.5.10.1 is fully faithful. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^0_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. It remains to check there exists in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ an isomorphism of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} H^0(\mathcal{E}^{(\bullet)})$. Since $\mathcal{E}^{(\bullet)}$ is an object of $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$, there exists an integer $N \geq 1$ large enough such that, for any $j \notin [-N, N] \cap \mathbb{Z}$ we have $\mathcal{E}^{j(\bullet)} = 0$ in $M(\mathcal{D}^{(\bullet)})$. For any integer $n \in \mathbb{Z}$, we denote by $\tau^{\geq n} : D(\mathcal{D}^{(\bullet)}) \to D^{\geq n}(\mathcal{D}^{(\bullet)})$, $\tau^{\leq n} : D(\mathcal{D}^{(\bullet)}) \to D^{\leq n}(\mathcal{D}^{(\bullet)})$. the cohomological canonical truncation functors (see 8.1.2.6)

1) *Let us check* $\tau^{\leq -1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ *in* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

a) Set $\mathcal{F}^{(\bullet)} := \tau^{\leq -1}(\mathcal{E}^{(\bullet)})$. We have therefore the isomorphism $\tau^{\leq -N-1}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \tau^{\leq -N-1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ in $D(\mathcal{D}^{(\bullet)})$. By using the exact triangle $\tau^{\leq -N-1}(\mathcal{F}^{(\bullet)}) \to \mathcal{F}^{(\bullet)} \to \tau^{\geq -N}(\mathcal{F}^{(\bullet)}) \to +1$ of $D(\mathcal{D}^{(\bullet)})$, this implies that the canonical morphism $\mathcal{F}^{(\bullet)} \to \tau^{\geq -N}(\mathcal{F}^{(\bullet)})$ is an isomorphism of $D(\mathcal{D}^{(\bullet)})$.

b) For any $j \in [-N, -1] \cap \mathbb{Z}$, we have the distinguished triangle in $D(\mathcal{D}^{(\bullet)})$ (and then in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$):

$$\mathcal{H}^j(\mathcal{F}^{(\bullet)}) \to \tau^{\geq j}(\mathcal{F}^{(\bullet)}) \to \tau^{\geq j+1}(\mathcal{F}^{(\bullet)}) \to +1.$$

Since, for any $j \in [-N, -1] \cap \mathbb{Z}$, $\mathcal{H}^j(\mathcal{F}^{(\bullet)}) = \mathcal{H}^j(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, this yields that the arrow $\tau^{\geq j}(\mathcal{F}^{(\bullet)}) \to \tau^{\geq j+1}(\mathcal{F}^{(\bullet)})$ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Hence we get $\tau^{\geq -N}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \tau^{\geq 0}(\mathcal{F}^{(\bullet)})$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

c) Since we have in $D(\mathcal{D}^{(\bullet)})$ the isomorphism $\tau^{\geq 0}(\mathcal{F}^{(\bullet)}) = \tau^{\geq 0}(\tau^{\leq -1}(\mathcal{E}^{(\bullet)})) \xrightarrow{\sim} 0$, it follows from the steps a) and b) that $\mathcal{F}^{(\bullet)} \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

2) *Let us now prove that the canonical morphism $H^0(\mathcal{E}^{(\bullet)}) \to \tau^{\geq 0}(\mathcal{E}^{(\bullet)})$ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.*

Set $\mathcal{G}^{(\bullet)} := \tau^{\geq 0}(\mathcal{E}^{(\bullet)})$. Similarly to the step 1.b), we check that the canonical morphism $\tau^{\geq 1}(\mathcal{E}^{(\bullet)}) = \tau^{\geq 1}(\mathcal{G}^{(\bullet)}) \to \tau^{\geq N+1}(\mathcal{G}^{(\bullet)})$ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Since $\tau^{\geq N+1}(\mathcal{G}^{(\bullet)}) \xrightarrow{\sim} \tau^{\geq N+1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ in $D(\mathcal{D}^{(\bullet)})$, this yields that $\tau^{\geq 1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. By using the distinguished triangle of $D(\mathcal{D}^{(\bullet)})$ (see [Sta22, 08J5 Remark 13.12.4])

$$H^0(\mathcal{E}^{(\bullet)}) \to \tau^{\geq 0}(\mathcal{E}^{(\bullet)}) \to \tau^{\geq 1}(\mathcal{E}^{(\bullet)}) \to +1,$$

this implies the result.

3) Via 1) and 2), we conclude by using the exact sequence $0 \to \tau^{\leq -1}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)} \to \tau^{\geq 0}(\mathcal{E}^{(\bullet)}) \to 0$ in $C(\mathcal{D}^{(\bullet)})$.

□

Corollary 8.1.5.11. *Let $\phi\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$). The morphism ϕ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$) if and only if, for any integer $n \in \mathbb{Z}$, the morphism $\mathcal{H}^n(\phi)\colon \mathcal{H}^n(\mathcal{E}^{(\bullet)}) \to \mathcal{H}^n(\mathcal{F}^{(\bullet)})$ is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$).*

Proof. Let us treat the non-respective case. There exists a distinguished triangle in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \underset{\phi}{\longrightarrow} \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to \mathcal{E}^{(\bullet)}[1]$. Following the properties concerning the triangulated categories, ϕ is an isomorphism if and only if $\mathcal{G}^{(\bullet)} \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Following 8.1.5.10, this is equivalent to saying that, for any integer $n \in \mathbb{Z}$, we have $\mathcal{H}^n(\mathcal{G}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. The lemma 8.1.5.7 allows us to conclude the non-respective case. Likewise we check the respective one. □

8.1.5.12. Let us denote by $D^{\sharp}_{N(\mathcal{D}^{(\bullet)})}(\mathcal{D}^{(\bullet)})$ the saturated (in the sense of 7.4.1.1) full triangulated subcategory of $D^{\sharp}(\mathcal{D}^{(\bullet)})$ consisting of complexes whose cohomology spaces are in $N(\mathcal{D}^{(\bullet)})$ i.e. $D^{\sharp}_{N(\mathcal{D}^{(\bullet)})}(\mathcal{D}^{(\bullet)})$ is the kernel of the canonical functor $D^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ induced by the localization functor $M(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

With notation 7.4.1.3, let $S^{\sharp}_{Nqi} := S(D^{\sharp}_{N(\mathcal{D}^{(\bullet)})}(\mathcal{D}^{(\bullet)}))$ be the saturated multiplicative system compatible with the triangulation of $D^{\sharp}(\mathcal{D}^{(\bullet)})$ which corresponds to $D^{\sharp}_{N(\mathcal{D}^{(\bullet)})}(\mathcal{D}^{(\bullet)})$. We can deduce from the theorem [Miy91, 3.2] that the canonical functor $D^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ induces canonically the equivalence of categories

$$D^{\sharp}(\mathcal{D}^{(\bullet)})/D^{\sharp}_{N(\mathcal{D}^{(\bullet)})}(\mathcal{D}^{(\bullet)}) := S^{\sharp -1}_{Nqi} D^{\sharp}(\mathcal{D}^{(\bullet)}) \cong D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})). \qquad (8.1.5.12.1)$$

By definition, a morphism $f^{(\bullet)}$ of $D^{\sharp}(\mathcal{D}^{(\bullet)})$ belongs to $S^{\sharp}_{Nqi}$ if and only if, for all distinguished triangle in $D^{\sharp}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{f^{(\bullet)}} \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to \mathcal{E}^{(\bullet)}[1]$, for all integer $n \in \mathbb{Z}$, we have $\mathcal{H}^n(\mathcal{G}^{(\bullet)}) \in N(\mathcal{D}^{(\bullet)})$).

Lemma 8.1.5.13. *With notation 8.1.5.12, we have $S^{\mathrm{b}} = S^{\mathrm{b}}_{Nqi}$. For $\sharp \in \{+, -, \mathrm{b}, \emptyset\}$, we have $S^{\sharp} \subset S^{\sharp}_{Nqi}$.*

Proof. 1) First we show $S^{\mathrm{b}}_{Nqi} \subset S^{\mathrm{b}}$. Take $f^{(\bullet)} \in S^{\mathrm{b}}_{Nqi}$ and a distinguished triangle in $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{f^{(\bullet)}} \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to \mathcal{E}^{(\bullet)}[1]$. By definition, for all integer $n \in \mathbb{Z}$, $\mathcal{H}^n(\mathcal{G}^{(\bullet)}) \in N(\mathcal{D}^{(\bullet)})$. That is, for all integer $n \in \mathbb{Z}$, we have $\mathcal{H}^n(\mathcal{G}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. By 8.1.5.10, this implies that $\mathcal{G}^{(\bullet)} \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. According to the properties of triangulated categories, $f^{(\bullet)}$ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. By 8.1.4.11, we get that $f^{(\bullet)} \in S^{\mathrm{b}}$.

2) Next we show that $S^{\sharp} \subset S^{\sharp}_{Nqi}$. Let $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $D^{\sharp}(\mathcal{D}^{(\bullet)})$. Since the cohomology space functor $H^0 \colon D^{\sharp}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is a cohomological functor, then we get at a long exact sequence in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ from the distinguished triangle in $D^{\sharp}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{f^{(\bullet)}} \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to \mathcal{E}^{(\bullet)}[1]$. Looking at this long exact sequence, we can check that $f^{(\bullet)} \in S^{\sharp}_{Nqi}$ if and only if, for all integer $n \in \mathbb{Z}$, $\mathcal{H}^n(f^{(\bullet)})$ is an isomorphism in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (which is an abelian category). But, if $f^{(\bullet)} \in S^{\sharp}$, then its image in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is an isomorphism. As the functor $\mathcal{H}^n \colon D^{\sharp}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ factors through $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, we deduce the required inclusion $S^{\sharp} \subset S^{\sharp}_{Nqi}$. □

Proposition 8.1.5.14. *For $\sharp \in \{+, -, \mathrm{b}, \emptyset\}$, the canonical functor $D^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ of triangulated categories induced by the functor of abelian categories $M(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ induces the morphism of triangulated categories*

$$\mathfrak{e} \colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \tag{8.1.5.14.1}$$

making commutative the diagram

$$\begin{array}{ccccc} & & S^{\sharp -1}_{Nqi} D^{\sharp}(\mathcal{D}^{(\bullet)}) & \xrightarrow[8.1.5.12.1]{\cong} & D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \\ & \nearrow^{Q_{S^{\sharp}_{Nqi}}} & \uparrow & & \uparrow \mathfrak{e} \\ D^{\sharp}(\mathcal{D}^{(\bullet)}) & \xrightarrow{Q_{S^{\sharp}}} & S^{\sharp -1} D^{\sharp}(\mathcal{D}^{(\bullet)}) & \xrightarrow[8.1.4.9]{\cong} & \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \end{array} \tag{8.1.5.14.2}$$

When $\sharp = \mathrm{b}$, the morphism $\mathfrak{e}$ is an equivalence of categories.

Proof. The left vertical arrow comes from the inclusion $S^{\sharp} \subset S^{\sharp}_{Nqi}$ (see 8.1.5.13). When $\sharp = \mathrm{b}$, since this inclusion becomes an equality, both vertical arrow are equivalences of categories. □

8.1.5.15. The morphism 8.1.5.14.1 commutes with cohomological functors, i.e. we have for any $n \in \mathbb{N}$ the commutative diagram

$$\begin{array}{ccccc} D^{\sharp}(\mathcal{D}^{(\bullet)}) & \longrightarrow & \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\mathfrak{e}} & D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \\ \downarrow H^n & & \vdots\, H^n & & \downarrow H^n \\ M(\mathcal{D}^{(\bullet)}) & \longrightarrow & \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & = & \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \end{array} \tag{8.1.5.15.1}$$

where the middle vertical arrow is the one making commutative by definition the left square (see 8.1.5.6). Indeed, since the canonical functor $M(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is exact, the outer of the large rectangle is commutative.

8.1.5.16. We have the commutative diagram up to canonical isomorphism

$$\begin{array}{ccc} \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{8.1.5.3} & \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \\ & \searrow & \downarrow \mathfrak{e}\ 8.1.5.14.1 \\ & & D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})). \end{array} \tag{8.1.5.16.1}$$

Indeed, by using the universal property of the localisation functor, we reduce to check it after applying the functor $M(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, which is easy.

8.2 Homomorphism bifunctor over $LD_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$

Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.

8.2.1 Homomorphism bifunctors of $\mathcal{D}^{(\bullet)}$-modules

8.2.1.1. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}$ be two left $\mathcal{D}^{(\bullet)}$-modules.

(a) We have the abelian sheaf on $X^{(I)}$ that we will denote by $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})$ which is characterized by the property: for any object $K^{(\bullet)}$ of $X^{(I)}$,

$$\mathrm{Hom}_{X^{(I)}}(K^{(\bullet)}, \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) = \mathrm{Hom}_{\mathcal{D}^{(\bullet)}|_{K^{(\bullet)}}}(\mathcal{E}^{(\bullet)}|_{K^{(\bullet)}}, \mathcal{F}^{(\bullet)}|_{K^{(\bullet)}})).$$

With notation 4.6.2.7.1, in the case where $K^{(\bullet)}$ is a final object, we have

$$\Gamma(X^{(I)}, \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) = \mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})). \tag{8.2.1.1.1}$$

Moreover, for any $(i, U) \in (I^{\circ})^{\natural} \times X_{Zar}$, we have

$$\mathrm{Hom}_{X^{(I)}}((i, U), \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) = \mathrm{Hom}_{\mathcal{D}^{(\bullet)}|_{(i,U)}}(\mathcal{E}^{(\bullet)}|_{(i,U)}, \mathcal{F}^{(\bullet)}|_{(i,U)})). \tag{8.2.1.1.2}$$

Via 8.1.1.5.3, a morphism of this latter abelian group is therefore a compatible family of $\mathcal{D}^{(j)}|_U$-linear homomorphisms $\mathcal{E}^{(j)}|_U \to \mathcal{F}^{(j)}|_U$ for any $j \geq i$.

(b) We define the abelian sheaf $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})$ on X by setting, for any open set U of X,

$$\Gamma(U, \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) = \mathrm{Hom}_{\mathcal{D}^{(\bullet)}|_U}(\mathcal{E}^{(\bullet)}|_U, \mathcal{F}^{(\bullet)}|_U). \tag{8.2.1.1.3}$$

8.2.1.2. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}$ be two left $\mathcal{D}^{(\bullet)}$-modules. With notation 8.1.1.2.5 and of 8.1.1.5.(d), with the description of 8.2.1.1.2, we have the equality of abelian sheaves on X:

$$\underset{\rightarrow X}{i}^{-1}(\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) = \mathcal{H}om_{\mathcal{D}^{(\bullet)}|_i}(\mathcal{E}^{(\bullet)}|_i, \mathcal{F}^{(\bullet)}|_i), \tag{8.2.1.2.1}$$

i.e. $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})$ is the projective system $(\mathcal{H}om_{\mathcal{D}^{(\bullet)}|_i}(\mathcal{E}^{(\bullet)}|_i, \mathcal{F}^{(\bullet)}|_i))_{i\in I}$ whose transition maps are the forgetful maps. This yields the isomorphism of abelian sheaves on X:

$$\underset{\rightarrow X*}{l}^{(I)} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}), \tag{8.2.1.2.2}$$

where following notation 8.1.1.2.3 we have $\underset{\rightarrow X*}{l}^{(I)} = \varprojlim_{i\in I^{\circ}}$.

8.2.1.3. Let $\mathcal{E}^{(\bullet)}$ be a $\mathcal{D}^{(\bullet)}$-module. Let $\mathcal{I}^{(\bullet)}$ be an injective $\mathcal{D}^{(\bullet)}$-module. Then it follows from [SGA4.2, V.4.10.2)] that $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet)})$ is a flasque abelian sheaf on $X_{\bullet}$. Since the functor $\underset{\rightarrow X*}{l}^{(I)}$ preserves the flasqueness (see [SGA4.2, V.4.9)]) then we deduce from 8.2.1.2.2 that $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet)})$ is a flasque abelian sheaf on X.

Notation 8.2.1.4. Denote by $\mathrm{Mod}(\mathbb{Z}_X)$ the abelian category of sheaves of abelian groups on X. Let $\mathcal{E}^{(\bullet),\bullet}$, $\mathcal{F}^{(\bullet),\bullet} \in K(\mathcal{D}^{(\bullet)})$ (exceptionally, we indicate the second $\bullet$ to clarify the following notations). With notation 8.2.1.1.b, we define the bifunctor

$$\mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,-) \colon K(\mathcal{D}^{(\bullet)}) \times K(\mathcal{D}^{(\bullet)}) \to K(\mathbb{Z}_X)$$

whose nth term for any integer $n \in \mathbb{Z}$ is defined by setting:

$$\mathcal{H}om^{n}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{F}^{(\bullet),\bullet}) := \prod_{p\in\mathbb{Z}} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),p},\ \mathcal{F}^{(\bullet),\ p+n}) \tag{8.2.1.4.1}$$

and the transition morphisms are given by the formula $d = d_{\mathcal{E}} + (-1)^n d_{\mathcal{F}}$.

Notation 8.2.1.5. We denote by $\mathbb{Z}_{X^{(\bullet)}}$ or $\mathbb{Z}_X^{(\bullet)}$ the constant inductive system of rings of X indexed by I with value $\mathbb{Z}_X$. Denote by $\mathrm{Mod}(\mathbb{Z})$ (resp. $\mathrm{Mod}(\mathbb{Z}_{X^{(\bullet)}})$) the category of abelian groups (resp. of abelian groups on $X^{(I)}$). Replacing "$\mathcal{H}om$" by "Hom" (resp. "$\mathscr{H}om$"), we define similarly to the construction of 8.2.1.4 the bifunctor (which are in fact the classical bifunctors of homomorphisms of the abelian category $\mathrm{Mod}(\mathcal{D}^{(\bullet)})$):

$$\mathrm{Hom}^\bullet_{\mathcal{D}^{(\bullet)}}(-,-)\colon K(\mathcal{D}^{(\bullet)}) \times K(\mathcal{D}^{(\bullet)}) \to K(\mathbb{Z}),$$
$$\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(-,-)\colon K(\mathcal{D}^{(\bullet)}) \times K(\mathcal{D}^{(\bullet)}) \to K(\mathbb{Z}_{X^{(\bullet)}}).$$

By construction (see respectively 8.2.1.1.1 and 8.2.1.1.3), for any $\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$, for any $(i,U) \in (I^\circ)^\natural \times X_{Zar}$, we have we have the canonical isomorphism of bifunctors

$$\Gamma((i,U),\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}|_{(i,U)}}(\mathcal{E}^{(\bullet)}|_{(i,U)},\ \mathcal{F}^{(\bullet)}|_{(i,U)}) \xrightarrow{\sim} \mathrm{Hom}^\bullet_{\mathcal{D}^{(\bullet)}|_{U^{(\bullet)}}}(\mathcal{E}^{(\bullet)}|_{U^{(\bullet)}},\ \mathcal{F}^{(\bullet)}|_{U^{(\bullet)}}), \tag{8.2.1.5.1}$$
$$\Gamma(U,\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathrm{Hom}^\bullet_{\mathcal{D}^{(\bullet)}|_U}(\mathcal{E}^{(\bullet)}|_U,\ \mathcal{F}^{(\bullet)}|_U). \tag{8.2.1.5.2}$$

8.2.1.6. We recall the following facts.

(a) An object $\mathcal{I}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$ is K-injective if for every acyclic complex $\mathcal{M}^{(\bullet)}$ we have $\mathrm{Hom}_{K(\mathcal{D}^{(\bullet)})}(\mathcal{M}^{(\bullet)},\mathcal{I}^{(\bullet)}) = 0$ (see [Sta22, 070H]).

(b) Products in the derived category $D(\mathcal{D}^{(\bullet)})$ of K-injective objects are obtained by taking termwise products and products of K-injective complexes are K-injective (see [Sta22, 0BK6]).

8.2.1.7. Let U be an open subset of X and $j\colon U \hookrightarrow X$ is the induced open immersion.

(a) Let $\mathcal{I}^{(\bullet)}$ be an injective left $\mathcal{D}^{(\bullet)}$-module. Since $\underset{\to I!}{j}$ is exact (see notation 8.1.1.5), then $\mathcal{I}^{(\bullet)}|U$ is an injective $\mathcal{D}^{(\bullet)}|U$-module. This yields that the functor $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,\mathcal{I}^{(\bullet)})\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathbb{Z}_X)$ is exact.

(b) Since $j^{-1}_{(i,U)} = j^*_{(i,U)}\colon \mathrm{Mod}({}^*\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}({}^*\mathcal{D}^{(\bullet)}|_{(i,U)})$ has an exact left adjoint functor (see 7.1.3.3.2), then it follows from [Sta22, 08BJ] that this functor $j^{-1}_{(i,U)}$ preserves the K-injectivity.

(c) Since $\underset{\to I!}{j}$ is exact (see notation 8.1.1.5), it follows from [Sta22, 08BJ] that for any K-injective complex $\mathcal{I}^{(\bullet)}$ of $K(\mathcal{D}^{(\bullet)})$, the complex $\mathcal{I}^{(\bullet)}|U$ is K-injective as object of $K(\mathcal{D}^{(\bullet)}|U)$.

8.2.1.8. Let $i \in I$, U be an open subset of X and $j\colon U \hookrightarrow X$ be the induced open immersion. It follows by construction from respectively 8.2.1.1.2 and 8.2.1.1.1 that for any $\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$, we have

$$H^n(\Gamma((i,U),\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}))) = \mathrm{Hom}_{K(\mathcal{D}^{(\bullet)}|_{(i,U)})}(\mathcal{E}^{(\bullet)}|_{(i,U)},\mathcal{F}^{(\bullet)}|_{(i,U)}[n])), \tag{8.2.1.8.1}$$
$$H^n(\Gamma(X^{(\bullet)},\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}))) = \mathrm{Hom}_{K(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}[n])). \tag{8.2.1.8.2}$$

Similarly, we check that for any $\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$, we have

$$H^n(\Gamma(U,\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)})) = \mathrm{Hom}_{K(\mathcal{D}^{(\bullet)}|_U)}(\mathcal{E}^{(\bullet)}|U,\mathcal{F}^{(\bullet)}|_U[n])). \tag{8.2.1.8.3}$$

8.2.2 Derived homomorphism bifunctors of $\mathcal{D}^{(\bullet)}$-modules

8.2.2.1. Similarly to [Sta22, 0A95], we check that for any quasi-isomorphism $\mathcal{I}^{(\bullet)} \xrightarrow{\sim} \mathcal{I}'^{(\bullet)}$ of K-injective complexes of $K(\mathcal{D}^{(\bullet)})$, for any quasi-isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$ of complexes of $K(\mathcal{D}^{(\bullet)})$, the morphism of $K(\mathbb{Z}_X)$

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}'^{(\bullet)},\mathcal{I}^{(\bullet)}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{I}'^{(\bullet)}) \tag{8.2.2.1.1}$$

is a quasi-isomorphism.

Let $\mathcal{E}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$ and $F_{\mathcal{E}}\colon K(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}_X)$ be the functor defined by $\mathcal{F}^{(\bullet)} \mapsto \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)})$. By using the isomorphism 8.2.2.1.1 (in the case where $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$ is the identity of $\mathcal{E}^{(\bullet)}$) then it follows from [Sta22, 06XN] that $\mathbb{R}F_{\mathcal{E}}$ is everywhere defined and every K-injective complex computes $\mathbb{R}F_{\mathcal{E}}$. Since this is functorial in $\mathcal{E}^{(\bullet)}$, we get the bifunctor

$$\mathbb{R}_{\mathrm{II}}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,-)\colon K(\mathcal{D}^{(\bullet)}) \times D(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}_X)$$

which is given by $\mathbb{R}_{\mathrm{II}}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) = \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{I}^{(\bullet)})$ where $\mathcal{I}^{(\bullet)}$ is a K-injective complex representing $\mathcal{F}^{(\bullet)}$. Using again 8.2.2.1.1 (this time by varying $\mathcal{E}$), we get the bifunctor

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,-)\colon D(\mathcal{D}^{(\bullet)}) \times D(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}_X), \tag{8.2.2.1.2}$$

which is the unique functor satisfying $\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(Q(-),-) = \mathbb{R}_{\mathrm{II}}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,-)$, where $Q\colon K(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^{(\bullet)})$ is the localisation morphism.

Notation 8.2.2.2. Similarly to 8.2.2.1.2, we get the bifunctors

$$\mathbb{R}\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(-,-)\colon D(\mathcal{D}^{(\bullet)}) \times D((\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}).$$
$$\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,-)\colon D(\mathcal{D}^{(\bullet)}) \times D(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}_{X^{(\bullet)}}).$$

which are respectively given for any $\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$ by the formulas

$$\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) = \mathrm{Hom}^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{I}^{(\bullet)}), \qquad \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) = \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{I}^{(\bullet)})$$

where $\mathcal{I}^{(\bullet)}$ is a K-injective complex representing $\mathcal{F}^{(\bullet)}$.

Remark 8.2.2.3. Let $\mathcal{R}$ be a sheaf on X of commutative rings endowed with a homomorphism of rings $\underleftarrow{l}_{X,I*}(\mathcal{R}) \to \mathcal{D}^{(\bullet)}$ such that the image of $\mathcal{R}$ in $\mathcal{D}^{(i)}$ are sent into the center of $\mathcal{D}^{(i)}$ for any $i \in I$. For instance, we can always take $\mathcal{R} = \mathbb{Z}_X$. Then we get the functor

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,-)\colon D(\mathcal{D}^{(\bullet)}) \times D(\mathcal{D}^{(\bullet)}) \to D(\mathcal{R}), \tag{8.2.2.3.1}$$

whose composition with the forgetful functor $D(\mathcal{R}) \to D(\mathbb{Z}_X)$ is isomorphic to 8.2.2.1.2. We have similar facts for the functors $\mathbb{R}\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(-,-)$ and $\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,-)$.

Lemma 8.2.2.4. *Let $\mathcal{R}$ be a sheaf on X of commutative rings endowed with a homomorphism of rings $\underleftarrow{l}_{X,I*}(\mathcal{R}) \to \mathcal{D}^{(\bullet)}$ such that the image of $\mathcal{R}$ in $\mathcal{D}^{(i)}$ are sent into the center of $\mathcal{D}^{(i)}$ for any $i \in I$. Set $\mathcal{R}^{(\bullet)} := \underleftarrow{l}_{X,I*}(\mathcal{R})$.*

Let $\mathcal{P}^{(\bullet)}$ be a complex of $K(\mathcal{D}^{(\bullet)})$ which is K-flat as an object of $K(\mathcal{R}^{(\bullet)})$. Let $\mathcal{I}^{(\bullet)}$ be a K-injective complex of $K(\mathcal{D}^{(\bullet)})$.

(a) The object $\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet)})$ of $K(\mathcal{R}^{(\bullet)})$ is K-injective.

(b) The object $\mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet)})$ of $K(\mathcal{R})$ is K-injective.

Proof. We prove (a) similarly to [Sta22, 0A96] (our lemma is a non-commutative version): for any acyclic complex $\mathcal{F} \in K(\mathcal{R}^{(\bullet)})$, we get the isomorphisms

$$\mathrm{Hom}_{K(\mathcal{R}^{(\bullet)})}\left(\mathcal{F},\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet)})\right) \xrightarrow[8.2.1.8.2]{\sim} H^0\Gamma\left(X^{(\bullet)},\mathscr{H}om^{\bullet}_{K(\mathcal{R}^{(\bullet)})}\left(\mathcal{F},\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet)})\right)\right)$$
$$\xrightarrow{\sim} H^0\Gamma\left(X^{(\bullet)},\mathscr{H}om^{\bullet}_{K(\mathcal{D}^{(\bullet)})}\left(\mathcal{F}\otimes_{\mathcal{R}^{(\bullet)}}\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet)}\right)\right) \xrightarrow[8.2.1.8.2]{\sim} \mathrm{Hom}_{K(\mathcal{D}^{(\bullet)})}\left(\mathcal{F}\otimes_{\mathcal{R}^{(\bullet)}}\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet)}\right) = 0,$$

which proves (a). Since $\underrightarrow{l}^{(I)}_{X*}$ has an exact left adjoint functor, then the functor $\underrightarrow{l}^{(I)}_{X*}\colon K(\mathcal{R}^{(\bullet)}) \to K(\mathcal{R})$ preserves K-injectivity (see [Sta22, 08BJ]). By using 8.2.1.2.2 this yields (b). □

Proposition 8.2.2.5. *Suppose there exists a sheaf $\mathcal{R}$ on X of commutative rings endowed with a flat homomorphism of rings $\underleftarrow{l}_{X,I*}(\mathcal{R}) \to \mathcal{D}^{(\bullet)}$ such that the image of $\mathcal{R}$ in $\mathcal{D}^{(i)}$ are sent into the center of $\mathcal{D}^{(i)}$ for any $i \in I$. Then for any $\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$, we have the isomorphisms*

$$\mathbb{R}\Gamma(X^{(\bullet)},-)\circ\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}), \tag{8.2.2.5.1}$$

$$\mathbb{R}\underrightarrow{l}^{(I)}_{X*}\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}), \tag{8.2.2.5.2}$$

$$\mathbb{R}\Gamma(X,-)\circ\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}). \tag{8.2.2.5.3}$$

Proof. Let us prove 8.2.2.5.1. Let $\mathcal{P}^{(\bullet)}$ be a K-flat complex of $K(\mathcal{D}^{(\bullet)})$ representing $\mathcal{E}^{(\bullet)}$. Let $\mathcal{I}^{(\bullet)}$ be a K-injective complex of $K(\mathcal{D}^{(\bullet)})$ representing $\mathcal{F}^{(\bullet)}$. We have $\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)})$. Set $\mathcal{R}^{(\bullet)} := \underset{\leftarrow}{l}_{X,I*}(\mathcal{R})$. Since $\mathcal{D}^{(\bullet)}$ is a $\mathcal{R}^{(\bullet)}$-flat module, then $\mathcal{P}^{(\bullet)}$ is K-flat as an object of $K(\mathcal{R}^{(\bullet)})$. Hence, following 8.2.2.4 $\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)})$ is a K-injective object of $K(\mathcal{R}^{(\bullet)})$. This yields the second quasi-isomorphism

$$\mathbb{R}\Gamma(X^{(\bullet)}, \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\Gamma(X^{(\bullet)}, \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)})) \xrightarrow{\sim} \Gamma(X^{(\bullet)}, \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)}))$$
$$= \mathrm{Hom}^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}).$$

Replacing $\mathbb{R}\Gamma(X^{(\bullet)}, -)$ by $\mathbb{R}\underset{\rightarrow}{l}^{(I)}_{X*}$, we get similarly 8.2.2.5.2 from 8.2.1.2.2. Since $\mathbb{R}\Gamma(X, -) \circ \mathbb{R}\underset{\rightarrow}{l}^{(I)}_{X*} \xrightarrow{\sim} \mathbb{R}\Gamma(X^{(\bullet)}, -)$, we get 8.2.2.5.3 from both 8.2.2.5.1 and 8.2.2.5.2. □

8.2.2.6. Let $\mathscr{F}$ be the collection of flasque $\mathbb{Z}_{X^{(\bullet)}}$-modules. We denote by $K^+(\mathscr{F})$ the full subcategory of $K^+(\mathbb{Z}_{X^{(\bullet)}})$ whose objects consist in complexes of terms in $\mathscr{F}$. Since an object of $\mathscr{F}$ is right acyclic for the functors $\underset{\rightarrow}{l}^{(I)}_{X*}$ and $\Gamma(X^{(\bullet)}, -)$, then from Leray's acyclicity lemma (see [Sta22, 015E-Lemma 13.16.7]), the complexes of $K^+(\mathscr{F})$ compute $\mathbb{R}\underset{\rightarrow}{l}^{(I)}_{X*}$ and $\mathbb{R}\Gamma(X^{(\bullet)}, -)$.

For bounded complexes, we can remove the flatness hypothesis of 8.2.2.5:

Proposition 8.2.2.7. *For any $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)}), \mathcal{F}^{(\bullet)} \in D^+(\mathcal{D}^{(\bullet)})$, we have the isomorphisms*

$$\mathbb{R}\Gamma(X^{(\bullet)}, -) \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}), \tag{8.2.2.7.1}$$
$$\mathbb{R}\underset{\rightarrow}{l}^{(I)}_{X*}\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}), \tag{8.2.2.7.2}$$
$$\mathbb{R}\Gamma(X, -) \circ \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}). \tag{8.2.2.7.3}$$

Proof. Let $\mathcal{I}^{(\bullet)}$ be an injective resolution in $K^+(\mathcal{D}^{(\bullet)})$ of $\mathcal{F}^{(\bullet)}$. We have $\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet)})$. Since a product of flasque sheaves is flasque, then by using 8.2.1.3, we get that $\mathscr{H}om^{n}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet)})$ is a flasque abelian sheaf on $X^{(\bullet)}$ for any integer n, i.e. $\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet)}) \in K^+(\mathscr{F})$. Hence, following 8.2.2.6, we get the first isomorphism

$$\mathbb{R}\Gamma(X^{(\bullet)}, -) \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \Gamma(X^{(\bullet)}, \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet)}))$$
$$\underset{8.2.1.1.1}{\xrightarrow{\sim}} \mathrm{Hom}^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}).$$

We proceed similarly to check 8.2.2.7.2. This yields 8.2.2.7.3 by composition. □

8.2.2.8. Let $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$. It follows from 8.2.1.7.(b) and from 8.2.1.2.1 that we have the isomorphisms

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})|_{(i,U)} \cong \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}|_{(i,U)}}(\mathcal{E}^{(\bullet)}|_{(i,U)}, \mathcal{F}^{(\bullet)}|_{(i,U)}), \tag{8.2.2.8.1}$$
$$\underset{\rightarrow}{i}^{-1}_{X}(\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}|_i}(\mathcal{E}^{(\bullet)}|_i, \mathcal{F}^{(\bullet)}|_i). \tag{8.2.2.8.2}$$

8.2.3 From I to $I^{\emptyset}$

8.2.3.1. We denote by $I^{\emptyset}$ the partially ordered set whose elements are equal to that of I and with the coarse order, i.e. $i \leq j$ if and only if $i = j$. We get the increasing map $\rho_I : I^{\emptyset} \to I$ of partially ordered sets. Following 8.1.1.2.1, this yields the morphism of topos $\underset{\rightarrow}{\rho}_{I,X} : X^{(I^{\emptyset})} \to X^{(I)}$. We set $\mathcal{D}^{(\bullet)}_{\emptyset} := \underset{\rightarrow}{\rho}^{-1}_{I,X}(\mathcal{D}^{(\bullet)})$, i.e. $\mathcal{D}^{(\bullet)}_{\emptyset}$ is the family $(\mathcal{D}^{(i)})_{i \in I}$ without transition maps (except the identities given by $i \leq i$). We get the morphism of ringed topoi $\underset{\rightarrow}{\rho}_{I,X} : (X^{(I^{\emptyset})}, \mathcal{D}^{(\bullet)}_{\emptyset}) \to (X^{(I)}, \mathcal{D}^{(\bullet)})$. The functor $\underset{\rightarrow}{\rho}^{-1}_{I,X} : \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)}_{\emptyset})$ is the forgetful functor (of the transition maps). It has a left adjoint functor that we will denote by $\underset{\rightarrow}{\rho}_{I,X,!} : \mathrm{Mod}(\mathcal{D}^{(\bullet)}_{\emptyset}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)})$ (even if the notation is the same, beware this is different from the left adjoint of 8.1.1.2.2 computed in the category of sheaves of sets, but we will only consider the modules case). Let $\mathcal{E}^{(\bullet)}_{\emptyset}$ be a left $\mathcal{D}^{(\bullet)}_{\emptyset}$-module. We denote by $\mathcal{F}^{(i)} = \oplus_{h \leq i} \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(h)}} \mathcal{E}^{(h)}_{\emptyset}$ and for any $i \leq j$ and by $\alpha^{j,i} : \mathcal{F}^{(i)} \to \mathcal{F}^{(j)}$ the canonical transition maps induced for any elements $h \leq i$ of I by the canonical maps $\mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(h)}} \mathcal{E}^{(h)}_{\emptyset} \to \mathcal{D}^{(j)} \otimes_{\mathcal{D}^{(h)}} \mathcal{E}^{(h)}_{\emptyset} \to \mathcal{F}^{(j)}$. Then $\underset{\rightarrow}{\rho}_{I,X,!}(\mathcal{E}^{(\bullet)}_{\emptyset}) = (\mathcal{F}^{(i)}, \alpha^{(j,i)})$.

8.2.3.2. Let U be an open subset of X and $j\colon U \hookrightarrow X$ be the induced open immersion. With notation 8.1.1.2.7, we have

$$\underrightarrow{j}_{I}^{-1} \circ \underrightarrow{\rho}_{I,X,!} \xrightarrow{\sim} \underrightarrow{\rho}_{I,U,!} \circ \underrightarrow{j}_{I^{\emptyset}}^{-1}. \tag{8.2.3.2.1}$$

8.2.3.3. Let $\mathscr{P}_{\emptyset}$ be the collection of flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-modules. We denote by $K^{-}(\mathscr{P}_{\emptyset})$ the full subcategory of $K^{-}(\mathcal{D}_{\emptyset}^{(\bullet)})$ whose objects consist in complexes of terms in $\mathscr{P}_{\emptyset}$.

Let $0 \to \mathcal{P}_{\emptyset}^{\prime(\bullet)} \to \mathcal{P}_{\emptyset}^{(\bullet)} \to \mathcal{P}_{\emptyset}^{\prime\prime(\bullet)} \to 0$ be a short exact sequence of flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-modules. For any $i \in I$, $\mathcal{P}_{\emptyset}^{\prime\prime(i)}$ is a flat $\mathcal{D}^{(i)}$-module. Hence, for any $i \in I$, we get the short exact sequence of flat left $\mathcal{D}^{(i)}$-modules

$$0 \to \oplus_{h \leq i} \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(h)}} \mathcal{P}_{\emptyset}^{\prime(h)} \to \oplus_{h \leq i} \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(h)}} \mathcal{P}_{\emptyset}^{(h)} \to \oplus_{h \leq i} \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(h)}} \mathcal{P}_{\emptyset}^{\prime\prime(h)} \to 0,$$

i.e. we have the short exact sequence $0 \to \underrightarrow{\rho}_{I,X,!}(\mathcal{P}_{\emptyset}^{\prime(\bullet)}) \to \underrightarrow{\rho}_{I,X,!}(\mathcal{P}_{\emptyset}^{(\bullet)}) \to \underrightarrow{\rho}_{I,X,!}(\mathcal{P}_{\emptyset}^{\prime\prime(\bullet)}) \to 0$ of flat left $\mathcal{D}^{(\bullet)}$-modules. Since any left $\mathcal{D}_{\emptyset}^{(\bullet)}$-modules is a quotient of a flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module, it follows from [Sta22, 05T9] that the objects of $\mathscr{P}_{\emptyset}$ are acyclic for the functor $\mathbb{L}\underrightarrow{\rho}_{I,X,!}$. Hence, from Leray's acyclicity lemma (see the dual version of [Sta22, 015E]), the complexes of $K^{-}(\mathscr{P}_{\emptyset})$ compute $\mathbb{L}\underrightarrow{\rho}_{I,X,!}$.

Let $\mathcal{E}_{\emptyset}^{(\bullet)} \in K^{-}(\mathcal{D}_{\emptyset}^{(\bullet)})$. By using [Sta22, 05T7], there exists a quasi-isomorphism of $\mathcal{P}_{\emptyset}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}_{\emptyset}^{(\bullet)}$ of $K^{-}(\mathcal{D}_{\emptyset}^{(\bullet)})$ with $\mathcal{P}_{\emptyset}^{(\bullet)} \in K^{-}(\mathscr{P}_{\emptyset})$. Hence, $\mathbb{L}\underrightarrow{\rho}_{I,X,!}$ is defined at $\mathcal{E}_{\emptyset}^{(\bullet)}$ and we have

$$\underrightarrow{\rho}_{I,X,!}(\mathcal{P}_{\emptyset}^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}\underrightarrow{\rho}_{I,X,!}(\mathcal{E}_{\emptyset}^{(\bullet)}). \tag{8.2.3.3.1}$$

8.2.3.4. Let $\mathcal{E}_{\emptyset}^{(\bullet)}$ be a left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module and $\mathcal{F}^{(\bullet)}$ be a left $\mathcal{D}^{(\bullet)}$-module. By adjointness (and also use 8.2.3.2.1 for the first isomorphism of the second line) we have

$$\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\underrightarrow{\rho}_{I,X,!}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathrm{Hom}_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{E}_{\emptyset}^{(\bullet)}, \underrightarrow{\rho}_{I,X}^{-1}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \prod_{i \in I} \mathrm{Hom}_{\mathcal{D}^{(i)}}(\mathcal{E}_{\emptyset}^{(i)}, \mathcal{F}^{(i)}), \tag{8.2.3.4.1}$$

$$\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underrightarrow{\rho}_{I,X,!}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{E}_{\emptyset}^{(\bullet)}, \underrightarrow{\rho}_{I,X}^{-1}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \prod_{i \in I} \mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}_{\emptyset}^{(i)}, \mathcal{F}^{(i)}). \tag{8.2.3.4.2}$$

8.2.3.5. Let $\mathcal{E}_{\emptyset}^{(\bullet)}$ be a left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module and $\mathcal{F}^{(\bullet)}$ be a left $\mathcal{D}^{(\bullet)}$-module.

(a) The object $\mathscr{H}om_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{E}_{\emptyset}^{(\bullet)}, \underrightarrow{\rho}_{I,X}^{-1}\mathcal{F}^{(\bullet)})$ is an abelian sheaf on $X^{(I^{\emptyset})}$. With notation 8.1.1.2.5, for any $i \in I^{\emptyset}$, we compute

$$\underrightarrow{i}_{X}^{-1}\left(\mathscr{H}om_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{E}_{\emptyset}^{(\bullet)}, \underrightarrow{\rho}_{I,X}^{-1}\mathcal{F}^{(\bullet)})\right) = \mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}_{\emptyset}^{(i)}, \mathcal{F}^{(i)}). \tag{8.2.3.5.1}$$

(b) On the other hand, the object $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underrightarrow{\rho}_{I,X,!}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)})$ an abelian sheaf on $X^{(I)}$. By construction (see 8.2.1.1.2), $\mathrm{Hom}_{X^{(I)}}((i,U), \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underrightarrow{\rho}_{I,X,!}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)}))$ corresponds to a compatible family of $\mathcal{D}^{(j)}|_U$-linear homomorphisms $\oplus_{h \leq j} \mathcal{D}^{(j)} \otimes_{\mathcal{D}^{(h)}} \mathcal{E}_{\emptyset}^{(h)}|_U \to \mathcal{F}^{(j)}|_U$ for any $j \geq i$, which is equal to a compatible family of $\mathcal{D}^{(h)}|_U$-linear homomorphisms $\mathcal{E}_{\emptyset}^{(h)}|_U \to \mathcal{F}^{(j)}|_U$ for any $j \geq i$ and any $h \leq j$, which is equal to a family of $\mathcal{D}^{(h)}|_U$-linear homomorphisms $\mathcal{E}_{\emptyset}^{(h)}|_U \to \mathcal{F}^{(i)}|_U$ any $h < i$ and of a family of $\mathcal{D}^{(j)}|_U$-linear homomorphisms $\mathcal{E}_{\emptyset}^{(j)}|_U \to \mathcal{F}^{(j)}|_U$ any $j \geq i$.

$$\underrightarrow{i}_{X}^{-1}\left(\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underrightarrow{\rho}_{I,X,!}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)})\right) = \prod_{j \geq i} \mathcal{H}om_{\mathcal{D}^{(j)}}(\mathcal{E}_{\emptyset}^{(j)}, \mathcal{F}^{(j)}) \times \prod_{h < i} \mathcal{H}om_{\mathcal{D}^{(h)}}(\mathcal{E}_{\emptyset}^{(h)}, \mathcal{F}^{(i)}). \tag{8.2.3.5.2}$$

8.2.3.6. Let $\mathrm{Mod}(\mathbb{Z})$ be the category of abelian groups. Since products are exact, then following [Sta22, 07KC] we can check the following properties

(a) $D(\mathbb{Z})$ has products,

(b) products $\prod_{i\in I} K_i$ in $D(\mathbb{Z})$ are obtained by taking termwise products of any complexes representing the K_i, and

(c) $H^n(\prod_{i\in I} K_i) = \prod_{i\in I} H^n(K_i)$ for any integer $n \in \mathbb{Z}$.

Lemma 8.2.3.7. *We have the following properties.*

(a) If $\mathcal{I}_\emptyset^{(\bullet)}$ is an injective left $\mathcal{D}_\emptyset^{(\bullet)}$-module then $\mathcal{I}_\emptyset^{(i)}$ is an injective left $\mathcal{D}_\emptyset^{(i)}$-module for any $i \in I$.

(b) A complex $\mathcal{E}_\emptyset^{(\bullet)} \in K({}^{\mathrm{l}}\mathcal{D}_\emptyset^{(\bullet)})$ is a K-injective if and only if $\mathcal{E}_\emptyset^{(i)}$ is a K-injective complex of $K(\mathcal{D}^{(i)})$ for any $i \in I$.

Proof. This is a consequence of 7.1.3.21.c-d. □

8.2.3.8. Let $\mathcal{E}_\emptyset^{(\bullet)}, \mathcal{F}_\emptyset^{(\bullet)} \in D({}^{\mathrm{l}}\mathcal{D}_\emptyset^{(\bullet)})$. Let $\mathcal{R}$ be a sheaf on X of commutative rings endowed with a homomorphism of rings $\underleftarrow{l}_{X,I,*}(\mathcal{R}) \to \mathcal{D}^{(\bullet)}$ such that the image of $\mathcal{R}$ in $\mathcal{D}^{(i)}$ are sent into the center of $\mathcal{D}^{(i)}$ for any $i \in I$. Let $R := \Gamma(X, \mathcal{R})$.

(a) Let $\mathcal{I}_\emptyset^{(\bullet)}$ be a K-injective complex of $K(\mathcal{D}_\emptyset^{(\bullet)})$ representing $\mathcal{F}_\emptyset^{(\bullet)}$. Following 8.2.3.7, for any $i \in I$, the object $\mathcal{I}_\emptyset^{(i)}$ is a K-injective complex of $K(\mathcal{D}^{(i)})$ representing $\mathcal{F}_\emptyset^{(i)}$. We have therefore in $D(R)$ the isomorphisms:

$$\mathbb{R}\operatorname{Hom}_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)}, \mathcal{F}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \operatorname{Hom}^\bullet_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)}, \mathcal{I}_\emptyset^{(\bullet)}) = \prod_{i\in I} \operatorname{Hom}^\bullet_{\mathcal{D}^{(i)}}(\mathcal{E}_i^{(\bullet)}, \mathcal{I}_\emptyset^{(i)}) \underset{8.2.3.6}{\xrightarrow{\sim}} \prod_{i\in I} \mathbb{R}\operatorname{Hom}_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)}, \mathcal{F}_\emptyset^{(i)}). \tag{8.2.3.8.1}$$

(b) Suppose $\mathcal{D}^{(\bullet)}$ is a flat $\underleftarrow{l}_{X,I,*}(\mathcal{R})$-module, which is equivalent to saying that $\mathcal{D}^{(i)}$ is a flat $\mathcal{R}^{(i)}$-module for any $i \in I$. Set $\mathcal{R}^{(\bullet)} := \underleftarrow{l}_{X,I*}(\mathcal{R})$ and $\mathcal{R}_\emptyset^{(\bullet)} := \underleftarrow{l}_{X,I^\emptyset,*}(\mathcal{R})$. Let $\mathcal{P}_\emptyset^{(\bullet)}$ be a K-flat complex of $K(\mathcal{D}_\emptyset^{(\bullet)})$ representing $\mathcal{E}_\emptyset^{(\bullet)}$. Let $\mathcal{I}_\emptyset^{(\bullet)}$ be a K-injective complex of $K(\mathcal{D}_\emptyset^{(\bullet)})$ representing $\mathcal{F}_\emptyset^{(\bullet)}$. This yields $\mathbb{R}\mathcal{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)}, \mathcal{F}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \mathcal{H}om^\bullet_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{P}_\emptyset^{(\bullet)}, \mathcal{I}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \prod_{i\in I} \mathcal{H}om^\bullet_{\mathcal{D}^{(i)}}(\mathcal{P}_\emptyset^{(i)}, \mathcal{I}_\emptyset^{(i)})$, where the product is computed in $K(\mathcal{R})$. For any $i \in I$, it follows from respectively 8.1.1.6 and 8.2.3.7 that $\mathcal{P}_\emptyset^{(i)}$ is a K-flat complex of $K(\mathcal{D}^{(i)})$ representing $\mathcal{E}_\emptyset^{(i)}$ and $\mathcal{I}_\emptyset^{(i)}$ is a K-injective complex of $K(\mathcal{D}^{(i)})$ representing $\mathcal{F}_\emptyset^{(i)}$. Since $\mathcal{D}^{(i)}$ is a flat $\mathcal{R}$-module, then $\mathcal{P}_\emptyset^{(\bullet)}$ is K-flat as an object of $K(\mathcal{R})$. Hence, following 8.2.2.4 $\mathcal{H}om^\bullet_{\mathcal{D}^{(i)}}(\mathcal{P}_\emptyset^{(i)}, \mathcal{I}_\emptyset^{(i)})$ is a K-injective object of $K(\mathcal{R})$. Using 8.2.1.6.b, we get in $D(\mathcal{R})$ the isomorphism of complexes $\mathcal{H}om^\bullet_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{P}_\emptyset^{(\bullet)}, \mathcal{I}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \prod_{i\in I} \mathcal{H}om^\bullet_{\mathcal{D}^{(i)}}(\mathcal{P}_\emptyset^{(i)}, \mathcal{I}_\emptyset^{(i)}) \xrightarrow{\sim} \prod_{i\in I} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)}, \mathcal{F}_\emptyset^{(i)})$, where the products are computed in $D(\mathcal{R})$. By composition, we get the isomorphism in $D(\mathcal{R})$:

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)}, \mathcal{F}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \prod_{i\in I} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)}, \mathcal{F}_\emptyset^{(i)}). \tag{8.2.3.8.2}$$

Similarly, for any $i \in I$, by using 8.2.3.5.1, 8.2.2.4 and 8.2.3.7, we can check the isomorphism in $D(\mathcal{R})$:

$$\underrightarrow{i}_X^{-1}\left(\mathbb{R}\mathscr{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)}, \mathcal{F}_\emptyset^{(\bullet)})\right) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)}, \mathcal{F}_\emptyset^{(i)}). \tag{8.2.3.8.3}$$

8.2.3.9. Let $\mathscr{F}_\emptyset$ be the collection of flasque $\mathbb{Z}_{X^{(I^\emptyset)}}$-modules. Recall, with the definition 7.1.3.14, following 7.1.2.19.(a), a $\mathbb{Z}_{X^{(I^\emptyset)}}$-module $\mathcal{E}^{(\bullet)}$ is flasque if and only if $\mathcal{E}^{(i)}$ is a flasque sheaf of sets on X for any $i \in I$. We denote by $K^+(\mathscr{F}_\emptyset)$ the full subcategory of $K^+(\mathbb{Z}_{X^{(I^\emptyset)}})$ whose objects consist in complexes of terms in $\mathscr{F}_\emptyset$.

(a) Since the objects of $\mathscr{F}_\emptyset$ are acyclic for the functor $\underleftarrow{l}_{X,I^\emptyset,*}$, then from Leray's acyclicity lemma (see [Sta22, 015E]), the complexes of $K^+(\mathscr{F}_\emptyset)$ compute $\mathbb{R}\underleftarrow{l}_{X,I^\emptyset,*}$ (beware, the functor $\underleftarrow{l}_{X,I^\emptyset,*} = \prod_{i\in I}$ is the product computed in $K^+(\mathbb{Z}_X)$ and is not exact). Following 7.1.3.14, there exists a quasi-isomorphism of $\mathcal{E}_\emptyset^{(\bullet)} \xrightarrow{\sim} \mathcal{F}_\emptyset^{(\bullet)}$ of $K^+(\mathbb{Z}_{X^{(I^\emptyset)}})$ with $\mathcal{F}_\emptyset^{(\bullet)} \in K^+(\mathscr{F}_\emptyset)$ and we have

$$\mathbb{R}\underleftarrow{l}_{X,I^\emptyset,*}(\mathcal{E}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \underleftarrow{l}_{X,I^\emptyset,*}(\mathcal{F}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \prod_{i\in I} \mathcal{F}_\emptyset^{(i)}, \tag{8.2.3.9.1}$$

where $\prod_{i\in I}\mathcal{F}_\emptyset^{(i)}$ is the product computed in $K^+(\mathbb{Z}_X)$ (i.e. it is computed by taking termwise products).

(b) Let $\mathcal{F}_\emptyset^{(\bullet)}$ be an object of $K^+(\mathscr{F}_\emptyset)$, i.e. let $\mathcal{F}_\emptyset^{(i)}$ be a collection of flasque abelian sheaves on X for any $i\in I$. Let $\mathcal{I}_\emptyset^{(\bullet)}$ be a complex of injective $\mathbb{Z}_{X^{(I^\emptyset)}}$-modules together with a quasi-isomorphism $\mathcal{F}_\emptyset^{(\bullet)}\xrightarrow{\sim}\mathcal{I}_\emptyset^{(\bullet)}$. Since this latter map is a quasi-isomorphism between two objects of $K^+(\mathscr{F}_\emptyset)$, then it follows from 8.2.3.9.1 that the induced morphism $\prod_{i\in I}\mathcal{F}_\emptyset^{(i)}\to\prod_{i\in I}\mathcal{I}_\emptyset^{(i)}$ is a quasi-isomorphism of $K^+(\mathbb{Z}_X)$. Since $\prod_{i\in I}\mathcal{I}_\emptyset^{(i)}$ is also equal to the product computed in $D^+(\mathbb{Z}_X)$ (see 8.2.1.6.b), this yields that $\prod_{i\in I}\mathcal{F}_\emptyset^{(i)}$ is also the product computed in $D^+(\mathbb{Z}_X)$. By default, a product $\prod_{i\in I}$ will means a product in the derived category.

8.2.3.10. Let $\mathcal{E}_\emptyset^{(\bullet)}\in D^-({}^{\mathrm{l}}\mathcal{D}_\emptyset^{(\bullet)})$, $\mathcal{F}_\emptyset^{(\bullet)}\in D^+({}^{\mathrm{l}}\mathcal{D}_\emptyset^{(\bullet)})$. Let $\mathcal{R}$ be a sheaf on X of commutative rings endowed with a homomorphism of rings $\underset{\leftarrow}{l}_{X,I,*}(\mathcal{R})\to\mathcal{D}^{(\bullet)}$ such that the image of $\mathcal{R}$ in $\mathcal{D}^{(i)}$ are sent into the center of $\mathcal{D}^{(i)}$ for any $i\in I$. Let $R:=\Gamma(X,\mathcal{R})$. Thanks to our boundedness hypotheses on $\mathcal{E}_\emptyset^{(\bullet)}$ and $\mathcal{F}_\emptyset^{(\bullet)}$, we can check the above isomorphism 8.2.3.8.2 without the hypotheses (even if this is in general harmless when $\mathcal{D}^{(\bullet)}$ comes from the theory of $\mathcal{D}$-modules) that $\mathcal{D}^{(\bullet)}$ is a flat $\underset{\leftarrow}{l}_{X,I,*}(\mathcal{R})$-module (therefore we can always choose $\mathcal{R}=\mathbb{Z}_X$) as follows:

Let $\mathcal{I}_\emptyset^{(\bullet)}$ be an injective resolution in $K^+(\mathcal{D}_\emptyset^{(\bullet)})$ of $\mathcal{F}_\emptyset^{(\bullet)}$. This yields the quasi-isomorphisms in $K(\mathbb{Z}_X)$:

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)},\mathcal{F}_\emptyset^{(\bullet)})\xrightarrow{\sim}\mathcal{H}om^\bullet_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)},\mathcal{I}_\emptyset^{(\bullet)})\xrightarrow{\sim}\prod_{i\in I}\mathcal{H}om^\bullet_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)},\mathcal{I}_\emptyset^{(i)}),\tag{8.2.3.10.1}$$

where the product is computed in $K(\mathbb{Z}_X)$. Since a product of flasque sheaves is flasque, then by using 8.2.1.3, we get that $\mathcal{H}om^n_{\mathcal{D}_\emptyset^{(i)}}(\mathcal{E}_\emptyset^{(i)},\mathcal{I}_\emptyset^{(i)})$ is a flasque sheaf for any integer n. Hence following 8.2.3.9.(b), the product appearing at 8.2.3.10.1 is also a product in $D(\mathbb{Z}_X)$. Since $\mathcal{I}_\emptyset^{(i)}$ is an injective resolution in $K^+(\mathcal{D}_\emptyset^{(i)})$ of $\mathcal{F}_\emptyset^{(i)}$ for any $i\in I$, this yields the isomorphism in $D(\mathbb{Z}_X)$

$$\prod_{i\in I}\mathcal{H}om^\bullet_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)},\mathcal{I}_\emptyset^{(i)})\xrightarrow{\sim}\prod_{i\in I}\mathbb{R}\mathcal{H}om^\bullet_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)},\mathcal{F}_\emptyset^{(i)}),\tag{8.2.3.10.2}$$

where the product of the right term is the product in $D(\mathbb{Z}_X)$. By composing 8.2.3.10.1 and 8.2.3.10.2, we get the isomorphism in $D^+(\mathbb{Z}_X)$:

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)},\mathcal{F}_\emptyset^{(\bullet)})\xrightarrow{\sim}\prod_{i\in I}\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)},\mathcal{F}_\emptyset^{(i)}).\tag{8.2.3.10.3}$$

Similarly, for any $i\in I$, we get the isomorphism in $D^+(\mathbb{Z}_X)$:

$$\underset{\rightarrow}{i}{}_X^{-1}\left(\mathbb{R}\mathscr{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)},\mathcal{F}_\emptyset^{(\bullet)})\right)\xrightarrow{\sim}\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}_\emptyset^{(i)},\mathcal{F}_\emptyset^{(i)}).\tag{8.2.3.10.4}$$

8.2.3.11. Let $\mathcal{I}^{(\bullet)}$ be an injective left $\mathcal{D}^{(\bullet)}$-module, $\mathcal{Q}_\emptyset^{(\bullet)}$ be a flat left $\mathcal{D}_\emptyset^{(\bullet)}$-module. Since $\mathcal{Q}_\emptyset^{(i)}$ is a flat left $\mathcal{D}^{(i)}$-module for any $i\in I$ (see 7.1.3.6), then $\mathcal{I}^{(i)}$ is acyclic for the functors $\mathrm{Hom}_{\mathcal{D}^{(i)}}(\mathcal{Q}_\emptyset^{(i)},-)$ and $\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{Q}_\emptyset^{(i)},-)$ (see 7.1.3.21.b). This means that $\underset{\rightarrow}{\rho}{}_{I,X}^{-1}(\mathcal{I}^{(\bullet)})$ is acyclic for the functor $\mathrm{Hom}_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{Q}_\emptyset^{(\bullet)},-)$ and $\mathcal{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{Q}_\emptyset^{(\bullet)},-)$. Moreover, $\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{Q}^{(i)},\mathcal{I}^{(i)})$ is flasque for any $i\in I$ (see 7.1.3.21.a).

8.2.3.12. Let $\mathcal{E}_\emptyset^{(\bullet)}\in D^-(\mathcal{D}_\emptyset^{(\bullet)})$ and $\mathcal{F}^{(\bullet)}\in D^+(\mathcal{D}^{(\bullet)})$.

(a) By taking a flat resolution of $\mathcal{E}^{(\bullet)}$ and an injective resolution of $\mathcal{F}^{(\bullet)}$, by using 8.2.3.3.1, 8.2.3.4.1 (resp. 8.2.3.8.1) we get the following first (resp. second) isomorphism:

$$\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathbb{L}\underset{\rightarrow}{\rho}_{I,X,!}(\mathcal{E}_\emptyset^{(\bullet)}),\mathcal{F}^{(\bullet)})\xrightarrow{\sim}\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{E}_\emptyset^{(\bullet)},\underset{\rightarrow}{\rho}{}_{I,X}^{-1}\mathcal{F}^{(\bullet)})\xrightarrow{\sim}\prod_{i\in I}\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(i)}}(\mathcal{E}^{(i)},\mathcal{F}^{(i)}).\tag{8.2.3.12.1}$$

(b) Similarly, by using 8.2.3.3.1, 8.2.3.4.2, (resp. 8.2.3.10.3) the following first (resp. second) isomorphisms

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathbb{L}\underset{\to I,X,!}{\rho}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{E}_{\emptyset}^{(\bullet)}, \underset{\to I,X}{\rho}^{-1}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \prod_{i\in I} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}^{(i)}, \mathcal{F}^{(i)}). \tag{8.2.3.12.2}$$

(c) We have the isomorphism

$$\underset{\to X}{i}^{-1}\left(\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathbb{L}\underset{\to I,X,!}{\rho}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)})\right) = \prod_{j\geq i} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(j)}}(\mathcal{E}_{\emptyset}^{(j)}, \mathcal{F}^{(j)}) \times \prod_{h<i} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(h)}}(\mathcal{E}_{\emptyset}^{(h)}, \mathcal{F}^{(i)}). \tag{8.2.3.12.3}$$

Indeed, let $\mathcal{P}_{\emptyset}^{(\bullet)\bullet} \in K^-(\mathscr{P}_{\emptyset})$ together with a quasi-isomorphism of $K^-(\mathcal{D}_{\emptyset}^{(\bullet)})$ of the form $\mathcal{P}_{\emptyset}^{(\bullet),\bullet} \xrightarrow{\sim} \mathcal{E}_{\emptyset}^{(\bullet)}$ (see notation 8.2.3.3). Let $\mathcal{I}^{(\bullet)\bullet}$ be an injective resolution in $K^+(\mathcal{D}^{(\bullet)})$ of $\mathcal{F}^{(\bullet)}$. Following 8.2.3.3.1, we get

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathbb{L}\underset{\to I,X,!}{\rho}(\mathcal{E}_{\emptyset}^{(\bullet)}), \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{P}_{\emptyset}^{(\bullet),\bullet}), \mathcal{I}^{(\bullet),\bullet}).$$

Since $\underset{\to X}{i}^{-1}$ commutes with finite products, we get for any $n \in \mathbb{Z}$ the first equality:

$$\begin{aligned}\underset{\to X}{i}^{-1}\left(\mathscr{H}om^{n}_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{P}_{\emptyset}^{(\bullet),\bullet}), \mathcal{I}^{(\bullet),\bullet})\right) &= \prod_{p\in\mathbb{Z}} \underset{\to X}{i}^{-1}\left(\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{P}_{\emptyset}^{(\bullet),p}), \mathcal{I}^{(\bullet),n+p})\right)\\ &\overset{8.2.3.5.2}{=} \prod_{p\in\mathbb{Z}}\left(\prod_{j\geq i}\mathcal{H}om_{\mathcal{D}^{(j)}}(\mathcal{P}_{\emptyset}^{(j),p}, \mathcal{I}^{(j),n+p}) \times \prod_{h<i}\mathcal{H}om_{\mathcal{D}^{(h)}}(\mathcal{P}_{\emptyset}^{(h),p}, \mathcal{I}^{(i),n+p})\right)\\ &\overset{8.2.1.4.1}{=} \prod_{j\geq i}\mathcal{H}om^{n}_{\mathcal{D}^{(j)}}(\mathcal{P}_{\emptyset}^{(j),\bullet}, \mathcal{I}^{(j),\bullet}) \times \prod_{h<i}\mathcal{H}om^{n}_{\mathcal{D}^{(h)}}(\mathcal{P}_{\emptyset}^{(h),\bullet}, \mathcal{I}^{(i),\bullet}).\end{aligned}$$

This yields

$$\underset{\to X}{i}^{-1}\left(\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{P}_{\emptyset}^{(\bullet),\bullet}), \mathcal{I}^{(\bullet),\bullet})\right) = \prod_{j\geq i}\mathcal{H}om^{\bullet}_{\mathcal{D}^{(j)}}(\mathcal{P}_{\emptyset}^{(j),\bullet}, \mathcal{I}^{(j),\bullet}) \times \prod_{h<i}\mathcal{H}om^{\bullet}_{\mathcal{D}^{(h)}}(\mathcal{P}_{\emptyset}^{(h),\bullet}, \mathcal{I}^{(i),\bullet}), \tag{8.2.3.12.4}$$

where the products are computed in $K(\mathbb{Z}_X)$. Since a product of flasque sheaves is flasque, then by using 8.2.3.11, we get that the sheaf $\mathcal{H}om^{n}_{\mathcal{D}^{(h)}}(\mathcal{I}_{\emptyset}^{(h),\bullet}, \mathcal{P}^{(j),\bullet})$ is flasque for any $h \leq j$ and any n. Hence following 8.2.3.9.(b), the product appearing at 8.2.3.12.4 is also a product in $D(\mathbb{Z}_X)$. From Leray's acyclicity lemma (see [Sta22, 015E]), it follows from 8.2.3.11 that for any $h \leq j$, any p we have

$$\mathcal{H}om^{\bullet}_{\mathcal{D}^{(h)}}(\mathcal{P}_{\emptyset}^{(h),\bullet}, \mathcal{I}^{(i),\bullet}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(h)}}(\mathcal{E}_{\emptyset}^{(h),\bullet}, \mathcal{F}^{(i),\bullet}).$$

Hence, we are done.

Proposition 8.2.3.13. *Let $u\colon I \to I'$ be increasing map of partially ordered sets, $\mathcal{D}'^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I')}$ endowed with a homomorphism of sheaf of rings $\mathcal{D}^{(\bullet)} \to \underset{\to X}{u}^{-1}(\mathcal{D}'^{(\bullet)})$. Let $\mathcal{F}'^{(\bullet)}$ be a left $\mathcal{D}'^{(\bullet)}$-module. We consider $\underset{\to X}{u}^{-1}(\mathcal{F}'^{(\bullet)})$ as a left $\mathcal{D}^{(\bullet)}$-module via the homomorphism $\mathcal{D}^{(\bullet)} \to \underset{\to X}{u}^{-1}(\mathcal{D}'^{(\bullet)})$.*

(a) Suppose $\underset{\to I',X}{\rho}^{-1}(\mathcal{F}'^{(\bullet)})$ is acyclic for the functors $\mathrm{Hom}_{\mathcal{D}'^{(\bullet)}_{\emptyset}}(\mathcal{Q}'^{(\bullet)}_{\emptyset}, -)$ for any flat left $\mathcal{D}'^{(\bullet)}_{\emptyset}$-module $\mathcal{Q}'^{(\bullet)}_{\emptyset}$. Then, for any flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module $\mathcal{Q}_{\emptyset}^{(\bullet)}$, we have:

(i) the left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module $\underset{\to I,X}{\rho}^{-1}(\underset{\to X}{u}^{-1}(\mathcal{F}'^{(\bullet)}))$ is acyclic for the functor $\mathrm{Hom}_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{Q}_{\emptyset}^{(\bullet)}, -)$,

(ii) the module $\underset{\to X}{u}^{-1}(\mathcal{F}'^{(\bullet)})$ is acyclic for the functor $\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}), -)$.

(b) Suppose $\mathcal{I}'^{(\bullet)} := \mathcal{F}'^{(\bullet)}$ is an injective left $\mathcal{D}'^{(\bullet)}$-module and let $\mathcal{Q}_{\emptyset}^{(\bullet)}$ be a flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module. Then:

(i) The left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module $\underset{\rightarrow I,X}{\rho}^{-1}(\underset{\rightarrow X}{u}^{-1}(\mathcal{I}'^{(\bullet)}))$ is right acyclic for both functors $\mathrm{Hom}_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{Q}_{\emptyset}^{(\bullet)},-)$ *and* $\mathcal{H}om_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{Q}_{\emptyset}^{(\bullet)},-)$ *;*

(ii) The module $\underset{\rightarrow X}{u}^{-1}(\mathcal{I}'^{(\bullet)})$ is right acyclic for the three functors of the form $\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),-)$, $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),-)$ *and* $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),-)$ *;*

(iii) The abelian sheaves $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),\underset{\rightarrow X}{u}^{-1}(\mathcal{I}'^{(\bullet)}))$ *and* $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),\underset{\rightarrow X}{u}^{-1}(\mathcal{I}'^{(\bullet)}))$ *are flasque.*

Proof. Let us check a). Since the non-respective case is checked similarly, let us prove the respective case. Let $\mathcal{Q}_{\emptyset}^{(\bullet)}$ be a flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module. We get $\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)})$ (see 8.2.3.3). By using the isomorphism

$$\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),\underset{\rightarrow X}{u}^{-1}(\mathcal{F}'^{(\bullet)})) \underset{8.2.3.12.1}{\xrightarrow{\sim}} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{Q}_{\emptyset}^{(\bullet)},\underset{\rightarrow I,X}{\rho}^{-1}(\underset{\rightarrow X}{u}^{-1}(\mathcal{F}'^{(\bullet)}))) \tag{8.2.3.13.1}$$

we reduce to check (i).

Following 8.2.3.6 and 8.2.3.8.1, the hypothesis on $\underset{\rightarrow I',X}{\rho}^{-1}(\mathcal{F}'^{(\bullet)})$ is equivalent to saying that for any $i' \in I'$ the module $\mathcal{F}'^{(i')}$ is acyclic for the functors $\mathrm{Hom}_{\mathcal{D}'^{(i')}}(\mathcal{Q}'^{(i')},-)$ for any flat left $\mathcal{D}'^{(i')}$-module $\mathcal{Q}'^{(i')}$. This yields the last isomorphisms in $D^+(\mathbb{Z})$ (recall products are easily computed in $D^+(\mathbb{Z})$: see 8.2.3.6):

$$\begin{gathered}\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{Q}_{\emptyset}^{(\bullet)},\underset{\rightarrow I,X}{\rho}^{-1}(\underset{\rightarrow X}{u}^{-1}(\mathcal{F}'^{(\bullet)}))) \underset{8.2.3.8.1}{\xrightarrow{\sim}} \prod_{i\in I}\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{(i)}}(\mathcal{Q}_{\emptyset}^{(i)},\mathcal{F}'^{(u(i))}) \\ \xrightarrow{\sim} \prod_{i\in I}\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}'^{(u(i))}}(\mathcal{D}'^{(u(i))}\otimes^{\mathbb{L}}_{\mathcal{D}^{(i)}}\mathcal{Q}_{\emptyset}^{(i)},\mathcal{F}'^{(u(i))}) \xrightarrow{\sim} \prod_{i\in I}\mathrm{Hom}_{\mathcal{D}'^{(u(i))}}(\mathcal{D}'^{(u(i))}\otimes_{\mathcal{D}^{(i)}}\mathcal{Q}_{\emptyset}^{(i)},\mathcal{F}'^{(u(i))}).\end{gathered} \tag{8.2.3.13.2}$$

Let us check b). It follows from 8.2.3.11 that $\mathcal{I}'^{(\bullet)}$ satisfies the condition of the part (a) of the Lemma and therefore we get the acyclicity concerning the functors involving Hom. By replacing 8.2.3.8.1 by 8.2.3.10.3 and by using the acyclicity of 8.2.3.11, we get the isomorphisms 8.2.3.13.2 where Hom is replaced by $\mathcal{H}om$ and $\mathcal{F}'^{(\bullet)}$ is replaced by $\mathcal{I}'^{(\bullet)}$, which yields:

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}_{\emptyset}^{(\bullet)}}(\mathcal{Q}_{\emptyset}^{(\bullet)},\underset{\rightarrow I,X}{\rho}^{-1}(\underset{\rightarrow X}{u}^{-1}(\mathcal{I}'^{(\bullet)}))) \xrightarrow{\sim} \prod_{i\in I}\mathcal{H}om_{\mathcal{D}'^{(u(i))}}(\mathcal{D}'^{(u(i))}\otimes_{\mathcal{D}^{(i)}}\mathcal{Q}_{\emptyset}^{(i)},\mathcal{I}'^{(u(i))}),$$

where the product in computed in $D^+(\mathbb{Z}_X)$ (hence, beware this is not obvious that the right term is a module). Since $\mathcal{I}'^{(u(i))}$ is injective, then using again 8.2.3.11 the sheaf $\mathcal{G}^{(i)} := \mathcal{H}om_{\mathcal{D}'^{(u(i))}}(\mathcal{D}'^{(u(i))}\otimes_{\mathcal{D}^{(i)}}\mathcal{Q}_{\emptyset}^{(i)},\mathcal{I}'^{(u(i))})$ is flasque. By using 8.2.3.9.(b), the product $\prod_{i\in I}\mathcal{G}^{(i)}$ computed in the category of flasque abelian sheaves on X is also a product in $D^+(\mathbb{Z}_X)$. Hence, we get the acyclicity of (i). By replacing 8.2.3.12.1 by 8.2.3.12.2, we get the isomorphisms 8.2.3.13.1 where Hom is replaced by $\mathcal{H}om$ and $\mathcal{F}'^{(\bullet)}$ is replaced by $\mathcal{I}'^{(\bullet)}$. This implies the acyclity of (ii) from (i) for the first two functors. Concerning the third one,

$$\begin{gathered}\underset{\rightarrow X}{i}^{-1}\left(\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),\underset{\rightarrow X}{u}^{-1}(\mathcal{I}'^{(\bullet)}))\right) \overset{8.2.3.12.3}{\xrightarrow{\sim}} \prod_{j\geq i}\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(j)}}(\mathcal{Q}_{\emptyset}^{(j)},\mathcal{I}'^{(u(j))})\times\prod_{h<i}\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(h)}}(\mathcal{Q}_{\emptyset}^{(h)},\mathcal{I}'^{(u(i))}) \\ \overset{8.2.3.11}{\xrightarrow{\sim}} \prod_{j\geq i}\mathcal{H}om_{\mathcal{D}^{(j)}}(\mathcal{Q}_{\emptyset}^{(j)},\mathcal{I}'^{(u(j))})\times\prod_{h<i}\mathcal{H}om_{\mathcal{D}^{(h)}}(\mathcal{Q}_{\emptyset}^{(h)},\mathcal{I}'^{(u(i))}),\end{gathered} \tag{8.2.3.13.3}$$

where the last product is equal to the product in $K(\mathbb{Z}_X)$ (use again 8.2.3.9.(b), and is therefore a $\mathbb{Z}_X$-sheaf. Hence, we get the required acyclicity.

Finally, we get by composition the isomorphism

$$\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\rightarrow I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)}),\underset{\rightarrow X}{u}^{-1}(\mathcal{I}'^{(\bullet)})) \xrightarrow{\sim} \prod_{i\in I}\mathcal{H}om_{\mathcal{D}'^{(u(i))}}(\mathcal{D}'^{(u(i))}\otimes_{\mathcal{D}^{(i)}}\mathcal{Q}_{\emptyset}^{(i)},\mathcal{I}'^{(u(i))})$$

of flasque sheaves (recall a product of flasque sheaves is flasque), which yields (iii) for the first sheaf. Concerning the second sheaf, this is a consequence of 8.2.3.13.3.

□

Remark 8.2.3.14. With notation 8.2.3.13, the functor (denoted slightly abusively) $\underset{\to}{u}_X^{-1}$ is the composition of $\mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\underset{\to}{u}_X^{-1}\mathcal{D}^{(\bullet)})$ induced by the inverse image by the topos morphism $\underset{\to}{u}_X \colon X^{(I')} \to X^{(I)}$ with the forgetful functor $\mathrm{Mod}(\underset{\to}{u}_X^{-1}\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}'^{(\bullet)})$. Hence, we have checked above a unification of both cases.

Corollary 8.2.3.15. *Let $\lambda \in L(I)$ and $\chi \in M(I)$. Let $\mathcal{I}^{(\bullet)}$ be an injective left $\mathcal{D}^{(\bullet)}$-module. We consider $\chi^*\lambda^*(\mathcal{I}^{(\bullet)})$ as a left $\mathcal{D}^{(\bullet)}$-module via the canonical homomorphism $\mathcal{D}^{(\bullet)} \to \lambda^*(\mathcal{D}^{(\bullet)})$. Let $\mathcal{Q}_\emptyset^{(\bullet)}$ be a flat left $\mathcal{D}_\emptyset^{(\bullet)}$-module.*

(a) The left $\mathcal{D}_\emptyset^{(\bullet)}$-module $\underset{\to I,X}{\rho}^{-1}(\chi^*\lambda^*(\mathcal{I}^{(\bullet)}))$ is acyclic for the functors $\mathrm{Hom}_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{Q}_\emptyset^{(\bullet)}, -)$ and $\mathcal{H}om_{\mathcal{D}_\emptyset^{(\bullet)}}(\mathcal{Q}_\emptyset^{(\bullet)}, -)$.

(b) The module $\chi^*\lambda^*(\mathcal{I}^{(\bullet)})$ is acyclic for the following three functors $\mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), -)$, $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), -)$ and $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), -)$.

(c) The sheaves $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), \chi^*\lambda^*(\mathcal{I}^{(\bullet)}))$ and $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), \chi^*\lambda^*(\mathcal{I}^{(\bullet)}))$ are flasque.

Proof. Since $\underset{\to I,X}{\rho}^{-1}(\chi^*\lambda^*(\mathcal{I}^{(\bullet)})) = \underset{\to I,X}{\rho}^{-1}(\lambda^*(\mathcal{I}^{(\bullet)}))$, we get (a) by applying 8.2.3.13.(b) in the case where $u = \lambda$ (recall $\lambda^*(\mathcal{I}^{(\bullet)}) = \underset{\to}{u}_X^{-1}(\mathcal{I}^{(\bullet)})$). Since $\mathcal{Q}_\emptyset^{(\bullet)}$ is flat, then $\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)})$. Hence, we get b) and c) for the first functor from 8.2.3.13.(b) and via the isomorphisms:

$$\begin{aligned}\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), \chi^*\lambda^*\mathcal{I}^{(\bullet)}) &\underset{8.2.3.12.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\mathcal{D}_\emptyset}(\mathcal{Q}_\emptyset^{(\bullet)}, \underset{\to I,X}{\rho}^{-1}(\chi^*\lambda^*\mathcal{I}^{(\bullet)}))\\ = \mathbb{R}\mathcal{H}om_{\mathcal{D}_\emptyset}(\mathcal{Q}_\emptyset^{(\bullet)}, \underset{\to I,X}{\rho}^{-1}(\lambda^*\mathcal{I}^{(\bullet)})) &\underset{8.2.3.12.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), \lambda^*\mathcal{I}^{(\bullet)}).\end{aligned}$$

Similarly, we get b) and c) for the second functor from 8.2.3.13.(b) and via the isomorphisms (which is a consequence of 8.2.3.13.3):

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), \chi^*\lambda^*\mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\underset{\to I,X,!}{\rho}(\mathcal{Q}_\emptyset^{(\bullet)}), \lambda^*\mathcal{I}^{(\bullet)}).$$

□

Lemma 8.2.3.16. *Let $\mathscr{P}$ be a collection of left $\mathcal{D}^{(\bullet)}$-modules. We denote by $\mathscr{I}(\mathscr{P})$ the collection of left $\mathcal{D}^{(\bullet)}$-modules which are acyclic for the functors $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet)}, -)$ (resp. $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet)}, -)$) for any $\mathcal{Q}^{(\bullet)} \in \mathscr{P}$. We denote by $\mathscr{P}^+$ the collection of left $\mathcal{D}^{(\bullet)}$-modules which are acyclic for the functors $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-, \mathcal{F}^{(\bullet)})$ (resp. $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-, \mathcal{F}^{(\bullet)})$) for any $\mathcal{F}^{(\bullet)} \in \mathscr{I}(\mathscr{P})$.*

Let $\mathcal{Q}_1^{(\bullet),\bullet} \to \mathcal{Q}_2^{(\bullet),\bullet}$ be a quasi-isomorphism of $K^-(\mathcal{D}^{(\bullet)})$ such that $\mathcal{Q}_i^{(\bullet),n} \in \mathscr{P}^+$, for any $i = 1, 2$, $n \in \mathbb{Z}$. Let $\mathcal{F}_1^{(\bullet),\bullet} \to \mathcal{F}_2^{(\bullet),\bullet}$ be a quasi-isomorphism of $K^+(\mathcal{D}^{(\bullet)})$ such that $\mathcal{F}_i^{(\bullet),n} \in \mathscr{I}(\mathscr{P})$, for any $i = 1, 2$, $n \in \mathbb{Z}$. Then the morphism of $K^+(\mathbb{Z}_X)$ (resp. $K^+(\mathbb{Z}_X^{(\bullet)})$)

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}_2^{(\bullet),\bullet}, \mathcal{F}_1^{(\bullet),\bullet}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}_1^{(\bullet),\bullet}, \mathcal{F}_2^{(\bullet),\bullet})$$
$$(\textit{resp. } \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}_2^{(\bullet),\bullet}, \mathcal{F}_1^{(\bullet),\bullet}) \to \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}_1^{(\bullet),\bullet}, \mathcal{F}_2^{(\bullet),\bullet})\ )$$

is a quasi-isomorphism.

Proof. Since the respective case is checked identically, let us only prove the non-respective one. 0) We remark that $\mathscr{I}(\mathscr{P})$ satisfies the following property:

(a) for any $\mathcal{F}^{(\bullet)}, \mathcal{G}^{(\bullet)} \in \mathscr{I}(\mathscr{P})$, we have $\mathcal{F}^{(\bullet)} \oplus \mathcal{G}^{(\bullet)} \in \mathscr{I}(\mathscr{P})$;

(b) for any exact sequence of left $\mathcal{D}^{(\bullet)}$-modules $0 \to \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to 0$, if $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \mathscr{I}(\mathscr{P})$, then $\mathcal{G}^{(\bullet)} \in \mathscr{I}(\mathscr{P})$.

and $\mathscr{P}^+$ satisties the dual property of $\mathscr{I}(\mathscr{P})$:

(a*) for any $\mathcal{F}^{(\bullet)}, \mathcal{G}^{(\bullet)} \in \mathscr{P}^+$, we have $\mathcal{F}^{(\bullet)} \oplus \mathcal{G}^{(\bullet)} \in \mathscr{P}^+$;

(b*) for any exact sequence of left $\mathcal{D}^{(\bullet)}$-modules $0 \to \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to 0$, if $\mathcal{F}^{(\bullet)}, \mathcal{G}^{(\bullet)} \in \mathscr{P}^+$, then $\mathcal{E}^{(\bullet)} \in \mathscr{P}^+$.

Hence, the cone of $\mathcal{Q}_1^{(\bullet),\bullet} \to \mathcal{Q}_2^{(\bullet),\bullet}$ is a complex of left $\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{P}^+$ and the cone of $\mathcal{F}_1^{(\bullet),\bullet} \to \mathcal{F}_2^{(\bullet),\bullet}$ is a complex of left $\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{I}(\mathscr{P})$. Hence we reduce to check the following two facts. Let $\mathcal{F}^{(\bullet),\bullet} \in K^+(\mathcal{D}^{(\bullet)})$ such that $\mathcal{F}^{(\bullet),n} \in \mathscr{I}(\mathscr{P})$, for any $n \in \mathbb{Z}$. Let $\mathcal{Q}^{(\bullet),\bullet} \in K^-(\mathcal{D}^{(\bullet)})$ such that $\mathcal{Q}^{(\bullet),n} \in \mathscr{P}^+$, for any $n \in \mathbb{Z}$.

1) In this step we prove that if $\mathcal{Q}^{(\bullet),\bullet}$ is acyclic then $\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet})$ is acyclic.

i) Remark that if $\mathcal{Q}^{(\bullet),n} = 0$ for any integer $n > a$ and $\mathcal{F}^{(\bullet),n} = 0$ for any integer $n < b$ then $H^n\left(\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet})\right) = 0$ for any $n < b - a$.

ii) Since $\mathcal{Q}^{(\bullet),\bullet}$ is bounded above, by using the property (b^*) satisfied by $\mathscr{P}^+$, we can prove by decreasing induction on the integer $n \in \mathbb{Z}$ that $\ker d^n$ are left $\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{P}^+$, where $d^n \colon \mathcal{Q}^{(\bullet),n} \to \mathcal{Q}^{(\bullet),n+1}$ are the transition maps. For any left $\mathcal{D}^{(\bullet)}$-module $\mathcal{F}^{(\bullet)} \in \mathscr{I}(\mathscr{P})$, the functor $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-, \mathcal{F}^{(\bullet)})$ sends short exact sequences of left $\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{P}^+$ to short exact sequences of abelian sheaves on X. Hence, by splitting $\mathcal{Q}^{(\bullet),\bullet}$ into short exact sequences, we can check that the complex $\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),j})$ is acyclic for any integer j.

iii) We can suppose $\mathcal{F}^{(\bullet),n} = 0$ for any integer $n < 0$ and $\mathcal{Q}^{(\bullet),n} = 0$ for any integer $n > 0$. By applying the δ-functor $\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, -)$ to the naive exact sequence

$$0 \to \mathcal{F}^{(\bullet),0} \to \mathcal{F}^{(\bullet),\bullet} \to \mathcal{F}^{(\bullet),\geq 1} \to 0,$$

we get the exact triangle

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),0}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\geq 1}) \to +1.$$

By using i) and ii), this yields that $H^0\left(\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet})\right) = 0$. Similarly, by induction on $n \geq 0$ we check that $H^n\left(\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet})\right) = 0$.

2) It remains to prove that if $\mathcal{F}^{(\bullet),\bullet}$ is acyclic then so is $\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet})$.

i) Since $\mathcal{F}^{(\bullet),\bullet}$ is bounded below, by using the property (b) satisfied by $\mathscr{I}(\mathscr{P})$, we can prove by induction on the integer $n \in \mathbb{Z}$ that $\operatorname{Im} d^n$ are left $\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{I}(\mathscr{P})$, where $d^n \colon \mathcal{F}^{(\bullet),n} \to \mathcal{F}^{(\bullet),n+1}$ are the transition maps. For any left $\mathcal{D}^{(\bullet)}$-module $\mathcal{Q}^{(\bullet)} \in \mathscr{P}^+$, the functor $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet)}, -)$ sends short exact sequences of left $\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{I}(\mathscr{P})$ to short exact sequences of abelian sheaves on X. Hence, by splitting $\mathcal{F}^{(\bullet),\bullet}$ into short exact sequences, this implies that $\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),j}, \mathcal{F}^{(\bullet),\bullet})$ is acyclic for any integer j.

ii) We can suppose $\mathcal{F}^{(\bullet),n} = 0$ for any integer $n < 0$ and $\mathcal{Q}^{(\bullet),n} = 0$ for any integer $n > 0$. By applying the δ-functor $\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(-, \mathcal{F}^{(\bullet),\bullet})$ to the naive exact sequence

$$0 \to \mathcal{Q}^{(\bullet),0} \to \mathcal{Q}^{(\bullet),\bullet} \to \mathcal{Q}^{(\bullet),\leq -1} \to 0,$$

we get the exact triangle

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\leq -1}, \mathcal{F}^{(\bullet),\bullet}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),0}, \mathcal{F}^{(\bullet),\bullet}) \to +1.$$

By using 1.i.) and 2.ii), this yields that $H^0\left(\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet})\right) = 0$. Similarly, by induction on $n \geq 0$ we check that $H^n\left(\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet),\bullet}, \mathcal{F}^{(\bullet),\bullet})\right) = 0$.

□

8.2.4 Derived homomorphism bifunctor over $LD_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$

8.2.4.1. Let $\mathcal{E}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$. The family $(\chi^*\lambda^*\mathcal{E}^{(\bullet)})_{(\lambda,\chi)\in L(I)\times M(I)}$ can be considered as an inductive system of objects of $X^{(I)}$ indexed by $L(I) \times M(I)$ with transition morphisms given by $\sigma_{\mathcal{E},(\lambda,\chi),(\lambda',\chi')}$ for any $(\lambda', \chi') \leq (\lambda, \chi)$ (see notation 8.1.4.1.1).

Notation 8.2.4.2. We denote by $\mathscr{I}(\mathcal{D}^{(\bullet)})$ or simply $\mathscr{I}$ the category of injective left $\mathcal{D}^{(\bullet)}$-modules, by $K^+(\mathscr{I})$ the full subcategory of $K^+(\mathcal{D}^{(\bullet)})$ whose objects consist in complexes of injective left $\mathcal{D}^{(\bullet)}$-modules. We denote by $\mathscr{P}(\mathcal{D}^{(\bullet)})$ or simply $\mathscr{P}$ the collection of objects of the form $\underset{\to I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)})$ where $\mathcal{Q}_{\emptyset}^{(\bullet)}$ is a flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module. We denote by $K^-(\mathscr{P})$ the full subcategory of $K^-(\mathcal{D}^{(\bullet)})$ whose objects consist in complexes of terms in $\mathscr{P}$.

We will need the following notation for some proofs. We denote by $\mathscr{I}(\mathscr{P})$ the collection of left $\mathcal{D}^{(\bullet)}$-modules which are acyclic for the functors $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet)},-)$ and $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{Q}^{(\bullet)},-)$ for any $\mathcal{Q}^{(\bullet)}\in\mathscr{P}$. We denote by $K^-(\mathscr{I}(\mathscr{P}))$ the full subcategory of $K^-(\mathcal{D}^{(\bullet)})$ whose objects consist in complexes of terms in $\mathscr{I}(\mathscr{P})$. Moreover, we denote by $\mathscr{P}^+$ the collection of left $\mathcal{D}^{(\bullet)}$-modules which are acyclic for the functors $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,\mathcal{F}^{(\bullet)})$ and $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,\mathcal{F}^{(\bullet)})$ for any $\mathcal{F}^{(\bullet)}\in\mathscr{I}(\mathscr{P})$.

8.2.4.3. We have the following properties.

(a) Let $\mathcal{E}_{\emptyset}^{(\bullet)}$ be a flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module, i.e. $\mathcal{E}_{\emptyset}^{(i)}$ is a flat left $\mathcal{D}^{(i)}$-module for any $i\in I$. Then $\underset{\to I,X,!}{\rho}(\mathcal{E}_{\emptyset}^{(\bullet)})$ is a flat left $\mathcal{D}^{(\bullet)}$-modules, i.e. $\underset{\to X}{i}^{-1}(\underset{\to I,X,!}{\rho}(\mathcal{E}_{\emptyset}^{(\bullet)}))$ is a left $\mathcal{D}^{(i)}$-module for any $i\in I$.

(b) Let $\mathcal{E}^{(\bullet)}$ be a left $\mathcal{D}^{(\bullet)}$-module. Choose $\mathcal{Q}_{\emptyset}^{(\bullet)}$ a flat left $\mathcal{D}_{\emptyset}^{(\bullet)}$-module endowed with an epimorphism of left $\mathcal{D}_{\emptyset}^{(\bullet)}$-modules $\mathcal{Q}_{\emptyset}^{(\bullet)}\to\underset{\to I,X}{\rho}^{-1}(\mathcal{E}^{(\bullet)})$. Since $\underset{\to I,X,!}{\rho}$ is right exact (but not left exact when the transition homomorphisms of $\mathcal{D}^{(\bullet)}$ are not flat), this yields an epimorphism of left $\mathcal{D}^{(\bullet)}$-modules $\underset{\to I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)})\to\underset{\to I,X,!}{\rho}\circ\underset{\to I,X}{\rho}^{-1}(\mathcal{E}^{(\bullet)})$. Since the adjoint morphism $\underset{\to I,X,!}{\rho}\circ\underset{\to I,X}{\rho}^{-1}(\mathcal{E}^{(\bullet)})\to\mathcal{E}^{(\bullet)}$ is an epimorphism, this implies by composition the epimorphism of the form $\underset{\to I,X,!}{\rho}(\mathcal{Q}_{\emptyset}^{(\bullet)})\to\mathcal{E}^{(\bullet)}$.

(c) Let $\mathcal{E}^{(\bullet)}\in K^-(\mathcal{D}^{(\bullet)})$. It follows from (b) and [Sta22, 05T7], that there exists $\mathcal{P}^{(\bullet)}\in K^-(\mathscr{P})$ endowed with a quasi-isomorphism $\mathcal{P}^{(\bullet)}\xrightarrow{\sim}\mathcal{E}^{(\bullet)}$.

(d) Let $(\lambda,\chi)\in L(I)\times M(I)$, $\mathcal{P}^{(\bullet)}\in K^-(\mathscr{P})$, and $\mathcal{I}^{(\bullet)}\in K^+(\mathscr{I})$. It follows from 8.2.3.15 that $\chi^*\lambda^*\mathcal{I}^{(\bullet)}\in K^+(\mathscr{I}(\mathscr{P}))$ (see the notation of 8.2.4.2). Hence, since $\mathscr{P}\subset\mathscr{P}^+$, it follows from 8.2.3.16 that the complexes $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\chi^*\lambda^*\mathcal{I}^{(\bullet)})$ and $\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\chi^*\lambda^*\mathcal{I}^{(\bullet)})$ are acyclic if either $\mathcal{P}^{(\bullet)}$ or $\mathcal{I}^{(\bullet)}$ is acyclic.

Notation 8.2.4.4. Remark that since $L(I)\times M(I)$ is filtered, the functor $\varinjlim_{(\lambda,\chi)\in L(I)\times M(I)}$ is exact on the category of abelian sheaves on X. If no confusion is possible, let us simply write $\varinjlim_{\lambda,\chi}:=\varinjlim_{(\lambda,\chi)\in L(I)\times M(I)}$.

Consider the bifunctor

$$\varinjlim_{\lambda,\chi}\mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)\colon K^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}}\times K^+(\mathcal{D}^{(\bullet)})\to K^+(\mathbb{Z}_X)\tag{8.2.4.4.1}$$

whose nth term for any integer $n\in\mathbb{Z}$ is defined for any $\mathcal{E}^{(\bullet),\bullet}\in K^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet),\bullet}\in K^+(\mathcal{D}^{(\bullet)})$ by setting

$$\varinjlim_{\lambda,\chi}\mathcal{H}om^{n}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \chi^*\lambda^*\mathcal{F}^{(\bullet),\bullet}):=\varinjlim_{\lambda,\chi}\prod_{p\in\mathbb{Z}}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),p},\ \chi^*\lambda^*\mathcal{F}^{(\bullet),\ p+n})\tag{8.2.4.4.2}$$

and the transition morphisms are given by the formula $d=d_{\mathcal{E}}+(-1)^{n+1}d_{\mathcal{F}}$.

8.2.4.5. Let $\mathcal{I}^{(\bullet)}\in K^+(\mathscr{I})$. Consider the functor

$$\phi_{\mathcal{I}^{(\bullet)}}\colon\varinjlim_{\lambda,\chi}\mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*\mathcal{I}^{(\bullet)})\colon K^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}}\to D^+(\mathbb{Z}_X).$$

Following 8.2.4.3.d, for any acyclic complex $\mathcal{P}^{(\bullet)}\in K^-(\mathscr{P})$, $\phi_{\mathcal{I}^{(\bullet)}}(\mathcal{P}^{(\bullet)})$ is acyclic. By using 8.2.4.3.c and [Sta22, 06XN], we get therefore the right derived functor $\mathbb{R}\phi_{\mathcal{I}^{(\bullet)}}\colon:D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}}\to D^+(\mathbb{Z}_X)$. This yields by functoriality the bifunctor

$$\mathbb{R}\varinjlim_{\lambda,\chi}\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)\colon D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}}\times K^+(\mathscr{I})\to D^+(\mathbb{Z}_X)$$

defined by setting

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{I}^{(\bullet)}) := \mathbb{R}\phi_{\mathcal{I}^{(\bullet)}}(\mathcal{E}^{(\bullet)})$$

for any $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$, $\mathcal{I}^{(\bullet)} \in K^+(\mathscr{I})$. Since the canonical functor $K^+(\mathscr{I}) \to D^+(\mathcal{D}^{(\bullet)})$ is an equivalence of categories, then we get the bifunctor

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)\colon D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D^+(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}_X). \tag{8.2.4.5.1}$$

For any $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in D^+(\mathcal{D}^{(\bullet)})$, by construction

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi^*\lambda^*\mathcal{I}^{(\bullet)})$$

where $\mathcal{I}^{(\bullet)} \in K^+(\mathscr{I})$ is a complex representing $\mathcal{F}^{(\bullet)}$ and $\mathcal{P}^{(\bullet)} \in K^-(\mathscr{P})$ is a complex representing $\mathcal{E}^{(\bullet)}$.

Proposition 8.2.4.6. *Let $Q^{\sharp}_{\mathrm{qi}}\colon K^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\mathcal{D}^{(\bullet)})$ be the localisation functor and $\mathcal{N}^{\sharp}_{\mathrm{qi}}(\mathcal{D}^{(\bullet)}) := \operatorname{Ker} Q^{\sharp}_{\mathrm{qi}}$ be the saturated null system of acyclic complexes of $K(\mathcal{D}^{(\bullet)})$; and similarly with $\mathbb{Z}_X$ instead of $\mathcal{D}^{(\bullet)}$.*

The functor 8.2.4.4.1 (remark that a bifunctor can be viewed as a functor) is right localizable with respect to $(\mathfrak{N}^-_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \mathfrak{N}^+_{\mathrm{qi}}(\mathcal{D}^{(\bullet)}), \mathfrak{N}^+_{\mathrm{qi}}(\mathbb{Z}_X))$ (in the sense of 7.4.1.10). Moreover, its right localization is the functor 8.2.4.5.1.

Proof. Denote by F the functor 8.2.4.4.1 and by Q_{qi} with the localization functor $K^+(\mathbb{Z}_X) \to D^+(\mathbb{Z}_X)$. Let $S^{\sharp}_{\mathrm{qi}}(\mathcal{D}^{(\bullet)}) := S(\mathfrak{N}^{\sharp}_{\mathrm{qi}}(\mathcal{D}^{(\bullet)}))$ be the saturated system of quasi-isomorphisms of $K^{\sharp}(\mathcal{D}^{(\bullet)})$ (we keep notation 7.4.1.2). Following 7.4.1.9.d and by definition (see 7.4.1.10), we have to check that the right derived functor of $Q_{\mathrm{qi}} \circ F$ with respect to $(S^-_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times S^+_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})$ is defined at any object of $K^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times K^+(\mathcal{D}^{(\bullet)})$. By using 8.2.4.3.(c)-(d), we can checked that both conditions are satisfied: i) for any $(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \in K^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times K^+(\mathcal{D}^{(\bullet)})$, there exists $(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)}) \in K^-(\mathscr{P})^{\mathrm{op}} \times K^+(\mathscr{I})$ and a morphism $(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to (\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)})$ in $(S^-_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times S^+_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})$ and ii) for any arrow $s\colon (\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)}) \to (\mathcal{P}'^{(\bullet)}, \mathcal{I}'^{(\bullet)})$ of $(S^-_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times S^+_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})$ with $(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet)}), (\mathcal{P}'^{(\bullet)}, \mathcal{I}'^{(\bullet)}) \in K^-(\mathscr{P})^{\mathrm{op}} \times K^+(\mathscr{I})$, its image by $Q_{\mathrm{qi}} \circ F$ is an isomorphism. Hence, we conclude by using [Sta22, 06XN]. ☐

8.2.4.7. Endowing the set $I \times L(I) \times M(I)$ with the order product, we can see $X^{(I\times L(I)\times M(I))}$ as the topos of inductive systems of objects of $X^{(I)}$ indexed by $L(I) \times M(I)$. We denote by $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$ the constant inductive system of rings of $X^{(I)}$ indexed by $L(I) \times M(I)$ with value $\mathcal{D}^{(\bullet)}$. We denote by $\mathbb{Z}_X^{(\bullet,\bullet)}$ the constant inductive system of rings of X indexed by $L(I) \times M(I)$ with value $\mathbb{Z}_X$.

Consider the bifunctor

$$\mathcal{H}om^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ -)\colon K(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times K(\mathcal{D}^{(\bullet),(\bullet,\bullet)}) \to K(\mathbb{Z}_X^{(\bullet,\bullet)}) \tag{8.2.4.7.1}$$

which is defined for any $\mathcal{E}^{(\bullet),\bullet} \in K^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet),(\bullet,\bullet),\bullet} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$, for any $(\lambda,\chi) \in L(I) \times M(I)$ and $n \in \mathbb{Z}$ by setting

$$\mathcal{H}om^{(\lambda,\chi),n}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{F}^{(\bullet),(\bullet,\bullet),\bullet}) := \prod_{p\in\mathbb{Z}} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),p},\ \mathcal{F}^{(\bullet),(\lambda,\chi),\ p+n}) \tag{8.2.4.7.2}$$

and the transition morphisms are given by the formula $d = d_{\mathcal{E}} + (-1)^{n+1} d_{\mathcal{F}}$.

8.2.4.8. By construction, for any $\mathcal{E}^{(\bullet)} \in K^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet),(\bullet,\bullet)} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$, we can see the object $\mathcal{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{F}^{(\bullet),(\bullet,\bullet)})$ as the following inductive system of $K(\mathbb{Z}_X)$ indexed by $L(I) \times M(I)$:

$$\mathcal{H}om^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{F}^{(\bullet),(\bullet,\bullet)}) = \left(\mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet),(\lambda,\chi)})\right)_{(\lambda,\chi)\in L(I)\times M(I)}, \tag{8.2.4.8.1}$$

where the right hand side is defined at 8.2.1.4.

8.2.4.9. The bifunctor 8.2.4.7.1 can be right derived as follows.

(a) Following 7.1.3.21.c (via the identification between inductive systems indexed by J and projective systems indexed by J° where $J = L(I) \times M(I)$, and by using the fact that the section 7.1 is still valid by replacing the topos $\mathrm{Top}(X)$ by any topos and in particular by the topos $X^{(I)}$), if $\mathcal{I}^{(\bullet),(\bullet,\bullet)}$ is an injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$-module, then for any $(\lambda,\chi) \in L(I) \times M(I)$ the left $\mathcal{D}^{(\bullet)}$-module $\mathcal{I}^{(\bullet),(\lambda,\chi)}$ is injective.

(b) Similarly to (a), following 7.1.3.21.d if $\mathcal{I}^{(\bullet),(\bullet,\bullet)}$ is K-injective complex of $K({}^l\mathcal{D}^{(\bullet),(\bullet,\bullet)})$-module, then $\mathcal{I}^{(\bullet),(\lambda,\chi)}$ is a K-injective complex of $K({}^l\mathcal{D}^{(\bullet)})$ for any $(\lambda,\chi) \in L(I) \times M(I)$.

(c) A morphism $\mathcal{G}^{(\bullet,\bullet)} \to \mathcal{G}'^{(\bullet,\bullet)}$ of $K(\mathbb{Z}_X^{(\bullet,\bullet)})$ is a quasi-isomorphism if and only if for any $(\lambda,\chi) \in L(I) \times M(I)$, the induced morphisms $\mathcal{G}^{(\lambda,\chi)} \to \mathcal{G}'^{(\lambda,\chi)}$ are quasi-isomorphisms.

(d) By using b) and c), by using the quasi-isomorphisms 8.2.2.1.1 and the equality 8.2.4.8.1, we can check that for any quasi-isomorphism $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \xrightarrow{\sim} \mathcal{I}'^{(\bullet),(\bullet,\bullet)}$ of K-injective complexes of $K(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$, for any quasi-isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$ of complexes of $K(\mathcal{D}^{(\bullet)})$, the morphism of $K(\mathbb{Z}_X^{(\bullet,\bullet)})$

$$\mathcal{H}om^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}'^{(\bullet)}, \mathcal{I}^{(\bullet),(\bullet,\bullet)}) \to \mathcal{H}om^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\bullet,\bullet)}) \tag{8.2.4.9.1}$$

is a quasi-isomorphism. Hence it follows from [Sta22, 06XN] that the bifunctor 8.2.4.7.1 is right localizable with respect to $(\mathfrak{N}_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \mathfrak{N}_{\mathrm{qi}}(\mathcal{D}^{(\bullet),(\bullet,\bullet)}), \mathfrak{N}_{\mathrm{qi}}(\mathbb{Z}_X))$. Its right localisation will be denoted by

$$\mathbb{R}\mathcal{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(-,\ -)\colon D(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D(\mathcal{D}^{(\bullet),(\bullet,\bullet)}) \to D(\mathbb{Z}_X^{(\bullet,\bullet)}) \tag{8.2.4.9.2}$$

and is computed by taking K-injective representation of objects in $D(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$.

(e) The exact functor $\varinjlim_{\lambda,\chi}\colon \mathrm{Mod}(\mathbb{Z}_X^{(\bullet,\bullet)}) \to \mathrm{Mod}(\mathbb{Z}_X)$ induces $\varinjlim_{\lambda,\chi}\colon D(\mathbb{Z}_X^{(\bullet,\bullet)}) \to D(\mathbb{Z}_X)$. By composing 8.2.4.9.2 with this latter functor, we get the bifunctor

$$\varinjlim_{\lambda,\chi} \circ \mathbb{R}\mathcal{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(-,\ -)\colon D(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D(\mathcal{D}^{(\bullet),(\bullet,\bullet)}) \to D(\mathbb{Z}_X). \tag{8.2.4.9.3}$$

8.2.4.10. We define the functor $\mathfrak{c}\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ by setting, for any left $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$, $\mathfrak{c}(\mathcal{E}^{(\bullet)})^{(\lambda,\chi)} := \chi^*\lambda^*(\mathcal{E}^{(\bullet)})$ and where for any $(\lambda_1,\chi_1) \le (\lambda_2,\chi_2)$ the transition maps $\chi_1^*\lambda_1^*\mathcal{E}^{(\bullet)} \to \chi_2^*\lambda_2^*\mathcal{E}^{(\bullet)}$ are the canonical ones i.e. are equal to $\sigma_{\mathcal{E},(\lambda_2,\chi_2),(\lambda_1,\chi_1)}$ (see 8.1.4.1.1). Since $\mathfrak{c}$ is exact, this yields the functor $\mathfrak{c}\colon D^\sharp(\mathcal{D}^{(\bullet)}) \to D^\sharp(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$, with $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.

Lemma 8.2.4.11. *For any $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in D^+(\mathcal{D}^{(\bullet)})$, we have the isomorphism*

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \varinjlim_{\lambda,\chi} \circ \mathbb{R}\mathcal{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathfrak{c}(\mathcal{F}^{(\bullet)})), \tag{8.2.4.11.1}$$

where the right bifunctor is constructed at 8.2.4.9.3 and the left one at 8.2.4.5.1.

Proof. Let $\mathcal{P}^{(\bullet)} \in K^-(\mathscr{P})$ be a complex endowed with a quasi-isomorphism $\mathcal{P}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$ and $\mathcal{I}^{(\bullet)} \in K^+(\mathscr{I})$ be a complex endowed with a quasi-isomorphism $\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mathcal{I}^{(\bullet)}$. Since $\mathfrak{c}$ is exact, we get the quasi-isomorphism $\mathfrak{c}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathfrak{c}(\mathcal{I}^{(\bullet)})$. Let $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$-modules endowed with a quasi-isomorphism $\mathfrak{c}(\mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \mathcal{I}^{(\bullet),(\bullet,\bullet)}$.

Let $(\lambda,\chi) \in L(I) \times M(I)$. Since $\mathcal{I}^{(\bullet),(\lambda,\chi)}$ is a bounded below complex of injective left $\mathcal{D}^{(\bullet)}$-modules (see 8.2.4.9.(a)), then we get the quasi-isomorphism

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) \xleftarrow{\sim} \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}). \tag{8.2.4.11.2}$$

Since $\mathfrak{c}(\mathcal{I}^{(\bullet)})^{(\lambda,\chi)} = \chi^*\lambda^*(\mathcal{F}^{(\bullet)})$, we get a quasi-isomorphism $\chi^*\lambda^*(\mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \mathcal{I}^{(\bullet),(\lambda,\chi)}$ of $K^+(\mathcal{D}^{(\bullet)})$. With notation 8.2.4.2, it follows from 8.2.3.15 that $\chi^*\lambda^*(\mathcal{I}^{(\bullet)}) \in K(\mathscr{I}(\mathscr{P}))$. Since the term of $\mathcal{I}^{(\bullet),(\lambda,\chi)}$ are injective, then we have also $\mathcal{I}^{(\bullet),(\lambda,\chi)} \in K(\mathscr{I}(\mathscr{P}))$. Hence, by using 8.2.3.16, we get that the morphism

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi^*\lambda^*\mathcal{I}^{(\bullet)}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) \tag{8.2.4.11.3}$$

is a quasi-isomorphism. By composing 8.2.4.11.2 and 8.2.4.11.3 and by taking the filtered inductive limit, we get the quasi-isomorphism of $K(\mathbb{Z}_X)$

$$\varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi^*\lambda^*\mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}), \tag{8.2.4.11.4}$$

which is our isomorphism 8.2.4.11.1 in $D(\mathbb{Z}_X)$. □

8.2.4.12. Replacing everywhere $\mathcal{H}om$ by Hom, similarly to 8.2.4.5.1 and 8.2.4.9.2 we get the bifunctors

$$\mathbb{R}\varinjlim_{\lambda,\chi} \operatorname{Hom}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)\colon D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D^+(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}), \tag{8.2.4.12.1}$$

$$\mathbb{R}\operatorname{Hom}^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(-,\ -)\colon D(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D(\mathcal{D}^{(\bullet),(\bullet,\bullet)}) \to D(\mathbb{Z}^{(\bullet,\bullet)}). \tag{8.2.4.12.2}$$

Similarly to 8.2.4.11, for any $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in D^+(\mathcal{D}^{(\bullet)})$, we have the isomorphism

$$\mathbb{R}\varinjlim_{\lambda,\chi} \operatorname{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \varinjlim_{\lambda,\chi} \circ \mathbb{R}\operatorname{Hom}^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathfrak{c}(\mathcal{F}^{(\bullet)})). \tag{8.2.4.12.3}$$

When f is the canonical map of topological spaces $f\colon X \to \{*\}$ and $J = L(I) \times M(I)$, the functor $\underset{\to}{f}_{J*}$ (see notation 8.1.1.2.7) will simply be denoted by $\Gamma(X^{(\bullet,\bullet)}, -)$. If $\mathcal{G}^{(\bullet,\bullet)} \in D^+(\mathbb{Z}_X^{(\bullet,\bullet)})$, we have by definition

$$\Gamma(X^{(\bullet,\bullet)}, \mathcal{G}^{(\bullet,\bullet)}) = \left(\Gamma(X, \mathcal{G}^{(\lambda,\chi)})\right)_{(\lambda,\chi)\in L(I)\times M(I)}. \tag{8.2.4.12.4}$$

8.2.4.13. Replacing everywhere $\mathcal{H}om$ by $\mathscr{H}om$, similarly to 8.2.4.5.1 and 8.2.4.9.2 we get the bifunctors

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)\colon D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D^+(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}_X^{(\bullet)}), \tag{8.2.4.13.1}$$

$$\mathbb{R}\mathscr{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(-,\ -)\colon D(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D(\mathcal{D}^{(\bullet),(\bullet,\bullet)}) \to D(\mathbb{Z}_X^{(\bullet),(\bullet,\bullet)}). \tag{8.2.4.13.2}$$

Similarly to 8.2.4.11, for any $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in D^+(\mathcal{D}^{(\bullet)})$, we have the isomorphism

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \varinjlim_{\lambda,\chi} \circ \mathbb{R}\mathscr{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathfrak{c}(\mathcal{F}^{(\bullet)})). \tag{8.2.4.13.3}$$

When f is the canonical map of topological spaces $f\colon X \to \{*\}$ and $J = I \times L(I) \times M(I)$, the functor $\underset{\to}{f}_{J*}$ (see notation 8.1.1.2.7) will simply be denoted by $\Gamma(X^{(\bullet),(\bullet,\bullet)}, -)$. If $\mathcal{G}^{(\bullet),(\bullet,\bullet)} \in D^+(\mathbb{Z}_X^{(\bullet),(\bullet,\bullet)})$, we have by definition

$$\Gamma(X^{(\bullet),(\bullet,\bullet)}, \mathcal{G}^{(\bullet),(\bullet,\bullet)}) = \left(\Gamma(X^{(\bullet)}, \mathcal{G}^{(\bullet),(\lambda,\chi)})\right)_{(\lambda,\chi)\in L(I)\times M(I)} = \left(\Gamma(X, \mathcal{G}^{(i),(\lambda,\chi)})\right)_{(i,\lambda,\chi)\in I\times L(I)\times M(I)}. \tag{8.2.4.13.4}$$

Lemma 8.2.4.14. *We have the following properties.*

1. *If X is coherent, then for any $\mathcal{E}^{(\bullet,\bullet)} \in D^+(\mathbb{Z}_X^{(\bullet,\bullet)})$ we have the functorial isomorphism*

$$\varinjlim_{\lambda,\chi} \circ \mathbb{R}\Gamma(X^{(\bullet,\bullet)}, \mathcal{E}^{(\bullet,\bullet)}) \xrightarrow{\sim} \mathbb{R}\Gamma(X, \varinjlim_{\lambda,\chi} \mathcal{E}^{(\bullet,\bullet)}). \tag{8.2.4.14.1}$$

2. *If I^o is coherent (for the topology 7.1.2.13) and X is coherent, then for any $\mathcal{E}^{(\bullet),(\bullet,\bullet)} \in D^+(\mathbb{Z}_X^{(\bullet),(\bullet,\bullet)})$ we have the functorial isomorphism*

$$\varinjlim_{\lambda,\chi} \circ \mathbb{R}\Gamma(X^{(\bullet),(\bullet,\bullet)}, \mathcal{E}^{(\bullet),(\bullet,\bullet)}) \xrightarrow{\sim} \mathbb{R}\Gamma(X^{(\bullet)}, \varinjlim_{\lambda,\chi} \mathcal{E}^{(\bullet),(\bullet,\bullet)}). \tag{8.2.4.14.2}$$

Proof. Since the first isomorphism is checked similarly, let us only check 8.2.4.14.2. Let $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \in K^+(\mathbb{Z}_X^{(\bullet),(\bullet,\bullet)})$ be a complex of injective abelian sheaves on $X^{(\bullet),(\bullet,\bullet)}$ quasi-isomorphic to $\mathcal{E}^{(\bullet),(\bullet,\bullet)}$. Then, for any $(\lambda,\chi) \in L(I) \times M(I)$, $\mathcal{I}^{(\lambda,\chi)}$ is a complex of flasque abelian sheaves on $X^{(\bullet)}$. Since I^o and X are coherent, then filtered inductive limits of flasque abelian sheaves on $X^{(\bullet)}$ are flasque (see 7.1.2.19.(c)) and since $X^{(\bullet)}$ is coherent then filtered inductive limits commute of abelian sheaves on $X^{(\bullet)}$ with the global section functor $\Gamma(X^{(\bullet)},-)$ (see 7.1.2.16). This yields

$$\varinjlim_{\lambda,\chi} \circ \mathbb{R}\Gamma(X^{(\bullet),(\bullet,\bullet)}, \mathcal{E}^{(\bullet),(\bullet,\bullet)}) \xrightarrow{\sim} \varinjlim_{\lambda,\chi} \left(\Gamma(X^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)})\right)_{\lambda,\chi} \tag{8.2.4.14.3}$$

$$\xrightarrow{\sim} \Gamma(X^{(\bullet)}, \varinjlim_{\lambda,\chi} \mathcal{I}^{(\bullet),(\lambda,\chi)}) \xrightarrow{\sim} \mathbb{R}\Gamma(X^{(\bullet)}, \varinjlim_{\lambda,\chi} \mathcal{E}^{(\bullet),(\bullet,\bullet)}). \tag{8.2.4.14.4}$$

□

Proposition 8.2.4.15. *Let $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in D^+(\mathcal{D}^{(\bullet)})$, $\mathcal{G}^{(\bullet),(\bullet,\bullet)} \in D^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$.*

(a) We have the bifunctorial isomorphisms

$$\mathbb{R}\Gamma(X^{(\bullet,\bullet)}, \mathbb{R}\mathcal{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet),(\bullet,\bullet)})) \xrightarrow{\sim} \mathbb{R}\operatorname{Hom}^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet),(\bullet,\bullet)}), \tag{8.2.4.15.1}$$

$$\mathbb{R}\Gamma(X^{(\bullet),(\bullet,\bullet)}, \mathbb{R}\mathscr{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet),(\bullet,\bullet)})) \xrightarrow{\sim} \mathbb{R}\operatorname{Hom}^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet),(\bullet,\bullet)}). \tag{8.2.4.15.2}$$

(b) If X is coherent, then we have the bifunctorial isomorphisms

$$\mathbb{R}\Gamma(X, \mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\varinjlim_{\lambda,\chi} \operatorname{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}). \tag{8.2.4.15.3}$$

(c) If I^o is coherent (for the topology 7.1.2.13) and X is coherent, then we have the bifunctorial isomorphisms

$$\mathbb{R}\Gamma(X^{(\bullet)}, \mathbb{R}\varinjlim_{\lambda,\chi} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\varinjlim_{\lambda,\chi} \operatorname{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}). \tag{8.2.4.15.4}$$

Proof. Let us check 8.2.4.15.1. Let $\mathcal{I}^{(\bullet),(\bullet,\bullet),\bullet} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$-modules representing $\mathcal{G}^{(\bullet),(\bullet,\bullet)}$. By construction,

$$\mathbb{R}\mathcal{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet),(\bullet,\bullet)}) \xrightarrow{\sim} \mathcal{H}om^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{I}^{(\bullet),(\bullet,\bullet),\bullet}).$$

For any integers r,s, since $\mathcal{I}^{(\bullet),(\bullet,\bullet),s}$ is injective, then $\mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),r},\ \mathcal{I}^{(\bullet),(\bullet,\bullet),s}))$ is a flasque sheave on X (see 8.2.1.3). Hence, $\mathcal{H}om^{(\lambda,\chi),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{I}^{(\bullet),(\bullet,\bullet),\bullet})$ is a complex of flasque abelian sheaves on X for any $(\lambda,\chi) \in L(I) \times M(I)$. Following 7.1.3.15.2 (recall an inductive system can be viewed as a projective system), since $\mathcal{H}om^{(\lambda,\chi),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{I}^{(\bullet),(\bullet,\bullet),\bullet}))$ is acyclic for the functor $\Gamma(X,-)$, this yields that $\mathcal{H}om^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{I}^{(\bullet),(\bullet,\bullet),\bullet}))$ is acyclic for the functor $\Gamma(X^{(\bullet,\bullet)},-)$. Hence, we get

$$\mathbb{R}\Gamma(X^{(\bullet,\bullet)}, \mathbb{R}\mathcal{H}om^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet),(\bullet,\bullet)}))) \xrightarrow{\sim} \Gamma(X^{(\bullet,\bullet)}, \mathcal{H}om^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{I}^{(\bullet),(\bullet,\bullet),\bullet}))$$

$$\xrightarrow[8.2.1.1.3]{\sim} \operatorname{Hom}^{(\bullet,\bullet),\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{I}^{(\bullet),(\bullet,\bullet),\bullet}) \xrightarrow{\sim} \mathbb{R}\operatorname{Hom}^{(\bullet,\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet),(\bullet,\bullet)})), \tag{8.2.4.15.5}$$

where for the second isomorphism we also use 8.2.4.8.1 and 8.2.4.12.4. Similarly, we prove 8.2.4.15.2 by using 8.2.1.1.1, 8.2.4.14.2 and 8.2.4.13.3.

Finally, by applying the functor $\varinjlim_{\lambda,\chi}$ to 8.2.4.15.1 (resp. 8.2.4.15.2) in the case where $\mathcal{G}^{(\bullet),(\bullet,\bullet)} = \mathfrak{c}(\mathcal{F}^{(\bullet)})$, we get 8.2.4.15.3 (resp. 8.2.4.15.4), modulo the isomorphisms of 8.2.4.14, 8.2.4.11.1 (resp.8.2.4.13.3) and 8.2.4.12.3. □

8.2.4.16. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$, $\lambda \in L(I)$, $\chi \in M(I)$ and $f \colon \chi^*\lambda^*\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $K(\mathcal{D}^{(\bullet)})$. With notation 8.1.4.1, consider the following diagram

$$\begin{array}{ccccc} \mathcal{E}^{(\bullet)} & \xrightarrow{\sigma_{\mathcal{E},(\lambda,\chi)}} & \chi^*\lambda^*\mathcal{E}^{(\bullet)} & \xrightarrow{f} & \mathcal{F}^{(\bullet)} \\ \downarrow{\scriptstyle \sigma_{\mathcal{E},(\lambda,\chi)}} & & \downarrow{\scriptstyle \sigma_{\chi^*\lambda^*\mathcal{E},(\lambda,\chi)}} & & \downarrow{\scriptstyle \sigma_{\mathcal{F},(\lambda,\chi)}} \\ \chi^*\lambda^*\mathcal{E}^{(\bullet)} & \xrightarrow{\chi^*\lambda^*(\sigma_{\mathcal{E},(\lambda,\chi)})} & \chi^*\lambda^*\chi^*\lambda^*\mathcal{E}^{(\bullet)} & \xrightarrow{\chi^*\lambda^*(f)} & \chi^*\lambda^*\mathcal{F}^{(\bullet)} \end{array} \tag{8.2.4.16.1}$$

which is commutative by functoriality. Concerning the left square, we compute more precisely that $\chi^*\lambda^*(\sigma_{\mathcal{E},(\lambda,\chi)}) = \sigma_{\chi^*\lambda^*\mathcal{E},(\lambda,\chi)}$.

If moreover $\mathcal{F}^{(\bullet)} \in K(\lambda^*\mathcal{D}^{(\bullet)})$ and $f \colon \chi^*\lambda^*\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ is a morphism of $K(\lambda^*\mathcal{D}^{(\bullet)})$, then the right square of 8.2.4.16.1 is therefore a commutative square of $K(\lambda^*\mathcal{D}^{(\bullet)})$.

8.2.4.17. Let $u \colon E' \to E$ be a topoi morphism. Let $\mathcal{D}$ be a sheaf of rings on E. Then, since (u^{-1}, u_*) is a adjoint paire, it follows from [SGA4.1, IV.13.4.2] that for any $\mathcal{D}$-modules $\mathcal{E}$ and $\mathcal{F}$ we have the canonical bifunctorial morphism $u^{-1}\mathscr{H}om_{\mathcal{D}}(\mathcal{E}, \mathcal{F}) \to \mathscr{H}om_{u^{-1}\mathcal{D}}(\mathcal{E}, \mathcal{F})$.

8.2.4.18. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$.

(a) Let $\chi \in M(I)$. The functor $\chi^* \colon K(\mathcal{D}^{(\bullet)}) \to K(\mathcal{D}^{(\bullet)})$ induces

$$\mathrm{Hom}^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathrm{Hom}^\bullet_{\mathcal{D}^{(\bullet)}}(\chi^*\mathcal{E}^{(\bullet)}, \chi^*\mathcal{F}^{(\bullet)}), \tag{8.2.4.18.1}$$

which is $f^{(\bullet)} \mapsto f^{(\bullet)}$ (the identity). By using 8.2.1.1.3 (resp. 8.2.1.2.1), we get from 8.2.4.18.1 a similar to 8.2.4.18.1 morphism with $\mathcal{H}om$ (resp. $\mathscr{H}om$) instead of Hom.

(b) Let $\lambda \colon I \to I$ be a morphism of $L(I)$. Remark than λ is continuous for the canonical topology (see 7.1.2.13) and also that $\lambda^* = \underrightarrow{\lambda}_X^{-1}$, where $\underrightarrow{\lambda}_X \colon X^{(I)} \to X^{(I)}$ is the topoi morphism induced by λ (see 8.1.1.2.1) We get a ringed topoi morphism $\underrightarrow{\lambda}_X \colon (X^{(I)}, \lambda^*\mathcal{D}^{(\bullet)}), \to (X^{(I)}, \mathcal{D}^{(\bullet)})$. This yields from 8.2.4.17 the canonical bifunctorial morphism of abelian sheaves on $X^{(I)}$:

$$\lambda^*\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathscr{H}om^\bullet_{\lambda^*\mathcal{D}^{(\bullet)}}(\lambda^*\mathcal{E}^{(\bullet)}, \lambda^*\mathcal{F}^{(\bullet)}). \tag{8.2.4.18.2}$$

Modulo 8.2.1.2.1, it corresponds to the functorial on $i \in I$ (the transition maps are the forgetful ones) family of morphisms

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}|_{\lambda(i)}}(\mathcal{E}^{(\bullet)}|_{\lambda(i)}, \mathcal{F}^{(\bullet)}|_{\lambda(i)}) \to \mathcal{H}om^\bullet_{(\lambda^*\mathcal{D}^{(\bullet)})|_i}((\lambda^*\mathcal{E}^{(\bullet)})|_i, (\lambda^*\mathcal{F}^{(\bullet)})|_i),$$

which is given by the forgetful map. The map λ induces also the morphism of abelian sheaves on X:

$$\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathcal{H}om^\bullet_{\lambda^*\mathcal{D}^{(\bullet)}}(\lambda^*\mathcal{E}^{(\bullet)}, \lambda^*\mathcal{F}^{(\bullet)}). \tag{8.2.4.18.3}$$

8.2.4.19. Let $\lambda \colon I \to I$ be a morphism of $L(I)$. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in K(\lambda^*\mathcal{D}^{(\bullet)})$. We have the forgetful morphisms of abelian sheaves:

$$\mathcal{H}om^\bullet_{\lambda^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}), \tag{8.2.4.19.1}$$

$$\mathscr{H}om^\bullet_{\lambda^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \lambda^*\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}), \tag{8.2.4.19.2}$$

8.2.4.20. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$, $\lambda \in L(I)$, $\chi \in M(I)$, $\mathcal{G}^{(\bullet)} \in K(\lambda^*\mathcal{D}^{(\bullet)})$. Consider the diagram

$$\begin{array}{ccccc} \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) & \xrightarrow{(3)} & \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) & \xrightarrow{(2)} & \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \\ \downarrow{\scriptstyle (1)} & & {\scriptstyle (\star)}\downarrow & & {\scriptstyle (4)}\uparrow \\ \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) & \longleftarrow & \mathcal{H}om^\bullet_{\lambda^*\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}) & \longrightarrow & \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)}, \chi^*\lambda^*\mathcal{F}^{(\bullet)}), \end{array} \tag{8.2.4.20.1}$$

where the numbered arrows are given by functoriality of the bifunctor $\mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(-,-)$ via the morphisms $\sigma_{\mathcal{E},(\lambda,\chi)}$ for the top horizontal maps (and by composition with the forgetful map $\mathcal{H}om^\bullet_{\lambda^*\mathcal{D}^{(\bullet)}}(-,-) \to$

$\mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,-)$ for the bottom morphism) and $\sigma_{\mathcal{F},(\lambda,\chi)}$ for the vertical maps and where the arrow $(\star)$ is defined by functoriality of the functor $\chi^*\lambda^*$ (see 8.2.4.18). Since $\chi^*\lambda^*(\sigma_{\mathcal{E},(\lambda,\chi)}) = \sigma_{\chi^*\lambda^*\mathcal{E},(\lambda,\chi)}$, then by using the commutativity of the diagram 8.2.4.16.1 we get the commutativity of the left square of 8.2.4.20.1. The commutativity of the right triangle is checked by functoriality in $\mathcal{E}$ of $\sigma_{\mathcal{E},(\lambda,\chi)}$.

Consider the diagram

$$\begin{tikzcd}
\lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \arrow[r,"(3)"] \arrow[d,"(1)"] & \lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \arrow[r,"(2)"] \arrow[d,"(\star)"] & \lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}) \\
\lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}) & \mathscr{H}om^{\bullet}_{\lambda^*\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}) \arrow[l] \arrow[r] & \lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}), \arrow[u,"(4)"']
\end{tikzcd} \tag{8.2.4.20.2}$$

where both bottom horizontal arrows are equal to the composition morphism of 8.2.4.19.2, where the arrow $(\star)$ is defined by the functor $\chi^*\lambda^*$ (see 8.2.4.18), where the numbered arrows are given by functoriality of the bifunctor $\lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,-)$. We easily check its commutativity.

From the diagram 8.2.4.16.1 (where $\mathcal{F}$ is replaced by $\mathcal{G}$ and f is a morphism of $K(\lambda^*\mathcal{D}^{(\bullet)})$) we check similarly the commutativity of the left square of the diagram

$$\begin{tikzcd}
\mathscr{H}om^{\bullet}_{\lambda^*\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\mathcal{G}^{(\bullet)}) \arrow[r] \arrow[d] \arrow[rr, bend left] & \lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\mathcal{G}^{(\bullet)}) \arrow[d] & \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\mathcal{G}^{(\bullet)}) \arrow[l] \arrow[d] \\
\mathscr{H}om^{\bullet}_{\lambda^*\mathcal{D}^{(\bullet)}}(\chi^*\lambda^*\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{G}^{(\bullet)}) & \lambda^*\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{G}^{(\bullet)}) \arrow[l,"(\star)"'] & \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{G}^{(\bullet)}), \arrow[l]
\end{tikzcd} \tag{8.2.4.20.3}$$

where the curvy arrow is the first morphism of 8.2.4.19.2, where the left top horizontal arrow is the composition of 8.2.4.19.2 (i.e. the top "triangle" is commutative by definition), where the arrow $(\star)$ is defined by the functor $\chi^*\lambda^*$ (see 8.2.4.18), where the vertical arrows are given by functoriality from the canonical morphisms $\sigma_{\mathcal{E},(\lambda,\chi)}$ or $\sigma_{\mathcal{F},(\lambda,\chi)}$. We easily check its commutativity.

Lemma 8.2.4.21. *Let $f\colon \mathcal{E}'^{(\bullet)} \to \mathcal{E}^{(\bullet)}$ be a morphism belonging to $S^-(\mathcal{D}^{(\bullet)})$ and $g\colon \mathcal{F}^{(\bullet)} \to \mathcal{F}'^{(\bullet)}$ be a morphism belonging to $S^+(\mathcal{D}^{(\bullet)})$, i.e. f and g are lim-ind-isogenies (see 8.1.4.3). Then the canonical morphisms*

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}) \to \mathbb{R}\varinjlim_{\lambda,\chi} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}'^{(\bullet)},\chi^*\lambda^*\mathcal{F}'^{(\bullet)}) \tag{8.2.4.21.1}$$

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}) \to \mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}'^{(\bullet)},\chi^*\lambda^*\mathcal{F}'^{(\bullet)}) \tag{8.2.4.21.2}$$

$$\mathbb{R}\varinjlim_{\lambda,\chi} \mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}) \to \mathbb{R}\varinjlim_{\lambda,\chi} \mathrm{Hom}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}'^{(\bullet)},\chi^*\lambda^*\mathcal{F}'^{(\bullet)}) \tag{8.2.4.21.3}$$

are isomorphisms.

Proof. Since the proofs are similar (replace $\mathscr{H}om$ by Hom or $\mathcal{H}om$), let us prove 8.2.4.21.1. We easily reduce to the following two cases.

1) Suppose there exists $\chi_0 \in M(I)$ and $\lambda_0 \in L(I)$ such that $g = \sigma_{\mathcal{F},(\lambda_0,\chi_0)}$ and $f = \mathrm{id}$ (see notation 8.1.4.1). Let $\mathcal{I}^{(\bullet)} \in K^+(\mathscr{I})$ be a complex representing $\mathcal{F}^{(\bullet)}$ and $\mathcal{P}^{(\bullet)} \in K^-(\mathscr{P})$ is a complex representing $\mathcal{E}^{(\bullet)}$. Using 8.1.2.2 and 8.1.3.2, we get

$$\chi^*\lambda^*\chi_0^*\lambda_0^*(\mathcal{I}^{(\bullet)}) = \chi^*(\chi_0\circ\lambda)^*\lambda^*\lambda_0^*(\mathcal{I}^{(\bullet)}) = (\chi + (\chi_0\circ\lambda))^*(\lambda_0\circ\lambda)^*(\mathcal{I}^{(\bullet)}). \tag{8.2.4.21.4}$$

Since the map $\lambda \mapsto \lambda_0\circ\lambda$ is an element of $L(L(I))$, since the map $\chi \mapsto \chi + (\chi_0\circ\lambda)$ is an element of $L(M(I))$, this yields the morphism

$$\varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\chi^*\lambda^*\mathcal{I}^{(\bullet)}) \to \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\chi^*\lambda^*\chi_0^*\lambda_0^*(\mathcal{I}^{(\bullet)})) \tag{8.2.4.21.5}$$

is an isomorphism.

Let $\mathcal{I}'^{(\bullet)} \in K^+(\mathscr{J})$ be a complex representing $\chi_0^*\lambda_0^*\mathcal{I}^{(\bullet)}$. For any $\chi \in M(I)$ and $\lambda \in L(I)$, the functors χ^* and λ^* are exact, Hence, we get the quasi-isomorphism $\chi^*\lambda^*\chi_0^*\lambda_0^*(\mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \chi^*\lambda^*\mathcal{I}'^{(\bullet)}$. Following 8.2.3.15, the modules of the complex $\chi^*\lambda^*\mathcal{I}'^{(\bullet)}$ belong to $\mathscr{J}(\mathscr{P})$ (see notation 8.2.4.2). Using 8.2.4.21.4, we check similarly that the modules of the complex $\chi^*\lambda^*\chi_0^*\lambda_0^*(\mathcal{I}^{(\bullet)})$ belong to $\mathscr{J}(\mathscr{P})$. Hence, it follows from 8.2.3.16 that the morphism

$$\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi^*\lambda^*\chi_0^*\lambda_0^*(\mathcal{I}^{(\bullet)})) \to \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi^*\lambda^*\mathcal{I}'^{(\bullet)}) \tag{8.2.4.21.6}$$

is an isomorphism. By applying the filtered limit $\varinjlim_{\lambda,\chi}$ to 8.2.4.21.6 and by composing this latter morphism with 8.2.4.21.5, we get the isomorphism 8.2.4.21.3.

2) Suppose there exists $\chi_0 \in M(I)$ and $\lambda_0 \in L(I)$ such that $f = \sigma_{\mathcal{E},(\lambda_0,\chi_0)}$ and $g = \mathrm{id}$.

i) Since the category $\mathscr{P}$ is not stable under the functor of the form $\chi_0^*\lambda_0^*$, via the isomorphism 8.2.4.13.3 this is more convenient to check that the canonical morphism

$$\varinjlim_{\lambda,\chi} \circ \mathbb{R}\mathscr{H}om^{(\bullet;\bullet)}_{\mathcal{D}^{(\bullet)}}(\chi_0^*\lambda_0^*\mathcal{E}^{(\bullet)},\ \mathfrak{c}(\mathcal{F}^{(\bullet)})) \to \varinjlim_{\lambda,\chi} \circ \mathbb{R}\mathscr{H}om^{(\bullet;\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathfrak{c}(\mathcal{F}^{(\bullet)})) \tag{8.2.4.21.7}$$

is an isomorphism.

ii) Let $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$-modules representing $\mathfrak{c}(\mathcal{F}^{(\bullet)})$. Let $\mathcal{I}'^{(\bullet),(\bullet,\bullet)} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$-modules endowed with a quasi-isomorphism $\chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\bullet,\bullet)} \to \mathcal{I}'^{(\bullet),(\bullet,\bullet)}$ of $K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ where $\chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\bullet,\bullet)} := (\chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)})_{\lambda,\chi}$. Consider the following diagram

$$\begin{array}{ccc}
\varinjlim_{\lambda,\chi} \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\chi_0^*\lambda_0^*\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(5)} & \varinjlim_{\lambda,\chi} \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) \\
\downarrow{\scriptstyle (1)} & \swarrow{\scriptstyle (\star)} & \downarrow{\scriptstyle (3)} \\
\varinjlim_{\lambda,\chi} \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\chi_0^*\lambda_0^*\mathcal{E}^{(\bullet)}, \chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(6)} & \varinjlim_{\lambda,\chi} \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}) \\
\downarrow{\scriptstyle (2)} & & \downarrow{\scriptstyle (4)} \\
\varinjlim_{\lambda,\chi} \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\chi_0^*\lambda_0^*\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(7)} & \varinjlim_{\lambda,\chi} \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)}),
\end{array} \tag{8.2.4.21.8}$$

where the numbered arrows are given by functoriality of the bifunctor $\varinjlim_{\lambda,\chi} \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(-,-)$ and where the arrow $(\star)$ is defined by functoriality from the functor $\chi_0^*\lambda_0^*$ (i.e. is the composition of 8.2.4.18.3 with the first morphism of 8.2.4.19.1). From the $\mathscr{H}om$ version of the commutative diagram 8.2.4.20.1, we get the commutativity of both triangles of the upper square of the diagram 8.2.4.21.8. Since the lower square is commutative by fonctoriality, the whole diagram 8.2.4.21.8 is commutative. Remark that the top morphism (5) represents 8.2.4.21.7. We now check this morphism (5) is an isomorphism via the following steps.

iii) Let us check that the composition morphism $(4)\circ(3)$ is a quasi-isomorphism. Let $\mathcal{P}^{(\bullet)} \in K^+(\mathcal{D}^{(\bullet)})$ be a complex of left $\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{P}$ representing $\mathcal{E}^{(\bullet)}$. Since $\mathcal{I}^{(\bullet),(\lambda,\chi)}$ and $\mathcal{I}'^{(\bullet),(\lambda,\chi)}$ are bounded below complexes of injective left $\mathcal{D}^{(\bullet)}$-modules, then we reduce to check that $(4)\circ(3)$ is a quasi-isomorphism when $\mathcal{E}^{(\bullet)}$ is replaced by $\mathcal{P}^{(\bullet)}$. Let $\mathcal{I}^{(\bullet)} \in K^+(\mathcal{D}^{(\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet)}$-modules representing $\mathcal{F}^{(\bullet)}$. Since $\mathfrak{c}$ is exact, then $\mathfrak{c}(\mathcal{I}^{(\bullet)})$ is quasi-isomorphic to $\mathfrak{c}(\mathcal{F}^{(\bullet)})$. Hence, there exists a quasi-isomorphim of $K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ of the form $\mathfrak{c}(\mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \mathcal{I}^{(\bullet),(\bullet,\bullet)}$. This induces the quasi-isomorphisms of $K^+(\mathcal{D}^{(\bullet)})$ of the form $\chi^*\lambda^*\mathcal{I}^{(\bullet)} \xrightarrow{\sim} \mathcal{I}^{(\bullet),(\lambda,\chi)}$ for any $\lambda \in L(I)$, $\chi \in M(I)$. Consider the diagram

$$\begin{array}{ccccc}
\varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) & \longrightarrow & \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \longrightarrow & \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)}) \\
\uparrow & & \uparrow & & \\
\varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi^*\lambda^*\mathcal{I}^{(\bullet)}) & \longrightarrow & \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)}, \chi_0^*\lambda_0^*\chi^*\lambda^*\mathcal{I}^{(\bullet)}), & &
\end{array} \tag{8.2.4.21.9}$$

whose morphisms are given by functoriality of the bifunctor $\varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,-)$.

Since $\chi^*\lambda^*\mathcal{I}^{(\bullet)} \xrightarrow{\sim} \mathcal{I}^{(\bullet),(\lambda,\chi)}$ and $\chi_0^*\lambda_0^*\chi^*\lambda^*\mathcal{I}^{(\bullet)} \xrightarrow{\sim} \chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}$ are quasi-isomorphisms of complexes of $K^+(\mathcal{D}^{(\bullet)})$ whose terms belong to $\mathscr{I}(\mathscr{P})$ (see Proposition 8.2.3.15) for any $\lambda \in L(I)$, $\chi \in M(I)$, then it follows from 8.2.3.16 that both vertical morphisms of 8.2.4.21.9 are quasi-isomorphisms. Similarly, we get from the quasi-isomorphism $\chi_0^*\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)} \xrightarrow{\sim} \mathcal{I}'^{(\bullet),(\lambda,\chi)}$, from 8.2.3.15 and 8.2.3.16 that the right top horizontal morphism of 8.2.4.21.9 is a quasi-isomorphism.

Using some formulas of 8.1.2.2 and 8.1.3.2, we compute

$$\chi_0^*\lambda_0^*\chi^*\lambda^*(\mathcal{I}^{(\bullet)}) = \chi_0^*(\chi\circ\lambda_0)^*\lambda_0^*\lambda^*(\mathcal{I}^{(\bullet)}) = (\chi_0 + (\chi\circ\lambda_0))^*(\lambda\circ\lambda_0)^*(\mathcal{I}^{(\bullet)}). \tag{8.2.4.21.10}$$

Since the map $\lambda \mapsto \lambda\circ\lambda_0$ is an element of $L(L(I)$, since the map $\chi \mapsto \chi_0 + (\chi\circ\lambda_0)$ is an element of $L(M(I))$, this yields the bottom horizontal morphism of 8.2.4.21.9 is an isomorphism. Hence, the morphisms of 8.2.4.21.9 are quasi-isomorphisms, in particular the composition of the top horizontal ones, i.e. $(4)\circ(3)$ is a quasi-isomorphism.

iv) Replacing $\mathcal{E}^{(\bullet)}$ by $\chi_0^*\lambda_0^*\mathcal{E}^{(\bullet)}$, it follows from iii) that $(2)\circ(1)$ is a quasi-isomorphism. Hence, we get from the commutativity of 8.2.4.21.8 that $(2)\circ(\star)$, (5) and (7) are quasi-isomorphisms. In particular, (5) is a quasi-isomorphism and then we are done. □

Definition 8.2.4.22. It follows from 8.2.4.21 that the bifunctor $\mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)$ of 8.2.4.5.1 factors through the localisation of the categories with respect to lim-ind-isogenies, i.e. via the Lemma 8.1.4.9 induces the following bifunctor denoted by

$$\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}_X). \tag{8.2.4.22.1}$$

Similarly, it follows from 8.2.4.21 that the bifunctor of 8.2.4.12.1 induces the bifunctor

$$\mathbb{R}\,\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}). \tag{8.2.4.22.2}$$

Similarly, it follows from 8.2.4.21 that the bifunctor of 8.2.4.13.1 induces the composite bifunctor

$$\mathbb{R}\mathscr{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}_X^{(\bullet)}) \to D^+(\mathbb{Z}_X^{(\bullet)}). \tag{8.2.4.22.3}$$

Remark 8.2.4.23. We have a $\mathscr{H}om$ or Hom version of the following which we leave to the reader to specify. Denote by $F(-,-)$ the bounded version of the bifunctor 8.2.4.4.1:

$$F(-,-) := \varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)\colon K^{\mathrm{b}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to K^+(\mathbb{Z}_X) \tag{8.2.4.23.1}$$

(a) Following 8.2.4.6 and with its notation, we have

$$\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}}\times\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\mathcal{D}^{(\bullet)})} F(-,-) = \mathbb{R}\varinjlim_{\lambda,\chi} \mathcal{H}om_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-)\colon D^{\mathrm{b}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}_X), \tag{8.2.4.23.2}$$

which is the restricted functor of 8.2.4.5.1.

(b) Since the composition of the localization morphism $Q_{LD}\colon D^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ with the equivalence of categories $\mathfrak{e}$ of 8.1.5.14.1 is the canonical functor $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, then with notation 8.1.5.12 we have $\mathfrak{N}_{LD:=}\operatorname{Ker} Q_{LD} = D^{\mathrm{b}}_{N(\mathcal{D}^{(\bullet)})}(\mathcal{D}^{(\bullet)})$. Moreover, $\mathfrak{N}_{\mathrm{LD}}$ is a saturated (in the sense of 7.4.1.1) strictly full triangulated subcategory of $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$. Let us denote by $G(-,-)$ the bifunctor 8.2.4.23.2. With the remark 7.4.1.11, the right localizable with respect to $\mathfrak{N}^{\mathrm{op}}_{LD} \times \mathfrak{N}_{LD}$ of G exists and

$$\mathbb{R}_{\mathfrak{N}^{\mathrm{op}}_{LD}\times\mathfrak{N}_{LD}} G(-,-) = \mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^{+}(\mathbb{Z}_X). \quad (8.2.4.23.3)$$

(c) Let $Q^{\mathrm{qi}}_{LD}\colon K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ be the localization morphism, let $\mathfrak{N}^{\mathrm{qi}}_{LD} := \operatorname{Ker} Q^{\mathrm{qi}}_{LD}$ be the saturated strictly full triangulated subcategory of $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$. It follows from 7.4.1.6 and 7.4.1.13.1 that

$$\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{(\mathfrak{N}^{\mathrm{qi}}_{LD})^{\mathrm{op}}\times\mathfrak{N}^{\mathrm{qi}}_{LD}} F(-,-) = \mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^{+}(\mathbb{Z}_X). \quad (8.2.4.23.4)$$

Proposition 8.2.4.24. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We have the isomorphism*

$$H^0\mathbb{R}\operatorname{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \operatorname{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}). \quad (8.2.4.24.1)$$

Proof. Let $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \in K^{+}(\mathcal{D}^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$-modules representing $\mathfrak{c}(\mathcal{F}^{(\bullet)})$. By using (the Hom version of) 8.2.4.8.1, we get the isomorphism

$$H^0\mathbb{R}\operatorname{Hom}^{(\bullet;\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathfrak{c}(\mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \left(H^0\operatorname{Hom}^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{I}^{(\bullet),(\lambda,\chi)})\right)_{(\lambda,\chi)\in L(I)\times M(I)}. \quad (8.2.4.24.2)$$

Since $\mathcal{I}^{(\bullet),(\lambda,\chi)}$ is a bounded below complex of injective left $\mathcal{D}^{(\bullet)}$-module and is quasi-isomorphic to $\chi^*\lambda^*\mathcal{F}^{(\bullet)}$, we get

$$\begin{aligned} H^0\operatorname{Hom}^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathcal{I}^{(\bullet),(\lambda,\chi)}) &\xrightarrow{\sim} \operatorname{Hom}_{D(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{I}^{(\bullet),(\lambda,\chi)}) \\ &\xrightarrow{\sim} \operatorname{Hom}_{D(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}). \end{aligned} \quad (8.2.4.24.3)$$

Since $L(I)\times M(I)$ is filtered, taking the inductive limit on 8.2.4.24.2 and 8.2.4.24.3 we get

$$H^0\varinjlim_{\lambda,\chi}\mathbb{R}\operatorname{Hom}^{(\bullet;\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathfrak{c}(\mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \varinjlim_{\lambda,\chi} H^0\mathbb{R}\operatorname{Hom}^{(\bullet;\bullet)}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\mathfrak{c}(\mathcal{F}^{(\bullet)})) \quad (8.2.4.24.4)$$

$$\xrightarrow{\sim} \varinjlim_{\lambda,\chi}\operatorname{Hom}_{D(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\chi^*\lambda^*\mathcal{F}^{(\bullet)}) \underset{8.1.4.12.1}{\xrightarrow{\sim}} \operatorname{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}). \quad (8.2.4.24.5)$$

We conclude the proof with 8.2.4.12.3. □

Proposition 8.2.4.25. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$,*

1. *If X is coherent, then we have the bifunctorial isomorphism*

$$\mathbb{R}\Gamma(X,\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}). \quad (8.2.4.25.1)$$

2. *If I^o and X are coherent, then we have the bifunctorial isomorphism*

$$\mathbb{R}\Gamma(X^{(\bullet)},\mathbb{R}\mathscr{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}). \quad (8.2.4.25.2)$$

Proof. By definition (see 8.2.4.22), this is a consequence of respectively 8.2.4.15.3 and 8.2.4.15.4. □

8.3 Homomorphism bifunctor of the derived category of $LM_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$

8.3.1 Invariance of $LD_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ via L-equivalences

Lemma 8.3.1.1. *Let $u\colon I' \to I$ be an increasing map of partially ordered sets, $\mathcal{D}'^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I')}$ endowed with a homomorphism of sheaf of rings $\mathcal{D}'^{(\bullet)} \to \underrightarrow{u}_X^{-1}(\mathcal{D}^{(\bullet)})$. Let $\mathcal{F}^{(\bullet)}$ be a left $\mathcal{D}^{(\bullet)}$-module. We consider $\underrightarrow{u}_X^{-1}(\mathcal{F}^{(\bullet)})$ as a left $\mathcal{D}'^{(\bullet)}$-module via the homomorphism $\mathcal{D}'^{(\bullet)} \to \underrightarrow{u}_X^{-1}(\mathcal{D}^{(\bullet)})$, which yields the exact functor $\underrightarrow{u}_X^{-1}\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}'^{(\bullet)})$. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.*

(a) The functor $\underrightarrow{u}_X^{-1}$ extends to the exact functor $\underrightarrow{u}_X^{-1}\colon \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$ and the δ-functor $\underrightarrow{u}_X^{-1}\colon \underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$ making commutative the diagram

$$\begin{array}{ccc} \underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}} & \underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)}) \\ {\scriptstyle 8.1.5.3}\uparrow & & {\scriptstyle 8.1.5.3}\uparrow \\ \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}} & \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)}). \end{array} \tag{8.3.1.1.1}$$

(b) If $u\colon I' \to I$ is an L-equivalence (see definition 8.1.3.8) then the functor $\underrightarrow{u}_X^{-1}$ extends to the exact functor $\underrightarrow{u}_X^{-1}\colon \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$ and the δ-functor $\underrightarrow{u}_X^{-1}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$ making commutative the diagram

$$\begin{array}{ccc} \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}} & \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)}) \\ {\scriptstyle 8.1.5.3}\uparrow & & {\scriptstyle 8.1.5.3}\uparrow \\ \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}} & \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)}). \end{array} \tag{8.3.1.1.2}$$

Proof. a) Since $\underrightarrow{u}_X^{-1}$ is an exact functor, we get the δ-functor $\underrightarrow{u}_X^{-1}\colon D^{\sharp}(\mathcal{D}^{(\bullet)}) \to D^{\sharp}(\mathcal{D}'^{(\bullet)})$. Let $\chi \in M(I)$ and $\mathcal{E}^{(\bullet)} \in D^{\sharp}(\mathcal{D}^{(\bullet)})$. To prove the factorizations of (a), it is sufficient to check that $\underrightarrow{u}_X^{-1}(\theta_{\mathcal{E},\chi})$ is invertible in $\underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$. Since $\chi \circ u \in M(I')$, this is a consequence of the commutative diagram:

$$\begin{array}{ccc} \underrightarrow{u}_X^{-1}(\mathcal{E}^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}(\theta_{\mathcal{E},\chi})} & \underrightarrow{u}_X^{-1}(\chi^*\mathcal{E}^{(\bullet)}) \\ & \searrow^{\theta_{\underrightarrow{u}_X^{-1}\mathcal{E},\chi\circ u}} & \| \\ & & (\chi \circ u)^*\underrightarrow{u}_X^{-1}(\mathcal{E}^{(\bullet)}). \end{array} \tag{8.3.1.1.3}$$

b) Let $v\colon I \to I'$ such that $v \circ u \in L(I')$ and $u \circ v \in L(I)$. Let $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\Lambda^{\sharp}(\mathcal{D}^{(\bullet)})$. Choose $\lambda \in L(I)$ and a morphism $g\colon \mathcal{F}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that $g \circ f = \rho_{\mathcal{E},\lambda}$ and $\lambda^*(f) \circ g = \rho_{\mathcal{F},\lambda}$ in $\underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We easily check that $v \circ \lambda \circ u \in L(I')$, $u \circ v \circ \lambda \in L(I)$ and we have the commutative diagram:

$$\begin{array}{ccc} \underrightarrow{u}_X^{-1}(\mathcal{E}^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}(\rho_{\mathcal{E},u\circ v\circ\lambda})} & \underrightarrow{u}_X^{-1}(u \circ v \circ \lambda)^*\mathcal{E}^{(\bullet)} \\ & \searrow^{\rho_{\underrightarrow{u}_X^{-1}\mathcal{E},v\circ\lambda\circ u}} & \| \\ & & (v \circ \lambda \circ u)^*\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}. \end{array} \tag{8.3.1.1.4}$$

Let g' be the morphism given by the following composition:

$$g'\colon \underrightarrow{u}_X^{-1}(\mathcal{F}^{(\bullet)}) \xrightarrow{\underrightarrow{u}_X^{-1}(g)} \underrightarrow{u}_X^{-1}\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\underrightarrow{u}_X^{-1}\lambda^*(\rho_{\mathcal{E},u\circ v})} \underrightarrow{u}_X^{-1}\lambda^*(u \circ v)^*\mathcal{E}^{(\bullet)} = (v \circ \lambda \circ u)^*\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}.$$

Via 8.3.1.1.4, we can check $g' \circ \underrightarrow{u}_X^{-1}(f) = \rho_{\underrightarrow{u}_X^{-1}\mathcal{E},v\circ\lambda\circ u}$ and $(v \circ \lambda \circ u)^*(\underrightarrow{u}_X^{-1}(f)) \circ g' = \rho_{\underrightarrow{u}_X^{-1}\mathcal{F},v\circ\lambda\circ u}$ in $\underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$. This yields that $\underrightarrow{u}_X^{-1}(f) \in \Lambda^{\sharp}(\mathcal{D}'^{(\bullet)})$ and we are done. □

Remark 8.3.1.2. With notation 8.3.1.1, the functor (denoted slightly abusively) $\underrightarrow{u}_X^{-1}$ is the composition of $\mathrm{Mod}(\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$ induced by the inverse image by the topos morphism $\underrightarrow{u}_X\colon X^{(I')} \to X^{(I)}$ with the forgetful functor $\mathrm{Mod}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}) \to \mathrm{Mod}(\mathcal{D}'^{(\bullet)})$. Hence, we have checked above a unification of both cases.

Proposition 8.3.1.3. *Let $u\colon I' \to I$ be an L-equivalence between two partially ordered sets (see definition 8.1.3.8). Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$.*

(a) The following functors

$$\underrightarrow{u}_X^{-1}\colon \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}), \qquad \underrightarrow{u}_X^{-1}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}). \tag{8.3.1.3.1}$$

defined at 8.3.1.1 are equivalences of categories.

Suppose $I' = I$ and $u \in L(I)$, denoting by $\lambda_0 := u$, the forgetful functors $\underrightarrow{LM}_{\mathbb{Q}}(\lambda_0^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda_0^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, induced by the canonical morphism $\rho_{\mathcal{D},\lambda_0}\colon \mathcal{D}^{(\bullet)} \to \lambda_0^*\mathcal{D}^{(\bullet)}$, are quasi-inverse equivalences of 8.3.1.3.1.

(b) Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Then $\underrightarrow{u}_X^{-1}$ induces the isomorphisms

$$\mathbb{R}\operatorname{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\operatorname{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})}(\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}, \underrightarrow{u}_X^{-1}\mathcal{F}^{(\bullet)}), \tag{8.3.1.3.2}$$

$$\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})}(\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}, \underrightarrow{u}_X^{-1}\mathcal{F}^{(\bullet)}), \tag{8.3.1.3.3}$$

$$\underrightarrow{u}_X^{-1}\mathbb{R}\mathscr{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})}(\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}, \underrightarrow{u}_X^{-1}\mathcal{F}^{(\bullet)}). \tag{8.3.1.3.4}$$

Proof. a) Since the case of modules is checked similarly let us only treat the case of complexes. Since the second part of (a) induces the first one, we can suppose $I' = I$ and $u \in L(I)$. In that case, we prefer to write $\lambda_0 := u$. Recall that by definition $\lambda_0^* = \underrightarrow{\lambda}_{0X}^{-1}$ (see 8.1.3.3). Let us denote by $\lambda_{0*}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda_0^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, the forgetful functor induced by the canonical morphism $\rho_{\mathcal{D},\lambda_0}\colon \mathcal{D}^{(\bullet)} \to \lambda_0^*\mathcal{D}^{(\bullet)}$. For any $\mathcal{E}^{(\bullet)} \in K(\mathcal{D}^{(\bullet)})$ the morphism $\rho_{\mathcal{E},\lambda_0}$ is an isomorphism in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. By functoriality in $\mathcal{E}$ of $\rho_{\mathcal{E},\lambda_0}$, this induces the isomorphism of functors $\mathrm{id} \to \lambda_{0*} \circ \lambda_0^*$ on $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Conversely, for any $\mathcal{F}^{(\bullet)} \in K(\lambda_0^*\mathcal{D}^{(\bullet)})$ the morphism $\rho_{\mathcal{F},\lambda_0}$ constructed in $K(\mathcal{D}^{(\bullet)})$ is in fact the same morphism constructed in $K(\lambda_0^*\mathcal{D}^{(\bullet)})$. Hence, $\rho_{\mathcal{F},\lambda_0}$ is an isomorphism in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda_0^*\mathcal{D}^{(\bullet)})$. By functoriality in $\mathcal{F}$ of $\rho_{\mathcal{F},\lambda_0}$, this yields the isomorphism of functors $\mathrm{id} \xrightarrow{\sim} \lambda_0^* \circ \lambda_{0*}$ on $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda_0^*\mathcal{D}^{(\bullet)})$.

b) i) Since the proof of 8.3.1.3.2 or 8.3.1.3.3 are similar, let us only prove 8.3.1.3.4. Let $\mathcal{I}^{(\bullet)} \in K^+(\mathscr{I}(\mathcal{D}^{(\bullet)}))$ be a complex endowed with a quasi-isomorphism $\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mathcal{I}^{(\bullet)}$, let $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \in K^+(\mathscr{I}(\mathcal{D}^{(\bullet),(\bullet,\bullet)}))$ together with a quasi-isomorphism $\mathfrak{c}(\mathcal{I}^{(\bullet)}) \xrightarrow{\sim} \mathcal{I}^{(\bullet),(\bullet,\bullet)}$, and $\mathcal{I}'^{(\bullet),(\bullet,\bullet)} \in K^+(\mathscr{I}((\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})^{(\bullet,\bullet)}))$ together with a quasi-isomorphism $\underrightarrow{u}_X^{-1}\mathcal{I}^{(\bullet),(\bullet,\bullet)} \xrightarrow{\sim} \mathcal{I}'^{(\bullet),(\bullet,\bullet)}$. Modulo the isomorphism 8.2.4.13.3, we construct the morphism as being equal to the composition of

$$\underrightarrow{u}_X^{-1} \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) \to \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}}(\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}, \underrightarrow{u}_X^{-1}\mathcal{I}^{(\bullet),(\lambda,\chi)}) \to \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}}(\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)}), \tag{8.3.1.3.5}$$

where the first morphism follows from the commutation of the functor $\underrightarrow{u}_X^{-1}$ with inductive limits and of 8.2.4.17. We check easily that this is, up to isomorphism, independent of the choices of $\mathcal{I}^{(\bullet),(\bullet,\bullet)}$ and $\mathcal{I}'^{(\bullet),(\bullet,\bullet)}$. It remains to check this is a quasi-isomorphism.

ii) The construction of 8.3.1.3.4 is transitive with respect to composition of the map u, i.e. if $v\colon I'' \to I'$ is an L-equivalence of partially ordered sets, if $\mathcal{I}''^{(\bullet),(\bullet,\bullet)}$ is an injective resolution of $\underrightarrow{v}_X^{-1}\mathcal{I}'^{(\bullet),(\bullet,\bullet)}$ in $K^+((\underrightarrow{v}_X^{-1}\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})^{(\bullet,\bullet)})$ then the composition

$$\begin{aligned}\underrightarrow{v}_X^{-1}\underrightarrow{u}_X^{-1} \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) &\to \underrightarrow{v}_X^{-1} \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}}(\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)})\\ &\to \varinjlim_{\lambda,\chi} \mathscr{H}om^{\bullet}_{\underrightarrow{v}_X^{-1}\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}}(\underrightarrow{v}_X^{-1}\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)}, \mathcal{I}''^{(\bullet),(\lambda,\chi)}).\end{aligned} \tag{8.3.1.3.6}$$

is equal (up to isomorphism) to the morphism constructed at 8.3.1.3.5 in the case where u is replaced by $u \circ v$. Hence, we reduce to the case where $\lambda_0 := u$.

iii) Take a resolution $\mathcal{P}^{(\bullet)}$ in $K^-(\mathcal{D}^{(\bullet)})$ of $\mathcal{E}^{(\bullet)}$ with terms in $\mathscr{P}$. Since for any $\lambda \in L(I)$, $\chi \in M(I)$, $\mathcal{I}^{(\bullet),(\lambda,\chi)}$ is a bounded above complex of injective $\mathcal{D}^{(\bullet)}$-modules, $\mathcal{I}'^{(\bullet),(\lambda,\chi)}$ is a bounded above complex of injective $\lambda_0^*\mathcal{D}^{(\bullet)}$-modules, we reduce to check that the morphism 8.3.1.3.5 is a quasi-isomorphism when $\mathcal{E}^{(\bullet)}$ is replaced by $\mathcal{P}^{(\bullet)}$.

iv) Take an injective resolution $\mathcal{I}''^{(\bullet),(\bullet,\bullet)}$ of $\lambda_0^*\mathcal{I}'^{(\bullet,\bullet)}$ in $K^+((\lambda_0^*\mathcal{D}^{(\bullet)})^{(\bullet,\bullet)})$. Take a resolution $\mathcal{P}'^{(\bullet)}$ in $K^-(\lambda_0^*\mathcal{D}^{(\bullet)})$ of $\lambda_0^*\mathcal{P}^{(\bullet)}$ with terms in $\mathscr{P}(\lambda_0^*\mathcal{D}^{(\bullet)})$. Consider the following diagram

$$\begin{array}{ccccc}
\lambda_0^*\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \longrightarrow & \lambda_0^*\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \longrightarrow & \lambda_0^*\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\mathcal{I}'^{(\bullet),(\lambda,\chi)}) \\
\downarrow{\scriptstyle (\star)} & \nearrow & & \nearrow & \downarrow{\scriptstyle (\star)} \\
\mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{P}^{(\bullet)},\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \rightarrow & \mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{P}^{(\bullet)},\mathcal{I}'^{(\bullet),(\lambda,\chi)}) & \rightarrow & \mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{P}^{(\bullet)},\lambda_0^*\mathcal{I}'^{(\bullet),(\lambda,\chi)}) \\
\downarrow & = & & \swarrow & \downarrow \\
\mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{P}^{(\bullet)},\mathcal{I}'^{(\bullet),(\lambda,\chi)}) & \longrightarrow & \mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{P}'^{(\bullet)},\lambda_0^*\mathcal{I}'^{(\bullet),(\lambda,\chi)}) & \longrightarrow & \mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{P}'^{(\bullet)},\mathcal{I}''^{(\bullet),(\lambda,\chi)})
\end{array} \tag{8.3.1.3.7}$$

where the arrows $(\star)$ are defined by functoriality of λ_0^* (see 8.2.4.18.2) and where the other ones are induced by functoriality of some homomorphism bifunctor. The bottom part of the diagram 8.3.1.3.7 is commutative by definition of the arrows, the commutativity of its left top triangle is induced by that of the right square of 8.2.4.20.2 (in the case where $\chi = \mathrm{id}$), the commutativity of its right top triangle is induced by that of the left square of 8.2.4.20.3 (in the case where $\chi = \mathrm{id}$). Since the trapeze is commutative by functoriality, then we have checked the commutativity of the whole diagram 8.3.1.3.7.

v) Let us check that the images under the functor $\varinjlim_{\lambda,\chi}$ of the top horizontal morphisms of the diagram 8.3.1.3.7 are quasi-isomorphisms. Since the morphism $\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)} \to \mathcal{I}'^{(\bullet),(\lambda,\chi)}$ is a quasi-isomorphism of bounded above complexes whose modules belong to $\mathscr{I}(\mathscr{P})$ (use see 8.2.3.13 in the case where $u = \mathrm{id}$ and $\mathcal{D}'^{(\bullet)} = \lambda_0^*\mathcal{D}^{(\bullet)}$ for the left term), then it follows from 8.2.3.16 that the right top horizontal morphism is an isomorphism.

It follows from 8.2.3.15 and 8.2.3.16 that the vertical morphisms

$$\begin{array}{ccc}
\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\chi^*\lambda^*\mathcal{I}^{(\bullet)}) & \longrightarrow & \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\lambda_0^*\chi^*\lambda^*\mathcal{I}^{(\bullet)}) \\
\downarrow & & \downarrow \\
\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \longrightarrow & \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{P}^{(\bullet)},\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)})
\end{array} \tag{8.3.1.3.8}$$

are quasi-isomorphism. Using 8.1.2.2 and 8.1.3.2, we get $\lambda_0^*\chi^*\lambda^*(\mathcal{I}^{(\bullet)}) = (\chi\circ\lambda_0)^*\lambda_0^*\lambda(\mathcal{I}^{(\bullet)}) = (\chi\circ\lambda_0)^*(\lambda\circ\lambda_0)^*(\mathcal{I}^{(\bullet)})$. Hence, by applying the functor $\varinjlim_{\lambda,\chi}$ to the top morphism of 8.3.1.3.8 we get an isomorphism. Hence, so is its bottom morphism, which is the top left horizontal morphism of 8.3.1.3.7. Hence, we are done.

vi) The morphism $\mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{P}^{(\bullet)},\mathcal{I}'^{(\bullet),(\lambda,\chi)}) \to \mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{P}'^{(\bullet)},\mathcal{I}'^{(\bullet),(\lambda,\chi)})$ induced by the quasi-isomorphism $\mathcal{P}'^{(\bullet)} \xrightarrow{\sim} \lambda_0^*\mathcal{P}^{(\bullet)}$ is a quasi-isomorphism. Hence, to check that the bottom horizontal morphisms of the diagram 8.3.1.3.7 are quasi-isomorphisms, we reduce to the case where $\lambda_0^*\mathcal{P}^{(\bullet)}$ is replaced by $\mathcal{P}'^{(\bullet)}$ at the source. Replacing in the step (v) $\mathcal{D}^{(\bullet)}$ by $\lambda_0^*\mathcal{D}^{(\bullet)}$, $\mathcal{P}^{(\bullet)}$ by $\mathcal{P}'^{(\bullet)}$, $\mathcal{I}^{(\bullet),(\lambda,\chi)})$ by $\mathcal{I}'^{(\bullet),(\lambda,\chi)}$ and $\mathcal{I}'^{(\bullet),(\lambda,\chi)}$ by $\mathcal{I}''^{(\bullet),(\lambda,\chi)}$, we check that the images under the functor $\varinjlim_{\lambda,\chi}$ of these bottom horizontal morphisms are isomorphism.

vii) Since we have in the diagram 8.3.1.3.7 a morphism from the bottom left term to the top right term, it follows from v) and vi) that the image under the functor $\varinjlim_{\lambda,\chi}$ of the composition of the left vertical morphisms of the diagram 8.3.1.3.7 is a quasi-isomorphism. Since this latter quasi-isomorphism is equal to the composition 8.3.1.3.5, then we are done. □

8.3.1.4. With notation and hypotheses of 8.3.1.3, consider the following diagram:

$$\begin{array}{ccccc} D^{\sharp}(\mathcal{D}^{(\bullet)}) & \xrightarrow{Q} & \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow[8.1.5.6.1]{H^n} & \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \\ \downarrow {\scriptstyle \underrightarrow{u}_X^{-1}} & & \cong \downarrow {\scriptstyle \underrightarrow{u}_X^{-1}} & & \cong \downarrow {\scriptstyle \underrightarrow{u}_X^{-1}} \\ D^{\sharp}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}) & \xrightarrow{Q} & \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}) & \xrightarrow[8.1.5.6.1]{H^n} & \underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}) \end{array} \quad \text{(top and bottom curved arrows } H^n\text{)} \tag{8.3.1.4.1}$$

where Q are the localization morphisms, where the functor 8.1.5.6.1 are making commutative (up to isomorphism) by definition the "curvy triangles" of the top and bottom. Since the functor $\underrightarrow{u}_X^{-1} : M(\mathcal{D}^{(\bullet)}) \to M(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$ is exact; then the big rectangle (i.e. the composition of both squares) is commutative (up to isomorphism). The left square is commutative (up to isomorphism) by construction (see 8.3.1.1) of the equivalence of categories 8.3.1.3.1. By unicity of the factorization of the top functor 8.1.5.6.1, we get the commutativity (up to isomorphism) of the right square. Hence, so is the diagram 8.3.1.4.1.

Notation 8.3.1.5 (Bimodules case in LD categories)**.** So that the categories of the $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ form (see notation 8.1.4.10) are more easily manipulated we will make the following assumptions: Let $\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}$ be two sheaves of rings on the topos $X^{(I)}$. Let $\mathcal{R}$ be a sheaf of commutative rings on $\mathfrak{X}$. We still denote by $\mathcal{R}$ the constant inductive system of rings of X indexed by I with value $\mathcal{R}$. Suppose $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ is solved by $\mathcal{R}$ (see definition 4.6.3.2).

Lemma 8.3.1.6. *Let $u \colon \widetilde{I} \to I$ be an increasing map of partially ordered sets which is an L-equivalence (see definition 8.1.3.8). With notation and hypotheses 8.3.1.5, let $\widetilde{\mathcal{D}}^{(\bullet)}$ (resp. $\widetilde{\mathcal{D}}'^{(\bullet)}$) be a sheaf of rings on the topos $X^{(\widetilde{I})}$ endowed with a homomorphism of sheaf of rings $\widetilde{\mathcal{D}}^{(\bullet)} \to \underrightarrow{u}_X^{-1}(\mathcal{D}^{(\bullet)})$ (resp. $\widetilde{\mathcal{D}}'^{(\bullet)} \to \underrightarrow{u}_X^{-1}(\mathcal{D}'^{(\bullet)})$). We still denote by $\mathcal{R}$ the constant inductive system of rings of X indexed by I' (or by I) with value $\mathcal{R}$. Suppose $(\widetilde{\mathcal{D}}^{(\bullet)}, \widetilde{\mathcal{D}}'^{(\bullet)})$ is solved by $\mathcal{R}$ (see definition 8.5.2.4).*

The functor $\underrightarrow{u}_X^{-1}$ extends to the exact functor $\underrightarrow{u}_X^{-1} : \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}, \mathcal{R}, \widetilde{\mathcal{D}}'^{(\bullet)})$ and the δ-functor $\underrightarrow{u}_X^{-1} : \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}, \mathcal{R}, \widetilde{\mathcal{D}}'^{(\bullet)})$ making commutative the diagram

$$\begin{array}{ccc} \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}} & \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}, \mathcal{R}, \widetilde{\mathcal{D}}'^{(\bullet)}) \\ \uparrow & & \uparrow \\ \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) & \xrightarrow{\underrightarrow{u}_X^{-1}} & \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}, \mathcal{R}, \widetilde{\mathcal{D}}'^{(\bullet)}). \end{array} \tag{8.3.1.6.1}$$

Proof. We can copy 8.3.1.1. □

Proposition 8.3.1.7. *We keep notation and hypotheses of 8.3.1.5. Let $u \colon \widetilde{I} \to I$ be an increasing map of partially ordered sets which is an L-equivalence (see definition 8.1.3.8). The following functors*

$$\begin{aligned} \underrightarrow{u}_X^{-1} &: \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}, \mathcal{R}, \underrightarrow{u}_X^{-1}\mathcal{D}'^{(\bullet)}), \\ \underrightarrow{u}_X^{-1} &: \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}, \mathcal{R}, \underrightarrow{u}_X^{-1}\mathcal{D}'^{(\bullet)}). \end{aligned} \tag{8.3.1.7.1}$$

defined at 8.3.1.6 are equivalences of categories.

Suppose $\widetilde{I} = I$ and $u \in L(I)$, denoting by $\lambda := u$, the forgetful functors $\underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \lambda^*\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ and $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ are quasi-inverse equivalences of 8.3.1.7.1.

Proof. We proceed similarly to the proofs 8.3.1.3. □

8.3.2 Varying $\mathcal{D}^{(\bullet)}$ in $LD_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$

8.3.2.1. Let λ, μ be two elements of $L(I)$, let $\mathcal{F}^{(\bullet)}$ be a left $\lambda^*\mathcal{D}^{(\bullet)}$-module. Then $\mu^*\mathcal{F}^{(\bullet)}$ is canonically endowed with a structure of left $\mu^*\lambda^*\mathcal{D}^{(\bullet)}$-module. Via the canonical morphisms of rings $\lambda^*\mathcal{D}^{(\bullet)} \to$

$\mu^*\lambda^*\mathcal{D}^{(\bullet)}$, this yields a structure of $\lambda^*\mathcal{D}^{(\bullet)}$-module on $\mu^*\mathcal{F}^{(\bullet)}$. We easily compute that the morphism $\rho_{\mathcal{F},\mu}\colon \mathcal{F}^{(\bullet)} \to \mu^*\mathcal{F}^{(\bullet)}$ is $\lambda^*\mathcal{D}^{(\bullet)}$-linear. On the other hand, via the canonical morphism $\mu^*\mathcal{D}^{(\bullet)} \to \mu^*\lambda^*\mathcal{D}^{(\bullet)}$, we get also a structure of left $\mu^*\mathcal{D}^{(\bullet)}$-module on $\mu^*\mathcal{F}^{(\bullet)}$.

When $\lambda \le \mu$, both structures of $\mu^*\mathcal{D}^{(\bullet)}$-module and $\lambda^*\mathcal{D}^{(\bullet)}$-module on $\mu^*\mathcal{F}^{(\bullet)}$ are compatible because of the commutativity of the following diagram

$$\begin{array}{ccc} \mu^*\mathcal{D}^{(\bullet)} & \xrightarrow{\mu^*\sigma_{\mathcal{D},\lambda}} & \mu^*\lambda^*\mathcal{D}^{(\bullet)} \\ & \nwarrow^{\sigma_{\mathcal{D},\mu,\lambda}} & \uparrow{\scriptstyle \sigma_{\lambda^*\mathcal{D},\mu}} \\ & & \lambda^*\mathcal{D}^{(\bullet)}. \end{array} \qquad (8.3.2.1.1)$$

We get similar properties when $\mathcal{F}^{(\bullet)} \in C(\lambda^*\mathcal{D}^{(\bullet)})$.

Lemma 8.3.2.2. *Suppose $\sharp \in \{\emptyset, -\}$.*

(a) Let $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ be a homomorphism of rings on the topos $X^{(I)}$. The extension functor $\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon D^\sharp(\mathcal{D}^{(\bullet)}) \to D^\sharp(\mathcal{D}'^{(\bullet)})$ induces by localisation the functor $\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$ and the functor $\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon D^\sharp(\mathcal{D}^{(\bullet)}) \to D^\sharp(\mathcal{D}'^{(\bullet)})$ induces the functor $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$.

(b) Let $\lambda \le \mu$ be two elements of $L(I)$, and $\mathcal{F}^{(\bullet)} \in D^\sharp(\lambda^*\mathcal{D}^{(\bullet)})$.

(i) The canonical morphism of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$

$$\mu^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \to \mu^*\mathcal{F}^{(\bullet)} \qquad (8.3.2.2.1)$$

belongs to $\Lambda(\mu^*\mathcal{D}^{(\bullet)})$.

(ii) The functors $\mu^*\colon D^\sharp(\lambda^*\mathcal{D}^{(\bullet)}) \to D^\sharp(\mu^*\mathcal{D}^{(\bullet)})$ (resp. $\mu^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}} -\colon D^\sharp(\lambda^*\mathcal{D}^{(\bullet)}) \to D^\sharp(\mu^*\mathcal{D}^{(\bullet)})$) induces by localisation a functor $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$, that we still denote by μ^* (resp. $\mu^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}} -$).

(c) Let $\lambda \in L(I)$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. The following assertions are equivalent:

(i) There exists an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$;

(ii) There exists an isomorphism $\lambda^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$;

(iii) There exists an isomorphism $\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$.

Proof. a) i) Set $\Xi := \Xi^\sharp(\mathcal{D}^{(\bullet)})$ and $\Xi' := \Xi^\sharp(\mathcal{D}'^{(\bullet)})$ (see notation 8.1.2.2). To get the factorisation $\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$, it is sufficient to check that the morphisms of the form $\mathrm{id} \otimes \theta_{\mathcal{E},\chi}$ for any $\mathcal{E}^{(\bullet)} \in C^\sharp(\mathcal{D}^{(\bullet)})$ and $\chi \in M(I)$ belong to Ξ'. Let $\mathcal{P}^{(\bullet)}$ be a K-flat complex of $C^\sharp(\mathcal{D}^{(\bullet)})$ which is quasi-isomorphic to $\mathcal{E}^{(\bullet)}$. It follows from 8.1.1.6 that $\chi^*\mathcal{P}^{(\bullet)}$ is a K-flat complex of $C^\sharp(\mathcal{D}^{(\bullet)})$ which is quasi-isomorphic to $\chi^*\mathcal{E}^{(\bullet)}$. Hence, the morphism $\mathrm{id} \otimes \theta_{\mathcal{P},\chi}\colon \mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)} \to \mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \chi^*\mathcal{P}^{(\bullet)}$ of $C^\sharp(\mathcal{D}'^{(\bullet)})$ represents the morphism $\mathrm{id} \otimes \theta_{\mathcal{E},\chi}$ in the derived category $D^\sharp(\mathcal{D}'^{(\bullet)})$. Since $\mathbb{Z}$ is in the center of $\mathcal{D}^{(\bullet)}$, we compute $\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \chi^*\mathcal{P}^{(\bullet)} = \chi^*\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)}$ and that $\mathrm{id} \otimes \theta_{\mathcal{P},\chi} = \theta_{\mathcal{P}',\chi}$, where $\mathcal{P}'^{(\bullet)} := \mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)}$.

a) ii)We have to check that the morphism of the form $\mathrm{id} \otimes^{\mathbb{L}} \sigma_{\mathcal{G},\chi,\lambda}$ for any $\mathcal{G}^{(\bullet)} \in C^\sharp(\mathcal{D}^{(\bullet)})$ and $\chi \in M(I)$ and $\lambda \in L(I)$ belong to S'. Choose a K-flat complex $\mathcal{P}^{(\bullet)}$ of left $\mathcal{D}^{(\bullet)}$-module repreesenting $\mathcal{G}^{(\bullet)}$. Choose a K-flat complex $\widetilde{\mathcal{P}}^{(\bullet)}$ of left $\mathcal{D}^{(\bullet)}$-module together with a quasi-isomorphism $s\colon \widetilde{\mathcal{P}}^{(\bullet)} \to \chi^*\lambda^*\mathcal{G}^{(\bullet)}$ of $K(\mathcal{D}^{(\bullet)})$. Let $g\colon \mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \chi^*\lambda^*\mathcal{P}^{(\bullet)} = \chi^*\left(\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \lambda^*\mathcal{P}^{(\bullet)}\right) \to \chi^*\left(\lambda^*\mathcal{D}'^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} \lambda^*\mathcal{P}^{(\bullet)}\right) = \chi^*\lambda^*\left(\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)}\right)$ be the canonical morphism. We conclude via the commutative diagram of

$K(\mathcal{D}'^{(\bullet)})$:

$$\begin{array}{ccccc}
\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{G}^{(\bullet)} & \xrightarrow{=} & \mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)} & \xrightarrow{\sigma_{\chi,\lambda}} & \chi^*\lambda^*\left(\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)}\right) \\
\Big\downarrow {\scriptstyle \mathrm{id}\otimes^{\mathbb{L}}\sigma_{\mathcal{G},\chi,\lambda}} & & \Big\downarrow {\scriptstyle \mathrm{id}\otimes\sigma_{\mathcal{P},\chi,\lambda}} & \nearrow {\scriptstyle g} & \Big\downarrow {\scriptstyle \chi^*\lambda^*(\mathrm{id}\otimes\sigma_{\mathcal{P},\chi,\lambda})} \\
 & & \mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \chi^*\lambda^*\mathcal{P}^{(\bullet)} & \xrightarrow[\sigma_{\chi,\lambda}]{} & \chi^*\lambda^*\left(\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \chi^*\lambda^*\mathcal{P}^{(\bullet)}\right) \\
 & & \Big\uparrow {\scriptstyle \sim\, s} & & \Big\uparrow {\scriptstyle \sim\, \chi^*\lambda^*(s)} \\
\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \chi^*\lambda^*\mathcal{G}^{(\bullet)} & \xrightarrow{=} & \mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \widetilde{\mathcal{P}}^{(\bullet)} & \xrightarrow[\sigma_{\chi,\lambda}]{} & \chi^*\lambda^*\left(\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \widetilde{\mathcal{P}}^{(\bullet)}\right).
\end{array} \qquad (8.3.2.2.2)$$

b) i) Let us prove that 8.3.2.2.1 belongs to $\Lambda(\mu^*\mathcal{D}^{(\bullet)})$. Let $\mathcal{P}^{(\bullet)}$ be a K-flat complex of $C^\sharp(\lambda^*\mathcal{D}^{(\bullet)})$ which is quasi-isomorphic to $\mathcal{F}^{(\bullet)}$. The canonical morphism $\mathcal{P}^{(\bullet)} \to \mu^*\mathcal{P}^{(\bullet)}$ is a morphism in $C^\sharp(\lambda^*\mathcal{D}^{(\bullet)})$ (see 8.3.2.1). Since moreover $\mu^*\mathcal{P}^{(\bullet)} \in C^\sharp(\mu^*\mathcal{D}^{(\bullet)})$, with the commutativity of 8.3.2.1.1, this yields the morphism $f\colon \mathcal{P}'^{(\bullet)} := \mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)} \to \mu^*\mathcal{P}^{(\bullet)}$ of $C^\sharp(\mu^*\mathcal{D}^{(\bullet)})$. The morphism f represents the morphism 8.3.2.2.1. By applying the functor μ^* to the canonical morphism $\mathcal{P}^{(\bullet)} \to \mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} \mathcal{P}^{(\bullet)} = \mathcal{P}'^{(\bullet)}$, we get $g\colon \mu^*\mathcal{P}^{(\bullet)} \to \mu^*(\mathcal{P}'^{(\bullet)})$. We compute that $g \circ f = \rho_{\mathcal{P}',\mu}$ and $\mu^*(f) \circ g = \rho_{\mu^*\mathcal{P},\mu}$. Hence, $f \in \Lambda'$ and we are done.

ii) Set $S := S^\sharp(\lambda^*\mathcal{D}^{(\bullet)})$ and $S' := S^\sharp(\mu^*\mathcal{D}'^{(\bullet)})$ (see notation 8.1.4.3). To get the functor $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$, it is sufficient to check that the morphisms of the form $\mu^*(\sigma_{\mathcal{G},\chi,\nu})$ (resp. $\mathrm{id}\otimes\sigma_{\mathcal{G},\chi,\nu}$) for any $\mathcal{G}^{(\bullet)} \in C^\sharp(\mathcal{D}^{(\bullet)})$, $\chi \in M(I)$ and $\nu \in L(I)$ belong to S'. Since $\mu^*(\sigma_{\mathcal{G},\chi,\nu})\colon \mu^*\mathcal{G}^{(\bullet)} \to \mu^*\chi^*\nu^*\mathcal{G}^{(\bullet)} = (\chi\circ\mu)^*(\nu\circ\mu)^*\mathcal{G}^{(\bullet)}$ is a lim-ind-isogeny (see 8.1.4.11), then we get the factorization concerning the functor μ^*. By using b.i) and also 8.1.4.11.(a), this yields the factorization of the functor $\mu^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda^*\mathcal{D}^{(\bullet)}} -$.

c) Since we have from 8.3.2.2.1 the isomorphism

$$\lambda^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$$

in $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$, then ii) and iii) are equivalent. Moreover, following 8.3.1.3.1 the functors λ^* and the forgetful functor induces canonically quasi-inverse equivalences of categories between $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. In particular, the canonical morphism $\mathcal{E}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ (resp. $\mathcal{F}^{(\bullet)} \to \lambda^*\mathcal{F}^{(\bullet)}$) is an isomorphism of $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$). This yields the equivalence between i) and iii). □

Notation 8.3.2.3. Let $\lambda \le \mu$ be two elements of $L(I)$. The forgetful functor induced by the canonical morphism of rings $\lambda^*\mathcal{D}^{(\bullet)} \to \mu^*\mathcal{D}^{(\bullet)}$ will be denoted by

$$\mathrm{forg}_{\lambda,\mu}\colon M(\mu^*\mathcal{D}^{(\bullet)}) \to M(\lambda^*\mathcal{D}^{(\bullet)}).$$

When $\mu = \mathrm{id}$, we simply note forg_λ. Since $\mathrm{forg}_{\lambda,\mu}$ is exact, it follows from 8.3.1.1 (and the remark 8.3.1.2) that we have the factorizations $\mathrm{forg}_{\lambda,\mu}\colon \underrightarrow{M}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{M}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$ and $\mathrm{forg}_{\lambda,\mu}\colon \underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. We use similar notation by replacing modules by complexes, i.e. by replacing the letters M appearing in the notation of the categories by D.

Proposition 8.3.2.4. *Let $\sharp \in \{\emptyset, -\}$ and $\lambda \le \mu$ be two elements of $L(I)$.*

1. *The functors $\mu^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda^*\mathcal{D}^{(\bullet)}} -$, $\mu^*\colon \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ are isomorphic.*

2. *The functors $\mathrm{forg}_{\lambda,\mu}$ and $\mu^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda^*\mathcal{D}^{(\bullet)}} -$ are quasi-inverse equivalences of categories between $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$.*

Proof. The first statement is 8.3.2.2.1. Similarly to 8.3.1.3.a, we prove that $\mathrm{forg}_{\lambda,\mu}$ and μ^* are quasi-inverse equivalences of categories between $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. This yields the second statement. □

Let us now consider the case of modules.

Lemma 8.3.2.5. *We have the following properties.*

(a) *Let $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ be a homomorphism of rings on the topos $X^{(I)}$. The extension functor $\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} -: M(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}'^{(\bullet)})$ induces by localisation the functor $\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} -: \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$ and the functor $\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} -: \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$.*

(b) *Let $\lambda \le \mu$ be two elements of $L(I)$, and $\mathcal{F}^{(\bullet)} \in M(\lambda^*\mathcal{D}^{(\bullet)})$.*

   (i) *The canonical morphism of $\underrightarrow{M}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$*

$$\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \to \mu^*\mathcal{F}^{(\bullet)} \tag{8.3.2.5.1}$$

   belongs to $\Lambda(\mu^*\mathcal{D}^{(\bullet)})$.

   (ii) *The functors $\mu^*: M(\lambda^*\mathcal{D}^{(\bullet)}) \to M(\mu^*\mathcal{D}^{(\bullet)})$ (resp. $\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} -: M(\lambda^*\mathcal{D}^{(\bullet)}) \to M(\mu^*\mathcal{D}^{(\bullet)})$) induces by localization the functors $\underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$, that we still denote by μ^* (resp. $\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} -$).*

(c) *Let $\lambda \in L(I)$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. The following assertions are equivalent:*

   (i) *There exists an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$;*

   (ii) *There exists an isomorphism $\lambda^*\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$;*

   (iii) *There exists an isomorphism $\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$.*

Proof. We can copy the proof of 8.3.2.2 (without taking K-flat resolution). □

8.3.2.6 (Adjointness)**.** Let $\lambda \le \mu$ be two elements of $L(I)$. The functor $\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} -: M(\lambda^*\mathcal{D}^{(\bullet)}) \to M(\mu^*\mathcal{D}^{(\bullet)})$ is a left adjoint to the forgetful functor $\mathrm{forg}_{\lambda,\mu}: M(\mu^*\mathcal{D}^{(\bullet)}) \to M(\lambda^*\mathcal{D}^{(\bullet)})$. Since the forgetful functor $\mathrm{forg}_{\lambda,\mu}$ commutes canonically to the functors of the form μ^* and χ^*, then it follows from 8.1.5.2.2 that $\mathrm{forg}_{\lambda,\mu}: \underrightarrow{M}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{M}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$ is a right adjoint to $\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} -: \underrightarrow{M}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{M}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ and $\mathrm{forg}_{\lambda,\mu}: \underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$ is a right adjoint to $\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} -: \underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$.

Proposition 8.3.2.7. *Let $\lambda \le \mu$ be two elements of $L(I)$.*

1. *The functors $\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} -$, $\mu^*: \underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ are isomorphic.*
2. *The functors $\mathrm{forg}_{\lambda,\mu}$ and $\mu^*\mathcal{D}^{(\bullet)} \otimes_{\lambda^*\mathcal{D}^{(\bullet)}} -$ are exact quasi-inverse equivalences of categories between $\underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$.*

Proof. The first statement is 8.3.2.5.1. By using 8.3.2.6, it is a question of checking that the adjunction morphisms are isomorphisms. Then this follows from 8.3.2.5. □

Corollary 8.3.2.8. *Let $\lambda \le \mu$ be two elements of $L(I)$. The forgetful functor*

$$\underrightarrow{M}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}) \xrightarrow{\mathrm{forg}_{\lambda,\mu}} \underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \tag{8.3.2.8.1}$$

is exact.

Proof. Since this a quotient by a Serre subcategory, the localisation functor $\underrightarrow{M}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ is exact. We conclude by using 8.3.2.7. □

Lemma 8.3.2.9. *We keep notation and hypotheses 8.3.1.5.*

(a) *Let $\lambda_1, \lambda_2 \le \mu$ be three elements of $L(I)$, and $\mathcal{F}^{(\bullet)} \in D^\sharp(\lambda_1^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda_2^*\mathcal{D}'^{(\bullet)})$. The canonical morphism of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}, \mu^*\mathcal{R}, \mu^*\mathcal{D}'^{(\bullet)})$*

$$\mu^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda_1^*\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda_2^*\mathcal{D}'^{(\bullet)}} \mu^*\mathcal{D}'^{(\bullet)} \to \mu^*\mathcal{F}^{(\bullet)} \tag{8.3.2.9.1}$$

belongs to $\Lambda(\mu^*\mathcal{D}^{(\bullet)}, \mu^*\mathcal{D}'^{(\bullet)})$.

The canonical morphism of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$

$$\mu^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda^*\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \to \mu^*\mathcal{F}^{(\bullet)} \tag{8.3.2.9.2}$$

belongs to $\Lambda(\mu^*\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$.

(b) Let $\lambda \in L(I)$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$. The following assertions are equivalent:

- *(i) There exists an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$;*
- *(ii) There exists an isomorphism $\lambda^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$;*
- *(iii) There exists an isomorphism $\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$.*

(c) Let $\lambda \in L(I)$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)})$. The following assertions are equivalent:

- *(i) There exists an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$;*
- *(ii) There exists an isomorphism $\lambda^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}'^{(\bullet)}} \lambda^*\mathcal{D}'^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)})$;*
- *(iii) There exists an isomorphism $\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)})$.*

Proof. This is checked similarly to the proof of 8.3.2.2. □

8.3.3 Local properties on X and $X^{(\bullet)}$

We suppose X coherent.

Definition 8.3.3.1. Put $\mathfrak{C} \in \{M, \underrightarrow{M}_{\mathbb{Q}}, \underrightarrow{LM}_{\mathbb{Q}}, \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}\}$. Let P be a property on the objects (resp. on the arrows) of $\mathfrak{C}(\mathcal{D}^{(\bullet)})$, where X, I, $\mathcal{D}^{(\bullet)}$ can vary. We keep notation 8.1.1.5.c,d.

(a) We say that the property P for the objects $\mathcal{E}^{(\bullet)}$ (resp. for the arrows f) of $\mathfrak{C}(\mathcal{D}^{(\bullet)})$ is local on X (with X and I fixed) if for any open subset U of X the following properties are equivalent:

- (i) The property P holds for $\mathcal{E}^{(\bullet)}|_U$ (resp. $f|_U$) ;
- (ii) For any open set V of U, the property P holds for $\mathcal{E}^{(\bullet)}|_V$ (resp. of $f|_V$) ;
- (iii) There exist an open covering $(U_\alpha)_{\alpha\in A}$ of U such that the property P holds for $\mathcal{E}^{(\bullet)}|_{U_\alpha}$ (resp. of $f|_{U_\alpha}$) for any $\alpha \in A$.

(b) We say that the property P for the objects $\mathcal{E}^{(\bullet)}$ (resp. for the arrows f) of $\mathfrak{C}(\mathcal{D}^{(\bullet)})$ is local on I (with X and I fixed) if both properties are equivalent ;

- (i) The property P holds for $\mathcal{E}^{(\bullet)}$ (resp. f) ;
- (ii) For any $i \in I$, the property P holds for $\mathcal{E}^{(\bullet)}|_{(i,X)}$ (resp. of $f|_{(i,X)}$).

(c) We say that the property P for the objects $\mathcal{E}^{(\bullet)}$ (resp. for the arrows f) of $\mathfrak{C}(\mathcal{D}^{(\bullet)})$ is local on $X^{(I)}$ if for any open subset U of X the following properties are equivalent:

- (i) The property P holds for $\mathcal{E}^{(\bullet)}|_U$ (resp. $f|_U$) ;
- (ii) For any $i \in I$, for any open subset V of U, the property P holds for $\mathcal{E}^{(\bullet)}|_{(i,V)}$ (resp. of $f_{(i,V)}$) ;
- (iii) For any $i \in I$, there exists an open covering $(U_\alpha)_{\alpha\in A}$ of U such that the property P holds for $\mathcal{E}^{(\bullet)}|_{(i,U_\alpha)}$ (resp. of $f|_{(i,U_\alpha)}$) for any $\alpha \in A$.

(d) We say that a property P for the objects and the arrows f of $\mathfrak{C}(\mathcal{D}^{(\bullet)})$ is quasi-local on X (resp. quasi-local on I, resp. quasi-local on $X^{(\bullet)}$), if we have the implication $(i) \Rightarrow (ii)$ of (a) (resp. (b), resp. (c)).

(e) We say that a property is closed under L-equivariance if for any L-equivalence $u\colon I' \to I$ between two partially ordered sets (see definition 8.1.3.8), for any object $\mathcal{E}^{(\bullet)}$ (resp. for any arrow f) of $\mathfrak{C}(\mathcal{D}^{(\bullet)})$, both properties are equivalent

- (i) The property P holds for $\mathcal{E}^{(\bullet)}$ (resp. f) ;
- (ii) The property P holds for $\underrightarrow{u}_X^{-1}(\mathcal{E}^{(\bullet)})$ (resp. $\underrightarrow{u}_X^{-1}(f)$).

Remark 8.3.3.2. We keep notation 8.3.3.1. We have the following links between above local properties.

(a) When I has a smallest element, the property P is local on I if and only if it is quasi-local on I.

(b) Assume I is strictly filtered. In that case, we have the following properties.

   (i) If the property P is quasi-local on I and is closed under L-equivariance, then P is local on I.

   (ii) If the property P is quasi-local on I for the objects (resp. the arrows) of $\mathfrak{C}(\mathcal{D}^{(\bullet)})$, closed under L-equivariance and local on X for the objects (resp. the arrows) of $\mathfrak{C}(\mathcal{D}^{(\bullet)}_{|(i,X)})$ for some $i \in I$, then P is local on $X^{(I)}$.

Lemma 8.3.3.3. *The property that "an object of $M(\mathcal{D}^{(\bullet)})$ is an object of $N(\mathcal{D}^{(\bullet)})$" (see notation 8.1.5.5) is local on X. When I is strictly filtered, it is local on $X^{(\bullet)}$.*

Proof. Let $\mathcal{E}^{(\bullet)}$ be a $\mathcal{D}^{(\bullet)}$-module. Following 8.1.4.11.(c) (still valid by replacing complexes by modules), the fact that $\mathcal{E}^{(\bullet)}$ is an object of $N(\mathcal{D}^{(\bullet)})$ is equivalent to saying that there exist $\chi \in M(I)$ and $\lambda \in L(I)$ such that the canonical arrow $\mathcal{E}^{(\bullet)} \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}$ is the zero morphism (in the category $M(\mathcal{D}^{(\bullet)})$).

Let us check the property "an object of $M(\mathcal{D}^{(\bullet)})$ is an object of $N(\mathcal{D}^{(\bullet)})$" say P is local on X. Let $(X_i)_{i\in I}$ be an open covering of X such that, for any $i \in I$, there exist $\chi_i \in M(I)$ and $\lambda_i \in L(I)$ such that the canonical arrow $\mathcal{E}^{(\bullet)}|X_i \to \chi_i^*\lambda_i^*\mathcal{E}^{(\bullet)}|X_i$ is the zero morphism. Since X is quasi-compact, we can suppose I finite. Hence, there exist $\chi \in M(I)$ and $\lambda \in L(I)$ such that, for any $i \in I$, we have $\chi \geq \chi_i$ and $\lambda \geq \lambda_i$. For any $i \in I$, the canonical morphism $\mathcal{E}^{(\bullet)}|X_i \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}|X_i$ is therefore the null morphism. Hence, P is local on X

It is straightforward that the property P is quasi-local on $X^{(I)}$ (e.g. on I) and closed under L-equivariance (use the equivalence of category 8.3.1.3.a). Hence, when I is strictly filtered, this yields that P is local on $X^{(\bullet)}$ by using the remark 8.3.3.2.b.(ii). □

Lemma 8.3.3.4. *Let $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. The property that the morphism f is a monomorphism (resp. an epimorphism, resp. an isomorphism) of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is local on X. When I is strictly filtered, it is local on $X^{(\bullet)}$.*

Proof. We already know that $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is an abelian category (see 8.1.5.5). Hence, f is a monomorphism (resp. an epimorphism, resp. an isomorphism) of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ if and only if its kernel (resp. cokernel, resp. kernel and cokernel) is null in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We conclude by using 8.3.3.3. □

Proposition 8.3.3.5. Let $\phi\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. The property that the morphism ϕ is an isomorphism is local on X. When I is strictly filtered, it is local on $X^{(\bullet)}$.

Proof. It follows from 8.3.3.4, 8.1.5.11 that the property is local on X. By using the equivalence of categories 8.3.1.3.1, it is also closed under L-equivariance. Since it is also quasi-local on $X^{(I)}$, then we conclude by using the remark 8.3.3.2.b.(ii). □

Lemma 8.3.3.6. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. The property $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{0}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is local on X. When I is strictly filtered, it is local on $X^{(\bullet)}$.*

Proof. Following 8.3.3.4, by using the commutativity (up to isomorphism) of the diagram 8.3.1.4.1, for any integer $n \in \mathbb{Z}$, the property $\mathcal{H}^n(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is local on X and closed under L-equivalence. Since it is obviously quasi-local, then we conclude by using the remark 8.3.3.2.b.(ii). □

Lemma 8.3.3.7. *Let $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$ be two objects of $M(\mathcal{D}^{(\bullet)})$. Let $(X_\alpha)_{\alpha\in A}$ be an open covering of X. Then there is a canonical bijection between the following data:*

(a) A morphism $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$;

(b) A set $(f_\alpha)_{\alpha\in A}$ of morphisms $f_\alpha\colon \mathcal{E}^{(\bullet)}|X_\alpha \to \mathcal{F}^{(\bullet)}|X_\alpha$ of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|X_\alpha)$ such that $f_\alpha|X_\alpha \cap X_\beta = f_\beta|X_\alpha \cap X_\beta$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|X_\alpha \cap X_\beta)$ for any $\alpha, \beta \in A$.

When I is strictly filtered, then we have a bijection between the data (a) and the following one:

(c) A set $(f_i)_{i\in I}$ of morphisms $f_i\colon \mathcal{E}^{(\bullet)}|_{(i,X)} \to \mathcal{F}^{(\bullet)}|_{(i,X)}$ of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,X)})$ such that for any element $i \leq j$ of I we have $f_i|_{(j,X)} = f_j$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(j,X)})$.

These properties can be interpreted by saying that the existence of a morphism in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is local on X, I and on $X^{(I)}$.

Proof. The implications $(a) \Rightarrow (b)$ and $(a) \Rightarrow (c)$ are clear. When I is strictly filtered, $(c) \Rightarrow (a)$ follows from the fully faithfulness of the restriction functor $|X^{(I_{\geq i})}$ (see 8.3.1.3.1). Let us prove $(b) \to (a)$. Let $(f_\alpha)_{\alpha\in A}$ be a set morphisms satisfying the condition of (b). Since X is quasi-compact, we can suppose A finite. Since a finite family of elements of $L(I)$ (resp. of $M(I)$) is bounded above by an element of $L(I)$ (resp. of $M(I)$), by increasing if necessary the elements of $L(I)$ or $M(I)$ which appear in the choices of the morphisms representing f_α, we can suppose there exist $\lambda \in L(I)$ and $\chi \in M(I)$, some morphisms $a_\alpha\colon \mathcal{E}^{(\bullet)}|X_\alpha \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}|X_\alpha$ in $M(\mathcal{D}^{(\bullet)}|X_\alpha)$ representing f_α. Since $X_\alpha \cap X_\beta$ is quasi-compact, by increasing again λ and χ if necessary, we can moreover assume that $a_\alpha|X_\alpha \cap X_\beta = a_\beta|X_\alpha \cap X_\beta$ in $M(\mathcal{D}^{(\bullet)}|X_\alpha \cap X_\beta)$. Then we get a morphism $a\colon \mathcal{E}^{(\bullet)} \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}$ in $M(\mathcal{D}^{(\bullet)})$ such that $a_\alpha = a|X_\alpha$. Hence we are done.

□

Lemma 8.3.3.8. *Let $f,\ g\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be two morphisms of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. The equality $f = g$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is local on X. When I is strictly filtered, it is local on $X^{(\bullet)}$.*

Proof. The equality $f = g$ is equivalent to saying that the canonical morphism $\ker(f-g) \to \mathcal{E}^{(\bullet)}$ is an isomorphism. Hence, this follows from 8.3.3.4. □

8.3.4 Derived homomorphism bifunctor over complexes of $LM_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, comparison

Suppose X is coherent.

Proposition 8.3.4.1. Let $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$ be two objects of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

(a) Denote by $\mathcal{H}om_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)})$ the presheaf of abelian groups on X defined by

$$U \mapsto \mathrm{Hom}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|U)}(\mathcal{E}^{(\bullet)}|U,\ \mathcal{F}^{(\bullet)}|U), \tag{8.3.4.1.1}$$

where U running over Z_{Zar}. Then $\mathcal{H}om_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)})$ is a sheaf.

(b) Denote by $\mathscr{H}om_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)})$ the presheaf of abelian groups on $X^{(\bullet)}$ defined by

$$(i,U) \mapsto \mathrm{Hom}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,U)})}(\mathcal{E}^{(\bullet)}|_{(i,U)},\ \mathcal{F}^{(\bullet)}|_{(i,U)}), \tag{8.3.4.1.2}$$

where (i,U) running over $(I^{\circ})^{\natural} \times X_{Zar}$. When I is strictly filtered, $\mathscr{H}om_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)})$ is a sheaf.

Proof. The proposition follows from the lemmas 8.3.3.7 and 8.3.3.8. □

8.3.4.2. With notation 8.3.4.1, we get by construction the isomorphism of abelian presheaves on X:

$$\underrightarrow{l}^{(I)}_{X,*}\mathscr{H}om_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{H}om_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}), \tag{8.3.4.2.1}$$

where $\underrightarrow{l}^{(I)}_{X,*}$ is the projective limit indexed by I^o (see notation 8.1.1.2.3).

Notation 8.3.4.3. Let $\mathcal{E}^{(\bullet),\bullet}$, $\mathcal{F}^{(\bullet),\bullet} \in K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ (exceptionally, we indicate the second $\bullet$ to clarify the following notations). With the notations of the proposition 8.3.4.1, we have the bifunctor

$$\mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \times K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to K(\mathbb{Z}_X)$$

whose the n-th term for any integer $n \in \mathbb{Z}$ is defined by setting:

$$\mathcal{H}om^{n}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet),\bullet},\ \mathcal{F}^{(\bullet),\bullet}) := \prod_{p\in\mathbb{Z}} \mathcal{H}om_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet),p},\ \mathcal{F}^{(\bullet),\ p+n}) \tag{8.3.4.3.1}$$

and the transition morphisms are given by the formula $d = d_{\mathcal{E}} + (-1)^{n+1} d_{\mathcal{F}}$.

Notation 8.3.4.4. Similarly to the construction of 8.3.4.3, by replacing everywhere "$\mathcal{H}om$" by "Hom" or "$\mathscr{H}om$", we have the following results.

(a) We define the bifunctor (which is by the way the standard homomorphisms bifunctor associated to the abelian category $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$):

$$\mathrm{Hom}^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \times K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to K(\mathbb{Z}).$$

By construction (see 8.3.4.1.1), for any $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, for any open subset U of X, we have the bifunctorial isomorphism of $K(\mathbb{Z})$:

$$\Gamma(U, \mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathrm{Hom}^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}). \tag{8.3.4.4.1}$$

(b) We define the bifunctor:

$$\mathscr{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)\colon K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \times K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to K(\mathbb{Z}^{(\bullet)}_{X}).$$

By construction (see 8.3.4.1.2), for any $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, for any open subset U of X, for any $(i, U) \in (I^{\mathrm{o}})^{\natural} \times X_{Zar}$, we have the bifunctorial isomorphism of $K(\mathbb{Z})$:

$$\Gamma((i,U), \mathscr{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) \xrightarrow{\sim} \mathrm{Hom}^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,U)})}(\mathcal{E}^{(\bullet)}|_{(i,U)},\ \mathcal{F}^{(\bullet)}|_{(i,U)}). \tag{8.3.4.4.2}$$

8.3.4.5. Suppose $\sharp \in \{-,\ +, \mathrm{b}\}$, let $Q^{\sharp}_{N}\colon K^{\sharp}(\mathcal{D}^{(\bullet)}) \to K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ be the canonical functor. Following the remark after the theorem [Miy91, 3.2], putting $\mathcal{N}^{\sharp}_{N}(\mathcal{D}^{(\bullet)}) := \ker Q^{\sharp}_{N}$ the associated saturated null system, the functor $Q^{\sharp}_{N}$ induces the equivalence of categories $K^{\sharp}(\mathcal{D}^{(\bullet)})/\mathcal{N}^{\sharp}_{N}(\mathcal{D}^{(\bullet)}) \cong K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, which is synthesized by saying $Q^{\sharp}_{N}$ is a quotient.

With the notations 8.2.4.4.1 (where we replace $\mathcal{H}om$ by Hom) and 8.3.4.4, it follows from 8.1.5.2.2 that we have the isomorphism of bifunctors $K^{-}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times K^{+}(\mathcal{D}^{(\bullet)}) \to K^{+}(\mathbb{Z})$:

$$\varinjlim_{\lambda\in L(I),\ \chi\in M(I)} \mathrm{Hom}^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^{*}\lambda^{*}-) \xrightarrow{\sim} \mathrm{Hom}^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(Q_N(-), Q_N(-)). \tag{8.3.4.5.1}$$

Since X is coherent, it has an open basis consisting of coherent open subsets. Since $\Gamma(U,-)$ commutes with filtered inductive limits when U is coherent (see 7.1.2.16), since $L(I) \times M(I)$ is filtered, then with notations 8.2.4.4.1 and 8.3.4.3 it follows from 8.2.1.5.2, 8.3.4.4.1 and 8.3.4.5.1 that we have the isomorphism of bifunctors $K^{-}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times K^{+}(\mathcal{D}^{(\bullet)}) \to K^{+}(\mathbb{Z}_X)$:

$$\varinjlim_{\lambda\in L(I),\ \chi\in M(I)} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^{*}\lambda^{*}-) \xrightarrow{\sim} \mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(Q_N(-), Q_N(-)). \tag{8.3.4.5.2}$$

Following the remark 7.4.1.11 and with notation 8.2.4.6, this implies that the right localisation with respect to $(\mathfrak{N}_N \times \mathfrak{N}_N, \mathfrak{N}_{qi})$ of the bifunctor of 8.2.4.4.1 exists and that we have the isomorphism of bifunctors $K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \times K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}_X)$:

$$\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{-}_{N}(\mathcal{D}^{(\bullet)})\times\mathfrak{N}^{+}_{N}(\mathcal{D}^{(\bullet)})} \varinjlim_{\lambda\in L,\ \chi\in M} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^{*}\lambda^{*}-) \xrightarrow{\sim} Q^{+}_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-). \tag{8.3.4.5.3}$$

8.3.4.6. Following notation 8.2.4.23 and 8.3.4.5, we denote by $Q^{\mathrm{b}}_N\colon K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ the canonical functor, $\mathcal{N}^{\mathrm{b}}_N(\mathcal{D}^{(\bullet)}) := \ker Q^{\mathrm{b}}_N$, $Q_{LD}\colon D^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $Q^{\mathrm{qi}}_{LD}\colon K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ the localization morphisms, $\mathfrak{N}^{\mathrm{qi}}_{LD} := \operatorname{Ker} Q^{\mathrm{qi}}_{LD}$. Set $\widetilde{Q}^{\mathrm{qi}}_{LD} := \mathfrak{e}\circ Q^{\mathrm{qi}}_{LD}\colon K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, where $\mathfrak{e}$ is the equivalence of categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \cong D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ (see 8.1.5.14.1) and $Q_{\mathrm{qi}}\colon K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ is the localisation morphism. We notice $\operatorname{Ker} \widetilde{Q}^{\mathrm{qi}}_{LD} = \mathfrak{N}^{\mathrm{qi}}_{LD}$. To avoid confusion, the right localisation $\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{qi}}_{LD}\times\mathfrak{N}^{\mathrm{qi}}_{LD}} F(-,-)$ of $F(-,-)$ (the functor defined at 8.2.4.23) will be denoted by $\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{Q^{\mathrm{qi}}_{LD}\times Q^{\mathrm{qi}}_{LD}} F(-,-)$ as a functor $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\circ}\times\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}_X)$ and by $\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\widetilde{Q}^{\mathrm{qi}}_{LD}\times \widetilde{Q}^{\mathrm{qi}}_{LD}} F(-,-)$ as a functor of $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}_X)$. Since the right derived bifunctor $\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{Q^{\mathrm{qi}}_{LD}\times Q^{\mathrm{qi}}_{LD}} F(-,-)$ exists (see 8.2.4.23.4), then so is $\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\widetilde{Q}^{\mathrm{qi}}_{LD}\times \widetilde{Q}^{\mathrm{qi}}_{LD}} F(-,-)$ and we have the canonical isomorphism of functors

$$\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) = \mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{Q^{\mathrm{qi}}_{LD}\times Q^{\mathrm{qi}}_{LD}} F(-,-) \xrightarrow{\sim} \mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\widetilde{Q}^{\mathrm{qi}}_{LD}\times \widetilde{Q}^{\mathrm{qi}}_{LD}} F(\mathfrak{e}(-),\mathfrak{e}(-)). \tag{8.3.4.6.1}$$

Hence, since the right derived bifunctor $\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{b}}_N(\mathcal{D}^{(\bullet)})\times\mathfrak{N}^{\mathrm{b}}_N(\mathcal{D}^{(\bullet)})} F(-,-)$ exists (see 8.3.4.5), since $\widetilde{Q}^{\mathrm{qi}}_{LD} = Q_{\mathrm{qi}}\circ Q^{\mathrm{b}}_N$ then it follows from Lemma 7.4.1.13 that $\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{b}}_N(\mathcal{D}^{(\bullet)})\times\mathfrak{N}^{\mathrm{b}}_N(\mathcal{D}^{(\bullet)})} F(-,-)$ is right localizable with respect to $(\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})), \mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})))$ and that we have the isomorphism of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\circ}\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}_X)$ of the form

$$\mathbb{R}_{\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))\times\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}\mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{b}}_N(\mathcal{D}^{(\bullet)})\times\mathfrak{N}^{\mathrm{b}}_N(\mathcal{D}^{(\bullet)})} F(-,-) \xrightarrow{\sim} \mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\widetilde{Q}^{\mathrm{qi}}_{LD}\times \widetilde{Q}^{\mathrm{qi}}_{LD}} F(-,-). \tag{8.3.4.6.2}$$

By using the (bounded version of the) isomorphism 8.3.4.5.3, this yields that the right localisation of the bifunctor $Q^{+}_{\mathrm{qi}}\circ\mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)$ with respect to $(\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})), \mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})))$ exists, which will be denoted by

$$\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-)\colon D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\circ}\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}_X), \tag{8.3.4.6.3}$$

and is endowed with the isomorphism of bifunctors

$$\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \xrightarrow{\sim} \mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\widetilde{Q}^{\mathrm{qi}}_{LD}\times \widetilde{Q}^{\mathrm{qi}}_{LD}} F(-,-). \tag{8.3.4.6.4}$$

Via 8.3.4.6.1 and 8.3.4.6.4 we have the isomorphism of bifunctors $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\circ}\times\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}_X)$ of the form

$$\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathfrak{e}(-),\mathfrak{e}(-)). \tag{8.3.4.6.5}$$

Moreover, by using the universal property of the right localization of a functor, using $Q_{\mathrm{qi}}\circ Q^{\mathrm{b}}_N = \widetilde{Q}^{\mathrm{qi}}_{LD}$, and $\widetilde{Q}^{\mathrm{qi}}_{LD} = \mathfrak{e} \circ Q^{\mathrm{qi}}_{LD}$, we get the commutative up to isomorphism diagram

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(Q^{\mathrm{qi}}_{LD}(-), Q^{\mathrm{qi}}_{LD}(-)) & \xrightarrow[\sim]{8.3.4.6.5} & \mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathfrak{e} \circ Q^{\mathrm{qi}}_{LD}, \mathfrak{e} \circ Q^{\mathrm{qi}}_{LD}) \\
{\scriptstyle 8.3.4.6.1}\uparrow{\scriptstyle \sim} & & \Vert \\
\mathbb{R}^{\mathfrak{N}^+_{\mathrm{qi}}(\mathbb{Z}_X)}_{\widetilde{Q}^{\mathrm{qi}}_{LD} \times \widetilde{Q}^{\mathrm{qi}}_{LD}} F(\widetilde{Q}^{\mathrm{qi}}_{LD}(-), \widetilde{Q}^{\mathrm{qi}}_{LD}(-)) & \xrightarrow[\sim]{8.3.4.6.4} & \mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\widetilde{Q}^{\mathrm{qi}}_{LD}(-), \widetilde{Q}^{\mathrm{qi}}_{LD}(-)) \\
{\scriptstyle \sim}\uparrow{\scriptstyle 8.3.4.6.2} & & \Vert \\
\mathbb{R}_{\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}} \times \mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}} \mathbb{R}^{\mathfrak{N}^+_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{b}}_N \times \mathfrak{N}^{\mathrm{b}}_N} F(\widetilde{Q}^{\mathrm{qi}}_{LD}(-), \widetilde{Q}^{\mathrm{qi}}_{LD}(-)) & \xrightarrow{\sim} & \mathbb{R}_{\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}} \times \mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}} Q^+_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\widetilde{Q}^{\mathrm{qi}}_{LD}(-), \widetilde{Q}^{\mathrm{qi}}_{LD}(-)) \\
{\scriptstyle adj}\uparrow & & \uparrow{\scriptstyle adj} \\
\mathbb{R}^{\mathfrak{N}^+_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{b}}_N \times \mathfrak{N}^{\mathrm{b}}_N} F(Q^{\mathrm{b}}_N(-), Q_N n^{\mathrm{b}}(-)) & \xrightarrow[8.3.4.5.3]{\sim} & Q^+_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(Q^{\mathrm{b}}_N(-), Q^{\mathrm{b}}_N(-)) \\
{\scriptstyle adj}\uparrow & \nearrow{\scriptstyle \sim\ 8.3.4.5.2} & \\
Q^+_{\mathrm{qi}} \circ F(-,-) & &
\end{array} \tag{8.3.4.6.6}$$

where the “adj” morphisms are given by adjunction from 7.4.1.9.1.

8.3.4.7. Suppose I^o is coherent, which implies $X^{(\bullet)}$ is a coherent topos. By copying the proof of 8.3.4.5.3 (i.e. by replacing everywhere “$\mathcal{H}om$” by “$\mathscr{H}om$” and by replacing the coherence of $I^o \times X$ instead of that of X), we get the isomorphism of bifunctors $K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \times K(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}^{(\bullet)}_X)$:

$$\mathbb{R}^{\mathfrak{N}^+_{\mathrm{qi}}(\mathbb{Z}^{(\bullet)}_X)}_{\mathfrak{N}^-_N(\mathcal{D}^{(\bullet)}) \times \mathfrak{N}^+_N(\mathcal{D}^{(\bullet)})} \varinjlim_{\lambda \in L,\ \chi \in M} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^* \lambda^* -) \xrightarrow{\sim} Q^+_{\mathrm{qi}} \circ \mathscr{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-). \tag{8.3.4.7.1}$$

Similarly to 8.3.4.6, it follows from the (bounded version of the) isomorphism 8.3.4.7.1, that the right localisation of the bifunctor $Q^+_{\mathrm{qi}} \circ \mathscr{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)$ with respect to $(\mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})), \mathfrak{N}^{\mathrm{b}}_{\mathrm{qi}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})))$ exists, which will be denoted by

$$\mathbb{R}\mathscr{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \colon D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\circ} \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D^+(\mathbb{Z}^{(\bullet)}_X), \tag{8.3.4.7.2}$$

and is endowed with the isomorphism of bifunctors

$$\mathbb{R}\mathscr{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \xrightarrow{\sim} \mathbb{R}^{\mathfrak{N}^+_{\mathrm{qi}}(\mathbb{Z}^{(\bullet)}_X)}_{\widetilde{Q}^{\mathrm{qi}}_{LD} \times \widetilde{Q}^{\mathrm{qi}}_{LD}} \varinjlim_{\lambda, \chi} \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,\ \chi^* \lambda^* -). \tag{8.3.4.7.3}$$

Via the $\mathscr{H}om$ version of 8.3.4.6.1 and via 8.3.4.7.3, we have the isomorphism of bifunctors $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\circ} \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^+(\mathbb{Z}^{(\bullet)}_X)$ of the form

$$\mathbb{R}\mathscr{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) \xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathfrak{e}(-), \mathfrak{e}(-)). \tag{8.3.4.7.4}$$

8.3.4.8. The standar bifunctor $\mathrm{Hom}^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)$ is right localisable with respect to quasi-isomorphism and its right derivated functor is denoted by

$$\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \colon D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\circ} \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}). \tag{8.3.4.8.1}$$

Recall, $\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})$ is computed by taking an injective resolution of $\mathcal{F}^{(\bullet)}$. Similarly to 8.3.4.6, we have moreover the isomorphism of bifunctors $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\circ} \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z})$ of the form

$$\mathbb{R}\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathfrak{e}(-), \mathfrak{e}(-)). \tag{8.3.4.8.2}$$

Hence it follows from 8.2.4.24.1 that we have the isomorphism of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\circ}\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))\to \mathrm{Mod}(\mathbb{Z})$ of the form:

$$H^{0}(\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-))\xrightarrow{\sim}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-). \tag{8.3.4.8.3}$$

It follows from 8.2.4.25.1, 8.3.4.6.5 and 8.3.4.8.2 that we have the isomorphism of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\circ}\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))\to D(\mathbb{Z})$ of the form

$$\mathbb{R}\Gamma(X,-)\circ\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-)\xrightarrow{\sim}\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-). \tag{8.3.4.8.4}$$

Suppose I^{o} is coherent. Similarly, it follows from 8.2.4.25.2 that we have that the isomorphism of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\circ}\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))\to D(\mathbb{Z})$ of the form

$$\mathbb{R}\Gamma(X^{(\bullet)},-)\circ\mathbb{R}\mathscr{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-)\xrightarrow{\sim}\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-). \tag{8.3.4.8.5}$$

8.4 Coherence

8.4.1 Coherence in $LD_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, comparison with the $\mathcal{D}^{\dagger}_{\mathbb{Q}}$-coherence, theorems A and B

Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}$ be a sheaf of rings on the topos $X^{(I)}$.

Definition 8.4.1.1. Let $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. The complex $\mathcal{E}^{(\bullet)}$ is said to be coherent if there exist $\lambda\in L(I)$ and $\mathcal{F}^{(\bullet)}\in D_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathcal{F}^{(\bullet)}$.

Remark 8.4.1.2. Let $\lambda\in L(I)$. Following 7.1.3.13, $\mathcal{F}^{(\bullet)}\in D_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$ means that $\mathcal{F}^{(\bullet)}$ satisfies the following conditions:

(a) For any $i\in I$, $\mathcal{F}^{(i)}\in D_{\mathrm{coh}}(\mathcal{D}^{(\lambda(i))})$;

(b) For any $i,j\in I$ such that $i\leq j$, the canonical homomorphism

$$\mathcal{D}^{(\lambda(j))}\overset{\mathbb{L}}{\otimes}_{\mathcal{D}^{(\lambda(i))}}\mathcal{F}^{(\lambda(i))}\to\mathcal{F}^{(\lambda(j))} \tag{8.4.1.2.1}$$

is an isomorphism.

Notation 8.4.1.3. Let $\sharp\in\{\emptyset,-,\mathrm{b},0\}$. We denote by $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ the strictly full subcategory of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ consisting of coherent complexes.

Lemma 8.4.1.4. *Let $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Let $\lambda\leq\mu$ be two elements of $L(I)$. Consider the following two properties.*

(a) There exists $\mathcal{F}^{(\bullet)}\in D_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathcal{F}^{(\bullet)}$.

(b) There exists $\mathcal{G}^{(\bullet)}\in D_{\mathrm{coh}}(\mu^{*}\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathcal{G}^{(\bullet)}$.

Then (a) $\Rightarrow$ (b).

Proof. Suppose there exists $\mathcal{F}^{(\bullet)}\in D_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathcal{F}^{(\bullet)}$. Following 8.3.2.2.c, we get the isomorphism $\underrightarrow{LD}_{\mathbb{Q}}(\lambda^{*}\mathcal{D}^{(\bullet)})$ of the form $\lambda^{*}\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathcal{F}^{(\bullet)}$. This yields the isomorphism $\mu^{*}\mathcal{D}^{(\bullet)}\overset{\mathbb{L}}{\otimes}_{\lambda^{*}\mathcal{D}^{(\bullet)}}\lambda^{*}\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mu^{*}\mathcal{D}^{(\bullet)}\overset{\mathbb{L}}{\otimes}_{\lambda^{*}\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mu^{*}\mathcal{D}^{(\bullet)})$. Since $\mathcal{G}^{(\bullet)}:=\mu^{*}\mathcal{D}^{(\bullet)}\overset{\mathbb{L}}{\otimes}_{\lambda^{*}\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)}\in D_{\mathrm{coh}}(\mu^{*}\mathcal{D}^{(\bullet)})$, since $\mu^{*}\mathcal{D}^{(\bullet)}\overset{\mathbb{L}}{\otimes}_{\lambda^{*}\mathcal{D}^{(\bullet)}}\lambda^{*}\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mu^{*}\mathcal{E}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mu^{*}\mathcal{D}^{(\bullet)})$ (see 8.3.2.2.1), we are done by using again 8.3.2.2.c. □

Proposition 8.4.1.5. *Let $u\colon I' \to I$ be an L-equivalence between two partially ordered sets (see definition 8.1.3.8). Let $\sharp \in \{\emptyset, -, \mathrm{b}, 0\}$. The equivalence of categories $\underrightarrow{u}_X^{-1}$ of 8.3.1.3.1 preserves the coherence, i.e. it induces the equivalence of categories*

$$\underrightarrow{u}_X^{-1}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}). \tag{8.4.1.5.1}$$

Suppose $I' = I$ and $u \in L(I)$. Denoting by $\lambda := u$, we have the forgetful functor $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}\,\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}\,\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ which is a quasi-inverse equivalence of 8.4.1.5.1.

Proof. 0) Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We already know that the proposition without the coherence hypotheses (see 8.3.1.3). Hence, we have to check $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ if and only if $\underrightarrow{u}_X^{-1}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$.

1) First suppose $I' = I$ and $\lambda := u \in L(I)$.

i) Suppose $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Let $\mu \in L(I)$ and $\mathcal{F}^{(\bullet)} \in D_{\mathrm{coh}}(\mu^*\mathcal{D}^{(\bullet)})$ together with an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Since $\lambda \circ \mu \geq \mu$, it follows from 8.4.1.4 that there exists $\mathcal{G}^{(\bullet)} \in D_{\mathrm{coh}}(\mu^*\lambda^*\mathcal{D}^{(\bullet)})$ together with an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. By using 8.3.2.2.c, this yields the isomorphism $\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. Hence, $\lambda^*(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$.

ii) Conversely, suppose $\lambda^*(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$. Let $\mu \in L(I)$ and $\mathcal{G}^{(\bullet)} \in D_{\mathrm{coh}}(\mu^*\lambda^*\mathcal{D}^{(\bullet)})$ together with an isomorphism $\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. By composing with the canonical isomorphism $\sigma_{\mathcal{E},\lambda}\colon \mathcal{E}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, we conclude $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$.

2) Let us come back to the general case. By definition, there exists an increasing map $v\colon I \to I'$ such that $u \circ v \in L(I)$, $v \circ u \in L(I')$.

i) Suppose $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Let $\lambda \in L(I)$ and $\mathcal{F}^{(\bullet)} \in D_{\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$ together with an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We have $\mu := u \circ (v \circ \lambda) \in L(I)$ and $\mu' := (v \circ \lambda) \circ u \in L(I')$. Since $\mu = u \circ v \circ \lambda \geq \lambda$, it follows from 8.4.1.4 that there exists $\mathcal{G}^{(\bullet)} \in D_{\mathrm{coh}}(\mu^*\mathcal{D}^{(\bullet)})$ together with an isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. With 8.3.2.2.c, this means we have the isomorphism $\mu^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$. Since $\mu'^*\underrightarrow{u}_X^{-1} = \underrightarrow{u}_X^{-1}\mu^*$, by applying the functor $\underrightarrow{u}_X^{-1}$ to this latter isomorphism, we get the isomorphism $\mu'^*\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \underrightarrow{u}_X^{-1}\mathcal{G}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mu'^*\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$, with $\underrightarrow{u}_X^{-1}\mathcal{G}^{(\bullet)} \in D_{\mathrm{coh}}(\mu'^*\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$. Hence, $\underrightarrow{u}_X^{-1}\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$.

ii) Since v is also an L-equivalence, we get from 2.i) that the functor $\underrightarrow{v}_X^{-1}$ preserve the coherence. Hence, by using 1), we get the converse of 2.i). □

Lemma 8.4.1.6. *We suppose I has a smallest element i_0. With notation 8.1.1.4, for any $\mathcal{E}^{(\bullet)} \in D_{\mathrm{coh}}(\mathcal{D}^{(\bullet)})$, we have $\mathcal{E}^{(i_0)} \in D_{\mathrm{coh}}(\mathcal{D}^{(i_0)})$ and the canonical isomorphism of $D(\mathcal{D}^{(\bullet)})$*

$$\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}. \tag{8.4.1.6.1}$$

Proof. First let us construct the morphism. Let $\mathcal{P}^{(\bullet)}$ be a K-flat complex of $K(\mathcal{D}^{(\bullet)})$ endowed with a quasi-isomorphism $\mathcal{P}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$. Then $\mathcal{P}^{(i_0)}$ is a K-flat complex of $K(\mathcal{D}^{(i_0)})$ endowed with a quasi-isomorphism $\mathcal{P}^{(i_0)} \xrightarrow{\sim} \mathcal{E}^{(i_0)}$. The morphism 8.4.1.6.1 corresponds to the canonical map $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{P}^{(i_0)} \to \mathcal{P}^{(\bullet)}$.

Finally, since a morphism $\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ in $D(\mathcal{D}^{(\bullet)})$ is an isomorphism if and only if the induced morphisms $\mathcal{E}^{(i)} \to \mathcal{F}^{(i)}$ in $D(\mathcal{D}^{(i)})$ are isomorphisms for any $i \in I$, then the fact that the morphism 8.4.1.6.1 is an isomorphism is a consequence of 7.1.3.13. □

Proposition 8.4.1.7. *Suppose I has a smallest element or is strictly filtered (see 8.1.3.8). Let $\sharp \in \{\emptyset, -, \mathrm{b}\}$. Then the subcategory $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ of $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is a triangulated subcategory.*

Proof. The cases where $\sharp \in \{-, \mathrm{b}\}$ is a consequence of the case where $\sharp$ is empty.

Let $i_0 \in I$ and $j\colon I^{i_0} \subset I$ be the inclusion. Since j is an L-equivalence, then following 8.4.1.5 (and use also 8.3.1.3), a complex $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ belongs to $\underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ if and only if $\underrightarrow{j}_X^{-1}(\mathcal{E}^{(\bullet)})$ belongs to $\underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\underrightarrow{j}_X^{-1}\mathcal{D}^{(\bullet)})$. Hence, we reduce to the case where I has a smallest element i_0.

Let $\mathcal{E}^{(\bullet)} \xrightarrow{f} \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to \mathcal{E}^{(\bullet)}[1]$ be a triangle of $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ such that $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. By using 8.4.1.4 (and also 8.3.2.2.c), there exist $\mu \in L(I)$, $\mathcal{E}'^{(\bullet)}, \mathcal{F}'^{(\bullet)} \in D_{\mathrm{coh}}(\mu^*\mathcal{D}^{(\bullet)})$ together with the isomorphisms in $\underrightarrow{LD}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$ of the form $\mu^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$, $\mu^*\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}'^{(\bullet)}$. We get the triangle $\mathcal{E}'^{(\bullet)} \to \mathcal{F}'^{(\bullet)} \to \mu^*\mathcal{G}^{(\bullet)} \to \mathcal{E}'^{(\bullet)}[1]$ of $\underrightarrow{LD}_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$. Using again 8.3.1.3 and 8.4.1.5, if $\mu^*(\mathcal{G}^{(\bullet)}) \in \underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\mu^*\mathcal{D}^{(\bullet)})$ then $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Hence, replacing $\mathcal{D}^{(\bullet)}$ by $\mu^*\mathcal{D}^{(\bullet)}$ if necesary, we can suppose that $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in D_{\mathrm{coh}}(\mathcal{D}^{(\bullet)})$.

The morphism $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is represented by a morphism $g\colon \mathcal{E}^{(\bullet)} \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ for some $(\lambda, \chi) \in L(I) \times M(I)$. Set $\mathcal{E}'^{(\bullet)} := \lambda^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)}$ and let $h\colon \mathcal{E}'^{(\bullet)} \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}$ be the induced morphism of $D(\lambda^*\mathcal{D}^{(\bullet)})$. Since the canonical morphisms $\mathcal{E}'^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ and $\mathcal{E}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ are morphism of $\Lambda(\mathcal{D}^{(\bullet)})$ (see 8.3.2.2.1 for the first one), then the canonical morphism $\mathcal{E}^{(\bullet)} \to \mathcal{E}'^{(\bullet)}$ is an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Hence, we get the distinguished triangle $\mathcal{E}'^{(\bullet)} \xrightarrow{h} \chi^*\lambda^*\mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to \mathcal{E}'^{(\bullet)}[1]$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

Set $\mathcal{D}'^{(\bullet)} := \lambda^*\mathcal{D}^{(\bullet)}$, $\mathcal{F}'^{(\bullet)} := \lambda^*\mathcal{F}^{(\bullet)}$. We have $\mathcal{E}'^{(\bullet)}, \mathcal{F}'^{(\bullet)} \in D_{\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$ (see 8.4.1.6). Let $\chi' \in M(I)$ be the map defined by $\chi'(i) := \chi(i) - \chi(i_0)$ for any $i \in I$. Remark that $\chi^* = \chi'^*$ and that the morphism $\mathcal{F}'^{(i_0)} \to \mathcal{F}'^{(i_0)}$ induced by $\theta_{\mathcal{F}',\chi'}$ is the identity (but the one induced by $\theta_{\mathcal{F}',\chi}$ is the multiplication by $p^{\chi(i_0)}$. With notation 8.1.1.4, this implies the commutativity of the outline rectangle of the diagram

$$\begin{array}{ccccccc}
\mathcal{E}'^{(i_0)} & \longrightarrow & \mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}'^{(i_0)}} \mathcal{E}'^{(i_0)} & & \xrightarrow{\qquad\sim\qquad} & & \mathcal{E}'^{(\bullet)} \\
\downarrow{\scriptstyle h^{(i_0)}} & & \downarrow{\scriptstyle \mathrm{id} \otimes h^{(i_0)}} & & & & \downarrow{\scriptstyle h} \\
\mathcal{F}'^{(i_0)} & \longrightarrow & \mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}'^{(i_0)}} \mathcal{F}'^{(i_0)} & \xrightarrow{\sim} & \mathcal{F}'^{(\bullet)} & \xrightarrow{\theta_{\mathcal{F}',\chi'}} & \chi^*\mathcal{F}'^{(\bullet)}
\end{array} \tag{8.4.1.7.1}$$

in $D(\mathcal{D}'^{(\bullet)})$, where the horizontal isomorphisms follows from the fact that $\mathcal{E}'^{(\bullet)}, \mathcal{F}'^{(\bullet)} \in D_{\mathrm{coh}}(\mathcal{D}'^{(\bullet)})$ and where to lighten we have removed $(\underset{\to}{l}{}^{(I)}_{X})^{-1}$ in the notation (e.g. $\mathcal{F}'^{(i_0)} = (\underset{\to}{l}{}^{(I)}_{X})^{-1}(\mathcal{F}'^{(i_0)})$). By universal property of the extension, this yields the commutativity of the right square. Hence, we get a morphism $h'\colon \mathcal{E}'^{(\bullet)} \to \mathcal{F}'^{(\bullet)}$ in $D(\mathcal{D}'^{(\bullet)})$ making commutative the diagram, in particular such that $h = \theta_{\mathcal{F}',\chi'} \circ h'$. Since $\mathcal{E}'^{(\bullet)}, \mathcal{F}'^{(\bullet)} \in D_{\mathrm{coh}}(\mathcal{D}'^{(\bullet)})$, then the cone $\mathcal{G}'^{(\bullet)}$ of h' in $D(\mathcal{D}'^{(\bullet)})$ belongs to $D_{\mathrm{coh}}(\mathcal{D}'^{(\bullet)})$. Since $\theta_{\mathcal{F}',\chi'}$ is an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then $\mathcal{G}'^{(\bullet)}$ and $\mathcal{G}^{(\bullet)}$ are isomorphic in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. □

Notation 8.4.1.8. Suppose I is a filtered set. Let us denote by $\mathcal{D}^\dagger := \varinjlim_{i \in I} \mathcal{D}^{(i)}$. From the topos morphism 8.1.1.2.4, we get the ringed topos morphism:

$$\underset{\to}{l}_{X,I}\colon (X, \mathcal{D}^\dagger) \to (X^{(I)}, \mathcal{D}^{(\bullet)}). \tag{8.4.1.8.1}$$

Recall $\underset{\to}{l}{}^{-1}_{X,I}(\mathcal{F}^{(\bullet)}) = \varinjlim_{i \in I} \mathcal{F}^{(i)}$ and $\underset{\leftarrow}{l}_{X,I*}(\mathcal{F})$ is the constant inductive system with value $\mathcal{F}$. We have $\underset{\to}{l}{}^*_{X,I} = \underset{\to}{l}{}^{-1}_{X,I}\colon M(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}^\dagger)$, which is exact. It induces the functor $\underset{\to}{l}{}^*_{X,I}\colon D(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^\dagger)$. By composition with the tensor product $- \otimes_{\mathbb{Z}} \mathbb{Q}\colon D(\mathcal{D}^\dagger) \to D(\mathcal{D}^\dagger_{\mathbb{Q}})$ we get a functor $D(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^\dagger_{\mathbb{Q}})$ that we will denote by $\underset{\to}{l}{}^*_{X,I,\mathbb{Q}}$ or simply by $\underset{\to}{l}{}^*_{\mathbb{Q}}$ if there is no ambiguity with I and X.

Proposition 8.4.1.9. *Suppose that I is filtered.*

(a) The functor $\underset{\to}{l}{}^*_{\mathbb{Q}}\colon D(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^\dagger_{\mathbb{Q}})$ (see 8.4.1.8) factors through $\underset{\to}{l}{}^*_{\mathbb{Q}}\colon \underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^\dagger_{\mathbb{Q}})$ and $\underset{\to}{l}{}^*_{\mathbb{Q}}\colon \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^\dagger_{\mathbb{Q}})$.

(b) Let $u\colon I' \to I$ be an L-equivalence between two partially ordered sets (see definition 8.1.3.8). Set $\mathcal{D}'^\dagger := \underset{\to}{l}{}^{-1}_{X,I'}(\underset{\to}{u}{}^{-1}_{X}\mathcal{D}^{(\bullet)})$. Then we have a canonical isomorphism $\mathcal{D}'^\dagger \xrightarrow{\sim} \mathcal{D}^\dagger$ of sheaves of rings on X making commutative (up to equivalence of categories) the diagram

$$\begin{array}{ccc}
\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \underset{\underset{\to}{u}{}^{-1}_{X}}{\xrightarrow{\cong}} & \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\underset{\to}{u}{}^{-1}_{X}\mathcal{D}^{(\bullet)}) \\
\downarrow{\scriptstyle \underset{\to}{l}{}^*_{X,I,\mathbb{Q}}} & & \downarrow{\scriptstyle \underset{\to}{l}{}^*_{X,I',\mathbb{Q}}} \\
D(\mathcal{D}^\dagger_{\mathbb{Q}}) & \underset{\cong}{\longleftarrow} & D(\mathcal{D}'^\dagger_{\mathbb{Q}})
\end{array} \tag{8.4.1.9.1}$$

where the top horizontal functor is the equivalence of categories of 8.3.1.3.1,

(c) *Suppose I has a smallest element or is strictly filtered (see 8.1.3.8). Then, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$, we have $\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in D^{\sharp}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$.*

Proof. a) The $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$. Let $\lambda \in L(I)$, $\chi \in M(I)$. Then $\theta_{\mathcal{E},\chi} \otimes \mathrm{id}\colon \mathcal{E}^{(\bullet)} \otimes_{\mathbb{Z}} \mathbb{Q} \to \chi^{*}\mathcal{E}^{(\bullet)} \otimes_{\mathbb{Z}} \mathbb{Q}$ is an isomorphism in $C(\mathcal{D}^{(\bullet)}_{\mathbb{Q}})$. Hence, $\underrightarrow{l}^{*}_{\mathbb{Q}}(\theta_{\mathcal{E},\chi})$ is an isomorphism in $D(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ and we get the first factorization. Following the part a) of the proof of 8.1.3.11, the canonical morphism $\underrightarrow{l}^{-1}_{X,I}(\rho_{\mathcal{E},\lambda})\colon \underrightarrow{l}^{-1}_{X,I}(\mathcal{E}^{(\bullet)}) \to \underrightarrow{l}^{-1}_{X,I}(\lambda^{*}\mathcal{E}^{(\bullet)})$ is an isomorphism in $C(\mathcal{D}^{(\bullet)})$. This yields the second factorization.

b) The property (b) follows from 8.1.3.11.

c) Since $\underrightarrow{l}^{*}_{X,I,\mathbb{Q}}$ is exact, we can suppose $\sharp$ is empty. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Let $i_0 \in I$. Since the inclusion $j\colon I^{i_0} \to I$ is an L-equivalence, following 8.4.1.5.1 (and 8.3.1.3.1), $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ if and only if $\underrightarrow{j}^{-1}_{X}\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\underrightarrow{j}^{-1}_{X}\mathcal{D}^{(\bullet)})$. Hence, by using the commutative diagram 8.4.1.9.1, we reduce to the case where $I^{i_0} = I$. By definition and by using 8.3.2.2.c, there exist $\lambda \in L(I)$, $\mathcal{E}'^{(\bullet)} \in D_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$ together with the isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$. Set $\mathcal{D}'^{(\bullet)} = \lambda^{*}\mathcal{D}^{(\bullet)}$. From 8.4.1.6, the canonical morphism

$$\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}'^{(i_0)}} \mathcal{E}'^{(i_0)} \to \mathcal{E}'^{(\bullet)} \tag{8.4.1.9.2}$$

is an isomorphism in $D(\mathcal{D}'^{(\bullet)})$. Let $\mathcal{P}'^{(\bullet)}$ be a K-flat complex of $K(\mathcal{D}'^{(\bullet)})$ endowed with a quasi-isomorphism $\mathcal{P}'^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$. By construction of 8.4.1.9.2, we get that the canonical morphism $\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}'^{(i_0)}} \mathcal{P}'^{(i_0)} \to \mathcal{P}'^{(\bullet)}$ of $K(\mathcal{D}'^{(\bullet)})$ is a quasi-isomorphism. This yields the last quasi-isomorphism:

$$\underrightarrow{l}^{-1}_{X,I}(\mathcal{D}'^{(\bullet)}) \otimes_{\mathcal{D}'^{(i_0)}} \mathcal{P}'^{(i_0)} \xrightarrow{\sim} \underrightarrow{l}^{-1}_{X,I}(\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{D}'^{(i_0)}} \mathcal{P}'^{(i_0)}) \xrightarrow{\sim} \underrightarrow{l}^{-1}_{X,I}(\mathcal{P}'^{(\bullet)})$$

of $K(\underrightarrow{l}^{-1}_{X,I}(\mathcal{D}'^{(\bullet)}))$. Since $\underrightarrow{l}^{-1}_{X,I}(\mathcal{D}'^{(\bullet)}) \xrightarrow{\sim} \mathcal{D}^{\dagger}$, this means that the canonical morphism $\mathcal{D}^{\dagger} \overset{\mathbb{L}}{\otimes}_{\mathcal{D}'^{(i_0)}} \mathcal{E}'^{(i_0)} \to \underrightarrow{l}^{-1}_{X,I}(\mathcal{E}'^{(\bullet)})$ is an isomorphism in $D(\mathcal{D}^{\dagger})$. Hence $\underrightarrow{l}^{-1}_{X,I}(\mathcal{E}'^{(\bullet)}) \in D_{\mathrm{coh}}(\mathcal{D}^{\dagger})$, and then $\underrightarrow{l}^{*}_{X,I,\mathbb{Q}}(\mathcal{E}'^{(\bullet)}) = (\underrightarrow{l}^{-1}_{X,I}(\mathcal{E}'^{(\bullet)}))_{\mathbb{Q}} \in D_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$. Since $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then we are done.

□

8.4.1.10. The proposition 8.4.1.9.a is still valid by replacing complexes by modules, i.e. by replacing in the notation of categories the letter D by M. More precisely, the exact functor $\underrightarrow{l}^{*}_{\mathbb{Q}}\colon M(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ factors through $\underrightarrow{l}^{*}_{\mathbb{Q}}\colon \underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ and even $\underrightarrow{l}^{*}_{\mathbb{Q}}\colon \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ making commutative the diagram

$$\begin{array}{ccccc} \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \longrightarrow & \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\mathcal{H}^n} & \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \\ \downarrow{\scriptstyle \underrightarrow{l}^{*}_{\mathbb{Q}}} & & \downarrow{\scriptstyle \underrightarrow{l}^{*}_{\mathbb{Q}}} & & \downarrow{\scriptstyle \underrightarrow{l}^{*}_{\mathbb{Q}}} \\ M(\mathcal{D}^{\dagger}_{\mathbb{Q}}) & \longrightarrow & D(\mathcal{D}^{\dagger}_{\mathbb{Q}}) & \xrightarrow{\mathcal{H}^n} & M(\mathcal{D}^{\dagger}_{\mathbb{Q}}). \end{array} \tag{8.4.1.10.1}$$

Proposition 8.4.1.11. *Suppose I is filtered. Let $i_0 \in I$, $\mathcal{E}^{(i_0)}$, $\mathcal{F}^{(i_0)}$ be two left $\mathcal{D}^{(i_0)}$-modules. Put $\mathcal{E}^{(i)} := \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)}$ and $\mathcal{F}^{(i)} := \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)}$ for any $i \geq i_0$. Put $\mathcal{D}^{\dagger} := \varinjlim_{i\in I} \mathcal{D}^{(i)}$, $\mathcal{E}^{\dagger} := \mathcal{D}^{\dagger} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)}$ and $\mathcal{F}^{\dagger} := \mathcal{D}^{\dagger} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)}$. We suppose $\mathcal{E}^{(i_0)}$ is of finite presentation.*

(a) *The canonical morphism*

$$\varinjlim_{i\in I^{i_0}} \mathcal{H}om_{\mathcal{D}^{(i)}}(\mathcal{E}^{(i)},\ \mathcal{F}^{(i)}) \to \mathcal{H}om_{\mathcal{D}^{\dagger}}(\mathcal{E}^{\dagger},\ \mathcal{F}^{\dagger}) \tag{8.4.1.11.1}$$

is an isomorphism.

(b) *Suppose X is coherent.*

(i) *The canonical morphism*

$$\varinjlim_{i\in I^{i_0}} \mathrm{Hom}_{\mathcal{D}^{(i)}}(\mathcal{E}^{(i)},\ \mathcal{F}^{(i)}) \to \mathrm{Hom}_{\mathcal{D}^{\dagger}}(\mathcal{E}^{\dagger},\ \mathcal{F}^{\dagger}) \tag{8.4.1.11.2}$$

is an isomorphism.

(ii) *Let $\mathcal{G}$ be a left $\mathcal{D}^\dagger$-module of finite presentation. Then there exists $j_0 \in I$ and a left $\mathcal{D}^{(j_0)}$-module $\mathcal{G}^{(j_0)}$ of finite presentation together with a $\mathcal{D}^\dagger$-linear isomorphism $\epsilon\colon \mathcal{D}^\dagger \otimes_{\mathcal{D}^{(j_0)}} \mathcal{G}^{(j_0)} \xrightarrow{\sim} \mathcal{G}$. Moreover, if $(j_0', \mathcal{G}'^{(j_0')}, \epsilon')$ satisfies the same property, then there exists $j \in I^{j_0} \cap I^{j_0'}$, a $\mathcal{D}^{(j)}$-linear isomorphism $\epsilon_j\colon \mathcal{D}^{(j)} \otimes_{\mathcal{D}^{(j_0)}} \mathcal{G}^{(j_0)} \xrightarrow{\sim} \mathcal{D}^{(j)} \otimes_{\mathcal{D}^{(j_0')}} \mathcal{G}'^{(j_0')}$ such that $\epsilon' \circ (\mathrm{id} \otimes \epsilon_j) = \epsilon$.*

Proof. a) The fact that the morphism 8.4.1.11.1 is an isomorphism is local on X. Hence, we can suppose that $\mathcal{E}^{(i_0)}$ has globally finite presentation. Since I^{i_0} is filtered, both functors $\varinjlim_{i \in I^{i_0}} \mathcal{H}om_{\mathcal{D}^{(i)}}(-,\ \mathcal{F}^{(i)})$ and $\mathcal{H}om_{\mathcal{D}^\dagger}(\mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(i_0)}} -,\ \mathcal{F}^\dagger)$ are left exact. Hence, by using the 5 lemma, we reduce to the case where $\mathcal{E}^{(i_0)} = \mathcal{D}^{(i_0)}$, which is obvious.

b) i) When X is coherent, filtered inductive limits commute with the global section functor $\Gamma(X, -)$ (see [SGA4.2, VI.5.1-2]). Hence, we get 8.4.1.11.2 from 8.4.1.11.1 by applying $\Gamma(X, -)$.

ii) Case 1): suppose $\mathcal{G}$ has globally finite presentation, i.e. is the cokernel of a morphism of $\mathcal{D}^\dagger$-modules of the form $f\colon (\mathcal{D}^\dagger)^r \to (\mathcal{D}^\dagger)^s$. It follows from b.i), that f comes from a morphism of $\mathcal{D}^{(i)}$-modules of the form $f^{(i)}\colon (\mathcal{D}^{(i)})^r \to (\mathcal{D}^{(i)})^s$. Hence, we can choose $\mathcal{G}^{(i)}$ as equal to the cokernel of $f^{(i)}$.

Case 2) In general, by glueing (and by using again the coherence of X), to construct the left $\mathcal{D}^{(j_0)}$-module $\mathcal{G}^{(j_0)}$ together with a $\mathcal{D}^\dagger$-linear isomorphism $\epsilon\colon \mathcal{D}^\dagger \otimes_{\mathcal{D}^{(j_0)}} \mathcal{G}^{(j_0)} \xrightarrow{\sim} \mathcal{G}$ we reduce to the case 1).

□

Remark 8.4.1.12. Let $f\colon (\mathcal{D}^\dagger)^r \to (\mathcal{D}^\dagger)^s$ be a morphism of left $\mathcal{D}^\dagger$-modules. Without the coherence hypothesis on X, this is not clear that f comes by extension from a morphism of $\mathcal{D}^{(i)}$-modules of the form $f^{(i)}\colon (\mathcal{D}^{(i)})^r \to (\mathcal{D}^{(i)})^s$. Indeed, the data of f is equivalent to that of rs elements of the set $\Gamma(X, \mathcal{D}^\dagger)$; the data of $f^{(i)}$ is equivalent to that of rs elements of the set $\Gamma(X, \mathcal{D}^{(i)})$. When X is not coherent, since $\Gamma(X, \mathcal{D}^\dagger) \xrightarrow{\sim} \varinjlim \Gamma(X, \mathcal{D}^{(i)})$ is not necessarily true, then this is not clear that an element of $\Gamma(X, \mathcal{D}^\dagger)$ comes from by extension an element of $\Gamma(X, \mathcal{D}^{(i)})$.

Corollary 8.4.1.13. *Suppose I is filtered, X is locally coherent, $\mathcal{D}^{(i)}$ is left (resp. right) coherent on X and $\mathcal{D}^{(i)} \to \mathcal{D}^{(j)}$ is flat for any $i \leq j$. Then $\mathcal{D}^\dagger := \varinjlim_{i \in I} \mathcal{D}^{(i)}$ is left (resp. right) coherent.*

Proof. Since this is local, we can suppose X is coherent. Let $f\colon (\mathcal{D}^\dagger)^r \to \mathcal{D}^\dagger$ be a morphism of left $\mathcal{D}^\dagger$-modules. Following 8.4.1.11, there exists $i \in I$, a morphism of left $\mathcal{D}^{(i)}$-modules $f^{(i)}\colon (\mathcal{D}^{(i)})^r \to \mathcal{D}^{(i)}$ such that $f = \mathcal{D}^\dagger \otimes_{\mathcal{D}^{(i)}} (f^{(i)})$. Since the functor $\mathcal{D}^\dagger \otimes_{\mathcal{D}^{(i)}} -$ is exact, $\ker f \xrightarrow{\sim} \mathcal{D}^\dagger \otimes_{\mathcal{D}^{(i)}} \ker f^{(i)}$ and we are done. □

Theorem 8.4.1.14. *Suppose X is the topological space associated to a noetherien affine $\mathcal{V}$-formal scheme $\mathfrak{X}$, Suppose I is a filtered set and put $\mathcal{D}^\dagger := \varinjlim_{i \in I} \mathcal{D}^{(i)}$, $D^\dagger := \Gamma(\mathfrak{X}, \mathcal{D}^\dagger)$. Suppose moreover that for any $i \in I$, $\mathcal{D}^{(i)}$ is a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}^{(i)}$ satisfying the conditions of 7.2.3 (for the p-adic topology).*

(a) *We have theorems A and B for $\mathcal{D}^\dagger$-modules of finite presentation:*

   (i) *The extension $D^\dagger \to \mathcal{D}^\dagger$ is flat ;*

   (ii) *For any $\mathcal{D}^\dagger$-module $\mathcal{E}$ of finite presentation, for any $q \geq 1$, we have $H^q(X, \mathcal{E}) = 0$;*

   (iii) *The functors $\Gamma(X, -)$ and $\mathcal{D}^\dagger \otimes_{D^\dagger} -$ induces canonically quasi-inverse exact equivalences between the category of $\mathcal{D}^\dagger$-modules of finite presentation and that of $D^\dagger$-modules of finite presentation.*

(b) *If moreover the transition maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any elements $i \leq j$ of I, then the sheaf of rings $\mathcal{D}^\dagger_{\mathbb{Q}}$ satisfies theorems A and B for coherent modules in the sense of 1.4.3.14.*

Proof. (a) Set $D^{(i)} := \Gamma(X, \mathcal{D}^{(i)})$. Since the topological space X is coherent, then for any $q \geq 0$, the functors $H^q(X, -)$ commute with filtered inductive limits and then for $q = 0$ we get $D^\dagger \xrightarrow{\sim} \varinjlim_{i \in I} D^{(i)}$. Moreover, following 7.2.3.16, the sheaves of rings $\mathcal{D}^{(i)}$ satisfy theorems A and B for coherent modules. In particular $D^{(i)} \to \mathcal{D}^{(i)}$ is flat then $D^\dagger \to \mathcal{D}^\dagger$ is flat.

Let $\mathcal{E}$ be a $\mathcal{D}^\dagger$-module of finite presentation. Following 8.4.1.11.b.ii), since X is coherent then there exists $i_0 \in I$ and a left $\mathcal{D}^{(i_0)}$-module $\mathcal{E}^{(i_0)}$ of finite presentation together with a $\mathcal{D}^\dagger$-linear isomorphism

$\epsilon\colon \mathcal{D}^{\dagger} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \xrightarrow{\sim} \mathcal{E}$. Set $\mathcal{E}^{(i)} := \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)}$ for any $i \geq i_0$. Following 7.2.3.3, $\mathcal{D}^{(i)}$ is therefore left coherent for any $i \in I$. Hence, $\mathcal{E}^{(i)}$ is a coherent $\mathcal{D}^{(i)}$-module. This yields

$$H^q(X, \mathcal{E}) \xrightarrow{\sim} H^q(X, \varinjlim_{i\in I^{i_0}} \mathcal{E}^{(i)}) \xrightarrow{\sim} \varinjlim_{i\in I^{i_0}} H^q(X, \mathcal{E}^{(i)}) \overset{7.2.3.16}{=} \varinjlim_{i\in I^{i_0}} 0 = 0.$$

For any $i \geq i_0$, set $E^{(i)} := \Gamma(X, \mathcal{E}^{(i)})$ and $E := \Gamma(X, \mathcal{E})$. It follows from Theorem A of 7.2.3.16.(i)-(ii), the canonical morphism

$$\mathcal{D}^{(i)} \otimes_{D^{(i_0)}} E^{(i_0)} \xrightarrow{\sim} \mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} = \mathcal{E}^{(i)} \tag{8.4.1.14.1}$$

is an isomorphism. By applying $\mathcal{D}^{(i)} \otimes_{D^{(i)}} -$ to the canonical morphism of coherent $D^{(i)}$-modules $D^{(i)} \otimes_{D^{(i_0)}} E^{(i_0)} \to E^{(i)}$, using again 7.2.3.16.(i)-(ii), we get 8.4.1.14.1 which is an isomorphism. Hence, $D^{(i)} \otimes_{D^{(i_0)}} E^{(i_0)} \to E^{(i)}$ is an isomorphism and is the image (up to isomorphism) by $\Gamma(X, -)$ of 8.4.1.14.1. Since filtered inductive limits commute with the functor $\Gamma(X, -)$ and with tensor products, we get $D^{\dagger} \otimes_{D^{(i_0)}} E^{(i_0)} \xrightarrow{\sim} E$. Hence, E is a $D^{\dagger}$-module of finite presentation.

Consider now the commutative diagram

$$\begin{array}{ccc} \varinjlim_{i\in I^{i_0}} \mathcal{D}^{(i)} \otimes_{D^{(i)}} E^{(i)} & \xrightarrow{\sim} & \varinjlim_{i\in I^{i_0}} \mathcal{E}^{(i)} \\ \downarrow \wr & & \downarrow \wr \\ \mathcal{D}^{\dagger} \otimes_{D^{\dagger}} E, & \longrightarrow & \mathcal{E} \end{array}$$

where vertical isomorphisms come from the commutation of filtered inductive limits with the functor $\Gamma(X, -)$ and with tensor products. Since the sheaves of rings $\mathcal{D}^{(i)}$ satisfy theorems A and B for coherent modules, then the top morphism is an isomorphism. This implies that so is the bottom one. Using the same arguments, we check that for any $D^{\dagger}$-module E of finite presentation, the canonical morphism $E \to \Gamma(X, \mathcal{D}^{\dagger} \otimes_{D^{\dagger}} E)$ is an isomorphism.

(b) The last part is a consequence of the first one and of the fact that following the corollary 8.4.1.13 the sheaf of rings $\mathcal{D}^{\dagger}_{\mathbb{Q}} := \varinjlim_{i\in I} \mathcal{D}^{(i)}_{\mathbb{Q}}$ is left (resp. right) coherent. □

Theorem 8.4.1.15. *Suppose that either I is filtered and has a smallest element or I is strictly filtered. Suppose moreover that X is coherent.*

(a) For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ and $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, the functor $\underrightarrow{l}^{*}_{X,I,\mathbb{Q}}$ induces an isomorphism

$$\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathrm{Hom}_{D(\mathcal{D}^{\dagger}_{\mathbb{Q}})}(\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}), \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})). \tag{8.4.1.15.1}$$

(b) Suppose the following conditions are satisfied

- *(i) The rings $\mathcal{D}^{(i)}$ are coherent sheaves for any $i \in I$*
- *(ii) The transition maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any elements $i \leq j$ of I;*
- *(iii) There exists an integer d such that, for any elements $i \leq j$ of I, the ring $\mathcal{D}^{(j)}$ is of tor-dimension $\leq d$ on $\mathcal{D}^{(i)}$;*
- *(iv) For any $i \in I$, for any coherent $\mathcal{D}^{(i)}_{\mathbb{Q}}$-module $\mathcal{E}$, there exists a coherent $\mathcal{D}^{(i)}$-module $\mathcal{E}'$ together with an isomorphism $\mathcal{E}'_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ of $\mathcal{D}^{(i)}_{\mathbb{Q}}$-modules.*

Under these hypotheses, the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ induces an equivalence of categories between $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$.

Proof. 0) Since the proof reduces (or the argument are the same) to the case where I is filtered and has a smallest element, let us suppose I is strictly filtered.

a) i) First let us construct canonically the morphism 8.4.1.15.1. For this purpose, let us construct for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, respectively in $D^{+}(\mathbb{Z}_X)$ and $D^{+}(\mathbb{Z})$ the following morphisms:

$$\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}), \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})), \tag{8.4.1.15.2}$$

$$\mathbb{R}\,\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}), \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})). \tag{8.4.1.15.3}$$

Set $\mathcal{E}^{\dagger}_{\mathbb{Q}} := \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})$, $\mathcal{F}^{\dagger}_{\mathbb{Q}} := \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})$. The functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ induces the canonical morphism of bifunctors $K^{-}(\mathcal{D}^{(\bullet)}) \times K^{+}(\mathcal{D}^{(\bullet)}) \to K^{+}(\mathbb{Z}_X)$:

$$\varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-, \chi^*\lambda^* -) \to \varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(-), \underrightarrow{l}^{*}_{\mathbb{Q}}(\chi^*\lambda^*(-))). \tag{8.4.1.15.4}$$

Moreover, it follows from the proof of 8.4.1.9.a that the morphism $\underrightarrow{l}^{*}_{\mathbb{Q}}(\sigma_{\mathcal{F},\lambda,\chi}) \colon \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)}) \to \underrightarrow{l}^{*}_{\mathbb{Q}}(\chi^*\lambda^*\mathcal{F}^{(\bullet)})$ is an isomorphism in $C(\mathcal{D}^{\dagger}_{\mathbb{Q}})$. This yields that the canonical morphism of bifunctors $K^{-}(\mathcal{D}^{(\bullet)}) \times K^{+}(\mathcal{D}^{(\bullet)}) \to K(\mathbb{Z}_X)$:

$$\mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(-), \underrightarrow{l}^{*}_{\mathbb{Q}}(-)) \to \varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(-), \underrightarrow{l}^{*}_{\mathbb{Q}}(\chi^*\lambda^*(-))) \tag{8.4.1.15.5}$$

is an isomorphism. Hence, with notation 8.3.4.6, there exists a unique morphism

$$\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(-), \underrightarrow{l}^{*}_{\mathbb{Q}}(-)) \tag{8.4.1.15.6}$$

of bifunctors $\underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \times \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D^{+}(\mathbb{Z}_X)$ making commutative the diagram of bifunctors $K^{-}(\mathcal{D}^{(\bullet)}) \times K^{+}(\mathcal{D}^{(\bullet)}) \to D^{+}(\mathbb{Z}_X)$:

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(Q^{\mathrm{qi}}_{LD}(-), Q^{\mathrm{qi}}_{LD}(-)) & \xrightarrow{8.4.1.15.6} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}} \circ Q^{\mathrm{qi}}_{LD}(-), \underrightarrow{l}^{*}_{\mathbb{Q}} \circ Q^{\mathrm{qi}}_{LD}(-)) \\
 & & \| \\
\uparrow{\scriptstyle adj} & & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(Q_{\mathrm{qi}} \circ \underrightarrow{l}^{*}_{\mathbb{Q}}(-), Q_{\mathrm{qi}} \circ \underrightarrow{l}^{*}_{\mathbb{Q}}(-)) \\
 & & \uparrow{\scriptstyle adj} \\
Q_{\mathrm{qi}} \circ \varinjlim_{\lambda,\chi} \mathcal{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-, \chi^*\lambda^*(-)) & \longrightarrow & Q_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(-), \underrightarrow{l}^{*}_{\mathbb{Q}}(-))
\end{array} \tag{8.4.1.15.7}$$

where the "adj" morphisms are given by adjunction from 7.4.1.9.1, where the bottom morphism is constructed by composing 8.4.1.15.4 and 8.4.1.15.5, where the right top arrow comes from the equality $\underrightarrow{l}^{*}_{\mathbb{Q}} \circ Q^{\mathrm{qi}}_{LD} = Q_{\mathrm{qi}} \circ \underrightarrow{l}^{*}_{\mathbb{Q}}$ as functors $K(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ with $\underrightarrow{l}^{*}_{\mathbb{Q}} \colon \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ for the left side and $\underrightarrow{l}^{*}_{\mathbb{Q}} \colon K(\mathcal{D}^{(\bullet)}) \to K(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ for the right one. By using Lemma 8.2.4.25 and the following similar isomorphism

$$\mathbb{R}\Gamma(X, \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}), \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)}))) \xrightarrow{\sim} \mathbb{R}\operatorname{Hom}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}), \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})), \tag{8.4.1.15.8}$$

by applying the functor $\mathbb{R}\Gamma(X,-)$ to 8.4.1.15.2, we get the functor 8.4.1.15.3 (or one can construct this latter morphism directly similarly to 8.4.1.15.2). By applying the functor H^0 to 8.4.1.15.3, it follows from 8.2.4.24 (and similarly for the right term), that we get the construction of the arrow 8.4.1.15.1.

ii) Suppose from now $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. We check 8.4.1.15.1, 8.4.1.15.2, 8.4.1.15.3 are isomorphisms.

1) By construction it is sufficient to prove it for 8.4.1.15.2. Let $\lambda \in L(I)$ and $\mathcal{E}'^{(\bullet)} \in D^{-}_{\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$ together with an isomorphism $\lambda^*\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$ in $\underrightarrow{LD}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$ (by definition of the coherence and use 8.3.2.2.c). Set $\mathcal{D}'^{\dagger}_{\mathbb{Q}} := \underrightarrow{l}^{*}_{X,I,\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$. Then we have a canonical isomorphism $\mathcal{D}'^{\dagger}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathbb{Q}}$ of sheaves of rings on X inducing the equivalence of categories of the right vertical arrow of the diagram:

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) & \xrightarrow{8.4.1.15.2} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}), \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})) \\
{\scriptstyle 8.3.1.3.3}\downarrow\cong & & \downarrow\cong \\
\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})}(\lambda^*\mathcal{E}^{(\bullet)}, \lambda^*\mathcal{F}^{(\bullet)}) & \xrightarrow{8.4.1.15.2} & \mathbb{R}\mathcal{H}om_{\mathcal{D}'^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}(\lambda^*\mathcal{E}^{(\bullet)}), \underrightarrow{l}^{*}_{\mathbb{Q}}(\lambda^*\mathcal{F}^{(\bullet)})).
\end{array} \tag{8.4.1.15.9}$$

By using the commutative diagram 8.4.1.9.1, we check that the diagram 8.4.1.15.9 is commutative up to canonical equivalence of categories. Hence, replacing $\mathcal{D}^{(\bullet)}$ by $\lambda^*\mathcal{D}^{(\bullet)}$ if necessary, by using the stability of the coherence of 8.4.1.5, we can suppose that $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Similarly, since I is strictly filtered, we can suppose that I has a smallest element i_0. Following 8.4.1.6, $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{coh}}(\mathcal{D}^{(i_0)})$ and we have the canonical isomorphism of $D^-(\mathcal{D}^{(\bullet)})$

$$\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}. \tag{8.4.1.15.10}$$

2) We reduce in the step to the case where $\mathcal{E}^{(\bullet)} = \mathcal{D}^{(\bullet)}$. Let us denote $f(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})$ the morphism 8.4.1.15.2. The morphism $f(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})$ is an isomorphism in $D^+(\mathbb{Z}_X)$ is equivalent to the fact that $H^k(f(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}))$ is an isomorphism of sheaves on X for any $k \in \mathbb{Z}$. Let $k \in \mathbb{Z}$. Since $\mathcal{F}^{(\bullet)}$ is bounded below, there exists n large enough (depending on k and on $\mathcal{F}^{(\bullet)}$ but not on $\mathcal{E}^{(\bullet)}$) such that the canonical morphism $H^k(f(\tau^{\geq n}\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) \to H^k(f(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}))$ is an isomorphism. Since the fact that $H^k(f(\tau^{\geq n}\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}))$ is an isomorphism is local on X, since $\mathcal{E}^{(i_0)} \in D^-_{\mathrm{coh}}(\mathcal{D}^{(i_0)})$, we can suppose there exists a bounded complex $\mathcal{L}^{(i_0)}$ of $C^{\mathrm{b}}(\mathcal{D}^{(i_0)})$ which is strictly perfect together with a morphism of complexes $\mathcal{L}^{(i_0)} \to \mathcal{E}^{(i_0)}$ which is an n-isomorphism (i.e. its cone is acyclic in degree $\geq n$). With 8.4.1.15.10, we get the n-isomorphism $\mathcal{L}^{(\bullet)} := \mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(i_0)}} \mathcal{L}^{(i_0)} \to \mathcal{E}^{(\bullet)}$, i.e. $\tau^{\geq n}\mathcal{L}^{(\bullet)} \xrightarrow{\sim} \tau^{\geq n}\mathcal{E}^{(\bullet)}$. Since $H^k(f(\mathcal{L}^{(\bullet)}, \mathcal{F}^{(\bullet)})) \to H^k(f(\tau^{\geq n}\mathcal{L}^{(\bullet)}, \mathcal{F}^{(\bullet)}))$ is an isomorphism, this yields $H^k(f(\tau^{\geq n}\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)})) \to H^k(f(\mathcal{L}^{(\bullet)}, \mathcal{F}^{(\bullet)}))$ is an isomorphism. Hence, we reduce to the case where $\mathcal{E}^{(\bullet)}$ is strictly perfect and we are done by additivity.

3) It remains to check the case $\mathcal{E}^{(\bullet)} = \mathcal{D}^{(\bullet)}$. Let $\mathcal{I}^{(\bullet)} \in K^+(\mathscr{J})$ endowed with a quasi-isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{I}^{(\bullet)}$ in $K^+(\mathcal{D}^{(\bullet)})$. It remains to check that $H^k(f(\mathcal{D}^{(\bullet)}, \mathcal{I}^{(\bullet)}))$ is an isomorphism for any $k \in \mathbb{Z}$. Since $\mathcal{D}^{(\bullet)} \in K^-(\mathscr{P})$, then the left arrow of 8.4.1.15.7 evaluated at $(\mathcal{D}^{(\bullet)}, \mathcal{I}^{(\bullet)})$ is an isomorphism. Moreover, since $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathbb{Q}}$, then the bottom right morphism of 8.4.1.15.7 is an isomorphism. Hence, we reduce to check that the canonical morphism

$$\varinjlim_{\lambda,\chi} \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{D}^{(\bullet)}, \chi^*\lambda^*(\mathcal{I}^{(\bullet)})) \to \mathcal{H}om^\bullet_{\mathcal{D}^\dagger_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}), \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{I}^{(\bullet)})), \tag{8.4.1.15.11}$$

is an isomorphism. Recall, the morphism 8.4.1.15.11 is constructed by composing 8.4.1.15.4 and 8.4.1.15.5.

We remark the following: for any complex $\mathcal{G}^{(\bullet)} \in C(\mathcal{D}^{(\bullet)})$, since i_0 is the smallest element of I, then we get the left canonical isomorphism of $C(\mathbb{Z}_X)$:

$$\mathcal{G}^{(i_0)} \xrightarrow{\sim} \mathcal{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{D}^{(\bullet)}, \mathcal{G}^{(\bullet)}), \qquad \mathcal{H}om^\bullet_{\mathcal{D}^\dagger_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}), \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{G}^{(\bullet)})) \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{G}^{(\bullet)}), \tag{8.4.1.15.12}$$

the right one is obvious. Hence, the morphism 8.4.1.15.11 is canonically isomorphic to the composition morphism

$$\varinjlim_{\lambda,\chi} (\chi^*\lambda^*\mathcal{I}^{(\bullet)})^{(i_0)} \underset{8.4.1.15.4}{\longrightarrow} \varinjlim_{\lambda,\chi} \underrightarrow{l}^*_{\mathbb{Q}}(\chi^*\lambda^*\mathcal{I}^{(\bullet)}) \underset{8.4.1.15.5}{\xleftarrow{\sim}} \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{I}^{(\bullet)}), \tag{8.4.1.15.13}$$

where the left arrow is induced by the canonical morphism $(\chi^*\lambda^*\mathcal{I})^{(i_0)} \to \underrightarrow{l}^*_{\mathbb{Q}}(\chi^*\lambda^*\mathcal{I}^{(\bullet)})$. Let $F_\lambda \colon M(I) \to \mathrm{Mod}(\mathbb{Z}_X)$ be the functor given by $\chi \mapsto (\chi^*\lambda^*\mathcal{I}^{(\bullet)})^{(i_0)}$. Let $\alpha \colon \mathbb{N} \to M(I)$ be the increasing map which associates to n the constant map with value n. Let $\beta \colon M(I) \to \mathbb{N}$ be the increasing map defined by $\chi \mapsto \chi(i_0)$. Then, $F_\lambda = F_\lambda \circ \alpha \circ \beta$. Moreover, $F_\lambda \circ \alpha$ is the inductive system $F_\lambda \circ \alpha(n) = \mathcal{I}^{(\lambda(i_0))}$ with transition map $F_\lambda \circ \alpha(n \to n+1)$ given by the multiplication with p. Hence, $\varinjlim F_\lambda \circ \alpha \xrightarrow{\sim} \mathcal{I}^{(\lambda(i_0))}_{\mathbb{Q}}$. Since β is surjective, then $\varinjlim F_\lambda = \varinjlim F_\lambda \circ \alpha \circ \beta \xrightarrow{\sim} \varinjlim F_\lambda \circ \alpha$. Hence, we have the isomorphisms

$$\varinjlim_{\lambda,\chi} (\chi^*\lambda^*\mathcal{I}^{(\bullet)})^{(i_0)} \xrightarrow{\sim} \varinjlim_{\lambda} \varinjlim F_\lambda \xrightarrow{\sim} \varinjlim_{\lambda \in L(I)} \mathcal{I}^{(\lambda(i_0))}_{\mathbb{Q}}. \tag{8.4.1.15.14}$$

Let $i \in I$. Since I is strictly filtered, then the canonical inclusion $j_i \colon I^i \subset I$ is an L-equivalence. Hence, there exists an increasing map $u_i \colon I \to I^i$ such that $\lambda_i := j_i \circ u_i \in L(I)$ and $u_i \circ j_i \in L(I^i)$. In particular, we get $\lambda_i(i_0) \geq i$. This yields a canonical morphism $\varinjlim_{i \in I} \mathcal{I}^{(i)}_{\mathbb{Q}} \to \varinjlim_{\lambda \in L(I)} \mathcal{I}^{(\lambda(i_0))}_{\mathbb{Q}}$ which is an inverse of $\varinjlim_{\lambda \in L(I)} \mathcal{I}^{(\lambda(i_0))}_{\mathbb{Q}} \to \varinjlim_{i \in I} \mathcal{I}^{(i)}_{\mathbb{Q}}$. Hence, we have the isomorphisms

$$\varinjlim_{\lambda,\chi} (\chi^*\lambda^*\mathcal{I}^{(\bullet)})^{(i_0)} \underset{8.4.1.15.14}{\xrightarrow{\sim}} \varinjlim_{\lambda \in L(I)} \mathcal{I}^{(\lambda(i_0))}_{\mathbb{Q}} \xrightarrow{\sim} \varinjlim_{i \in I} \mathcal{I}^{(i)}_{\mathbb{Q}} = \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{I}^{(\bullet)}). \tag{8.4.1.15.15}$$

b) It follows from a) that the functor $\underset{\rightarrow\mathbb{Q}}{l}^*\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger})$ is fully faithful. It remains to check its essential surjectivity. From 8.4.1.13, we get from the property (i) and (ii) that $\mathcal{D}^{\dagger}_{\mathbb{Q}}$ is a coherent sheaf of rings. Hence, $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ is generated as triangulated category by $\mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ (i.e. the smallest triangulated subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ containing $\mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ is $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$). Hence, by using some distinguished triangles of truncation and by induction hypothesis on the cardinal of nonzero cohomological spaces, with [BGK+87, I.2.18], by fully faithfulness of functor $\underset{\rightarrow\mathbb{Q}}{l}^*$, we reduce therefore to check that an object $\mathcal{G} \in \mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ is in the essential image of $\underset{\rightarrow\mathbb{Q}}{l}^*$. Following 8.4.1.11.b.(ii), since our rings are coherent (after tensorisation by $-\otimes\mathbb{Q}$), there exists $i \in I$ and a coherent left $\mathcal{D}^{(i)}_{\mathbb{Q}}$-module $\mathcal{G}^{(i)}$ together with a $\mathcal{D}^{\dagger}_{\mathbb{Q}}$-linear isomorphism $\epsilon\colon \mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{\mathcal{D}^{(i)}_{\mathbb{Q}}} \mathcal{G}^{(i)} \xrightarrow{\sim} \mathcal{G}$. Using the hypothesis (iv), there exists a coherent $\mathcal{D}^{(i)}$-module $\mathcal{F}^{(i)}$ together with an isomorphism $\mathcal{F}^{(i)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{G}^{(i)}$ of $\mathcal{D}^{(i)}_{\mathbb{Q}}$-modules. Let $j\colon I^i \subset I$ be the canonical inclusion. From the hypothesis (iii), we get $\mathcal{F}^{(\bullet)} := (\underset{\rightarrow X}{j}^{-1}\mathcal{D}^{(\bullet)}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(i)}} \mathcal{F}^{(i)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\underset{\rightarrow X}{j}^{-1}\mathcal{D}^{(\bullet)})$. Since j is an L-equivalence, with 8.4.1.9.b, we get $\underset{\rightarrow X,I^i,\mathbb{Q}}{l}^*(\underset{\rightarrow X}{j}^{-1}\mathcal{D}^{(\bullet)}) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathbb{Q}}$ and then the isomorphisms $\underset{\rightarrow X,I^i,\mathbb{Q}}{l}^*(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \underset{\rightarrow X,I^i,\mathbb{Q}}{l}^*(\underset{\rightarrow X}{j}^{-1}\mathcal{D}^{(\bullet)}) \otimes_{\mathcal{D}^{(i)}_{\mathbb{Q}}} \mathcal{F}^{(i)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{G}$. It follows from the equivalence of categories 8.4.1.5.1 that there exists $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ endowed with an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\underset{\rightarrow X}{j}^{-1}\mathcal{D}^{(\bullet)})$ of the form $\underset{\rightarrow X}{j}^{-1}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$. From the commutative diagram 8.4.1.9.1, we get the first isomorphism $\underset{\rightarrow X,I,\mathbb{Q}}{l}^*(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \underset{\rightarrow X,I^i,\mathbb{Q}}{l}^*(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{G}$.

□

8.4.1.16. Suppose X is the topological space associated to a noetherien affine $\mathcal{V}$-formal scheme $\mathfrak{X}$ of finite Krull dimension. Set $D^{(\bullet)} := \Gamma(\mathfrak{X}, \mathcal{D}^{(\bullet)})$. Following 8.1.1.2.7, the structural morphism $f\colon \mathfrak{X} \to \mathrm{Spf}\,\mathcal{V}$ induces the ringed topoi morphism

$$\underset{\rightarrow I}{f}\colon (X^{(I)}, \mathcal{D}^{(\bullet)}) \to (\{*\}^{(I)}, D^{(\bullet)}), \tag{8.4.1.16.1}$$

where $\{*\}$ is the topological space underlying to $\mathrm{Spf}\,\mathcal{V}$. The functor $\underset{\rightarrow I*}{f}$ can also be denoted by $\Gamma(\mathfrak{X}^{(\bullet)}, -)$ and $\underset{\rightarrow I}{f}^* = \mathcal{D}^{(\bullet)} \otimes_{D^{(\bullet)}} -$. Let $\chi \in M(I)$. For any $\mathcal{G}^{(\bullet)\bullet} \in C(\mathcal{D}^{(\bullet)})$, we have the isomorphism of $C(D^{(\bullet)})$:

$$\chi^* \circ \underset{\rightarrow I*}{f}(\mathcal{G}^{(\bullet)\bullet}) \xrightarrow{\sim} \underset{\rightarrow I*}{f} \circ \chi^*(\mathcal{G}^{(\bullet)\bullet}). \tag{8.4.1.16.2}$$

Following 7.1.3.15.2, a $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is $\underset{\rightarrow I*}{f}$-acyclic if and only if $\mathcal{E}^{(i)}$ is a $\underset{\rightarrow I*}{f}$-acyclic $\mathcal{D}^{(\bullet)}$-module for any $i \in I$. Hence, the functor χ^* sends $\underset{\rightarrow I*}{f}$-acyclic modules to $\underset{\rightarrow I*}{f}$-acyclic modules. Since $\mathfrak{X}$ has finite Krull dimension then f_* has bounded cohomological dimension. Hence so is $\underset{\rightarrow I*}{f}$ (see 7.1.3.16). This yields that, for any $\mathcal{E}^{(\bullet)\bullet} \in D(\mathcal{D}^{(\bullet)})$, by using a resolution of $\mathcal{E}^{(\bullet)\bullet}$ by $\underset{\rightarrow I*}{f}$-acyclic modules (following 4.6.1.6.b, such resolutions exist because of the boundedness of the cohomological dimension of $\underset{\rightarrow I*}{f}$), we get the functorial in χ isomorphism of $D(\mathcal{D}^{(\bullet)})$:

$$\chi^* \circ \mathbb{R}\underset{\rightarrow I*}{f}(\mathcal{E}^{(\bullet)\bullet}) \xrightarrow{\sim} \chi^* \circ \underset{\rightarrow I*}{f}(\mathcal{F}^{(\bullet)\bullet}) \overset{8.4.1.16.2}{\xrightarrow{\sim}} \underset{\rightarrow I*}{f} \circ \chi^*(\mathcal{F}^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{R}\underset{\rightarrow I*}{f} \circ \chi^*(\mathcal{E}^{(\bullet)\bullet}). \tag{8.4.1.16.3}$$

Let $E^{(\bullet)\bullet} \in D(D^{(\bullet)})$. Choose $P^{(\bullet)\bullet}$ a K-flat complex of $K(D^{(\bullet)})$ together with a quasi-isomorphism $P^{(\bullet)\bullet} \to E^{(\bullet)\bullet}$ of $K(D^{(\bullet)})$. Following 7.1.3.6, $P^{(\bullet)\bullet}$ is a K-flat complex means $P^{(i)\bullet}$ is a K-flat complex of $K(D^{(i)})$. Hence, using again 7.1.3.6 and the exactness of χ^*, we get that $\chi^*(P^{(\bullet)\bullet})$ is a K-flat complex of $K(D^{(\bullet)})$ together with a quasi-isomorphism $\chi^* P^{(\bullet)\bullet} \to \chi^* E^{(\bullet)\bullet}$ of $K(D^{(\bullet)})$. This yields the functorial in χ and $E^{(\bullet)\bullet}$ isomorphism in $D(\mathcal{D}^{(\bullet)})$:

$$\chi^* \circ \mathbb{L}\underset{\rightarrow I}{f}^*(E^{(\bullet)\bullet}) \xleftarrow{\sim} \chi^* \circ \underset{\rightarrow I}{f}^*(P^{(\bullet)\bullet}) \xrightarrow{\sim} \underset{\rightarrow I}{f}^* \circ \chi^*(P^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{L}\underset{\rightarrow I}{f}^* \circ \chi^*(E^{(\bullet)\bullet}). \tag{8.4.1.16.4}$$

Let $\lambda \in L(I)$. Let $E^{(\bullet)\bullet} \in D(D^{(\bullet)})$. Let $\mathcal{E}^{(\bullet)\bullet} \in D(\mathcal{D}^{(\bullet)})$. Similarly, we get the isomorphisms:

$$\lambda^* \circ \mathbb{R}\underset{\rightarrow I*}{f}(\mathcal{E}^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{R}\underset{\rightarrow I*}{f} \circ \lambda^*(\mathcal{E}^{(\bullet)\bullet}), \qquad \lambda^* \circ \mathbb{L}\underset{\rightarrow I}{f}^*(E^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{L}\underset{\rightarrow I}{f}^* \circ \lambda^*(E^{(\bullet)\bullet}) \tag{8.4.1.16.5}$$

It follows from 8.4.1.16.3, 8.4.1.16.4, 8.4.1.16.5, that we get the factorisations:

$$\mathbb{L}\underset{\rightarrow I*}{f}\colon \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}_{\mathbb{Q}}(D^{(\bullet)}), \qquad \mathbb{L}\underset{\rightarrow I}{f}^*\colon \underrightarrow{LD}_{\mathbb{Q}}(D^{(\bullet)}) \to \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \tag{8.4.1.16.6}$$

Corollary 8.4.1.17. *Suppose X is the topological space associated to a noetherien affine $\mathcal{V}$-formal scheme $\mathfrak{X}$. Suppose that either I is filtered and has a smallest element or I is strictly filtered. Put $\mathcal{D}^{\dagger} := \varinjlim_{i\in I} \mathcal{D}^{(i)}$, $D^{(i)} := \Gamma(\mathfrak{X}, \mathcal{D}^{(i)})$, $D^{\dagger} := \Gamma(\mathfrak{X}, \mathcal{D}^{\dagger})$. Suppose moreover the following conditions holds*

(i) The sheaves of rings $\mathcal{D}^{(i)}$ on $\mathfrak{X}$ are equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}^{(i)}$ satisfying the conditions of 7.2.3 (for the p-adic topology) for any $i \in I$;

(ii) The transition maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any elements $i \le j$ of I;

(iii) There exists an integer d such that, for any elements $i \le j$ of I, the ring $\mathcal{D}^{(j)}$ is of tor-dimension $\le d$ on $\mathcal{D}^{(i)}$;

(iv) For any $i \in I$, for any coherent $\mathcal{D}^{(i)}_{\mathbb{Q}}$-module $\mathcal{E}$, there exists a coherent $\mathcal{D}^{(i)}$-module $\mathcal{E}'$ together with an isomorphism $\mathcal{E}'_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ of $\mathcal{D}^{(i)}_{\mathbb{Q}}$-modules.

With notation 8.4.1.16, the functors $\underset{\rightarrow I}{f}^{*} = \mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathbb{Q}}} -$ and $\mathbb{R}\underset{\rightarrow I*}{f} = \mathbb{R}\Gamma(\mathfrak{X}^{(\bullet)}, -)$ of 8.4.1.16.6 induce quasi-inverse equivalence between the categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(D^{(\bullet)})$. We have moreover the commutative (up to canonical isomorphism) diagram of categories

$$\begin{array}{ccc}
\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) & \xrightarrow[8.4.1.15]{\underset{\rightarrow}{l}^{*}_{\mathbb{Q}}} & D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathbb{Q}}) \\
{\scriptstyle \mathcal{D}^{(\bullet)}\otimes_{D^{(\bullet)}}-}\uparrow\ \downarrow{\scriptstyle \mathbb{R}\Gamma(\mathfrak{X}^{(\bullet)},-)} & & {\scriptstyle \mathcal{D}^{\dagger}_{\mathbb{Q}}\otimes_{D^{\dagger}_{\mathbb{Q}}}-}\uparrow\ \downarrow{\scriptstyle \mathbb{R}\Gamma(\mathfrak{X},-)} \\
\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(D^{(\bullet)}) & \xrightarrow[8.4.1.15]{\underset{\rightarrow}{l}^{*}_{\mathbb{Q}}} & D^{\mathrm{b}}_{\mathrm{coh}}(D^{\dagger}_{\mathbb{Q}})
\end{array} \tag{8.4.1.17.1}$$

whose functors are all equivalence of categories.

Proof. With our hypotheses, the functor $\underset{\rightarrow I}{f}^{*} = \mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathbb{Q}}} -$ is exact, which justifies the notation. Let $E^{(\bullet)} \in D(D^{(\bullet)})$, $\mathcal{E}^{(\bullet)} \in D(\mathcal{D}^{(\bullet)})$. Since the functors $\mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathbb{Q}}} -$ and $\Gamma(\mathfrak{X}, -)$ commute with filtrant inductive limites and with the functor $- \otimes_{\mathbb{Z}} \mathbb{Q}$, we get the following first (resp. second) isomorphism of $D(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ (resp. $D(D^{\dagger}_{\mathbb{Q}})$):

$$\underset{\rightarrow}{l}^{*}_{\mathbb{Q}}(\mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathbb{Q}}} (E^{(\bullet)})) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathbb{Q}}} \underset{\rightarrow}{l}^{*}_{\mathbb{Q}}(E^{(\bullet)}), \qquad \underset{\rightarrow}{l}^{*}_{\mathbb{Q}}(\Gamma(\mathfrak{X}, \mathcal{E}^{(\bullet)})) \xrightarrow{\sim} \Gamma(\mathfrak{X}, \underset{\rightarrow}{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})).$$

With our hypotheses, the functors $\mathbb{R}\Gamma(\mathfrak{X}, -)$ and $\mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathbb{Q}}} -$ (the left part of the diagram 8.4.1.17.1) are quasi-inverse equivalence between $D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}D^{\dagger}_{\mathbb{Q}})$ and $D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathbb{Q}})$ (see Theorem 8.4.1.14). Following 8.4.1.15, both horizontal functors of the diagram 8.4.1.17.1 are equivalence of categories. Hence, we are done. □

Example 8.4.1.18. Both above theorems and corollary will essentially be useful in the case of differential operators with overconvergent singularities (see later 8.7.5.4) or also in the case of the sheaf of functions with overconvergent singularities (see 8.7.4.6).

8.4.2 Coherent modules up to ind-isogeny on formal scheme

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. We suppose $p\mathcal{O}_{\mathfrak{X}} \subset \mathcal{I}$. Let I be a partially ordered set. Let $\mathcal{D}^{(\bullet)} = (\mathcal{D}^{(i)}, \alpha^{(j,i)}_{\mathcal{D}})$ be a sheaf of rings on the topos $\mathfrak{X}^{(I)}$. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$. For any $i \in I$, we suppose $\mathcal{D}^{(i)}$ is a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}^{(i)}$ satisfying the conditions of 7.2.3. Recall following 7.2.3.3, $\mathcal{D}^{(i)}$ is left coherent.

Lemma 8.4.2.1. *Assume I has a smallest element i_0. Then we have the following properties.*

1. *The functors $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} -$ and $\mathcal{E}^{(\bullet)} \mapsto \mathcal{E}^{(i_0)}$ induce quasi-inverse equivalences between the category of coherent $\mathcal{D}^{(i_0)}$-modules (resp. of $\mathcal{D}^{(i_0)}$-modules of global finite presentation) and that of $\mathcal{D}^{(\bullet)}$-modules of finite presentation (resp. of $\mathcal{D}^{(\bullet)}$-modules of global finite presentation).*

2. *Let $\mathcal{E}^{(\bullet)}$ be a $\mathcal{D}^{(\bullet)}$-module. The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is of finite presentation if and only if there exists an open covering $(\mathfrak{X}_\alpha)_{\alpha\in A}$ of $\mathfrak{X}$ such that, for any $\alpha \in A$, we have an exact sequence in $M(\mathcal{D}^{(\bullet)})$ of the form:*
$$\left(\mathcal{D}^{(\bullet)}|_{\mathfrak{X}_\alpha}\right)^{r_\alpha} \to \left(\mathcal{D}^{(\bullet)}|_{\mathfrak{X}_\alpha}\right)^{s_\alpha} \to \mathcal{E}^{(\bullet)}|_{\mathfrak{X}_\alpha} \to 0,$$
where $r_\alpha, s_\alpha \in \mathbb{N}$.

Proof. The respective first statement is obvious (see 7.1.3.7). Since $\mathcal{D}^{(i_0)}$ is coherent , the non-respective first statement follows from 7.1.3.8. This yields the second one. □

Remark 8.4.2.2. Assume I has a smallest element i_0. We complete Lemma 8.4.2.1 with the following facts.

(a) Since the extensions $\mathcal{D}^{(i)} \to \mathcal{D}^{(j)}$ are not flat, the category of $\mathcal{D}^{(\bullet)}$-modules of finite presentation is not stable under kernel.

(b) If $\mathfrak{X}$ is affine, following the theorem of type A, the notions of coherent $\mathcal{D}^{(i_0)}$-modules and of $\mathcal{D}^{(i_0)}$-modules having a global finite presentation are then equal. Following 8.4.2.1, this yields that the notions of $\mathcal{D}^{(\bullet)}$-modules of finite presentation and of $\mathcal{D}^{(\bullet)}$-modules having a global finite presentation are then equal. Moreover, the functor $\mathcal{D}^{(\bullet)} \otimes_{\Gamma(\mathfrak{X},\mathcal{D}^{(i_0)})} -$ from the category of $\Gamma(\mathfrak{X}, \mathcal{D}^{(i_0)})$-modules of finite type into that of $\mathcal{D}^{(\bullet)}$-modules of finite presentation is an equivalence of categories such that a quasi-inverse functor is given by $\mathcal{G}^{(\bullet)} \mapsto \Gamma(\mathfrak{X}, \mathcal{G}^{(i_0)})$.

Lemma 8.4.2.3. *Assume I has a smallest element i_0. Let $\mathcal{E}^{(\bullet)}$ be a $\mathcal{D}^{(\bullet)}$-module. The following conditions are equivalent.*

(a) The module $\mathcal{E}^{(\bullet)}$ is isomorphic in $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ to a $\mathcal{D}^{(\bullet)}$-module of finite presentation ;

(b) The module $\mathcal{E}^{(i_0)}$ is isogenic to a coherent $\mathcal{D}^{(i_0)}$-module and the canonical morphism $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \to \mathcal{E}^{(\bullet)}$ is an ind-isogeny of $M(\mathcal{D}^{(\bullet)})$ (see notation 8.1.1.4).

Proof. i) Let $\mathcal{F}^{(i_0)}$ be a $\mathcal{D}^{(i_0)}$-module, $f^{(i_0)} : \mathcal{E}^{(i_0)} \to \mathcal{F}^{(i_0)}$ and $g^{(i_0)} : \mathcal{F}^{(i_0)} \to \mathcal{E}^{(i_0)}$ be two $\mathcal{D}^{(i_0)}$-linear morphisms such that $f^{(i_0)} \circ g^{(i_0)}$ and $g^{(i_0)} \circ f^{(i_0)}$ are the multiplications by p^n for some integer $n \geq 0$. We get by extension the morphisms $f^{(\bullet)} : \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \to \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)}$ and $g^{(\bullet)} : \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)} \to \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)}$. Taking $\chi \in M(I)$ equal to the constant fonction with value n, by composing $g^{(\bullet)}$ with the canonical morphism $id \to \chi^*$, we get the arrow $h^{(\bullet)} : \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)} \to \chi^*(\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)})$. This yields that $\chi^*(f^{(\bullet)}) \circ h^{(\bullet)} = \theta_\chi$ and $h^{(\bullet)} \circ f^{(\bullet)} = \theta_\chi$ are the canonical morphisms, i.e. $f^{(\bullet)}$ is an ind-isogeny.

ii) When $\mathcal{F}^{(i_0)}$ is a coherent $\mathcal{D}^{(i_0)}$-module, $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)}$ is a $\mathcal{D}^{(\bullet)}$-module of finite presentation (see 8.4.2.1). This yields the implication $(b) \Rightarrow (a)$.

iii) Let us prove $(a) \Rightarrow (b)$. Suppose the condition (a) is satisfied, i.e. assume that $\mathcal{E}^{(\bullet)}$ is isomorphic in $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ to a $\mathcal{D}^{(\bullet)}$-module $\mathcal{F}^{(\bullet)}$ of finite presentation. In this case, there exists $\chi \in M(I)$ and an ind-isogeny of $M(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$. This yields an isogeny $\mathcal{E}^{(i_0)} \to \mathcal{F}^{(i_0)}$. Hence, the induced map by extension $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \to \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)}$ is an ind-isogeny (see part i) of the proof). Following 8.4.2.1, $\mathcal{F}^{(i_0)}$ is a coherent $\mathcal{D}^{(i_0)}$-module and the canonical morphism $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)} \to \mathcal{F}^{(\bullet)}$ is an isomorphism. This yields the ind-isogeny of $M(\mathcal{D}^{(\bullet)})$:
$$\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \to \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{F}^{(i_0)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}.$$
Since this composition is equal to the composition $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \to \mathcal{E}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$, since $\mathcal{E}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$ is an ind-isogeny this implies that so is $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \to \mathcal{E}^{(\bullet)}$.

□

Definition 8.4.2.4. Let $\mathcal{E}^{(\bullet)}$ be a left (resp. right) $\mathcal{D}^{(\bullet)}$-module.

(a) The module $\mathcal{E}^{(\bullet)}$ is "generated by finitely many global sections up to an ind-isogeny" if there exists a surjective morphism in $\underrightarrow{M}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)})$ of the form
$$(\mathcal{D}^{(\bullet)})^N \to \mathcal{E}^{(\bullet)},$$
for some positive integer N.

(b) The module $\mathcal{E}^{(\bullet)}$ has "a global presentation up to an ind-isogeny" (resp. "a global finite presentation up to an ind-isogeny", resp. is "free up to an ind-isogeny", resp. is "finite free up to an ind-isogeny") if there exists an exact sequence in $\underrightarrow{M}_{\mathbb{Q}}({}^{*}\mathcal{D}^{(\bullet)})$ of the form

$$\oplus_{i\in I}\mathcal{D}^{(\bullet)} \to \oplus_{j\in J}\mathcal{D}^{(\bullet)} \to \mathcal{E}^{(\bullet)} \to 0,$$

for some sets I and J (resp. some finite sets I and J, resp. I is the empty set and J is a set resp. I is the empty set and J is a finite set).

(c) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is of finite type up to an ind-isogeny (resp. has local presentation up to an ind-isogeny, resp. is of finite presentation up to an ind-isogeny, resp. is locally free up to an ind-isogeny, resp. is locally finite free up to an ind-isogeny) if for any object $(i,\mathfrak{U}) \in I^{\natural} \times \mathfrak{X}_{Zar}$, there exists a covering $\{(i,\mathfrak{U}_{\alpha}) \to (i,\mathfrak{U})\}_{\alpha\in A}$ such that for any $\alpha \in A$ the object $\mathcal{E}^{(\bullet)}|_{(i,\mathfrak{U}_{\alpha})}$ of $\underrightarrow{M}_{\mathbb{Q}}({}^{*}\mathcal{D}^{(\bullet)}|_{(i,\mathfrak{U}_{\alpha})})$ is generated by finitely many global sections (resp. has global presentation, resp. has global finite presentation, resp. is free, resp. is finite free) up to an ind-isogeny.

(d) The module $\mathcal{E}^{(\bullet)}$ is a " coherent up to an ind-isogeny $\mathcal{D}^{(\bullet)}$-module" if it is of finite type up to an ind-isogeny and if for any $i \in I$ and for any open set $\mathfrak{U}$ of $\mathfrak{X}$, for any homomorphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,\mathfrak{U})})$ of the form $u^{(\bullet)} \colon \left(\mathcal{D}^{(\bullet)}|_{(i,\mathfrak{U})}\right)^{r} \to \mathcal{E}^{(\bullet)}|_{(i,\mathfrak{U})}$, the kernel of $u^{(\bullet)}$ is of finite type up to an ind-isogeny.

Lemma 8.4.2.5. *Assume I has a smallest element i_0. Let $\mathcal{E}^{(\bullet)}$ a $\mathcal{D}^{(\bullet)}$-module. Then the following properties are equivalent.*

(a) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ has a global finite presentation up to an ind-isogeny.

(b) There exists a $\mathcal{D}^{(\bullet)}$-module $\mathcal{F}^{(\bullet)}$ having a global finite presentation together with an isomorphism in $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$.

(c) The module $\mathcal{E}^{(i_0)}$ is isogenic to a $\mathcal{D}^{(i_0)}$-module having a global finite presentation and the canonical morphism $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)} \to \mathcal{E}^{(\bullet)}$ is an ind-isogeny of $M(\mathcal{D}^{(\bullet)})$ (see notation 8.1.1.4).

Proof. To check the equivalence between (b) and (c), it is sufficient to copy the proof of 8.4.2.3. The implication $(b) \Rightarrow (a)$ is trivial. Conversely, let us prove $(a) \Rightarrow (b)$. Let's assume that $\mathcal{E}^{(\bullet)}$ is the cokernel in $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of a arrow of the form $f^{(\bullet)} \colon \left(\mathcal{D}^{(\bullet)}\right)^{r} \to \left(\mathcal{D}^{(\bullet)}\right)^{s}$. Let $\chi \in M(I)$ and $\phi^{(\bullet)} \colon \left(\mathcal{D}^{(\bullet)}\right)^{r} \to \chi^{*}\left(\mathcal{D}^{(\bullet)}\right)^{s}$ be a morphism of $M(\mathcal{D}^{(\bullet)})$ representing $f^{(\bullet)}$. Put $\chi' \in M(I)$ such that for any $i \in I$, $\chi'(i) := \chi(i) - \chi(i_0)$. Hence, we get the commutative diagram

$$\begin{array}{ccccccc}
\left(\mathcal{D}^{(i_0)}\right)^{r} & \xrightarrow{\phi^{(i_0)}} & \left(\mathcal{D}^{(i_0)}\right)^{s} & \longrightarrow & \mathrm{Coker}\ \phi^{(i_0)} & \longrightarrow & 0 \\
\downarrow \alpha_{\mathcal{D}}^{(i,i_0)} & & \downarrow p^{\chi'(i)}\alpha_{\mathcal{D}}^{(i,i_0)} & & \vdots\downarrow & & \\
\left(\mathcal{D}^{(i)}\right)^{r} & \xrightarrow{\phi^{(i)}} & \left(\mathcal{D}^{(i)}\right)^{s} & \longrightarrow & \mathrm{Coker}\ \phi^{(i)} & \longrightarrow & 0
\end{array}$$

whose horizontal sequences are exact. This yields by extension the commutative diagram of $M(\mathcal{D}^{(\bullet)})$

$$\begin{array}{ccccccc}
\left(\mathcal{D}^{(\bullet)}\right)^{r} & \xrightarrow{\mathcal{D}^{(\bullet)}\otimes\phi^{(i_0)}} & \left(\mathcal{D}^{(\bullet)}\right)^{s} & \longrightarrow & \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathrm{Coker}\ \phi^{(i_0)} & \longrightarrow & 0 \\
\downarrow id & & \downarrow \theta_{\chi'} & & \downarrow & & \\
\left(\mathcal{D}^{(\bullet)}\right)^{r} & \xrightarrow{\phi^{(\bullet)}} & \chi'^{*}\left(\mathcal{D}^{(\bullet)}\right)^{s} & \longrightarrow & \mathrm{Coker}\ \phi^{(\bullet)} & \longrightarrow & 0
\end{array} \tag{8.4.2.5.1}$$

whose horizontal sequences are exact. By using the five lemma applied to the diagram 8.4.2.5.1 of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, since both left vertical morphisms of 8.4.2.5.1 are isomorphisms of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then so is $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathrm{Coker}\ \phi^{(i_0)} \to \mathrm{Coker}\ \phi^{(\bullet)}$. Since $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathrm{Coker}\ \phi^{(i_0)}$ is a $\mathcal{D}^{(\bullet)}$-module having a global finite presentation, this implies the required result. □

Lemma 8.4.2.6. *Assume I has a smallest element i_0. Let $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ be two $\mathcal{D}^{(\bullet)}$-modules having a global finite presentation up to an ind-isogeny. Let $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Then* $\mathrm{Coker}\, f^{(\bullet)}$ *has a global finite presentation up to an ind-isogeny.*

Proof. By using 8.4.2.5, we can suppose that $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ are two $\mathcal{D}^{(\bullet)}$-modules having a global finite presentation. Let $\chi \in M(I)$ and $\phi^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi^*\mathcal{F}^{(\bullet)}$ be a morphism of $M(\mathcal{D}^{(\bullet)})$ representing $f^{(\bullet)}$. By copying the proof of the implication $(a) \Rightarrow (b)$ of 8.4.2.5, we can check that $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathrm{Coker}\ \phi^{(i_0)} \to \mathrm{Coker}\ \phi^{(\bullet)}$ is an ind-isogeny. Since $\mathcal{D}^{(i_0)}$ is coherent, then $\mathrm{Coker}\ \phi^{(i_0)}$ is a coherent $\mathcal{D}^{(i_0)}$-module. Hence, we conclude by using again 8.4.2.5; □

Remark 8.4.2.7. Suppose I is a countable well ordered set. For any map $\alpha\colon I \to \mathbb{N}$ there exists $\chi \in M(I)$ such that $\alpha(i) \le \chi(i)$ for any $i \in I$.

Lemma 8.4.2.8. *Suppose I is a countable well ordered set and $\mathfrak{X}$ is noetherian. Let $f^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $M(\mathcal{D}^{(\bullet)})$ such that, for any $i \in I$, the $\mathcal{D}^{(i)}$-modules $\mathcal{E}^{(i)}$ and $\mathcal{F}^{(i)}$ are coherent. The following properties are equivalent.*

(a) The morphism $f^{(\bullet)}$ is an ind-isogeny of $M(\mathcal{D}^{(\bullet)})$;

(b) The morphism $f^{(\bullet)}_{\mathbb{Q}}\colon \mathcal{E}^{(\bullet)}_{\mathbb{Q}} \to \mathcal{F}^{(\bullet)}_{\mathbb{Q}}$ induced by tensorisation with $\mathbb{Q}$ is an isomorphism of $\mathcal{D}^{(\bullet)}_{\mathbb{Q}}$-modules.

Proof. 0) Since the canonical morphisms of the form $\mathcal{E}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ with $\chi \in M(I)$ becomes isomorphisms after applying the functor $\mathbb{Q} \otimes_{\mathbb{Z}} -$, the implication $(a) \Rightarrow (b)$ is obvious. Conversely let's assume that $f^{(\bullet)}_{\mathbb{Q}}$ is an isomorphism.

1) Following 7.4.5.1, if we denote by $\mathcal{E}^{(i)}_t$ the subsheaf of p-torsion sections of $\mathcal{E}^{(i)}$, then $\mathcal{E}^{(i)}_t$ is a coherent sub-$\mathcal{D}^{(i)}$-module of $\mathcal{E}^{(i)}$. Denote by $\alpha\colon \mathcal{E}^{(\bullet)} \to \mathcal{E}^{(\bullet)}/\mathcal{E}^{(\bullet)}_t$ the canonical projection. Let us check that this is an ind-isogeny of $M(\mathcal{D}^{(\bullet)})$. Since $\mathfrak{X}$ is noetherian, then there exists $\chi \in M(I)$ such that $p^{\chi(i)}\mathcal{E}^{(i)}_t = 0$ for any $i \in I$ (see the proof of 7.4.5.1 and use also the remark 8.4.2.7). Hence the map $p^{\chi(i)}\colon \mathcal{E}^{(i)} \to \mathcal{E}^{(i)}$ factors uniquely through $\beta^{(i)}\colon \mathcal{E}^{(i)}/\mathcal{E}^{(i)}_t \to \mathcal{E}^{(i)}$. This yields that the canonical map $\theta_{\mathcal{E},\chi}\colon \mathcal{E}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ factors through $\beta^{(\bullet)}\colon \mathcal{E}^{(\bullet)}/\mathcal{E}^{(\bullet)}_t \to \chi^*\mathcal{E}^{(\bullet)}$ So, the morphism $\beta^{(\bullet)}\colon \mathcal{E}^{(\bullet)}/\mathcal{E}^{(\bullet)}_t \to \chi^*\mathcal{E}^{(\bullet)}$of $M(\mathcal{D}^{(\bullet)})$ is such that $\beta^{(\bullet)} \circ \alpha^{(\bullet)}$ and $\chi^*(\alpha^{(\bullet)}) \circ \beta^{(\bullet)}$ are the canonical morphisms.

2) By using the step 1), we reduce to check that the canonical morphism $\mathcal{E}^{(\bullet)}/\mathcal{E}^{(\bullet)}_t \to \mathcal{F}^{(\bullet)}/\mathcal{F}^{(\bullet)}_t$ induced by $f^{(\bullet)}$ is an ind-isogeny, i.e. we can suppose that, for any $i \in I$, $\mathcal{E}^{(i)}$ and $\mathcal{F}^{(i)}$ are p-torsion free. For any $\chi \in M(I)$, let us denote by $h^{(\bullet)}_{\chi} := \theta_{\mathcal{E}_{\mathbb{Q}},\chi} \circ (f^{(\bullet)}_{\mathbb{Q}})^{-1}\colon \mathcal{F}^{(\bullet)}_{\mathbb{Q}} \to \chi^*\mathcal{E}^{(\bullet)}_{\mathbb{Q}}$, the morphism of $\mathcal{D}^{(\bullet)}_{\mathbb{Q}}$-modules. We can suppose that $\chi \in M(I)$ is large enough so that for any $i \in I$ the canonical isomorphism $h^{(i)}_{\chi} = p^{\chi(i)}(f^{(i)}_{\mathbb{Q}})^{-1}\colon \mathcal{F}^{(i)}_{\mathbb{Q}} \to \mathcal{E}^{(i)}_{\mathbb{Q}}$ factors uniquely through a morphism of the form $g^{(i)}\colon \mathcal{F}^{(i)} \to \mathcal{E}^{(i)}$ (use again the remark 8.4.2.7). Since $\chi^*\mathcal{E}^{(\bullet)} \subset \chi^*\mathcal{E}^{(\bullet)}_{\mathbb{Q}}$ and $\chi^*\mathcal{F}^{(\bullet)} \subset \chi^*\mathcal{F}^{(\bullet)}_{\mathbb{Q}}$, we compute in fact that the morphism $h^{(\bullet)}_{\chi}$ induces the morphism $g^{(\bullet)}\colon \mathcal{F}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ (i.e., the $g^{(i)}$ commute with transition morphisms) and satisfies the equalities $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$. □

Since this is almost straightforward, let us give the following corollary of the above lemma which will be useful later:

Corollary 8.4.2.9. *Suppose I is a countable well ordered set and $\mathfrak{X}$ is noetherian. Let $f\colon \mathcal{E}^{(\bullet)\bullet} \to \mathcal{F}^{(\bullet)\bullet}$ be a morphism of $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$ such that, for any $i \in I$, the complexes $\mathcal{E}^{(i)\bullet}$ and $\mathcal{F}^{(i)\bullet}$ are objects of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(i)})$. The following properties are equivalent.*

(a) The morphism f is an isomorphism of $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$;

(b) The induced morphism $f_{\mathbb{Q}}\colon \mathcal{E}^{(\bullet)\bullet}_{\mathbb{Q}} \to \mathcal{F}^{(\bullet)\bullet}_{\mathbb{Q}}$ is an isomorphism of $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)}_{\mathbb{Q}})$.

Proof. The implication $(a) \Rightarrow (b)$ is obvious. Conversely let's assume that $f_{\mathbb{Q}}$ is an isomorphism. Let $\mathcal{G}^{(\bullet)}$ be a cone of f. It follows from 8.1.5.11 that we reduce to check that for any $n \in \mathbb{N}$ we have the isomorphism $\mathcal{H}^n\mathcal{G}^{(\bullet)} \xrightarrow{\sim} 0$ in $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, i.e. the canonical map $\mathcal{H}^n\mathcal{G}^{(\bullet)} \to 0$ is an ind-isogeny. By hypothesis, since $\mathcal{G}^{(\bullet)}_{\mathbb{Q}} \xrightarrow{\sim} 0$ in $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)}_{\mathbb{Q}})$ then $\mathcal{H}^n\mathcal{G}^{(\bullet)}_{\mathbb{Q}} \xrightarrow{\sim} 0$ in $M(\mathcal{D}^{(\bullet)}_{\mathbb{Q}})$. Hence, we conclude by using 8.4.2.8 to the canonical map $\mathcal{H}^n\mathcal{G}^{(\bullet)} \to 0$. □

Definition 8.4.2.10. We say that I is locally countably well ordered if $I_{\ge i}$ is countable and well ordered for any $i \in I$.

Lemma 8.4.2.11. *Assume I is locally countably well ordered (see 8.4.2.10) and that the maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any $i \leq j$ elements of I. Let $\mathcal{E}^{(\bullet)}$ a $\mathcal{D}^{(\bullet)}$-module. Then the following properties are equivalent.*

(a) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is of finite presentation up to an ind-isogeny ;

(b) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is coherent up to an ind-isogeny.

In particular, the sheaf of rings $\mathcal{D}^{(\bullet)}$ is therefore coherent up to an ind-isogeny $\mathcal{D}^{(\bullet)}$-module.

Proof. The implication $(b) \Rightarrow (a)$ is obvious. Conversely, suppose $\mathcal{E}^{(\bullet)}$ is of finite presentation up to an ind-isogeny. Since both properties (a) and (b) are local on $\mathfrak{X}^{(\bullet)}$ (see definition 8.3.3.1) and stable by isomorphism in $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, via the lemma 8.4.2.1 and the equivalence between (a) and (b) of 8.4.2.5, we can suppose I is countably well ordered with smallest element i_0, $\mathcal{E}^{(i_0)}$ is a $\mathcal{D}^{(i_0)}$-module having a global finite presentation and $\mathcal{E}^{(\bullet)} = \mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)}$. Let $f^{(\bullet)} \colon \left(\mathcal{D}^{(\bullet)}\right)^r \to \mathcal{E}^{(\bullet)}$ be a morphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. It is a question of checking that $\ker f^{(\bullet)}$ is of finite type up to an ind-isogeny. Let $\chi \in M(I)$ such that there exists $a^{(\bullet)} \colon \left(\mathcal{D}^{(\bullet)}\right)^r \to \chi^* \mathcal{E}^{(\bullet)}$ a morphism of $M(\mathcal{D}^{(\bullet)})$ representing $f^{(\bullet)}$. Since $\mathcal{D}^{(i)}$ is a coherent ring, since the extensions $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat, then it follows from the lemma 8.4.2.8 that the canonical morphism $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \ker a^{(i_0)} \to \ker a^{(\bullet)}$ is an ind-isogeny of $M(\mathcal{D}^{(\bullet)})$. Hence we are done. □

Remark 8.4.2.12. With the notations of the lemma 8.4.2.11, since the extensions $\mathcal{D}^{(i)} \to \mathcal{D}^{(j)}$ are not flat, it seems false that the sheaf of rings $\mathcal{D}^{(\bullet)}$ is coherent (as object of $M(\mathcal{D}^{(\bullet)})$).

Lemma 8.4.2.13. *If $\mathcal{P}^{(\bullet)}$ is a projective object of $M(\mathcal{D}^{(\bullet)})$, then $\mathcal{P}^{(\bullet)}$ is a projective object of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.*

Proof. Let $g^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be an epimorphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ and $f^{(\bullet)} \colon \mathcal{P}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ a morphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Choose $\chi \in M(I)$, $\phi^{(\bullet)} \colon \mathcal{P}^{(\bullet)} \to \chi^* \mathcal{F}^{(\bullet)}$ and $\psi^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \chi^* \mathcal{F}^{(\bullet)}$ some morphisms of $M(\mathcal{D}^{(\bullet)})$ representing respectively $f^{(\bullet)}$ and $g^{(\bullet)}$. Denote by $\mathcal{G}^{(\bullet)} := \chi^* \mathcal{F}^{(\bullet)}$, $\mathcal{H}^{(\bullet)} := \operatorname{im} \psi^{(\bullet)}$ (computed in $M(\mathcal{D}^{(\bullet)})$), $\varpi^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{H}^{(\bullet)}$ the canonical epimorphism and by $\alpha^{(\bullet)} \colon \mathcal{H}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ the canonical monomorphism (both are morphisms of $M(\mathcal{D}^{(\bullet)})$). Since $g^{(\bullet)}$ is an epimorphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then $\alpha^{(\bullet)}$ is an ind-isogeny, i.e. there exists $\chi_1 \in M(I)$ and a morphism $\beta^{(\bullet)} \colon \mathcal{G}^{(\bullet)} \to \chi_1^* \mathcal{H}^{(\bullet)}$ such that $\beta^{(\bullet)} \circ \alpha^{(\bullet)} = \theta_{\mathcal{H},\chi_1}$ and $\chi_1^*(\alpha^{(\bullet)}) \circ \beta^{(\bullet)} = \theta_{\mathcal{G},\chi_1}$. Since $\mathcal{P}^{(\bullet)}$ is a projective object of $M(\mathcal{D}^{(\bullet)})$, since $\chi_1^*(\varpi^{(\bullet)})$ is an epimorphism of $M(\mathcal{D}^{(\bullet)})$, then there exists a morphism $\vartheta^{(\bullet)} \colon \mathcal{P}^{(\bullet)} \to \chi_1^* \mathcal{E}^{(\bullet)}$ of $M(\mathcal{D}^{(\bullet)})$ such that $\chi_1^*(\varpi^{(\bullet)}) \circ \vartheta^{(\bullet)} = \beta^{(\bullet)} \circ \phi^{(\bullet)}$. We notice moreover that $\chi_1^*(\psi^{(\bullet)}) \circ \vartheta^{(\bullet)} = \theta_{\mathcal{G},\chi_1} \circ \phi^{(\bullet)}$. We get the morphism $h^{(\bullet)} := (\theta_{\mathcal{E},\chi_1})^{-1} \circ \vartheta^{(\bullet)} \colon \mathcal{P}^{(\bullet)} \to \mathcal{E}^{(\bullet)}$ of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We have $g^{(\bullet)} \circ h^{(\bullet)} = f^{(\bullet)}$. □

Remark 8.4.2.14. It is not clear that if $\mathcal{I}^{(\bullet)}$ is an injective object of $M(\mathcal{D}^{(\bullet)})$, then $\mathcal{I}^{(\bullet)}$ is an injective object of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

Notation 8.4.2.15. Denote by $\underrightarrow{M}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ the full subcategory of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ consisting of coherent $\mathcal{D}^{(\bullet)}$-modules up to an ind-isogeny. Likewise, when $\mathfrak{X}$ is affine, taking all the above arguments into this context, we define similarly the full subcategory $\underrightarrow{M}_{\mathbb{Q},\mathrm{coh}}(D^{(\bullet)})$ of $\underrightarrow{M}_{\mathbb{Q}}(D^{(\bullet)})$ consisting of coherent $D^{(\bullet)}$-modules up to an ind-isogeny, where $D^{(\bullet)} := \Gamma(\mathfrak{X}, \mathcal{D}^{(\bullet)})$.

Proposition 8.4.2.16. Assume I is locally countably well ordered (see 8.4.2.10) and that the maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any $i \leq j$ elements of I. The full subcategory $\underrightarrow{M}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is stable by isomorphism, kernel, cokernel, extension.

Proof. The coherence up to ind-isogeny being a local property on $\mathfrak{X}^{(\bullet)}$ we can suppose that I is countably well ordered. The stability of the coherence up to ind-isogeny by isomorphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is trivial. Let us check now the stability by kernel and cokernel. Let $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{M}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. By localness on $\mathfrak{X}^{(\bullet)}$, we can suppose $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ are two $\mathcal{D}^{(\bullet)}$-modules having a global finite presentation up to ind-isogeny. By using 8.4.2.5, we reduce to the case where $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ are two $\mathcal{D}^{(\bullet)}$-modules having a global finite presentation. From 8.4.2.6 and 8.4.2.11, we get the stability under cokernels. It remains the stability under kernels. Let $\chi \in M(I)$ and $\phi^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \chi^* \mathcal{F}^{(\bullet)}$ be a morphism of $M(\mathcal{D}^{(\bullet)})$ representing $f^{(\bullet)}$. We get the composite morphism $\psi^{(\bullet)} \colon \mathcal{E}^{(\bullet)}_{\mathbb{Q}} \xrightarrow{\phi^{(\bullet)} \otimes \mathrm{id}} (\chi^* \mathcal{F}^{(\bullet)})_{\mathbb{Q}} \xleftarrow{\sim} \mathcal{F}^{(\bullet)}_{\mathbb{Q}}$ of $M(\mathcal{D}^{(\bullet)}_{\mathbb{Q}})$.

Following 8.4.2.1, since $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ have global finite presentation, then $\psi^{(\bullet)} = \mathcal{D}^{(\bullet)}_{\mathbb{Q}} \otimes_{\mathcal{D}^{(i_0)}_{\mathbb{Q}}} \psi^{(i_0)}$. Since the extensions $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat, then $\operatorname{Ker} \psi^{(\bullet)} = \mathcal{D}^{(\bullet)}_{\mathbb{Q}} \otimes_{\mathcal{D}^{(i_0)}_{\mathbb{Q}}} \operatorname{Ker} \psi^{(i_0)}$. Moreover, since $\mathbb{Z} \to \mathbb{Q}$ is flat, we have $(\ker \phi^{(i_0)})_{\mathbb{Q}} = \ker \psi^{(i_0)}$ and $\ker \psi^{(\bullet)} = (\ker \phi^{(\bullet)})_{\mathbb{Q}}$. Since $\mathcal{D}^{(i)}$ is a coherent ring, then $\mathcal{D}^{(i)} \otimes_{\mathcal{D}^{(i_0)}} \ker \phi^{(i_0)}$ and $\ker \phi^{(i)}$ are coherent $\mathcal{D}^{(i)}$-modules for any $i \in I$. Hence, it follows from the lemma 8.4.2.8 that the canonical morphism $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(i_0)}} \ker \phi^{(i_0)} \to \ker \phi^{(\bullet)}$ is an ind-isogeny of $M(\mathcal{D}^{(\bullet)})$. We conclude by using 8.4.2.5.

Now let us treat the stability by extension. Let $0 \to \mathcal{E}^{(\bullet)} \underset{f^{(\bullet)}}{\longrightarrow} \mathcal{F}^{(\bullet)} \underset{g^{(\bullet)}}{\longrightarrow} \mathcal{G}^{(\bullet)} \to 0$ be an exact sequence in the category $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ with $\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet)} \in \underrightarrow{M}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Since the coherence of $\mathcal{F}^{(\bullet)}$ is local on $\mathfrak{X}^{(\bullet)}$, we can suppose there exists some epimorphisms in $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $a^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^r \to \mathcal{E}^{(\bullet)}$ and $b^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^s \to \mathcal{G}^{(\bullet)}$. Following 8.4.2.13, there exists $h^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^s \to \mathcal{F}^{(\bullet)}$ such that $g^{(\bullet)} \circ h^{(\bullet)} = b^{(\bullet)}$. This implies that $\left(\mathcal{D}^{(\bullet)}\right)^r \oplus \left(\mathcal{D}^{(\bullet)}\right)^s \to \mathcal{F}^{(\bullet)}$ defined by $f^{(\bullet)} \circ a^{(\bullet)} + h^{(\bullet)}$ is an epimorphism. We have therefore checked that $\mathcal{F}^{(\bullet)}$ is of finite type up to an ind-isogeny. Let $\alpha^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^t \to \mathcal{F}^{(\bullet)}$ a morphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. It remains to check that $\ker \alpha^{(\bullet)}$ is of finite type up to an ind-isogeny. Since $\mathcal{G}^{(\bullet)}$ is coherent up to an ind-isogeny, $\ker(g^{(\bullet)} \circ \alpha^{(\bullet)})$ is of finite type up to an ind-isogeny. Since what we have to check is local on $\mathfrak{X}^{(\bullet)}$, we can suppose there exists an epimorphism of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\beta^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^u \to \ker(g^{(\bullet)} \circ \alpha^{(\bullet)})$. Since $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is an abelian category, we have the canonical isomorphism $\alpha^{(\bullet)}(\ker(g^{(\bullet)} \circ \alpha^{(\bullet)})) \xrightarrow{\sim} \operatorname{im}(\alpha^{(\bullet)}) \cap \ker g^{(\bullet)}$. In particular, if we denote by $\delta^{(\bullet)}\colon \ker(g^{(\bullet)} \circ \alpha^{(\bullet)}) \to \mathcal{F}^{(\bullet)}$ the composition of $\alpha^{(\bullet)}$ with the monomorphism $\ker(g^{(\bullet)} \circ \alpha^{(\bullet)}) \subset \left(\mathcal{D}^{(\bullet)}\right)^t$, we get the canonical factorization $\epsilon^{(\bullet)}\colon \ker(g^{(\bullet)} \circ \alpha^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ of $\delta^{(\bullet)}$ by $f^{(\bullet)}$. Since $\mathcal{E}^{(\bullet)}$ is coherent up to an ind-isogeny, $\ker(\epsilon^{(\bullet)} \circ \beta^{(\bullet)})$ is of finite type up to an ind-isogeny. Since $f^{(\bullet)}$ is a monomorphism, this yields that $\ker(f^{(\bullet)} \circ \epsilon^{(\bullet)} \circ \beta^{(\bullet)})$ is of finite type up to an ind-isogeny. Since $f^{(\bullet)} \circ \epsilon^{(\bullet)} \circ \beta^{(\bullet)} = \delta^{(\bullet)} \circ \beta^{(\bullet)}$, then $\ker(\delta^{(\bullet)} \circ \beta^{(\bullet)})$ is of finite type up to an ind-isogeny. Moreover, we have the isomorphisms $\beta^{(\bullet)}(\ker(\delta^{(\bullet)} \circ \beta^{(\bullet)})) \xrightarrow{\sim} \operatorname{im}(\beta^{(\bullet)}) \cap \ker(\delta^{(\bullet)}) \xrightarrow{\sim} \ker(\delta^{(\bullet)}) = \ker(\alpha^{(\bullet)})$, which is therefore of finite type up to an ind-isogeny. □

8.4.3 Coherent modules up to lim-ind-isogeny on formal scheme

We keep notation and hypotheses of 8.4.2.

Definition 8.4.3.1 (Coherence up to lim-ind-isogeny)**.** Let $\mathcal{E}^{(\bullet)}$ be a left (resp. right) $\mathcal{D}^{(\bullet)}$-module.

(a) The module $\mathcal{E}^{(\bullet)}$ is "generated by finitely many global sections up to a lim-ind-isogeny " if there exists a surjective morphism in $\underrightarrow{LM}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)})$ of the form

$$(\mathcal{D}^{(\bullet)})^N \to \mathcal{E}^{(\bullet)},$$

for some positive integer N.

(b) The module $\mathcal{E}^{(\bullet)}$ has "a global presentation up to a lim-ind-isogeny " (resp. "a global finite presentation up to a lim-ind-isogeny ", resp. is "free up to a lim-ind-isogeny ", resp. is "finite free up to a lim-ind-isogeny ") if there exists an exact sequence in $\underrightarrow{LM}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)})$ of the form

$$\oplus_{i\in I}\mathcal{D}^{(\bullet)} \to \oplus_{j\in J}\mathcal{D}^{(\bullet)} \to \mathcal{E}^{(\bullet)} \to 0,$$

for some sets I and J (resp. some finite sets I and J, resp. I is the empty set and J is a set resp. I is the empty set and J is a finite set).

(c) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is of finite type up to a lim-ind-isogeny (resp. has local presentation up to a lim-ind-isogeny , resp. is of finite presentation up to a lim-ind-isogeny , resp. is locally free up to a lim-ind-isogeny , resp. is locally finite free up to a lim-ind-isogeny) if for any object $(i, \mathfrak{U}) \in I^{\natural} \times \mathfrak{X}_{Zar}$, there exists a covering $\{(i, \mathfrak{U}_\alpha) \to (i, \mathfrak{U})\}_{\alpha\in A}$ such that for any $\alpha \in A$ the object $\mathcal{E}^{(\bullet)}|_{(i,\mathfrak{U}_\alpha)}$ of $\underrightarrow{LM}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)}|_{(i,\mathfrak{U}_\alpha)})$ is generated by finitely many global sections (resp. has global presentation, resp. has global finite presentation, resp. is free, resp. is finite free) up to a lim-ind-isogeny .

(d) The module $\mathcal{E}^{(\bullet)}$ is a " coherent up to a lim-ind-isogeny $\mathcal{D}^{(\bullet)}$-module" if it is of finite type up to a lim-ind-isogeny and if for any $i \in I$ and for any open set $\mathfrak{U}$ of $\mathfrak{X}$, for any homomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,\mathfrak{U})})$ of the form $u^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}|_{(i,\mathfrak{U})}\right)^r \to \mathcal{E}^{(\bullet)}|_{(i,\mathfrak{U})}$, the kernel of $u^{(\bullet)}$ is of finite type up to a lim-ind-isogeny .

The following lemma will be improved via 8.4.5.10 with more hypotheses satisfied by $\mathcal{D}^{(\bullet)}$.

Lemma 8.4.3.2. *Assume I has a smallest element i_0. Let $\mathcal{E}^{(\bullet)}$ a $\mathcal{D}^{(\bullet)}$-module. Then the following properties are equivalent.*

(a) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ has a global finite presentation up to a lim-ind-isogeny.

(b) There exists $\lambda \in L(I)$ and a $\lambda^*\mathcal{D}^{(\bullet)}$-module $\mathcal{F}^{(\bullet)}$ having a global finite presentation such that $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ are isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

.

Proof. Since $(\mathcal{D}^{(\bullet)})^r \to (\lambda^*\mathcal{D}^{(\bullet)})^r$ is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then we get the implication $(b) \Rightarrow (a)$. Conversely, let us prove $(a) \Rightarrow (b)$. Let's assume that $\mathcal{E}^{(\bullet)}$ is the cokernel in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of a arrow of the form $f^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^r \to \left(\mathcal{D}^{(\bullet)}\right)^s$. Let $\chi \in M(I)$, $\lambda \in L(I)$ and $\phi^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^r \to \chi^*\left(\lambda^*\mathcal{D}^{(\bullet)}\right)^s$ be a morphism of $M(\mathcal{D}^{(\bullet)})$ representing $f^{(\bullet)}$. Since $\chi^*\left(\lambda^*\mathcal{D}^{(\bullet)}\right)^s$ is endowed with a canonical structure of $\lambda^*\mathcal{D}^{(\bullet)}$-module, this implies by adjointness (see 8.3.2.6) that the morphism $\phi^{(\bullet)}$ factors uniquely through a morphism of $M(\lambda^*\mathcal{D}^{(\bullet)})$ of the form $\psi^{(\bullet)}\colon \left(\lambda^*\mathcal{D}^{(\bullet)}\right)^r \to \chi^*\left(\lambda^*\mathcal{D}^{(\bullet)}\right)^s$. Let Coker $\psi^{(\bullet)}$ be the cokernel of $\psi^{(\bullet)}$ computed in $M(\lambda^*\mathcal{D}^{(\bullet)})$. From the proof $(a) \to (b)$ of the lemma 8.4.2.5 ("replace" $\mathcal{D}^{(\bullet)}$ by $\lambda^*\mathcal{D}^{(\bullet)}$), there exists a $\lambda^*\mathcal{D}^{(\bullet)}$-module $\mathcal{F}^{(\bullet)}$ having a global finite presentation together with an isomorphism in $\underrightarrow{M}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$ (and then in $\underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$) of the form $\mathcal{F}^{(\bullet)} \xrightarrow{\sim}$ Coker $\psi^{(\bullet)}$. Since Coker $\psi^{(\bullet)}$ is isomorphic to $\mathcal{E}^{(\bullet)}$ in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then we are done. □

Lemma 8.4.3.3. *Assume I is locally countably well ordered (see 8.4.2.10) and that the maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any $i \leq j$ elements of I. Let $\mathcal{E}^{(\bullet)}$ be a $\mathcal{D}^{(\bullet)}$-module. Then the following properties are equivalent.*

(a) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is of finite presentation up to a lim-ind-isogeny ;

(b) The $\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is coherent up to a lim-ind-isogeny.

In particular, the sheaf of rings $\mathcal{D}^{(\bullet)}$ is therefore a coherent up to a lim- ind-isogeny $\mathcal{D}^{(\bullet)}$-module.

Proof. The implication $(b) \Rightarrow (a)$ is trivial. Conversely, let us prove $(a) \Rightarrow (b)$. Let $\mathcal{E}^{(\bullet)}$ be a $\mathcal{D}^{(\bullet)}$-module of finite presentation up to lim-ind-isogeny. Since the coherence up to lim-ind-isogeny is local on $\mathfrak{X}^{(\bullet)}$, we can suppose I is countably well ordered and that $\mathcal{E}^{(\bullet)}$ is a $\mathcal{D}^{(\bullet)}$-module having a global finite presentation up to lim-ind-isogeny. Following 8.4.3.2, by stability under isomorphisms of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the property of coherence up to lim-ind-isogeny, we reduce to the case where $\mathcal{E}^{(\bullet)}$ is a $\lambda^*\mathcal{D}^{(\bullet)}$-module having a global finite presentation. Let $f^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^r \to \mathcal{E}^{(\bullet)}$ be morphism of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. It is a question of checking that $\ker f^{(\bullet)}$ is of finite type up to a lim-ind-isogeny. Let $\chi \in M(I)$, $\lambda \in L(I)$, $a^{(\bullet)}\colon \left(\mathcal{D}^{(\bullet)}\right)^r \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}$ be a morphism of $M(\mathcal{D}^{(\bullet)})$ representing $f^{(\bullet)}$. By adjointness (see 8.3.2.6), the morphism $a^{(\bullet)}$ factors uniquely through a morphism $b^{(\bullet)}\colon \left(\lambda^*\mathcal{D}^{(\bullet)}\right)^r \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}$ of $M(\lambda^*\mathcal{D}^{(\bullet)})$. It follows from propositions 8.4.2.11 and 8.4.2.16 that $\ker b^{(\bullet)}$ is a coherent $\lambda^*\mathcal{D}^{(\bullet)}$-module up to an ind-isogeny. Hence, $\ker b^{(\bullet)}$ is a $\lambda^*\mathcal{D}^{(\bullet)}$-module of finite type up to an ind-isogeny, and therefore is a $\mathcal{D}^{(\bullet)}$-module of finite type up to a lim-ind-isogeny (indeed, we can use the exactness of the functor $\underrightarrow{M}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of 8.3.2.8.1). Since $\ker b^{(\bullet)}$ and $\ker f^{(\bullet)}$ are isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then we conclude the proof. □

Notation 8.4.3.4. We denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ consisting of coherent $\mathcal{D}^{(\bullet)}$-modules up to lim-ind-isogeny. Similarly, when $\mathfrak{X}$ is affine and $D^{(\bullet)} = \Gamma(\mathfrak{X}, \mathcal{D}^{(\bullet)})$, we denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(D^{(\bullet)})$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q}}(D^{(\bullet)})$ consisting of coherent $\mathcal{D}^{(\bullet)}$-modules up to lim-ind-isogeny (we replace "$\mathcal{D}$" by "D").

Remark 8.4.3.5. Let $\lambda \in L(I)$. We have also the full subcategory $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$ of $\underrightarrow{LM}_{\mathbb{Q}}(\lambda^*\mathcal{D}^{(\bullet)})$ of coherent up to a lim-ind-isogeny $\lambda^*\mathcal{D}^{(\bullet)}$-modules. With the lemma 8.3.2.7 and with the characterization of the global finite presentation given in 8.4.3.2, the functors forg_λ and $\lambda^*\mathcal{D}^{(\bullet)}\otimes_{\mathcal{D}^{(\bullet)}} -$ induce quasi-inverse equivalences of categories between $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$ and $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$.

Lemma 8.4.3.6. *If $\mathcal{P}^{(\bullet)}$ is a projective object of $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then $\mathcal{P}^{(\bullet)}$ is a projective object of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.*

Proof. The proof is identical to that of 8.4.2.13 (we replace χ by λ). □

Proposition 8.4.3.7. *Assume I is locally countably well ordered (see 8.4.2.10) and that the maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any $i \leq j$ elements of I. Then the full subcategory $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is stable by isomorphisms, kernels, cokernels, extensions.*

Proof. We can copy the proof of 8.4.2.16 (we use 8.4.3.2, 8.4.3.6 and the fact that the category $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is abelian). □

8.4.4 Passage to the limits on $D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$

We keep notation and hypotheses of 8.4.2. Let $\sharp \in \{+,-,\mathrm{b},\emptyset\}$.

8.4.4.1. Suppose I is filtered. Then we have the exact functor $\underrightarrow{l}^*_{\mathbb{Q}} \colon \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to M(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ (see 8.4.1.10). We set $\mathcal{D}^{\dagger}_{\mathbb{Q}} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We get the functor $\underrightarrow{l}^*_{\mathbb{Q}} \colon K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to K^{\sharp}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$. Since the functor $\underrightarrow{l}^*_{\mathbb{Q}} \colon K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to K^{\sharp}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ sends acyclic complexes to acyclic complexes, hence it factors through the functor

$$\underrightarrow{l}^*_{\mathbb{Q}} \colon D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D^{\sharp}(\mathcal{D}^{\dagger}_{\mathbb{Q}}) \tag{8.4.4.1.1}$$

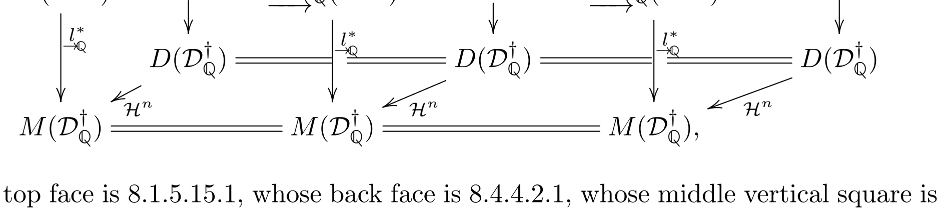
which commutes to the localization functors $Q_{\mathrm{qi}} \colon K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ and $Q_{\mathrm{qi}} \colon K^{\sharp}(\mathcal{D}^{\dagger}_{\mathbb{Q}}) \to D^{\sharp}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$, i.e. we have the equality $Q_{\mathrm{qi}} \circ \underrightarrow{l}^*_{\mathbb{Q}} = \underrightarrow{l}^*_{\mathbb{Q}} \circ Q_{\mathrm{qi}}$ of functors of $K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ (up to canonical isomorphism), with $\underrightarrow{l}^*_{\mathbb{Q}} \colon K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to K(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ for the left side and $\underrightarrow{l}^*_{\mathbb{Q}} \colon D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ for the right one.

Lemma 8.4.4.2. *Suppose I is filtered. We have the commutative up to canonical isomorphism diagram:*

$$\begin{array}{ccc}
\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) & \xrightarrow[\mathfrak{e}]{8.1.5.14.1} & D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \\
\uparrow & \searrow^{\underrightarrow{l}^*_{\mathbb{Q}}}_{8.4.1.9} & \downarrow{\scriptstyle 8.4.4.1.1}\ \underrightarrow{l}^*_{\mathbb{Q}} \\
D^{\sharp}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\underrightarrow{l}^*_{\mathbb{Q}}} & D^{\sharp}(\mathcal{D}^{\dagger}_{\mathbb{Q}}).
\end{array} \tag{8.4.4.2.1}$$

Proof. The left triangle is commutative by definition of the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ of the diagonal (see the proof of 8.4.1.9). By using the universal property of localisation, to check the commutativity of the right triangle it is sufficient to check the commutativity of the outline square, which is easy. □

8.4.4.3. We have the canonical commutative diagram



(8.4.4.3.1)

whose top face is 8.1.5.15.1, whose back face is 8.4.4.2.1, whose middle vertical square is the right square of 8.4.1.10.1, whose commutativity of the right and left squares comes from the exactness of $\underrightarrow{l}^*_{\mathbb{Q}}$.

8.4.4.4. Suppose I is filtered. For any $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$ two objects of $K^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ induces the following morphism of $K(\mathbb{Z}_{\mathfrak{X}})$:

$$\mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)}) \to \mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}), \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})). \tag{8.4.4.4.1}$$

Recall that $\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-)$ is the right localisation of $\mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-)$ (beware its existence is not obvious, see 8.3.4.6.3). By universal property of the right localisation of a (bi)functor, this yields there exists a canonical morphism

$$\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(-), \underrightarrow{l}^*_{\mathbb{Q}}(-)) \tag{8.4.4.4.2}$$

of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}_X)$ making commutative (by definition) the diagram of bifunctors $K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\mathrm{op}} \times K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\mathrm{op}} \to D(\mathbb{Z}_{\mathfrak{X}})$:

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(Q_{\mathrm{qi}}(-), Q_{\mathrm{qi}}(-)) & \xrightarrow{8.4.4.4.2} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}} \circ Q_{\mathrm{qi}}(-), \underrightarrow{l}^*_{\mathbb{Q}} \circ Q_{\mathrm{qi}}(-)) \\
 & & \| \\
\uparrow{\scriptstyle adj} & & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(Q_{\mathrm{qi}} \circ \underrightarrow{l}^*_{\mathbb{Q}}(-), Q_{\mathrm{qi}} \circ \underrightarrow{l}^*_{\mathbb{Q}}(-)) \\
 & & \uparrow{\scriptstyle adj} \\
Q_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) & \xrightarrow[8.4.4.4.1]{} & Q_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(-), \underrightarrow{l}^*_{\mathbb{Q}}(-))
\end{array} \tag{8.4.4.4.3}$$

where the "adj" morphisms are given by adjunction from 7.4.1.9.1 and where the top arrow is the composition of 8.4.4.4.2 with Q_{qi}.

Similarly, by universal property of the right localisation of a (bi)functor, we check there exists a canonical morphism

$$\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \to \mathbb{R}\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(-), \underrightarrow{l}^*_{\mathbb{Q}}(-)) \tag{8.4.4.4.4}$$

of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\mathrm{op}} \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z})$.

Lemma 8.4.4.5. *We have the commutative diagram of bifunctors* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to D(\mathbb{Z}_X)$

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) & \underset{\cong}{\xrightarrow{8.3.4.6.5}} & \mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathfrak{e}(-), \mathfrak{e}(-)) \\
\downarrow{\scriptstyle 8.4.1.15.2} & & \downarrow{\scriptstyle 8.4.4.4.2} \\
\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(-), \underrightarrow{l}^*_{\mathbb{Q}}(-) & \xrightarrow{\cong} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(\mathfrak{e}(-)), \underrightarrow{l}^*_{\mathbb{Q}}(\mathfrak{e}(-)).
\end{array} \tag{8.4.4.5.1}$$

Proof. By using the universal property of right localisation functor, with notation 8.2.4.23, we reduce to check it after composition with the adjunction map

$$Q^{+}_{\mathrm{qi}} \circ F(-,-) \to \mathbb{R}^{\mathfrak{N}^{+}_{\mathrm{qi}}(\mathbb{Z}_X)}_{\mathfrak{N}^{\mathrm{qi}}_{LD} \times \mathfrak{N}^{\mathrm{qi}}_{LD}} F(Q^{\mathrm{qi}}_{LD}(-), (Q^{\mathrm{qi}}_{LD}(-)) = \mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(Q^{\mathrm{qi}}_{LD}(-), (Q^{\mathrm{qi}}_{LD}(-)).$$

With notation 8.3.4.6, consider the commutative diagram of bifunctors $K^{\mathrm{b}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to D^{+}(\mathbb{Z}_X)$:

$$\begin{array}{ccc}
Q^{+}_{\mathrm{qi}} \circ F(-,-) & \xrightarrow{8.3.4.6.6} & Q^{+}_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(Q^{\mathrm{b}}_{N}(-), Q^{\mathrm{b}}_{N}(-)) \\
\downarrow{\scriptstyle 8.4.1.15.7} & & \downarrow{\scriptstyle 8.4.4.4.3} \\
Q_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(-), \underrightarrow{l}^*_{\mathbb{Q}}(-)) & \xrightarrow{\sim} & Q_{\mathrm{qi}} \circ \mathcal{H}om^{\bullet}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}} \circ Q^{\mathrm{b}}_{N}(-), \underrightarrow{l}^*_{\mathbb{Q}} \circ Q^{\mathrm{b}}_{N}(-))
\end{array} \tag{8.4.4.5.2}$$

where the left, top, right arrow are the canonical ones and appears respectively at the bottom diagram of 8.4.1.15.7, 8.3.4.6.6, 8.4.4.4.3, where the bottom isomorphism is given by the canonical isomorphism $\underrightarrow{l}^*_{\mathbb{Q}} \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}} \circ Q^{\mathrm{b}}_N$, where $\underrightarrow{l}^*_{\mathbb{Q}} \colon K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to K^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ for the left side and $\underrightarrow{l}^*_{\mathbb{Q}} \colon K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to K^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ for the right side. Therefore, by using the commutative diagrams 8.4.1.15.7, 8.3.4.6.6, 8.4.4.4.3, we are done. □

Proposition 8.4.4.6. *Let $u \colon I' \to I$ be an L-equivalence between two partially ordered sets (see definition 8.1.3.8). Then $\underrightarrow{u}_X^{-1}$ induces respectively the isomorphisms of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\mathrm{op}} \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z})$ and $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\mathrm{op}} \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}_X)$:*

$$\mathbb{R}\operatorname{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \xrightarrow{\sim} \mathbb{R}\operatorname{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}))}(\underrightarrow{u}_X^{-1}(-), \underrightarrow{u}_X^{-1}(-)), \tag{8.4.4.6.1}$$

$$\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}))}(\underrightarrow{u}_X^{-1}(-), \underrightarrow{u}_X^{-1}(-)). \tag{8.4.4.6.2}$$

Proof. Let $\mathfrak{f} \colon D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \cong \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ be a quasi-inverse functor of $\mathfrak{e} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \cong D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ of 8.1.5.14.1. The isomorphism 8.4.4.6.2 is the one making commutative the diagram of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\mathrm{op}} \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D(\mathbb{Z}_X)$:

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(-,-) & \dashrightarrow & \mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}))}(\underrightarrow{u}_X^{-1}(-), \underrightarrow{u}_X^{-1}(-)) \\
\uparrow{\scriptstyle\sim} & & \uparrow{\scriptstyle\sim} \\
\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathfrak{e}\circ\mathfrak{f}(-), \mathfrak{e}\circ\mathfrak{f}(-)) & & \mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}))}(\mathfrak{e}\circ\underrightarrow{u}_X^{-1}\circ\mathfrak{f}(-), \mathfrak{e}\circ\underrightarrow{u}_X^{-1}\circ\mathfrak{f}(-)) \\
\uparrow{\scriptstyle\sim\ 8.3.4.6.5} & & \uparrow{\scriptstyle\sim\ 8.3.4.6.5} \\
\mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})}(\mathfrak{f}(-), \mathfrak{f}(-)) & \xrightarrow[\sim]{8.3.1.3.3} & \mathbb{R}\mathcal{H}om_{\underrightarrow{LD}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})}(\underrightarrow{u}_X^{-1}\circ\mathfrak{f}(-), \underrightarrow{u}_X^{-1}\circ\mathfrak{f}(-)),
\end{array} \tag{8.4.4.6.3}$$

where the top right (resp. top left) vertical isomorphism comes from the isomorphism $\mathfrak{e}\circ\underrightarrow{u}_X^{-1}\circ\mathfrak{f} \xrightarrow{\sim} \underrightarrow{u}_X^{-1}$ (resp. $\mathfrak{e}\circ\mathfrak{f} \xrightarrow{\sim} \mathrm{id}$). By using 8.3.1.3.2 instead of 8.3.1.3.3, we construct similarly the isomorphism 8.4.4.6.1.

□

8.4.4.7. Let $u \colon I' \to I$ be an L-equivalence between two partially ordered sets (see definition 8.1.3.8). Set $\mathcal{D}'^{\dagger} := \underrightarrow{l}^{-1}_{X,I'}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$. By composing 8.4.1.15.9 (still valid replacing λ^* by $\underrightarrow{u}_X^{-1}$) with 8.4.4.6.3, by using the commutative diagram 8.4.4.5.1, we get the commutative up to canonical isomorphism diagram of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))^{\mathrm{op}} \times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D^{+}(\mathbb{Z}_{\mathfrak{X}})$:

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(-,-) & \xrightarrow{8.4.4.4.2} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}(-), \underrightarrow{l}^*_{\mathbb{Q}}(-) \\
{\scriptstyle 8.4.4.6.2}\downarrow{\scriptstyle\cong} & & \downarrow{\scriptstyle\cong} \\
\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}))}(\underrightarrow{u}_X^{-1}(-), \underrightarrow{u}_X^{-1}(-)) & \xrightarrow{8.4.4.4.2} & \mathbb{R}\mathcal{H}om_{\mathcal{D}'^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^*_{\mathbb{Q}}\circ\lambda^*(-), \underrightarrow{l}^*_{\mathbb{Q}}\circ\lambda^*(-)).
\end{array} \tag{8.4.4.7.1}$$

8.4.5 Coherence in $D(LM_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, coherent modules, comparison

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. We suppose $p\mathcal{O}_{\mathfrak{X}} \subset \mathcal{I}$. Let I be a partially ordered set which is strictly filtered and locally countably well ordered (see 8.4.2.10). Let $\mathcal{D}^{(\bullet)} = (\mathcal{D}^{(i)}, \alpha^{(j,i)}_{\mathcal{D}})$ be a sheaf of rings on the topos $\mathfrak{X}^{(I)}$. Suppose moreover the following conditions are satisfied

(i) For any $i \in I$, we suppose $\mathcal{D}^{(i)}$ is a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}^{(i)}$ satisfying the conditions of 7.2.3. Recall following 7.2.3.3, $\mathcal{D}^{(i)}$ is therefore left coherent.

(ii) The transition maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any elements $i \leq j$ of I;

(iii) There exists an integer d such that, for any elements $i \leq j$ of I, the ring $\mathcal{D}^{(j)}$ is of tor-dimension $\leq d$ on $\mathcal{D}^{(i)}$;

(iv) For any $i \in I$, for any coherent $\mathcal{D}_{\mathbb{Q}}^{(i)}$-module $\mathcal{E}$, there exists a coherent $\mathcal{D}^{(i)}$-module $\mathcal{E}'$ together with an isomorphism $\mathcal{E}'_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ of $\mathcal{D}_{\mathbb{Q}}^{(i)}$-modules.

Notation 8.4.5.1. For any $\sharp \in \{0, +, -, \mathrm{b}, \emptyset\}$, we denote by $D^{\sharp}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ the full subcategory of $D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ consisting of complexes $\mathcal{E}^{(\bullet)}$ such that, for any $n \in \mathbb{Z}$, $\mathcal{H}^n(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ (see notation 8.4.3.4). These objects are called coherent complexes of $D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$.

8.4.5.2. By definition, the property that an object of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is an object of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ is local on $\mathfrak{X}^{(\bullet)}$. This yields that the notion of coherence of 8.4.5.1 is local on $\mathfrak{X}^{(\bullet)}$, i.e. the fact that a complex $\mathcal{E}^{(\bullet)}$ of $D^{\sharp}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ is coherent is local on $\mathfrak{X}^{(\bullet)}$.

Theorem 8.4.5.3. *For any $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, $\mathcal{F}^{(\bullet)} \in D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, the morphism of $D(\mathbb{Z}_{\mathfrak{X}})$ defined in 8.4.4.4.2 and the morphism of $D(\mathbb{Z})$ defined in 8.4.4.4.4:*

$$\mathbb{R}\mathcal{H}om_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)}) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{E}^{(\bullet)}, \underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{F}^{(\bullet)}), \tag{8.4.5.3.1}$$

$$\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)}) \to \mathbb{R}\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathbb{Q}}}(\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{E}^{(\bullet)}, \underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{F}^{(\bullet)}) \tag{8.4.5.3.2}$$

are isomorphisms.

Proof. i) Let us treat the case of 8.4.5.3.1. By using lemma [Har66, I.7.1.(ii)] (that we can use thanks to 8.4.3.7), we reduce to the case where $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. By using 8.4.1.5 and 8.4.4.7.1, since I is strictly filtered then we reduce to the case where I is countably well ordered. Let i_0 be the smallest element of I. Since this is local on $\mathfrak{X}$, we can suppose $\mathfrak{X}$ affine and $\mathcal{E}^{(\bullet)}$ has global finite presentation up to lim-ind-isogeny. Following the lemma 8.4.3.2, there exist $\lambda \in L(I)$ and a $\lambda^{*}\mathcal{D}^{(\bullet)}$-module $\mathcal{G}^{(\bullet)}$ having a global finite presentation such that $\mathcal{E}^{(\bullet)}$ and $\mathcal{G}^{(\bullet)}$ are isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Hence we reduce to check the theorem when $\mathcal{E}^{(\bullet)}$ has a global finite presentation as $\mathcal{D}^{(\bullet)}$-module. Following the second remark of 8.4.2.2, $E^{(i_0)} := \Gamma(\mathfrak{X}, \mathcal{E}^{(i_0)})$ is a coherent $D^{(i_0)} := \Gamma(\mathfrak{X}, \mathcal{D}^{(i_0)})$-module and the canonical morphism $\mathcal{D}^{(\bullet)} \otimes_{D^{(i_0)}} E^{(i_0)} \to \mathcal{E}^{(\bullet)}$ is an isomorphism. We get a left resolution of $E^{(i_0)}$ by free $D^{(i_0)}$-modules of finite type. It induces a left resolution of $\mathcal{E}^{(\bullet)}$ by free $\mathcal{D}^{(\bullet)}$-modules of finite type. Hence, by copying the proof of [Har66, I.7.1.(iv)] (i.e. by using stupid truncation exact sequences), we reduce to check the theorem when $\mathcal{E}^{(\bullet)}$ is a free $\mathcal{D}^{(\bullet)}$-module of finite type. By additivity, we can suppose $\mathcal{E}^{(\bullet)} = \mathcal{D}^{(\bullet)}$. Since $\mathcal{D}^{(\bullet)} \in D_{\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ (use the first remark of 8.4.1.2), then we conclude the proof by using Theorem 8.4.4.5 and the isomorphism 8.4.1.15.1.

ii) We check 8.4.5.3.2 similarly to 8.4.5.3.1 or we can also notice that by applying the functor $\mathbb{R}\Gamma(\mathfrak{X}, -)$ to the morphism 8.4.5.3.1, we get the arrow 8.4.5.3.2 by using the isomorphism 8.3.4.8.4. □

Lemma 8.4.5.4. *For any integer $n \in \mathbb{Z}$, the functor $\mathcal{H}^n \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ defined at 8.1.5.6.1 has the factorization $\mathcal{H}^n \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$.*

Proof. Let $n \in \mathbb{Z}$ and $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. By using the right commutative diagram of 8.3.1.4.1, since I is strictly filtered then we reduce to the case where I is countably well ordered. Let i_0 be the smallest element of I. Since $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ is closed in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ under isomorphisms (see 8.4.3.7), then by definition (see 8.4.1.1) we can suppose there exists $\lambda \in L(I)$ such that $\mathcal{F}^{(\bullet)} \in D_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$. We set $\mathcal{G}^{(\bullet)} := \mathcal{H}^n(\mathcal{F}^{(\bullet)})$, $\mathcal{E}^{(i_0)} := \mathcal{H}^n(\mathcal{F}^{(i_0)})$ and $\mathcal{E}^{(\bullet)} := \lambda^{*}\mathcal{D}^{(\bullet)} \otimes_{\mathcal{D}^{(\lambda(i_0))}} \mathcal{E}^{(i_0)}$. Following 7.1.3.13 $\mathcal{F}^{(i_0)} \in D_{\mathrm{coh}}(\mathcal{D}^{(\lambda(i_0))})$. Hence, with the lemma 8.4.2.1, the $\lambda^{*}\mathcal{D}^{(\bullet)}$-module $\mathcal{E}^{(\bullet)}$ is of finite presentation. We have the canonical morphism $\mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ of $M(\lambda^{*}\mathcal{D}^{(\bullet)})$. Since the homomorphisms $\mathcal{D}_{\mathbb{Q}}^{(\lambda(i_0))} \to \mathcal{D}_{\mathbb{Q}}^{(\lambda(i))}$ are flat, we check that the arrow $\mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ becomes an isomorphism after applying the functor $\mathbb{Q} \otimes_{\mathbb{Z}} -$. For any $i \in I$, $\mathcal{E}^{(i)}, \mathcal{G}^{(i)}$ are coherent $\mathcal{D}^{(\lambda(i))}$-modules. Since I is countably well ordered, by using lemma 8.4.2.8, this yields that $\mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ is an ind-isogeny. Hence we are done. □

Lemma 8.4.5.5. *The equivalences of the lemma 8.1.5.10 factors through the canonical quasi-inverse equivalences of categories of the form $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \cong \underrightarrow{LD}^{0}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ and $H^0 \colon \underrightarrow{LD}^{0}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \cong \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$.*

Proof. By using lemma 8.1.5.10, it is sufficient to check that the factorization of both functors. By using lemma 8.4.5.4, this is already known for the functor H^0. It remains to check that if $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ then $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^0_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. By using 8.3.1.1.2 and 8.4.1.5, since I is strictly filtered then we reduce to the case where I is countably well ordered. Let i_0 be the smallest element of I. Since this is local on $\mathfrak{X}$, we can suppose $\mathfrak{X}$ affine and $\mathcal{E}^{(\bullet)}$ has global finite presentation up to lim-ind-isogeny. Following the lemma 8.4.3.2, there exist $\lambda \in L(I)$ and a $\lambda^*\mathcal{D}^{(\bullet)}$-module $\mathcal{G}^{(\bullet)}$ having a global finite presentation such that $\mathcal{E}^{(\bullet)}$ and $\mathcal{G}^{(\bullet)}$ are isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Hence we reduce to the case where $\mathcal{E}^{(\bullet)}$ has a global finite presentation as $\mathcal{D}^{(\bullet)}$-module. Following 8.4.2.1, $\mathcal{E}^{(i_0)}$ is a coherent $\mathcal{D}^{(i_0)}$-module. We set $\mathcal{F}^{(\bullet)} := \mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(i_0)}} \mathcal{E}^{(i_0)}$. By using the hypothesis 8.4.5.iii, we get that the complex $\mathcal{F}^{(\bullet)}$ has bounded cohomology and therefore $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Let $n \in \mathbb{Z} \setminus \{0\}$. Moreover, since the extensions $\mathcal{D}^{(i_0)}_{\mathbb{Q}} \to \mathcal{D}^{(i)}_{\mathbb{Q}}$ are flat, we get $(\mathcal{H}^n(\mathcal{F}^{(\bullet)}))_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{H}^n(\mathcal{F}^{(\bullet)}_{\mathbb{Q}}) \xrightarrow{\sim} 0$. Since $\mathcal{H}^n(\mathcal{F}^{(i)})$ is a coherent $\mathcal{D}^{(i)}$-module for any $i \in I$, it follows from 8.4.2.8 that $\mathcal{H}^n(\mathcal{F}^{(\bullet)})$ is ind-isogenic to 0. Hence, we have checked $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^0_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. With the lemma 8.1.5.10, this implies the isomorphism $\mathcal{F}^{(\bullet)} \xrightarrow{\sim} H^0(\mathcal{F}^{(\bullet)})$ in $\underrightarrow{LD}^0_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Since $H^0(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$, this yields $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^0_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. □

Theorem 8.4.5.6. *We have the commutative diagram whose functors are equivalences of categories:*

$$\begin{array}{ccc} \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) & \xrightarrow[\mathfrak{e}]{8.1.5.14.1} & D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \\ & \searrow^{8.4.1.15}_{\underrightarrow{l}^*_{\mathbb{Q}}} & \downarrow {\scriptstyle 8.4.4.1.1}\ \underrightarrow{l}^*_{\mathbb{Q}} \\ & & D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}}). \end{array} \tag{8.4.5.6.1}$$

Proof. It follows from lemmas 8.1.5.15.1 and 8.4.5.4 that the equivalence of categories $\mathfrak{e} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}) \cong D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ of 8.1.5.14.1 factors through the (fully faithful) functor

$$\mathfrak{e} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})). \tag{8.4.5.6.2}$$

It follows from 8.4.5.5 and 8.4.1.15.b (and from the commutativity of the left square of 8.4.1.10.1) that we have the factorization

$$\underrightarrow{l}^*_{\mathbb{Q}} \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to \mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathbb{Q}}). \tag{8.4.5.6.3}$$

Moreover, since $\underrightarrow{l}^*_{\mathbb{Q}}$ commutes with H^n (more precisely, by using the commutative right square of 8.4.4.3.1), then the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ of 8.4.4.1.1 factors through

$$\underrightarrow{l}^*_{\mathbb{Q}} \colon D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}}). \tag{8.4.5.6.4}$$

Hence, we get the commutative diagram 8.4.5.6.1 from that of the top triangle of 8.4.4.2.1. It follows from Theorem 8.4.5.3.2 that the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ of 8.4.5.6.4 is fully faithful. Since the composition of the functors 8.4.5.6.2 and 8.4.5.6.4 is an equivalence of categories (see Theorem 8.4.1.15) then so is the functor 8.4.5.6.4. Hence, the functor 8.4.5.6.2 is also an equivalence.

□

8.4.5.7. Using the commutativity of the diagram 8.1.5.15.1 and the stability of the coherence of Lemma 8.4.5.4 and Theorem 8.4.5.6, we get the commutative (up to canonical isomorphism) diagram:

$$\begin{array}{ccccc} D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})) & \longrightarrow & D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) & \overset{\mathfrak{e}}{\underset{\cong}{\longleftarrow}} & \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \\ \downarrow {\scriptstyle H^n} & & \downarrow {\scriptstyle H^n} & & \downarrow {\scriptstyle H^n} \\ \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) & = & \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) & = & \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}). \end{array} \tag{8.4.5.7.1}$$

8.4.5.8. We have the following properties

(a) Using 8.4.3.7, we get that $D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ is a saturated triangulated subcategory (some authors say thick or épaisse) of $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, i.e. is a strict triangulated subcategory closed under direct summands. Hence, using the equivalences of categories 8.1.5.14.1 and 8.4.5.6.2, we get that $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ is a saturated triangulated subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

(b) Using again using the equivalences of categories 8.1.5.14.1 and 8.4.5.6.2, it follows from 8.4.5.2 the following local property: the fact that a complex of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ belongs to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ (resp. $\underrightarrow{LD}^{0}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$) is local on $\mathfrak{X}$.

Lemma 8.4.5.9. *Denote by $D^0_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathbb{Q}})$ the full subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathbb{Q}})$ of the complexes $\mathcal{E}$ such that, for any integer $n \neq 0$, we have $\mathcal{H}^n(\mathcal{E}) = 0$.*

(a) Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. The property $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{0}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ is equivalent to $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in D^0_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathbb{Q}})$.

(b) We have the diagram of functors commutative up to canonical equivalence

$$\begin{array}{ccccc} \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) & \xrightarrow{\cong} & \underrightarrow{LD}^{0}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) & \xrightarrow[H^0]{\cong} & \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \\ \cong\downarrow \underrightarrow{l}^*_{\mathbb{Q}} & & \cong\downarrow \underrightarrow{l}^*_{\mathbb{Q}} & & \cong\downarrow \underrightarrow{l}^*_{\mathbb{Q}} \\ \mathrm{Coh}(\mathcal{D}^\dagger_{\mathbb{Q}}) & \xrightarrow{\cong} & D^0_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathbb{Q}}) & \xrightarrow[H^0]{\cong} & \mathrm{Coh}(\mathcal{D}^\dagger_{\mathbb{Q}}), \end{array} \tag{8.4.5.9.1}$$

whose every functors are equivalences of categories.

Proof. It follows from the commutativity of the diagram 8.4.1.10.1 and from the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q}}$ of Theorem 8.4.5.6, that we have the fully faithful functor $\underrightarrow{l}^*_{\mathbb{Q}} \colon \underrightarrow{LD}^{0}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to D^0_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathbb{Q}})$. We have the functor 8.4.5.6.3 making commutative the diagram 8.4.5.9.1. It remains to check that the functors of the diagram 8.4.5.9.1 are equivalences of categories. Following Lemma 8.4.5.5, this is known for the top horizontal morphisms. For the bottom horizontal ones, this is obvious. By using the commutativity of the left square of the diagram 8.4.5.9.1 this yields that the left vertical functor of 8.4.5.9.1 is fully faithful. Hence, by using the commutativity of the diagram 8.4.1.10.1, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ and for any $n \in \mathbb{Z}$, this yields $H^n(\mathcal{E}^{(\bullet)}) = 0$ if and only if $H^n(\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})) = 0$. This implies the property (a) and the fact that the middle vertical functor of 8.4.5.9.1 is an equivalence of categories. Hence, we are done. □

With the hypotheses of the subsection 8.4.5, the following proposition improves 8.4.3.2:

Lemma 8.4.5.10. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Suppose $\mathfrak{X}$ quasi-compact. Hence there exists $i \in I$, such that for any affine open U of X, $\mathcal{E}^{(\bullet)}|_{(i,U)}$ is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,U)})$ to a $\mathcal{D}^{(\bullet)}|_{(i,U)}$-module having a global finite presentation.*

Proof. We can suppose X affine. Let $\mathcal{G} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in \mathrm{Coh}(\mathcal{D}^\dagger_{\mathbb{Q}})$. Following 8.4.1.11.b.(ii), since our rings are coherent (after tensorisation with $\mathbb{Q}$), there exists $i \in I$ and a coherent left $\mathcal{D}^{(i)}_{\mathbb{Q}}$-module $\mathcal{G}^{(i)}$ together with a $\mathcal{D}^\dagger_{\mathbb{Q}}$-linear isomorphism $\epsilon \colon \mathcal{D}^\dagger_{\mathbb{Q}} \otimes_{\mathcal{D}^{(i)}_{\mathbb{Q}}} \mathcal{G}^{(i)} \xrightarrow{\sim} \mathcal{G}$. Using the hypothesis (8.4.5.iv), there exists a coherent $\mathcal{D}^{(i)}$-module $\mathcal{F}^{(i)}$ together with an isomorphism $\mathcal{F}^{(i)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{G}^{(i)}$ of $\mathcal{D}^{(i)}_{\mathbb{Q}}$-modules. Since X is affine, then $\mathcal{F}^{(i)}$ is a $\mathcal{D}^{(i)}$-module having a global finite presentation. This yields that $\mathcal{F}^{(\bullet)} := (\mathcal{D}^{(\bullet)}|_{(i,X)}) \otimes_{\mathcal{D}^{(i)}} \mathcal{F}^{(i)}$ is a $\mathcal{D}^{(\bullet)}|_{(i,X)}$-module having a global finite presentation. Let $j \colon I_{\geq i} \subset I$ be the canonical inclusion. Since j is an L-equivalence, with 8.4.1.9.b, we get $\underrightarrow{l}^*_{X,I_{\geq i},\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,X)}) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathbb{Q}}$ and then the isomorphisms $\underrightarrow{l}^*_{X,I_{\geq i},\mathbb{Q}}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \underrightarrow{l}^*_{X,I_{\geq i},\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,X)}) \otimes_{\mathcal{D}^{(i)}_{\mathbb{Q}}} \mathcal{F}^{(i)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{G}$. By using the commutative diagram 8.4.1.9.1 (recall the restriction functor $|_{(i,X)}$ is equal by definition to $\underrightarrow{j}^{-1}_X$), we get the isomorphism $\mathcal{G} = \underrightarrow{l}^*_{X,I,\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \underrightarrow{l}^*_{X,I_{\geq i},\mathbb{Q}}(\mathcal{E}^{(\bullet)}|_{(i,X)})$. By using the full faithfulness of the functor $\underrightarrow{l}^*_{X,I_{\geq i},\mathbb{Q}}$ (see 8.4.5.9.1), this yields that $\mathcal{E}^{(\bullet)}|_{(i,X)}$ and $\mathcal{F}^{(\bullet)}$ are isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}|_{(i,X)})$. Hence, we are done. □

Corollary 8.4.5.11. *We suppose $\mathfrak{X}$ affine. We have the commutative canonical diagram*

$$\begin{array}{ccccc} D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})) & \longrightarrow & D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})) & \xleftarrow{\mathfrak{c}} & \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \\ \downarrow \underrightarrow{l}^*_{X,\mathbb{Q}} & & \searrow \underrightarrow{l}^*_{X,\mathbb{Q}} & 8.4.1.15 & \downarrow \underrightarrow{l}^*_{X,\mathbb{Q}} \\ D^{\mathrm{b}}(\mathrm{Coh}(\mathcal{D}^\dagger_{\mathbb{Q}})) & & \longrightarrow & & D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathbb{Q}}), \end{array} \tag{8.4.5.11.1}$$

whose functors are equivalences of categories.

Proof. By universal property of the localisation, to check that the left trapeze is commutative, we reduce to check it after composing with the functor $K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})) \to D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$, which is easy. Hence, we get the commutativity of the diagram 8.4.5.11.1 from that of 8.4.5.6.1. Moreover, if follows from 4.6.1.9 (resp. 8.4.5.6) that the bottom functor (resp. the functors of the right triangle) of the diagram 8.4.5.11.1 is an equivalence of categories. Since the exact functor $\underrightarrow{l}^*_{X,\mathbb{Q}}$ induces an equivalence of categories between $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ and $\mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ (see 8.4.5.9.1), then so is the left functor. Hence, we are done. □

8.4.5.12. We have the following fact.

(a) Let $\mathcal{E}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$, Let $\mathcal{E}^{\bullet} := \underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)\bullet}$, where $\underrightarrow{l}^*_{\mathbb{Q}}$ is induced by the equivalence of categories of 8.4.5.6.3. Choose m_0 large enough so that there exists p-torsion free coherent $\mathcal{D}^{(m_0)}$-modules $\mathcal{F}^{(0)n}$ such that $\mathcal{D}^{\dagger}_{\mathbb{Q}} \otimes_{\mathcal{D}^{(m_0)}} \mathcal{F}^{(0)n} \xrightarrow{\sim} \mathcal{E}^n$. For any $m \geq 0$, let $\mathcal{F}^{(m)}$ and be the quotient of $\mathcal{D}^{(m+m_0)} \otimes_{\mathcal{D}^{(m_0)}} \mathcal{F}^{(0)}$ by its p-torsion part. We get the complex $\mathcal{F}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$ such that $\underrightarrow{l}^*_{\mathbb{Q}}\mathcal{F}^{(\bullet)\bullet} \xrightarrow{\sim} \mathcal{E}^{\bullet}$. Hence, we obtain the isomorphism $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ of $K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$.

(b) Let $\mathcal{F}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$. It follows from 8.1.5.2.2 that there exists $\mathcal{G}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$ together with an isomorphism of $K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$ of the form $\mathfrak{e}(\mathcal{G}^{(\bullet)\bullet}) \xrightarrow{\sim} \mathcal{F}^{(\bullet)\bullet}$ such that $\mathcal{G}^{(\bullet)n}$ for any integer n is of the form $\lambda^*\chi^*\mathcal{F}^{(\bullet)n}$.

Corollary 8.4.5.13. *Suppose $\mathfrak{X}$ affine. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. There exist a representant $\mathcal{E}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$ of $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)n}$ is p-torsion free and $\mathfrak{e}(\mathcal{E}^{(\bullet)n}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ for any $n \in \mathbb{Z}$.*

Proof. Let $\mathcal{E}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$ be a representant of $\mathcal{E}^{(\bullet)}$. Following 8.4.5.11, there exists $\mathcal{F}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$ endowed with an isomorphism $\mathcal{F}^{(\bullet)\bullet} \xrightarrow{\sim} \mathfrak{e}(\mathcal{E}^{(\bullet)\bullet})$ of $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$, where $\mathfrak{e}\colon K^{\mathrm{b}}(\mathcal{D}^{(\bullet)}) \to K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}))$. It follows from 8.4.5.12 that there exists $\mathcal{G}^{(\bullet)\bullet} \in K^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$ endowed with an isomorphism $\mathfrak{e}(\mathcal{G}^{(\bullet)\bullet}) \xrightarrow{\sim} \mathcal{F}^{(\bullet)\bullet}$ of $K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}))$ and such that $\mathcal{G}^{(\bullet)n}$ is p-torsion free (and $\mathfrak{e}(\mathcal{G}^{(\bullet)n}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$) for any $n \in \mathbb{Z}$. Since $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ is a triangulated category, then we get by induction that $\mathcal{G}^{(\bullet)\bullet}$ is an object of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Hence, since $\mathfrak{e}(\mathcal{G}^{(\bullet)\bullet})$ and $\mathfrak{e}(\mathcal{E}^{(\bullet)\bullet})$ are isomorphic in $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$, then it follows from 8.4.5.11 that $\mathcal{G}^{(\bullet)\bullet}$ and $\mathcal{E}^{(\bullet)\bullet}$ are isomorphic in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. □

8.5 Quasi-coherence

8.5.1 Quasi-coherence in $D(\mathcal{D}^{(\bullet)})$ or $D(\mathcal{D}^{(\bullet)}_{\bullet})$

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. Let I be a partially ordered set. Let $\mathcal{D}^{(\bullet)} = (\mathcal{D}^{(i)}, \alpha^{j,i}_{\mathcal{D}})$ be a sheaf of rings on the topos $\mathfrak{X}^{(I)}$. We suppose there exists a homomorphism $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}^{(\bullet)}$ such that $\mathcal{D}^{(i)}$ equipped with the induced $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}^{(i)}$ is a sheaf of rings on $\mathfrak{X}$ satisfying the conditions of 7.3.2.

Example 8.5.1.1. We will use essentially in this book the following cases. Let $\mathfrak{S}^{\sharp}$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^{\sharp} \to \mathfrak{S}^{\sharp}$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension.

(a) Let $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}$ be a commutative $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$-algebra endowed with a compatible structure of left $\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$-module such that for any $m \in \mathbb{N}$, $\mathcal{B}^{(m)}_{\mathfrak{X}}$ satisfies the hypotheses of 7.3.2. Since $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$ is $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}$-flat (for both structures), then $\mathcal{D}^{(\bullet)} = \mathcal{B}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$ satisfies the conditions of 8.5.1 (in the case where $I = \mathbb{N}$).

(b) Suppose $\mathfrak{X}$ is moreover p-torsion free (see 3.3.1.12 for some example). Let $\lambda \in L(\mathbb{N})$. Let Z be a divisor of $\mathfrak{X}^{\sharp} \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi\mathcal{V})$. For any $m \in \mathbb{N}$, we set $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z) := \mathcal{B}^{(\lambda(m))}_{\mathfrak{X}}(Z)$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z) := \mathcal{B}^{(\lambda(m))}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$. Then following 8.7.4.2 the sheaves $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)$ satisfies the conditions of 8.5.1.

Notation 8.5.1.2. Following 8.1.1.1, with notation 7.1.2.1, the topos of inductive system indexed by I of sheaves on X is by definition

$$\mathfrak{X}^{(I)} := \mathrm{Top}(X)_{I^{\circ}} := \mathrm{Sh}(I^{\circ \natural} \times X_{Zar}),$$

where I° the partially ordered set equal to I as a set but equipped with the ordering opposite to that of I (see 7.1.1.1).

We endow the set $\mathbb{N} \times I^{\circ}$ with the order product i.e. $(n_1, i_1) \leq (n_2, i_2)$ in $\mathbb{N} \times I^{\circ}$ if and only if $n_1 \leq n_2$ in $\mathbb{N}$ and $i_1 \geq i_2$ in I. We set

$$X_{\bullet}^{(I)} := \mathrm{Top}(X)_{\mathbb{N} \times I^{\circ}} := \mathrm{Sh}((\mathbb{N} \times I^{\circ})^{\natural} \times X_{Zar}).$$

The object of $X_{\bullet}^{(I)}$ are denoted by $\mathcal{E}_{\bullet}^{(\bullet)} = (\mathcal{E}_n^{(i)}, \alpha_{m,n}^{j,i})_{i \leq j, m \leq n}$ where $\alpha_{m,n}^{j,i} \colon \mathcal{E}_n^{(i)} \to \mathcal{E}_m^{(j)}$ is a functorial in $i \leq j$ in I and $m \leq n$ in $\mathbb{N}$ morphism of sheaves on X. Remark this yields the morphism of $\mathrm{Top}(X)_{\mathbb{N}}$ (resp. $\mathrm{Top}(X)_{I^{\circ}}$) of the form $\alpha^{j,i} \colon \mathcal{E}_{\bullet}^{(i)} \to \mathcal{E}_{\bullet}^{(j)}$ (resp. $\alpha_{m,n} \colon \mathcal{E}_n^{(\bullet)} \to \mathcal{E}_m^{(\bullet)}$). We denote by $\mathcal{D}_{\bullet}^{(\bullet)} = (\mathcal{D}^{(i)}/\mathcal{I}^{n+1}\mathcal{D}^{(i)}, \alpha_{m,n}^{j,i})$ the sheaf of rings on the topos $X_{\bullet}^{(I)}$ so that $\alpha_{m,n}^{j,i} \colon \mathcal{D}^{(i)}/\mathcal{I}^{n+1}\mathcal{D}^{(i)} \to \mathcal{D}^{(j)}/\mathcal{I}^{m+1}\mathcal{D}^{(j)}$ are the morphisms induced by $\alpha_{\mathcal{D}}^{j,i}$ for any $i \leq j$ in I and $m \leq n$ in $\mathbb{N}$.

1) Fix $i \in I$. Let $i \colon \{i\} \to I$ be the inclusion map sending i to i and $i \colon \mathbb{N} \times \{i\} \to \mathbb{N} \times I^{\circ}$ be the inclusion map sending (n, i) to (n, i). The morphisms defined at 7.1.2.4.1 are in this case denoted by

$$\underrightarrow{i}_{\mathfrak{X}} = (\underrightarrow{i}_{\mathfrak{X}}^{-1} \dashv \underrightarrow{i}_{\mathfrak{X}*}) \colon \mathfrak{X} \to \mathfrak{X}^{(I)}, \qquad \underrightarrow{i}_{X_{\bullet}} = (\underrightarrow{i}_{X_{\bullet}}^{-1} \dashv \underrightarrow{i}_{X_{\bullet}*}) \colon X_{\bullet} \to X_{\bullet}^{(I)}, \tag{8.5.1.2.1}$$

where $\mathfrak{X}$ means by abuse of notation $\mathrm{Top}(\mathfrak{X})$. We have $\underrightarrow{i}_{X_{\bullet}}^{-1}(\mathcal{E}_{\bullet}^{(\bullet)}) = \mathcal{E}_{\bullet}^{(i)}$ for any $\mathcal{E}_{\bullet}^{(\bullet)} \in X_{\bullet}^{(I)}$ and $\underrightarrow{i}_{\mathfrak{X}}^{-1}(\mathcal{E}^{(\bullet)}) = \mathcal{E}^{(i)}$ for any $\mathcal{E}^{(\bullet)} \in \mathfrak{X}$ (with identities as transition maps). Similarly to 8.1.1.2.6, for any $\mathcal{E}_{\bullet} \in X_{\bullet}$, we compute

$$(\underrightarrow{i}_{X_{\bullet}*}(\mathcal{E}_{\bullet}))^{(j)} = \begin{cases} \mathcal{E}_{\bullet} & \text{if } j \leq i \\ e & \text{otherwise} \end{cases}, \qquad (\underrightarrow{i}_{X_{\bullet}!}(\mathcal{E}_{\bullet}))^{(j)} = \begin{cases} \mathcal{E}_{\bullet} & \text{if } j \geq i \\ \emptyset & \text{otherwise} \end{cases} \tag{8.5.1.2.2}$$

where e (resp. $\emptyset$) is the final (resp. initial) object of $X_{\bullet}$.

2) Let $\{*\}$ be some one element set. Let $u \colon \mathbb{N} \times I^{\circ} \to \{*\} \times I^{\circ}$ be the canonical projection. Then the morphism of 7.1.2.4.1 induces in this case the following ringed topos morphism

$$\underleftarrow{l}_{\mathfrak{X}^{(I)}} = (\underleftarrow{l}_{\mathfrak{X}^{(I)}}^{-1} \dashv \underleftarrow{l}_{\mathfrak{X}^{(I)},*}) \colon (X_{\bullet}^{(I)}, \mathcal{D}_{\bullet}^{(\bullet)}) \to (\mathfrak{X}^{(I)}, \mathcal{D}^{(\bullet)}). \tag{8.5.1.2.3}$$

We have $\underleftarrow{l}_{\mathfrak{X}^{(I)}}^{-1}(\mathcal{E}^{(\bullet)})_n = \mathcal{E}^{(\bullet)}$ for any $\mathcal{E}^{(\bullet)} \in \mathfrak{X}^{(I)}$ and any $n \in \mathbb{N}$; transition morphisms $\underleftarrow{l}_{\mathfrak{X}^{(I)}}^{-1}(\mathcal{E}^{(\bullet)})_{n+1} \to \underleftarrow{l}_{\mathfrak{X}^{(I)}}^{-1}(\mathcal{E}^{(\bullet)})_n$ are the identities. Moreover, for any $\mathcal{E}_{\bullet}^{(\bullet)} = (\mathcal{E}_n^{(i)}, \alpha_{m,n}^{j,i})_{i \leq j, m \leq n} \in X_{\bullet}^{(I)}$ and any $i \in I$, we have

$$\underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathcal{E}_{\bullet}^{(\bullet)}) = (\varprojlim_{n \in \mathbb{N}} \mathcal{E}_n^{(i)}, \beta^{j,i}), \tag{8.5.1.2.4}$$

where the projective limit $\varprojlim_{n \in \mathbb{N}} \mathcal{E}_n^{(i)}$ is precisely that of the functor $\mathrm{Cat}(\mathbb{N})^{\mathrm{op}} \to \mathrm{Sh}(X_{Zar})$ induced by the object $\mathcal{E}_{\bullet}^{(i)}$, where $\beta^{j,i} \colon \varprojlim_{n \in \mathbb{N}} \mathcal{E}_n^{(i)} \to \varprojlim_{m \in \mathbb{N}} \mathcal{E}_m^{(j)}$ for $i \leq j$ in I is the morphism given by functoriality from the family of morphisms $\alpha_{m,n}^{j,i}$. Hence, we have

$$\underrightarrow{i}_{\mathfrak{X}}^{-1} \underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathcal{E}_{\bullet}^{(\bullet)}) = \varprojlim_{n \in \mathbb{N}} \mathcal{E}_n^{(i)} = \underleftarrow{l}_{\mathfrak{X}*} \underrightarrow{i}_{X_{\bullet}}^{-1}(\mathcal{E}_{\bullet}^{(\bullet)}). \tag{8.5.1.2.5}$$

8.5.1.3. Let $\mathcal{E}_{\bullet}^{(\bullet)\bullet} \in K^{+}(\mathcal{D}_{\bullet}^{(\bullet)})$. Following 7.1.3.14, there exists $\mathcal{F}_{\bullet}^{(\bullet)\bullet} \in K^{+}(\mathcal{D}_{\bullet}^{(\bullet)})$ such that $\mathcal{F}_{\bullet}^{(\bullet)n}$ is a flasque $\mathcal{D}_{\bullet}^{(\bullet)}$-module for any $n \in \mathbb{Z}$ and a quasi-isomorphism $\mathcal{E}_{\bullet}^{(\bullet)\bullet} \to \mathcal{F}_{\bullet}^{(\bullet)\bullet}$ of $K^{+}(\mathcal{D}_{\bullet}^{(\bullet)})$.

Recall, following 7.1.2.19.a, a $\mathcal{D}_{\bullet}^{(\bullet)}$-module $\mathcal{G}_{\bullet}^{(\bullet)}$ is flasque if and only if $\mathcal{G}_n^{(i)}$ is a flasque sheaf on X for any $i \in I$ and $n \in \mathbb{N}$ and the morphism $\mathcal{G}_n^{(i)} \to \mathcal{G}_m^{(j)}$ is surjective in the category of presheaves on X for any $i \leq j, m \leq n$. For any $i \in I$, this yields that $\mathcal{F}_{\bullet}^{(i)\bullet} = \underrightarrow{i}_{X_{\bullet}}^{-1}(\mathcal{F}_{\bullet}^{(\bullet)\bullet})$ is a complex of flasque $\mathcal{D}_{\bullet}^{(i)}$-modules which is endowed with a quasi-isomorphism $\mathcal{E}_\bullet^{(i)\bullet} \to \mathcal{F}_\bullet^{(i)\bullet}$ of $K^+(\mathcal{D}_\bullet^{(i)})$. Hence we get the isomorphisms of $D^+(\mathcal{D}^{(i)})$:

$$\begin{aligned} \underset{\rightarrow}{i}_{\mathfrak{X}}^{-1} \circ \mathbb{R}\underset{\leftarrow}{l}_{\mathfrak{X}(I)*}(\mathcal{E}_\bullet^{(\bullet)\bullet}) &\xrightarrow{\sim} \underset{\rightarrow}{i}_{\mathfrak{X}}^{-1} \circ \underset{\leftarrow}{l}_{\mathfrak{X}(I)*}(\mathcal{F}_\bullet^{(\bullet)\bullet}) \overset{8.5.1.2.5}{\xrightarrow{\sim}} \underset{\leftarrow}{l}_{\mathfrak{X}*}\underset{\rightarrow}{i}_{X_\bullet}^{-1}(\mathcal{F}_\bullet^{(\bullet)\bullet}) \\ &= \underset{\leftarrow}{l}_{\mathfrak{X}*}(\mathcal{F}_\bullet^{(i)\bullet}) \xleftarrow{\sim} \mathbb{R}\underset{\leftarrow}{l}_{\mathfrak{X}*}(\mathcal{E}_\bullet^{(i)\bullet}) = \mathbb{R}\underset{\leftarrow}{l}_{\mathfrak{X}*}\underset{\rightarrow}{i}_{X_\bullet}^{-1}(\mathcal{E}_\bullet^{(\bullet)\bullet}). \end{aligned} \tag{8.5.1.3.1}$$

It follows from 8.5.1.3.1 that a $\mathcal{D}_\bullet^{(\bullet)}$-module $\mathcal{G}_\bullet^{(\bullet)}$ is $\underset{\leftarrow}{l}_{\mathfrak{X}(I),*}$-acyclic if and only if the $\mathcal{D}_\bullet^{(i)}$-module $\mathcal{G}_\bullet^{(i)}$ is $\underset{\leftarrow}{l}_{\mathfrak{X},*}$-acyclic for any $i \in I$.

8.5.1.4 (Bounded cohomological dimension)**.** Following 7.3.1.2, the functor $\underset{\leftarrow}{l}_{\mathfrak{X}*}$ has cohomological dimension bounded by $d+1$. By using 8.5.1.3.1 this yields that the functor $\underset{\leftarrow}{l}_{\mathfrak{X}(I)*}\colon \operatorname{Mod}(\mathcal{D}_\bullet^{(\bullet)}) \to \operatorname{Mod}(\mathcal{D}^{(\bullet)})$ has also cohomological dimension bounded by $d+1$ and then the functor $\underset{\leftarrow}{l}_{\mathfrak{X}(I)*}$ is way-out in both directions.

Following 4.6.1.6.b, for any $\mathcal{E}_\bullet^{(\bullet)\bullet} \in K(\mathcal{D}_\bullet^{(\bullet)})$ (resp. for any $\mathcal{E}_\bullet^{(\bullet)} \in K^-(\mathcal{D}_\bullet^{(\bullet)})$), there exist a complex $\mathcal{I}_\bullet^{(\bullet)\bullet} \in K(\mathcal{D}_\bullet^{(\bullet)})$ (resp. $\mathcal{I}_\bullet^{(\bullet)\bullet} \in K^-(\mathcal{D}_\bullet^{(\bullet)})$) of $\underset{\leftarrow}{l}_{\mathfrak{X}(I),*}$-acyclic left $\mathcal{D}_\bullet^{(\bullet)}$-modules and a quasi-isomorphism $\mathcal{E}_\bullet^{(\bullet)\bullet} \xrightarrow{\sim} \mathcal{I}_\bullet^{(\bullet)\bullet}$. Moreover, we have the isomorphism $\mathbb{R}\underset{\leftarrow}{l}_{\mathfrak{X}(I),*}\mathcal{E}_\bullet^{(\bullet)\bullet} \xrightarrow{\sim} \underset{\leftarrow}{l}_{\mathfrak{X}(I),*}\mathcal{I}_\bullet^{(\bullet)\bullet}$.

It follows from 8.5.1.3.1 that the functor $\underset{\rightarrow}{i}_{X_\bullet}^{-1}$ sends an $\underset{\leftarrow}{l}_{\mathfrak{X},*}$-acyclic module from a $\underset{\leftarrow}{l}_{\mathfrak{X}(I),*}$-acyclic module. Hence, similarly to 8.5.1.3.1, for any $\mathcal{E}_\bullet^{(\bullet)\bullet} \in D(\mathcal{D}_\bullet^{(\bullet)})$ we get the isomorphism

$$\underset{\rightarrow}{i}_{\mathfrak{X}}^{-1} \circ \mathbb{R}\underset{\leftarrow}{l}_{\mathfrak{X}(I)*}(\mathcal{E}_\bullet^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{R}\underset{\leftarrow}{l}_{\mathfrak{X}*} \circ \underset{\rightarrow}{i}_{X_\bullet}^{-1}(\mathcal{E}_\bullet^{(\bullet)\bullet}). \tag{8.5.1.4.1}$$

8.5.1.5. Let $\mathcal{E}^{(\bullet)\bullet} \in K^-(\mathcal{D}^{(\bullet)})$. There exists $\mathcal{F}^{(\bullet)\bullet} \in K^-(\mathcal{D}^{(\bullet)})$ such that $\mathcal{F}^{(\bullet)n}$ is a flat $\mathcal{D}^{(\bullet)}$-module for any $n \in \mathbb{Z}$ together with a quasi-isomorphism $\mathcal{E}^{(\bullet)\bullet} \to \mathcal{F}^{(\bullet)\bullet}$ of $K^-(\mathcal{D}^{(\bullet)})$. Let $i \in I$. It follows from 7.1.3.6 that $\mathcal{F}^{(i)n}$ is a flat $\mathcal{D}^{(i)}$-module for any $n \in \mathbb{Z}$ and that the induced morphism $\mathcal{E}^{(i)\bullet} \to \mathcal{F}^{(i)\bullet}$ is a quasi-isomorphism of $K^-(\mathcal{D}^{(i)})$. This yields the canonical isomorphisms

$$\begin{aligned} \underset{\rightarrow}{i}_{X_\bullet}^{-1} \circ \mathbb{L}\underset{\leftarrow}{l}_{\mathfrak{X}(I)}^{*}(\mathcal{E}^{(\bullet)\bullet}) &= \underset{\rightarrow}{i}_{X_\bullet}^{-1}(\mathcal{D}_\bullet^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)\bullet}) \xleftarrow{\sim} \underset{\rightarrow}{i}_{X_\bullet}^{-1}(\mathcal{D}_\bullet^{(\bullet)} \otimes_{\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)\bullet}) \\ &= \mathcal{D}_\bullet^{(i)} \otimes_{\mathcal{D}^{(i)}} \mathcal{F}^{(i)\bullet} \xrightarrow{\sim} \mathcal{D}_\bullet^{(i)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(i)}} \mathcal{E}^{(i)\bullet} = \mathbb{L}\underset{\leftarrow}{l}_{\mathfrak{X}}^{*}\underset{\rightarrow}{i}_{\mathfrak{X}}^{-1}(\mathcal{E}^{(\bullet)\bullet}), \end{aligned} \tag{8.5.1.5.1}$$

where $\underset{\leftarrow}{l}_{\mathfrak{X}(I)}$ is the ringed topos morphism 8.5.1.2.3.

Similarly to 7.3.1.5, we have the following definition:

Definition 8.5.1.6. Let $\mathcal{O}_{\mathfrak{X}}^{(\bullet)} := \underset{\rightarrow}{l}_{\mathfrak{X},I*}(\mathcal{O}_{\mathfrak{X}})$ be the constant inductive system with value $\mathcal{O}_{\mathfrak{X}}$ (see notation 8.1.1.2.4). Let $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{O}_{\mathfrak{X}}^{(\bullet)})$. We say $\mathcal{E}^\bullet$ is $\mathcal{O}_{\mathfrak{X}}^{(\bullet)}$*-quasi-coherent* if the following conditions holds:

(a) The complex $\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{(i)}$ has $\mathcal{O}_{X_0}$-quasi-coherent cohomology for any $i \in I$.

(b) The canonical morphism of $D^-(\mathcal{O}_{\mathfrak{X}}^{(\bullet)})$

$$\mathcal{E}^{(\bullet)} \to \mathbb{R}\underset{\leftarrow}{l}_{\mathfrak{X}(I)*}(\mathbb{L}\underset{\leftarrow}{l}_{\mathfrak{X}(I)}^{*}\mathcal{E}^{(\bullet)}), \tag{8.5.1.6.1}$$

where $\underset{\leftarrow}{l}_{\mathfrak{X}(I)}$ is the ringed topos morphism 8.5.1.2.3 in the case $\mathcal{D}^{(\bullet)} = \mathcal{O}_{\mathfrak{X}}^{(\bullet)}$, is an isomorphism.

Similarly to 7.3.1.10, we have the following quasi-coherent notion:

Definition 8.5.1.7. Let $\mathcal{O}_{X_n}^{(\bullet)} := \underset{\rightarrow}{l}_{X_n,I*}(\mathcal{O}_{X_n})$ for any $n \in \mathbb{N}$ (see notation 8.1.1.2.4). In the case where $\mathcal{D}^{(\bullet)} = \mathcal{O}_{\mathfrak{X}}^{(\bullet)}$, the sheaf of rings $\mathcal{D}_\bullet^{(\bullet)}$ is written $\mathcal{O}_{X_\bullet}^{(\bullet)}$. Let $\mathcal{E}_\bullet^{(\bullet)} \in D^-(\mathcal{O}_{X_\bullet}^{(\bullet)})$. We say $\mathcal{E}_\bullet^{(\bullet)}$ is $\mathcal{O}_{X_\bullet}^{(\bullet)}$*-quasi-coherent* if the following conditions hold:

(a) The complex $\mathcal{E}_0^{(i)}$ is in $D^-_{\mathrm{qc}}(\mathcal{O}_{X_0})$ for any $i \in I$.

(b) The canonical morphisms of $D^-(\mathcal{O}_{X_n}^{(\bullet)})$

$$\mathcal{O}_{X_n}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_{n+1}}^{(\bullet)}} \mathcal{E}_{n+1}^{(\bullet)} \to \mathcal{E}_n^{(\bullet)} \tag{8.5.1.7.1}$$

are isomorphisms for all $n \in \mathbb{N}$.

8.5.1.8. Let $* \in \{\mathrm{l}, \mathrm{r}\}$. We denote by $D^-_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)})$ (resp. $D^-_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}_\bullet)$) the full subcategory of $D^-({}^*\mathcal{D}^{(\bullet)})$ (resp. $D^-({}^*\mathcal{D}^{(\bullet)}_\bullet)$) consisting of complexes which are $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$-quasi-coherent (resp. $\mathcal{O}^{(\bullet)}_{X_\bullet}$-quasi-coherent modules) in the sense of 8.5.1.6 (resp. 8.5.1.7). The objects of $D^-_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)})$ (resp. $D^-_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}_\bullet)$) are called $\mathcal{D}^{(\bullet)}$-quasi-coherent complexes of $D^-({}^*\mathcal{D}^{(\bullet)})$ (resp. $\mathcal{D}^{(\bullet)}_\bullet$-quasi-coherent complexes of $D^-({}^*\mathcal{D}^{(\bullet)}_\bullet)$), or simply quasi-coherent complexes. Moreover, $D^-_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)})$ is a triangulated subcategory of $D^-(\mathcal{D}^{(\bullet)})$ and $D^-_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}_\bullet)$ is a triangulated subcategory of $D^-(\mathcal{D}^{(\bullet)}_\bullet)$. The full subcategory of $D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)})$ (resp. $D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}_\bullet)$) consisting of quasi-coherent complexes of finite tor dimension on $\mathcal{D}^{(\bullet)}_\bullet$ is denoted by $D_{\mathrm{qc,tdf}}({}^*\mathcal{D}^{(\bullet)})$ (resp. $D_{\mathrm{qc,tdf}}({}^*\mathcal{D}^{(\bullet)}_\bullet)$). Finally, the $\mathcal{D}^{(\bullet)}$-quasi-coherence is a local notion on $\mathfrak{X}$: 1) a complex $\mathcal{E}^{(\bullet)}$ of $D^-(\mathcal{D}^{(\bullet)})$ is quasi-coherent if and only if there exists an open covering $(\mathfrak{U}_\alpha)_\alpha$ of $\mathfrak{X}$ such that $\mathcal{E}^{(\bullet)}|_{\mathfrak{U}_\alpha}$ is quasi-coherent for any α ; 2) if $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ then $\mathcal{E}^{(\bullet)}|_{\mathfrak{U}} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}|_{\mathfrak{U}})$ for any open set $\mathfrak{U}$ of $\mathfrak{X}$. Similarly, the $\mathcal{D}^{(\bullet)}_\bullet$-quasi-coherence is a local notion on $\mathfrak{X}$.

8.5.1.9. Let $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$. It follows from the isomorphisms 8.5.1.4.1 and 8.5.1.5.1 that the property $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ is equivalent to saying $\mathcal{E}^{(i)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(i)})$ for any $i \in I$. Since this is the case when I has cardinal one, this yields this notion of quasi-coherence does not depend on the choice of the ideal of definition of $\mathfrak{X}$.

Let $\mathcal{E}^{(\bullet)}_\bullet \in D^-(\mathcal{D}^{(\bullet)}_\bullet)$. It follows from the isomorphism 8.5.1.5.1 that the property $\mathcal{E}^{(\bullet)}_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_\bullet)$ is equivalent to saying $\mathcal{E}^{(i)}_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}^{(i)}_\bullet)$ for any $i \in I$.

Let $\mathcal{E}^{(\bullet)}_\bullet \in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}_\bullet)$. It follows from the flatness properties given at 7.1.3.6 that for any integers $a \le b$, $\mathcal{E}^{(\bullet)}_\bullet$ has tor amplitude in $[a, b]$ if and only if $\mathcal{E}^{(i)}_\bullet$ has tor amplitude in $[a, b]$ for any $i \in I$. We have similar properties replacing $\mathcal{D}^{(\bullet)}_\bullet$ by $\mathcal{D}^{(\bullet)}$.

Using again the flatness properties of 7.1.3.6, we notice that the property $\mathcal{D}^{(\bullet)}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}^{(\bullet)}$) has right finite tor dimension on $\mathcal{D}^{(\bullet)}$ (resp. $\mathcal{D}^{(\bullet)}_0$) is equivalent to saying that $\mathcal{D}^{(i)}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}^{(i)}$) has right finite tor dimension on $\mathcal{D}^{(i)}$ (resp. $\mathcal{D}^{(i)}_0$) for any $i \in I$.

Theorem 8.5.1.10. *With notation 8.5.1.2, we have the following properties.*

(a) The functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ and $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ induce canonically quasi-inverse equivalences of categories between $D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_\bullet)$ and $D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$

(b) Suppose that $\mathcal{D}^{(\bullet)}_0$ (resp. $gr^\bullet_{\mathcal{I}}\mathcal{D}^{(\bullet)}$) has right finite tor dimension on $\mathcal{D}^{(\bullet)}$ (resp. $\mathcal{D}^{(\bullet)}_0$). Then the functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ and $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ induce canonically quasi-inverse equivalences of categories between $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_\bullet)$ and $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$.

(c) The functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ and $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ induce canonically quasi-inverse equivalences of categories between $D_{\mathrm{qc,tdf}}(\mathcal{D}^{(\bullet)}_\bullet)$ and $D_{\mathrm{qc,tdf}}(\mathcal{D}^{(\bullet)})$.

More precisely let $\mathcal{E}^\bullet \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ (resp. $\mathcal{E}^{(\bullet)}_\bullet \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_\bullet)$) and $a \le b$ be two integers. Then $\mathcal{E}^{(\bullet)}$ (resp. $\mathcal{E}^{(\bullet)}_\bullet$) has tor amplitude in $[a, b]$ if and only if $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}(\mathcal{E}^{(\bullet)})$ (resp. $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}\mathcal{E}^{(\bullet)}_\bullet$) has tor amplitude in $[a, b]$.

Proof. By using the isomorphisms 8.5.1.4.1 and 8.5.1.5.1 and the remarks of 8.5.1.9, this is a consequence of Theorems 7.3.2.10, 7.3.2.15. □

8.5.2 Derived completed tensor products in $D(\mathcal{D}^{(\bullet)})$ or $D(\mathcal{D}^{(\bullet)}_\bullet)$

We would extend the definition of derived completed tensor products as in 7.3.4 to the case of inductive systems and we would like to give few properties.

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. Let I be a partially ordered set. Let $\mathcal{D}^{(\bullet)}$ (resp. $\mathcal{D}'^{(\bullet)}$, resp. $\mathcal{D}''^{(\bullet)}$, resp. $\mathcal{D}'''^{(\bullet)}$) be a sheaf of rings on the topos $\mathfrak{X}^{(I)}$. We suppose there exists a homomorphism $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}^{(\bullet)}$ (resp. $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}'^{(\bullet)}$, resp. $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}''^{(\bullet)}$, resp. $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}'''^{(\bullet)}$) such that $\mathcal{D}^{(i)}$ (resp. $\mathcal{D}'^{(i)}$, resp. $\mathcal{D}''^{(i)}$, resp. $\mathcal{D}'''^{(i)}$) equipped with the induced map $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}^{(i)}$ (resp. $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}'^{(i)}$, resp. $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}''^{(i)}$, resp. $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}'''^{(i)}$) is a sheaf of rings on $\mathfrak{X}$ satisfying the conditions of 7.3.2.

8.5.2.1 (Independence of $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ and $\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}}$). We have the topoi morphisms $\underleftarrow{l}_{\mathfrak{X}^{(I)}} \colon (X^{(I)}_{\bullet}, \mathcal{D}^{(\bullet)}_{\bullet}) \to\colon (\mathfrak{X}^{(I)}, \mathcal{D}^{(\bullet)})$ and $\underleftarrow{l}_{\mathfrak{X}^{(I)}} \colon (X^{(I)}_{\bullet}, \mathbb{Z}_{X^{(I)}_{\bullet}}) \to\colon (\mathfrak{X}^{(I)}, \mathbb{Z}_{\mathfrak{X}^{(I)}})$.

(a) Both functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ can be computed by taking the same flasque resolution (see 7.1.3.14) and therefore we have the canonical commutative diagram

$$\begin{array}{ccc} D^{-}(\mathcal{D}^{(\bullet)}_{\bullet}) & \xrightarrow{\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}} & D^{-}(\mathcal{D}^{(\bullet)}) \\ \downarrow & & \downarrow \\ D^{-}(\mathbb{Z}_{X^{(I)}_{\bullet}}) & \xrightarrow{\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}} & D^{-}(\mathbb{Z}_{\mathfrak{X}^{(I)}}), \end{array}$$

where the vertical maps are the forgetful functors. We have obviously the same property for the exact functor $\underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}}$.

(b) Following 7.3.2.3.d, the canonical morphism

$$\mathcal{O}_{X^{(\bullet)}_{\bullet}} \otimes^{\mathbb{L}}_{\underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}} \mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}}(\mathcal{E}^{(\bullet)}) \to \mathcal{D}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}} \mathcal{D}^{(\bullet)}} \underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}}(\mathcal{E}^{(\bullet)}) =\colon \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}}(\mathcal{E}^{(\bullet)})$$

is an isomorphism for any $\mathcal{E}^{(\bullet)} \in D^{-}({}^{l}\mathcal{D}^{(\bullet)})$, and similarly for right modules. Hence, the functor $\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}}$ does not depend, up to canonical forgetful functor, to the choice of such $\mathcal{D}^{(\bullet)}$.

8.5.2.2. Let $\mathcal{E}^{(\bullet)} \in D^{-}({}^{l}\mathcal{D}^{(\bullet)})$, $\mathcal{M}^{(\bullet)} \in D^{-}({}^{r}\mathcal{D}^{(\bullet)})$ be two complexes of $\mathcal{D}^{(\bullet)}$-modules, respectively to the left, to the right. Similarly to 7.3.4.2.1, we define their *completed tensor product* by setting

$$\mathcal{M}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} := \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}} \mathcal{M}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}} \mathcal{E}^{(\bullet)}). \tag{8.5.2.2.1}$$

By adjunction (see 7.3.2.2), similarly to 7.3.4.3, we construct the canonical morphism in $D^{-}(\mathbb{Z}_{\mathfrak{X}^{(I)}})$ of the form

$$\mathcal{M}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \to \mathcal{M}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \tag{8.5.2.2.2}$$

which is an isomorphism when one of the two complexes belongs to $D^{-}_{\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ and the other one to $D^{-}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$.

When $\mathcal{D}^{(\bullet)}$ is commutative, we have the isomorphism of $D^{-}({}^{r}\mathcal{D}^{(\bullet)})$:

$$\mathcal{M}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*} \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}} (\mathcal{M}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)}) \tag{8.5.2.2.3}$$

and the map 8.5.2.2.2 is (modulo the canonical isomorphism 8.5.2.2.3) the adjunction morphism.

8.5.2.3. Suppose there exists a homomorphism of sheaf of rings on $\mathfrak{X}$ of the form $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ such that the composition of $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}^{(\bullet)}$ with $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ gives $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}'^{(\bullet)}$.

(a) Let $* \in \{\mathrm{l}, \mathrm{r}\}$ and $\star \in \{-, \mathrm{b}\}$. By definition (see 8.5.1.8), the forgetful functors $D^{\star}({}^{*}\mathcal{D}'^{(\bullet)}) \to D^{\star}({}^{*}\mathcal{D}^{(\bullet)})$ and $D^{\star}({}^{*}\mathcal{D}'^{(\bullet)}_{\bullet}) \to D^{\star}({}^{*}\mathcal{D}^{(\bullet)}_{\bullet})$ preserve the quasi-coherence, i.e. induces the functor

$$forg_{\mathcal{D},\mathcal{D}'} \colon D^{\star}_{\mathrm{qc}}({}^{*}\mathcal{D}'^{(\bullet)}) \to D^{\star}_{\mathrm{qc}}({}^{*}\mathcal{D}^{(\bullet)}), \qquad forg_{\mathcal{D},\mathcal{D}'} \colon D^{\star}_{\mathrm{qc}}({}^{*}\mathcal{D}'^{(\bullet)}_{\bullet}) \to D^{\star}_{\mathrm{qc}}({}^{*}\mathcal{D}^{(\bullet)}_{\bullet}). \tag{8.5.2.3.1}$$

(b) Since $\mathcal{D}^{(i)}_{\bullet}$ satisfied the condition 7.3.2.d for the left structure, then it follows from 7.3.1.14 and 8.5.1.9 that the functor $\mathcal{D}'^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} -$ preserves the quasi-coherence, i.e., induces the functor

$$\mathcal{D}'^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} - \colon D^{-}_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet}) \to D^{-}_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet}). \tag{8.5.2.3.2}$$

(c) Let $\mathcal{E}^{(\bullet)} \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)})$. Since $\mathcal{D}'^{(\bullet)}_{\bullet} \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}} \mathcal{D}'^{(\bullet)}$ (see 7.3.2.3.b), then we get

$$\mathcal{D}'^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xleftarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathcal{D}'^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}} \mathcal{E}^{(\bullet)}), \tag{8.5.2.3.3}$$

Using the preservation of the quasi-coherence under the functors $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ and $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ of 8.5.1.10, the property 8.5.2.3.2 and the isomorphism 8.5.2.3.3, we get that the functor $\mathcal{D}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}-$ preserves the quasi-coherence, i.e. induces the functor

$$\mathcal{D}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}-\colon D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}) \to D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}). \tag{8.5.2.3.4}$$

Similarly, we get the functor $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{D}'^{(\bullet)}\colon D^-_{\mathrm{qc}}({}^{r}\mathcal{D}^{(\bullet)}) \to D^-_{\mathrm{qc}}({}^{r}\mathcal{D}'^{(\bullet)})$.

In order to derive complexes of bimodules, we need further hypotheses on $\mathcal{D}^{(\bullet)}$.

Definition 8.5.2.4. Let us introduce the following definition (compare with 4.6.3.2.b). A pair $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$ consisting of a sheaf $\mathcal{R}^{(\bullet)}$ of commutative rings on the topos $\mathfrak{X}^{(I)}$ and an ideal $\mathcal{K}^{(\bullet)}$ of $\mathcal{R}^{(\bullet)}$ is said to be solving $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ if it satisfies the following conditions

(i) $\mathcal{O}_{\mathfrak{X}}$ is endowed with a structure of $\mathcal{R}^{(i)}$-algebra such that $\mathcal{K}^{(i)}\mathcal{O}_{\mathfrak{X}} = \mathcal{I}$ for any $i \in I$;

(ii) $\mathcal{R}^{(\bullet)}$ is sent to the center of $\mathcal{D}^{(\bullet)}$ and of $\mathcal{D}'^{(\bullet)}$;

(iii) $\mathcal{D}^{(\bullet)}$ and $\mathcal{D}'^{(\bullet)}$ are flat on $\mathcal{R}^{(\bullet)}$.

In that case, we say that $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ is solvable. We remark that if $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$ solves $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$, then $\mathcal{R}^{(\bullet)}_{\bullet}$ is a solving ring of $(\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{D}'^{(\bullet)}_{\bullet})$ (see Definition 4.6.3.2.b), where $\mathcal{R}^{(\bullet)}_{\bullet} := (\mathcal{R}^{(\bullet)}/(\mathcal{K}^{(\bullet)})^{i+1})_{i\in\mathbb{N}}$, $\mathcal{D}^{(\bullet)}_{\bullet} := (\mathcal{D}^{(\bullet)}/\mathcal{I}^{i+1}\mathcal{D}^{(\bullet)})_{i\in\mathbb{N}}$ and $\mathcal{D}'^{(\bullet)}_{\bullet} := (\mathcal{D}'^{(\bullet)}/\mathcal{I}^{i+1}\mathcal{D}'^{(\bullet)})_{i\in\mathbb{N}}$. Finally, $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$ solves $(\mathcal{D}^{(\bullet)}, \mathcal{I})$ means by definition that $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$ solves $(\mathcal{D}^{(\bullet)}, \mathcal{D}^{(\bullet)}, \mathcal{I})$.

A pair $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$ is said to be "strongly solving $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$" is it is solving $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ and if the following condition holds.

(iv) $\mathcal{R}^{(\bullet)}_0$ (resp. $gr^{\bullet}_{\mathcal{K}^{(\bullet)}}\mathcal{R}^{(\bullet)}$) has right finite tor dimension on $\mathcal{R}^{(\bullet)}$ (resp. $\mathcal{R}^{(\bullet)}_0$).

By flatness, remark that we have therefore $\mathcal{D}^{(\bullet)}_0$ (resp. $gr^{\bullet}_{\mathcal{I}}\mathcal{D}^{(\bullet)}$) has right finite tor dimension on $\mathcal{D}^{(\bullet)}$ (resp. $\mathcal{D}^{(\bullet)}_0$) and similarly $\mathcal{D}'^{(\bullet)}_0$ (resp. $gr^{\bullet}_{\mathcal{I}}\mathcal{D}'^{(\bullet)}$) has right finite tor dimension on $\mathcal{D}'^{(\bullet)}$ (resp. $\mathcal{D}'^{(\bullet)}_0$).

Example 8.5.2.5. We will use essentially in this book the following cases. Let $\mathfrak{S}^{\sharp}$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^{\sharp} \to \mathfrak{S}^{\sharp}$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension and is p-torsion free (see 3.3.1.12 for some example). For any integer $i \geq 0$, set $X^{\sharp}_i := X^{\sharp} \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$. Let Z be a divisor of X_0. Let $\lambda \in L(\mathbb{N})$. Then it follows from 8.7.4.2 that we can choose $I = \mathbb{N}$, $\mathcal{R}^{(\bullet)}$ is the constant inductive system with value $\mathcal{V}$, $\mathcal{K}^{(\bullet)}$ is the constant inductive system with value $\mathfrak{m}$, $\mathcal{I} = \mathfrak{m}\mathcal{O}_{\mathfrak{X}}$ and $\mathcal{D}^{(\bullet)}$ is such that $\mathcal{D}^{(m)} = \varprojlim_i \mathcal{B}^{(\lambda(m))}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X^{\sharp}_i/S^{\sharp}_i}$ for any $m \in \mathbb{N}$ with the canonical transition maps $\mathcal{D}^{(m)} \to \mathcal{D}^{(m+1)}$.

8.5.2.6. Suppose $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ is solved by $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$. Let $\mathcal{E}^{\bullet} \in K({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}})$. The following condition

(v) The structures of $\mathcal{R}^{(\bullet)}$-module induced on the $(\mathcal{D}'^{(\bullet)}, \mathcal{D}^{(\bullet)})$-bimodules $\mathcal{E}^n$ by the structure of left $\mathcal{D}'^{(\bullet)}$-module and of right $\mathcal{D}^{(\bullet)}$-module coincide for any $n \in \mathbb{Z}$;

is equivalent to saying that $\mathcal{E}^{\bullet} \in K({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{R}^{(\bullet)}} \mathcal{D}^{(\bullet)\mathrm{o}})$.

We denote by $D({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{\mathrm{r}}\mathcal{D}^{(\bullet)})$ (resp. $D({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}^{(\bullet)}_{\bullet}, {}^{\mathrm{r}}\mathcal{D}^{(\bullet)}_{\bullet})$) the strictly full subcategory of $D({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, {}^{\mathrm{r}}\mathcal{D}^{(\bullet)})$ (resp. $D({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet}, {}^{\mathrm{r}}\mathcal{D}^{(\bullet)}_{\bullet})$) consisting of complexes isomorphic to an object of $K({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{R}^{(\bullet)}} \mathcal{D}^{(\bullet)\mathrm{o}})$ (resp. $K({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet} \otimes_{\mathcal{R}^{(\bullet)}_{\bullet}} \mathcal{D}^{(\bullet)\mathrm{o}}_{\bullet})$).

8.5.2.7. Suppose $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ is solved by $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$. The functor $\underleftarrow{l}^*_{\mathfrak{X}^{(I)}} = -\otimes_{\mathcal{R}^{(\bullet)}}\mathcal{R}^{(\bullet)}_{\bullet}\colon \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}}) \to \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{D}^{(\bullet)\mathrm{r}}_{\bullet})$ is canonically isomorphic (modulo forgetful functors) to $-\otimes_{\mathcal{D}^{(\bullet)}}\mathcal{D}^{(\bullet)}_{\bullet}\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)\mathrm{r}}) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)\mathrm{r}}_{\bullet})$ and $\mathcal{D}'^{(\bullet)}_{\bullet} \otimes_{\mathcal{D}'^{(\bullet)}} -\colon \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}) \to \mathrm{Mod}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet})$.

Let $\star \in \{\emptyset, -, \mathrm{b}\}$. When $\star = \mathrm{b}$, we always suppose that $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ is strongly solved by $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$. Since $\mathcal{D}^{(\bullet)} \otimes_{\mathcal{R}^{(\bullet)}} (\mathcal{D}'^{(\bullet)})^o$ is flat over $\mathcal{D}^{(\bullet)}$, $(\mathcal{D}'^{(\bullet)})^o$ and $\mathcal{R}^{(\bullet)}$, then by using resolutions by K-flat complexes of left $\mathcal{D}'^{(\bullet)} \otimes_{\mathcal{R}^{(\bullet)}} (\mathcal{D}^{(\bullet)})^o$-modules we get the functor

$$\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}} = - \otimes^{\mathbb{L}}_{\underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}}(\mathcal{R}^{(\bullet)})} \mathcal{R}^{(\bullet)}_\bullet \colon D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}}) \to D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet) \tag{8.5.2.7.1}$$

which is canonically isomorphic to the functors $- \otimes^{\mathbb{L}}_{\underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}}(\mathcal{D}^{(\bullet)})} \mathcal{D}^{(\bullet)}_\bullet \colon D^\star(\mathcal{D}^{(\bullet)\mathrm{r}}) \to D^\star(\mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$ and $\mathcal{D}'^{(\bullet)}_\bullet \otimes^{\mathbb{L}}_{\underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}}(\mathcal{D}'^{(\bullet)})} - \colon D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}) \to D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet)$. Similarly, by using resolutions by K-injective complexes of left $\mathcal{D}'^{(\bullet)}_\bullet \otimes_{\underleftarrow{l}^{-1}_{\mathfrak{X}^{(I)}}(\mathcal{R}^{(\bullet)})} (\mathcal{D}^{(\bullet)}_\bullet)^o$-modules, we get the functor

$$\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*} \colon D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet) \to D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}\mathcal{D}^{(\bullet)\mathrm{r}}) \tag{8.5.2.7.2}$$

which is canonically isomorphic to the functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*} \colon D^\star(\mathcal{D}^{(\bullet)\mathrm{r}}_\bullet) \to D^\star(\mathcal{D}^{(\bullet)\mathrm{r}})$ and $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*} \colon \colon D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet) \to D^\star({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)})$.

Let $\mathcal{E}^{(\bullet)}_\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}})$. The property $\mathcal{E}^{(\bullet)}_\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet)$ (resp. $\mathcal{E}^{(\bullet)}_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$) is satisfied if and only if both conditions hold:

(a) The image via the forgetful functor $D^-({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_0, \mathcal{R}^{(\bullet)}_0, \mathcal{D}^{(\bullet)\mathrm{r}}_0) \to D^-({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_0) \to D^-(\mathcal{O}^{(\bullet)}_{X_0})$ (resp. $D^-({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_0, \mathcal{R}^{(\bullet)}_0, \mathcal{D}^{(\bullet)\mathrm{r}}_0) \to D^-(\mathcal{D}^{(\bullet)\mathrm{r}}_0) \to D^-(\mathcal{O}^{(\bullet)}_{X_0})$)) of the complex $\mathcal{E}^{(\bullet)}_0$ is in $D^-_{\mathrm{qc}}(\mathcal{O}^{(\bullet)}_{X_0})$.

(b) The canonical map
$$\mathcal{R}^{(\bullet)}_i \overset{\mathbb{L}}{\otimes}_{\mathcal{R}^{(\bullet)}_{i+1}} \mathcal{E}^{(\bullet)}_{i+1} \to \mathcal{E}^{(\bullet)}_i \tag{8.5.2.7.3}$$
is an isomorphism.

We denote respectively by $D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$ and $D^-_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$ the full subcategory of $D^-({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$ consisting of complexes $\mathcal{E}^{(\bullet)}_\bullet$ which belongs to $\mathcal{E}^{(\bullet)}_\bullet \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet)$ (resp. $\mathcal{E}^{(\bullet)}_\bullet \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$). Beware that the property 8.5.2.6.(v) is not necessarily satisfied for $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$ instead of $\mathcal{R}^{(\bullet)}$, so we do have to distinguish the categories $D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$ and $D^-_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$.

Similarly, we denote by $D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}})$ and $D^-_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}})$ the full subcategory of complexes $\mathcal{E}^{(\bullet)}$ which belong to $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)})$ (resp. $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)\mathrm{r}})$). It follows from Theorem 8.5.1.10 that the functors $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ of 8.5.2.7.1 and $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ of 8.5.2.7.2 induce quasi-inverse equivalences of categories between $D^-_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}})$ and $D^-_{.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$ and between $D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}})$ and $D^-_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}^{(\bullet)\mathrm{r}}_\bullet)$.

8.5.2.8. Suppose $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ and $(\mathcal{D}^{(\bullet)}, \mathcal{D}''^{(\bullet)}, \mathcal{I})$ are solved by $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$. We have the bifunctors

$$\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_\bullet}(-,-) \colon D({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)\mathrm{r}}_\bullet) \times D({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}''^{(\bullet)\mathrm{r}}_\bullet) \to D({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}''^{(\bullet)\mathrm{r}}_\bullet), \tag{8.5.2.8.1}$$

$$- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_\bullet} - \colon D({}^{*}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}_\bullet{}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, {}^{*}\mathcal{D}''^{(\bullet)}_\bullet) \to D({}^{*}\mathcal{D}'^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, {}^{*}\mathcal{D}''^{(\bullet)}_\bullet). \tag{8.5.2.8.2}$$

We have similar bifunctors by changing the indices l and r. Via the functors 8.5.2.7.1 and 8.5.2.7.2, we can check the bifunctor 8.5.2.2.1 induces

$$- \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon D({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{*}\mathcal{D}''^{(\bullet)}) \to D({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{*}\mathcal{D}''^{(\bullet)}). \tag{8.5.2.8.3}$$

Let $\mathcal{M}^{(\bullet)} \in D({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}})$, $\mathcal{E}^{(\bullet)} \in D({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{*}\mathcal{D}''^{(\bullet)})$ be two complexes. Since $\mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{M}^{(\bullet)}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_\bullet} \mathbb{L}\underleftarrow{l}^*_X(\mathcal{E}^{(\bullet)})$ (remark we have three different functors $\mathbb{L}\underleftarrow{l}^*_X$ such as 8.5.2.7.1), then we get by adjunction via the adjoint pair $(\mathbb{L}\underleftarrow{l}^*_X \dashv \mathbb{R}\underleftarrow{l}_{X*})$, (see the functors 8.5.2.7.1 and 8.5.2.7.2) the canonical morphism

$$\mathcal{M}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \to \mathcal{M}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \tag{8.5.2.8.4}$$

which is an isomorphism when either $\mathcal{M}^{(\bullet)} \in D^-_{\mathrm{coh}}(\mathcal{D}^{(\bullet)\mathrm{r}})$ and $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)})$, or $\mathcal{M}^{(\bullet)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)\mathrm{r}})$ and $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)})$. Indeed, for instance, suppose $\mathcal{M}^{(\bullet)} \in D^-_{\mathrm{coh}}(\mathcal{D}^{(\bullet)\mathrm{r}})$ and $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)})$. Then, since both functors $- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)}$ and $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{E}^{(\bullet)}$ are way-out left (use 7.3.1.2 for the second functor), then following (the way-out left version of) [Har66, I.7.1 (ii) and (iv)], since this is local, we reduce to the case where $\mathcal{M}^{(\bullet)} = \mathcal{D}^{(\bullet)}$, which is obvious.

Proposition 8.5.2.9. *Suppose* $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ *and* $(\mathcal{D}^{(\bullet)}, \mathcal{D}''^{(\bullet)}, \mathcal{I})$ *are solved by* $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$. *With* $*, ** \in \{r, l\}$, *the functors 8.5.2.8.2 and 8.5.2.8.3 preserve the quasi-coherence for bounded above complexes, i.e. they factor through the functor*

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} - \colon D^{-}_{\mathrm{qc},.}({}^{*}\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}^{(\bullet)}_{\bullet}, \mathcal{D}^{(\bullet)\mathrm{r}}_{\bullet}) \times D^{-}_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}^{(\bullet)}_{\bullet}, {}^{*}\mathcal{D}''^{(\bullet)}_{\bullet}) \to D^{-}_{\mathrm{qc},.}({}^{*}\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}^{(\bullet)}_{\bullet}, {}^{**}\mathcal{D}''^{(\bullet)}_{\bullet}), \tag{8.5.2.9.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon D^{-}_{\mathrm{qc},.}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times D^{-}_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{*}\mathcal{D}''^{(\bullet)}) \to D^{-}_{\mathrm{qc},.}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{**}\mathcal{D}''^{(\bullet)}), \tag{8.5.2.9.2}$$

and similarly replacing the indexes "qc, ." *by* "., qc".

Proof. We can copy the proof of 7.3.4.10. □

Example 8.5.2.10. When $\mathcal{D}$ is commutative, we get the factorisations

$$- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} - \colon D_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{\bullet}) \times D_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{\bullet}) \to D_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{\bullet}), \tag{8.5.2.10.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon D^{-}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}) \times D^{-}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}) \to D^{-}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}). \tag{8.5.2.10.2}$$

Proposition 8.5.2.11. *Suppose* $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$, $(\mathcal{D}^{(\bullet)}, \mathcal{D}''^{(\bullet)}, \mathcal{I})$ *and* $(\mathcal{D}''^{(\bullet)}, \mathcal{D}'''^{(\bullet)}, \mathcal{I})$ *are solved by* $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$. *Let* $*, ** \in \{r, l\}$. *Let* $\mathcal{E}^{(\bullet)} \in D^{-}_{\mathrm{qc},.}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, \mathcal{D}^{(\bullet)\mathrm{r}})$, $\mathcal{F}^{(\bullet)} \in D^{-}_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{\mathrm{r}}\mathcal{D}''^{(\bullet)})$, $\mathcal{G}^{(\bullet)} \in D^{-}_{\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}''^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{**}\mathcal{D}'''^{(\bullet)})$. *The associativity isomorphism of the derived complete tensor product of quasi-coherent complexes holds, i.e. we have the isomorphism in* $D^{-}_{\mathrm{qc},.}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}^{(\bullet)}, {}^{**}\mathcal{D}'''^{(\bullet)})$:

$$\left(\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)}\right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''^{(\bullet)}} \mathcal{G}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \left(\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}''^{(\bullet)}} \mathcal{G}^{(\bullet)}\right). \tag{8.5.2.11.1}$$

Proof. By using Theorem 8.5.1.10 and Proposition 8.5.2.9, we can copy the proof of 7.3.4.12. □

In the case of extension by ring homomorphisms, contrary to 8.5.2.11, we get the following associativity without the use of solving pairs:

Proposition 8.5.2.12. *Suppose there exists a homomorphism of sheaf of rings on* $\mathfrak{X}$ *of the form* $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)} \to \mathcal{D}''^{(\bullet)}$ *such that the composition of* $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}^{(\bullet)}$ *with* $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ *gives* $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}'^{(\bullet)}$ *and the composition of* $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}'^{(\bullet)}$ *with* $\mathcal{D}'^{(\bullet)} \to \mathcal{D}''^{(\bullet)}$ *gives* $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}''^{(\bullet)}$.

(a) For any Let $\mathcal{E}^{(\bullet)}_{\bullet} \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet})$, *we have the associativity isomorphism in* $D^{-}({}^{\mathrm{l}}\mathcal{D}''^{(\bullet)}_{\bullet})$:

$$\mathcal{D}''^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathcal{E}^{(\bullet)}_{\bullet} \xrightarrow{\sim} \left(\mathcal{D}''^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}'^{(\bullet)}_{\bullet}} \mathcal{D}'^{(\bullet)}\right) \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathcal{E}^{(\bullet)}_{\bullet} \xrightarrow{\sim} \mathcal{D}''^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}'^{(\bullet)}_{\bullet}} \left(\mathcal{D}'^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathcal{E}^{(\bullet)}_{\bullet}\right). \tag{8.5.2.12.1}$$

(b) For any $\mathcal{E}^{(\bullet)} \in D^{-}_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)})$, *we have the associativity isomorphism in* $D^{-}_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}''^{(\bullet)})$:

$$\mathcal{D}''^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \left(\mathcal{D}''^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}'^{(\bullet)}} \mathcal{D}'^{(\bullet)}\right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{D}''^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}'^{(\bullet)}} \left(\mathcal{D}'^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)}\right). \tag{8.5.2.12.2}$$

Proof. By using a flat resolution of we get the isomorphism 8.5.2.12.1. By using Theorem 8.5.1.10, we get 8.5.2.12.2 from 8.5.2.12.1. □

Proposition 8.5.2.13. *Suppose* $\mathfrak{X}$ *is quasi-compact. Suppose* $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ *is solved by* $(\mathcal{R}^{(\bullet)}, \mathcal{K}^{(\bullet)})$. *Let* $*, ** \in \{r, l\}$, $\star \in \{\mathrm{b}, -\}$. *Let* $\mathcal{E}^{(\bullet)}_{\bullet} \in D_{\mathrm{perf}}({}^{*}\mathcal{D}^{(\bullet)}_{\bullet})$, $\mathcal{F}^{(\bullet)}_{\bullet} \in D^{\star}_{.,\mathrm{qc}}({}^{*}\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}^{(\bullet)}_{\bullet}, {}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$, *Then* $\mathbb{R}\mathscr{H}om_{\mathcal{D}_{\bullet}}(\mathcal{E}^{(\bullet)}_{\bullet}, \mathcal{F}^{(\bullet)}_{\bullet}) \in D^{\star}_{\mathrm{qc}}({}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$. *If moreover* $\mathcal{F}^{(\bullet)}_{\bullet} \in D_{\mathrm{perf}}({}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$, *then* $\mathbb{R}\mathscr{H}om_{\mathcal{D}_{\bullet}}(\mathcal{E}^{(\bullet)}_{\bullet}, \mathcal{F}^{(\bullet)}_{\bullet}) \in D_{\mathrm{perf}}({}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$.

Proof. We can copy the proof of 7.3.4.17. □

8.5.3 $LD(\mathcal{D}^{(\bullet)}_\bullet)$

We keep notation 8.5.2.

8.5.3.1. Similarly to 8.1.2.2, we define the notion of ind-isogenies of a left $\mathcal{D}^{(\bullet)}_\bullet$-module as follows. Let $\mathcal{E}^{(\bullet)}_\bullet = (\mathcal{E}^{(i)}_n, \alpha^{j,i}_{m,n})_{i\le j, m\le n}$, be a left $\mathcal{D}^{(\bullet)}_\bullet$-module. For any map $\chi \in M(I)$ (see notation 8.1.2.1), for any $\mathcal{E}^{(\bullet)}_\bullet = (\mathcal{E}^{(i)}, \alpha^{j,i}_{m,n})$ we set

$$\chi^*(\mathcal{E}^{(\bullet)}_\bullet) := (\mathcal{E}^{(i)}_n, p^{\chi(j)-\chi(i)}\alpha^{j,i}_{m,n}). \tag{8.5.3.1.1}$$

We obtain the functor $\chi^*\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}_\bullet) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)}_\bullet)$ as follows: if $f^{(\bullet)}_\bullet\colon \mathcal{E}^{(\bullet)}_\bullet \to \mathcal{F}^{(\bullet)}_\bullet$ is a morphism of $\mathrm{Mod}(\mathcal{D}^{(\bullet)}_\bullet)$, then $\chi^*(f^{(\bullet)}_\bullet)\colon \chi^*(\mathcal{E}^{(\bullet)}_\bullet) \to \chi^*(\mathcal{F}^{(\bullet)}_\bullet)$ is the morphism of left $\mathcal{D}^{(\bullet)}_\bullet$-modules such that $(\chi^*(f^{(\bullet)}_\bullet))^{(i)} = f^{(i)}_\bullet$. Since the functor $\chi^*\colon \mathrm{Mod}(\mathcal{D}^{(\bullet)}_\bullet) \to \mathrm{Mod}(\mathcal{D}^{(\bullet)}_\bullet)$ is exact, then for any $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$, this induces the functor $\chi^*\colon D^\sharp(\mathcal{D}^{(\bullet)}_\bullet) \to D^\sharp(\mathcal{D}^{(\bullet)}_\bullet)$.

Notation 8.5.3.2 (Ind-isogenies)**.** (a) Let $\chi_1, \chi_2 \in M(I)$ such that $\chi_1 \le \chi_2$. For any $\mathcal{E}^{(\bullet)}_\bullet \in D(\mathcal{D}^{(\bullet)}_\bullet)$, let

$$\theta_{\mathcal{E},\chi_2,\chi_1}\colon \chi^*_{1\bullet}(\mathcal{E}^{(\bullet)}_\bullet) \to \chi^*_{2\bullet}(\mathcal{E}^{(\bullet)}_\bullet) \tag{8.5.3.2.1}$$

be the morphism defined by $p^{\chi_2(n)-\chi_1(n)}\colon \mathcal{E}^{(n)} \to \mathcal{E}^{(n)}$ for any $n \in \mathbb{N}$. When $\chi_1 = 0$, we simply write $\theta_{\mathcal{E},\chi_2}$. We get a functor $\theta_{\mathcal{E}}\colon M(I) \to D(\mathcal{D}^{(\bullet)}_\bullet)$ given by $\chi \mapsto \chi^*(\mathcal{E}^{(\bullet)}_\bullet)$, where $M(I)$ is the category associated with its structure of partially ordered set (see 7.1.2.1).

(b) A morphism $f^{(\bullet)}_\bullet\colon \mathcal{E}^{(\bullet)}_\bullet \to \mathcal{F}^{(\bullet)}_\bullet$ of $D(\mathcal{D}^{(\bullet)}_\bullet)$ is an "ind-isogeny" of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet)$ if there exist $\chi \in M(I)$ and a morphism $g^{(\bullet)}_\bullet\colon \mathcal{F}^{(\bullet)}_\bullet \to \chi^*\mathcal{E}^{(\bullet)}_\bullet$ of $D(\mathcal{D}^{(\bullet)}_\bullet)$ such that $g^{(\bullet)}_\bullet \circ f^{(\bullet)}_\bullet = \theta_{\mathcal{E},\chi}$ and $\chi^*(f^{(\bullet)}_\bullet) \circ g^{(\bullet)}_\bullet = \theta_{\mathcal{F},\chi}$. We denote by $\Xi(\mathcal{D}^{(\bullet)}_\bullet)$ the set of ind-isogenies of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet)$. For any $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$, we set $\Xi^\sharp(\mathcal{D}^{(\bullet)}_\bullet) := \Xi(\mathcal{D}^{(\bullet)}_\bullet) \cap D^\sharp(\mathcal{D}^{(\bullet)}_\bullet)$. If no confusion is possible with respect to $\mathcal{D}^{(\bullet)}_\bullet$, we simply write $\Xi^\sharp := \Xi^\sharp(\mathcal{D}^{(\bullet)}_\bullet)$.

8.5.3.3. With the notation 8.5.1.2.4, for any $\mathcal{E}^{(\bullet)}_\bullet \in \mathrm{Mod}(\mathcal{D}^{(\bullet)}_\bullet)$, we compute

$$\chi^* \circ \underleftarrow{l}_{\mathfrak{X}(I)*}(\mathcal{E}^{(\bullet)}_\bullet) = (\varprojlim_{n\in\mathbb{N}} \mathcal{E}^{(i)}_n, p^{\chi(j)-\chi(i)}\beta^{j,i}) = \underleftarrow{l}_{\mathfrak{X}(I)*}(\mathcal{E}^{(i)}_n, p^{\chi(j)-\chi(i)}\alpha^{j,i}_{m,n}) = \underleftarrow{l}_{\mathfrak{X}(I)*} \circ \chi^*(\mathcal{E}^{(\bullet)}_\bullet). \tag{8.5.3.3.1}$$

It follows from the last sentence of the paragraph 8.5.1.3 that the functor χ^* sends $\underleftarrow{l}_{\mathfrak{X}(I),*}$-acyclic modules to $\underleftarrow{l}_{\mathfrak{X}(I),*}$-acyclic modules. Hence, for any $\mathcal{E}^{(\bullet)\bullet}_\bullet \in D(\mathcal{D}^{(\bullet)}_\bullet)$, by using a resolution $\mathcal{F}^{(\bullet)\bullet}_\bullet$ of $\mathcal{E}^{(\bullet)\bullet}_\bullet$ by $\underleftarrow{l}_{\mathfrak{X}(I),*}$-acyclic modules (following 4.6.1.6.b, such resolutions exist because of the boundedness of the cohomological dimension of $\underleftarrow{l}_{\mathfrak{X}(I),*}$ of 8.5.1.4 and such resolutions compute derived functors), we get the functorial in χ isomorphism of $D(\mathcal{D}^{(\bullet)})$:

$$\chi^* \circ \mathbb{R}\underleftarrow{l}_{\mathfrak{X}(I)*}(\mathcal{E}^{(\bullet)\bullet}_\bullet) \xrightarrow{\sim} \chi^* \circ \underleftarrow{l}_{\mathfrak{X}(I)*}(\mathcal{F}^{(\bullet)\bullet}_\bullet) \overset{8.5.3.3.1}{\xrightarrow{\sim}} \underleftarrow{l}_{\mathfrak{X}(I)*} \circ \chi^*(\mathcal{F}^{(\bullet)\bullet}_\bullet) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}(I)*} \circ \chi^*(\mathcal{E}^{(\bullet)\bullet}_\bullet). \tag{8.5.3.3.2}$$

8.5.3.4. Let $\mathcal{E}^{(\bullet)\bullet} \in D(\mathcal{D}^{(\bullet)})$. Choose $\mathcal{P}^{(\bullet)\bullet}$ a K-flat complex of $K(\mathcal{D}^{(\bullet)})$ together with a quasi-isomorphism $\mathcal{P}^{(\bullet)\bullet} \to \mathcal{E}^{(\bullet)\bullet}$ of $K(\mathcal{D}^{(\bullet)})$. Following 7.1.3.6, $\mathcal{P}^{(\bullet)\bullet}$ is a K-flat complex means $\mathcal{P}^{(i)\bullet}$ is a K-flat complex of $K(\mathcal{D}^{(i)})$. Hence, using again 7.1.3.6 and the exactness of χ^*, we get that $\chi^*(\mathcal{P}^{(\bullet)\bullet})$ is a K-flat complex of $K(\mathcal{D}^{(\bullet)})$ together with a quasi-isomorphism $\chi^*\mathcal{P}^{(\bullet)\bullet} \to \chi^*\mathcal{E}^{(\bullet)\bullet}$ of $K(\mathcal{D}^{(\bullet)})$. This yields the functorial in χ and $\mathcal{E}^{(\bullet)\bullet}$ isomorphism in $D(\mathcal{D}^{(\bullet)})$:

$$\chi^* \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)}(\mathcal{E}^{(\bullet)\bullet}) \xleftarrow{\sim} \chi^* \circ \underleftarrow{l}^*_{\mathfrak{X}(I)}(\mathcal{P}^{(\bullet)\bullet}) \xrightarrow{\sim} \underleftarrow{l}^*_{\mathfrak{X}(I)} \circ \chi^*(\mathcal{P}^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)} \circ \chi^*(\mathcal{E}^{(\bullet)\bullet}). \tag{8.5.3.4.1}$$

Notation 8.5.3.5. The subset of ind-isogenies is a saturated multiplicative system compatible with its triangulated structure (this follows from Proposition 7.4.1.7 and the fact that by copying its proof we can check Lemma 8.1.2.3 is still valid replacing $\mathcal{D}^{(\bullet)}$ by $\mathcal{D}^{(\bullet)}_\bullet$). For any $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$, the localisation of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet)$ with respect to ind-isogenies is denoted by $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet)$.

8.5.3.6. We have the following notations and definitions. For any map $\lambda \in L(I)$, for any left $\mathcal{D}_{\bullet}^{(\bullet)}$-module $\mathcal{E}_{\bullet}^{(\bullet)} = (\mathcal{E}_n^{(i)}, \alpha_{m,n}^{j,i})_{i\leq j, m\leq n}$, we set

$$\lambda^*(\mathcal{E}_{\bullet}^{(\bullet)}) := (\mathcal{E}_n^{(\lambda(i))}, \alpha_{m,n}^{\lambda(j),\lambda(i)})_{i\leq j, m\leq n}.$$

We obtain the functor $\lambda^* \colon \mathrm{Mod}(\mathcal{D}_{\bullet}^{(\bullet)}) \to \mathrm{Mod}(\lambda^*\mathcal{D}_{\bullet}^{(\bullet)})$ as follows: if $f_{\bullet}^{(\bullet)} \colon \mathcal{E}_{\bullet}^{(\bullet)} \to \mathcal{F}_{\bullet}^{(\bullet)}$ is a morphism of $\mathrm{Mod}(\mathcal{D}_{\bullet}^{(\bullet)})$, then $\lambda^*(f_{\bullet}^{(\bullet)}) \colon \lambda^*(\mathcal{E}_{\bullet}^{(\bullet)}) \to \lambda^*(\mathcal{F}_{\bullet}^{(\bullet)})$ is the morphism of left $\lambda^*\mathcal{D}_{\bullet}^{(\bullet)}$-modules such that $(\lambda^*(f_{\bullet}^{(\bullet)}))^{(i)} = f_{\bullet}^{(\lambda(i))}$. Since the functor $\lambda^* \colon \mathrm{Mod}(\mathcal{D}_{\bullet}^{(\bullet)}) \to \mathrm{Mod}(\lambda^*\mathcal{D}_{\bullet}^{(\bullet)})$ is exact, then this induces the functor $\lambda^* \colon D^\sharp(\mathcal{D}_{\bullet}^{(\bullet)}) \to D^\sharp(\lambda^*\mathcal{D}_{\bullet}^{(\bullet)})$.

Notation 8.5.3.7 (Lim-isomorphims)**.** (a) Let $\lambda_1, \lambda_2 \in L(I)$. When $\lambda_1 \leq \lambda_2$, for any left $\mathcal{D}_{\bullet}^{(\bullet)}$-module $\mathcal{E}_{\bullet}^{(\bullet)} = (\mathcal{E}_n^{(i)}, \alpha_{m,n}^{j,i})_{i\leq j, m\leq n}$ we have the canonical morphism $\lambda_1^*(\mathcal{E}_{\bullet}^{(\bullet)}) \to \lambda_2^*(\mathcal{E}_{\bullet}^{(\bullet)})$ defined by the morphism $\alpha_{\bullet}^{\lambda_2(i),\lambda_1(i)} \colon \mathcal{E}_{\bullet}^{(\lambda_1(i))} \to \mathcal{E}_{\bullet}^{(\lambda_2(i))}$. The morphism $\lambda_1^*\mathcal{D}_{\bullet}^{(\bullet)} \to \lambda_2^*\mathcal{D}_{\bullet}^{(\bullet)}$ is in fact a ring homomorphism and the morphism $\lambda_1^*(\mathcal{E}_{\bullet}^{(\bullet)}) \to \lambda_2^*(\mathcal{E}_{\bullet}^{(\bullet)})$ is $\lambda_1^*\mathcal{D}_{\bullet}^{(\bullet)}$-linear. This yields the morphisms of functors $\rho_{\lambda_1,\lambda_2} \colon D^\sharp(\mathcal{D}_{\bullet}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\lambda_1^*\mathcal{D}_{\bullet}^{(\bullet)})$ (resp. $\rho_{\lambda_2,\lambda_1} \colon \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)}) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\lambda_1^*\mathcal{D}_{\bullet}^{(\bullet)})$) of the form $\lambda_1^* \to \lambda_2^*$. For any $\mathcal{E}_{\bullet}^{(\bullet)} \in \mathrm{Ob}\, D^\sharp(\mathcal{D}_{\bullet}^{(\bullet)}) = \mathrm{Ob}\, \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$, we set $\rho_{\mathcal{E},\lambda_2,\lambda_1} := \rho_{\lambda_2,\lambda_1}(\mathcal{E}_{\bullet}^{(\bullet)}) \colon \lambda_1^*(\mathcal{E}_{\bullet}^{(\bullet)}) \to \lambda_2^*(\mathcal{E}_{\bullet}^{(\bullet)})$. When $\lambda_1 = \mathrm{id}$, we set $\rho_{\mathcal{E},\lambda_2} := \rho_{\mathcal{E},\lambda_2,\mathrm{id}}$. We get a functor $\rho_{\mathcal{E}} \colon L(I) \to \underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$ given by $\rho \mapsto \rho^*(\mathcal{E}_{\bullet}^{(\bullet)})$, where $L(I)$ is the category associated with its structure of partially ordered set (see 7.1.2.1).

(b) We denote by $\Lambda^\sharp(\mathcal{D}_{\bullet}^{(\bullet)})$ the set of morphisms $f_{\bullet}^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$ such that there exist $\lambda \in L(I)$ and a morphism $g_{\bullet}^{(\bullet)} \colon \mathcal{F}_{\bullet}^{(\bullet)} \to \lambda^*\mathcal{E}_{\bullet}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$ such that $g_{\bullet}^{(\bullet)} \circ f_{\bullet}^{(\bullet)} = \rho_{\mathcal{E},\lambda}$ and $\lambda^*(f_{\bullet}^{(\bullet)}) \circ g_{\bullet}^{(\bullet)} = \rho_{\mathcal{F},\lambda}$ in $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$. If no confusion is possible with respect to $\mathcal{D}_{\bullet}^{(\bullet)}$, we simply write $\Lambda^\sharp := \Lambda^\sharp(\mathcal{D}_{\bullet}^{(\bullet)})$. The morphisms belonging to Λ are called "lim-isomorphisms".

Notation 8.5.3.8. It follows from the analogous Lemma 8.1.3.4 and Proposition 7.4.1.7 that $\Lambda^\sharp$ is a saturated multiplicative system of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$ compatible with its triangulated structure. By localizing $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$ with respect to lim-isomorphisms we get a category denoted by $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}_{\bullet}^{(\bullet)})$.

8.5.3.9. With the notation 8.5.1.2.4, for any $\lambda \in L(I)$, for any $\mathcal{E}_{\bullet}^{(\bullet)} \in \mathrm{Mod}(\mathcal{D}_{\bullet}^{(\bullet)})$, we compute

$$\lambda^* \circ \underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathcal{E}_{\bullet}^{(\bullet)}) = (\varprojlim_{n\in\mathbb{N}} \mathcal{E}_n^{(\lambda(i))}, \beta_{m,n}^{\lambda(j),\lambda(i)}) = \underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathcal{E}_n^{(\lambda(i))}, \alpha_{m,n}^{\lambda(j),\lambda(i)}) = \underleftarrow{l}_{\mathfrak{X}^{(I)}*} \circ \lambda^*(\mathcal{E}_{\bullet}^{(\bullet)}). \tag{8.5.3.9.1}$$

It follows from the last sentence of the paragraph 8.5.1.3 that the functor λ^* sends $\underleftarrow{l}_{\mathfrak{X}^{(I)},*}$-acyclic modules to $\underleftarrow{l}_{\mathfrak{X}^{(I)},*}$-acyclic modules. Hence, for any $\mathcal{E}_{\bullet}^{(\bullet)\bullet} \in D(\mathcal{D}_{\bullet}^{(\bullet)})$, by using a resolution $\mathcal{F}_{\bullet}^{(\bullet)\bullet}$ of $\mathcal{E}_{\bullet}^{(\bullet)\bullet}$ by $\underleftarrow{l}_{\mathfrak{X}^{(I)},*}$-acyclic modules (following 4.6.1.6.b, such resolutions exist because of the boundedness of the cohomological dimension of $\underleftarrow{l}_{\mathfrak{X}^{(I)},*}$ of 8.5.1.4 and such resolutions compute derived functors), we get the functorial in χ isomorphism of $D(\mathcal{D}^{(\bullet)})$:

$$\lambda^* \circ \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathcal{E}_{\bullet}^{(\bullet)\bullet}) \xrightarrow{\sim} \lambda^* \circ \underleftarrow{l}_{\mathfrak{X}^{(I)}*}(\mathcal{F}_{\bullet}^{(\bullet)\bullet}) \overset{8.5.3.9.1}{\xrightarrow{\sim}} \underleftarrow{l}_{\mathfrak{X}^{(I)}*} \circ \lambda^*(\mathcal{F}_{\bullet}^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*} \circ \lambda^*(\mathcal{E}_{\bullet}^{(\bullet)\bullet}). \tag{8.5.3.9.2}$$

8.5.3.10. Let $\lambda \in L(I)$. Let $\mathcal{E}^{(\bullet)\bullet} \in D(\mathcal{D}^{(\bullet)})$. Choose $\mathcal{P}^{(\bullet)\bullet}$ a K-flat complex of $K(\mathcal{D}^{(\bullet)})$ together with a quasi-isomorphism $\mathcal{P}^{(\bullet)\bullet} \to \mathcal{E}^{(\bullet)\bullet}$ of $K(\mathcal{D}^{(\bullet)})$. We get the functorial in λ and $\mathcal{E}^{(\bullet)\bullet}$ isomorphisms of $D(\lambda^*\mathcal{D}^{(\bullet)})$:

$$\lambda^* \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}(\mathcal{E}^{(\bullet)\bullet}) \xleftarrow{\sim} \lambda^* \circ \underleftarrow{l}^*_{\mathfrak{X}^{(I)}}(\mathcal{P}^{(\bullet)\bullet}) \xrightarrow{\sim} \underleftarrow{l}^*_{\mathfrak{X}^{(I)}} \circ \lambda^*(\mathcal{P}^{(\bullet)\bullet}) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}} \circ \lambda^*(\mathcal{E}^{(\bullet)\bullet}). \tag{8.5.3.10.1}$$

Notation 8.5.3.11. Let $(\lambda_1, \chi_1) \leq (\lambda_2, \chi_2)$ in $L(I) \times M(I)$. Let $\mathcal{E}_{\bullet}^{(\bullet)} \in D^\sharp(\mathcal{D}_{\bullet}^{(\bullet)})$. We get the canonical morphism $\chi_1^*\lambda_1^*\mathcal{E}_{\bullet}^{(\bullet)} \to \chi_2^*\lambda_2^*\mathcal{E}_{\bullet}^{(\bullet)}$ which is given by

$$\sigma_{\mathcal{E},(\lambda_2,\chi_2),(\lambda_1,\chi_1)} := \theta_{\lambda_2^*\mathcal{E},(\chi_2,\chi_1)} \circ \chi_1^*(\rho_{\mathcal{E},(\lambda_2,\lambda_1)}) = \chi_2^*(\rho_{\mathcal{E},(\lambda_2,\lambda_1)}) \circ \theta_{\lambda_1^*\mathcal{E},(\chi_2,\chi_1)} \tag{8.5.3.11.1}$$

We set $\sigma_{\mathcal{E},(\lambda_2,\chi_2)} := \sigma_{\mathcal{E},(\lambda_2,\chi_2),(\mathrm{id},0)}$.

Definition 8.5.3.12. For any $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$, let $S^\sharp(\mathcal{D}^{(\bullet)})$ be the collection of morphisms $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $D^\sharp(\mathcal{D}^{(\bullet)})$ such that there exist $\chi \in M(I)$, $\lambda \in L(I)$ and a morphism $g^{(\bullet)} \colon \mathcal{F}^{(\bullet)} \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \sigma_{\mathcal{E},(\lambda,\chi)}$ and $\chi^*\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} = \sigma_{\mathcal{F},(\lambda,\chi)}$. If no confusion is possible with respect to $\mathcal{D}^{(\bullet)}$, we simply write $S^\sharp := S^\sharp(\mathcal{D}^{(\bullet)})$. The morphisms of $S^\sharp$ are called lim-ind-isogenies.

Similarly to 8.1.4.9, we have the canonical equivalence of categories

$$S^{\sharp-1} D^\sharp(\mathcal{D}^{(\bullet)}_\bullet) \cong \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet)$$

which is the identity over the objects. f $K(\mathcal{D}^{(\bullet)} \otimes_{\mathcal{R}^{(\bullet)}} \mathcal{D}'^{(\bullet)})$.

8.5.3.13. A morphism $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ is an "ind-isogeny of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$" if there exist $\chi \in M(I)$ and a morphism $g^{(\bullet)} \colon \mathcal{F}^{(\bullet)} \to \chi^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \theta_{\mathcal{E},\chi}$ and $\chi^*(f^{(\bullet)}) \circ g^{(\bullet)} = \theta_{\mathcal{F},\chi}$. We denote by $\Xi^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ the set of ind-isogenies of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$. The localisation of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ with respect to ind-isogenies is denoted by $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$.

We denote by $\Lambda^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ the set of morphisms $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ such that there exist $\lambda \in L(I)$ and a morphism $g^{(\bullet)} \colon \mathcal{F}^{(\bullet)} \to \lambda^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{D}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \rho_{\mathcal{E},\lambda}$ and $\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} = \rho_{\mathcal{F},\lambda}$ in $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$. The morphisms belonging to $\Lambda^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ are called "lim-isomorphisms". By localising $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ with respect to lim-isomorphisms, we get the category $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$.

Let $S^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ be the collection of morphisms $f^{(\bullet)} \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ of $D^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ such that there exist $\chi \in M(I)$, $\lambda \in L(I)$ and a morphism $g^{(\bullet)} \colon \mathcal{F}^{(\bullet)} \to \chi^*\lambda^*\mathcal{E}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ such that $g^{(\bullet)} \circ f^{(\bullet)} = \sigma_{\mathcal{E},(\lambda,\chi)}$ and $\chi^*\lambda^*(f^{(\bullet)}) \circ g^{(\bullet)} = \sigma_{\mathcal{F},(\lambda,\chi)}$. The morphisms of $S^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ are called "lim-ind-isogenies". Similarly to 8.1.4.9, we have the canonical equivalence of categories

$$S^{\sharp-1} D^\sharp(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet) \cong \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$$

which is the identity over the objects. We define also the abelian category $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$. Similarly to 8.1.5.3 we establish that the canonical functor $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet) \to \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ is fully faithful.

Suppose $(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ is left or right solved by $\mathcal{R}^{(\bullet)}_\bullet$ (see definition 4.6.3.2). Then we denote by $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ (resp. $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{R}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$) the strictly full subcategory of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$ (resp. $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_\bullet, \mathcal{D}'^{(\bullet)}_\bullet)$) consisting of complexes isomorphic to a complex of $K(\mathcal{D}^{(\bullet)}_\bullet \otimes_{\mathcal{R}^{(\bullet)}_\bullet} \mathcal{D}'^{(\bullet)}_\bullet)$.

8.5.3.14. The lemma 8.3.2.2 is still valid by adding some index $\bullet$, i.e. by replacing $X^{(I)}$ by $X^{(I)}_\bullet$ and $\mathcal{D}^{(\bullet)}$ by $\mathcal{D}^{(\bullet)}_\bullet$ etc. For instance, let $\sharp \in \{\emptyset, -\}$, let $\lambda \le \mu$ be two elements of $L(I)$, and $\mathcal{F}^{(\bullet)}_\bullet \in D^\sharp(\lambda^*\mathcal{D}^{(\bullet)}_\bullet)$. The canonical morphism of $\underrightarrow{D}^\sharp_{\mathbb{Q}}(\mu^*\mathcal{D}^{(\bullet)})$

$$\mu^*\mathcal{D}^{(\bullet)}_\bullet \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}_\bullet} \mathcal{F}^{(\bullet)}_\bullet \to \mu^*\mathcal{F}^{(\bullet)}_\bullet \tag{8.5.3.14.1}$$

belongs to $\Lambda(\mu^*\mathcal{D}^{(\bullet)}_\bullet)$.

8.5.4 Quasi-coherence, finite tor dimension, tensor products in $LD_{\mathbb{Q}}$

We keep notation 8.5.2 and we suppose I is a strictly filtered partially ordered set. We set $\mathcal{D}^\dagger = \varinjlim_{i\in I} \mathcal{D}^{(i)}$, $\mathcal{D}'^\dagger = \varinjlim_{i\in I} \mathcal{D}'^{(i)}$, $\mathcal{D}''^\dagger = \varinjlim_{i\in I} \mathcal{D}''^{(i)}$. Let $\sharp \in \{-, \mathrm{b}\}$.

Definition 8.5.4.1. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We say that $\mathcal{E}^{(\bullet)}$ is *quasi-coherent* (as an object of $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$) if it is isomorphic in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ to a complex $\mathcal{F}^{(\bullet)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ (see notation 8.5.1.8), i.e., following 8.5.1.9 to a complex $\mathcal{F}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$ such that for all $i \in I$, we have $\mathcal{F}^{(i)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(i)})$. We denote by $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ the full subcategory of $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ consisting of quasi-coherent complexes.

Remark 8.5.4.2. With the notation of 8.5.1.1.b, let $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Following 8.5.1.9, the property $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ is equivalent to the property that, for any $m \in \mathbb{Z}$, $\mathcal{E}^{(m)} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Hence, the above definition of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ is equal to that of Berthelot's one formulated in [Ber02, 4.2.3] (without singularities along a divisor).

Proposition 8.5.4.3. *We have the following properties.*

(a) $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ *is a triangulated subcategory of* $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$.

(b) If $u\colon I' \to I$ *is an L-equivalence then the equivalence of 8.3.1.3.1 induces the equivalence of categories*

$$\underrightarrow{u}_X^{-1}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}). \tag{8.5.4.3.1}$$

(c) $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ *(see notation 8.4.1.1) is a full triangulated subcategory of* $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)})$.

Proof. a) Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$ such that for all $i \in I$, we have $\mathcal{E}^{(i)}, \mathcal{F}^{(i)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(i)})$. Let $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Hence, there exist $\lambda \in L(I)$, $\chi \in M(I)$ and a morphism $u^{(\bullet)}\colon \mathcal{E}^{(\bullet)} \to \chi^*\lambda^*\mathcal{F}^{(\bullet)}$ of $D(\mathcal{D}^{(\bullet)})$ representing f (see 8.1.4.12.1). For any $i \in I$, $u^{(i)}\colon \mathcal{E}^{(i)} \to \mathcal{F}^{(\lambda(i))}$ is a morphism of $D^-_{\mathrm{qc}}(\mathcal{D}^{(i)})$ which is a triangulated subcategory of $D^-(\mathcal{D}^{(i)})$. By using 8.5.1.9, this implies that the cone of $u^{(\bullet)}$ belongs to $D_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$. Hence, we are done.

b) By using 8.5.1.9, we can check that the functor $\underrightarrow{u}_X^{-1}$ factors through $D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}) \to D^-_{\mathrm{qc}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)})$. Hence, we get the functor 8.5.4.3.1. Let $\mathcal{E}^{\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. With the equivalence 8.3.1.3.1, it remains to check that if $\underrightarrow{u}_X^{-1}(\mathcal{E}^{(\bullet)})$ is quasi-coherent, then $\mathcal{E}^{(\bullet)}$ is quasi-coherence. We easily reduce to the case $I' = I$ and $\lambda := u \in L(I)$. In that case, since the canonical morphism $\mathcal{E}^{(\bullet)} \to \lambda^*(\mathcal{E}^{(\bullet)})$ is an isomorphism in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, then we are done.

c) Using theorem 8.4.1.7, we reduce to check that $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ (see notation 8.4.1.1) is a subcategory of $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)})$. Let $\mathcal{E}^{\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. We can suppose there exists $\lambda \in L(I)$ such that $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{coh}}(\lambda^*\mathcal{D}^{(\bullet)})$. Since $\mathcal{D}^{(\lambda(i))}$ is quasi-coherent, then we can apply 7.3.1.16, i.e. $D^-_{\mathrm{coh}}(\mathcal{D}^{(\lambda(i))})$ is a triangulated subcategory of $D^-_{\mathrm{qc}}(\mathcal{D}^{(\lambda(i))})$. Hence, $\mathcal{E}^{(i)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\lambda(i))})$ and therefore $\mathcal{E}^{(i)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(i)})$, i.e. $\mathcal{E}^{(\bullet)} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ (use 8.5.1.9). □

Definition 8.5.4.4. Let $\mathcal{E}^{(\bullet)}_{\bullet} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$. We say that $\mathcal{E}^{(\bullet}$ is *quasi-coherent* if it is isomorphic in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$ to a complex $\mathcal{F}^{(\bullet)}_{\bullet} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{\bullet})$ (see notation 8.5.1.8), i.e., to a complex $\mathcal{F}^{(\bullet)}_{\bullet} \in D^-(\mathcal{D}^{(\bullet)}_{\bullet})$ such that for all $i \in I$, we have $\mathcal{F}^{(i)}_{\bullet} \in D^-_{\mathrm{qc}}(\mathcal{D}^{(i)}_{\bullet})$. We denote by $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{\bullet})$ the full subcategory of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$ consisting of quasi-coherent complexes.

Theorem 8.5.4.5. *Let* $\sharp \in \{-, \mathrm{b}\}$. *In the case where* $\sharp = \mathrm{b}$ *we suppose moreover that* $\mathcal{D}^{(\bullet)}_0$ *(resp.* $gr^{\bullet}_{\mathcal{I}}\mathcal{D}^{(\bullet)}$*) has right finite tor dimension on* $\mathcal{D}^{(\bullet)}$ *(resp.* $\mathcal{D}^{(\bullet)}_0$*). Then the functors* $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ *and* $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ *induce canonically quasi-inverse equivalences of categories between* $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{\bullet})$ *and* $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)})$.

Proof. It follows from the theorem 8.5.1.10 that we reduce to check that the functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ and $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ of 8.5.1.10 preserve ind-isogenies (resp. lim-isomorphisms), which is a consequence of 8.5.3.3.2 and 8.5.3.9.2. □

Notation 8.5.4.6 (Bimodules case for quasi-coherence in LD categories)**.** We give a quasi-coherent context of the notation and hypotheses of 8.3.1.5 as follows: Let $\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}$ be two sheaves of rings on the topos $X^{(I)}$. Let $\mathcal{R}$ be a sheaf of commutative rings on $\mathfrak{X}$, $\mathcal{K}$ be an ideal of $\mathcal{R}$. We still denote by $\mathcal{R}$ (resp. $\mathcal{K}$) the constant inductive system of rings of X indexed by I with value $\mathcal{R}$ (resp. $\mathcal{K}$). Suppose $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ and $(\mathcal{D}^{(\bullet)}, \mathcal{D}''^{(\bullet)}, \mathcal{I})$ are solved by $(\mathcal{R}, \mathcal{K})$ (see definition 8.5.2.4). Set $\mathcal{R}_i := \mathcal{R} \otimes_{\mathcal{K}} \mathcal{K}^{i+1}$ for any $i \in \mathbb{N}$ and $\mathcal{R}_{\bullet} := (\mathcal{R}_i)_{i \in \mathbb{N}}$ the inductive system with the canonical transition map.

Definition 8.5.4.7. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$. We keep the notation and hypotheses of 8.5.4.6. Let $*, ** \in \{l, r\}$. We denote by $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},.,\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$ the full subcategory of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$

(see notation 8.1.4.10) consisting of complexes $\mathcal{E}^{(\bullet)}$ such that there exists $\mathcal{F}^{(\bullet)} \in D^{\sharp}_{\cdot,\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$ (see notation 8.5.2.7) together with an isomorphism in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$. We define similarly $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc},.}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$, $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc},.}({}^*\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$, $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},.,\mathrm{qc}}({}^*\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$.

Lemma 8.5.4.8. *We keep the notation and hypotheses of 8.5.4.6. Let* $*, ** \in \{l, r\}$*.*

(a) The functor $- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} -$ *factors through*

$$- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} - \colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, \mathcal{D}^{(\bullet)\mathrm{r}}_{\bullet}) \times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}''^{(\bullet)}_{\bullet}) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}''^{(\bullet)}_{\bullet}). \tag{8.5.4.8.1}$$

(b) The functor 8.5.2.8.3 induces the functor:

$$- \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}''^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}''^{(\bullet)}). \tag{8.5.4.8.2}$$

(c) Moreover, both above functors preserve the ($\mathcal{D}^{(\bullet)}$ or $\mathcal{D}'^{(\bullet)}$) quasi-coherence, e.g. we get the factorization

$$- \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc},.}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^*\mathcal{D}''^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc},.}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^*\mathcal{D}''^{(\bullet)}). \tag{8.5.4.8.3}$$

Proof. 1) Let us prove the factorisation 8.5.4.8.2. We can suppose $* = l$ and $** = r$. We need to check that the functor 8.5.2.8.3 sends a lim-ind-isogeny to a lim-ind-isogeny. Let $\mathcal{E}^{(\bullet)} \in D^{-}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}})$, $\mathcal{F}^{(\bullet)} \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{r}\mathcal{D}''^{(\bullet)})$. Let $\chi \in M(I)$, $\lambda \in L(I)$. Set $\mathcal{E}^{(\bullet)}_{\bullet} := \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}(I)}(\mathcal{E}^{(\bullet)}) \in D^{-}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, \mathcal{D}^{(\bullet)\mathrm{r}}_{\bullet})$ and $\mathcal{F}^{(\bullet)}_{\bullet} := \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}(I)}(\mathcal{F}^{(\bullet)}) \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{r}\mathcal{D}''^{(\bullet)}_{\bullet})$.

By using a resolution of $\mathcal{E}^{(\bullet)}_{\bullet}$ by flat left $\mathcal{D}'^{(\bullet)}_{\bullet} \otimes_{\mathcal{R}_{\bullet}} (\mathcal{D}^{(\bullet)}_{\bullet})^{o}$-modules, we can check there exists a morphism $\mathcal{E}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \chi^*\lambda^*\mathcal{F}^{(\bullet)}_{\bullet} \to \chi^*\lambda^*\left(\mathcal{E}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathcal{F}^{(\bullet)}_{\bullet}\right)$ making commutative the canonical diagram

$$\begin{array}{ccc} \mathcal{E}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathcal{F}^{(\bullet)}_{\bullet} & \xrightarrow{\mathrm{id} \otimes \sigma_{\mathcal{F},(\lambda,\chi)}} & \mathcal{E}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \chi^*\lambda^*\mathcal{F}^{(\bullet)}_{\bullet} \\ \downarrow \sigma_{\mathcal{E}\otimes\mathcal{F},(\lambda,\chi)} & \swarrow & \downarrow \sigma_{\mathcal{E}\otimes\chi^*\lambda^*\mathcal{F},(\lambda,\chi)} \\ \chi^*\lambda^*\left(\mathcal{E}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathcal{F}^{(\bullet)}_{\bullet}\right) & \xrightarrow[\chi^*\lambda^*(id\otimes\sigma_{\mathcal{F},(\lambda,\chi)})]{} & \chi^*\lambda^*\left(\mathcal{E}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \chi^*\lambda^*\mathcal{F}^{(\bullet)}_{\bullet}\right), \end{array} \tag{8.5.4.8.4}$$

where σ are the canonical morphisms (see notation 8.5.3.11.1) and where the square is commutative by functoriality. By applying the functor $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}(I)*}$ to the diagram 8.5.4.8.4 and by using the commutation isomorphisms 8.5.3.3.2 and 8.5.3.9.2, we get the morphism $\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\chi^*\lambda^*\mathcal{F}^{(\bullet)} \to \chi^*\lambda^*\left(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)}\right)$ making commutative the diagram:

$$\begin{array}{ccc} \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)} & \xrightarrow{\mathrm{id} \otimes \sigma_{\mathcal{F},(\lambda,\chi)}} & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\chi^*\lambda^*\mathcal{F}^{(\bullet)} \\ \downarrow \sigma_{\mathcal{E}\otimes\mathcal{F},(\lambda,\chi)} & \swarrow & \downarrow \\ \chi^*\lambda^*\left(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)}\right) & \longrightarrow & \chi^*\lambda^*\left(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\chi^*\lambda^*\mathcal{F}^{(\bullet)}\right). \end{array} \tag{8.5.4.8.5}$$

This yields the factorization $\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{r}\mathcal{D}''^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^{r}\mathcal{D}''^{(\bullet)})$ and then by functoriality,

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon D^{-}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{r}\mathcal{D}''^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^{r}\mathcal{D}''^{(\bullet)}).$$

Similarly, we get the factorization with respect to the first factor.

2) The factorisation 8.5.4.8.1 is more or less contained in the proof of 1) : this is a consequence of the commutative diagram 8.5.4.8.4.

3) The preservation of quasi-coherence follows from 8.5.2.9. □

Remark 8.5.4.9. We keep the notation and hypotheses of 8.5.4.6. Similarly to 8.5.4.8.1 (more precisely, we use a similar to 8.5.4.8.4 diagram), we check that we have the factorisation:

$$- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} - \colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}''^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}''^{(\bullet)}). \tag{8.5.4.9.1}$$

But contrary to the complete version, it does not preserves the quasi-coherence.

8.5.4.10. We keep the notation and hypotheses of 8.5.4.6. Let $\lambda \in L(I)$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}})$ (resp. either $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},.,\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}})$ or $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc},.}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}})$). Moreover, let $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{r}\mathcal{D}''^{(\bullet)})$. We have the morphisms (resp. isomorphisms) in $D({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}})$:

$$\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)} \circ \lambda^*(\mathcal{D}^{(\bullet)}) \overset{8.5.3.10.1}{\xrightarrow{\sim}} \lambda^* \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)}(\mathcal{D}^{(\bullet)}) \xleftarrow{\sim} \lambda^*(\mathcal{D}^{(\bullet)}_{\bullet}) \tag{8.5.4.10.1}$$

This yields the isomorphisms of $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\lambda^*\mathcal{D}^{(\bullet)\mathrm{r}})$

$$\begin{aligned}\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\lambda^*\mathcal{D}^{(\bullet)} = \mathbb{R}\underleftarrow{l}_{\mathfrak{X}(I)*}(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)}\mathcal{E}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)}\lambda^*\mathcal{D}^{(\bullet)}) &\overset{8.5.4.10.1}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}(I)*}(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)}\mathcal{E}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \lambda^*\mathcal{D}^{(\bullet)}_{\bullet})\\ \underset{8.5.3.14.1}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}(I)*} \circ \lambda^* \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)}(\mathcal{E}^{(\bullet)}) \overset{8.5.3.9.2}{\xrightarrow{\sim}} \lambda^* \circ \mathbb{R}\underleftarrow{l}_{\mathfrak{X}(I)*} \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(I)}(\mathcal{E}^{(\bullet)}) &\leftarrow \lambda^*\mathcal{E}^{(\bullet)}\end{aligned} \tag{8.5.4.10.2}$$

Then we have in $\underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^*\mathcal{D}''^{(\bullet)})$ the morphisms (resp. isomorphisms):

$$\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)} \overset{8.5.2.11.1}{\xrightarrow{\sim}} (\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\lambda^*\mathcal{D}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)} \underset{8.5.4.10.2}{\xleftarrow{\sim}} (\lambda^*\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)}. \tag{8.5.4.10.3}$$

Similarly, we have in $\underrightarrow{LD}^{-}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^*\mathcal{D}''^{(\bullet)})$ the isomorphisms:

$$\mathcal{E}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \overset{4.6.3.5.1}{\xrightarrow{\sim}} (\mathcal{E}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \lambda^*\mathcal{D}^{(\bullet)}) \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \underset{8.3.2.2.1}{\xrightarrow{\sim}} (\lambda^*\mathcal{E}^{(\bullet)}) \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)}. \tag{8.5.4.10.4}$$

Definition 8.5.4.11. Let $a \leq b$ be two integers. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We say that $\mathcal{E}^{(\bullet)}$ has *has finite tor dimension in* $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ (resp. *LD-tor amplitude in* $[a, b]$) if there exist $\lambda \in L(I)$ and a complex $\mathcal{F}^{(\bullet)} \in D_{\mathrm{tdf}}(\lambda^*\mathcal{D}^{(\bullet)})$ (resp. $\mathcal{F}^{(\bullet)} \in D(\lambda^*\mathcal{D}^{(\bullet)})$ of tor amplitude in $[a, b]$) together with an isomorphic in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$. We denote by $\underrightarrow{LD}_{\mathbb{Q},\mathrm{tdf}}(\mathcal{D}^{(\bullet)})$ the strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ consisting of complexes of finite tor dimension in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. We denote by $\underrightarrow{LD}_{\mathbb{Q},\mathrm{qc},\mathrm{tdf}}(\mathcal{D}^{(\bullet)})$ the full subcategory of $\underrightarrow{LD}_{\mathbb{Q},\mathrm{tdf}}(\mathcal{D}^{(\bullet)})$ consisting of quasi-coherent complexes.

Let $\mathcal{E}^{(\bullet)}_{\bullet} \in \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$. We say that $\mathcal{E}^{(\bullet)}_{\bullet}$ has *finite tor dimension in* $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$ (resp. *LD-tor amplitude in* $[a, b]$) if there exist $\lambda \in L(I)$ and a complex $\mathcal{F}^{(\bullet)}_{\bullet} \in D_{\mathrm{tdf}}(\lambda^*\mathcal{D}^{(\bullet)}_{\bullet})$ (resp. $\mathcal{F}^{(\bullet)}_{\bullet} \in D(\lambda^*\mathcal{D}^{(\bullet)}_{\bullet})$ of tor amplitude in $[a, b]$) together with an isomorphic in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$ of the form $\mathcal{E}^{(\bullet)}_{\bullet} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}_{\bullet}$. We denote by $\underrightarrow{LD}_{\mathbb{Q},\mathrm{tdf}}(\mathcal{D}^{(\bullet)}_{\bullet})$ the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$ consisting of complexes of finite tor dimension in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{\bullet})$. We denote by $\underrightarrow{LD}_{\mathbb{Q},\mathrm{qc},\mathrm{tdf}}(\mathcal{D}^{(\bullet)})$ the full subcategory of $\underrightarrow{LD}_{\mathbb{Q},\mathrm{tdf}}(\mathcal{D}^{(\bullet)})$ consisting of quasi-coherent complexes.

Remark 8.5.4.12. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},\mathrm{qc},\mathrm{tdf}}(\mathcal{D}^{(\bullet)})$. Then this is not clear there exist $\lambda \in L(I)$ and a complex $\mathcal{F}^{(\bullet)} \in D_{\mathrm{qc},\mathrm{tdf}}(\lambda^*\mathcal{D}^{(\bullet)})$ (see notation 8.5.1.8) together with an isomorphic in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$.

Notation 8.5.4.13. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$. Let $*, ** \in \{l, r\}$. We keep the notation and hypotheses of 8.5.4.6. We denote by $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},.,\mathrm{tdf}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$ the full subcategory of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$ consisting of complexes $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$ (see notation 8.1.4.10) such that there exist $\lambda \in L(I)$ and $\mathcal{F}^{(\bullet)} \in D^{\sharp}_{.,\mathrm{tdf}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\lambda^*\mathcal{D}'^{(\bullet)})$ (see notation 8.5.2.7) together with an isomorphism in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$. We define similarly $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{tdf},.}({}^*\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}'^{(\bullet)})$, $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{tdf},.}({}^*\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$, $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},.,\mathrm{tdf}}({}^*\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}'^{(\bullet)}_{\bullet})$.

Lemma 8.5.4.14. *We keep the notation and hypotheses of 8.5.4.6.*

(a) The functor $- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} -$ *factors through*

$$- \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} - \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, \mathcal{D}^{(\bullet)\mathrm{r}}_{\bullet}) \times \underrightarrow{LD}_{\mathbb{Q},.,\mathrm{tdf}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}''^{(\bullet)}_{\bullet}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^*\mathcal{D}'^{(\bullet)}_{\bullet}, \mathcal{R}_{\bullet}, {}^{**}\mathcal{D}''^{(\bullet)}_{\bullet}). \tag{8.5.4.14.1}$$

(b) *The functor 8.5.2.8.3 induces the functor:*

$$- \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times \underrightarrow{LD}_{\mathbb{Q},\mathrm{tdf},.}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}''^{(\bullet)}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^{**}\mathcal{D}''^{(\bullet)}). \tag{8.5.4.14.2}$$

(c) *Moreover, both functors preserve the quasi-coherence, e.g. we get the factorization*

$$- \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}, \mathcal{D}^{(\bullet)\mathrm{r}}) \times \underrightarrow{LD}_{\mathbb{Q},\mathrm{qc},\mathrm{tdf},.}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}, \mathcal{R}, {}^{*}\mathcal{D}''^{(\bullet)}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{*}\mathcal{D}'^{(\bullet)}, \mathcal{R}, {}^{*}\mathcal{D}''^{(\bullet)}). \tag{8.5.4.14.3}$$

Proof. By using the isomorphisms 8.5.4.10.3, 8.5.4.10.4 and the Lemma 8.3.2.9 we get the boundedness of the functors of Lemma 8.5.4.8. □

Theorem 8.5.4.15. *The functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ and $\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}}$ induce canonically quasi-inverse equivalences of categories between $D_{\mathrm{qc,tdf}}(\mathcal{D}^{(\bullet)}_{\bullet})$ and $D_{\mathrm{qc,tdf}}(\mathcal{D}^{(\bullet)})$.*

More precisely let $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)})$ (resp. $\mathcal{E}^{(\bullet)}_{\bullet} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{\bullet})$) and $a \leq b$ be two integers. Then $\mathcal{E}^{(\bullet)}$ (resp. $\mathcal{E}^{(\bullet)}_{\bullet}$) has LD-tor amplitude in $[a,b]$ if and only if $\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}}(\mathcal{E}^{(\bullet)})$ (resp. $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}\mathcal{E}^{(\bullet)}_{\bullet}$) has LD-tor amplitude in $[a,b]$.

Proof. It follows from the theorem 8.5.1.10 that we reduce to check that the functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)}*}$ and $\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(I)}}$ of 8.5.1.10 preserve ind-isogenies (resp. lim-isomorphisms), which is a consequence of the functoriality of the isomorphisms 8.5.3.3.2 and 8.5.3.9.2. □

8.5.4.16. Suppose there exists a homomorphism of sheaf of rings on $\mathfrak{X}$ of the form $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ such that the composition of $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}^{(\bullet)}$ with $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ gives $\mathcal{O}^{(\bullet)}_{\mathfrak{X}} \to \mathcal{D}'^{(\bullet)}$.

(a) Let $* \in \{\mathrm{l},\mathrm{r}\}$ and $\star \in \{-,\mathrm{b}\}$. Since the functors $\mathrm{forg}_{\mathcal{D},\mathcal{D}'}$ of 8.5.2.3.1 send a lim-ind-isogeny to a lim-ind-isogeny, then we obtain the factorization of the form:

$$forg_{\mathcal{D},\mathcal{D}'}\colon \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\mathcal{D}^{(\bullet)}), forg_{\mathcal{D},\mathcal{D}'}\colon \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\mathcal{D}'^{(\bullet)}_{\bullet}) \to \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\mathcal{D}^{(\bullet)}_{\bullet}). \tag{8.5.4.16.1}$$

When $\mathcal{D}^{(\bullet)} \to \mathcal{D}'^{(\bullet)}$ is flat, we get the factorization

$$forg_{\mathcal{D},\mathcal{D}'}\colon \underrightarrow{LD}_{\mathbb{Q},\mathrm{qc,tdf}}({}^{*}\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}_{\mathbb{Q},\mathrm{qc,tdf}}({}^{*}\mathcal{D}^{(\bullet)}). \tag{8.5.4.16.2}$$

(b) Following 8.3.2.2.(a), the functor 8.5.2.3.2 sends a lim-ind-isogeny to a lim-ind-isogeny, then we obtain the factorization of the form:

$$\mathcal{D}'^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} -\colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet}) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}_{\bullet}). \tag{8.5.4.16.3}$$

If $\mathcal{E}^{(\bullet)}_{\bullet} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\bullet})$ has LD-tor amplitude in $[a,b]$, then so is $\mathcal{D}'^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\bullet}} \mathcal{E}^{(\bullet)}_{\bullet}$.

(c) Following 8.3.2.2.(a), the functor 8.5.2.3.4 sends a lim-ind-isogeny to a lim-ind-isogeny. We obtain therefore the factorization of the form:

$$\mathcal{D}'^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}). \tag{8.5.4.16.4}$$

If $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)})$ has LD-tor amplitude in $[a,b]$, then so is $\mathcal{D}'^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)}$ (use Theorem 8.5.4.15).

Similarly, we get the functor $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{D}'^{(\bullet)}\colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{r}\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{r}\mathcal{D}'^{(\bullet)})$.

Proposition 8.5.4.17. *With the notation 8.5.4.16, the functor 8.5.4.16.4 preserves the coherence and induces:*

$$\mathcal{D}'^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} -\colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}'^{(\bullet)}). \tag{8.5.4.17.1}$$

Moreover, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$, the canonical morphism of $D^{-}(\mathcal{D}^{(\bullet)})$ (see 8.5.2.2.2)

$$\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \to \mathcal{D}'^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \tag{8.5.4.17.2}$$

is an isomorphism in $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}'^{(\bullet)})$.

Proof. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. By hypothesis, there exist $\lambda \in L(I)$ and $\mathcal{F}^{(\bullet)} \in D^{-}_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$. This yields the isomorphism of $\underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$

$$\mathcal{D}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{D}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)} \underset{8.5.4.10.3}{\xrightarrow{\sim}} \lambda^{*}\mathcal{D}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\lambda^{*}\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)}. \tag{8.5.4.17.3}$$

Since $\mathcal{F}^{(\bullet)} \in D^{-}_{\mathrm{coh}}(\lambda^{*}\mathcal{D}^{(\bullet)})$, then the canonical morphism of $D^{-}(\lambda^{*}\mathcal{D}'^{(\bullet)})$

$$\lambda^{*}\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\lambda^{*}\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \to \lambda^{*}\mathcal{D}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\lambda^{*}\mathcal{D}^{(\bullet)}}\mathcal{F}^{(\bullet)} \tag{8.5.4.17.4}$$

is an isomorphism (see 8.5.2.2.2) and therefore its target belongs to $D^{-}_{\mathrm{coh}}(\lambda^{*}\mathcal{D}'^{(\bullet)})$. Hence, it follows from the isomorphism 8.5.4.17.3 that we get the factorization 8.5.4.17.1. We have moreover the isomorphisms of $\underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$

$$\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)} \underset{8.5.4.10.4}{\xrightarrow{\sim}} \lambda^{*}\mathcal{D}'^{(\bullet)} \otimes^{\mathbb{L}}_{\lambda^{*}\mathcal{D}^{(\bullet)}} \mathcal{F}^{(\bullet)}. \tag{8.5.4.17.5}$$

By composing 8.5.4.17.3, 8.5.4.17.4 and 8.5.4.17.5, we get the isomorphism 8.5.4.17.2.

Similarly, we get the functor $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}}\mathcal{D}'^{(\bullet)} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}({}^{r}\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{coh}}({}^{r}\mathcal{D}'^{(\bullet)})$.

□

8.5.4.18. Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0,p)$ with maximal ideal $\mathfrak{m}$. Let $\mathfrak{S}^{\sharp}$ be a nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10, $\mathfrak{X}^{\sharp}$ be a log smooth $\mathfrak{S}^{\sharp}$-log-formal scheme. For any $m \in \mathbb{N}$, let $\mathcal{B}^{(m)}_{\mathfrak{X}}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible structure of $\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$-module and satisfying the hypotheses of 7.3.2. We suppose that, for any $m \in \mathbb{N}$, we have a morphism of $\mathcal{O}_{\mathfrak{X}}$-algebras $\mathcal{B}^{(m)}_{\mathfrak{X}} \to \mathcal{B}^{(m+1)}_{\mathfrak{X}}$ which is moreover $\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$-linear. This yields the homomorphism $\mathcal{B}^{(m)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} \to \mathcal{B}^{(m+1)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m+1)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$ of sheaves of rings on $\mathfrak{X}$ and we denote by $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} := (\mathcal{B}^{(m)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})_{m\in\mathbb{N}}$ the corresponding object of $\mathfrak{X}^{(\mathbb{N})}$. Let $* \in \{\mathrm{l},\mathrm{r}\}$. In the case where $\mathcal{D}^{(\bullet)} = \mathcal{B}^{(\bullet)}_{\mathfrak{X}}$ (resp. $\mathcal{D}^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$), we set $\mathcal{B}^{(\bullet)}_{X_{\bullet}} := \mathcal{D}^{(\bullet)}_{\bullet}$ (resp. $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}} := \mathcal{D}^{(\bullet)}_{\bullet}$). In both cases, we have the ringed topos

$$\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}} = (\underleftarrow{l}^{-1}_{\mathfrak{X}^{(\mathbb{N})}} \dashv \underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}) \colon (X^{(\mathbb{N})}_{\bullet}, \mathcal{D}^{(\bullet)}_{\bullet}) \to (\mathfrak{X}^{(\mathbb{N})}, \mathcal{D}^{(\bullet)}). \tag{8.5.4.18.1}$$

Since $\mathcal{B}^{(\bullet)}_{\mathfrak{X}} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$ is flat, for any $\mathcal{E}^{(\bullet)} \in D(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$, it follows from 4.3.4.6.1 that by taking K-flat representation of $\mathcal{E}^{(\bullet)}$ we get the canonical morphism

$$\mathcal{B}^{(\bullet)}_{X_{\bullet}} \otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}} \mathcal{E}^{(\bullet)} \tag{8.5.4.18.2}$$

is an isomorphism.

8.5.4.19. We keep notation 8.5.4.18. Since a resolution of $\mathcal{F}^{(\bullet)}_{\bullet}$ by flat left $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}$-modules is also a resolution by flat $\mathcal{B}^{(\bullet)}_{X_{\bullet}}$-modules, then it follows from 4.2.3.1 that we have the tensor product

$$-\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_{\bullet}}} - \colon D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) \times D^{-}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) \to D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}).$$

By copying the proof of 8.5.4.8, we can check it preserves lim-ind-isogenies and we get therefore the bifunctor

$$-\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_{\bullet}}} - \colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) \times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) \tag{8.5.4.19.1}$$

making commutative the diagram

$$\begin{array}{ccc}
\underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{X_{\bullet}}) \times \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{X_{\bullet}}) & \xrightarrow[8.5.4.8.1]{-\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_{\bullet}}}-} & \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{X_{\bullet}}) \\
\uparrow & & \uparrow \\
\underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) \times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) & \xrightarrow{-\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_{\bullet}}}-} & \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}})
\end{array} \tag{8.5.4.19.2}$$

The bifunctor 8.5.4.19.1 preserves the quasi-coherence.

Lemma 8.5.4.20. *Let us keep notation 8.5.4.18. We have the bifunctor*

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}-\colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})\times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})\to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}) \tag{8.5.4.20.1}$$

making commutative the diagram

$$\begin{array}{ccc}
\underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}})\times \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}) & \xrightarrow[8.5.4.8.2]{-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}-} & \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}) \\
\uparrow & & \uparrow \\
\underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})\times \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}) & \xrightarrow{-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}-} & \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}).
\end{array} \tag{8.5.4.20.2}$$

The bifunctor 8.5.4.20.1 preserves the quasi-coherence and corresponds to 8.5.4.19.1 via the equivalence of categories of Theorem 8.5.1.10, i.e. we have the commutative (up to canonical isomorphism) diagram:

$$\begin{array}{ccc}
\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}})\times \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) & \xrightarrow{-\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_{\bullet}}}-} & \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}) \\
\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}\times\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}\uparrow\ \downarrow\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}\times\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*} & & \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}\uparrow\ \downarrow\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*} \\
\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})\times \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}) & \xrightarrow{-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}-} & \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}).
\end{array} \tag{8.5.4.20.3}$$

Proof. 1) First, we check we have a commutative diagram like 8.5.4.20.2 but with $\underrightarrow{LD}^{-}_{\mathbb{Q}}$ replaced by D^{-}. Let $\mathcal{E}^{(\bullet)}\in D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$. It follows from 4.4.4.1.4, that the canonical morphism

$$\mathcal{B}^{(\bullet)}_{X_{\bullet}}\otimes_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)}\to \widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}\otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}}\mathcal{E}^{(\bullet)}=:\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)})$$

is an isomorphism in $D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}})$. We set $\mathcal{E}^{(\bullet)}_{\bullet}:=\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)})\in D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}})$, $\mathcal{F}^{(\bullet)}_{\bullet}:=\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{F}^{(\bullet)})\in D^{-}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}})$. Hence, by applying $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}$ and by definition (see 8.5.2.2.1), we get

$$\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}\mathcal{F}^{(\bullet)}\xrightarrow{\sim}\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}\left(\mathcal{E}^{(\bullet)}_{\bullet}\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_{\bullet}}}\mathcal{F}^{(\bullet)}_{\bullet}\right)\in D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}). \tag{8.5.4.20.4}$$

2) We can copy the proof of 8.5.4.8 to get the localized functor with respect to lim-ind-isogenies. Moreover, by construction we get the commutative diagram 8.5.4.20.3 up to canonical isomorphism. □

Lemma 8.5.4.21. *Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0,p)$ with maximal ideal $\mathfrak{m}$. Let $\mathfrak{S}^{\sharp}$ be a nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10, $\mathfrak{X}^{\sharp}$ be a log smooth $\mathfrak{S}^{\sharp}$-log-formal scheme. For any $m\in\mathbb{N}$, let $\mathcal{B}^{(m)}_{\mathfrak{X}}$ and $\mathcal{C}^{(m)}_{\mathfrak{X}}$ be two commutative $\mathcal{O}_{\mathfrak{X}}$-algebras endowed with a compatible structure of $\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$-module and satisfying the hypotheses of 7.3.2. We suppose that, for any $m\in\mathbb{N}$, we have the commutative diagram*

$$\begin{array}{ccc}
\mathcal{B}^{(m)}_{\mathfrak{X}} & \longrightarrow & \mathcal{B}^{(m+1)}_{\mathfrak{X}} \\
\downarrow & & \downarrow \\
\mathcal{C}^{(m)}_{\mathfrak{X}} & \longrightarrow & \mathcal{C}^{(m+1)}_{\mathfrak{X}}
\end{array} \tag{8.5.4.21.1}$$

whose arrows are both morphisms of $\mathcal{O}_{\mathfrak{X}}$-algebras and morphisms of left $\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$-modules. With notation 8.5.4.20, this yields the homomorphism of sheaves of rings on $\mathfrak{X}^{(\mathbb{N})}$ of the form $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}\to\mathcal{C}^{(\bullet)}_{\mathfrak{X}}$ and $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}\to\mathcal{C}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$.

(a) *For any* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{B}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{C}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$*, we have the canonical morphism of* $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\mathcal{C}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$

$$\mathcal{F}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{C}^{(\bullet)}_{\mathfrak{X}}}\left(\mathcal{C}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)}\right). \tag{8.5.4.21.2}$$

(b) *For any* $\mathcal{E}^{(\bullet)} \in D^{-}({}^{\mathrm{l}}\mathcal{B}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$ *the canonical morphism of* $D^{-}({}^{\mathrm{l}}\mathcal{C}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$

$$\mathcal{C}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)} \to (\mathcal{C}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}}\mathcal{E}^{(\bullet)} \tag{8.5.4.21.3}$$

is an isomorphism.

Proof. By using 4.3.4.12.1, we get the isomorphism of $D^{-}({}^{\mathrm{l}}\mathcal{C}^{(\bullet)}_{X_\bullet} \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}})$

$$\mathcal{F}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_\bullet}} \mathcal{E}^{(\bullet)}_{\bullet} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}_{\bullet} \otimes^{\mathbb{L}}_{\mathcal{C}^{(\bullet)}_{X_\bullet}} \left(\mathcal{C}^{(\bullet)}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_\bullet}} \mathcal{E}^{(\bullet)}_{\bullet}\right). \tag{8.5.4.21.4}$$

Hence, via the quasi-inverse equivalences of categories of 8.5.4.5, we get 8.5.4.21.2 from 8.5.4.21.4. Similarly, the isomorphism 8.5.4.21.3 follows from 4.3.4.6.1 and from the quasi-inverse equivalences of categories of 8.5.4.5. □

Remark 8.5.4.22. Beware the isomorphism 8.5.4.21.2 might be wrong if complexes are not quasi-coherent.

8.5.5 Strongly quasi-flat relative I-ringed $\mathcal{V}$-log formal schemes

In order to give examples when we can apply for instance theorems 8.5.4.5 and 8.5.4.15 in the context of bounded quasi-coherent complexes, let us introduce the following notion of relative I-ringed $\mathcal{V}$-log formal scheme.

Definition 8.5.5.1. We fix I is a partially ordered set. For convenience, let us define the following categories.

(a) We define the category of "I-ringed $\mathcal{V}$-log formal scheme" as follows:

   (i) Its objects consist in pairs $(\mathfrak{X}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}})$ where $\mathfrak{X}^{\sharp}$ is a $\mathcal{V}$-log formal scheme, $\mathfrak{X}$ is the underlying topological space of $\mathfrak{X}^{\sharp}$, $\mathfrak{X}^{(\bullet)} = \mathfrak{X}^{(I)}$, and $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}$ is a commutative $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$-algebra. The underlying ringed I-topos of $(\mathfrak{X}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}})$ is $(\mathfrak{X}^{(\bullet)}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}})$.

   (ii) A morphism of I-ringed $\mathcal{V}$-log formal scheme $(\mathfrak{X}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}}) \to (\mathfrak{Y}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{Y}})$ is the data a morphism of log schemes of the form $\alpha\colon \mathfrak{X}^{\sharp} \to \mathfrak{Y}^{\sharp}$ and of a morphism of $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$-algebras $\alpha^{*}\mathcal{B}^{(\bullet)}_{\mathfrak{Y}} \to \mathcal{B}^{(\bullet)}_{\mathfrak{X}}$.

(b) We define the category of "relative I-ringed $\mathcal{V}$-log formal scheme" as follows: a "relative I-ringed $\mathcal{V}$-log formal scheme" $(\mathfrak{X}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}})/(\mathfrak{Y}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{Y}})$ is a morphism of I-ringed $\mathcal{V}$-log formal schemes of the form $(\mathfrak{X}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}}) \to (\mathfrak{Y}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{Y}})$. A morphism of relative I-ringed $\mathcal{V}$-log formal schemes $(\mathfrak{X}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}})/(\mathfrak{Y}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{Y}}) \to (\mathfrak{X}'^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}'})/(\mathfrak{Y}'^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{Y}'})$ is a commutative square of the form

$$\begin{array}{ccc} (\mathfrak{X}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}}) & \xrightarrow{f} & (\mathfrak{X}'^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{X}'}) \\ \downarrow{\scriptstyle \alpha} & & \downarrow{\scriptstyle \alpha'} \\ (\mathfrak{Y}^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{Y}}) & \xrightarrow{g} & (\mathfrak{Y}'^{\sharp}, \mathcal{B}^{(\bullet)}_{\mathfrak{Y}'}), \end{array} \tag{8.5.5.1.1}$$

such that the arrows are morphisms of I-ringed $\mathcal{V}$-log formal schemes.

Example 8.5.5.2. A (logarithmic) $\mathcal{V}$-formal scheme can be viewed as a I-ringed $\mathcal{V}$-log formal scheme via the faithfully flat functor given by $\mathfrak{X}^{\sharp} \mapsto (\mathfrak{X}^{\sharp}, \mathcal{O}^{(\bullet)}_{\mathfrak{X}})$. By abuse of notation, we can simply write $\mathfrak{X}^{\sharp}$ for $(\mathfrak{X}^{\sharp}, \mathcal{O}^{(\bullet)}_{\mathfrak{X}})$.

Definition 8.5.5.3. Let $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(\bullet)})/\mathfrak{S}^\sharp$ be a relative I-ringed $\mathcal{V}$-log formal scheme.

(a) We say that $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(\bullet)})/\mathfrak{S}^\sharp$ is quasi-flat, if there exists a morphism $\mathfrak{S} \to \mathfrak{T}$ of $\mathcal{V}$-formal schemes such that the induced morphism of ringed spaces $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(i)}) \to \mathfrak{T}$ is flat, for any $i \in I$.

(b) We say that $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(\bullet)})/\mathfrak{S}^\sharp$ is strongly quasi-flat if there exists a morphism $\mathfrak{S} \to \mathfrak{T}$ of $\mathcal{V}$-formal schemes such that the induced morphism of ringed spaces $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(i)}) \to \mathfrak{T}$ is flat for any $i \in I$ and such that, denoting by $\mathcal{I}_{\mathfrak{T}}$ an ideal of definition of $\mathfrak{T}$, the sheaf $\mathcal{O}_{T_0}$ (resp. $gr^{\bullet}_{\mathcal{I}_{\mathfrak{T}}} \mathcal{O}_{\mathfrak{T}}$) has finite tor dimension on $\mathcal{O}_{\mathfrak{T}}$ (resp. $\mathcal{O}_{T_0}$).

(c) Let $\widetilde{\alpha} \colon (\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(\bullet)})/\mathfrak{S}^\sharp \to (\mathfrak{X}'^\sharp, \mathcal{B}_{\mathfrak{X}'}^{(\bullet)})/\mathfrak{S}'^\sharp$ be a morphism of relative I-ringed $\mathcal{V}$-log formal schemes. We say that $\widetilde{\alpha}$ is "strongly quasi-flat" if there exists a morphism $\mathfrak{S} \to \mathfrak{T}$ of $\mathcal{V}$-formal schemes such that both induced morphisms of ringed spaces $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(i)}) \to \mathfrak{T}$ and $(\mathfrak{X}'^\sharp, \mathcal{B}_{\mathfrak{X}'}^{(i)}) \to \mathfrak{T}$ are flat for any $i \in I$ and such that denoting by $\mathcal{I}_{\mathfrak{T}}$ an ideal of definition of $\mathfrak{T}$ the sheaf $\mathcal{O}_{T_0}$ (resp. $gr^{\bullet}_{\mathcal{I}_{\mathfrak{T}}} \mathcal{O}_{\mathfrak{T}}$) has finite tor dimension on $\mathcal{O}_{\mathfrak{T}}$ (resp. $\mathcal{O}_{T_0}$). Remark that in both $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(\bullet)})/\mathfrak{S}^\sharp$ and $(\mathfrak{X}'^\sharp, \mathcal{B}_{\mathfrak{X}'}^{(\bullet)})/\mathfrak{S}^\sharp$ are strongly quasi-flat.

8.5.5.4. The notion of strong quasi-flatness is interesting because of the following: With notation 8.5.4.18, suppose that $(\mathfrak{X}^\sharp, \mathcal{B}_{\mathfrak{X}}^{(\bullet)})/\mathfrak{S}^\sharp$ is strongly quasi-flat in the sense of 8.5.5.3. Set $\mathcal{D}^{(\bullet)} := \mathcal{B}_{\mathfrak{X}}^{(\bullet)}$ (resp. $\mathcal{D}^{(\bullet)} := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$). By definition (resp. and by flatness of the homomorphism $\mathcal{B}_{\mathfrak{X}}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$), we get that $\mathcal{D}_0^{(\bullet)}$ (resp. $gr^{\bullet}_{\mathcal{I}} \mathcal{D}^{(\bullet)}$) has right and left finite tor dimension on $\mathcal{D}^{(\bullet)}$ (resp. $\mathcal{D}_0^{(\bullet)}$). Hence, we can apply for instance theorems 8.5.4.5 and 8.5.4.15.

The main example of such context will be given at 8.7.4.2.

8.6 Duality

Let I be a partially ordered set and let X be a topological space. Let $\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}$ be two sheaves of rings on the topos $X^{(I)}$. Let $\mathcal{R}$ be a sheaf of commutative rings on $\mathfrak{X}$, $\mathcal{K}$ be an ideal of $\mathcal{R}$. We still denote by $\mathcal{R}$ (resp. $\mathcal{K}$) the constant inductive system of rings of X indexed by I with value $\mathcal{R}$ (resp. $\mathcal{K}$). Suppose $(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)}, \mathcal{I})$ is solved by $(\mathcal{R}, \mathcal{K})$ (see definition 8.5.2.4).

8.6.1 Perfectness in $LD_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$, comparison with the $\mathcal{D}^{\dagger}_{\mathbb{Q}}$-perfectness

Definition 8.6.1.1. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. The complex $\mathcal{E}^{(\bullet)}$ is said to be perfect if there exist $\lambda \in L(I)$ and $\mathcal{F}^{(\bullet)} \in D_{\mathrm{perf}}(\lambda^* \mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$.

Remark 8.6.1.2. Beware that this is not clear that the perfectness in the sense of 8.6.1.1 is local on X or on $X^{(\bullet)}$.

8.6.1.3. Let $\lambda \in L(I)$. Following 7.1.3.13, $\mathcal{F}^{(\bullet)} \in D_{\mathrm{perf}}(\lambda^* \mathcal{D}^{(\bullet)})$ means that $\mathcal{F}^{(\bullet)}$ satisfies the following conditions:

(i) For any $i \in I$, $\mathcal{F}^{(i)} \in D_{\mathrm{perf}}(\mathcal{D}^{(\lambda(i))})$;

(ii) For any $i, j \in I$ such that $i \leq j$, the canonical homomorphism

$$\mathcal{D}^{(\lambda(j))} \otimes^{\mathbb{L}}_{\mathcal{D}^{(\lambda(i))}} \mathcal{F}^{(\lambda(i))} \to \mathcal{F}^{(\lambda(j))} \tag{8.6.1.3.1}$$

is an isomorphism.

Notation 8.6.1.4. Let $\sharp \in \{\emptyset, -, \mathrm{b}, 0\}$. We denote by $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)})$ the strictly full subcategory of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ consisting of perfect complexes. The category $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)})$ is a strictly full subcategory of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$ and of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{tdf}}(\mathcal{D}^{(\bullet)})$ (see notation 8.5.4.11).

Lemma 8.6.1.5. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$. Let $\lambda \leq \mu$ be two elements of $L(I)$. Consider the following two properties.*

(a) There exists $\mathcal{F}^{(\bullet)} \in D_{\mathrm{perf}}(\lambda^*\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$.

(b) There exists $\mathcal{G}^{(\bullet)} \in D_{\mathrm{perf}}(\mu^*\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$.

Then (a) $\Rightarrow$ (b).

Proof. Using the fact the functor $\mu^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}} -$ preserves the perfectness, i.e. induces $\mu^*\mathcal{D}^{(\bullet)} \otimes^{\mathbb{L}}_{\lambda^*\mathcal{D}^{(\bullet)}} - \colon D_{\mathrm{perf}}(\lambda^*\mathcal{D}^{(\bullet)}) \to D_{\mathrm{perf}}(\mu^*\mathcal{D}^{(\bullet)})$, we can copy the proof of 8.4.1.4. □

Proposition 8.6.1.6. *Let $u\colon I' \to I$ be an L-equivalence between two partially ordered sets (see definition 8.1.3.8). Let $\sharp \in \{\emptyset, -, \mathrm{b}, 0\}$. The equivalence of categories $\underrightarrow{u}_X^{-1}$ of 8.3.1.3.1 preserves the perfectness, i.e. it induces the equivalence of categories*

$$\underrightarrow{u}_X^{-1}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}). \tag{8.6.1.6.1}$$

Suppose $I' = I$ and $u \in L(I)$. Denoting by $\lambda := u$, we have the forgetful functor $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}\,\mathrm{perf}}(\lambda^*\mathcal{D}^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q}\,\mathrm{perf}}(\mathcal{D}^{(\bullet)})$ which is a quasi-inverse equivalence of 8.6.1.6.1.

Proof. For any $\mu \in L(I)$, by using the functor $\underrightarrow{u}_X^{-1}$ preserves the perfectness, i.e. induces $\underrightarrow{u}_X^{-1}\colon D_{\mathrm{perf}}(\mu^*\mathcal{D}^{(\bullet)}) \to D_{\mathrm{perf}}(\underrightarrow{u}_X^{-1}\mu^*\mathcal{D}^{(\bullet)})$, we can copy the proof of 8.4.1.5. □

Proposition 8.6.1.7. *Suppose I has a smallest element or is strictly filtered (see 8.1.3.8). Let $\sharp \in \{\emptyset, -, \mathrm{b}\}$. Then the subcategory $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)})$ of $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ is a triangulated subcategory.*

Proof. We can copy the proof of 8.4.1.7. □

Theorem 8.6.1.8. *Suppose that either I is filtered and has a smallest element or I is strictly filtered. Suppose moreover that X is coherent. Suppose the following conditions are satisfied*

(i) The rings $\mathcal{D}^{(i)}$ are coherent sheaves for any $i \in I$

(ii) The transition maps $\mathcal{D}^{(i)}_{\mathbb{Q}} \to \mathcal{D}^{(j)}_{\mathbb{Q}}$ are flat for any elements $i \leq j$ of I;

(iii) There exists an integer d such that, for any elements $i \leq j$ of I, the ring $\mathcal{D}^{(j)}$ is of tor-dimension $\leq d$ on $\mathcal{D}^{(i)}$;

(iv) For any $i \in I$, for any coherent $\mathcal{D}^{(i)}_{\mathbb{Q}}$-module $\mathcal{E}$, there exists a coherent $\mathcal{D}^{(i)}$-module $\mathcal{E}'$ together with an isomorphism $\mathcal{E}'_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ of $\mathcal{D}^{(i)}_{\mathbb{Q}}$-modules.

Under these hypotheses, the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ induces a fully faithful functor $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)}) \to D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$.

Proof. The factorisation of $\underrightarrow{l}^*_{\mathbb{Q}}$ is obvious and the fully faithfulness follows from 8.4.1.15. □

Remark 8.6.1.9. Keep notation and hypotheses of 8.6.1.8. This is not clear that the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ induces a fully faithful functor $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)}) \to D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$. It follows from 7.1.3.12 that if the ring $\mathcal{D}^{(i)}$ has finite tor dimension for any $i \in I$ then by using 1.4.3.29, we get $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)}) = \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)})$. Moreover, in the case $\mathcal{D}^{\dagger}$ has also finite tor dimension, we get $D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathbb{Q}}) = D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathbb{Q}})$ (use loc.cit.).

Let us finish the subsection by considering the bimodules case.

Definition 8.6.1.10. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$. We denote by $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},.,\mathrm{perf}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ the full subcategory of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ consisting of complexes $\mathcal{E}^{(\bullet)}$ such that there exist $\lambda \in L(I)$ and $\mathcal{F}^{(\bullet)} \in D^{\sharp}_{.,\mathrm{perf}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$. We define similarly $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf},.}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$.

Remark 8.6.1.11. Recall the category $D^{\sharp}_{.,\mathrm{perf}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)})$ is the strictly full subcategory of $D^{\sharp}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)})$ consisting in complexes whose image in $D^{\sharp}(\mathcal{D}'^{(\bullet)})$ belongs to $D^{\sharp}_{\mathrm{perf}}(\mathcal{D}'^{(\bullet)})$. However, this is not clear that if $\mathcal{E}^{(\bullet)}$ is a complex of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ whose image in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$ belongs to $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}'^{(\bullet)})$, then $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},.,\mathrm{perf}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$.

Lemma 8.6.1.12. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$. Let $\lambda \leq \mu$ be two elements of $L(I)$. Consider the following two properties.*

(a) There exists $\mathcal{F}^{(\bullet)} \in D_{\mathrm{perf},.}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$.

(b) There exists $\mathcal{G}^{(\bullet)} \in D_{\mathrm{perf},.}(\mu^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ of the form $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$.

Then (a) ⇒ (b).

Proof. Using the fact the functor $\mu^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda^*\mathcal{D}^{(\bullet)}} -$ preserves the perfectness, i.e. induces $\mu^*\mathcal{D}^{(\bullet)} \overset{\mathbb{L}}{\otimes}_{\lambda^*\mathcal{D}^{(\bullet)}} - \colon D_{\mathrm{perf}}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to D_{\mathrm{perf}}(\mu^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$, by using 8.3.2.9.(b), we can copy the proof of 8.4.1.4. □

Lemma 8.6.1.13. *Let λ, μ be two elements of $L(I)$. Let $\mathcal{E}^{(\bullet)} \in D_{\mathrm{perf},.}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$. Then $\mu^*\mathcal{E}^{(\bullet)} \in D_{\mathrm{perf},.}(\mu^*\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \mu^*\mathcal{D}'^{(\bullet)})$.*

Proof. This is obvious from 8.6.1.3. □

Proposition 8.6.1.14. *Let $u\colon \widetilde{I} \to I$ be an increasing map of partially ordered sets which is an L-equivalence (see definition 8.1.3.8). The equivalence of categories $\underrightarrow{u}_X^{-1}$ of 8.3.1.7.1 preserves the perfectness, i.e. it induces the equivalence of categories*

$$\underrightarrow{u}_X^{-1} \colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf},.}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf},.}(\underrightarrow{u}_X^{-1}\mathcal{D}^{(\bullet)}, \mathcal{R}, \underrightarrow{u}_X^{-1}\mathcal{D}'^{(\bullet)}). \tag{8.6.1.14.1}$$

Suppose $\widetilde{I} = I$ and $u \in L(I)$. Denoting by $\lambda := u$, the forgetful functor $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf},.}(\lambda^*\mathcal{D}^{(\bullet)}, \mathcal{R}, \lambda^*\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf},.}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ is a quasi-inverse equivalence of 8.6.1.14.1.

Proof. We proceed similarly to the proofs 8.3.1.3 and 8.4.1.5 (use also 8.6.1.13). □

Proposition 8.6.1.15. *Suppose I has a smallest element or is strictly filtered (see 8.1.3.8). Let $\sharp \in \{\emptyset, -, \mathrm{b}\}$. Then the subcategory $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ of $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$ is a triangulated subcategory.*

Proof. We can copy the proof of 8.4.1.7. □

8.6.2 Dual functor

Suppose that either I is filtered and has a smallest element or I is strictly filtered.

8.6.2.1. Since $L(I) \times M(I)$ is a filtered set, then we get the functor

$$\mathscr{F}(-,-) := \underset{(\lambda,\chi)\in L(I)\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD} \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-) \colon D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D^+(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to \mathrm{Ind}\, \underrightarrow{LD}^+_{\mathbb{Q}}({}^r\mathcal{D}'^{(\bullet)}) \tag{8.6.2.1.1}$$

where $Q_{LD}\colon D^+({}^r\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^+_{\mathbb{Q}}({}^r\mathcal{D}'^{(\bullet)})$ is the localisation functor, where $\underset{(\lambda,\chi)\in L(I)\times M(I)}{\text{“}\varinjlim\text{”}}$ means the inductive limits in the category of ind-objects of $\underrightarrow{LD}^+_{\mathbb{Q}}({}^r\mathcal{D}'^{(\bullet)})$, and where

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,\ \chi^*\lambda^*-) \colon D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times D^+(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to D^+({}^r\mathcal{D}'^{(\bullet)})$$

is the functor defined similarly to 8.5.2.8.1.

Lemma 8.6.2.2. *Let $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{E}'^{(\bullet)}$ be a morphism belonging to $S^{-}(\mathcal{D}^{(\bullet)})$. Let $g\colon \mathcal{F}^{(\bullet)} \to \mathcal{F}'^{(\bullet)}$ be a morphism belonging to $S^{+}(\mathcal{D}^{(\bullet)}, \mathcal{D}'^{(\bullet)})$ (see notation 8.1.4.10) between two objects of $D^{+}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$. Then the canonical morphism*

$$\mathscr{F}(\mathcal{E}'^{(\bullet)}, \mathcal{F}^{(\bullet)}) \to \mathscr{F}(\mathcal{E}^{(\bullet)}, \mathcal{F}'^{(\bullet)}) \tag{8.6.2.2.1}$$

is an isomorphism.

Proof. We easily reduce to the following two cases.

1) Suppose there exists $\chi_0 \in M(I)$ and $\lambda_0 \in L(I)$ such that $g = \sigma_{\mathcal{F},(\lambda_0,\chi_0)}$ and $f = \mathrm{id}$ (see notation 8.1.4.1). Then we can copy the part 1) of the proof the 8.2.4.21.

2) Suppose there exist $\chi_0 \in M(I)$ and $\lambda_0 \in L(I)$ such that $f = \sigma_{\mathcal{E},(\lambda_0,\chi_0)}$. We copy the part 2) of the proof the 8.2.4.21 as follows: We denote by $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$ (resp. $\mathcal{D}'^{(\bullet),(\bullet,\bullet)}$, resp. $\mathcal{R}$) the constant inductive system of rings of $X^{(I)}$ indexed by $L(I) \times M(I)$ with value $\mathcal{D}^{(\bullet)}$ (resp. $\mathcal{D}'^{(\bullet)}$, resp $\mathcal{R}$). Let $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \in K^{+}(\mathcal{D}^{(\bullet),(\bullet,\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)} \otimes_{\mathcal{R}} (\mathcal{D}'^{(\bullet),(\bullet,\bullet)})^{o}$-modules representing $\mathfrak{c}(\mathcal{F}^{(\bullet)})$. Let $\mathcal{I}'^{(\bullet),(\bullet,\bullet)} \in K^{+}(\mathcal{D}^{(\bullet),(\bullet,\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)} \otimes_{\mathcal{R}} (\mathcal{D}'^{(\bullet),(\bullet,\bullet)})^{o}$-modules endowed with a quasi-isomorphism $\chi_0^{*}\lambda_0^{*}\mathcal{I}^{(\bullet),(\bullet,\bullet)} \to \mathcal{I}'^{(\bullet),(\bullet,\bullet)}$ of $K^{+}(\mathcal{D}^{(\bullet),(\bullet,\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet),(\bullet,\bullet)})$, where $\chi_0^{*}\lambda_0^{*}\mathcal{I}^{(\bullet),(\bullet,\bullet)} := (\chi_0^{*}\lambda_0^{*}\mathcal{I}^{(\bullet),(\lambda,\chi)})_{\lambda,\chi}$. Consider the following diagram of $K^{+}(\mathcal{D}'^{(\bullet)})$:

$$\begin{array}{ccc}
\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi_0^{*}\lambda_0^{*}\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(5)} & \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) \\
\downarrow{\scriptstyle (1)} & \swarrow{\scriptstyle (\star)} & \downarrow{\scriptstyle (3)} \\
\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi_0^{*}\lambda_0^{*}\mathcal{E}^{(\bullet)}, \chi_0^{*}\lambda_0^{*}\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(6)} & \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi_0^{*}\lambda_0^{*}\mathcal{I}^{(\bullet),(\lambda,\chi)}) \\
\downarrow{\scriptstyle (2)} & & \downarrow{\scriptstyle (4)} \\
\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\chi_0^{*}\lambda_0^{*}\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(7)} & \mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)}),
\end{array} \tag{8.6.2.2.2}$$

where the numbered arrows are given by functoriality of the bifunctor $\mathscr{H}om^{\bullet}_{\mathcal{D}^{(\bullet)}}(-,-)$ and where the arrow $(\star)$ is defined by functoriality from the functor $\chi_0^{*}\lambda_0^{*}$ (i.e. is the composition of 8.2.4.18.3 with the first morphism of 8.2.4.19.1). It follows from the $\mathscr{H}om$ version of the commutative diagram 8.2.4.20.1 that we get the commutativity of both triangles of the diagram 8.6.2.2.2. Since its bottom square is commutative by functoriality, then the diagram 8.6.2.2.2 is commutative.

Let $Q^{\mathrm{qi}}_{LD}\colon K^{+}({}^{r}\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{+}_{\mathbb{Q}}({}^{r}\mathcal{D}'^{(\bullet)})$ be the localisation functor. By applying the functor "$\varinjlim_{(\lambda,\chi)}$" Q^{qi}_{LD} to the diagram 8.6.2.2.2 we get the commutative diagram

$$\begin{array}{ccc}
\text{“}\varinjlim_{(\lambda,\chi)}\text{”}\, Q_{LD} \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\chi_0^{*}\lambda_0^{*}\mathcal{E}^{(\bullet)}, \chi^{*}\lambda^{*}\mathcal{D}^{(\bullet)}) & \xrightarrow{(5)} & \text{“}\varinjlim_{(\lambda,\chi)}\text{”}\, Q_{LD} \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi^{*}\lambda^{*}\mathcal{D}^{(\bullet)}) \\
\downarrow{\scriptstyle (2)\circ(1)} & \swarrow{\scriptstyle (2)\circ(\star)} & \downarrow{\scriptstyle (4)\circ(3)} \\
\text{“}\varinjlim_{(\lambda,\chi)}\text{”}\, Q_{LD} \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\chi_0^{*}\lambda_0^{*}\mathcal{E}^{(\bullet)}, \chi_0^{*}\lambda_0^{*}\chi^{*}\lambda^{*}\mathcal{D}^{(\bullet)}) & \xrightarrow{(7)} & \text{“}\varinjlim_{(\lambda,\chi)}\text{”}\, Q_{LD} \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \chi_0^{*}\lambda_0^{*}\chi^{*}\lambda^{*}\mathcal{D}^{(\bullet)})
\end{array} \tag{8.6.2.2.3}$$

where in the notation concerning the arrows, we have omitted indicating "$\varinjlim_{(\lambda,\chi)}$" Q^{qi}_{LD}. Remark that the top morphism (5) is 8.6.2.2.1. By copying the part 2.iii) of the proof of 8.2.4.21, we get that both vertical arrows of 8.6.2.2.3 are isomorphisms. Hence, we are done. □

8.6.2.3. It follows from 8.6.2.2 that the functor $\mathscr{F}$ of 8.6.2.1.1 induces the functor

$$\mathscr{F}(-,-)\colon \underrightarrow{LD}^{-}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{+}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to \mathrm{Ind}\, \underrightarrow{LD}^{+}_{\mathbb{Q}}({}^{r}\mathcal{D}'^{(\bullet)}). \tag{8.6.2.3.1}$$

Lemma 8.6.2.4. *Let $\lambda_0 \in L(I)$, $\mathcal{E}^{(\bullet)} \in D^-(\mathcal{D}^{(\bullet)})$ and $\mathcal{F}^{(\bullet)} \in D^+(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$. The canonical morphism*

$$\underset{(\lambda,\chi)\in L(I)^{\lambda_0}\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD}\circ\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \to \underset{(\lambda,\chi)\in L(I)\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD}\circ\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)})$$

is an isomorphism.

Proof. We reduce to check

$$\underset{(\lambda,\chi)\in L(I)^{\lambda_0}\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD}\circ\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \to \underset{(\lambda,\chi)\in L(I)^{\lambda_0}\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD}\circ\mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)})$$

is an isomorphism. Only in this proof, we denote by $\mathcal{D}^{(\bullet),(\bullet,\bullet)}$ (resp. $\mathcal{D}'^{(\bullet),(\bullet,\bullet)}$, resp. $\mathcal{R}$) the constant inductive system of sheaves of rings on $X^{(I)}$ indexed by $L(I)^{\lambda_0} \times M(I)$ with value $\mathcal{D}^{(\bullet)}$ (resp $\mathcal{D}'^{(\bullet)}$, resp. $\mathcal{R}$). We denote by $\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)}$ (resp. $\widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)}$, resp. $\widetilde{\mathcal{R}}$) the constant inductive system of rings of $X^{(I)}$ indexed by $L(I)^{\lambda_0} \times M(I)$ with value $\lambda_0^*\mathcal{D}^{(\bullet)}$ (resp. $\lambda_0^*\mathcal{D}'^{(\bullet)}$, resp $\mathcal{R}$). We define the functor $\widetilde{\mathfrak{c}}\colon K^+(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)}) \to K^+(\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)}, \widetilde{\mathcal{R}}, \widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)})$ by setting, for any $\mathcal{G}^{(\bullet)} \in K^+(\mathcal{D}^{(\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet)})$, for any $\lambda \geq \lambda_0$ in $L(I)$ and any $\chi \in M(I)$, $\widetilde{\mathfrak{c}}(\mathcal{G}^{(\bullet)})^{(\lambda,\chi)} := \chi^*\lambda^*(\mathcal{G}^{(\bullet)})$ and where for any $(\lambda_1, \chi_1) \leq (\lambda_2, \chi_2)$ the transition maps $\chi_1^*\lambda_1^*\mathcal{G}^{(\bullet)} \to \chi_2^*\lambda_2^*\mathcal{G}^{(\bullet)}$ are the canonical ones i.e. are equal to $\sigma_{\mathcal{G},(\lambda_2,\chi_2),(\lambda_1,\chi_1)}$ (see 8.1.4.1.1).

Let $\widetilde{\mathcal{I}}^{(\bullet),(\bullet,\bullet)} \in K^+(\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)}, \widetilde{\mathcal{R}}, \widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)} \otimes_{\widetilde{\mathcal{R}}} (\widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)})^o$-modules representing $\widetilde{\mathfrak{c}}(\mathcal{F}^{(\bullet)})$. Let $\mathcal{I}^{(\bullet),(\bullet,\bullet)} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)} \otimes_{\mathcal{R}} (\mathcal{D}'^{(\bullet),(\bullet,\bullet)})^o$-modules endowed with a quasi-isomorphism $\widetilde{\mathcal{I}}^{(\bullet),(\bullet,\bullet)} \to \mathcal{I}^{(\bullet),(\bullet,\bullet)}$ of the category $K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet),(\bullet,\bullet)})$.

Let $\widetilde{\mathcal{I}}'^{(\bullet),(\bullet,\bullet)} \in K^+(\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)}, \widetilde{\mathcal{R}}, \widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)} \otimes_{\widetilde{\mathcal{R}}} (\widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)})^o$-modules endowed with a quasi-isomorphism $\lambda_0^*\mathcal{I}^{(\bullet),(\bullet,\bullet)} \to \widetilde{\mathcal{I}}'^{(\bullet),(\bullet,\bullet)}$ of $K^+(\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)}, \widetilde{\mathcal{R}}, \widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)})$, where $\lambda_0^*\mathcal{I}^{(\bullet),(\bullet,\bullet)} = (\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)})_{\lambda,\chi}$. Let $\mathcal{I}'^{(\bullet),(\bullet,\bullet)} \in K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet),(\bullet,\bullet)})$ be a complex of injective left $\mathcal{D}^{(\bullet),(\bullet,\bullet)} \otimes_{\mathcal{R}} (\mathcal{D}'^{(\bullet),(\bullet,\bullet)})^o$-modules endowed with a quasi-isomorphism $\widetilde{\mathcal{I}}'^{(\bullet),(\bullet,\bullet)} \to \mathcal{I}'^{(\bullet),(\bullet,\bullet)}$ of $K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)}, \mathcal{R}, \mathcal{D}'^{(\bullet),(\bullet,\bullet)})$.

Consider the diagram of $K^+(\mathcal{D}'^{(\bullet)})$:

$$\begin{array}{ccccc}
\mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)}, \widetilde{\mathcal{I}}^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(\alpha)} & \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \widetilde{\mathcal{I}}^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(4)} & \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{I}^{(\bullet),(\lambda,\chi)}) \\
\downarrow{\scriptstyle (1)} & \swarrow{\scriptstyle (\star\star)} & & \swarrow{\scriptstyle (\star)} & \\
\mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)}, \lambda_0^*\widetilde{\mathcal{I}}^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(2)} & \mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)}, \lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}) & \xrightarrow[(i)]{} & \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)}, \lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)}) \\
& \swarrow{\scriptstyle (3)} & & \swarrow{\scriptstyle (5)} & \\
\mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)}, \widetilde{\mathcal{I}}'^{(\bullet),(\lambda,\chi)}) & \xrightarrow[(ii)]{} & \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)}, \widetilde{\mathcal{I}}'^{(\bullet),(\lambda,\chi)}) & \xrightarrow{(6)} & \mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)}, \mathcal{I}'^{(\bullet),(\lambda,\chi)})
\end{array}$$

(8.6.2.4.1)

where (i) and (ii) are the forgetful functors (see 8.2.4.19.2), where α is the composition of the forgetful functor 8.2.4.19.2 with the map induced by functoriality from the canonical map $\mathcal{E}^{(\bullet)} \to \lambda_0^*\mathcal{E}^{(\bullet)}$, where the numbered arrows are given by functoriality of the bifunctors $\mathscr{H}om^\bullet_{\mathcal{D}^{(\bullet)}}(-,-)$ or $\mathscr{H}om^\bullet_{\lambda_0^*\mathcal{D}^{(\bullet)}}(-,-)$ and where the arrows $(\star)$ and $(\star\star)$ are defined at 8.2.4.18.3. The triangle is commutative (see 8.2.4.20.3), the diamonds are commutative by functoriality. Hence, we get the commutativity of the diagram:

$$\begin{array}{ccc}
\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)}) & \xrightarrow{(4)\circ(\alpha)} & \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \\
{\scriptstyle (3)\circ(2)\circ(1)}\downarrow & \swarrow{\scriptstyle (3)\circ(\star)} & \downarrow{\scriptstyle (6)\circ(5)\circ(i)\circ(\star)} \\
\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)},\ \lambda_0^*\chi^*\lambda^*\mathcal{F}^{(\bullet)}) & \xrightarrow{(6)\circ(ii)} & \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)},\ \lambda_0^*\chi^*\lambda^*\mathcal{F}^{(\bullet)}).
\end{array} \tag{8.6.2.4.2}$$

Since both maps $\lambda_0^*\widetilde{\mathcal{I}}^{(\bullet),(\lambda,\chi)} \to \lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)} \to \widetilde{\mathcal{I}}'^{(\bullet),(\lambda,\chi)}$ are quasi-isomorphisms of $K^+(\widetilde{\mathcal{D}}^{(\bullet),(\bullet,\bullet)}, \widetilde{\mathcal{R}}, \widetilde{\mathcal{D}}'^{(\bullet),(\bullet,\bullet)})$ then the left vertical map of 8.6.2.4.2 is equal to the canonical morphism. Since both maps $\lambda_0^*\mathcal{I}^{(\bullet),(\lambda,\chi)} \to$

$\widetilde{\mathcal{I}}^{(\bullet),(\lambda,\chi)} \to \mathcal{I}'^{(\bullet),(\lambda,\chi)}$ are quasi-isomorphisms of $K^+(\mathcal{D}^{(\bullet),(\bullet,\bullet)},\mathcal{R},\mathcal{D}'^{(\bullet),(\bullet,\bullet)})$ then the right vertical map of 8.6.2.4.2 is equal to the canonical morphism. Finally, it is tautological that the three other arrows of 8.6.2.4.2 are the canonical ones.

By applying the functor $\underset{(\lambda,\chi)\in L(I)^{\lambda_0}\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD}$ to the diagram 8.6.2.4.2, we get a commutative diagram say $(\mathcal{D}iag)$. Since the right vertical morphism of $(\mathcal{D}iag)$ is equal to the map denoted by $(2)\circ(\star)$ of the diagram 8.6.2.2.3, then it is an isomorphism (see the proof of 8.6.2.2). Let $\widetilde{\mathcal{P}}^{(\bullet)} \in K^+(\lambda_0^*\mathcal{D}^{(\bullet)})$ be a complex of left $\lambda_0^*\mathcal{D}^{(\bullet)}$-modules belonging to $\mathscr{P}(\lambda_0^*\mathcal{D}^{(\bullet)})$ representing $\lambda_0^*\mathcal{E}^{(\bullet)}$. By copying the part 2.iii) of the proof of 8.2.4.21, we get that the left vertical arrows of the diagram $(\mathcal{D}iag)$ is an isomorphism. Hence, we are done. □

Lemma 8.6.2.5. *Suppose I is strictly filtered and X is quasi-compact. Let $\lambda_0 \in L(I)$, $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{perf}}(\lambda_0^*\mathcal{D}^{(\bullet)})$, let $g\colon \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ be a morphism belonging to $S^{\mathrm{b}}(\mathcal{D}^{(\bullet)},\mathcal{D}'^{(\bullet)})$ (see notation 8.1.4.10) between two objects of $D^{\mathrm{b}}(\mathcal{D}^{(\bullet)},\mathcal{R},\mathcal{D}'^{(\bullet)})$. Then the canonical morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^r\mathcal{D}'^{(\bullet)})$*

$$Q_{LD}\circ \mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)}) \to Q_{LD}\circ \mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet)}) \tag{8.6.2.5.1}$$

induced by g is an isomorphism.

Proof. Since $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{perf}}(\lambda_0^*\mathcal{D}^{(\bullet)})$, then both complexes of the map 8.6.2.5.1 do belong to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}'^{(\bullet)})$. We can therefore apply Corollary 8.1.5.11. Hence, with lemma 8.3.3.8, the property that 8.6.2.5.1 is an isomorphism is local on $X^{(\bullet)}$. This implies that we can suppose $\mathcal{E}^{(\bullet)}$ is strictly perfect. Hence, by devissage, we reduce to the case where $\mathcal{E}^{(\bullet)} = \lambda_0^*\mathcal{D}^{(\bullet)}$, which is obvious. □

Proposition 8.6.2.6. *Suppose I is strictly filtered and X is quasi-compact. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)})$.*

(a) For any $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)},\mathcal{R},\mathcal{D}'^{(\bullet)})$, we have $\mathscr{F}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^r\mathcal{D}'^{(\bullet)})$ (see notation 8.6.2.3.1).

(b) For any $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},.,\mathrm{perf}}(\mathcal{D}^{(\bullet)},\mathcal{R},\mathcal{D}'^{(\bullet)})$, we have $\mathscr{F}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^r\mathcal{D}'^{(\bullet)})$.

Proof. We can suppose there exists $\lambda_0 \in L(I)$ such that $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{perf}}(\lambda_0^*\mathcal{D}^{(\bullet)})$.

a) Similarly to 8.6.2.2, we establish that the canonical morphism

$$\underset{(\lambda,\chi)\in L(I)^{\lambda_0}\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD}\circ\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\lambda_0^*\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)}) \to \underset{(\lambda,\chi)\in L(I)^{\lambda_0}\times M(I)}{\text{“}\varinjlim\text{”}} Q_{LD}\circ\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \chi^*\lambda^*\mathcal{F}^{(\bullet)})$$

is an isomorphism. It follows from Lemmas 8.6.2.4 and 8.6.2.5 that we have the canonical isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^r\mathcal{D}'^{(\bullet)})$:

$$Q_{LD}\circ \mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \lambda_0^*\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathscr{F}(\mathcal{E}^{(\bullet)},\lambda_0^*\mathcal{F}^{(\bullet)}).$$

Since $\mathscr{F}(\mathcal{E}^{(\bullet)},\lambda_0^*\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{F}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)})$, then we are done.

b) Suppose now $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},.,\mathrm{perf}}(\mathcal{D}^{(\bullet)},\mathcal{R},\mathcal{D}'^{(\bullet)})$. Following 8.6.1.14, we have $\lambda_0^*\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}_{\mathbb{Q},.,\mathrm{perf}}(\lambda_0^*\mathcal{D}^{(\bullet)},\mathcal{R},\lambda_0^*\mathcal{D}'^{(\bullet)})$. Hence, there exists $\mu_0 \in L(I)$, $\mathcal{G}^{(\bullet)} \in D^{\mathrm{b}}_{.,\mathrm{perf}}(\lambda_0^*\mathcal{D}^{(\bullet)},\mathcal{R},\mu_0^*\lambda_0^*\mathcal{D}^{(\bullet)})$ together with an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\lambda_0^*\mathcal{D}^{(\bullet)},\mathcal{R},\lambda_0^*\mathcal{D}'^{(\bullet)})$ of the form $\lambda_0^*\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}$. This yields the isomorphisms

$$\mathscr{F}(\mathcal{E}^{(\bullet)},\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathscr{F}(\mathcal{E}^{(\bullet)},\lambda_0^*\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathscr{F}(\mathcal{E}^{(\bullet)},\mathcal{G}^{(\bullet)}) \xleftarrow{\sim} Q_{LD}\circ\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet)}),$$

where the last isomorphism comes from 8.6.2.5.1. Since $\mathbb{R}\mathscr{H}om_{\lambda_0^*\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)},\ \mathcal{G}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{perf}}(\mu_0^*\lambda_0^*\mathcal{D}'^{(\bullet)})$, then we are done. □

Notation 8.6.2.7 (Duality)**.** Suppose I is strictly filtered and X is quasi-compact. We denote by

$$\mathbb{R}_{\mathrm{LD}}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,-) := \mathscr{F}(-,-)\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)},\mathcal{R},\mathcal{D}'^{(\bullet)}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^r\mathcal{D}'^{(\bullet)}) \tag{8.6.2.7.1}$$

the functor induced by $\mathscr{F}$ (see 8.6.2.6). Following 8.6.2.3.1, we get also the functor:

$$\mathbb{R}_{\mathrm{LD}}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,\mathcal{D}^{(\bullet)})\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^r\mathcal{D}^{(\bullet)}). \tag{8.6.2.7.2}$$

Following the proof of 8.6.2.6, for any $\lambda_0 \in L(I)$ and $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{perf}}(\lambda_0^* \mathcal{D}^{(\bullet)})$, we have the isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^r\mathcal{D}^{(\bullet)})$:

$$\mathbb{R}_{\mathrm{LD}} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{D}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{\lambda_0^* \mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \lambda_0^* \mathcal{D}^{(\bullet)}). \tag{8.6.2.7.3}$$

A translation of 8.6.2.6 is that the functor $Q_{LD} \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-, \mathcal{D}^{(\bullet)}) \colon D^-(\mathcal{D}^{(\bullet)})^{\mathrm{op}} \to \underrightarrow{LD}^+_{\mathbb{Q}}({}^r\mathcal{D}^{(\bullet)})$ is universally right localisable with respect to $S^{\mathrm{b}}(\mathcal{D}^{(\bullet)})$ at any object of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\mathcal{D}^{(\bullet)})$ (see definition 7.4.1.9) and we have

$$\mathbb{R}_{S^{\mathrm{b}}(\mathcal{D}^{(\bullet)})} Q_{LD} \circ \mathbb{R}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{D}^{(\bullet)}) = \mathbb{R}_{\mathrm{LD}} \mathscr{H}om_{\mathcal{D}^{(\bullet)}}(\mathcal{E}^{(\bullet)}, \mathcal{D}^{(\bullet)}). \tag{8.6.2.7.4}$$

8.7 Sheaf of differential operators with infinite order and finite level

8.7.1 The sheaf of differential operators $\mathcal{D}^\dagger$

Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is locally noetherian.

8.7.1.1. Let $\mathcal{B}^{(\bullet)}$ be an inductive system of commutative $\mathcal{O}_{\mathfrak{X}}$-algebras indexed by $\mathbb{N}$ satisfying the following conditions.

(a) For any $m \in \mathbb{N}$, $\mathcal{B}^{(m)}$ is endowed with a structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra such that the transition map $\mathcal{B}^{(m)} \to \mathcal{B}^{(m+1)}$ are $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear ;

(b) For any $m \in \mathbb{N}$, for any affine open $\mathfrak{U}$ of $\mathfrak{X}$, the ring $\Gamma(U, \mathcal{B}^{(m)})$ is noetherian ;

(c) For any $m \in \mathbb{N}$, for any $i \geq 0$, $\mathcal{B}^{(m)}/\mathfrak{m}^{i+1}\mathcal{B}^{(m)}$ is a quasi-coherent $\mathcal{O}_{X_i}$-module and the canonical homomorphism $\mathcal{B}^{(m)} \to \varprojlim_{i \in \mathbb{N}} \mathcal{B}^{(m)}/\mathfrak{m}^{i+1}\mathcal{B}^{(m)}$ is an isomorphism.

When the transition maps $\mathcal{B}^{(m)} \to \mathcal{B}^{(m+1)}$ are the identities, we say that $\mathcal{B}^{(\bullet)}$ is constant and we denote it by $\mathcal{B}$. We remark that the conditions b and c are equal to that of 7.2.3 in the case where $\mathcal{I} = \mathfrak{m}$. Hence, for instance we get following 7.2.3.3 that for any open immersion $\mathfrak{V} \subset \mathfrak{U}$ of affine opens, the homomorphism $\Gamma(\mathfrak{U}, \mathcal{B}^{(\bullet)}) \to \Gamma(\mathfrak{V}, \mathcal{B}^{(\bullet)})$ is flat.

Definition 8.7.1.2. We keep notation 8.7.1.1 and we suppose $\mathcal{B}^{(\bullet)}$ is constant.

(a) We define the *sheaf of differential operators of infinite order and finite level with coefficients in* $\mathcal{B}$ to be

$$\mathcal{B} \otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \varinjlim_m \mathcal{B} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}.$$

When $\mathcal{B} = \mathcal{O}_{\mathfrak{X}}$, we simply write $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and call it the *sheaf of differential operators of infinite order and finite level.*

(b) We define the *sheaf of differential operators of infinite order and infinite level with coefficients in* $\mathcal{B}$ to be $\mathcal{B} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, the p-adic completion of $\mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

8.7.1.3. We keep notation 8.7.1.1. Since $\mathcal{B}^{(m)}$ is endowed with a structure of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module, then $\mathcal{B} := \varinjlim_m \mathcal{B}^{(m)}$ is endowed with a structure of left $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. We set

$$\mathcal{B} \otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \varinjlim_m \mathcal{B}^{(m)} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp},$$

$$\mathcal{B} \otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} := \left(\mathcal{B} \otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\right)_{\mathbb{Q}}.$$

Let $\mathcal{B}^{(\bullet)}_t$ be the ideal of $\mathcal{B}^{(\bullet)}$ consisting of p-torsion sections and $\mathcal{B}'^{(\bullet)} := \mathcal{B}^{(\bullet)}/\mathcal{B}^{(\bullet)}_t$. Then $\mathcal{B}'^{(\bullet)}$ satisfies the condition (a) of 8.7.1.1. Moreover, $\mathcal{B}'^{(m)}$ is a coherent $\mathcal{B}^{(m)}$-module for any $m \in \mathbb{N}$ (see 7.4.5.1). With

7.2.3.16, this implies that $\mathcal{B}'^{(\bullet)}$ satisfies the properties (b) and (c) of 8.7.1.1. By setting $\mathcal{B}' := \varinjlim_m \mathcal{B}'^{(m)}$, it follows from 7.5.1.10 that the canonical homomorphism

$$\mathcal{B} \otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \mathcal{B}' \otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \tag{8.7.1.3.1}$$

is an isomorphism.

8.7.1.4. With notation 8.7.1.3, $\mathcal{B} \otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is right and left flat over $\mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ Indeed, this follows from 7.5.1.4 by taking inductive limits.

Proof. Following 4.1.2.17.(d), $\Gamma(\mathfrak{U}, \mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ is right and left noetherian for any affine open $\mathfrak{U} \subset \mathfrak{X}$. According to 7.2.2.2, $\Gamma(\mathfrak{U}, \mathcal{B} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ is the p-adic completion of $\Gamma(\mathfrak{U}, \mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Hence, we are done. □

8.7.1.5. We keep notation 8.7.1.1. For any $m' \geq m$, by p-adic completion of 3.2.3.5.1 and by using the transition maps, we get the maps

$$\mathcal{B}^{(m)} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\rho_{m',m}} \mathcal{B}^{(m')} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\rho_{m'}} \mathcal{B} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{8.7.1.5.1}$$

It follows from 3.1.4.3.1, 3.2.3.1.1 and 3.2.2.14.3 that the maps of 3.2.3.5.1 are homomorphisms of rings. From 3.2.3.5.2, we get the formula

$$\rho_{m',m}(\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}) = \frac{q^{(m)}_{\underline{k}}!}{q^{(m')}_{\underline{k}}!} \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m')}} \text{ and } \rho_m(\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}) = \underline{q}^{(m)}_{\underline{k}}! \underline{\partial}_\sharp^{[\underline{k}]}. \tag{8.7.1.5.2}$$

Hence, when $\mathcal{B}^{(\bullet)}$ is constant and $\mathcal{B}$ is p-torsion free, the homomorphisms 8.7.1.5.1 are injective.

8.7.1.6 (p-adic norm, v_p, v_π)**.** We denote by e the absolute ramification index of $\mathcal{V}$. We keep notation 8.7.1.1 and suppose $\mathcal{B}^{(m)}$ is p-torsion free for some $m \in \mathbb{N}$. Let $\mathfrak{U}^\sharp$ be an affine open of $\mathfrak{X}^\sharp$. We endow $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathbb{Q}}) \xrightarrow{\sim} \Gamma(\mathfrak{U}, \mathcal{B}^{(m)})_K$ with a norm induced by the p-adic topology on $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)})$ as follows. For any $b \in \Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathbb{Q}})$, we set $\|b\| = p^{-v_p(b)}$, where $E_b = \{n \in \mathbb{Z} \ ; \ b \in p^n \Gamma(\mathfrak{U}, \mathcal{B}^{(m)})\}$ and $v_p(b) := \max E_b$ if $b \neq 0$ and $v_p(0) = +\infty$. This norm is called the p-adic norm on $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathbb{Q}})$ given by $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)})$.

Remark moreover that $\|bb'\| \leq \|b\| \|b'\|$ and then $v_p \colon B_K \to \mathbb{Z} \cup \{+\infty\}$ is a quasi-valuation. We call v_p to be the p-adic quasi-valuation of $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathbb{Q}})$ induced by $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)})$. We also define $v_\pi(b) := \max\{n \in \mathbb{Z} \ ; \ b \in \pi^n \Gamma(\mathfrak{U}, \mathcal{B}^{(m)})\}$ if $b \neq 0$ and $v_\pi(b) = +\infty$ otherwise. We say that $v_\pi \colon B_K \to \mathbb{Z} \cup \{+\infty\}$ the π-adic quasi-valuation of $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathbb{Q}})$ induced by $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)})$. For any $b \in \Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathbb{Q}})$, we have

$$v_p(b) \leq \frac{v_\pi(b)}{e} < v_p(b) + 1. \tag{8.7.1.6.1}$$

We denote by $| - |$ the p-adic norm on $\mathbb{Q}$ given by $\mathbb{Z}_{(p)}$. Hence, by convention $|p| = p^{-1}$.

Lemma 8.7.1.7. *With notation 1.2.1.2 we have the following estimates.*

(a) For any $k, m \in \mathbb{N}$, we have the inequalities

$$\frac{k}{p^m(p-1)} - \log_p(k+1) - \frac{p}{(p-1)} < v_p(q^{(m)}_k!) \leq \frac{k}{p^m(p-1)}. \tag{8.7.1.7.1}$$

(b) For any $m \in \mathbb{N}$ there exists $\eta' < 1$, $c' \in \mathbb{R}$ such that $|q^{(m)}_k!| \leq c' \eta'^k$ for all $k \in \mathbb{N}$.

(c) For any $\eta < 1$ there exist $m \in \mathbb{N}$, $c \in \mathbb{R}$ such that $\eta^k \leq c |q^{(m)}_k!|$ for all $k \in \mathbb{N}$.

Proof. Let us write $q = q^{(m)}_k$. Then $\frac{k}{p^m(p-1)} - \frac{1}{(p-1)} < \frac{q}{(p-1)} \leq \frac{k}{p^m(p-1)}$. Using the estimates 1.2.1.1.2 of $\sigma(q)$, we get moreover

$$-\log_p(k+1) - 1 < \frac{-\sigma(q)}{(p-1)} \leq 0.$$

Since $v_p(q!) = \frac{(q-\sigma(q))}{(p-1)}$ (see 1.2.1.1.1), then we get 8.7.1.7.1 by addition.

The inequality $|q_k^{(m)}!| \leq c'\eta'^k$ is equivalent to saying that $-v_p(q_k^{(m)}!) \leq \log_p(c') + k\log_p(\eta')$. The inequality $\eta^k \leq c|q_k^{(m)}!|$ is equivalent to saying that $k\log_p(\eta) \leq \log_p(c) - v_p(q_k^{(m)}!)$. Hence, the estimates 8.7.1.7.1 imply easily (b) and (c). ☐

Proposition 8.7.1.8. We keep notation 8.7.1.1. Suppose $\mathcal{B}^{(\bullet)}$ is constant and $\mathcal{B}$ is p-torsion free. Let $\mathfrak{U}^\sharp$ be an affine open of $\mathfrak{X}^\sharp$ endowed with logarithmic coordinates. Let $P \in \Gamma(\mathfrak{U}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Following 7.5.1.5.2 (in the case where $m = +\infty$), we can uniquely write

$$P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}\underline{\partial}_\sharp^{[\underline{k}]},$$

with $b_{\underline{k}} \in \Gamma(\mathfrak{U}, \mathcal{B})$ a sequence converging to 0 for the p-adic topology when $|\underline{k}|$ goes to infinity. For any $i \in \mathbb{N}$, let $P_i \in \Gamma(U, \mathcal{B}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{D}_{X_i^\sharp/S_i^\sharp})$ be the image of P, where $\mathcal{B}_i := \mathcal{B}/\mathfrak{m}^{i+1}\mathcal{B}$. The following conditions are equivalent:

(a) $P \in \Gamma(\mathfrak{U}, \mathcal{B}\otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$;

(b) $\exists \alpha, \beta \in \mathbb{R}$ such that $\mathrm{ord}(P_i) \leq \alpha i + \beta$ for any $i \in \mathbb{N}$;

(c) $\exists c, \eta \in \mathbb{R}_+$ such that $\eta < 1$ and $\|b_{\underline{k}}\| \leq c\eta^{|\underline{k}|}$, for any $\underline{k} \in \mathbb{N}^d$.

Proof. (a) $\Rightarrow$ (b). Set $B := \Gamma(\mathfrak{U}, \mathcal{B})$. Set $B_i := \Gamma(\mathfrak{U}, \mathcal{B}_i)$. Suppose $P \in \Gamma(\mathfrak{U}, \mathcal{B}\otimes^\dagger_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Then there exists $m \in \mathbb{N}$ large enough such that $P \in \Gamma(\mathfrak{U}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Let us fix such an m. Following 7.5.1.5.1, there exists a unique sequence $(b_{\underline{k}}^{(m)})_{\underline{k}\in\mathbb{N}^d}$ of elements of B such that $b_{\underline{k}}^{(m)} \to 0$ for the p-adic topology when $|\underline{k}| \to \infty$ and $P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}^{(m)}\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}$. Since $\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}} = \underline{q}_{\underline{k}}^{(m)}!\underline{\partial}_\sharp^{[\underline{k}]}$ (see 8.7.1.5.2), then we get $P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}^{(m)}\underline{q}_{\underline{k}}^{(m)}!\underline{\partial}_\sharp^{[\underline{k}]}$, i.e. $b_{\underline{k}} = b_{\underline{k}}^{(m)}\underline{q}_{\underline{k}}^{(m)}!$. Using 8.7.1.7, $\exists \eta < 1$, $\exists c \in \mathbb{R}$ such that $|\underline{q}_{\underline{k}}^{(m)}!| \leq c\eta^{|\underline{k}|}$ for any $\underline{k} \in \mathbb{N}^d$. Setting $a := e\log_p(1/\eta)$ and $b := e\log_p(1/c)$, using the first inequality 8.7.1.6.1, this yields $v_\pi(b_{\underline{k}}) \geq ev_p(\underline{q}_{\underline{k}}^{(m)}!) \geq a|\underline{k}| + b$, where v_p is the p-adic valuation of $\mathbb{Z}_{(p)}$ and v_π is the π-adic quasi-valuation of B. This is equivalent to saying that $\mathrm{ord}(P_i) \leq \frac{1}{a}i - \frac{b}{a}$ for any $i \in \mathbb{N}$.

(b) $\Rightarrow$ (c). Suppose $\exists \alpha, \beta \in \mathbb{R}$ such that $\mathrm{ord}(P_i) \leq \alpha i + \beta$ for any $i \in \mathbb{N}$. Let $\underline{k} \in \mathbb{N}^d$. Set $i_{\underline{k}} := v_\pi(b_{\underline{k}})$. Since the image of $b_{\underline{k}}$ in $B_{i_{\underline{k}}}$ is not null, then $|\underline{k}| \leq \alpha i_{\underline{k}} + \beta$. Hence, using the second inequality 8.7.1.6.1, we get $\|b_{\underline{k}}\| = p^{-v_p(b_{\underline{k}})} < p^{1-\frac{i_{\underline{k}}}{e}} \leq p^{1-\frac{(|\underline{k}|-\beta)}{\alpha e}} = p^{1+\frac{\beta}{\alpha e}}\left(p^{-\frac{1}{\alpha e}}\right)^{|\underline{k}|}$. Hence, we can choose $c = p^{1+\frac{\beta}{\alpha e}}$ and $\eta = p^{-1/\alpha e}$.

(c) $\Rightarrow$ (a). Suppose $\exists c, \eta \in \mathbb{R}_{>0}$ such that $\eta < 1$ and $\|b_{\underline{k}}\| \leq c\eta^{|\underline{k}|}$, for any $\underline{k} \in \mathbb{N}^d$. We have to prove that for m large enough, $b_{\underline{k}}/\underline{q}_{\underline{k}}^{(m)}! \in B$. The inequality $\|b_{\underline{k}}\| \leq c\eta^{|\underline{k}|}$ is equivalent to $v_p(b_{\underline{k}}) \geq \lambda|\underline{k}| + \mu$, with $\mu = -\log_p(c)$ and $\lambda = -\log_p(\eta) > 0$. Using 8.7.1.7.1, this yields

$$v_p(b_{\underline{k}}/\underline{q}_{\underline{k}}^{(m)}!) \geq \lambda|\underline{k}| + \mu - |\underline{k}|/p^m(p-1) = (\lambda - 1/p^m(p-1))\,|\underline{k}| + \mu. \tag{8.7.1.8.1}$$

Suppose m large enough such that $\lambda - 1/p^m(p-1) > 0$. Hence, if $\mu \geq 0$, then $v_p(b_{\underline{k}}/\underline{q}_{\underline{k}}^{(m)}!) \geq 0$, i.e. $b_{\underline{k}}/\underline{q}_{\underline{k}}^{(m)}! \in B$ and we are done. Suppose now $\mu < 0$ and m large enough such that the inequalities hold

$$p^m \geq -\frac{\mu}{(\lambda - 1/p^m(p-1))} \Leftrightarrow p^m\lambda - 1/(p-1) \geq -\mu \Leftrightarrow p^m \geq (-\mu + 1/(p-1))/\lambda. \tag{8.7.1.8.2}$$

Let $\underline{k} \in \mathbb{N}^d$. If $|\underline{k}| \geq -\mu/(\lambda - 1/p^m(p-1))$, then $(\lambda - 1/p^m(p-1))\,|\underline{k}| + \mu \geq 0$ and we are done thanks to 8.7.1.8.1. On the other hand, if $|\underline{k}| \leq -\mu/(\lambda - 1/p^m(p-1))$, then from 8.7.1.8.2 we get $|\underline{k}| \leq p^m$. Hence, $\underline{q}_{\underline{k}}^{(m)}! = 1$ and then $b_{\underline{k}}/\underline{q}_{\underline{k}}^{(m)}! \in B$. ☐

The Spencer exact sequence (see 4.7.3.7.2) is wrong at the level m when $m \geq 1$. However, we get the exactness of the end of the sequence up to a multiplication by p^m (or $p^m!$ with logarithmic log structures):

Proposition 8.7.1.9. *Suppose $\mathfrak{X}/\mathfrak{S}$ is smooth equipped with coordinates $t_1, \dots, t_d$. We use notation 7.5.1.5.*

(a) Let $P = \sum_{\underline{k}} a_{\underline{k}} \partial^{\langle \underline{k} \rangle} \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$ *with* $a_{\underline{k}} = 0$ *for all* $\underline{k}$ *such that* $k_1 = 0$*. Then there exists a unique operator* $Q \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$ *such that* $p^m P = Q\partial_1$*.*

(b) Let $P = \sum_{\underline{k}} a_{\underline{k}} \partial^{[\underline{k}]} \in \Gamma(\mathfrak{X}, \mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$*. If* $a_{\underline{k}} = 0$ *for all* $\underline{k}$ *such that* $k_1 = 0$*, then there exists a unique operator* $Q \in \Gamma(\mathfrak{U}, \mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$ *such that* $P = Q\partial_1$*.*

Proof. The part (b) follows from (a) by taking limit. For (a) we now take $\underline{k}$ such that $k_1 \neq 0$. In $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$ we have the relation:

$$\left\langle \begin{matrix} k_1 \\ 1 \end{matrix} \right\rangle \partial_1^{\langle k_1 \rangle} = \partial_1^{\langle k_1 - 1 \rangle} \partial_1, \quad \text{with} \quad \left\langle \begin{matrix} k_1 \\ 1 \end{matrix} \right\rangle = \begin{cases} k_1 & \text{if } p^m \nmid k, \\ p^m & \text{if } p^m | k. \end{cases}$$

For any k_1, $\left\langle \begin{smallmatrix} k_1 \\ 1 \end{smallmatrix} \right\rangle$ divides p^m in $\mathbb{Z}_p$, thus we can take Q to be

$$Q = \sum_{k_1 \neq 0} (p^m \left\langle \begin{matrix} k_1 \\ 1 \end{matrix} \right\rangle^{-1}) a_{\underline{k}} \underline{\partial}^{\langle \underline{k} - \epsilon_1 \rangle}.$$

Finally, the uniqueness of Q follows easily from the fact that $\mathcal{O}_{\mathfrak{X}}$ is p-torsion free and from the unicity of the writing of Q of the form $Q = \sum_{\underline{k}} b_{\underline{k}} \partial^{\langle \underline{k} \rangle} \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$. □

Proposition 8.7.1.10. *Suppose* $\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}$ *is equipped with logarithmic coordinates* $u_1, \ldots, u_d$ *and* $\mathfrak{X}$ *is* p*-torsion free. We use notation 7.5.1.5.*

(a) Let $P = \sum_{\underline{k}} a_{\underline{k}} \partial_{\sharp}^{\langle \underline{k} \rangle} \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$ *with* $a_{\underline{k}} = 0$ *for all* $\underline{k}$ *such that* $k_1 = 0$*. Then there exists a unique operator* $Q \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$ *such that* $p^m! P = Q\partial_{\sharp i}$*.*

(b) Let $P = \sum_{\underline{k}} a_{\underline{k}} \partial_{\sharp}^{[\underline{k}]} \in \Gamma(\mathfrak{X}, \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$*. If* $a_{\underline{k}} = 0$ *for all* $\underline{k}$ *such that* $k_1 = 0$*, then there exists a unique operator* $Q \in \Gamma(\mathfrak{U}, \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$ *such that* $P = Q\partial_{\sharp i}$*.*

Proof. The part (b) follows from (a) by taking limit. We can suppose P is of the form $\partial_{\sharp 1}^{\langle n \rangle_{(m)}}$ for some integer $n \geq 0$. Let us prove by induction on $n \geq 0$ that there exists a unique operator $Q \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$ such that $p^m! \partial_{\sharp 1}^{\langle n \rangle_{(m)}} = Q\partial_1$. Following 3.2.3.11.c, there exists a unique operator $Q \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$ such that $n! \partial_{\sharp 1}^{\langle n \rangle_{(m)}} = Q\partial_1$. Hence, when $1 \leq n \leq p^m$ we are done. Suppose now $n \geq p^m$ and let $q \geq 1$ and $0 \leq r < p^m$ be some integers such that $n = p^m q + r$. Following 3.2.3.13.1, we have the formula

$$\partial_{\sharp 1}^{\langle p^m(q-1)+r \rangle_{(m)}} \partial_{\sharp 1}^{\langle p^m \rangle_{(m)}} = \left\langle \begin{matrix} p^m q + r \\ p^m \end{matrix} \right\rangle \partial_{\sharp 1}^{\langle p^m q + r \rangle_{(m)}}$$
$$+ \sum_{k=\max\{p^m(q-1)+r, p^m\}}^{p^m q + r - 1} \frac{k!}{(p^m q + r - k)!(k - p^m)!(k - (p^m(q-1) + r))!} \frac{q^{(m)}_{p^m}! q^{(m)}_{p^m(q-1)+r}!}{q^{(m)}_{k}!} \partial_{\sharp 1}^{\langle k \rangle_{(m)}}$$

with $\frac{k!}{(p^m q + r - k)!(k - p^m)!(k - (p^m(q-1) + r))!} \frac{q^{(m)}_{p^m}! q^{(m)}_{p^m(q-1)+r}!}{q^{(m)}_{k}!} \in \mathbb{Z}_{(p)}$. Following 1.2.1.5.1, we have $\left\langle \begin{smallmatrix} p^m q + r \\ p^m \end{smallmatrix} \right\rangle \in \mathbb{Z}^*_{(p)}$. Hence, we conclude the induction. Finally, the uniqueness of Q follows from the fact that $\mathcal{O}_{\mathfrak{X}}$ is p-torsion free, from the property 3.2.3.14.1 and the unicity of the writing $P = \sum_{\underline{k}} a_{\underline{k}} \partial_{\sharp}^{\langle \underline{k} \rangle}$. □

8.7.2 Swapping left and right $\mathcal{D}^{\dagger}$-modules

Let $\mathfrak{S}^{\sharp}$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^{\sharp} \to \mathfrak{S}^{\sharp}$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is locally noetherian.

Let $\mathcal{B}^{(\bullet)}$ be an inductive system of commutative $\mathcal{O}_{\mathfrak{X}}$-algebras indexed by $\mathbb{N}$ satisfying the conditions of 8.7.1.1. Set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} := \mathcal{B}^{(m)} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$, $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$, i.e. $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} = \mathcal{B} \otimes^{\dagger}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$ (see notation 8.7.1.3). We get a canonical left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure on $\mathcal{B} := \varinjlim_m \mathcal{B}^{(m)}$. This yield a structure of left $\widehat{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure on $\widehat{\mathcal{B}}$, where $\widehat{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is the p-adic completion of $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (or of $\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$). We suppose $\mathcal{B}^{(\bullet)}$ has no p-torsion (this is an harmless hypothesis: see 8.7.1.3.1). In that case $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ has no p-torsion and is included in its p-adic completion $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

8.7.2.1. Following 7.5.1.11, the sheaf $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}^{(m)} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is endowed with a canonical right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure extending its structure of $\mathcal{B}^{(m)}$-module. By taking the inductive limits on the level, the sheaf $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is endowed with a canonical right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure extending its structure of $\mathcal{B}$-module.

Suppose $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d \in M_{\mathfrak{X}^\sharp}$. By p-adic completion of the logarithmic adjoint operator (see 3.4.1.2.3), we get the map $\Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ given by $P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}} \underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}} \mapsto \widetilde{P} := \sum_{\underline{k}\in\mathbb{N}^d} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k}\rangle_{(m)}} b_{\underline{k}}$, where $b_{\underline{k}}$ is a sequence of elements of $\Gamma(\mathfrak{X}, \mathcal{B}^{(m)})$ converging to 0 for the p-adic topology when $|\underline{k}|$ goes to infinity. With the local description 8.7.1.8, we can check the logarithmic adjoint operator (see 3.4.1.2.3) extends to a By taking inductive limits on the level, this yields the map $\Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. This map is also induced (via the inclusion $\Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \subset \Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$), by the p-adic completion of the logarithmic adjoint operator $\Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to \Gamma(\mathfrak{X}, \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ given by $P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}} \underline{\partial}_\sharp^{[\underline{k}]} \mapsto \widetilde{P} := \sum_{\underline{k}\in\mathbb{N}^d} \widetilde{\underline{\partial}}_\sharp^{[\underline{k}]} b_{\underline{k}}$, where $b_{\underline{k}}$ is a sequence of elements of $\Gamma(\mathfrak{X}, \mathcal{B})$ converging to 0 for the p-adic topology when $|\underline{k}|$ goes to infinity. It follows from the formula 7.5.1.11.1 that the action of $P \in \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ on the section $b\, d\log t_1 \wedge \cdots \wedge d\log t_d$, where b is section of $\mathcal{B}$ is given by the formula

$$(b\ d\log t_1 \wedge \cdots \wedge d\log t_d) \cdot P = \widetilde{P}(b) d\log t_1 \wedge \cdots \wedge d\log t_d. \tag{8.7.2.1.1}$$

8.7.2.2. We have the following properties.

(a) By taking the inductive limits on the level, we get from 7.5.1.13.(a) a structure of right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-bimodule on $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

(b) Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Via the canonical isomorphism of $\mathcal{B}$-modules:

$$\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E} \xrightarrow{\sim} \left(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\right) \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E} \tag{8.7.2.2.1}$$

we get a structure of right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E}$. Suppose $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d \in M_{\mathfrak{X}^\sharp}$. With notation 8.7.2.1, we compute the action of $P \in \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ on the section $d\log t_1 \wedge \cdots \wedge d\log t_d \otimes x$ of $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E}$, where x is a section of $\mathcal{E}$, is given by the formula

$$(d\log t_1 \wedge \cdots \wedge d\log t_d \otimes x) \cdot P = d\log t_1 \wedge \cdots \wedge d\log t_d \otimes \widetilde{P} \cdot x. \tag{8.7.2.2.2}$$

Hence, the structure of right $\mathcal{B}^{(m)} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}^{(m)}} \mathcal{E}$ given by 7.5.1.12 is equal to the one induced (via the canonical map $\mathcal{B}^{(m)} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$) by its structure of right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module.

(c) Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Via the canonical isomorphism

$$\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M}) \xrightarrow{\sim} \mathscr{H}om_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M}), \tag{8.7.2.2.3}$$

we get a structure of left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M})$. Suppose $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d \in M_{\mathfrak{X}^\sharp}$. With notation 8.7.2.1, we compute the action of $P \in \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ on the section $x \otimes (d\log t_1 \wedge \cdots \wedge d\log t_d)^*$ of $\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M})$, where x is section of $\mathcal{M}$, is given by the formula

$$P \cdot (x \otimes (d\log t_1 \wedge \cdots \wedge d\log t_d)^*) = x \cdot \widetilde{P} \otimes (d\log t_1 \wedge \cdots \wedge d\log t_d)^*. \tag{8.7.2.2.4}$$

Hence, the induced structure of left $\mathcal{B}^{(m)} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module corresponds to that of 7.5.1.12.

8.7.2.3. Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module.

(a) Using 8.7.2.2.4, we easily compute that the canonical $\mathcal{B}$-linear isomorphism

$$(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_r \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E} \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E} \tag{8.7.2.3.1}$$

is right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear.

(b) Since $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is locally free (of rank one), the canonical $\mathcal{B}$-linear morphism

$$\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{H}om_{\mathcal{B}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \mathcal{M}) \xrightarrow{\sim} \mathcal{M} \tag{8.7.2.3.2}$$

is an isomorphism. Using 8.7.2.2.4, we compute this isomorphism is moreover $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. Similarly, the canonical $\mathcal{B}$-linear isomorphism :

$$\mathcal{E} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \mathcal{E}). \tag{8.7.2.3.3}$$

is $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear.

(c) $\mathcal{H}om_{\mathcal{B}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -)$ and $\mathcal{H}om_{\mathcal{O}}(\omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -)$ (resp. $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} -$ and $\omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_X} -$) are canonically isomorphism on the category of right (resp. left) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules.

(d) The functors $- \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} = \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -)$ and $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} -$ are exact and induce quasi-inverse equivalences between the category of (resp. coherent, resp. flat, resp. locally projective of finite type) left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules and that of (resp. coherent, resp. flat, resp. locally projective of finite type) right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules. Hence, for any $\star \in \{-, +, \mathrm{b}, \emptyset\}$, the functors $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} -$ and $\mathscr{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, -)$ induce quasi-inverse equivalences of categories between $D^{\star}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $D^{\star}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Moreover, these equivalences preserve K-flat complexes and K-injective complexes.

8.7.2.4. By taking the projective limits, the inductive limits on the level, we get from 4.2.5.6.1 the transposition isomorphism of right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules:

$$\widetilde{\delta}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \delta_{\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} : \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{8.7.2.4.1}$$

By applying to this isomorphism the functor $- \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}$ to the right (resp. left) structure from the source (resp. target), we get the isomorphism of $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules:

$$\widetilde{\alpha}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} : \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{8.7.2.4.2}$$

By applying to this isomorphism the functor $- \otimes_{\mathcal{B}} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ to the left (resp. right) structure from the source (resp. target), this yields the isomorphism

$$\widetilde{\beta}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} : \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{8.7.2.4.3}$$

8.7.2.5. Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. By copying the proof of 8.7.2.5, we get the following isomorphism of $\mathcal{O}_S$-modules:

$$\mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E} \xrightarrow{\sim} (\omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} (\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}). \tag{8.7.2.5.1}$$

8.7.2.6. The sheaf $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} := \mathcal{B}^{(m)}_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is endowed with a canonical right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module structure extending its structure of $\mathcal{B}^{(m)}_{\mathbb{Q}}$-module. By taking the inductive limits on the level, the sheaf $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} := \mathcal{B}_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is endowed with a canonical right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module structure extending its structure of $\mathcal{B}_{\mathbb{Q}}$-module. The results of this subsection are still valid by replacing respectively $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ by $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ by $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$.

8.7.3 Overconvergent singularities

Proposition 8.7.3.1. We keep notation 3.4. We suppose with S is endowed with a quasi-coherent (resp. coherent of the formal case) m-PD-ideal $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S)$ such that $p \in \mathfrak{a}_S$. Let $m, r \in \mathbb{N}$ be two integers such that p^{m+1} divides r. Fix $f \in \Gamma(X, \mathcal{O}_X)$, put $\mathcal{B}'_X(f,r) := \mathcal{O}_X[T]/(f^r T - p)$, Y be the open of X complementary to $V(f)$ and $j\colon Y \subset X$ be the inclusion.

(a) There exists on $\mathcal{B}'_X(f,r)$ a canonical structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module compatible with its structure of $\mathcal{O}_X$-algebra such that $\mathcal{B}'_X(f,r) \to j_* \mathcal{O}_Y$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear.

(b) If $g \in \Gamma(X, \mathcal{O}_X)$, and $f' = gf$, the $\mathcal{O}_X$-algebra homomorphism

$$\rho_g \colon \mathcal{B}'_X(f,r) = \mathcal{O}_X[T]/(f^r T - p) \to \mathcal{B}'_X(f',r) = \mathcal{O}_X[T']/(f'^r T' - p)$$

such that $\rho_g(T) = g^r T'$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear.

(c) If r is divisible by $p^{m'+1}$ with $m' \geq m$, then the structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{B}'_X(f,r)$ is equal to that induced by its structure of $\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$-module.

Proof. a) Since the formal case is checked identically, let us focus on the algebraic one. Consider the following commutative diagram

$$\begin{array}{ccc} X^\sharp & \xrightarrow{\phi_f} & \mathbb{A}^1_{\mathbb{Z}_{(p)}} = \operatorname{Spec} \mathbb{Z}_{(p)}[t] \\ \downarrow & & \downarrow \\ (S^\sharp, \mathfrak{a}_S, \mathfrak{b}_S, \alpha_S) & \longrightarrow & (\operatorname{Spec} \mathbb{Z}_{(p)}, (p), (p), \alpha_{(p)}), \end{array} \tag{8.7.3.1.1}$$

where ϕ_f is the morphism given by f and where $((p), \alpha_{(p)})$ is the canonical m-PD-structure of (p) (see 1.2.4.2.a). Hence, by using the preservation of $\mathcal{D}$-module structures under pullbacks (see 4.4.2.4), since $\mathcal{B}'_X(f,r) = \phi_f^*(\mathcal{B}'_{\mathbb{A}^1_{\mathbb{Z}_{(p)}}}(t,r))$, we reduce to the case where $S^\sharp = \operatorname{Spec} \mathbb{Z}_{(p)}$ and $X^\sharp = \operatorname{Spec} \mathbb{Z}_{(p)}[t]$, $f = t$. Since the ideal of the closed immersion $\Delta_{X/S}$ is the ideal of $\mathbb{Z}_{(p)}[t_1, t_2] = (\mathbb{Z}_{(p)}[t_1])[t_2 - t_1]$ generated by $t_2 - t_1$, then following 1.3.2.6, we have $(|X|, \mathcal{P}^n_{X/S,(m)}) = \operatorname{Spec}(\mathbb{Z}_{(p)}[t_1]\langle t_2 - t_1\rangle_{(m)}/I^{\{n+1\}})$, where and $I = \overline{(t_2 - t_1)}$ is the m-PD-ideal generated by $t_2 - t_1$. We have $r = p^{m+1} q$. Since $\mathbb{Z}_{(p)}[t_1]\langle t_2 - t_1\rangle_{(m)}/I^{\{n+1\}}$ is p-torsion free, then we compute there exists a of degree r homogeneous m-PD-polynomial $\phi^{(m)}_r(t_1, t_2) \in I$ such that

$$t_2^r - t_1^r = p \phi^{(m)}_r(t_1, t_2). \tag{8.7.3.1.2}$$

Set $T_1 := T \otimes 1 \in \mathcal{O}_X[T]/(f^r T - p) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)}$ and $T_2 := 1 \otimes T \in \mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{O}_X[T]/(f^r T - p)$. We are looking for an $\mathcal{O}_X$-algebra isomorphism ε_n making commutative the diagram below:

$$\begin{array}{ccccc} \mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{O}_X[T]/(f^r T - p) & & \xrightarrow[\sim]{\varepsilon_n} & & \mathcal{O}_X[T]/(f^r T - p) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)} \\ \downarrow & & & & \downarrow \\ j_*(\mathcal{P}^n_{Y/S,(m)} \otimes_{\mathcal{O}_Y} \mathcal{O}_Y) & \xrightarrow{\sim} & j_* \mathcal{P}^n_{Y/S,(m)} & \xleftarrow[\sim]{} & j_*(\mathcal{O}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y/S,(m)}) \end{array} \tag{8.7.3.1.3}$$

where the bottom isomorphisms are the canonical isomorphisms and the composite bottom isomorphism is $\varepsilon_n^{\mathcal{O}_Y}$ (see 3.4.2.4.1). The image of T_2 (resp. T_1) in $\mathcal{P}^n_{Y/S,(m)}$ is $p t_2^{-r}$ (resp. $p t_1^{-r}$). To do so, we define an $\mathcal{O}_X$-algebra map $\varepsilon_n(T_2)$ by setting

$$\varepsilon_n(T_2) = T_1(1 + T_1 \phi^{(m)}_r(t_1, t_2))^{-1},$$

which has a meaning because $\phi^{(m)}_r(t_1, t_2)$ is nilpotent in $\mathcal{P}^n_{X/S,(m)}$. Its inverse is given by $T_1 \mapsto T_2(1 - T_2 \phi^{(m)}_r(t_1, t_2))^{-1}$. Since $\phi^{(m)}_r(t_1, t_2) \in I$, then $\varepsilon_0 = \mathrm{id}$. Moreover, the cocycle condition is a consequence of the formula

$$\phi^{(m)}_r(t_1, t_2) + \phi^{(m)}_r(t_2, t_3) = \phi^{(m)}_r(t_1, t_3) \tag{8.7.3.1.4}$$

in $\mathbb{Z}_{(p)}[t_1]\langle t_2 - t_1, t_3 - t_2\rangle_{(m)}$.

b) and c) We leave the proof to the reader. □

Remark 8.7.3.2. Contrary to Berthelot's notation of [Ber96c, 4.2], we have added a prime, i.e. the ring $\mathcal{B}'_X(f,r)$ was written $\mathcal{B}_X(f,r)$. The reason is that in order to use Huyghe sheaves of 8.7.3.16, we prefer to work by default with the slight modification of 8.7.3.8 introduced by Huyghe where p is replaced by π.

Proposition 8.7.3.3. We consider the algebraic case of 3.4 (beware the nilpotence condition is too strong in the formal case). Let $m, r \in \mathbb{N}$ be two integers such that p^{m+1} divides r. Let $\mathcal{I} \subset \mathcal{O}_S$ be an m-PD-nilpotent quasi-coherent ideal which extends to X, $f, g \in \Gamma(X, \mathcal{O}_X)$, $h \in \Gamma(X, \mathcal{I}\mathcal{O}_X)$, and $f' = gf + h$. There exists the canonical $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear homomorphism of $\mathcal{O}_X$-algebras

$$\eta_{g,h} \colon \mathcal{B}'_X(f,r) \to \mathcal{B}'_X(f',r),$$

satisfying the following properties:

(a) If $g' \in \Gamma(X, \mathcal{O}_X)$, $h' \in \Gamma(X, \mathcal{I}\mathcal{O}_X)$, and $f'' = g'f' + h'$, $g'' = g'g$, $h'' = g'h + h'$, then $\eta_{g'',h''} = \eta_{g',h'} \circ \eta_{g,h}$.

(b) $\eta_{g,0} = \rho_g$, $\eta_{1,0} = \mathrm{id}$.

(c) If f is not a divisor of 0 in $\mathcal{O}_X/\mathcal{I}\mathcal{O}_X$, $\eta_{g,h}$ only depends on f, f', r and will be denoted $\eta_{f',f,r}$.

(d) If r is divisible by $p^{m'+1}$, with $m' \geq m$, $\eta_{g,h}$ is independent from $m \leq m'$.

Proof. This is checked similarly to [Ber96c, 4.2.2]. For the reader, we will only recall below the construction of $\eta_{g,h}$.

1) Suppose $g = 1$. Let $u \colon Z^\sharp \hookrightarrow X^\sharp$ be the exact closed immersion given by $\mathcal{I}\mathcal{O}_X$. Put $S_0 = \operatorname{Spec} \mathbb{Z}_{(p)}$ and $X_0 = \operatorname{Spec} \mathbb{Z}_{(p)}[t]$. Let $\overline{f}$ and $\overline{f'}$ be the image of f and f' via the morphism $\Gamma(X, \mathcal{O}_X) \to \Gamma(Z, \mathcal{O}_Z)$ induced by u. Since $\overline{f} = \overline{f'}$, then f an f' induce the same morphism $\phi_{\overline{f}} \colon Z^\sharp \to X_0$. Since $\mathcal{I}$ is an m-PD-nilpotent ideal, then by using the universal property of the m-PD-envelope, for any integer n large enough, we get a unique factorization $\theta \colon X \to \Delta^n_{X_0/S_0^\sharp,(m)}$ making commutative the following diagram

$$\begin{array}{ccccc} Z^\sharp & \hookrightarrow & & \longrightarrow & X^\sharp \\ \downarrow{\scriptstyle \phi_{\overline{f}}} & & \swarrow{\scriptstyle \theta} & & \downarrow{\scriptstyle \phi_{f'} \times \phi_f} \\ X_0 & \longrightarrow & \Delta^n_{X_0/S_0,(m)} & \longrightarrow & X_0 \times_{S_0} X_0. \end{array} \qquad (8.7.3.3.1)$$

Let $\epsilon_n \colon \mathcal{P}^n_{X_0/S_0,(m)} \otimes_{\mathcal{O}_{X_0}} \mathcal{B}'_{X_0}(t,r) \xrightarrow{\sim} \mathcal{B}'_{X_0}(t,r) \otimes_{\mathcal{O}_{X_0}} \mathcal{P}^n_{X_0/S_0,(m)}$ be the isomorphism given by the $\mathcal{D}^{(m)}_{X_0/S_0}$-module structure of $\mathcal{B}'_{X_0}(t,r)$. Taking the inverse image by θ we get the isomorphism $\epsilon_h \colon \mathcal{B}'_X(f,r) \xrightarrow{\sim} \mathcal{B}'_X(f',r)$ which is independent on the choice of n.

2) In general, $\eta_{g,h} := \epsilon_h \circ \rho_g$. □

Notation 8.7.3.4. We consider the algebraic case of 3.4. Let $m, r \in \mathbb{N}$ be two integers such that p^{m+1} divides r. Let $\mathcal{I} \subset \mathcal{O}_S$ be an m-PD-nilpotent quasi-coherent ideal which extends to X, let $X_0^\sharp = V(\mathcal{I}\mathcal{O}_X) \hookrightarrow X^\sharp$ be the exact closed immersion induced $\mathcal{I}$. We suppose X_0 regular.

(a) Let Z be a divisor of X_0. Let $U^\sharp$ be an open set of $X^\sharp$, $f \in \Gamma(U, \mathcal{O}_X)$ such that the closed immersion $Z^\sharp \cap U_0^\sharp \hookrightarrow U_0^\sharp$ is given by $\overline{f} \in \Gamma(U_0, \mathcal{O}_{X_0})$ the image of f via $\Gamma(U, \mathcal{O}_X) \to \Gamma(U_0, \mathcal{O}_{X_0})$. Following 8.7.3.3, $\mathcal{B}'_U(f,r)$ only depends on Z up to canonical isomorphism. More precisely, let $f' \in \Gamma(U, \mathcal{O}_X)$ be such that the closed immersion $Z^\sharp \cap U_0^\sharp \hookrightarrow U_0^\sharp$ is given by $\overline{f'} \in \Gamma(U_0, \mathcal{O}_{X_0})$ the image of f' via $\Gamma(U, \mathcal{O}_X) \to \Gamma(U_0, \mathcal{O}_{X_0})$. There exists $g \in \Gamma(U, \mathcal{O}_X)$ such that $\overline{g}$ is a unit of $\Gamma(U, \mathcal{O}_{X_0})$ and $\overline{f'} = \overline{g}\overline{f}$. Hence, there exists $h \in \Gamma(U, \mathcal{I}\mathcal{O}_X)$ such that $f' = gf + h$. Since $\mathcal{I}$ is m-PD-nilpotent then $\mathcal{I}$ is nilpotent. Hence, since $\overline{g}$ is a unit of $\Gamma(U, \mathcal{O}_{X_0})$ then g is a unit of $\Gamma(U, \mathcal{O}_X)$. We get $f = g^{-1}f' - h$. Hence $\eta_{f',f,r} \colon \mathcal{B}'_U(f',r)$ is an isomorphism with $\eta_{f,f',r}$ as an inverse (indeed, following 8.7.3.3.a, we have $\eta_{f,f',r} \circ \eta_{f',f,r} = \eta_{f,f,r}$ and $\eta_{f',f,r} \circ \eta_{f,f',r} = \eta_{f',f',r}$). Hence, glueing $\mathcal{B}'_U(f,r)$ we get the $\mathcal{O}_X$-algebra $\mathcal{B}'_X(Z \hookrightarrow X_0, r)$ endowed with a compatible $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure. Put $\mathcal{B}'^{(m)}_X(Z \hookrightarrow X_0) := \mathcal{B}'_X(Z \hookrightarrow X_0, p^{m+1})$. If there is no ambiguity with $\mathcal{I}$ then we can simply write $\mathcal{B}'_X(Z,r)$ and $\mathcal{B}'^{(m)}_X(Z)$.

(b) Let $Z' \supset Z$ be two divisors of X_0. If f and f' are two liftings of a local equation of respectively Z and Z' in X_0, then the homomorphism $\eta_{f',f,r} \colon \mathcal{B}'_X(f,r) \to \mathcal{B}'_X(f',r)$ of 8.7.3.3.c are compatible with the glueing isomorphisms which yields

$$\eta_{Z',Z,r} \colon \mathcal{B}'_X(Z,r) \to \mathcal{B}'_X(Z',r). \tag{8.7.3.4.1}$$

If $Z'' \subset Z'$ is a third divisor of X_0 then we get

$$\eta_{Z'',Z,r} = \eta_{Z'',Z',r} \circ \eta_{Z',Z,r}. \tag{8.7.3.4.2}$$

(c) Let $a \geq 1$ be an integer. Then we can check that the canonical isomorphism $\mathcal{B}'(f^a, r) \xrightarrow{\sim} \mathcal{B}'(f, ar)$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear and that this is compatible with the glueing isomorphism. The yields the equality

$$\mathcal{B}'_X(aZ, r) = \mathcal{B}'_X(Z, ar). \tag{8.7.3.4.3}$$

We get

$$\eta_{Z,ar,r} := \eta_{aZ,Z,r} \colon \mathcal{B}'_X(Z,r) \to \mathcal{B}'_X(Z,ar). \tag{8.7.3.4.4}$$

If $a' \geq 1$ is another integer, we get

$$\eta_{Z,a'ar,r} = \eta_{Z,a'ar,ar} \circ \eta_{Z,ar,r}. \tag{8.7.3.4.5}$$

(d) When r' is a multiple of $p^{m'+1}$, with $m' \geq m$, the structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{B}'_X(Z,r)$ is induced by its structure of $\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$-module, and the homomorphisms $\eta_{Z',Z,r}$ and $\eta_{Z,ar,r}$ are independent of $m \geq m'$.

Notation 8.7.3.5. Let $m \in \mathbb{N}$ be an integer such that $p^m \geq e/(p-1)$. Let $r \in \mathbb{N}$ be an integer such that p^{m+1} divides r. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is locally noetherian. Let $X^\sharp_i := \mathfrak{X}^\sharp \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\mathfrak{m}^{i+1})$, $X^\sharp := X^\sharp_0$. We suppose X regular. Let Z be a divisor of X.

Following 1.2.4.2.(a) $\pi\mathcal{V}$ has an m-PD-structure. Hence, we can use 8.7.3.4 and we get the $\mathcal{O}_{X_i}$-algebra $\mathcal{B}'_{X_i}(Z,r)$ endowed with a compatible $\mathcal{D}^{(m)}_{X^\sharp_i/S^\sharp_i}$-module structure for any $i \in \mathbb{N}$. We observe that the canonical isomorphism

$$\mathcal{B}'_{X_i}(Z,r)/\mathfrak{m}^i \mathcal{B}'_{X_i}(Z,r) \xrightarrow{\sim} \mathcal{B}'_{X_{i-1}}(Z,r)$$

is $\mathcal{D}^{(m)}_{X^\sharp_{i-1}/S^\sharp_{i-1}}$-linear (the structure of the left term is induced by base change). This yields a structure of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on

$$\mathcal{B}'_{\mathfrak{X}}(Z,r) := \varprojlim_i \mathcal{B}'_{X_i}(Z,r), \quad \mathcal{B}'^{(m)}_{\mathfrak{X}}(Z) = \mathcal{B}'_{\mathfrak{X}}(Z, p^{m+1}). \tag{8.7.3.5.1}$$

Moreover, the induced structure of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{B}'_{\mathfrak{X}}(Z,r)$ is compatible with its $\mathcal{O}_{\mathfrak{X}}$-algebra structure (we can use the remark 4.1.1.2). Beware, contrary to what might appear in the literature, to lighten the notation we have chosen to write $\mathcal{B}'_{\mathfrak{X}}(Z,r)$ instead of $\widehat{\mathcal{B}'}_{\mathfrak{X}}(Z,r)$ because we can only define a priori $\mathcal{B}'_{\mathfrak{X}}(Z,r)$ by p-adic completion. However, when the divisor Z lift to an effective Cartier divisor $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$, we can get $\mathcal{B}'_{\mathfrak{X}}(Z,r)$ as p-adic completion of a sheaf of rings on $\mathfrak{P}$ (see just below 8.7.3.9.1).

Finally, we put

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z) := \varinjlim_m \mathcal{B}'^{(m)}_{\mathfrak{X}}(Z) \tag{8.7.3.5.2}$$

and call it the sheaf of *functions* on $\mathfrak{X}$ *with overconvergent singularities* along the divisor Z. An important result is: $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger Z)$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-module. The proof will be given below at Theorem 12.2.7.1.

If $Z \subset T$ are two divisors of X, we get from 8.7.3.3 the canonical morphisms $\mathcal{B}'^{(m)}_{X_i}(Z) \to \mathcal{B}'^{(m)}_{X_i}(T)$, $\mathcal{B}'^{(m)}_{\mathfrak{X}}(Z) \to \mathcal{B}'^{(m)}_{\mathfrak{X}}(T)$, and $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z) \to \mathcal{O}_{\mathfrak{X}}({}^\dagger T)$.

Suppose $\mathfrak{X}$ is noetherian. Then for any divisor Z of X, there exists $a \in \mathbb{N}$ such that $Z_{\mathrm{red}} \subset Z \subset p^a Z_{\mathrm{red}}$. Since $\mathcal{B}'^{(m)}_{\mathfrak{X}}(p^a Z) = \mathcal{B}'^{(m+a)}_{\mathfrak{X}}(Z)$ (see 8.7.3.4.3), this yields that the canonical morphism

$$\mathcal{B}'^{(\bullet)}_{\mathfrak{X}}(Z_{\mathrm{red}}) \to \mathcal{B}'^{(\bullet)}_{\mathfrak{X}}(Z) \tag{8.7.3.5.3}$$

is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{O}^{(\bullet)}_{\mathfrak{X}})$. By applying the inductive limit on the level (without tensoring with $\mathbb{Q}$), we get the isomorphism

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z_{\mathrm{red}}) \to \mathcal{O}_{\mathfrak{X}}({}^\dagger Z). \tag{8.7.3.5.4}$$

Proposition 8.7.3.6. *We keep notation 8.7.3.5. Let $r \in \mathbb{N}$ be an integer such that p^{m+1} divides r. Fix $f \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ and put $\mathcal{B}_{\mathfrak{X}}(f,r) := \mathcal{O}_X\{T\}/(f^r T - \pi)$. Let $\mathfrak{Y}$ be the open of $\mathfrak{X}$ complementary to $V(f)$ and $j\colon \mathfrak{Y} \subset \mathfrak{X}$ be the inclusion. There exists on $\mathcal{B}_{\mathfrak{X}}(f,r)$ a canonical structure of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra such that the inclusion $\mathcal{B}_{\mathfrak{X}}(f,r) \to j_*\mathcal{O}_{\mathfrak{Y}}$ is $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear.*

Proof. Since $\mathcal{B}_{\mathfrak{X}}(f,r)$ is p-adically complete, then we reduce to check that there exists on $\mathcal{B}_{\mathfrak{X}}(f,r)$ a canonical structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module compatible with its structure of $\mathcal{O}_{\mathfrak{X}}$-algebra such that the inclusion $\mathcal{B}_{\mathfrak{X}}(f,r) \to j_*\mathcal{O}_{\mathfrak{Y}}$ is $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear. Consider the following commutative diagram

$$\begin{array}{ccc} \mathfrak{X}^\sharp & \xrightarrow{\phi_f} & \widehat{\mathbb{A}}^1_{\mathcal{V}} = \operatorname{Spf} \mathcal{V}\{t\} \\ \downarrow & & \downarrow \\ (S^\sharp, \mathfrak{a}_S, \mathfrak{b}_S, \alpha_S) & \longrightarrow & (\operatorname{Spf} \mathcal{V}, (\pi), (\pi^{e+1}), \alpha), \end{array} \tag{8.7.3.6.1}$$

where ϕ_f is the morphism given by f and where $((\pi^{e+1}), \alpha))$ is the canonical m-PD-structure of (π) (see 1.2.4.2.a). Hence, by using the preservation of $\mathcal{D}$-module structures under pullbacks (see 4.4.2.4), since $\mathcal{B}_{\mathfrak{X}}(f,r) = \phi_f^*(\mathcal{B}_{\widehat{\mathbb{A}}^1_{\mathcal{V}}}(t,r))$, we reduce to the case where $\mathfrak{S}^\sharp = \operatorname{Spf} \mathcal{V}$ and $\mathfrak{X}^\sharp = \operatorname{Spf} \mathcal{V}\{t\}$, $f = t$. Since the ideal of the closed immersion $\Delta_{\mathfrak{X}/\mathfrak{S}}$ is the ideal of $\mathcal{V}\{t_1, t_2\} = (\mathcal{V}\{t_1\})\{t_2 - t_1\}$ generated by $t_2 - t_1$, since $\mathcal{P}^n_{\mathfrak{X}/\mathfrak{S},(m)} = \varprojlim_i \mathcal{P}^n_{X_i/\mathfrak{S}_i,(m)}$, then following 1.3.2.6, we have $(|\mathfrak{X}|, \mathcal{P}^n_{\mathfrak{X}/\mathfrak{S},(m)}) = \operatorname{Spf}(\mathcal{V}\{t_1\}\langle t_2 - t_1\rangle_{(m)}/I^{\{n+1\}})$, where and $I = \overline{(t_2 - t_1)}$ is the m-PD-ideal generated by $t_2 - t_1$. We have $r = p^{m+1}q$. Following 8.7.3.1.2, there exists a of degree r homogeneous m-PD-polynomial $\phi^{(m)}_r(t_1, t_2), \psi^{(m)}_r(t_1, t_2) \in I$ (and even with coefficient in $\mathbb{Z}_{(p)}$) such that $t_2^r - t_1^r = p\phi^{(m)}_r(t_1, t_2) = \pi\psi^{(m)}_r(t_1, t_2)$ Set $T_1 := T \otimes 1 \in \mathcal{O}_{\mathfrak{X}}\{T\}/(f^r T - \pi) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^n_{\mathfrak{X}/\mathfrak{S},(m)}$ and $T_2 := 1 \otimes T \in \mathcal{P}^n_{\mathfrak{X}/\mathfrak{S},(m)} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}\{T\}/(f^r T - \pi)$. We are looking for an $\mathcal{O}_{\mathfrak{X}}$-algebra isomorphism ε_n making commutative the diagram below:

$$\begin{array}{ccccc} \mathcal{P}^n_{\mathfrak{X}/\mathfrak{S},(m)} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}\{T\}/(f^r T - \pi) & & \xrightarrow[\sim]{\varepsilon_n} & & \mathcal{O}_{\mathfrak{X}}\{T\}/(f^r T - \pi) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^n_{\mathfrak{X}/\mathfrak{S},(m)} \\ \downarrow & & & & \downarrow \\ j_*(\mathcal{P}^n_{\mathfrak{Y}/\mathfrak{S},(m)} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \mathcal{O}_{\mathfrak{Y}}) & \xrightarrow{\sim} & j_*\mathcal{P}^n_{\mathfrak{Y}/\mathfrak{S},(m)} & \xleftarrow[\sim]{} & j_*(\mathcal{O}_{\mathfrak{Y}} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \mathcal{P}^n_{\mathfrak{Y}/\mathfrak{S},(m)}) \end{array} \tag{8.7.3.6.2}$$

where the bottom isomorphisms are the canonical isomorphisms and the composite bottom isomorphism is $\varepsilon_n^{\mathcal{O}_{\mathfrak{Y}}}$ (see 3.4.2.4.1). The image of T_2 (resp. T_1) in $\mathcal{P}^n_{\mathfrak{Y}/\mathfrak{S},(m)}$ is πt_2^{-r} (resp. πt_1^{-r}). To do so, we define an $\mathcal{O}_{\mathfrak{X}}$-algebra map $\varepsilon_n(T_2)$ by setting

$$\varepsilon_n(T_2) = T_1(1 + T_1\psi^{(m)}_r(t_1, t_2))^{-1},$$

which has a meaning because $\psi^{(m)}_r(t_1, t_2)$ is nilpotent in $\mathcal{P}^n_{\mathfrak{X}/\mathfrak{S},(m)}$. Its inverse is given by $T_1 \mapsto T_2(1 - T_2\psi^{(m)}_r(t_1, t_2))^{-1}$. Since $\psi^{(m)}_r(t_1, t_2) \in I$, then $\varepsilon_0 = \mathrm{id}$. Moreover, the cocycle condition is a consequence of the formula

$$\psi^{(m)}_r(t_1, t_2) + \psi^{(m)}_r(t_2, t_3) = \psi^{(m)}_r(t_1, t_3) \tag{8.7.3.6.3}$$

in $\mathcal{V}\{t_1\}\langle t_2 - t_1, t_3 - t_2\rangle_{(m)}$ □

Proposition 8.7.3.7. *We keep notation 8.7.3.5. Let $r \in \mathbb{N}$ be an integer such that p^{m+1} divides r. Let $f, g, h \in \Gamma(X, \mathcal{O}_{\mathfrak{X}})$ such that $f' = gf + \pi h$. There exists the canonical $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear homomorphism of $\mathcal{O}_{\mathfrak{X}}$-algebras*

$$\eta_{g,h} \colon \mathcal{B}_{\mathfrak{X}}(f, r) \to \mathcal{B}_{\mathfrak{X}}(f', r),$$

satisfying the following properties:

(a) If $g' \in \Gamma(X, \mathcal{O}_{\mathfrak{X}})$, $h' \in \Gamma(X, \pi\mathcal{O}_{\mathfrak{X}})$, and $f'' = g'f' + \pi h'$, $g'' = g'g$, $h'' = g'h + h'$, then $\eta_{g'',h''} = \eta_{g',h'} \circ \eta_{g,h}$.

(b) $\eta_{1,0} = \mathrm{id}$.

(c) If f is not a divisor of 0 in $\mathcal{O}_{\mathfrak{X}}/\pi\mathcal{O}_{\mathfrak{X}}$, $\eta_{g,h}$ only depends on f, f', r and will be denoted $\eta_{f',f,r}$.

(d) If r is divisible by $p^{m'+1}$, with $m' \geq m$, $\eta_{g,h}$ is independent from $m \leq m'$.

Proof. 1) Suppose $g = 1$. Then $f = f' - \pi h = f'u$, where $u := (\mathrm{id} - \pi f'^{-1} h) \in \mathcal{B}^{\times}_{\mathfrak{X}}(f', r)$. we get the isomorphism $\eta_{1,h}$ defined by setting $\eta_{1,h}(T) = u^{-1}T'$, i.e. $\eta_{1,h}(\pi f^{-r}) = u^{-1}\pi f'^{-r}$. 2) Suppose $h = 0$. Then we get the morphism $\eta_{g,0}$ defined by setting $\eta_{g,0}(T) = g^r T'$, i.e. $\eta_{g,0}(\pi f^{-r}) = g^r \pi f'^{-r}$. 3) In general, we get the map $\eta_{g,h} := \eta_{1,h} \circ \eta_{g,0}$. The $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linearity follows from the commutative diagram

$$\begin{array}{ccc} \mathcal{B}_{\mathfrak{X}}(f, r) & \xrightarrow{\eta_{g,h}} & \mathcal{B}_{\mathfrak{X}}(f', r) \\ \downarrow & & \downarrow \\ j_* \mathcal{O}_{\mathfrak{Y}} & = & j_* \mathcal{O}_{\mathfrak{Y}} \end{array} \tag{8.7.3.7.1}$$

where the vertical map are $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear (see 8.7.3.6).

□

Notation 8.7.3.8. We keep notation 8.7.3.5. Let $\mathfrak{U}^\sharp$ be an open set of $\mathfrak{X}^\sharp$, $f \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}})$ such that the closed immersion $Z^\sharp \cap U^\sharp \hookrightarrow U^\sharp$ is given by $\overline{f} \in \Gamma(U, \mathcal{O}_X)$ the image of f via $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}) \to \Gamma(U, \mathcal{O}_X)$. Following 8.7.3.7, $\mathcal{B}_{\mathfrak{U}}(f, r)$ only depends on Z up to canonical isomorphism. Hence, glueing $\mathcal{B}_{\mathfrak{U}}(f, r)$ we get the $\mathcal{O}_X$-algebra $\mathcal{B}_{\mathfrak{X}}(Z, r)$ endowed with a compatible $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure. Put $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) := \mathcal{B}_{\mathfrak{X}}(Z, p^{m+1})$.

We have the isomorphism:

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z) \xrightarrow{\sim} \varinjlim_{m} \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \tag{8.7.3.8.1}$$

If $Z \subset T$ are two divisors of X, we get from 8.7.3.7 the canonical morphism $\eta_{T,Z,r} \colon \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m)}_{\mathfrak{X}}(T)$, and $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z) \to \mathcal{O}_{\mathfrak{X}}({}^\dagger T)$. These algebras satisfy the same properties than in 8.7.3.4 and we keep the corresponding notation, e.g.

.

Suppose $\mathfrak{X}$ is noetherian. Then for any divisor Z of X, there exists $a \in \mathbb{N}$ such that $Z_{\mathrm{red}} \subset Z \subset p^a Z_{\mathrm{red}}$. Since $\mathcal{B}^{(m)}_{\mathfrak{X}}(p^a Z) = \mathcal{B}^{(m+a)}_{\mathfrak{X}}(Z)$ (similarly to 8.7.3.4.3), this yields that the canonical morphism

$$\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z_{\mathrm{red}}) \to \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z) \tag{8.7.3.8.2}$$

is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{O}^{(\bullet)}_{\mathfrak{X}})$. By applying the inductive limit on the level (without tensoring with $\mathbb{Q}$), we get the isomorphism

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z_{\mathrm{red}}) \to \mathcal{O}_{\mathfrak{X}}({}^\dagger Z). \tag{8.7.3.8.3}$$

Notation 8.7.3.9. With notation 8.7.3.5, suppose there exists an effective Cartier divisor $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$ (see definition 4.5.2.1) which is a lifting of Z. Let $m, r \in \mathbb{N}$ be two integers such that p^{m+1} divides r. Then, similarly to 8.7.3.4, by glueing $\mathcal{B}_{\mathfrak{X}}(f, r)$ when f is an equation of $\mathfrak{Z} \subset \mathfrak{X}$ we can define $\mathcal{B}_{\mathfrak{X}}(\mathfrak{Z}, r)$ (indeed we can get a formal version of 8.7.3.3 in the case where $\mathcal{I}$ is null). We get the isomorphism:

$$\widehat{\mathcal{B}}_{\mathfrak{X}}(\mathfrak{Z}, r) \xrightarrow{\sim} \mathcal{B}_{\mathfrak{X}}(Z, r), \tag{8.7.3.9.1}$$

where the LHS is the p-adic completion of $\mathcal{B}_{\mathfrak{X}}(\mathfrak{Z}, r)$. We also set $\mathcal{B}^{(m)}_{\mathfrak{X}}(\mathfrak{Z}) := \mathcal{B}_{\mathfrak{X}}(\mathfrak{Z}, p^{m+1})$.

8.7.3.10 (p-adic completion, p-adic weak completion)**.** Let A be a noetherian p-adic ring. We denote by $A\{T\}$ the p-adic completion of the polynomial ring $A[T]$ with one variable. This is called the ring of restricted power series (see [Gro60, 0.7.5]). We get

$$A\{T\} := \widehat{A[T]} = \left\{ \sum_{n=0}^{\infty} a_n T^n : a_n \in A, \lim_{n\to+\infty} a_n = 0 \right\},$$

where A is endowed with the p-adic topology. Following [Gro60, 0.7.6.15], for any $f \in A$, we write

$$\begin{aligned} A_{\{f\}} &:= \widehat{A_f} = A\{T\}/(fT-1) \\ &= \left\{ \sum_{n=0}^{\infty} \frac{a_n}{f^n} : a_n \in A, \lim_{n\to+\infty} a_n = 0 \right\} \end{aligned}$$

where A is endowed with the p-adic topology.

The *p-adic weak completion of $A[T]$ as A-algebra* is

$$A[T]^{\dagger} = \left\{ \sum_{n=0}^{\infty} a_n T^n : \exists\, c, \eta \in \mathbb{R}, \eta < 1 \text{ such that } \|a_n\| \leq c\eta^n \right\},$$

where $\| - \|$ is the p-adic norm of A (see 8.7.1.6). The p-adic weak completion of A_f as A-algebra is

$$A_f^{\dagger} := A[T]^{\dagger}/(fT-1) = \left\{ \sum_{n=0}^{\infty} \frac{a_n}{f^n} : a_n \in A, \exists\, c, \eta \in \mathbb{R}, \eta < 1 \text{ such that } \|a_n\| \leq c\eta^n \text{ for all } n \right\}.$$

Using the computation of 8.7.1.8, we can check

$$A_f^{\dagger} = \left\{ \sum_{n=0}^{\infty} a_n f^n : a_n \in A, \exists\, \lambda > 0 \text{ such that } v_p(a_n) \geq \frac{n}{\lambda} - 1 \right\}.$$

8.7.3.11 (Local description)**.** Let $\mathfrak{S}^{\sharp}$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^{\sharp} \to \mathfrak{S}^{\sharp}$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is locally noetherian and X_0 is regular. Let Z be a divisor of X, $\mathfrak{Y}^{\sharp}$ be the open of $\mathfrak{X}^{\sharp}$ complementary to the support of Z and $j \colon \mathfrak{Y}^{\sharp} \to \mathfrak{X}^{\sharp}$ be the canonical morphism. Let $\mathfrak{U} = \operatorname{Spf} A$ be an affine open of $\mathfrak{X}$, $f \in A$ such that $Z = V(\bar{f}) \subset X_0$ where $\bar{f}$ is the image of f in $A/\mathfrak{m}A$.

(a) We have

$$\Gamma(\mathfrak{U}, j_* \mathcal{O}_{\mathfrak{Y}}) = A_{\{f\}} = \left\{ \sum_{n=0}^{\infty} \frac{a_n}{f^n} : a_n \in A, \lim_{n\to+\infty} a_n = 0 \right\}.$$

(b) Let r' and r be two any positive integer such that r divides r'. Then $\Gamma(\mathfrak{U}, \mathcal{B}_{\mathfrak{X}}(Z,r)) = A\{T\}/(f^r T - p)$ and $\Gamma(\mathfrak{U}, \mathcal{B}_{\mathfrak{X}}(Z,r')) = A\{T'\}/(f^{r'} T' - p)$. Moreover, by taking the inverse limits over $i \in \mathbb{N}$ of the morphisms $\eta_{Z,r',r} \colon \mathcal{B}_{X_i}(Z,r) \to \mathcal{B}_{X_i}(Z,r')$ of 8.7.3.4.4 and taking the sections over $\mathfrak{U}$ functor, we get the morphism $\Gamma(\mathfrak{U}, \mathcal{B}_{\mathfrak{X}}(Z,r)) \to \Gamma(\mathfrak{U}, \mathcal{B}_{\mathfrak{X}}(Z,r'))$ which is given by $T \mapsto f^{r'-r} T'$.

(c) After tensorising by $\mathbb{Q}$ the sheaf $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)$ we have the following nice description from the computation of (b):

$$\begin{aligned} \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}) &\xrightarrow{\sim} \varinjlim_{m} \Gamma(\mathfrak{U}, \mathcal{B}_{\mathfrak{X}}^{(m)}(Z)_{\mathbb{Q}}) \xrightarrow{\sim} \varinjlim_{m} \left(A\{t\}/(f^{p^{m+1}} t - p) \right)_K \xrightarrow{\sim} (A_f^{\dagger})_K \\ &\xrightarrow{\sim} \left\{ \sum_{n=0}^{\infty} \frac{a_n}{f^n} : a_n \in A_K, \exists\, c, \eta \in \mathbb{R}, \eta < 1 \text{ such that } \|a_n\| \leq c\eta^n \right\}, \end{aligned} \tag{8.7.3.11.1}$$

where A_K is endowed with the topology induced by the p-adic topology of A which induces a p-adic norm on A_K (see 8.7.1.6).

8.7.3.12. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose X is regular. Let Z be a divisor of X. We define the sheaf of "differential operators of finite level on $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ with overconvergent singularities along of Z" by setting

$$\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z) = \varinjlim_m \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}.$$

We have the ring homomorphism $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)$.

Remark 8.7.3.13. With notation 8.7.3.12, let $\mathfrak{Y}^\sharp$ be the open of $\mathfrak{X}^\sharp$ complementary to Z and let $j\colon \mathfrak{Y}^\sharp \subset \mathfrak{X}^\sharp$ be the inclusion of the complementary open. We will see via 8.7.6.8 that the sheaf $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ (resp. $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$) plays the role of an "overconvergent direct image" of $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$ (resp. $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$). Bearing in mind the algebraic case, where j_* induces an equivalence between the category of $\mathcal{O}_Y$-quasi-coherent modules and that of $j_*\mathcal{O}_Y$-quasi-coherent modules, we are led to replace the category of coherent $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules by that of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-modules, and the functor j_* (resp. j^*) by the restriction of the scalars of $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$ to $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ (resp. the extension of the scalars from $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ to $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$). The main reason is to get finiteness results. For instance, when $\mathfrak{X}$ is a proper and smooth formal scheme over $\mathcal{V}$, then the sheaf $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ is coherent as $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-module (see 12.2.7.1) and has in particular finite de Rham cohomology, which is not the case for $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$ (for instance when $\mathfrak{Y}$ is the affine space).

Proposition 8.7.3.14. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension and that X is regular. Let Z be a divisor of X, $\mathfrak{Y}^\sharp$ be the open of $\mathfrak{X}^\sharp$ complementary to the support of Z and $j\colon \mathfrak{Y}^\sharp \to \mathfrak{X}^\sharp$ be the canonical morphism.

(a) For any affine open formal subscheme $\mathfrak{U} \subset \mathfrak{X}$, $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z))$, and $\Gamma(\mathfrak{U}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}})$ are noetherian.

(b) The extensions $\mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to \mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}$ and $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} \to \mathcal{B}^{(m+1)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}$ are flat.

(c) The sheaves $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$, $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}$, and $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ are coherent. Moreover, coherent modules over these sheaves satisfy theorems A and B.

Proof. We can copy the proof of [Ber96c, 4.3.2]. □

In the rest of the section, we keep notation and hypotheses of 8.7.3.14. We give below few constructions of Huyghe (see [Huy03, 2.2]).

Lemma 8.7.3.15. *Suppose there exist two sections f and g of $\mathcal{O}_{\mathfrak{X}}$ lifting an equation of de Z in X. Then the modules $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)[1/f]$ and $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)[1/g]$ are canonically isomorphic.*

Proof. There exists $v \in \mathcal{O}_{\mathfrak{X}}$, $u \in \mathcal{O}_{\mathfrak{X}}^\times$, such that $g = u(f - \pi v)$. We have $h := u(1 - \pi v f^{-1}) \in (\mathcal{B}^{(m)}_{\mathfrak{X}}(Z))^\times$ (its inverse is given by $u^{-1} \sum_{n\in\mathbb{N}} \pi^n v^n f^{-n}$). Since $g = fh$, then we are done. □

Notation 8.7.3.16. It follows from Lemma 8.7.3.15 that we can glue the rings $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)[1/f]$ which gives a sheaf of rings on $\mathfrak{X}$ denoted by $\mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)$ We denote by $(*Z)\colon \mathrm{Mod}(\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)) \to \mathrm{Mod}(\mathcal{B}^{(m)}_{\mathfrak{X}}(*Z))$ the functor defined by setting for any $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$-module $\mathcal{E}$:

$$\mathcal{E}(*Z) = \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z) \otimes_{\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)} \mathcal{E}.$$

Notation 8.7.3.17. Suppose there exists an effective Cartier divisor $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z (see definition 4.5.2.1). If there exist two sections f and g of $\mathcal{O}_{\mathfrak{X}}$ giving an equation of $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$, then Then the modules $\mathcal{O}_{\mathfrak{X}}[1/f]$ and $\mathcal{O}_{\mathfrak{X}}[1/g]$ are canonically isomorphic. By glueing, we get the sheaf of rings $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})$. We define the localisation functor $(\mathfrak{Z})\colon \mathrm{Mod}(\mathcal{O}_{\mathfrak{X}}) \to \mathrm{Mod}(\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}))$ by setting for any $\mathcal{O}_{\mathfrak{X}}$-module $\mathcal{E}$:

$$\mathcal{E}(\mathfrak{Z}) = \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}.$$

.

Lemma 8.7.3.18. *The canonical inclusion $\mathcal{O}_{\mathfrak{X}} \subset \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \cap j_*\mathcal{O}_{\mathfrak{Y}}$ is an isomorphism.*

Proof. Since this is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ affine and integral, and there exists $f \in A$ such that $\mathfrak{Y} = \mathrm{Spf}\, A\{1/f\}$. Since $A/\pi A$ is integral then we get the injective map $\alpha\colon A/\pi A \to A\{1/f\}/\pi A\{1/f\}$. Let $h \in A_{\mathbb{Q}} \cap A\{1/f\}$. Let $s \in \mathbb{Z}$ be minimal such that $\pi^s h \in A$. Set $k := \pi^s h$. By the absurd, suppose $s \geq 1$. Denoting by $\overline{k}$ the image of k in $A/\pi A$, since $k \in \pi A\{1/f\}$ then $\alpha(\overline{k}) = 0$ and therefore $k \in \pi A$. Since A is p-torsion free, this yields $\pi^{s-1}h \in A$, which is in contradiction with respect to the minimality of s. Hence, we are done. □

Lemma 8.7.3.19. *Suppose there exists an effective Cartier divisor $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z (see definition 4.5.2.1). Denote by $(\mathfrak{Z})$ the localisation functor $(\mathfrak{Z})\colon \mathrm{Mod}(\mathcal{O}_{\mathfrak{X}}) \to \mathrm{Mod}(\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}))$.*

(a) For any $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$-module $\mathcal{E}$, we have the canonical isomorphism $\mathcal{E}(*Z) \xrightarrow{\sim} \mathcal{E}(\mathfrak{Z})$.

(b) We have the equality $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}) = \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} \cap j_*\mathcal{O}_{\mathfrak{Y}}$.

(c) We have moreover the equality:

$$\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) + \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}) = \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z). \tag{8.7.3.19.1}$$

(d) We have the equalities $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}}$ (see notation of 8.7.3.9):

$$\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) + \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)_{\mathbb{Q}}. \tag{8.7.3.19.2}$$

Proof. a) The first statement is tautological.

b) Since this is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ affine and integral, and there exists $f \in A$ such that $\mathfrak{Z} = V(fA)$. Then $B := \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})) = A[1/f]$, $B_{\mathbb{Q}} = \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}})$ and $\Gamma(\mathfrak{X}, j_*\mathcal{O}_{\mathfrak{Y}}) = A\{1/f\}$. The inclusion $B \subset A\{1/f\}$ induces the isomorphism $\iota\colon B/\pi B \xrightarrow{\sim} A\{1/f\}/\pi A\{1/f\}$. Let $h \in B_{\mathbb{Q}} \cap A\{1/f\}$. Let $s \in \mathbb{Z}$ be minimal such that $\pi^s h \in B$. Set $k := \pi^s h$. By the absurd, suppose $s \geq 1$. Denoting by $\overline{k}$ the image of k in $B/\pi B$, since $k \in \pi A\{1/f\}$ then $\iota(\overline{k}) = 0$ and therefore $k \in \pi B$. Since B is p-torsion free, this yields $\pi^{s-1}h \in B$, which is in contradiction with respect to the minimality of s. Hence, we are done.

c) We have to check that the inclusion $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) + \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}) \subset \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)$ is an equality. Since this is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ affine and there exists $f \in A$ such that $\mathfrak{Z} = V(f)$. Let $P \in \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z))$. Then we get $P = f^{-n}Q$, for some $n \in \mathbb{N}$ and $Q \in \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z))$. We can write $Q = Q_0 + p^n R$, with $Q_0 \in A[1/f]$ and $R \in \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z))$. Since $p^n f^{-n} \in \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z))$, then we are done.

d) Since this is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ affine and there exists $f \in A$ such that $\mathfrak{Z} = V(f)$. Let us check the first equality. Since $1/f \in \mathcal{B}^{(m)}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}}$, then we get the inclusion $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} \subset \mathcal{B}^{(m)}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}}$. Conversely, the fact that the inclusion $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} \subset \mathcal{B}^{(m)}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}}$ is an equality follows from the fact that $p/f^{p^{m+1}} \in \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}}$.

Since $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) + \mathcal{B}^{(m)}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}$, then we get the first equality of 8.7.3.19.2. Finally if follows from 8.7.3.19.1 the last equality: $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} + \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)_{\mathbb{Q}}$. Finally if follows from 8.7.3.19.1 the last equality: $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} + \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})_{\mathbb{Q}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)_{\mathbb{Q}}$. □

Remark 8.7.3.20. Since the canonical inclusion $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} \to \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)_{\mathbb{Q}}$ is an isomorphism, then for any $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$-module $\mathcal{E}$, we have the canonical morphism $\mathcal{E}_{\mathbb{Q}} \to \mathcal{E}(*Z)_{\mathbb{Q}}$ is an isomorphism.

Lemma 8.7.3.21. *We have the equality $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} \cap j_*\mathcal{O}_{\mathfrak{Y}} = \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)$.*

Proof. Since this is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ affine and integral, and there exists $f \in A$ such that $\mathfrak{Z} := V(f)$ is an effective Cartier divisor in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z. Let $B = \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(\mathfrak{Z}))$, $\widehat{B}$ its p-adic completion. Let $u \in \widehat{B}_{\mathbb{Q}} \cap A\{1/f\}$. Since $u \in \widehat{B}_{\mathbb{Q}}$ then following 8.7.3.19.2, we can write $u = h + r$, with $r \in \widehat{B}$ and $h \in A[1/f]_{\mathbb{Q}}$. Since $u \in A\{1/f\}$ and $\widehat{B} \subset A\{1/f\}$, then $h \in A[1/f]_{\mathbb{Q}} \cap A\{1/f\}$. Following 8.7.3.19.(b) we get the equality $A[1/f]_{\mathbb{Q}} \cap A\{1/f\} = A[1/f] \subset \widehat{B}[1/f]$ and we are done. □

Notation 8.7.3.22. We introduce the following sheaf of differential operators by adding some coefficients.

(a) By using Leibnitz formula, since $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$ is a sub-$\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module of $j_*\mathcal{O}_{\mathfrak{Y}}$, then so is $\mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)$. Hence, $\mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)$ is an $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. We get the sheaf of rings

$$\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z) := \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \qquad \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z) := \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z) \otimes_{\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z).$$

The sheaf of rings $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ is endowed with two structure of $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$-algebras (the left and the right one). This yields two sheaves:

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z) := \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z) \otimes_{\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z), \qquad \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(\natural Z) := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) \otimes_{\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)} \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z),$$

where we choose the left (resp. right) structure for the left (resp. right) notation. Since $j^*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z) = \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ and $j^*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(\natural Z) = \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$, then we can identify both sheaves as subsheaves of $j_*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$. We will see they are identical (see 8.7.3.23.1).

(b) Suppose there exists an effective Cartier divisor $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z (see definition 4.5.2.1). By using Leibnitz formula, we compute $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})$ is a sub-$\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module of $j_*\mathcal{O}_{\mathfrak{Y}}$. Hence, $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})$ is an $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module and we get the sheaf of rings

$$\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(\mathfrak{Z}) := \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}.$$

Lemma 8.7.3.23. *Suppose there exists an effective Cartier divisor $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z (see definition 4.5.2.1). We have the equality*

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z) = \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) + \mathcal{D}^{(m)}_{\mathfrak{X}}(\mathfrak{Z}) = \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(\natural Z). \tag{8.7.3.23.1}$$

Proof. i) Let us check that the inclusion $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) + \mathcal{D}^{(m)}_{\mathfrak{X}}(\mathfrak{Z}) \subset \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z)$ is an equality. Since this is local, we can suppose $\mathfrak{X} = \operatorname{Spf} A$ affine and integral, and there exists $f \in A$ such that $\mathfrak{Z} := V(f)$ is an effective Cartier divisor in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z. Let $P \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z))$. Then we get $P = f^{-n}Q$, for some $n \in \mathbb{N}$ and $Q \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. We can write $Q = Q_0 + p^n R$, with $Q_0 \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}}(\mathfrak{Z}))$ and $R \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Since $p^n f^{-n} \in \Gamma(\mathfrak{Y}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, hence we are done.

ii) Similarly we check the second inclusion is the identity: let $P \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(\natural Z))$. Then we get $P = Qf^{-n}$, for some $n \in \mathbb{N}$ and $Q \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. We can write $Q = Q_0 + p^n R$, with $Q_0 \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}}(\mathfrak{Z}))$ and $R \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Since $p^n f^{-n} \in \Gamma(\mathfrak{Y}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, hence we are done. □

Proposition 8.7.3.24. *The sheaf $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z)$ is a subring of $j_*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$.*

Proof. Since this is local, then we can suppose there exists an effective Cartier divisor $\mathfrak{Z}$ in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z. Hence, this follows from the equality 8.7.3.23.1. Let $P \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ $Q \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}}(\mathfrak{Z}))$. Then there exists $n \in \mathbb{N}$ such that $f^n Q \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}})$ and $Qf^n \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}})$. Since $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ is a ring, this implies that $(PQ)f^n = P(Qf^n) \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ and $f^n(QP) = (f^nQ)P \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Hence, $PQ, QP \in \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z))$. □

Notation 8.7.3.25. We set $\mathcal{O}_{\mathfrak{X}}(^\dagger *Z) := \varinjlim_m \mathcal{B}^{(m)}_{\mathfrak{X}}(*Z)$. Moreover, for all integer m, we write $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z) := \mathcal{O}_{\mathfrak{X}}(^\dagger * Z) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z) := \varinjlim_m \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(*Z) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(^\dagger * Z) \otimes_{\mathcal{O}_{\mathfrak{X}}(^\dagger Z)} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger Z)$.

Lemma 8.7.3.26. *Suppose $\mathfrak{X} = \operatorname{Spf} A$ is affine and there exists $f \in A$ such that $\mathfrak{Z} := V(f)$ is an effective Cartier divisor in $\mathfrak{X}/\mathfrak{S}$ which is a lifting of Z. Then $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}(^\dagger * Z)) = A[\frac{1}{f}]^\dagger$, where $A[\frac{1}{f}]^\dagger$ the p-adic weak completion of $A[\frac{1}{f}]$ as A-algebra (see 8.7.3.10).*

Proof. Set $B_{\mathfrak{X}}(Z,r) := \Gamma(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}}(Z,r))$ and $B_{\mathfrak{X}}(*Z,r) := \Gamma(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}}(*Z,r))$. We have:

$$B_{\mathfrak{X}}(Z,r) = \left\{ \sum_{n=0}^{\infty} a_n f^{-n} \ \mid a_n \in A,\ v_\pi(a_n) \geq \frac{n}{r} \text{ for all } n \right\}.$$

Hence, $B_{\mathfrak{X}}(*Z,r) = \left\{ \sum_{n=0}^{\infty} a_n f^{-n} \mid a_n \in A,\ \exists s \in \mathbb{N} \text{ satisfying } v_\pi(a_n) \geq \frac{n}{r} - s \text{ for all } n \right\}$. This yields the equality $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}(^\dagger * Z)) = \left\{ \sum_{n=0}^{\infty} a_n f^{-n} : a_n \in A, \exists\, \lambda > 0 \text{ such that } v_\pi(a_n) \geq \frac{n}{\lambda} - 1 \text{ for all } n \right\}$ and we are done. □

Proposition 8.7.3.27. *The sheaves of rings $\mathcal{O}_{\mathfrak{X}}(^\dagger * Z)$ and $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z)$ are coherent.*

Proof. This follows from 8.7.3.26 and 4.1.2.17.(e). □

8.7.3.28. Suppose $\mathfrak{X}$ is noetherian.

(a) Let $\mathcal{E}$ a left $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger Z)$-module. Suppose that there exists a section $f \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ lifting a local equation of Z. Then, similarly to 7.4.3.1.1, we can check that the canonical map

$$\mathbb{R}\Gamma(\mathfrak{X}, \mathcal{E})[1/f] \to \mathbb{R}\Gamma(\mathfrak{X}, \mathcal{E}(*Z)). \qquad (8.7.3.28.1)$$

is an isomorphism.

(b) Moreover, if $\mathcal{F}$ is a $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z)$-module of finite presentation, then there exists a $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger Z)$-module of finite presentation $\mathcal{E}$ such that $\mathcal{E}(*Z) \xrightarrow{\sim} \mathcal{F}$. Indeed, this is checked similarly to 8.4.1.11.b.ii).

Theorem 8.7.3.29. *Suppose $\mathfrak{X}$ is affine. We obtain then theorems A and B:*

A) The functors $\Gamma(\mathfrak{X}, -)$ and $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z) \otimes_{\Gamma(\mathfrak{X}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z))} -$ are quasi-inverse equivalences between the category of $\Gamma(\mathfrak{X}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z))$-modules of finite presentation and that of $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger * Z)$-modules of finite presentation.

B) For all $\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger * Z)$-module of finite presentation $\mathcal{F}$, for all integer $q \geq 1$, $H^q(\mathfrak{X}, \mathcal{F}) = 0$.

Proof. By 8.4.1.14.(a), we know this without the symbol "$*$". We can conclude by using 8.7.3.28. □

Remark 8.7.3.30. After tensoring with $\mathbb{Q}$, we get a coherent version of theorem A and B (see 8.7.5.5).

Let us first state a general theorem of C. Huyghe, which shows that, when Z is a large divisor in a diagram projective, the coherent $\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$-modules behave well from the cohomological point of view as coherent sheaves on an affine scheme; we can see this theorem as an analogue of theorems A and B, with overconvergence at infinity:

Theorem 8.7.3.31 ([Huy04, 5.3.3])**.** *Let $\mathfrak{X}$ be a projective and smooth $\mathcal{V}$-formal scheme, $Z \subset X$ be an ample divisor of its special fiber, and let $D^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}} := \Gamma(\mathfrak{X}, \mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}})$.*

(i) The ring $D^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$ is coherent, and the functor $\Gamma(\mathfrak{X}, -)$ induces an equivalence of categories between the category of coherent $\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$-modules and that of $D^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$-coherent modules.

(ii) For all $n \geq 1$, and all coherent $\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$-module, we have $H^n(\mathfrak{X}, \mathcal{E}) = 0$.

C. Huyghe further establishes an invariance theorem which shows that the category of coherent $\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$-modules does not depend on the smooth compactification X of $\mathfrak{Y}$:

Theorem 8.7.3.32 ([Huy04, 7.3.3])**.** *Let $f \colon \mathfrak{X}' \to \mathfrak{X}$ be a proper morphism of smooth $\mathcal{V}$-formal schemes, $Z \subset X$, $Z' \subset X'$ two divisors of the special fibers of X and X', $\mathfrak{Y} = \mathfrak{X} \setminus Z$, $\mathfrak{Y}' = \mathfrak{X}' \setminus Z'$. We assume that f induces an isomorphism $\mathfrak{Y}' \xrightarrow{\sim} f^{-1}(\mathfrak{Y})$. Then the functors $f^!_{Z',Z}$ and $f_{Z,Z',+}$ induce quasi-inverse category equivalences between the category of coherent $\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$-modules, and that coherent $\mathcal{D}^\dagger_{\mathfrak{X}'}(^\dagger Z')_{\mathbb{Q}}$-modules.*

8.7.4 Increasing the level: finiteness of the tor-dimension with overconvergent coefficients

Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension.

Lemma 8.7.4.1. *Let $r \in \mathbb{N}$, A be a separated complete $\mathcal{V}$-algebra (for the p-adic topology), noetherian (of finite Krull dimension) and p-torsion free, $f \in A$ which is not a zero divisor modulo $\mathfrak{m}$, $A_{\{f\}}$ be the p-adic completion of A_f, $B = A[T]/(f^rT - p)$.*

(a) The ring B is p-torsion free and is p-adically separated.

(b) The homomorphism $\widehat{B} \to A_{\{f\}}$ sending T to p/f^r is injective.

(c) If $A \otimes_{\mathcal{V}} k$ is integral then so is $\widehat{B}$.

Proof. This is [Ber96c, 4.3.3]. □

Corollary 8.7.4.2. *Suppose $\mathfrak{X}^\sharp$ is p-torsion free (see 3.3.1.12 for some example). Let Z be a divisor of X_0. Let $m, r \in \mathbb{N}$ be two integers such that p^{m+1} divides r.*

(a) With the notation 8.5.4.18, 8.7.3.4 and 8.7.3.5.1, the sheaf $\mathcal{B}_{\mathfrak{X}}(Z,r)$ is p-torsion free and we have the canonical isomorphism

$$\mathbb{L}\underset{\leftarrow X}{l}^*(\mathcal{B}_{\mathfrak{X}}(Z,r)) := \mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} (\mathcal{B}_{\mathfrak{X}}(Z,r)) \xrightarrow{\sim} \mathcal{B}_{X_\bullet}(Z,r), \tag{8.7.4.2.1}$$

$$\mathbb{L}\underset{\leftarrow X}{l}^*(\mathcal{B}_{\mathfrak{X}}(Z,r)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \xrightarrow{\sim} \mathcal{B}_{X_\bullet}(Z,r) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}. \tag{8.7.4.2.2}$$

(b) We have $\mathcal{B}_{\mathfrak{X}}(Z,r) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$, $\mathcal{B}_{X_\bullet}(Z,r) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$ and $\mathcal{B}_{\mathfrak{X}}(Z,r)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ and $\mathcal{B}_{X_\bullet}(Z,r) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$.

(c) Moreover, $(\mathfrak{X}^\sharp, \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))/\mathfrak{S}^\sharp$ is strongly quasi-flat (see definition 8.5.5.3).

Proof. This is a consequence of 8.7.4.1 and of 7.3.1.7 (for the last property, more precisely, in the definition 8.5.5.3, we can choose $\mathfrak{T} = \mathrm{Spf}\,\mathcal{V}$). □

8.7.4.3. It follows from 7.3.2.10 that the functors $\mathbb{R}\underset{\leftarrow X *}{l}$ and $\mathbb{L}\underset{\leftarrow X}{l}^*$ induce canonically quasi-inverse equivalences of categories between $D^-_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$ and $D^-_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$.

Since $\mathcal{O}_{\mathfrak{X}}$-module $\mathcal{O}_{X_i}$ have tor-dimension ≤ 1 for any $i \in \mathbb{N}$, then the functor $\mathbb{L}\underset{\leftarrow X}{l}^* = \mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} -$ preserves the boundedness. Hence, the functors $\mathbb{R}\underset{\leftarrow X *}{l}$ and $\mathbb{L}\underset{\leftarrow X}{l}^*$ induce canonically quasi-inverse equivalences of categories between $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$ and $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$.

Lemma 8.7.4.4. *Let $m' \geq m \geq 0$ be two integers, $D \subset T$ be two divisors of X. We suppose $\mathfrak{X}$ is p-torsion free.*

(a) The kernel of the canonical epimorphism $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(T) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(T)$ is a quasi-coherent $\mathcal{O}_X$-module.

(b) The canonical morphism $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(T) \to \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(T)$ is an isomorphism, where the complete tensor product is defined at 7.3.4.2.1.

(c) The $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$-module $\mathcal{B}^{(m')}_{\mathfrak{X}}(T)$ has tor-dimension ≤ 2.

(d) The $\mathcal{O}_{\mathfrak{X}}$-module $\mathcal{B}^{(m')}_{\mathfrak{X}}(T)$ has tor-dimension ≤ 1.

Proof. Since the lemma is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\,A$ affine, and $T \subset X$ (resp $D \subset X$) has a local equation $\phi \in A/\pi A$ (resp. $\psi \in A/\pi A$). Since $D \subset T$, then ϕ is a multiple of ψ. Choose $g \in A$ a lifting of ψ and then f a lifting of ϕ which is a multiple of g. For any integer $r \geq 0$, put $\mathcal{B}(g,r) := \mathcal{O}_{\mathfrak{X}}[X]/(g^rX - p)$ and $\mathcal{B}^{(m)}(g) := \mathcal{B}^{(m)}(g, p^{m+1})$ where $\mathcal{O}_{\mathfrak{X}}[X]$ is a polynomial ring in the variable X with coefficients in

$\mathcal{O}_{\mathfrak{X}}$. For any integer $s \geq 0$, put $\mathcal{B}(f,s) := \mathcal{O}_{\mathfrak{X}}[Y]/(f^s Y - p)$, $\mathcal{B}^{(m')}(f) := \mathcal{B}(f, p^{m'+1})$ where $\mathcal{O}_{\mathfrak{X}}[Y]$ is a polynomial ring in the variable Y with coefficients in $\mathcal{O}_{\mathfrak{X}}$ (we use two distinct letters for the variable to avoid confusion later). Recall $\mathcal{B}^{(m')}_{\mathfrak{X}}(T) \xrightarrow{\sim} \mathcal{B}^{(m')}(f)$ (see 8.7.3.5.1) and do not depend (up to a canonical isomorphism) on the choice of f such that f modulo πA is a local equation of $T \subset X$. Since $\mathcal{B}^{(m')}(f) = \mathcal{B}(f^{p^{m'-m}}, p^{m+1})$ and since f is a multiple of g then we get from 8.7.3.1 the canonical morphism $\mathcal{B}^{(m)}(g) \to \mathcal{B}^{(m')}(f)$. It follows from 8.7.4.1 that we have the commutative diagram of injective ring morphisms

$$\begin{array}{ccc} B^{(m)}(g) & \hookrightarrow & A_{\{g\}} \\ \downarrow & & \downarrow \\ B^{(m')}(f) & \hookrightarrow & A_{\{f\}}. \end{array} \tag{8.7.4.4.1}$$

Since the image in $A_{\{g\}}$ of the class of X in $B^{(m)}(g)$ is $\frac{p}{g^{p^{m+1}}}$, since $B^{(m)}(g) \to A_{\{g\}}$ is injective then we still denote by $\frac{p}{g^{p^{m+1}}}$ the class of X in $B^{(m)}(g)$ or its image in $B^{(m')}(f)$ (following 8.7.4.4.1 this is harmless).

1) Let us prove first that, for any integer $j \leq -1$, $\mathcal{H}^j(\mathcal{B}^{(m)}(g) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f)) = 0$.

We have the short exact sequence $0 \to \mathcal{O}_{\mathfrak{X}}[X] \underset{\alpha}{\longrightarrow} \mathcal{O}_{\mathfrak{X}}[X] \underset{\beta}{\longrightarrow} \mathcal{B}^{(m)}(g) \to 0$, where α is the multiplication by $g^{p^{m+1}}X - p$ and β is the morphism of $\mathcal{O}_{\mathfrak{X}}$-algebras given by $X \mapsto \frac{p}{g^{p^{m+1}}}$. Since this exact sequence gives a canonical resolution of $\mathcal{B}^{(m)}(g)$ by some flat $\mathcal{O}_{\mathfrak{X}}$-modules, by applying the functor $- \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f)$ to this exact sequence, we see that it is a question of proving that p (or $g^{p^{m+1}}$) is not a zero divisor of $B^{(m')}(f)$. Since $B^{(m')}(f)$ is p-torsion free (see 8.7.4.1), then we are done.

2) Consider the diagram of $B^{(m')}(f)$-modules:

$$\begin{array}{ccccccccc} 0 & \to & \mathcal{O}_{\mathfrak{X}}[X] \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f) & \xrightarrow{\alpha\otimes \mathrm{id}} & \mathcal{O}_{\mathfrak{X}}[X] \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f) & \xrightarrow{\beta\otimes \mathrm{id}} & \mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f) & \to & 0 \\ & & \downarrow a & & \| & & \downarrow c & & \\ 0 & \to & \mathcal{B}^{(m')}(f)[X] & \xrightarrow{\alpha'} & \mathcal{B}^{(m')}(f)[X] & \xrightarrow{\beta'} & \mathcal{B}^{(m')}(f) & \to & 0, \end{array} \tag{8.7.4.4.2}$$

where α' is the multiplication by $X - \frac{p}{g^{p^{m+1}}}$, β' is the morphism the morphism of $\mathcal{B}^{(m')}(f)$-algebras given by $X \mapsto \frac{p}{g^{p^{m+1}}}$, a is the multiplication by $g^{p^{m+1}}$, c is induced by the ring morphism $\mathcal{B}^{(m)}(g) \to \mathcal{B}^{(m')}(f)$ and the identity of $\mathcal{B}^{(m')}(f)$. We compute easily that the diagram 8.7.4.4.2 is commutative. Moreover, the horizontal sequences are exact. Hence by using the snake lemma, we get the isomorphism $\mathcal{N}_0 := \operatorname{Ker} c \xrightarrow{\sim} \operatorname{Coker} a$. This implies that $\mathcal{N}_0$, is killed by $1 \otimes g^{p^{m+1}}$ and therefore by p. Since $\mathcal{B}^{(m')}(f)$ is p-torsion free, since $\mathcal{B}^{(m)}_{X_i}(D) \otimes_{\mathcal{O}_{X_i}} \mathcal{B}^{(m')}_{X_i}(T) \xrightarrow{\sim} \mathcal{V}/\pi^{i+1}\mathcal{V} \otimes_{\mathcal{V}} \mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f)$, this implies the short exact sequence $0 \to \mathcal{N}_0 \to \mathcal{B}^{(m)}_{X_i}(D) \otimes_{\mathcal{O}_{X_i}} \mathcal{B}^{(m')}_{X_i}(T) \to \mathcal{B}^{(m')}_{X_i}(T) \to 0$. For $i = 0$, this implies que $\mathcal{N}_0$ is a quasi-coherent $\mathcal{O}_X$-module. Following 7.3.1.9, this yields $\mathcal{N}_0 \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$. By taking the projective limits, we get moreover the exact sequence: $0 \to \mathcal{N}_0 \to \mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(T) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(T) \to 0$. Since $\mathcal{B}^{(m')}_{\mathfrak{X}}(T)$ is p-torsion free and separated complete, then $\mathcal{B}^{(m')}_{\mathfrak{X}}(T) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ (see 7.3.2.15). Since the notion of quasi-coherence of 7.3.1.5 is closed under devissage, i.e. quasi-coherent complexes are a triangulated subcategory of that all complexes, then $\mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(T) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$.

3) On the other hand, since $\mathcal{B}^{(m)}_{\mathfrak{X}}(D), \mathcal{B}^{(m')}_{\mathfrak{X}}(T) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ (see 8.7.4.2), then following 7.3.4.10, $\mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(T) \in D^{-}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$. Moreover, we get the isomorphism

$$\mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \left(\mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(T)\right) \xrightarrow{\sim} \mathcal{B}^{(m)}_{X_\bullet}(D) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_\bullet}} \mathcal{B}^{(m)}_{X_\bullet}(T).$$

4) Hence, with the last result of 2) and with 3), in order to prove the isomorphism of (b), it remains to check the canonical isomorphism $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \left(\mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(T)\right) \xrightarrow{\sim} \mathcal{B}^{(m)}_{X_i}(D) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{B}^{(m)}_{X_i}(T)$. This

is checked as follows: By applying the functor $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} -$ to the diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & \mathcal{N}_0 & \longrightarrow & \mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f) & \longrightarrow & \mathcal{B}^{(m')}(f) & \longrightarrow & 0 \\ & & \| & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & \mathcal{N}_0 & \longrightarrow & \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(T) & \longrightarrow & \mathcal{B}^{(m')}_{\mathfrak{X}}(T) & \longrightarrow & 0, \end{array} \tag{8.7.4.4.3}$$

we get $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \left(\mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f)\right) \xrightarrow{\sim} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \left(\mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(T)\right)$. Finally following the step 1), we get $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \left(\mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f)\right) \xrightarrow{\sim} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m)}(g)) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f)) \xrightarrow{\sim} \mathcal{B}^{(m)}_{X_i}(D) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{B}^{(m')}_{X_i}(T)$.

5) It remains to check the property (c) via the following steps 5,6,7). We have the short exact sequence $0 \to \mathcal{O}_{\mathfrak{X}}[Y] \underset{\alpha''}{\longrightarrow} \mathcal{O}_{\mathfrak{X}}[Y] \underset{\beta''}{\longrightarrow} \mathcal{B}^{(m')}(f) \to 0$, where α'' is the multiplication by $f^{p^{m'+1}}Y - p$ and β'' is the morphism of $\mathcal{O}_{\mathfrak{X}}$-algebras given by $Y \mapsto \frac{p}{f^{p^{m'+1}}}$. Since $\mathcal{B}^{(m)}(g)$ is p-torsion free, by applying the functor $\mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} -$, similarly to the step 1) we get the exact sequence

$$0 \longrightarrow \mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}[Y] \xrightarrow{\mathrm{id}\otimes\alpha''} \mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}[Y] \xrightarrow{\mathrm{id}\otimes\beta''} \mathcal{B}^{(m)}(g) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}(f) \longrightarrow 0. \tag{8.7.4.4.4}$$

We set $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)\{Y\} := \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{O}_{\mathfrak{X}}[Y]$. By taking the p-adic completion of 8.7.4.4.4, we get the sequence

$$0 \longrightarrow \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\{Y\} \xrightarrow{\widehat{\alpha}} \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\{Y\} \xrightarrow{\widehat{\beta}} \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(T) \longrightarrow 0 \tag{8.7.4.4.5}$$

where $\widehat{\alpha}$ is the multiplication by $f^{p^{m'+1}}Y - p$ and $\widehat{\beta}$ is the morphism of complete $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$-algebras given by $Y \mapsto \frac{p}{f^{p^{m'+1}}}$. Since $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$ is p-torsion free, then the sequence is exact. Hence, $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(T)$ has tor-dimension ≤ 1 as $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$-module.

6) With notation of 2), $\mathcal{N}_0 \xrightarrow{\sim} \mathrm{Coker}\, a \xrightarrow{\sim} (\mathcal{B}^{(m')}(f)/g^{p^{m+1}}\mathcal{B}^{(m')}(f))[X]$. Since $\mathcal{B}^{(m')}(f) := \mathcal{O}_{\mathfrak{X}}[Y]/(f^{p^{m'+1}}Y - p)$, then we get $\mathcal{B}^{(m')}(f)/g^{p^{m+1}}\mathcal{B}^{(m')} \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}[Y]/(g^{p^{m+1}}, f^{p^{m'+1}}Y - p)$, where $(g^{p^{m+1}}, f^{p^{m'+1}}Y - p)$ is the ideal of $\mathcal{O}_{\mathfrak{X}}[Y]$ generated by the elements $g^{p^{m+1}}$ and $f^{p^{m'+1}}Y - p$. Using the same notation Y instead of X to define $\mathcal{B}^{(m)}(g)$, since $(g^{p^{m+1}}, f^{p^{m'+1}}Y - p) = (g^{p^{m+1}}, p) = (g^{p^{m+1}}, g^{p^{m+1}}Y - p)$, then we get

$$\mathcal{B}^{(m')}(f)/g^{p^{m+1}}\mathcal{B}^{(m')}(f) \xrightarrow{\sim} \mathcal{O}_X[Y]/(\overline{g}^{p^{m+1}}) \xrightarrow{\sim} \mathcal{B}^{(m)}(g)/g^{p^{m+1}}\mathcal{B}^{(m)}(g),$$

where $\overline{g}$ is the image of g via the projection $\mathcal{O}_{\mathfrak{X}} \to \mathcal{O}_X$. Similarly, since $\mathcal{B}^{(m)}(g) \xrightarrow{\sim} \mathcal{B}^{(m)}_{\mathfrak{X}}(D)$ taking the p-adic completion, we get

$$\mathcal{B}^{(m)}_{\mathfrak{X}}(D)/g^{p^{m+1}}\mathcal{B}^{(m)}_{\mathfrak{X}}(D) \xrightarrow{\sim} \mathcal{O}_X[Y]/(\overline{g}^{p^{m+1}}).$$

This yields

$$\mathcal{N}_0 \xrightarrow{\sim} (\mathcal{B}^{(m)}_{\mathfrak{X}}(D)/g^{p^{m+1}}\mathcal{B}^{(m)}_{\mathfrak{X}}(D))[Y].$$

Since $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$ is p-torsion free, since $g^{p^{m+1}}Y = p$ in $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$, then $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$ is $g^{p^{m+1}}$-torsion free. Hence, $\mathcal{N}_0$ has tor-dimension ≤ 1 as $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$-module.

7) It follows from the parts 5) and 6) of the proof and from the bottom exact sequence of the diagram 8.7.4.4.3 that $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$-module $\mathcal{B}^{(m')}_{\mathfrak{X}}(T)$ has tor-dimension ≤ 2.

□

Remark 8.7.4.5. With notation 8.7.4.4, it seems false in general that for any $i \in \mathbb{N}$, the canonical morphism $\mathcal{B}^{(m)}_{X_i}(D) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{B}^{(m)}_{X_i}(T) \to \mathcal{B}^{(m)}_{X_i}(D) \otimes_{\mathcal{O}_{X_i}} \mathcal{B}^{(m)}_{X_i}(T)$ is an isomorphism. But, when the divisors are reduced and irreducible components are two by two distinct, then this becomes true (see 9.1.3.1).

8.7.4.6. We keep notation 8.7.3.12. Following 8.1, we denote by $M(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$ the category of $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)$-modules. Let $\sharp \in \{\emptyset, +, -, \mathrm{b}\}$. We get $D^{\sharp}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$ the derived category of complexes of $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)$-modules with the corresponding boundedness property. Moreover, we denote similarly to 8.1 by $\underrightarrow{D}^{\sharp}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$, $\underrightarrow{M}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$, $\underrightarrow{LD}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$, $\underrightarrow{LM}^{\sharp}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$ the localized categories of $D^{\sharp}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$. We have also the notion of coherent up to lim-ind-isogeny $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)$-modules and we denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$ of coherent up to lim-ind-isogeny $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)$-modules. By using the flatness property of 8.7.3.14, the finiteness tor-dimension of 8.7.4.4.c, we can applying 8.4.1.15.b. Hence, we get the canonical fully faithful functor $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))$ and of the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ induces the equivalence of categories

$$\underrightarrow{l}^{*}_{\mathbb{Q}} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}). \tag{8.7.4.6.1}$$

Corollary 8.7.4.7. *Let $\mu \in L(\mathbb{N})$, $m' \geq m \geq 0$ be two integers and $n = \mu(m)$, $n' = \mu(m')$. Let $D \subset T$ be two divisors of P. We suppose $\mathfrak{X}$ is p-torsion free. We have the following tor finiteness results.*

(a) The $\mathcal{O}_{X_\bullet}$-module $\mathcal{B}^{(n')}_{X_\bullet}(T)$ (resp. $\mathcal{B}^{(n)}_{X_\bullet}(D)$-module $\mathcal{B}^{(n')}_{X_\bullet}(T)$) has tor-dimension ≤ 1 (resp. has tor-dimension ≤ 2).

(b) The (left or right) $\mathcal{B}^{(n)}_{X_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module $\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ has tor-dimension ≤ 2.

(c) The (left or right) $\mathcal{B}^{(n)}_{X_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module $\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}$ has tor-dimension $\leq d+2$.

(d) The $\mathcal{B}^{(n)}_{\mathfrak{X}}(D)$-module $\mathcal{B}^{(n')}_{\mathfrak{X}}(T)$ has tor-dimension ≤ 2. The (left or right) $\mathcal{B}^{(n)}_{\mathfrak{X}}(D) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{B}^{(n')}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ has tor-dimension ≤ 2. The (left or right) $\mathcal{B}^{(n)}_{\mathfrak{X}}(D) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{B}^{(n')}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ has tor-dimension $\leq d+2$.

Proof. a) The first statement follows from 8.7.4.4.c.

b) Let us check b). Since the proof is the same, we reduce to check the left case. Let $\mathcal{M}_\bullet$ be a right $\mathcal{B}^{(n)}_{X_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module. Let $\mathcal{P}^\bullet_\bullet$ be a resolution of $\mathcal{M}_\bullet$ by flat right $\mathcal{B}^{(n)}_{X_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module. Since $\mathcal{P}^\bullet_\bullet$ is also a resolution of $\mathcal{M}_\bullet$ by flat $\mathcal{B}^{(n)}_{X_\bullet}(D)$-modules, then we get:

$$\begin{aligned} \mathcal{M}_\bullet \otimes^{\mathbb{L}}_{\mathcal{B}^{(n)}_{X_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \left(\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) &\xrightarrow{\sim} \mathcal{P}^\bullet_\bullet \otimes_{\mathcal{B}^{(n)}_{X_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \left(\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) \\ \underset{4.3.4.8.3}{\xleftarrow{\sim}} \mathcal{P}^\bullet_\bullet \otimes_{\mathcal{B}^{(n)}_{X_\bullet}(D)} \mathcal{B}^{(n')}_{X_\bullet}(T) &\xleftarrow{\sim} \mathcal{M}_\bullet \otimes^{\mathbb{L}}_{\mathcal{B}^{(n)}_{X_\bullet}(D)} \mathcal{B}^{(n')}_{X_\bullet}(T). \end{aligned} \tag{8.7.4.7.1}$$

Hence, it follows from the part (a) that the object $\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$ of $D^{\mathrm{b}}_{\mathrm{qc}}({}^{l}\mathcal{B}^{(n)}_{X_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ has tor-amplitude in $[-2, 0]$.

c) Let us check c). Let $\mathcal{N}_\bullet$ be a right $\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module. Let $\mathcal{Q}^\bullet_\bullet$ be a resolution of $\mathcal{N}_\bullet$ by flat $\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module. We have the isomorphisms of $(\mathcal{B}^{(n')}_{X_\bullet}(T), \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet})$-bimodules:

$$\begin{aligned} \mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet} &\xleftarrow{\sim} \mathcal{B}^{(n')}_{X_\bullet}(T) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet} \xrightarrow{\sim} \mathcal{B}^{(n')}_{X_\bullet}(T) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_\bullet}} \left(\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) \\ \underset{4.6.3.5}{\xrightarrow{\sim}} \left(\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet} &\xrightarrow{\sim} \left(\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}. \end{aligned}$$

This yields the canonical morphism of complexes of $(\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}, \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet})$-bimodules

$$\left(\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet} \to \left(\mathcal{B}^{(n')}_{X_\bullet}(T) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) \otimes_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}} \mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}$$

is an isomorphism. By using 4.3.1.2.1, we get the isomorphism of complexes of $(\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet},\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet})$-bimodules

$$\left(\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right)\otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}\xrightarrow{\sim}\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}. \tag{8.7.4.7.2}$$

This yields the first isomorphism:

$$\mathcal{N}_\bullet\otimes^{\mathbb{L}}_{\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\left(\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}\right)\underset{8.7.4.7.2}{\xrightarrow{\sim}}$$

$$\mathcal{N}_\bullet\otimes^{\mathbb{L}}_{\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\left(\left(\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right)\otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}\right) \tag{8.7.4.7.3}$$

$$\underset{4.6.3.5}{\xrightarrow{\sim}}\left(\mathcal{N}_\bullet\otimes^{\mathbb{L}}_{\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\left(\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}\right)\right)\otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet} \tag{8.7.4.7.4}$$

$$\xrightarrow{\sim}\mathcal{N}_\bullet\otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet} \tag{8.7.4.7.5}$$

Hence, it follows from 3.2.4.3 that the object $\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet}$ of $D^{\mathrm{b}}_{\mathrm{qc}}({}^l\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet})$ has tor amplitude in $[-d,0]$. Hence, c) follows from b).

d) Let us check the non-respective case (the respective ones are checked similarly). Since $\mathcal{B}^{(n')}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\xrightarrow{\sim}\mathbb{R}\underleftarrow{l}_{X*}(\mathcal{B}^{(n')}_{X_\bullet}(T)\otimes_{\mathcal{O}_{X_\bullet}}\mathcal{D}^{(m')}_{X^\sharp_\bullet/S^\sharp_\bullet})$ (for any $n'\geq m'$ and T), then the part c) is a consequence of the part c) and of the Theorem 7.3.2.15.

□

8.7.5 Flatness by adding overconvergent singularities

Lemma 8.7.5.1. *We keep notation 3.4 in the algebraic case. Let $m\in\mathbb{N}$, r be a multiple of p^{m+1}, r' be a multiple of r. Fix $f\in\Gamma(X,\mathcal{O}_X)$ and put $\mathcal{B}_X(f,r):=\mathcal{O}_X[T]/(f^rT-p)$. Let $\rho_{f^{\frac{r'}{r}-1}}\colon\mathcal{B}_X(f,r)=\mathcal{O}_X[T]/(f^rT-p)\to\mathcal{B}_X(f^{\frac{r'}{r}},r)=\mathcal{B}_X(f,r')=\mathcal{O}_X[T']/(f^{r'}T'-p)$ be the homomorphism of $\mathcal{O}_X$ algebras of 8.7.3.1 given by $T\mapsto f^{r'-r}T'$. Then for any $k\in\mathbb{N}$, the sub-$\mathcal{B}_X(f,r)$-module of $\mathcal{B}_X(f,r')$ generated by T'^i for $i\leq k$ is a left sub-$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{B}_X(f,r')$.*

Proof. First, suppose $S^\sharp=\operatorname{Spec}\mathbb{Z}_{(p)}$ and $X^\sharp=\operatorname{Spec}\mathbb{Z}_{(p)}[t]$, $f=t$. This case has already been proved in [Ber96c, 4.3.4]. More generally, using the diagram of the form 8.7.3.1.1, we get by construction $\rho_{f^{\frac{r'}{r}-1}}=\phi_f^*(\rho_{t^{\frac{r'}{r}-1}})$. Hence, we are done. Since the structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{B}_X(f,r')$ is induced by pullback via 4.4.2.4, then we are done. □

Theorem 8.7.5.2. *Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp\to\mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is locally noetherian of finite Krull dimension and p-torsion free. Let Z be a divisor of X, $m'\geq m$, r (resp. r') a multiple of p^{m+1} (resp. $p^{m'+1}$). Then with notation 8.7.3.5 the extension*

$$\mathcal{B}_{\mathfrak{X}}(Z,r)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}\to\mathcal{B}_{\mathfrak{X}}(Z,r')\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$$

is left and right flat.

Proof. It follows from 7.5.3.1 that we only need to show

$$\mathcal{B}_{\mathfrak{X}}(Z,r)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}\to\mathcal{B}_{\mathfrak{X}}(Z,r')\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$$

is flat. This check is similar to that of 7.5.3.1. Since this is local, we can suppose $\mathfrak{X}^\sharp\to\mathfrak{S}^\sharp$ is endowed with logarithmic coordinates $u_1,\dots,u_d$, $\mathcal{X}$ is connected affine and there exists $f\in\Gamma(\mathfrak{X},\mathcal{O}_{\mathfrak{X}})=:A$ such that its image in $A/\pi A$ is a local equation of the divisor Z of X.

Let $B = A[T]/(f^r T - p)$, $B' = A[T']/(f^{r'} T' - p)$, $D = \Gamma(\mathfrak{U}, \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$; $\widehat{B}, \widehat{B'}, \widehat{D}$ be their respective p-adic completion. Let $\eta \colon B \to B'$ be the A-algebra homomorphism given by $T \mapsto f^{r'-r} T'$. Let $\eta' \colon B \otimes D \to B' \otimes D$ be the homomorphism induced by η (we simply write in the proof $\otimes$ for $\otimes_A$). It suffices to prove $B' \widehat{\otimes} D_{\mathbb{Q}}$ is flat over $B \widehat{\otimes} D_{\mathbb{Q}}$. Observe that since f is not a zero divisor modulo π, the rings B and B' are p-torsion free (see 8.7.4.1). Hence, since B and B' are noetherian then $\widehat{B}$ and $\widehat{B}'$ are p-torsion free by flatness. Again, by flatness $B \otimes D$, $B' \otimes D$, $B \widehat{\otimes} D$, $\widehat{B'} \widehat{\otimes} \widehat{D}$ are p-torsion free. It follows from 8.7.4.1 that $B \to \widehat{B}$ and $\widehat{B} \to \widehat{B}'$ are injective. Hence, since $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ is endowed with logarithmic coordinates then $B \widehat{\otimes} D \to B' \widehat{\otimes} D$ and $B' \otimes D \to B' \widehat{\otimes} D$ are injective (use the description 7.5.1.5.2). Let us introduce the set

$$D' = B \widehat{\otimes} D + B' \otimes D \subset B' \widehat{\otimes} D.$$

In fact D' is a subring: let $P \in B \widehat{\otimes} D$ and $Q \in B' \otimes D$. It is enough to check that $PQ, QP \in D'$. There exists $a \in \mathbb{N}$ such that $f^a Q \in B \otimes D$. Since $p = f^r T$in B, this yields $p^a Q \in B \otimes D$. We can write $P = P_1 + p^a P_2$ with $P_1 \in B \otimes D$ and $P_2 \in B \widehat{\otimes} D$. Since $PQ = P_1 Q + P_2 (p^a Q)$ and $QP = QP_1 + (p^a Q) P_2$, then we are done.

Now let's prove that the canonical morphism $\widehat{D'} \to B' \widehat{\otimes} D$ is an isomorphism. We have to check the homomorphisms $D'/p^i D' \to B' \widehat{\otimes} D / p^i (B' \widehat{\otimes} D)$ are isomorphisms for all integer $i \geq 1$. Since $B' \otimes D / p^i B' \otimes D) \xrightarrow{\sim} B' \widehat{\otimes} D / p^i (B' \widehat{\otimes} D)$ and $B' \otimes D \subseteq D'$ then we get the surjectivity. For the injectivity, an operator of $D' \cap p^i (B' \widehat{\otimes} D)$ can be written of the form $P + Q = p^i P'$ with $P \in B \widehat{\otimes} D$, $Q \in B' \otimes D$ and $P' \in B' \widehat{\otimes} D$. We can write $P = P_1 + p^i P_2$ with $P_1 \in B \otimes D$ and $P_2 \in B \widehat{\otimes} D$. Then $P_1 + Q \in (B' \otimes D) \cap p^i (B' \widehat{\otimes} D) = p^i B' \otimes D$. Hence, $P + Q = (P_1 + Q) + p^i P_2 \in p^i D'$ and we are done.

Since $B_{\mathbb{Q}} \to B'_{\mathbb{Q}}$ is an isomorphism, then so is $(B \otimes D)_{\mathbb{Q}} \to (B' \otimes D)_{\mathbb{Q}}$. This yields the equality $B \widehat{\otimes} D_{\mathbb{Q}} = D'_{\mathbb{Q}}$. Hence, it is sufficient to prove that D' is noetherian because this implies the flatness of $D' \to \widehat{D'}$. We prove this noetherianity as follows.

For any $k \in \mathbb{N}$, let B'_k be the sub-B-module of B' generated by T'^j for $0 \leq j \leq k$. Following 8.7.5.1, B'_k is a left sub-D-module of B'. Hence, by using the formula 4.1.2.2.3, we can check that $E'_k := B'_k \otimes D$ is a left sub-$B \otimes D$-module of $B' \otimes D$.

The element P' of E'_k are the element of $B' \otimes D$ which can be written of the form

$$P' = \sum_{\underline{i} \in \mathbb{N}^d} b'_{\underline{i}} \underline{\partial}_\sharp^{\langle \underline{i} \rangle} = \sum_{\underline{i} \in \mathbb{N}^d} \left(\sum_{j=0}^k T'^j b_{\underline{i},j} \right) \underline{\partial}_\sharp^{\langle \underline{i} \rangle} = \sum_{j=0}^k T'^j \left(\sum_{\underline{i} \in \mathbb{N}^d} b_{\underline{i},j} \underline{\partial}_\sharp^{\langle \underline{i} \rangle} \right), \tag{8.7.5.2.1}$$

where the sums are finite, $b_{\underline{i},j} \in B$ and $b'_{\underline{i}} = \sum_{j=0}^k T'^j b_{\underline{i},j} \in B'_k$. In the left equality of 8.7.5.2.1, the elements $b'_{\underline{i}} \in B'$ are uniquely determined by P' but be aware that this is not clear in the right equality for $b_{\underline{i},j}$.

By p-adic completion, for any integer $k \geq 0$, we get the homomorphism of $B \widehat{\otimes} D$-modules $B'_k \widehat{\otimes} D \to B' \widehat{\otimes} D$ whose image is denoted by D'_k. Set $D'_k = 0$ for any integer $k < 0$. Since E'_k is generated as sub-$B \otimes D$-module of $B' \otimes D$ by T'^j for $j = 0, \ldots, k$, then D'_k is the sub-$B \widehat{\otimes} D$-module of $B' \widehat{\otimes} D$ generated by T'^j for $j = 0, \ldots, k$. We prove now that $\operatorname{gr} D' := \oplus_{k \in \mathbb{N}} D'_k / D'_{k-1}$ is noetherian, which will imply that so is D' (recall 1.4.2.9).

The element P' of D'_k are the element of $B' \otimes D$ which can be written of the form

$$P' = \sum_{j=0}^k T'^j \left(\sum_{\underline{i} \in \mathbb{N}^d} b_{\underline{i},j} \underline{\partial}_\sharp^{\langle \underline{i} \rangle} \right) = \sum_{\underline{i} \in \mathbb{N}^d} \left(\sum_{j=0}^k T'^j b_{\underline{i},j} \right) \underline{\partial}_\sharp^{\langle \underline{i} \rangle} = \sum_{\underline{i} \in \mathbb{N}^d} b'_{\underline{i}} \underline{\partial}_\sharp^{\langle \underline{i} \rangle}, \tag{8.7.5.2.2}$$

where $b_{\underline{i},j} \in \widehat{B}$ converges to 0 when $|\underline{i}|$ goes to infinity, where $b'_{\underline{i}} := \sum_{j=0}^k T'^j b_{\underline{i},j} \in \widehat{B'}$.

For $k \geq 1$ we have $f^{r'} T'^k = p T'^{k-1} \in D'_{k-1}$ because $f^{r'} T' = p$ in $B' \widehat{\otimes} D$; thus $f^{r'} \operatorname{gr}_k D' = 0$. Write $r' = ar$. Since $p = f^r T$, then $f^{r'}$ divides p^a in $B \widehat{\otimes} D$ and thus $p^a \operatorname{gr}_k D' = 0$ for $k \geq 1$. Since $\operatorname{gr}_0 D' = D'_0 = B \widehat{\otimes} D$ then we get the ring homomorphism $B \widehat{\otimes} D \to \operatorname{gr} D'$. This yields a structure of $B \widehat{\otimes} D$-module on $p^a \operatorname{gr} D'$ such that $p^a \operatorname{gr} D' = p^a \operatorname{gr}_0 D' = p^a B \widehat{\otimes} D$ is $B \widehat{\otimes} D$-linear. Since $B \widehat{\otimes} D$ is noetherian, then so is $p^a \operatorname{gr} D'$.

Now let us check that $\operatorname{gr} D' / p^a \operatorname{gr} D'$ is noetherian. We have

$$\operatorname{gr} D' / p^a \operatorname{gr} D' = (B \widehat{\otimes} D) / p^a (B \widehat{\otimes} D) \oplus_{k \geq 1} \operatorname{gr}_k D'. \tag{8.7.5.2.3}$$

For any $n \in \mathbb{N}$, we set $D_n := \Gamma(\mathfrak{U}, \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,n})$ which yields the order filtration $(D_n)_{n\in\mathbb{N}}$ on D. For any $k, n \in \mathbb{N}$, we put $C'_{I,k} := D'_k \cap (B' \otimes D)$, $C'_{II,n} := B' \otimes D_n$.

Let $k \geq 1$ be an integer. Since $p^a D'_k \subset D'_{k-1}$, since $\widehat{B} = B + p^a \widehat{B}$, then we get from 8.7.5.2.1 and 8.7.5.2.2 $D'_k \subset E'_k + D'_{k-1}$. Since we have also $E'_k \subset D'_k \cap (B' \otimes D) = C'_{I,k}$, then the monomorphism $\mathrm{gr}^I_k(B' \otimes D) = C'_{I,k}/C'_{I,k-1} \hookrightarrow D'_k/D'_{k-1}$ is in fact an isomorphism. Since $C'_{I,0} = (B\widehat{\otimes}D) \cap (B' \otimes D) \to (B\widehat{\otimes}D)/p^a(B\widehat{\otimes}D)$ is surjective, then it follows from 8.7.5.2.3 that the canonical morphism $\mathrm{gr}^I(B' \otimes D) \to \mathrm{gr}\, D'/p^a \mathrm{gr}\, D'$ is an epimorphism. Hence, we reduce to prove $\mathrm{gr}^I(B' \otimes D)$ is noetherian. Since $\mathrm{gr}^{II}(B' \otimes D) \xrightarrow{\sim} B' \otimes \mathrm{gr}\, D$ is noetherian, then $B' \otimes D$ is noetherian and so is $\mathrm{gr}^I(B' \otimes D)$. Hence $\mathrm{gr}\, D'/p^a \mathrm{gr}\, D'$ is noetherian. Finally the exact sequence

$$0 \to p^a \mathrm{gr}\, D' \to \mathrm{gr}\, D' \to \mathrm{gr}\, D'/p^a \mathrm{gr}\, D' \to 0$$

implies that $\mathrm{gr}\, D'$ is noetherian. This completes the proof of theorem 8.7.5.2. □

Corollary 8.7.5.3. *With notation and hypotheses of 8.7.5.5, the sheaf $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger Z)_\mathbb{Q}$ is right and left flat over $\mathcal{B}_\mathfrak{X}(Z,r)\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$.*

8.7.5.4. It follows from Corollary 7.2.3.16 (see also the example 7.2.3.2 which can be applied in the case where $\mathcal{B} = \mathcal{B}^{(m)}_\mathfrak{X}(Z)$ thanks to 8.7.3.14), Proposition 7.4.5.2, the corollary 8.7.4.7 and Theorem 8.7.5.2 that the condition of Theorem 8.4.1.15.b are fully satisfied in the case where $I = \mathbb{N}$ and for any $i \in I$, $\mathcal{D}^{(i)} := \mathcal{B}^{(\lambda(i))}_\mathfrak{X}(Z)\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}}\mathcal{D}^{(i)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, where $\lambda \in L(\mathbb{N})$. Hence, we have the equivalence of categories:

$$\underrightarrow{l}^*_\mathbb{Q} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)_\mathbb{Q}). \tag{8.7.5.4.1}$$

Theorem 8.7.5.5. *With notation and hypotheses of 8.7.5.2, the sheaf $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger Z)_\mathbb{Q}$ (see 8.7.3.12) is coherent. We have theorems of type A and B for right or left coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger Z)_\mathbb{Q}$-modules (in the sense of 1.4.3.14).*

Proof. Following 8.4.1.14, this is a consequence of 8.7.5.2. □

Remark 8.7.5.6. With notation and hypotheses of 8.7.5.5, we do not know if $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ (and a fortiori $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(^\dagger Z)$) is coherent.

8.7.6 Restriction outside the overconvergent singularities: full faithfulness

Lemma 8.7.6.1. *Let $S^\sharp$ be a nice fine log scheme over* $\mathrm{Spec}(\mathbb{Z}/p\mathbb{Z})$, *(see definition 3.1.1.1). Let $X^\sharp \to S^\sharp$ be a log smooth morphism of log schemes, $f \in \Gamma(X, \mathcal{O}_X)$, r be a multiple of p^{m+2} and consider the $\mathcal{O}_X$-algebra $\mathcal{B}_X(f,r) := \mathcal{O}_X[T]/(f^r T)$ endowed with its canonical structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module compatible with its structure of $\mathcal{O}_X$-algebra (see 8.7.3.1). Then $T \otimes 1$ belongs to the center of the sheaf of rings $\mathcal{B}_X(f,r) \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.*

Proof. Since this is local, we can suppose $X^\sharp/S^\sharp$ has logarithmic coordinates. By using 4.1.2.2.3, we reduce to check that $\underline{\partial}^{\langle k\rangle}_\sharp(T) = 0$. Following Taylor formula (see 4.2.1.5.4), this is equivalent to saying that for any $n \in \mathbb{N}$ we have $\varepsilon_n^{\mathcal{B}_{X(f,r)}}(1 \otimes T) = T \otimes 1$. Consider the following commutative diagram

$$\begin{array}{ccc} X^\sharp & \xrightarrow{\phi_f} & \mathbb{A}^1_{\mathbb{Z}_{(p)}} = \mathrm{Spec}\,\mathbb{Z}_{(p)}[t] \\ \downarrow & & \downarrow \\ (S^\sharp, \mathfrak{a}_S, \mathfrak{b}_S, \alpha_S) & \longrightarrow & (\mathrm{Spec}\,\mathbb{Z}_{(p)}, (p), (p), \alpha_{(p)}), \end{array} \tag{8.7.6.1.1}$$

where ϕ_f is the morphism given by f, $\alpha_{(p)}$ is the canonical m-PD (see 1.2.4.2.a). By construction, the canonical structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module compatible with its structure of $\mathcal{O}_X$-algebra on $\mathcal{B}_X(f,r)$ is given by pullback (see 4.4.2.4) via $\mathcal{B}_X(f,r) = \phi^*_f(\mathcal{B}_{\mathbb{A}^1_{\mathbb{Z}_{(p)}}}(t,r))$. By construction the m-PD-stratification

$\varepsilon_n^{\mathcal{B}_{X(f,r)}}$ is therefore given by pullback from the m-PD-stratification $\varepsilon_n^{\mathcal{B}_{\mathbb{A}^1}(t,r)}$. Hence, we reduce to the case where $S^\sharp = \operatorname{Spec} \mathbb{Z}_{(p)}$ and $X^\sharp = \operatorname{Spec} \mathbb{Z}_{(p)}[t]$, $f = t$. This latter case has already been proved in [Ber96c, 4.3.9]. □

Lemma 8.7.6.2. *Let $A \to B$ be a ring homomorphism. The following property are equivalent.*

(a) B is right flat on A and for any monogeneous of finite presentation left A-module M, we have the implication $B \otimes_A M = 0 \Rightarrow M = 0$;

(b) B is faithfully flat as A-module.

Proof. The implication $(b) \Rightarrow (a)$ is straightforward. Let us prove $(a) \Rightarrow (b)$. Let M be a left A-module such that $B \otimes_A M = 0$. Let $x \in M$. If we set $M' = A \cdot x \subset M$, then by flatness $B \otimes_A M' = 0$. Hence, to check that $M = 0$ we reduce to the case where M is monogeneous. We get $M = A/J$ with J a left ideal of A. Let Λ be the set of finite subsets of J. For any $\lambda \in \Lambda$, let J_λ be the left ideal of A generated by the element of λ. Then $J = \cup_{\lambda \in \Lambda} J_\lambda$. Let $M_\lambda := A/J_\lambda$. Since filtered inductive limits are exact, then we have $\varinjlim_{\lambda \in \Lambda} M_\lambda = M$ and therefore $\varinjlim_{\lambda \in \Lambda} B \otimes_A M_\lambda = 0$. Since Λ is filtered, then for λ large enough, $1 \otimes \overline{1} = 0$ in $B \otimes_A M_\lambda$, where $\overline{1}$ is the image of 1 in M_λ. Since $B \otimes_A M_\lambda = B/BJ_\lambda$ is generated by $1 \otimes \overline{1}$, this yields $B \otimes_A M_\lambda = 0$. Hence, $M_\lambda = 0$. This yields $M = 0$. □

Definition 8.7.6.3. Let X be a topological space, $\mathcal{A} \to \mathcal{B}$ be a homomorphism of sheaves of rings on X. We say that $\mathcal{A} \to \mathcal{B}$ is right (resp. left) faithfully flat if for any $x \in X$, $\mathcal{A}_x \to \mathcal{B}_x$ is right (resp. left) faithfully flat.

Lemma 8.7.6.4. *Let X be a topological space, $\mathcal{A} \to \mathcal{B}$ be a homomorphism of sheaves of rings on X. The following properties are equivalent:*

(a) $\mathcal{A} \to \mathcal{B}$ is right faithfully flat ;

(b) $\mathcal{A} \to \mathcal{B}$ is right flat and that for any left $\mathcal{A}$-module $\mathcal{M}$, we have the implication $\mathcal{B} \otimes_{\mathcal{A}} \mathcal{M} = 0 \Rightarrow \mathcal{M} = 0$.

Proof. Since $\mathcal{M} = 0$ if and only if $\mathcal{M}_x = 0$ for any $x \in X$, then we get $(a) \Rightarrow (b)$ (for instance use Lemma 8.7.6.2). Suppose now $\mathcal{A} \to \mathcal{B}$ satisfies (b) and let us prove (a). Let $x \in X$ and let M be a monogeneous left $\mathcal{A}_x$-module of finite presentation such that $\mathcal{B}_x \otimes_{\mathcal{A}_x} M = 0$. Following 8.7.6.2, it is enough to check that $M = 0$. Let $\mathfrak{B}$ be the collection of open subsets of X containing x. Following 8.4.1.11.b, since $\mathfrak{B}$ is filtered, then there exist $U \in \mathfrak{B}$ and M_U a left $\Gamma(U, \mathcal{A})$-module of finite presentation endowed with the isomorphism $M \xrightarrow{\sim} \mathcal{A}_x \otimes_{\Gamma(U,\mathcal{A})} M_U$. Using again 8.4.1.11.b, shrinking U if necessary, we can suppose that M_U is monogeneous. Since $\mathcal{B}_x \otimes_{\Gamma(U,\mathcal{A})} M_U \xrightarrow{\sim} \mathcal{B}_x \otimes_{\mathcal{A}_x} M = 0$, since $\mathfrak{B}$ is filtered, since M_U is monogeneous, then there exists $U' \in \mathfrak{B}$ such that $U' \subset U$ and $\Gamma(U', \mathcal{B}) \otimes_{\Gamma(U,\mathcal{A})} M_U = 0$. Set $\mathcal{M}_{U'} := \mathcal{A}|_{U'} \otimes_{\Gamma(U,\mathcal{A})} M_U$. Then $\mathcal{B}|_{U'} \otimes_{\mathcal{A}|_{U'}} \mathcal{M}_{U'} = 0$. Let $j \colon U' \subset X$ be the inclusion and $j_!(\mathcal{M}_{U'})$ be the extension by zero outside U' of $\mathcal{M}_{U'}$ (recall $j_!(\mathcal{M}_{U'})$ is the sheaf associated with the presheaf $V \mapsto \Gamma(V, \mathcal{M}_{U'})$ is $V \subset U'$ and $V \mapsto 0$ if $V \not\subset U'$). Then $\mathcal{B} \otimes_{\mathcal{A}} \mathcal{M} = 0$. Hence by hypothesis $\mathcal{M} = 0$ and therefore $M = \mathcal{M}_x = 0$.

□

Lemma 8.7.6.5. *Let X be a coherent topological space, $\mathcal{A} \to \mathcal{B}$ be a homomorphism of sheaves of rings on X. Suppose there exists a basis $\mathfrak{B}$ of opens of X such that, for any $U \in \mathfrak{B}$, $\Gamma(U, \mathcal{A}) \to \Gamma(U, \mathcal{B})$ is right faithfully flat. Then, $\mathcal{A} \to \mathcal{B}$ is right faithfully flat.*

Proof. Let $x \in X$ and let M be a monogeneous left $\mathcal{A}_x$-module of finite presentation such that $\mathcal{B}_x \otimes_{\mathcal{A}_x} M = 0$. Following 8.7.6.2, it is enough to check that $M = 0$. Using the same arguments as the beginning of the proof of $(b) \Rightarrow (a)$ of 8.7.6.4, we can check there exist $U' \subset U$ two elements of $\mathfrak{B}$, M_U a monogeneous left $\Gamma(U, \mathcal{A})$-module of finite presentation endowed with the isomorphism $M \xrightarrow{\sim} \mathcal{A}_x \otimes_{\Gamma(U,\mathcal{A})} M_U$ such that $\Gamma(U', \mathcal{B}) \otimes_{\Gamma(U,\mathcal{A})} M_U = 0$. Hence, $\Gamma(U', \mathcal{B}) \otimes_{\Gamma(U',\mathcal{A})} (\Gamma(U', \mathcal{A}) \otimes_{\Gamma(U,\mathcal{A})} M_U) = 0$. By hypothesis, this implies $\Gamma(U', \mathcal{A}) \otimes_{\Gamma(U,\mathcal{A})} M_U = 0$ and therefore $M = 0$. □

8.7.6.6. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is p-torsion free. Let Z be a divisor of X, $\mathfrak{Y}^\sharp$ be the open of $\mathfrak{X}^\sharp$ complementary to the support of Z and $j \colon \mathfrak{Y}^\sharp \to \mathfrak{X}^\sharp$ be the canonical morphism.

For any multiple r of p^{m+1}, the canonical $\mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$-linear ring homomorphism $\mathcal{O}_{X_i} \to \mathcal{B}_{X_i}(Z,r)$ is an isomorphism outside Z, i.e. it becomes an isomorphism on the open Y_i. This yields the ring homomorphism $\mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp} \to \mathcal{B}_{X_i}(Z,r) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$ is an isomorphism outside Z. By completion, this yields the ring homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}}(Z,r)$, $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}}(Z,r)\widehat{\otimes}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ are isomomorphisms outside Z. Going through the limit on the level this implies the ring homomorphisms $\mathcal{O}_{\mathfrak{X}} \to \mathcal{O}_{\mathfrak{X}}({}^\dagger Z)$, $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)$ are isomorphisms outside Z. By adjointness, this yields the ring homomorphisms

$$\mathcal{B}_{\mathfrak{X}}(Z,r) \to j_*\mathcal{O}_{\mathfrak{Y}}, \quad \mathcal{O}_{\mathfrak{X}}({}^\dagger Z) \to j_*\mathcal{O}_{\mathfrak{Y}}, \tag{8.7.6.6.1}$$

$$\mathcal{B}_{\mathfrak{X}}(Z,r)\widehat{\otimes}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to j_*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}, \qquad \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z) \to j_*\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}. \tag{8.7.6.6.2}$$

Lemma 8.7.6.7. *With notation 8.7.6.6, suppose $\mathfrak{X}^\sharp$ is affine and there exists $f \in \Gamma(\mathfrak{X},\mathcal{O}_{\mathfrak{X}})$ lifting a local equation of Z in X. Let $m' \geq m$. Set $D^{(m)}_{m'} := \Gamma(\mathfrak{X}, \mathcal{B}^{(m'')}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ for any $m'' \geq m$. Let E be an f-torsion free monogeneous left $D^{(m)}_{m'}$-module such that $(E/pE)_f = 0$. Then for $m'' \geq m'$ large enough we have $D^{(m)}_{m''} \otimes_{D^{(m)}_{m'}} E = 0$.*

Proof. Choose a generator e of E. Then there exists $s \in \mathbb{N}$, $R \in D^{(m)}_{m'}$ such that $(f^s - pR)e = 0$. Set $B_{m'} := A\{T\}/(f^{p^{m'+1}}T - p) = \Gamma(\mathfrak{U}, \mathcal{B}^{(m')}_{\mathfrak{X}}(Z))$. Increasing m' if necessary (i.e. replacing E by $D^{(m)}_{m''} \otimes_{D^{(m)}_{m'}} E$ with m'' large enough such that $s \leq p^{m''+1}$), we get $f^s(1-TR')e = 0$ with $R' = f^{p^{m'+1}-s}R$. Since E is f-torsion free, then $(1-TR')e = 0$ and therefore $(1-TR')^p e = 0$. Let $S \in D^{(m)}_{m'}$ such that $(1-TR')^p = 1+pS+(TR')^p$. We can suppose $m' \geq m+1$ and then following 8.7.6.1 we get that T belongs to the center of $D^{(m)}_{m'}/pD^{(m)}_{m'}$. Hence, we can write $(1-TR')^p = 1+pS'+T^pR''$ with $R'', S' \in D^{(m)}_{m'}$. Set $B_{m'+1} := A\{T'\}/(f^{p^{m'+2}}T' - p) = \Gamma(\mathfrak{U}, \mathcal{B}^{(m'+1)}_{\mathfrak{X}}(Z))$. Using the computation of 8.7.3.11.(b), we get that the homomorphism $B_{m'} \to B_{m'+1}$ (and therefore $D^{(m)}_{m'} \to D^{(m)}_{m'+1}$) sends T to $f^{(p-1)p^{m'+1}}T'$ and then sends T^p to $f^{(p-1)p^{m'+2}}(T')^p = pf^{(p-2)p^{m'+2}}(T')^{p-1}$. This yields that we can write $(1-TR')^p = 1+pQ$ with $Q \in D^{(m)}_{m'+1}$. Since $D^{(m)}_{m'+1}$ is p-adically complete, this implies that $(1-TR')^p$ is invertible in $D^{(m)}_{m'+1}$. Hence, $1 \otimes e = 0$ in $D^{(m)}_{m'+1} \otimes_{D^{(m)}_{m'}} E$ and then $D^{(m)}_{m'+1} \otimes_{D^{(m)}_{m'}} E = 0$. Hence, we are done. □

Theorem 8.7.6.8. *We keep notation 8.7.6.6*

(a) The ring homomorphisms 8.7.6.6.1 and 8.7.6.6.2 are injective, left and right flat.

(b) The induced ring homomorphisms

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \to j_*\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}, \tag{8.7.6.8.1}$$

$$\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \to j_*\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \tag{8.7.6.8.2}$$

are left and right faithfully flat.

Proof. (a) The injectivity of 8.7.6.6.1 is a consequence of 8.7.4.1.b. By using the local description 7.5.1.5.2, we get the injectivity of 8.7.6.6.2 from that of 8.7.6.6.1.

(i) Let us now check the flatness. Since this is local, we can suppose $\mathcal{X}$ is affine and there exists $f \in \Gamma(\mathfrak{X},\mathcal{O}_{\mathfrak{X}}) =: A$ giving a local equation of the divisor Z of X. Let $B = A[T]/(f^rT - p)$. Since the canonical morphism $B \to A_f$ is induced by adjointness from the isomorphism $B_f \xrightarrow{\sim} A_f$, this morphism $B \to A_f$ is flat. Since these rings are noetherian, then so is the p-adic completion $\widehat{B} \to A_{\{f\}}$, which corresponds to the canonical morphism $\Gamma(\mathfrak{U}, \mathcal{B}_{\mathfrak{X}}(f,r)) \to \Gamma(\mathfrak{U}, j_*\mathcal{O}_{\mathfrak{Y}})$. Going through the limits, we get that the the canonical morphism $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}({}^\dagger Z)) \to \Gamma(\mathfrak{U}, j_*\mathcal{O}_{\mathfrak{Y}})$ is flat. Hence, we have checked that the homomorphisms of 8.7.6.6.1 are flat.

(ii) Using the same arguments as in (i), for any affine open $\mathfrak{U}$ of $\mathfrak{X}$ such that there exists $f \in \Gamma(\mathfrak{X},\mathcal{O}_{\mathfrak{X}}) =: A$ giving a local equation of the divisor Z of X, we get the flatness of $\Gamma(\mathfrak{U}, \mathcal{B}_{\mathfrak{X}}(Z,r)\widehat{\otimes}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to \Gamma(\mathfrak{U}, j_*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ and $\Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)) \to \Gamma(\mathfrak{U}, j_*\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ and therefore that of the morphisms of 8.7.6.6.2.

(b) Let us now check the full faithfulness of 8.7.6.8.2. Let $\mathfrak{U}^\sharp = (\operatorname{Spf} A, M_{\mathfrak{U}^\sharp})$ be an affine open of $\mathfrak{X}^\sharp$ such that there exists $f \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}})$ lifting a local equation of Z in X. Set $D = \Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z))$, $D^{(m)}_{m'} := \Gamma(\mathfrak{U}, \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ for $m' \geq m$, $D' := \Gamma(\mathfrak{U} \cap \mathfrak{Y}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $D'^{(m)} = \Gamma(\mathfrak{U} \cap \mathfrak{Y}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Let M be a monogeneous left $D_{\mathbb{Q}}$-module of finite presentation such that $D'_{\mathbb{Q}} \otimes_{D_{\mathbb{Q}}} M = 0$. With 8.7.6.2 and 8.7.6.5, we reduce to check that $M = 0$.

Since $\mathfrak{U}$ is coherent, then filtered inductive limits commute with the section functor $\Gamma(\mathfrak{U}, -)$ (see [SGA4.2, VI.5.1-2]) and therefore $\Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \xrightarrow{\sim} D_{\mathbb{Q}} \xrightarrow{\sim} \varinjlim_{m' \geq m} D^{(m)}_{m',\mathbb{Q}}$. Following 8.4.1.11.b, there exists a monogeneous left $D^{(m)}_{m',\mathbb{Q}}$-module N for $m' \geq m$ large enough together with an isomorphism of left $D_{\mathbb{Q}}$-module $M \xrightarrow{\sim} D_{\mathbb{Q}} \otimes_{D^{(m)}_{m',\mathbb{Q}}} N$. Hence $D'_{\mathbb{Q}} \otimes_{D^{(m)}_{m',\mathbb{Q}}} N = 0$. Since $D'_{\mathbb{Q}} \xrightarrow{\sim} \varinjlim D'^{(m)}_{\mathbb{Q}}$, then increasing $m' \geq m$ is necessary we can suppose $D'^{(m)}_{\mathbb{Q}} \otimes_{D^{(m)}_{m',\mathbb{Q}}} N = 0$.

The left $D^{(m)}_{m',\mathbb{Q}}$-module N is the cokernel of some morphism of the form $(D^{(m)}_{m',\mathbb{Q}})^n \to D^{(m)}_{m',\mathbb{Q}}$ for some integer n. Since such morphism is the image via $- \otimes_{\mathbb{Z}} \mathbb{Q}$ of some morphism of the form $(D^{(m)}_{m'})^n \to D_{m'}$, then there exists a monogeneous p-torsion free left $D^{(m)}_{m'}$-module E endowed with an isomorphism of left $D^{(m)}_{m',\mathbb{Q}}$-module $N \xrightarrow{\sim} E_{\mathbb{Q}}$. Following the proof of the part (a), the extension $D^{(m)}_{m'} \to D'^{(m)}$ is flat. Hence, $D'^{(m)} \otimes_{D^{(m)}_{m'}} E$ is p-torsion free and therefore is null. Since $D'^{(m)}/pD'^{(m)} \xrightarrow{\sim} (D^{(m)}_{m'}/pD^{(m)}_{m'})_f$, this implies that $(E/pE)_f = 0$. Moreover, since E is p-torsion free then *a fortiori* E is f-torsion free. Hence, it follows from 8.7.6.7 that $D_{\mathbb{Q}} \otimes_{D^{(m)}_{m'}} E = 0$. Since $M \xrightarrow{\sim} D_{\mathbb{Q}} \otimes_{D^{(m)}_{m'}} E$ then we are done.

(b') Using similar arguments, we can check the full faithfulness of 8.7.6.8.1. □

Remark 8.7.6.9. Let $\mathcal{E}$ be a coherent $\mathcal{B}^{(m_0)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}$-module. If $\mathcal{E}|\mathfrak{Y}$ is a locally projective $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-module of finite type, then for $m \geq m_0$ large enough, $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(m_0)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}} \mathcal{E}$ is a locally projective $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}$-module of finite type. Indeed, since $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \to j_* \mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$ is faithfully flat (see 8.7.6.8), then $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(m_0)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}} \mathcal{E}$ is a projective $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module of finite type. We conclude using Proposition 8.4.1.11.

Corollary 8.7.6.10. *With the notation 8.7.6.6, the homomorphism $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$ is left and right flat.*

Proof. It follows from 7.2.3.3.a that $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to j_* \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ is flat. Passing to the limits and tensoring by $\mathbb{Q}$ this yields that $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to j_* \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ is flat. We conclude from the full faithfulness of 8.7.6.8.2. □

Proposition 8.7.6.11. *We keep the notations 8.7.6.8.*

(a) For any coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-module $\mathcal{E}$, the canonical homomorphism

$$j_* \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}} \mathcal{E} \to j_* j^* \mathcal{E} \tag{8.7.6.11.1}$$

is an isomorphism.

(b) A coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-module $\mathcal{E}$ is null if and only if $j^*\mathcal{E}$ is null.

Proof. The first assertion is local and then we can suppose $\mathcal{X}$ is affine, there exists $f \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}) =: A$ giving a lifting of a local equation of the divisor Z of X and that $\mathcal{M}$ has a global finite presentation. In that case j is an open immersion of affine formal log schemes. Hence the functor j_* (and therefore j_*j^*) is exact (this follows from theorem B of 8.7.5.5). By flatness (see 8.7.6.8) the functor $j_* \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}} -$ is exact. Hence, using the five lemma we reduce to check that the morphism 8.7.6.11.1 is an isomorphism when $\mathcal{M}$ is a free $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-module of finite type. This latter case is obvious.

By using the full faithfulness of 8.7.6.8.2, we get the statement (b) from (a). □

Theorem 8.7.6.12. *With the notation 8.7.6.8, the canonical homomorphisms $\mathcal{O}_{\mathfrak{X}}(\dagger * Z) \to j_* \mathcal{O}_{\mathfrak{Y}}$ and $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(\dagger * Z) \to j_* \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$ are left and right faithfully flat.*

Proof. We already know that these morphisms without the symbol "$*$" are flat (see 8.7.6.8). This yields that the morphisms of 8.7.6.12 are flat. Let $\mathfrak{X}'$ be an affine open of $\mathfrak{X}$ on which there exists $f \in \Gamma(\mathfrak{X}', \mathcal{O}_{\mathfrak{X}})$ lifting a local equation of Z in X. Let M be a monogeneous left $\Gamma(\mathfrak{X}', \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z))$-module of finite presentation such that $\Gamma(\mathfrak{X}' \cap \mathfrak{Y}, \mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{S}^{\sharp}}) \otimes_{\Gamma(\mathfrak{X}', \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger}*Z))} M = 0$. By using 8.7.6.2 and 8.7.6.5, it suffices to prove that $M = 0$.

Let $m' \geq m$ be large enough such that there exists a monogeneous $\Gamma(\mathfrak{X}', \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \widehat{\otimes} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(*Z))$-module M' of finite presentation inducing M by scalar extension and such that

$$\Gamma(\mathfrak{X}' \cap \mathfrak{Y}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}) \otimes_{\Gamma(\mathfrak{X}', \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \widehat{\otimes} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(*Z))} M' = 0.$$

On $\mathfrak{X}'$, the functor $(*Z)$ is isomorphic to the localisation functor of localisation $(\mathfrak{Z})$. Let e be a generator of M'. Write E' for the sub-$\Gamma(\mathfrak{X}', \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \widehat{\otimes} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$-module of M' generated by e. Then E' is a f-torsion free monogeneous $\Gamma(\mathfrak{X}', \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \widehat{\otimes} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})$-module such that $E'[1/f] \xrightarrow{\sim} M'$. As $M'/pM' = 0$, we obtain the equality $(E'/pE')_f = 0$, Hence, it follows from Lemma 8.7.6.7 that $E := \Gamma(\mathfrak{X}', \mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger}Z)) \otimes_{\Gamma(\mathfrak{X}', \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \widehat{\otimes} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})} E' = 0$. Since $M \xrightarrow{\sim} E_f$, then we are done. □

Corollary 8.7.6.13. *With the notation 8.7.6.8, the homomorphism $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} \to \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z)$ is left and right flat.*

Proposition 8.7.6.14. For all $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z)$-module of finite presentation $\mathcal{E}$, the canonical homomorphism

$$j_* \mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{S}^{\sharp}} \otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger}*Z)} \mathcal{E} \to j_* j^* \mathcal{E} \tag{8.7.6.14.1}$$

is an isomorphism. Moreover, a morphism of $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z)$-modules of finite presentation is injective (resp. surjective, resp. bijective) if and only if so is its restriction to $\mathfrak{Y}$.

We have analogous results when we replace "$\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z)$" by "$\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z)$" and "$\mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{S}^{\sharp}}$" by "$\mathcal{D}^{(m)}_{\mathfrak{Y}^{\sharp}/\mathfrak{S}^{\sharp}}$".

Proof. We argue as in 8.7.6.11: the right exactness of the functors in $\mathcal{E}$ (because of the theorem B for coherent $\mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{S}^{\sharp}}$-modules or coherent $\mathcal{D}^{(m)}_{\mathfrak{Y}^{\sharp}/\mathfrak{S}^{\sharp}}$-modules implies the exactness of j_* in our case) we end up to establish the isomorphism 8.7.6.14.1, in the immediate case where $\mathcal{E} = \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z)$ or $\mathcal{E} = \mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(^{\dagger} * Z)$. Proposition 8.7.6.12 then implies the required criteria. □

8.7.7 Homological global dimension

8.7.7.1. With its notation, it follows from the equivalence between left and right $\mathcal{D}$-modules of the subsection 8.7.2 that when $\mathfrak{X}$ is affine we have

$$\mathrm{l.gl.dim}\, \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}) = \mathrm{r.gl.dim}\, \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}).$$

Hence, we simply denote by $\mathrm{gl.dim}\, \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$ this number.

Proposition 8.7.7.2. *Let $\mathfrak{S}^{\sharp}$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^{\sharp} \to \mathfrak{S}^{\sharp}$ be a log smooth morphism of log formal schemes. We suppose $\mathfrak{X}$ is locally noetherian. Let $\mathcal{B}^{(\bullet)}$ be an inductive system of commutative $\mathcal{O}_{\mathfrak{X}}$-algebras indexed by $\mathbb{N}$ satisfying the conditions of 8.7.1.1. We keep notation 8.7.2.1 and 8.7.2. The following conditions hold.*

(a) We have the exact sequence of coherent left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$-modules:

$$0 \to \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \wedge^d \mathcal{T}_{\mathfrak{X}^{\sharp}/\mathfrak{Y}^{\sharp}} \cdots \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{T}_{\mathfrak{X}^{\sharp}/\mathfrak{Y}^{\sharp}} \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}} \to \mathcal{B}_{\mathbb{Q}} \to 0, \tag{8.7.7.2.1}$$

i.e. the canonical complex morphism

$$\widetilde{\mathrm{Sp}}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}} \to \mathcal{B}_{\mathbb{Q}}. \tag{8.7.7.2.2}$$

is a quasi-isomorphism. In particular,

$$\mathcal{B}_{\mathbb{Q}} \in D^{\mathrm{b}}_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}). \tag{8.7.7.2.3}$$

(b) *The map* $\widetilde{\omega}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}} \otimes_{\mathcal{B}} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}} \xrightarrow{\beta} \widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$ *given by the structure of a right* $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$*-module on* $\widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$ *induces a* $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$*-linear resolution* $\mathrm{DR}(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})[d_{\mathfrak{X}/\mathfrak{S}}] \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$ *of* $\widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$.

Proof. We get the rest of the proposition by taking the inductive limit on the level of 7.5.10.4. □

8.7.7.3 (Biduality)**.** The $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$-linear functor denoted by $\mathbb{D}_{\widetilde{\mathfrak{X}}^{\sharp}} \colon D(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}) \to D(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$ is defined by setting for any $\mathcal{E} \in D(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$

$$\mathbb{D}_{\widetilde{\mathfrak{X}}^{\sharp}}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}}(\mathcal{E}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}))[d_{X/S}]. \tag{8.7.7.3.1}$$

Similarly to 5.1.4.4, we can check that for any $\mathcal{E} \in D(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$, we have a canonical morphism $\mathcal{E} \to \mathbb{D}_{\widetilde{\mathfrak{X}}^{\sharp}} \circ \mathbb{D}_{\widetilde{\mathfrak{X}}^{\sharp}}(\mathcal{E})$, which is an isomorphism when $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$.

Proposition 8.7.7.4. *We keep notation 8.7.7.2 and we suppose the rank of* $\Omega^1_{X^{\sharp}/S^{\sharp}}$ *is constant and equal to d.*

(a) *We have* $\mathcal{E}xt^{i}_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}}(\mathcal{B}_{\mathbb{Q}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}) = 0$ *for* $i \neq d$.

(b) *There are the canonical isomorphisms of right (left)* $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$*-modules*

$$\mathcal{E}xt^{d}_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}}(\mathcal{B}_{\mathbb{Q}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}) \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}},$$
$$\mathcal{E}xt^{d}_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}}(\widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{B}_{\mathbb{Q}}.$$

(c) *Suppose* $\mathfrak{X}$ *is affine. Then we have* $d \leq \mathrm{tor}.\dim \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}})$.

Proof. We get the first statement and the first isomorphism of the proposition by taking the inductive limit on the level of 7.5.10.5. The second isomorphism is a consequence of the biduality isomorphism (see 8.7.7.3). When $\mathfrak{X}$ is affine, by using theorems A and B for coherent $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$-modules, by applying the exact functor $\Gamma(\mathfrak{X}, -)$ on the isomorphisms of (b) we get

$$\mathrm{Ext}^{d}_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}}(\mathcal{B}_{\mathbb{Q}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}) \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}, \mathrm{Ext}^{d}_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}}(\widetilde{\omega}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{B}_{\mathbb{Q}}.$$

The third assertion is therefore a consequence of 1.4.3.30. □

Example 8.7.7.5. We denote by $\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}$ one of the sheaves of rings $\mathcal{D}^{(0)}_{\mathfrak{X}^{\sharp}}$, $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}}$ (resp. $\mathcal{D}_{\mathfrak{X}^{\sharp},\mathbb{Q}}$, $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp},\mathbb{Q}}$, $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp},\mathbb{Q}}$, resp. $\mathcal{D}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$, $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$). Let us denote by $\omega_{\mathfrak{X}^{\sharp}}({}^{\dagger}T) := \omega_{\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}({}^{\dagger}T)$. With 4.7.3.7 and 4.7.3.14 (level 0 case), with 4.7.3.15 (algebraic infinite level case), with 7.5.10.5 (level m case), with 8.7.7.2.3 and 8.7.7.4, the following assertions hold.

(a) The canonical morphism $\omega_{\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}} \to \omega_{\mathfrak{X}^{\sharp}}$ (resp. $\omega_{\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}} \to \omega_{\mathfrak{X}^{\sharp},\mathbb{Q}}$, resp. $\omega_{\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}} \to \omega_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$) induces a quasi-isomorphism $\Omega^{\bullet}_{\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}[d] \xrightarrow{\sim} \omega_{\mathfrak{X}^{\sharp}}$ (resp. $\Omega^{\bullet}_{\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}[d] \xrightarrow{\sim} \omega_{\mathfrak{X}^{\sharp},\mathbb{Q}}$, resp. $\Omega^{\bullet}_{\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}[d] \xrightarrow{\sim} \omega_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$).

(b) $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^{\dagger}T) \in D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$ and $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^{\dagger}T) \in D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$.

(c) We have a canonical isomorphism of $D_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$:

$$\mathbb{D}^{\mathrm{alg}}_{T}(\mathcal{O}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}, \qquad \mathbb{D}_{T}(\mathcal{O}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}. \tag{8.7.7.5.1}$$

Beware that this isomorphism is not compatible with Frobenius: we need a Tate twist (see 11.3.5.2).

Proposition 8.7.7.6 (Berthelot)**.** *Let $\mathfrak{X} \to \mathfrak{S}$ be a smooth morphism of $\mathcal{V}$-formal schemes. We suppose $\mathfrak{X}$ is affine and $\mathcal{V}$-flat, S is regular and the rank of $\Omega^1_{X/S}$ is constant and equal to d. Let $r := \sup_{s \in f(X)} \dim \mathcal{O}_{S,s}$. Set $\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}} := \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$, $\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}} := \Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$, $D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}} := \Gamma(\mathfrak{X}, \mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$.*

(a) The ring $\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$ has homological global dimension equal to $2d + r + 1$.

(b) Let $E^{(m)}$ be a p-torsion free left $\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-module of finite type. Then $E^{(m)}$ admits a resolution by projective of finite type left $\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-modules of length $\leq 2d + r$.

(c) Let $E^{(m)}$ be a $\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-module of finite type. Then $E^{(m)}$ admits a resolution by projective of finite type left $\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-modules of length $\leq 2d + r$.

(d) We have the inequalities $d \leq \mathrm{gl}.\dim \widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}} \leq 2d + r$.

(e) We have $d \leq \mathrm{tor}.\dim D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}} \leq 2d + r$ and coherent left $D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-module admits a resolution by projective of finite type left $D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-modules of length $\leq 2d + r$.

(f) We have the inequalities $d \leq \mathrm{tor}.\dim D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}} \leq \mathrm{gl}.\dim D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}} \leq 2d + r + 1$.

Proof. The parts a), b), c), d) of the proposition follow from 6.1.4.1, 7.5.10.5 and from 1.4.3.31. The part (e) follows from 1.4.3.32. It remains to check (f). The inequality $d \leq \mathrm{gl}.\dim D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$ is already known in a wider context (see 8.7.7.4). The inequality $\mathrm{gl}.\dim D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}} \leq 2d + r + 1$ follows from (see 2.3.4.3).

□

Proposition 8.7.7.7 (Montagnon)**.** *Let $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$. Let $\mathfrak{X} \to \mathfrak{S}$ be a smooth adic morphism of formal schemes. We suppose is locally noetherian and the rank of $\Omega^1_{X/S}$ is constant and equal to d. Let $\mathfrak{D}$ be a strict normal crossing divisor relative to $\mathfrak{X}/\mathfrak{S}$. Let $M_{\mathfrak{D}}$ be the log structure of $\mathfrak{X}$ given by $\mathfrak{D}$ and let $\mathfrak{X}^{\sharp} := (\mathfrak{X}, M_{\mathfrak{D}})$.*

(a) If $\mathfrak{X}$ is affine then the rings $\Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}})$, $\Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}})$, $\Gamma(\mathfrak{X}, \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}})$ have finite global dimensions.

(b) The rings $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}$, $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}$, $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}$ have finite tor dimensions.

Proof. By copying the proof of 8.7.7.6, this is a consequence 6.1.4.2. □

Remark 8.7.7.8. With the notation of 8.7.7.6, since the rings are noetherian, then we have $\mathrm{tor}.\dim(\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}) = \mathrm{gl}.\dim(\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$, $\mathrm{tor}.\dim(\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}) = \mathrm{gl}.\dim(\widehat{D}^{(m)}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$ (see 2.3.4.2). Beware that $\mathrm{tor}.\dim D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$ is equal to $\mathrm{gl}.\dim D^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$. We have a similar remark for the log version 8.7.7.7.

Theorem 8.7.7.9 (Noot-Huyghe)**.** *Let $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$. Let $\mathfrak{X} \to \mathfrak{S}$ be a smooth morphism of $\mathcal{V}$-formal schemes. We suppose $\mathfrak{X}$ is locally noetherian and the rank of $\Omega^1_{X/S}$ is constant and equal to d. Let Z be a divisor of X, $\mathfrak{U}$ be an affine open subscheme of $\mathfrak{X}$. We have the inequality:* $\mathrm{gl}.\dim(\Gamma(\mathfrak{U}, \mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})) \leq 2d + 2$.

Proof. This has been proved by C. Noot-Huyghe in [Huy07, Th. 3.1.3.2 and 3.2.1.2]. □

8.7.7.10. Let $\mathfrak{X} \to \mathfrak{S}$ be a noetherian smooth morphism of $\mathcal{V}$-formal schemes and Z be a divisor of X. Following 8.4.1.15, for any $* \in \{\mathrm{r}, \mathrm{l}\}$, the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ induces the equivalence of categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(Z)) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$. It follows from 8.7.7.6 and 7.1.3.13 that for any $\lambda \in L(\mathbb{N})$ we have the equality $D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\lambda^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}) = D^{\mathrm{b}}_{\mathrm{coh}}({}^{*}\lambda^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. With notation 8.6.1.4, this yields $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. Then the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ induces an equivalence $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}) \cong D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}})$.

We get from 8.7.7.9 the equality $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}) = D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$. Howerver, when Z is not empty, it is not clear that the inclusion $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(Z)) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(Z))$ is an equality. Hence, we only get a priori a fully faithful functor $\underrightarrow{l}^{*}_{\mathbb{Q}} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(Z)) \to D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$.

8.7.8 Arithmetic differential operators of finite congruence, link with Ardakov-Wadsley's theory of $\mathcal{D}$-modules

8.7.8.1. Let $\mathfrak{X}_0$ be a smooth formal scheme over $\mathcal{V}$ and let $\mathcal{D}^{(m)}_{\mathfrak{X}_0}$ be Berthelot's sheaf of arithmetic differential operators of level m on $\mathfrak{X}_0$. For any number $k \geq 0$, let $\mathcal{D}^{(k,m)}_{\mathfrak{X}_0}$ be the $\mathcal{V}$-subalgebra of $\mathcal{D}^{(m)}_{\mathfrak{X}_0}$ consisting of those differential operators which are generated, locally where we have coordinates $x_1, ..., x_M$ and corresponding derivations $\partial_1, ..., \partial_M$, by operators of the form

$$\pi^{k|\underline{\nu}|}\underline{\partial}^{\langle\underline{\nu}\rangle_{(m)}} = \pi^{k(\nu_1+\ldots+\nu_M)}\prod_{l=1}^{M}\partial_l^{\langle\nu_l\rangle_{(m)}}.$$

Given an admissible blow-up $\mathrm{pr} : \mathfrak{X} \to \mathfrak{X}_0$, we let $k_{\mathfrak{X}}$ be the minimal k such that $\pi^k \mathcal{O}_{\mathfrak{X}} \subset \mathcal{I}$ for any coherent ideal sheaf $\mathcal{I}$ on $\mathfrak{X}_0$ whose blow-up is $\mathfrak{X}$. In [HSS21, 2.1.12], C. Huyghe, T. Schmidt, and M. Strauch checked that

$$\mathcal{D}^{(k,m)}_{\mathfrak{X}} := \mathrm{pr}^* \mathcal{D}^{(k,m)}_{\mathfrak{X}_0} = \mathcal{O}_{\mathfrak{X}} \otimes_{\mathrm{pr}^{-1}\mathcal{O}_{\mathfrak{X}_0}} \mathrm{pr}^{-1}\mathcal{D}^{(k,m)}_{\mathfrak{X}_0}$$

is naturally a sheaf of rings on $\mathfrak{X}$ whenever $k \geq k_{\mathfrak{X}}$. Similarly to Berthelot's sheaves of arithmetic $\mathcal{D}$-module, we write

$$\widehat{\mathcal{D}}^{(k,m)}_{\mathfrak{X}} = \varprojlim_i \mathcal{D}^{(k,m)}_{\mathfrak{X}}/\pi^i \quad \text{and} \quad \mathcal{D}^{\dagger}_{\mathfrak{X},k} = \varinjlim_m \widehat{\mathcal{D}}^{(k,m)}_{\mathfrak{X}} \to \mathbb{Q}\ ,$$

and call these sheaves *arithmetic differential operators of congruence level*[1] k on $\mathfrak{X}$. The structure theory of these differential operators goes largely parallel to the classical smooth setting (when $\mathfrak{X} = \mathfrak{X}_0$ and $k = 0$), as developed in this book. In particular, the sheaves $\mathcal{D}^{(k,m)}_{\mathfrak{X}}, \widehat{\mathcal{D}}^{(k,m)}_{\mathfrak{X}}$ and $\mathcal{D}^{\dagger}_{\mathfrak{X},k}$ are sheaves of coherent rings on $\mathfrak{X}$. Cartan's theorems A and B hold for the sheaf $\mathcal{D}^{\dagger}_{\mathfrak{X},k}$, when restricted to an affine open subscheme $\mathfrak{U}$ of $\mathfrak{X}$ (see [HSS21, 3.1.12 and 3.1.15]). A key result (the 'invariance theorem') shows that in case of a morphism $\mathfrak{X}' \to \mathfrak{X}$ between admissible blow-ups of $\mathfrak{X}_0$, the categories of coherent modules over $\mathcal{D}^{\dagger}_{\mathfrak{X}',k}$ and over $\mathcal{D}^{\dagger}_{\mathfrak{X},k}$, respectively, are naturally equivalent. As a consequence, this yields theorems A and B on the whole blow-up $\mathfrak{X}$ provided the base $\mathfrak{X}_0$ is affine (see [HSS21, 2.3.12]).

Passing to the projective limit

$$\mathcal{D}_{\mathfrak{X},\infty} = \varprojlim_k \mathcal{D}^{\dagger}_{\mathfrak{X},k},$$

we get the category $\mathcal{C}_{\mathfrak{X}}$ of *coadmissible* $\mathcal{D}_{\mathfrak{X},\infty}$*.modules.* This is a full abelian subcategory of the category of all $\mathcal{D}_{\mathfrak{X},\infty}$-modules. Its construction relies on the fact that the ring of local sections $\Gamma(\mathfrak{V}, \mathcal{D}_{\mathfrak{X},\infty})$ over an open affine $\mathfrak{V} \subseteq \mathfrak{X}$ is a Fréchet-Stein algebra. This concept and study of coadmissible modules over Fréchet-Stein algebra were introduced by P. Schneider and J. Teitelbaum in [ST03]. For such coadmissible $\mathcal{D}_{\mathfrak{X},\infty}$-module, C. Huyghe, T. Schmidt, and M. Strauch established Cartan's theorems A and B hold (see [HSS21, 3.1.12 an 3.1.15]).

Consider the Zariski-Riemann space of $\mathfrak{X}_0$, i.e., the projective limit $\langle\mathfrak{X}_0\rangle = \varprojlim \mathfrak{X}$ of all admissible formal blow-ups $\mathfrak{X} \to \mathfrak{X}_0$, cf. [Bos14]. One can then form the inductive limit

$$\mathcal{D}_{\langle\mathfrak{X}_0\rangle} = \varinjlim_{\mathfrak{X}} \mathrm{sp}_{\mathfrak{X}}^{-1}\mathcal{D}_{\mathfrak{X},\infty}\ ,$$

where $\mathrm{sp}_{\mathfrak{X}} : \langle\mathfrak{X}_0\rangle \to \mathfrak{X}$ is the projection map. This is a sheaf of rings on $\langle\mathfrak{X}_0\rangle$ and we get the abelian category of coadmissible $\mathcal{D}_{\langle\mathfrak{X}_0\rangle}$-modules. C. Huyghe, T. Schmidt, and M. Strauch proved analogues of Theorems A and B in this setting (see [HSS21, 3.2.6])

This work of C. Huyghe, T. Schmidt, M. Strauch of [HSS21], [HSS22] presented above is a generalisation of the construction of D. Patel, T. Schmidt, and M. Strauch in [PSS14, PSS17] and is related to distribution algebras of arithmetic $\mathcal{D}$-modules (see [HS18]). Moreover, A. Shiho introduced in [Shi15] sheaves of p-adic differential operators of negative level $-m$, as they are called there. These are closely related to the sheaves considered here, where the congruence level k corresponds to Shiho's level $-m$.

Some application of this generalization is the localization theorem of [HPSS]: in this context $\mathfrak{X}_0$ is the smooth model of the flag variety of a connected split reductive group $\mathbb{G}$ over K, and the main result of [HPSS] establishes then an anti-equivalence between the category of admissible locally analytic $\mathbb{G}(L)$-representations (with trivial character) [ST03] and the category of so-called coadmissible equivariant

[1] The terminology is motivated by the relation to congruence subgroups in reductive groups in the case of formal models of flag varieties, cf. [HPSS].

arithmetic $\mathcal{D}$-modules on the system of all formal models of the rigid analytic flag variety of $\mathbb{G}$. We also have a twisted version by A. Sarrazola in [SA23]: when $\mathcal{V}$ is the ring of integers of a finite extension $\mathbb{Q}_p$, A. Sarrazola defined and studied the category of coadmissible $\mathbb{G}$-equivariant twisted (by an algebraic character of a split maximal torus of $\mathbb{G}$) arithmetic $\mathcal{D}$-modules over the induced rigid flag variety. He generalized the main results from a paper by Huyghe, Patel, Schmidt and Strauch in [HPSS19] for algebraic characters. A. Sarrazola also proved in [SA24] a twisted version of a Beilinson-Bernstein theorem for twisted arithmetic differential operators on the formal flag variety. This extends for instance the Beilinson-Bernstein's theorem for arithmetic $\mathcal{D}$-modules proved by C. Huyghe in [Huy09].

8.7.8.2 (Comparison with K. Ardakov and S. Wadsley theory)**.** K. Ardakov and S. Wadsley are developing a theory of $\mathcal{D}$-modules on general smooth rigid-analytic spaces, cf. [Ard14, AW18, AW19]. In their work they consider deformations of crystalline differential operators (as in [AW13]), whereas we take as a starting point deformations of Berthelot's arithmetic differential operators. The category of coadmissible $\mathcal{D}_{\langle \mathfrak{X}_0 \rangle}$-modules as defined by C. Huyghe, T. Schmidt, M. Strauch, when pulled back to the site of the rigid-analytic space of classical points, coincides with the corresponding category studied in [Ard14, AW18, AW19].

8.8 Frobenius structures

8.8.1 Frobenius descente of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-modules

Let $m \in \mathbb{N}$ be an integer. Let $\mathfrak{a} := \pi^h \mathcal{V}$ and $\mathfrak{b} := \pi^k \mathcal{V}$. Following 1.2.4.2.(a) $(\mathfrak{a}, \mathfrak{b}, ^{[\,]})$ is an m-ideal if and only if $e/(p-1) \leq k$, $e+h \geq k$, $hp^m \geq k$ and $k \geq h$. In particular, $\mathfrak{a}$ has an m-PD-structure if and only if $hp^m \geq e/(p-1)$. From now, fix such a m-PD-ideal $(\mathfrak{a}, \mathfrak{b}, ^{[\,]})$ of $\mathcal{V}$.

To avoid being limited in certain applications by hypotheses on the branching index, we will thus be led to consider not only liftings of the relative Frobenius modulo $\mathfrak{m}$ of a $\mathcal{V}$-formal scheme $\mathfrak{X}$, but, more generally, raisings of the Frobenius relative to the reduction of $\mathfrak{X}$ modulo $\mathfrak{a}$. For any integer $i \in \mathbb{N}$, for any $\mathcal{V}$-formal scheme $\mathfrak{S}$, we denote here S_i the reduction of $\mathfrak{S}$ modulo $\mathfrak{a}^{i+1}$ (and not $\mathfrak{m}^{i+1}$). The ideal $\mathfrak{b}\mathcal{O}_{S_i}$ endows $\mathfrak{a}\mathcal{O}_{S_i}$ with an m-PD nilpotent m-PD-structure. Remark that if $\mathfrak{a}$ is topologically m-PD-nilpotent (i.e. if $hp^m > e/(p-1)$ following 1.3.1.3), then $\mathfrak{a}\mathcal{O}_{S_i}$ is m-PD nilpotent.

Proposition 8.8.1.1. *Let $s \in \mathbb{N}$, $\mathfrak{S}$ be a flat $\mathcal{V}$-formal scheme, $\mathfrak{X}$ be an $\mathfrak{S}$-smooth formal scheme, $X_0 \to S_0$ be its reduction modulo $\mathfrak{a}$, $F\colon \mathfrak{X} \to \mathfrak{X}'$ a morphism of smooth $\mathfrak{S}$-schemes lifting $F^s_{X_0/S_0}$. Let $\mathcal{B}_{\mathfrak{X}'}$ be an $\mathcal{O}_{\mathfrak{X}'}$-algebra endowed with a compatible structure of left $\mathcal{D}_{\mathfrak{X}'/\mathfrak{S}}$-module. Set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} := \mathcal{B}_{\mathfrak{X}'} \widehat{\otimes} \mathcal{D}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$, $\mathcal{B}_{\mathfrak{X}} := F^* \mathcal{B}_{\mathfrak{X}'}$ and $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}} := \mathcal{B}_{\mathfrak{X}} \widehat{\otimes} \mathcal{D}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$. So:*

(a) $F^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$, $F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$ and $F^* F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$ are respectively provided with canonical structures of $(\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}})$-bimodule , $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}, \widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}})$-bimodule, and of $(\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}, \widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}})$- bimodule; moreover, the canonical homomorphism

$$F^* F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} \to F^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}, \qquad (\text{resp. } F^* F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} \to F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}})$$

is $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-linear on the left (resp. on the right), and locally identifies $F^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$ (resp. $F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$) to a direct factor of $F^* F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$ on $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$.

(b) There exists a canonical isomorphism of $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-bimodules

$$\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} F^* F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}. \tag{8.8.1.1.1}$$

(c) There exists a canonical isomorphism of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-bimodules

$$F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}} F^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}. \tag{8.8.1.1.2}$$

Proof. By p-adic completion, this is a consequence of such results over schemes (see 6.1.3). For more details, see [Ber00, 4.1.2]. □

Remark 8.8.1.2. Suppose $\mathfrak{X}/\mathfrak{S}$ has coordinates $t_1, \ldots, t_d$. If $m \geq 1$, then the sheaf $\Gamma(\mathfrak{X}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$ contains zero divisors. Indeed, let $F\colon \mathfrak{X} \to \mathfrak{X}'$ is a morphism of $\mathcal{V}$-formal schemes lifting the m-th power of Frobenius of X. Then $(\underline{t}^{\underline{\alpha}})$ with $0 \leq \alpha_j < p^M$ is a basis of $\mathcal{O}_{\mathfrak{X}}$ over $\mathcal{O}_{\mathfrak{X}'}$. Let $(\theta_{\underline{\alpha}})$ be the dual basis of $F^\flat \mathcal{O}_{\mathfrak{X}'} = \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}'}}(\mathcal{O}_{\mathfrak{X}}, \mathcal{O}_{\mathfrak{X}'})$. Then the isomorphism 8.8.1.1.1 becomes an isomorphism of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-modules of the form

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} \oplus_{\underline{\alpha}} F^* \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}/\mathfrak{S}} \cdot \theta_{\underline{\alpha}}.$$

Let $1 = \sum_{\underline{\alpha}} e_{\underline{\alpha}}$ be the decomposition of 1. Since the map $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}} \to F^* \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}/\mathfrak{S}} \cdot \theta_{\underline{\alpha}}$ is a surjective morphism of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-modules which sends 1 to $e_{\underline{\alpha}}$, we get $e_{\underline{\alpha}} \neq 0$ for any $\underline{\alpha}$. Since $e_{\underline{\beta}} = e_{\underline{\beta}} \cdot 1 = \sum_{\underline{\alpha}} e_{\underline{\beta}} e_{\underline{\alpha}}$, then we obtain $e_{\underline{\beta}} e_{\underline{\alpha}} = 0$ if $\underline{\beta} \neq \underline{\alpha}$, $e_{\underline{\beta}}^2 = e_{\underline{\beta}}$.

Theorem 8.8.1.3. *We keep notations and hypotheses of 8.8.1.1.*

(a) For any left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-module $\mathcal{E}'$ (resp. right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-modules $\mathcal{M}'$), $F^*\mathcal{E}'$ (resp. $F^\flat \mathcal{M}'$) is endowed with a functorial structure of left (resp. right) $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-module.

(b) The functor F^* (resp. $F^\flat$) induces an equivalence between the category of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-modules and left (resp. right) $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-modules.

(c) The functor which associates from a left (resp. right) $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-module $\mathcal{E}$ the left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-module $F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}} \mathcal{E}$ (resp. $\mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}} F^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$) is quasi-inverse to F^* (resp. $F^\flat$).

(d) A left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-module $\mathcal{E}'$ (resp. $\mathcal{M}'$) is coherent if and only if $F^*(\mathcal{E}')$ (resp. $F^\flat \mathcal{M}'$) is $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-coherent.

(e) For any left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-module $\mathcal{E}'$, we have the canonical isomorphism of right $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-modules of the form

$$\omega_{\mathfrak{X}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{X}}} F^*(\mathcal{E}') \xrightarrow{\sim} F^\flat(\omega_{\mathfrak{X}'/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{E}'). \tag{8.8.1.3.1}$$

Proof. By p-adic completion, this is a consequence of such results over schemes (see 6.1.3). For more details, see [Ber00, 4.1.3]. □

8.8.1.4. Suppose $\mathfrak{a}$ is topologically m-PD-nilpotent. If F and F' are two liftings of the relative Frobenius $F^s_{X_0/S_0}$, then by taking the p-adic completion of the glueing isomorphisms of the form (see 6.1.5.1), we get the canonical isomorphism $\tau_{F,F'}\colon F'^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} \xrightarrow{\sim} F^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$. Hence, by glueing these bimodules, we get the $(\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}})$-bimodule $(F^s_{X_0/S_0})^*(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}})$. This yields the functor from the category of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-modules to that of left $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-modules by setting

$$(F^s_{X_0/S_0})^*(\mathcal{E}') := (F^s_{X_0/S_0})^*(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}} \mathcal{E}'. \tag{8.8.1.4.1}$$

Similarly, by p-adic completion, we get from 6.1.5.1, the canonical isomorphism $\sigma_{F,F'}\colon F'^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} \xrightarrow{\sim} F^\flat \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$. By glueing, this yields the $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}, \widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}})$-bimodule $(F^s_{X_0/S_0})^\flat(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}})$. This yields the functor from the category of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-modules to that of right $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-modules by setting

$$(F^s_{X_0/S_0})^\flat(\mathcal{M}') := \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}} (F^s_{X_0/S_0})^\flat(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}).$$

The theorem 8.8.1.3 (in particular) is still valid in this context, i.e. we do not need to suppose that $F^s_{X_0/S_0}$ has a lifting.

Theorem 8.8.1.5. *We keep notations and hypotheses of 8.8.1.1. Let $m' \geq m$, $\mathcal{C}_{\mathfrak{X}'}$ be an $\mathcal{O}_{\mathfrak{X}'}$-algebra endowed with a compatible structure of left left $\mathcal{D}^{(m')}_{\mathfrak{X}'/\mathfrak{S}}$-module, $\mathcal{B}_{\mathfrak{X}'} \to \mathcal{C}_{\mathfrak{X}'}$ a homomorphism of $\mathcal{O}_{\mathfrak{X}'}$-algebras which is $\mathcal{D}^{(m')}_{\mathfrak{X}'/\mathfrak{S}}$-linear. Set*

$$\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}'/\mathfrak{S}} := \mathcal{C}_{\mathfrak{X}'} \widehat{\otimes} \mathcal{D}^{(m')}_{\mathfrak{X}'/\mathfrak{S}}, \qquad \mathcal{C}_{\mathfrak{X}} := F^* \mathcal{C}_{\mathfrak{X}'}, \qquad \widetilde{\mathcal{D}}^{(m'+s)}_{\mathfrak{X}/\mathfrak{S}} := \mathcal{C}_{\mathfrak{X}} \widehat{\otimes} \mathcal{D}^{(m'+s)}_{\mathfrak{X}/\mathfrak{S}}.$$

For any $\mathcal{E}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}})$, there exists in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}})$ the canonical isomorphism:

$$\widetilde{\mathcal{D}}^{(m'+s)}_{\mathfrak{X}/\mathfrak{S}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}} F^* \mathcal{E}' \xrightarrow{\sim} \left(F^* (\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}'/\mathfrak{S}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}} \mathcal{E}' \right). \tag{8.8.1.5.1}$$

Proof. By associativity of the tensor products, we reduce to check

$$\widetilde{\mathcal{D}}^{(m'+s)}_{\mathfrak{X}} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}{\otimes}} F^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \xrightarrow{\sim} F^* (\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}'}).$$

Since $F^*(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'})$ is a locally projective of finite type left $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-module, then the tensor product is p-adically complete and this therefore follows from 6.2.3.5. □

8.8.2 Frobenius descente of $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-modules

8.8.2.1. Let $\mathfrak{a} \subset \mathfrak{m}$ be an ideal containing p. Fix a PD-ideal $\mathfrak{b} \subset \mathfrak{a}$ (e.g. $\mathfrak{b} = (p)$). Let $m_0 \in \mathbb{N}$ be large enough such that $\mathfrak{b}$ endows $\mathfrak{a}$ with an m_0-PD-structure. Replacing m_0 by $m_0 + 1$ if necessary, we can suppose that this structure is topologically m_0-PD-nilpotent. Let $\mathfrak{S}$ be a flat $\mathcal{V}$-formal scheme. For any integer $i \in \mathbb{N}$, we denote here S_i the reduction of $\mathfrak{S}$ modulo $\mathfrak{a}^{i+1}$ (and not $\mathfrak{m}^{i+1}$).

Let $\mathfrak{X}$ be a smooth formal $\mathfrak{S}$-scheme. Let X_0 be its special fiber, $s \in \mathbb{N}$ and integer and $X_0^{(s)}$ be the base change of X_0 by the s-th power of the absolute Frobenius of S_0. Suppose there exists $F \colon \mathfrak{X} \to \mathfrak{X}'$ a morphism of smooth formal $\mathfrak{S}$-schemes which is a lifting of the relative Frobenius $F^s_{X_0/S_0} \colon X_0 \to X_0^{(s)}$.

Let $(\mathcal{B}^{(m)}_{\mathfrak{X}'})_{m \geq m_0}$ be an inductive system of commutative $\mathcal{O}_{\mathfrak{X}'}$-algebras indexed by integers great or equal to m_0 and satisfying the conditions of 8.7.1.1. For any $m \geq m_0$, set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} := \mathcal{B}^{(m)}_{\mathfrak{X}'} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}'}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$, $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}} := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$. We set $\mathcal{B}^{(m+s)}_{\mathfrak{X}'} := F^* \mathcal{B}^{(m)}_{\mathfrak{X}'}$, $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}} := \mathcal{B}^{(m+s)}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$, $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}} := \varinjlim_m \widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$.

Proposition 8.8.2.2. *We keep notations and hypotheses of 8.8.2.1.*

(a) $F^* \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$, $F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$ and $F^* F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$ are respectively provided with canonical structures of $(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}})$-bimodule , $(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}})$-bimodule , and of $(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}})$- bimodule; moreover, the canonical homomorphism

$$F^* F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \to F^* \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}, \qquad (\textit{resp. } F^* F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \to F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}})$$

is $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-linear on the left (resp. on the right), and locally identifies $F^* \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$ (resp. $F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$) to a direct factor of $F^* F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$ on $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$.

(b) There exists a canonical isomorphism of $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-bimodules

$$\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} F^* F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}. \tag{8.8.2.2.1}$$

(c) There exists a canonical isomorphism of $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-bimodules

$$F^\flat \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}} F^* \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}. \tag{8.8.2.2.2}$$

Proof. By taking inductive limits on the level, this is a consequence of 8.8.1.1. For more details, see [Ber00, 4.2.2]. □

Theorem 8.8.2.3. *We keep notations and hypotheses of 8.8.2.1.*

(a) *For any left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-module $\mathcal{E}'$ (resp. right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-modules $\mathcal{M}'$), $F^*\mathcal{E}'$ (resp. $F^\flat\mathcal{M}'$) is endowed with a functorial structure of left (resp. right) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module.*

(b) *The functor F^* (resp. $F^\flat$) induces an equivalence between the category of left (resp. right) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-modules and left (resp. right) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-modules.*

(c) *The functor F_+ which associates from a left (resp. right) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module $\mathcal{E}$ the left (resp. right) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-module $F_+(\mathcal{E}) := F^\flat\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}} \mathcal{E}$ (resp. $F_+(\mathcal{M}) := \mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}} F^*\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$) is quasi-inverse to F^* (resp. $F^\flat$).*

(d) *For any left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-module $\mathcal{E}'$ (resp. right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-modules $\mathcal{M}'$), $F^*\mathcal{E}'$ (resp. $F^\flat\mathcal{M}'$) is a flat (coherent) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module if and only if $\mathcal{E}'$ (resp. $\mathcal{M}'$) is a flat (coherent) $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-module.*

(e) *For any left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-module $\mathcal{E}'$, we have the canonical isomorphism of right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module-modules of the form*
$$\omega_{\mathfrak{X}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{X}}} F^*(\mathcal{E}') \xrightarrow{\sim} F^\flat(\omega_{\mathfrak{X}'/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{E}'). \tag{8.8.2.3.1}$$

Proof. By taking inductive limits on the level, this is a consequence of 8.8.1.3. For more details, see [Ber00, 4.2.4]. □

8.8.2.4. If F and F' are two liftings of the relative Frobenius $F^s_{X_0/S_0}$, then by taking the inductive limit on the level of the glueing isomorphisms of 8.8.1.4 we get the canonical isomorphism $\tau_{F,F'}\colon F'^*\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \xrightarrow{\sim} F^*\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$. Hence, by glueing these bimodules, we get the $(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}})$-bimodule $(F^s_{X_0/S_0})^*(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}})$. This yields the functor from the category of left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-modules to that of left $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-modules by setting
$$(F^s_{X_0/S_0})^*(\mathcal{E}') := (F^s_{X_0/S_0})^*(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}) \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}} \mathcal{E}'. \tag{8.8.2.4.1}$$

Similarly, by taking the inductive limit on the level of the glueing isomorphisms of 8.8.1.4 we get the canonical isomorphism $\sigma_{F,F'}\colon F'^\flat\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \xrightarrow{\sim} F^\flat\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$. By glueing, this yields the $(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}, \widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}})$-bimodule $(F^s_{X_0/S_0})^\flat(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}})$. This yields the functor from the category of right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}$-modules to that of right $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-modules by setting
$$(F^s_{X_0/S_0})^\flat(\mathcal{M}') := \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}} (F^s_{X_0/S_0})^\flat(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}).$$

The theorem 8.8.2.3 is still valid in this context, i.e. we do not need to suppose that $F^s_{X_0/S_0}$ has a lifting.

Theorem 8.8.2.5. *We keep notations and hypotheses of 8.8.2.1. Let $\mathcal{E}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}})$. There exists in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}})$ the canonical isomorphism:*
$$\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}} F^*\mathcal{E}' \xrightarrow{\sim} \left(F^*(\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}} \mathcal{E}'\right). \tag{8.8.2.5.1}$$

Proof. By taking inductive limits on the level, this is a consequence of 8.8.1.5. □

8.8.3 F-complexes

8.8.3.1. Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. Suppose there exists an automorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining. Let $\mathfrak{X}$ be a smooth $\mathcal{V}$-formal scheme. We denote by $\mathfrak{X}' := \mathfrak{X}^\sigma$ the $\mathcal{V}$-formal scheme deduced from $\mathfrak{X}$ by the base change defined by σ. Following 8.8.2.3 and the remark 8.8.2.4, the functor $(F^s_{X_0/S_0})^*$ (resp. $(F^s_{X_0/S_0})^\flat$) induces an equivalence between the category of left (resp. right) $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}'/\mathfrak{S}}$-modules and left (resp. right) $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-modules. For simplicity, we simply denote by F^* and $F^\flat$ these functors, which is compatible with such a functor when $F\colon \mathfrak{X} \to \mathfrak{X}'$ is a lifting of $F^s_{X_0/S_0}$. If $\mathcal{E}$ is a left $\mathcal{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-module (or a left $\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module etc.), we denote by $\mathcal{E}^\sigma$ is the left $\mathcal{D}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-module (or left $\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}}$-module etc.) induced from $\mathcal{E}$ by base change via σ.

Let us further assume that we have the following data

(a) an inductive system of $\mathcal{O}_{\mathfrak{X}}$-algebra $(\mathcal{B}^{(m)}_{\mathfrak{X}})_{m\geq m_0}$, such that each $\mathcal{B}^{(m)}_{\mathfrak{X}}$ is p-adically complete, and endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-module so that $\mathcal{B}^{(m)}_{\mathfrak{X}} \to \mathcal{B}^{(m+1)}_{\mathfrak{X}}$ is $\mathcal{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-linear ; by setting $\mathcal{B}^{(m)}_{\mathfrak{X}'} := (\mathcal{B}^{(m)}_{\mathfrak{X}})^\sigma$ this yields inductive system of $\mathcal{O}_{\mathfrak{X}}$-algebra $(\mathcal{B}^{(m)}_{\mathfrak{X}'})_{m\geq m_0}$, such that each $\mathcal{B}^{(m)}_{\mathfrak{X}'}$ is p-adically complete, and endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-module so that $\mathcal{B}^{(m)}_{\mathfrak{X}'} \to \mathcal{B}^{(m+1)}_{\mathfrak{X}'}$ is $\mathcal{D}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$-linear ;

(b) a family of $\mathcal{D}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-linear isomorphism $F^*(\mathcal{B}^{(m)}_{\mathfrak{X}'}) \xrightarrow{\sim} \mathcal{B}^{(m+s)}_{\mathfrak{X}}$ which commutes with the transition maps, i.e., making commutative the diagram

$$\begin{array}{ccc} F^*(\mathcal{B}^{(m)}_{\mathfrak{X}'}) & \longrightarrow & \mathcal{B}^{(m+s)}_{\mathfrak{X}} \\ \downarrow & & \downarrow \\ F^*(\mathcal{B}^{(m+1)}_{\mathfrak{X}'}) & \longrightarrow & \mathcal{B}^{(m+1+s)}_{\mathfrak{X}}. \end{array} \tag{8.8.3.1.1}$$

For any $m \geq m_0$, set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}} := \mathcal{B}^{(m)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$, $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}} := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}} := \mathcal{B}^{(m)}_{\mathfrak{X}'}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}'}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$, $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}'/\mathfrak{S}} := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}$. The isomorphisms $F^*(\mathcal{B}^{(m)}_{\mathfrak{X}}) \xrightarrow{\sim} \mathcal{B}^{(m+s)}_{\mathfrak{X}}$ induce the ring isomorphisms

$$F^*(\mathcal{B}^{(m)}_{\mathfrak{X}'})\widehat{\otimes}\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$$

which are compatible when m varies. This yields the ring isomorphism

$$\varinjlim_m F^*(\mathcal{B}^{(m)}_{\mathfrak{X}'})\widehat{\otimes}\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}. \tag{8.8.3.1.2}$$

Let $\mathcal{E}$ be a left $\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module and let $\mathcal{E}^\sigma$ be the left $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}'/\mathfrak{S}}$-module induced from $\mathcal{E}$ by base change via σ. It follows from 8.8.2.3 that $F^*(\mathcal{E}^\sigma)$ is endowed with a structure of left $\varinjlim_m F^*(\mathcal{B}^{(m)}_{\mathfrak{X}'})\widehat{\otimes}\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-module. Via 8.8.3.1.2, we get a structure of left $\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module on $F^*\mathcal{E} := F^*(\mathcal{E}^\sigma)$ (we keep this abuse of notation). Similarly, for any integer $n \in \mathbb{N}$, we get the left $\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module by setting $F^{n*}\mathcal{E} := (F^{ns}_{X_0/S_0})^*(\mathcal{E}^{\sigma^n})$.

Definition 8.8.3.2. With notation and hypotheses of 8.8.3.1, a "left F-$\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module" (or a left F^s-$\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module if we would like to clarify s) is the data of a left $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module $\mathcal{E}$ together with a $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-linear isomorphism $\Phi\colon \mathcal{E} \xrightarrow{\sim} F^*\mathcal{E}$. A morphism of left F-$\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-modules $u\colon (\mathcal{E},\Phi) \to (\mathcal{F},\Psi)$ is a morphism of $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-modules $u\colon \mathcal{E} \to \mathcal{F}$ such that $\Psi \circ u = F^*(u) \circ \Phi$.

A "coherent (of finite presentation) left F-$\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module" is a left F-$\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module $(\mathcal{E},\Phi)$ such that $\mathcal{E}$ is a coherent (of finite presentation) $\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}}$-module.

Similarly, for $\star \in \{\emptyset, \mathrm{coh}, \mathrm{tdf}, \mathrm{perf}\}$, $* \in \{\mathrm{b}, -, +, \emptyset\}$, we define an F-complex of $D^*_\star({}^1\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}})$ (resp. $D({}^1\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}})$) is the data of a complex $\mathcal{E}$ of $D^*_\star({}^1\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}})$ together with an isomorphism of $D^*_\star({}^1\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}})$ of the form $\Phi\colon \mathcal{E} \xrightarrow{\sim} F^*\mathcal{E}$. A morphism $u\colon (\mathcal{E},\Phi) \to (\mathcal{F},\Psi)$ of F-complexes of $D^*_\star({}^1\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}})$ is a morphism $u\colon \mathcal{E} \to \mathcal{F}$ of $D({}^1\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}})$ such that $\Psi \circ u = F^*(u) \circ \Phi$. We denote by F-$D^*_\star({}^1\widetilde{\mathcal{D}}^\dagger_{\mathfrak{X}/\mathfrak{S}})$ the corresponding category of F-complexes.

Definition 8.8.3.3 (Tate twist)**.** Let $(\mathcal{E}, \Phi)$ be an F-$\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module (resp. complex). For any integer d, we define an F-$\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module (resp. complex) $(\mathcal{E}, \Phi)(d) := (\mathcal{E}, \Phi(d))$ as follows: the underlying $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-module (resp. complex) is the same as $\mathcal{E}$ and $\Phi(d) := q^{-d}\Phi$, where $q = p^s$ (beware s is hidden in the notation "F"). The object $(\mathcal{E}, \Phi)(d)$ is called the Tate twist of $(\mathcal{E}, \Phi)$.

Theorem 8.8.3.4. *There exists a canonical equivalence between the category of left F-$\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module of finite presentation and the category of couples $(\mathcal{E}^{(m)}, \Phi^{(m+s)})$, where $\mathcal{E}^{(m)}$ is left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$-module of finite presentation, and*

$$\Phi^{(m+s)} \colon \widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}} \mathcal{E}^{(m)} \xrightarrow{\sim} F^*((\mathcal{E}^{(m)})^{\sigma})$$

is a $\widetilde{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}$-linear isomorphism.

Proof. We have the functor $(\mathcal{E}^{(m)}, \Phi^{(m+s)}) \mapsto (\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}} \mathcal{E}^{(m)}, \Phi)$, where Φ is induced from $\Phi^{(m+s)}$ thanks to the commutation isomorphism 8.8.2.5.1. For the details, see [Ber00, 4.5.4]. □

Corollary 8.8.3.5. *Suppose $\mathfrak{X}$ is quasi-compact, the transition maps $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}} \to \widetilde{\mathcal{D}}^{(m+1)}_{\mathfrak{X}/\mathfrak{S}}$ are flat, the algebras $\mathcal{B}_{\mathfrak{X}}/\mathfrak{m}^{i+1}\mathcal{B}_{\mathfrak{X}}$ are quasi-coherent with noetherian sections on affine opens. The category of coherent left F-$\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}$-module is a noetherian.*

Proof. See [Ber00, 4.5.5]. □

Chapter 9

Cohomological operations for coherent $\mathcal{D}^\dagger$-modules or quasi-coherent inductive systems of arithmetic $\mathcal{D}$-modules

9.1 Localization functor outside a divisor

Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is p-torsion free, noetherian of finite Krull dimension. For any integer $i \geq 0$, set $X_i^\sharp := \mathfrak{X}^\sharp \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$. We suppose X_0 is regular.

Let $\lambda_0 \leq \mu_0$ be two maps of $L(\mathbb{N})$. Let $D \subset Z$ be two divisors of X_0. For any $m \in \mathbb{N}$, for any $i \in \mathbb{N}$, we set $\widetilde{\mathcal{B}}^{(m)}_{X_i}(D) := \mathcal{B}^{(\lambda_0(m))}_{X_i}(D)$, $\widetilde{\mathcal{B}}^{(m)}_{X_i}(Z) := \mathcal{B}^{(\mu_0(m))}_{X_i}(Z)$ and $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D) := \widetilde{\mathcal{B}}^{(m)}_{X_i}(D) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S^\sharp}(Z) := \widetilde{\mathcal{B}}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$. For any $m \in \mathbb{N}$, we set $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}}(D)$, $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z) := \mathcal{B}^{(\mu_0(m))}_{\mathfrak{X}}(Z)$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. When $\lambda_0 = \mathrm{id}$ or $\mu_0 = \mathrm{id}$, we write $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$ and $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ or $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$ and $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$.

Following 8.7.4.2 the sheaves $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ satisfy 7.3.2 ; similarly with D replaced by Z. Via the canonical homomorphisms of sheaves of rings $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \to \widetilde{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ (resp. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \to \widetilde{\mathcal{B}}^{(m+1)}_{\mathfrak{X}}(D)$) we get a sheaf of rings denoted by $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ (resp. $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)$) on $\mathfrak{X}^{(\mathbb{N})}$; similarly with D replaced by Z. We get also the sheaf of rings $\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(D)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet^\sharp/S_\bullet^\sharp}(D)$ on $X_\bullet^{(\mathbb{N})}$; similarly with D replaced by Z. When D is empty, $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)$ (resp. $\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(D)$) is denoted by $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$ (resp. $\mathcal{O}^{(\bullet)}_{X_\bullet}$, i.e. $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$ is the subring of $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ whose transition morphisms are the identity of $\mathcal{O}_{\mathfrak{X}}$. We have the canonical ring homomorphisms $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$.

Following 8.7.4.2, $(\mathfrak{X}^\sharp, \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z))/\mathfrak{S}^\sharp$ is strongly quasi-flat (see definition 8.5.5.3). Hence, we can apply 8.5.4.5 and 8.5.4.15 in this context where $\mathcal{D}^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ or $\mathcal{D}^{(\bullet)} = \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$ (see 8.5.5.4).

9.1.1 Internal tensor products, localization functor outside a divisor

9.1.1.1. It follows from 8.7.4.7, we have the following tor finiteness results.

(a) The $\mathcal{O}^{(\bullet)}_{X_\bullet}$-module $\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(T)$ has tor-dimension ≤ 1. The $\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(D)$-module $\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(T)$ has tor-dimension ≤ 2.

(b) The (left or right) $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet^\sharp/S_\bullet^\sharp}(D)$-module $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet^\sharp/S_\bullet^\sharp}(Z)$ has tor-dimension $\leq d+2$.

(c) Let $\nu \in L(\mathbb{N})$. Denoting the constant sheaf $\underrightarrow{l}_{\mathfrak{X}^{(\mathbb{N})},\mathbb{N}*}(\widetilde{\mathcal{D}}^{(\nu(0))}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$ on $X^{(\mathbb{N})}_{\mathbb{N}}$ simply by $\widetilde{\mathcal{D}}^{(\nu(0))}_{X^\sharp_\bullet/S^\sharp_\bullet}(D)$, the (left or right) $\widetilde{\mathcal{D}}^{(\nu(0))}_{X^\sharp_\bullet/S^\sharp_\bullet}(D)$-module $\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$ has tor-dimension $\leq d+2$. Moreover, the (left or right) $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D)$-module $\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$ has tor-dimension $\leq d+2$.

(d) The $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$-module $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)$ has tor-dimension ≤ 1. The $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)$-module $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)$ has tor-dimension ≤ 2.

(e) The (left or right) $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ has tor-dimension $\leq d+2$.

(f) Let $\nu \in L(\mathbb{N})$. Denoting the constant sheaf $\underrightarrow{l}_{X,\mathbb{N}*}(\widetilde{\mathcal{D}}^{(\nu(0))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$ on $\mathcal{X}^{(\mathbb{N})}$ simply by $\widetilde{\mathcal{D}}^{(\nu(0))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$, the (left or right) $\widetilde{\mathcal{D}}^{(\nu(0))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module $\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ has tor-dimension $\leq d+2$. Moreover, the (left or right) $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module $\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ has tor-dimension $\leq d+2$.

9.1.1.2. We have the morphism of ringed topoi

$$\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}} = (\underleftarrow{l}^{-1}_{\mathfrak{X}^{(\mathbb{N})}} \dashv \underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}) \colon (X^{(\mathbb{N})}_\bullet, \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to (\mathfrak{X}^{(\mathbb{N})}, \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)). \tag{9.1.1.2.1}$$

We keep notation 8.5.4.18, e.g. for any $\mathcal{E}^{(\bullet)} \in D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ and $\mathcal{M}^{(\bullet)} \in D^-({}^{r}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, we set:

$$\mathcal{M}^{(\bullet)}_\bullet := \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{M}^{(\bullet)}) = \mathcal{M}^{(\bullet)} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z), \qquad \mathcal{E}^{(\bullet)}_\bullet := \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)}) = \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \mathcal{E}^{(\bullet)},$$

9.1.1.3. Let $* = r$ or $* = l$. Following respectively 8.5.4.19.1 and 8.5.4.20 (see also the last example of 7.3.2.1), we have the following tensor product bifunctors

$$- \otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_\bullet}(Z)} - \colon \underrightarrow{LD}^-_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \times \underrightarrow{LD}^-_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to \underrightarrow{LD}^-_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)), \tag{9.1.1.3.1}$$

$$- \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} - \colon \underrightarrow{LD}^-_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \times \underrightarrow{LD}^-_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^-_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)). \tag{9.1.1.3.2}$$

Notation 9.1.1.4 (Quasi-coherence and partial forgetful functor of the divisor)**.** Let $\star \in \{-, \mathrm{b}\}$.

(a) The *partial forgetful functors of the divisor* $D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$ and $D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to D^\star_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$ (thanks to the example 8.5.1.1.b, this is a special case of 8.5.2.3.1) will be denoted by $\mathrm{forg}_{D,Z}$.

(b) Following 8.5.4.16.1, the forgetful functors $\mathrm{forg}_{D,Z}$ induces

$$\mathrm{forg}_{D,Z} \colon \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D)), \qquad \mathrm{forg}_{D,Z} \colon \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)). \tag{9.1.1.4.1}$$

(c) We still denote by $\mathrm{forg}_{D,Z} \colon D^\star(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D^\star(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}})$ the partial forgetful functor of the divisor.

9.1.1.5. Let $\star \in \{-, \mathrm{b}\}$.

(a) It follows from 4.3.4.6.1 (and from 9.1.1.1.a-b in the case where $\star = \mathrm{b}$) that for any $\mathcal{E}^{(\bullet)}_\bullet \in D^\star({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$, the morphism of $D^\star({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$:

$$\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(D)} \mathcal{E}^{(\bullet)}_\bullet \to \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D)} \mathcal{E}^{(\bullet)}_\bullet =: ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}_\bullet) \tag{9.1.1.5.1}$$

is an isomorphism.

(b) For any $\mathcal{E}^{(\bullet)} \in D^{\star}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, it follows from 8.5.4.21.3 (and from 9.1.1.1.d-e) that the morphism of $D^{\star}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$:

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\mathcal{E}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)}\mathcal{E}^{(\bullet)} =: ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}) \tag{9.1.1.5.2}$$

is an isomorphism.

(c) Following 8.5.4.16.4, we get from 9.1.1.5.2 the localization outside Z functor:

$$({}^\dagger Z,\, D) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)} -\colon \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)) \to \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)). \tag{9.1.1.5.3}$$

We also write $\mathcal{E}^{(\bullet)}({}^\dagger D,\, Z) := ({}^\dagger Z,\, D)(\mathcal{E}^{(\bullet)})$. This functor $({}^\dagger Z,\, D)$ is *the localization outside Z functor*. When $D = \emptyset$, we omit writing it.

9.1.1.6. Following 7.5.1.13, the $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$-module $\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$, where $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z) \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ for any $m \in \mathbb{N}$ with the canonical transition maps, is endowed with a canonical structure of right $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$-module. Moreover, $\widetilde{\omega}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ satisfies the conditions of 7.3.2 for any $m \in \mathbb{N}$, i.e. $\widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) := \widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ is quasi-coherent in the sense of 8.5.1.7.

9.1.1.7. Let $\star \in \{-, \mathrm{b}\}$. We have a right version of 9.1.1.5.

(a) It follows from 4.3.4.8.3 (and from 9.1.1.1.a-b in the case where $\star = \mathrm{b}$) that for any $\mathcal{M}^{(\bullet)}_\bullet \in D^{\star}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$, the morphism of $D^{\star}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$:

$$\mathcal{M}^{(\bullet)}_\bullet \otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(D)} \widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z) \to \mathcal{M}^{(\bullet)}_\bullet \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D)} \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) =: ({}^\dagger Z, D)(\mathcal{M}^{(\bullet)}_\bullet) \tag{9.1.1.7.1}$$

is an isomorphism. For any $\mathcal{E}^{(\bullet)}_\bullet \in D^{\star}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$, with notation 9.1.1.6, it follows from 9.1.1.5.1 and 9.1.1.7.1 that we have the canonical isomorphism

$$({}^\dagger Z, D)(\widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D) \otimes_{\mathcal{O}_{X_\bullet}} \mathcal{E}^{(\bullet)}_\bullet) \xrightarrow{\sim} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes_{\mathcal{O}_{X_\bullet}} ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}_\bullet). \tag{9.1.1.7.2}$$

(b) For any $\mathcal{M}^{(\bullet)} \in D^{\star}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, it follows from 8.5.4.21.3 (and from 9.1.1.1.d-e) that the morphism of $D^{\star}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$:

$$\mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \to \mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) =: ({}^\dagger Z, D)(\mathcal{M}^{(\bullet)}) \tag{9.1.1.7.3}$$

is an isomorphism. For any $\mathcal{E}^{(\bullet)} \in D^{\star}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, it follows from 9.1.1.5.2 and 9.1.1.7.3 that we have the canonical isomorphism

$$({}^\dagger Z, D)(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) \otimes_{\mathcal{O}_{\mathfrak{X}}} ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}). \tag{9.1.1.7.4}$$

(c) Following 8.5.4.16.4, we get from 9.1.1.7.3 the localization outside Z functor:

$$({}^\dagger Z,\, D) := -\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)\colon \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)) \to \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)). \tag{9.1.1.7.5}$$

We also write $\mathcal{M}^{(\bullet)}({}^\dagger D,\, Z) := ({}^\dagger Z,\, D)(\mathcal{M}^{(\bullet)})$. This functor $({}^\dagger Z,\, D)$ is *the localization outside Z functor*. When $D = \emptyset$, we omit writing it.

9.1.1.8. For any $\mathcal{E}^{(\bullet)}_\bullet \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$ and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, it follows from 8.5.4.5 that we have the functorial isomorphisms

$$({}^\dagger Z, D) \circ \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}(\mathcal{E}^{(\bullet)}_\bullet) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*} \circ ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}_\bullet), \qquad ({}^\dagger Z, D) \circ \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}} \circ ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}). \tag{9.1.1.8.1}$$

For any $\mathcal{E}^{(\bullet)}_{\bullet} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z))$ and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$, it follows from 8.5.4.5 that we have the functorial isomorphisms

$$\mathrm{forg}_{D,Z} \circ \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}(\mathcal{E}^{(\bullet)}_{\bullet}) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*} \circ \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}_{\bullet}), \qquad \mathrm{forg}_{D,Z} \circ \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}} \circ \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}). \tag{9.1.1.8.2}$$

Remark 9.1.1.9. Let $\star \in \{-, \mathrm{b}\}$. Let $\mathfrak{X}^{\sharp} \to \mathfrak{X}'^{\sharp}$ be a morphism of log formal schemes which are log smooth over $\mathfrak{S}^{\sharp}$ whose underlying morphism of formal schemes is the identity. We keep similar to 9.1 notation replacing $\mathfrak{X}$ by $\mathfrak{X}'$. Since a flat $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(D)$-module or a flat $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(D)$-module is also a flat $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)$-module, then it follows that the functor $({}^{\dagger}Z, D)$ of 9.1.1.5.1 that we get the commutative (up to canonical isomorphism) square:

$$\begin{array}{ccc}
D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(D)) & \xrightarrow[9.1.1.5.1]{({}^{\dagger}Z,D)} & D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)) \\
\downarrow & & \downarrow \\
D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(D)) & \xrightarrow[9.1.1.5.1]{({}^{\dagger}Z,D)} & D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z))
\end{array}$$

where the vertical maps are the forgetful functors. Since the functors $\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}$ and $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}$ commute with the forgetful functors (induced by the homomorphisms of the form $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z)$), then we get the commutative (up to canonical isomorphism) square:

$$\begin{array}{ccc}
D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(D)) & \xrightarrow[9.1.1.5.2]{({}^{\dagger}Z,D)} & D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z)) \\
\downarrow & & \downarrow \\
D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(D)) & \xrightarrow[9.1.1.5.2]{({}^{\dagger}Z,D)} & D^{\star}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))
\end{array}$$

where the vertical maps are the forgetful functors.

9.1.1.10. If follows from 8.7.3.8.2 that the canonical morphism $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z_{\mathrm{red}}) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$ is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z_{\mathrm{red}}))$ and that the canonical morphism $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z_{\mathrm{red}}) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)$ is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z_{\mathrm{red}}))$. This yields that the canonical morphism $\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z_{\mathrm{red}}) \to \widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z)$ is an isomorphism of $\underrightarrow{LM}(\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z_{\mathrm{red}}))$, and that canonical morphism $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z_{\mathrm{red}}) \to \widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)$ is an isomorphism of $\underrightarrow{LM}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z_{\mathrm{red}}))$, Hence, the functors $({}^{\dagger}Z, D)$ and $({}^{\dagger}Z_{\mathrm{red}}, D_{\mathrm{red}})$ are canonically isomorphic.

9.1.1.11 (Preservation of the coherence and perfection)**.** Let $\star \in \{-, \mathrm{b}\}$ and $? \in \{\mathrm{coh}, \mathrm{perf}\}$. The functors $({}^{\dagger}Z,\, D)$ of 9.1.1.5.3 and 9.1.1.7.5 preserve coherence and perfectness, i.e. they induce the functors

$$({}^{\dagger}Z,\, D)\colon \underrightarrow{LD}^{\star}_{\mathbb{Q},?}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(D)) \to \underrightarrow{LD}^{\star}_{\mathbb{Q},?}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)). \tag{9.1.1.11.1}$$

9.1.1.12 (Coherent complexes)**.** Let $\sharp \in \{-, \mathrm{b}\}$. We write in the same way the associated functor for coherent complexes:

$$({}^{\dagger}Z, D) := \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}} \otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}}} -\colon D^{\sharp}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}}) \to D^{\sharp}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}). \tag{9.1.1.12.1}$$

The functor 9.1.1.12.1 is exact, which justifies the absence of the symbol $\mathbb{L}$. Following 8.4.1.9.c, we have the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T)) \to D^{\sharp}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$ in the case where $T = D$ or $T = Z$. The functors 9.1.1.5.3 and 9.1.1.12.1 are compatible with these functors $\underrightarrow{l}^{*}_{\mathbb{Q}}$ i.e. for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(D))$ we have the canonical isomorphism of $D^{\sharp}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$

$$({}^{\dagger}Z, D) \circ \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \underrightarrow{l}^{*}_{\mathbb{Q}} \circ ({}^{\dagger}Z, D)(\mathcal{E}^{(\bullet)}). \tag{9.1.1.12.2}$$

Hence, both notation of $({}^{\dagger}Z, D)$ are compatible.

9.1.1.13. Let $D' \subset D$ be a third divisor of X and let $\lambda'_0 \leq \lambda_0$ be a third map of $L(\mathbb{N})$. Let $\sharp \in \{-, \mathrm{b}\}$. For any $m \in \mathbb{N}$, we set $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D') := \mathcal{B}^{(\lambda'_0(m))}_{\mathfrak{X}}(D)$, and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D') := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D')\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. We get similarly to 9.1.1.5 the functors $({}^\dagger Z, D')$ and $({}^\dagger D, D')$. It follows from 8.5.2.12.1 (resp. 8.5.2.12.2) that we have the isomorphism

$$({}^\dagger Z, D) \circ ({}^\dagger D, D') \xrightarrow{\sim} ({}^\dagger Z, D') \tag{9.1.1.13.1}$$

of functors $D^\sharp({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D')) \to D^\sharp({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$ (resp. $D^\sharp_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D')) \to D^\sharp_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$).

Proposition 9.1.1.14. *Let $\nu \in L(\mathbb{N})$. Let $\star \in \{-, \mathrm{b}\}$. We have the functors:*

$$\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\nu(0))}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} -\colon D^\star(\widetilde{\mathcal{D}}^{(\nu(0))}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to D^\star(\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)), \tag{9.1.1.14.1}$$

$$\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\nu(0))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} -\colon D^\star(\widetilde{\mathcal{D}}^{(\nu(0))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to D^\star(\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)), \tag{9.1.1.14.2}$$

and similarly replacing $\widetilde{\mathcal{D}}^{(\nu(0))}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$ (resp. $\widetilde{\mathcal{D}}^{(\nu(0))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$) by $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$ (resp. $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$).

Proof. It follows from 9.1.1.1.(c) that these functors preserve the boundedness of the cohomology. □

Remark 9.1.1.15. Let $\star \in \{-, \mathrm{b}\}$. Let $\nu \in L(\mathbb{N})$ and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^\star_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$.

(a) Following 8.3.2.2.(bi) (and 9.1.1.1.(f)), we have the canonical isomorphism of $\underrightarrow{LD}^\star_{\mathbb{Q}}(\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$

$$\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \nu^*\mathcal{E}^{(\bullet)}. \tag{9.1.1.15.1}$$

(b) Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. By using $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) \xrightarrow{\sim} \nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$, we get the first of the canonical isomorphisms of $\underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$:

$$\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}(\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}\mathcal{E}^{(\bullet)})$$
$$\xrightarrow[8.5.3.14.1]{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}(\nu^*\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}\mathcal{E}^{(\bullet)}) \xrightarrow[8.5.3.9.2]{\sim} \nu^*\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \nu^*\mathcal{E}^{(\bullet)}.$$

With 9.1.1.15.1, this yields the canonical morphisms

$$\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \mathcal{E}^{(\bullet)} \to \nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)}\mathcal{E}^{(\bullet)} \to \nu^*\mathcal{E}^{(\bullet)}$$

are isomorphisms in $\underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Moreover, it follows from 8.3.1.3 that we have the equivalence of categories

$$\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} -\colon \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \cong \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \tag{9.1.1.15.2}$$

whose forgetful functor $\underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\nu^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^\star_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ is canonically a quasi-inverse equivalence.

Proposition 9.1.1.16. *Let $\sharp \in \{-, \mathrm{b}\}$.*

(a) The forgetful functor and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -$ induce quasi-inverse equivalences of categories between $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ and $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

(b) The forgetful functor and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -$ (or $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -$) induce quasi-inverse equivalences of categories between $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ and $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$, between $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$) and $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

(c) The forgetful functor and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -$ *are quasi-inverse equivalences of categories between* $\underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ *and* $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$*, between* $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ *and* $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$*.*

Proof. 1) We have the ring extensions $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \to \mu_0^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)$. Hence, $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)$ is an isomorphism in $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. By using the functor 8.5.4.9.1 (which preserves here the boundedness thanks to 9.1.1.1.(e)), this yields for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ the isomorphisms of $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$:

$$\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{E}^{(\bullet)}, \tag{9.1.1.16.1}$$

which implies the first assertion.

2) Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. We have the isomorphisms of $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$

$$\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{E}^{(\bullet)}. \tag{9.1.1.16.2}$$

This yields the second assertion with respect to the functor $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -$. Hence, with 9.1.1.16.1 and 9.1.1.16.2, the canonical morphism

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{E}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{E}^{(\bullet)} \tag{9.1.1.16.3}$$

is an isomorphism, which yields the quasi-coherent case of the second statement.

3) Let $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. Since $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \to \mu_0^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)$ is an isomorphism in $\underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$, this yields the isomorphisms of $\underrightarrow{LD}^\sharp_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$:

$$\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mu_0^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{F}^{(\bullet)}. \tag{9.1.1.16.4}$$

Since $\mu_0^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{coh}}(\mu_0^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ (use 8.5.4.17), then $\mu_0^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^\sharp_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ (use 8.4.1.5). Hence, with Proposition 8.5.4.17, we have checked the coherent case of the second statement.

4) We check the third one similarly. □

9.1.2 Preservation of bounded quasi-coherence by localization functor outside a divisor, internal tensor products

Proposition 9.1.2.1. *Let $D' \subset D$ be a third divisors of X. Let $m' \geq m \geq 0$ be two integers. The canonical homomorphisms of* $D^-(\widetilde{\mathcal{B}}^{(m')}_{\mathfrak{X}}(Z))$

$$\mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(m)}_{\mathfrak{X}}(D')} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(Z), \tag{9.1.2.1.1}$$

$$\mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}_{\mathcal{B}^{(m)}_{\mathfrak{X}}(D')} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \tag{9.1.2.1.2}$$

are p^3-isogenies (see definition 7.4.2.1.(c)).

Proof. 1) Following the lemma 8.7.4.4.a, the kernel of the canonical epimorphism $a\colon \mathcal{B}^{(m)}_{\mathfrak{X}}(D') \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(Z)$ is a quasi-coherent $\mathcal{O}_X$-module. Hence, it follows from 7.4.2.6.b that a is a p-isogeny. Moreover, following lemma 8.7.4.4.b, the canonical morphism $\mathcal{B}^{(m)}_{\mathfrak{X}}(D') \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m)}_{\mathfrak{X}}(D') \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z)$ is an isomorphism. Hence, we get by composition the p-isogeny $\alpha\colon \mathcal{B}^{(m)}_{\mathfrak{X}}(D') \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(Z)$.

2) Since the functor $\mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(m)}_{\mathfrak{X}}(D')} -$ sends a p-isogeny to a p-isogeny, then we get the p-isogeny

$$\beta\colon \mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \xrightarrow{\sim} \mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(m)}_{\mathfrak{X}}(D')} (\mathcal{B}^{(m)}_{\mathfrak{X}}(D') \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z)) \to \mathcal{B}^{(m)}_{\mathfrak{X}}(D) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(m)}_{\mathfrak{X}}(D')} \mathcal{B}^{(m')}_{\mathfrak{X}}(Z).$$

Let $\gamma \colon \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(m)}_{\mathfrak{X}}(D')}\mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(Z)$ be the canonical morphism (the last one of 9.1.2.1.1). Following the part 1) of the proof (replace D' by D), the composition $\gamma\circ\beta \colon \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m')}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(m')}_{\mathfrak{X}}(Z)$ is a p-isogeny. Since so is β, then γ is a p^3-isogeny (see **??.??**). Since the composition of the following two canonical morphisms of 9.1.2.1.1 is the identity, by using **??.??**, this yields that the first morphism is also a p^3-isogeny.

3) Likewise (we remove the symbols $\mathbb{L}$) we can check that the canonical morphisms of 9.1.2.1.2 are p^3-isogenies.

□

Corollary 9.1.2.2. *The canonical morphisms of $D^{\mathrm{b}}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$*

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \tag{9.1.2.2.1}$$

are lim-ind-isogenies.

Proof. This is a consequence of 9.1.2.1. □

Proposition 9.1.2.3. *Let $\sharp \in \{-, \mathrm{b}\}$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ (resp. $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$).*

(a) The functorial in $\mathcal{E}^{(\bullet)}$ canonical morphism:

$$({}^\dagger Z,\, D)\circ \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)} \tag{9.1.2.3.1}$$

is an isomorphism of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ (resp. $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$).

(b) The functorial in $\mathcal{E}^{(\bullet)}$ canonical morphism:

$$\mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}) \to \mathrm{forg}_{D,Z}\circ({}^\dagger Z, D)\circ \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}) \tag{9.1.2.3.2}$$

is an isomorphism of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$ (resp. $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$).

(c) The functor $\mathrm{forg}_{D,Z}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$ (resp. $\mathrm{forg}_{D,Z}\colon \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$) is fully faithful.

Proof. 1) Since the functors $({}^\dagger Z,\, D)$ and $\mathrm{forg}_{D,Z}$ commute with $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}$ and $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}$ (see 9.1.1.8.1 and 9.1.1.8.2), then via the equivalence of categories of Theorem 8.5.1.10 we reduce to check the non-respective case.

2) Let us check the non-respective case. With the notations 9.1.1.5.2, we have canonical isomorphisms of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$:

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \left(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\right)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)} \underset{9.1.2.2}{\xrightarrow{\sim}} \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)} \xleftarrow{\sim} \mathcal{E}^{(\bullet)}.$$

This composition is the canonical morphism $({}^\dagger Z,\, D)\circ \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ which is therefore an isomorphism. This yields the canonical isomorphism $\mathrm{forg}_{D,Z}\circ({}^\dagger Z, D)\circ \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)})$ of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. Since the composition $\mathrm{forg}_{T,D}(\mathcal{E}^{(\bullet)}) \to \mathrm{forg}_{D,Z}\circ({}^\dagger Z, D)\circ \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)})$ is the identity, this implies that the canonical morphism 9.1.2.3.2 is an isomorphism. The fully faithfulness of $\mathrm{forg}_{D,Z}$ is a consequence of both previous assertions. □

Corollary 9.1.2.4. *Let $D' \subset D$ be a third divisor of X and let $\lambda'_0 \le \lambda_0$ be a third map of $L(\mathbb{N})$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$ (resp. $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D))$). With notation 9.1.1.13, we get the functorial in $\mathcal{E}^{(\bullet)}$ canonical morphism*

$$({}^\dagger Z,\, D')\circ \mathrm{forg}_{D',D}(\mathcal{E}^{(\bullet)}) \to ({}^\dagger Z,\ D)(\mathcal{E}^{(\bullet)}) \tag{9.1.2.4.1}$$

is an isomorphism of $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ (resp. $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$).

Proof. Following 9.1.2.3.1, we benefit from the canonical isomorphism $({}^\dagger D,\ D')\circ \mathrm{forg}_{D',D}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$. By applying the functor $({}^\dagger Z,\ D)$ to this latter isomorphism, the isomorphism $({}^\dagger Z,\ D') \xrightarrow{\sim} ({}^\dagger Z,\ D)\circ ({}^\dagger D,\ D')$ of 9.1.1.13.1 allows us then to conclude. □

Notation 9.1.2.5. Let $D' \subset D \subset Z$ be some divisors of X. Following 9.1.2.4, by forgetting to write some forgetful functors, the functors $({}^\dagger Z,\ D')$ and $({}^\dagger Z,\ D)$ are canonically isomorphic over categories of the form $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}$. Hence, we can simply write $({}^\dagger Z)$ in both case.

Proposition 9.1.2.6. *Suppose the log structure of $\mathfrak{S}^\sharp$ is trivial and that S is regular. Suppose $\mathfrak{X}/\mathfrak{S}$ is smooth and that $M_{\mathfrak{X}^\sharp}$ is the log structure given by a strict normal crossing divisor of $\mathfrak{X}/\mathfrak{S}$.*

(a) We have the equalities $D^{\mathrm{b}}_{\mathrm{qc}}(\widehat{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) = D_{\mathrm{qc,tdf}}(\widehat{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, $D^{\mathrm{b}}_{\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}) = D_{\mathrm{qc,tdf}}(\widehat{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, $D^{\mathrm{b}}_{\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) = D_{\mathrm{qc,tdf}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

(b) With notation 8.5.4.11, we have $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc,tdf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc,tdf}}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z))$ and similarly for $\mathfrak{X}$ and $\mathfrak{S}$ replaced respectively by $X_\bullet$ and $S_\bullet$.

(c) The bifunctors 9.1.1.3.2 and 9.1.1.3.1 factor respectively through the bifunctors

$$-\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_\bullet}(Z)} -\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)), \tag{9.1.2.6.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} -\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)). \tag{9.1.2.6.2}$$

Proof. a) i) Let us check $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_{X^\sharp/S}) = D^{\mathrm{b}}_{\mathrm{qc,tdf}}(\mathcal{D}^{(m)}_{X^\sharp/S})$. Since this is local, we can suppose X affine. With the theorems of type A for the quasi-coherent sheaves (see 4.6.1.7.c), we reduce then to check $D^{\mathrm{b}}(D^{(m)}_{X^\sharp/S}) = D^{\mathrm{b}}_{\mathrm{tdf}}(D^{(m)}_{X^\sharp/S})$. This last equality is a consequence of the fact that $D^{(m)}_{X^\sharp/S}$ is a ring of global dimension $\leq N$ for some integer N independent from m (see 6.1.4.2 and [Sta22, 066P]).

ii) By using Theorem 8.5.1.10, proposition 7.3.1.13 and the paragraph 8.5.1.9, since $D^{(m)}_{X^\sharp/S}$ is a ring of finite global dimension

b) The inclusion is a consequence of the flatness of $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$. Let us now prove the equality. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}}(Z))$. It follows from 9.1.2.3.1 (in the case where D empty), that we have the isomorphism $({}^\dagger Z)\circ \mathrm{forg}_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}}(Z))$. It follows from a) that $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) = \underrightarrow{LD}_{\mathbb{Q},\mathrm{qc,tdf}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$. Hence, we get $\mathrm{forg}_Z(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc,tdf}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}})$. Since the functor $({}^\dagger Z)$ preserves the LD-tor amplitude, we conclude the proof.

c) Similarly to 8.5.4.14, we get c) from the b). □

Corollary 9.1.2.7. *Let $\sharp \in \{-, \mathrm{b}\}$. When $\sharp = \mathrm{b}$, we suppose we are in the context of Proposition 9.1.2.6. Let $\mathcal{M}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$. We have the canonical isomorphism in $\underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ of the form*

$$({}^\dagger Z,\, D)(\mathcal{M}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}({}^\dagger Z,\, D)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z,\, D)\left(\mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\mathcal{E}^{(\bullet)}\right). \tag{9.1.2.7.1}$$

Proof. Following notation 9.1.1.2, we set $\mathcal{E}^{(\bullet)}_\bullet = \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)})$ and $\mathcal{M}^{(\bullet)}_\bullet = \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{M}^{(\bullet)})$. By using 9.1.1.5.1, we get the isomorphism:

$$({}^\dagger Z,\, D)(\mathcal{M}^{(\bullet)}_\bullet)\otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)}({}^\dagger Z,\, D)(\mathcal{E}^{(\bullet)}_\bullet) \xrightarrow{\sim} ({}^\dagger Z,\, D)\left(\mathcal{M}^{(\bullet)}_\bullet\otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(D)}\mathcal{E}^{(\bullet)}_\bullet\right). \tag{9.1.2.7.2}$$

Hence, with the commutativity isomorphisms 9.1.1.8.1 and using the commutativity of the diagram 8.5.4.20.3, we get 9.1.2.7.1 from 9.1.2.7.2. □

Corollary 9.1.2.8. *Let $\sharp \in \{-, \mathrm{b}\}$. When $\sharp = \mathrm{b}$, we suppose we are in the context of Proposition 9.1.2.6. Let $\mathcal{M}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$, and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\sharp}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$. We have the isomorphism*

$$\mathrm{forg}_{D,Z}(\mathcal{M}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathrm{forg}_{D,Z}\left(\mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}\right). \tag{9.1.2.8.1}$$

Proof. We construct the isomorphism 9.1.2.8.1 by composing the following isomorphisms:

$$\mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)} \overset{9.1.2.3.1}{\xrightarrow{\sim}} \mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\left(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}(\mathrm{forg}_{D,Z}(\mathcal{E}^{(\bullet)}))\right) \overset{8.5.4.21.4}{\xrightarrow{\sim}} \mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)}\mathcal{E}^{(\bullet)}.$$

□

9.1.3 Composition of localisation functors

Let Z' be a second divisor of X. Let $\mu'_0 \in L(\mathbb{N})$. For any $m \in \mathbb{N}$, for any $i \in \mathbb{N}$, we set $\widetilde{\mathcal{B}}^{(m)}_{X_i}(Z') := \mathcal{B}^{(\mu'_0(m))}_{X_i}(Z')$, and $\widetilde{\mathcal{D}}^{(m)}_{X_i^{\sharp}/S_i^{\sharp}}(Z') := \widetilde{\mathcal{B}}^{(m)}_{X_i}(Z')\otimes_{\mathcal{O}_{X_i}}\mathcal{D}^{(m)}_{X_i^{\sharp}/S_i^{\sharp}}$. For any $m \in \mathbb{N}$, we set $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z') := \mathcal{B}^{(\mu'_0(m))}_{\mathfrak{X}}(Z')$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z') := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z')\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$. When $Z \subset Z'$, we can suppose $\mu_0 \leq \mu'_0$ (see 9.1.1.16).

The following Lemma improves the part (a) and (b) of Lemma 8.7.4.4 by adding hypotheses on the divisors.

Lemma 9.1.3.1. *Suppose Z, Z' are two reduced divisors of X whose irreducible components are two by two distinct. Let $\mathfrak{U}''$ the open set of $\mathfrak{X}$ complementary to $Z \cup Z'$.*

(a) For any $i \in \mathbb{N}$, the canonical morphism $\mathcal{B}^{(m)}_{X_i}(Z) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{B}^{(m)}_{X_i}(Z') \to \mathcal{B}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{B}^{(m)}_{X_i}(Z')$ is an isomorphism.

(b) The canonical morphism $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m)}_{\mathfrak{X}}(Z') \to \mathcal{B}^{(m)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m)}_{\mathfrak{X}}(Z')$ is an isomorphism and the $\mathcal{O}_{\mathfrak{X}}$-algebra $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m)}_{\mathfrak{X}}(Z')$ is p-torsion free.

(c) The canonical morphism of $\mathcal{O}_{\mathfrak{X}}$-algebras $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(m)}_{\mathfrak{X}}(Z') \to j_*\mathcal{O}_{\mathfrak{U}''}$, where $j : \mathfrak{U}'' \hookrightarrow \mathfrak{X}$ is the inclusion, is a monomorphism.

(d) Let χ, $\lambda : \mathbb{N} \to \mathbb{N}$ defined respectively by setting for any integer $m \in \mathbb{N}$, $\chi(m) := p^{p-1}$ and $\lambda(m) := m+1$. We have two canonical ring monomorphisms $\alpha^{(\bullet)} : \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z') \to \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z \cup Z')$ and $\beta^{(\bullet)} : \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z \cup Z') \to \chi^*\lambda^*(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z'))$ such that $\chi^*\lambda^*(\alpha^{(\bullet)}) \circ \beta^{(\bullet)} = \sigma_{\mathcal{F},(\lambda,\chi)}$ and $\beta^{(\bullet)} \circ \alpha^{(\bullet)} = \sigma_{\mathcal{E},(\lambda,\chi)}$ (see notation 8.1.4.1.1).

Proof. 0) Since the assertions a), b) and c) are local on $\mathfrak{X}$, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ affine, integral and there exist $f_1, \ldots, f_r \in \mathcal{O}_{\mathfrak{X}}$ (resp. $f'_1, \ldots, f'_{r'} \in \mathcal{O}_{\mathfrak{X}}$) lifting a local equation of the irreducible components of $Z \subset X$ (resp $Z' \subset X$). Denote by $f := \prod_{s=1}^{r} f_s$ and $f' := \prod_{s=1}^{r'} f'_s$. We have therefore the isomorphisms $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}\{T\}/(f^{p^{m+1}}T - p)$ and $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z') \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}\{T'\}/((f')^{p^{m+1}}T' - p)$, where we took care to distinguish the variables T and T'.

a) We have to prove that for any $j \leq -1$, $\mathcal{H}^j(\mathcal{B}^{(m)}_{X_i}(Z) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{B}^{(m)}_{X_i}(Z')) = 0$.

Since $\mathfrak{X}$ is p-torsion free, we have the short exact sequence $0 \to \mathcal{O}_{\mathfrak{X}}\{T\} \underset{f^{p^{m+1}}T-p}{\longrightarrow} \mathcal{O}_{\mathfrak{X}}\{T\} \to \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \to 0$. Since $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$ is p-torsion free (see 8.7.4.1), this yields the short exact sequence $0 \to \mathcal{O}_{X_i}[T] \underset{\overline{f}^{p^{m+1}}T-p}{\longrightarrow} \mathcal{O}_{X_i}[T] \to \mathcal{B}^{(m)}_{X_i}(Z) \to 0$ where $\overline{f}$ is the reduction of f modulo π^{i+1}. Since this exact sequence gives a canonical resolution of $\mathcal{B}^{(m)}_{X_i}(Z)$ by some flat $\mathcal{O}_{X_i}$-modules, by applying the functor $- \otimes_{\mathcal{O}_{X_i}} \mathcal{B}^{(m)}_{X_i}(Z')$ to this exact sequence, we see that it is a question of proving that the image de $\overline{f}$ in $B^{(m)}_{X_i}(Z')$ is nonzero and is nonzero divisor. Since $\widehat{B}^{(m)}_{\mathfrak{X}}(Z')$ is p-torsion free (see 8.7.4.1), we reduce to the case $i = 0$. Set $\overline{A} = \Gamma(X, \mathcal{O}_X)$. In that case, we get $\mathcal{B}^{(m)}_X(Z') \xrightarrow{\sim} \mathcal{O}_X[T']/(\overline{f'}^{p^{m+1}}T')$ where $\overline{f'}$ is the reduction of f' modulo π, i.e. is the image of f' on $\overline{A}$. Let $P(T'), Q(T') \in \overline{A}[T']$ satisfying the equality $\overline{f} \cdot P(T') = (\overline{f'}^{p^{m+1}} T') \cdot Q(T')$ in $\overline{A}[T']$. We have to check that $\overline{f'}^{p^{m+1}} T'$ divides $P(T')$. Since $\overline{A}/\overline{f'_s}\,\overline{A}$ is integral for any $s = 1, \ldots, r'$ (because Z' is reduced), since the image of $\overline{f}$ on $\overline{A}/\overline{f'_s}\,\overline{A}$ is not null (because the irreducible components of Z and Z' are two by two distinct), since $\overline{A}$ is integral, then from an equality of the form $\overline{f}\overline{a} = \overline{f'}^{p^{m+1}} \overline{a'}$ in $\overline{A}$ with $a, a' \in A$, we get $\overline{f'}^{p^{m+1}}$ divides $\overline{a}$. Hence we are done.

b) By applying the functor $\mathbb{R}\varprojlim_i$ to the canonical isomorphisms of (a), via Mittag-Leffler, we get the desired isomorphism of (b) (or we can invoke 8.7.4.4.b). Moreover, following 8.7.4.2, $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m)}_{\mathfrak{X}}(Z') \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ and $k \otimes^{\mathbb{L}}_{\mathcal{V}} \left(\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m)}_{\mathfrak{X}}(Z') \right) \xrightarrow{\sim} \mathcal{B}^{(m)}_{X}(Z) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{B}^{(m)}_{X}(Z')$. This yields following a) and the isomorphism of b) that $\mathcal{H}^{-1}(k \otimes^{\mathbb{L}}_{\mathcal{V}} (\mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m)}_{\mathfrak{X}}(Z'))) \xrightarrow{\sim} 0$.

c) It is sufficient to copy the proof of 8.7.4.1.(b): denote $B^{(m)}_{\mathfrak{X}}(Z) := \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$ and $B^{(m)}_{\mathfrak{X}}(Z') := \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z')$. We get $\widehat{B} := \Gamma(\mathfrak{X}, \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m)}_{\mathfrak{X}}(Z')) \xrightarrow{\sim} B^{(m)}_{\mathfrak{X}}(Z) \widehat{\otimes}_A B^{(m)}_{\mathfrak{X}}(Z')$. Since $\widehat{B}$ is p-torsion free, then it is f-torsion free and we get therefore the monomorphism $\widehat{B} \hookrightarrow \widehat{B}_f$. Denote by $\mathfrak{U} = D(f)$ the open set of $\mathfrak{X}$ complementary to Z. Since $(B^{(m)}_{\mathfrak{X}}(Z)_f)^{\widehat{}} \xrightarrow{\sim} A_{\{f\}}$, then we get the first isomorphism: $(\widehat{B}_f)^{\widehat{}} \xrightarrow{\sim} A_{\{f\}} \widehat{\otimes}_A B^{(m)}_{\mathfrak{X}}(Z') \xrightarrow{\sim} A_{\{f\}}\{T'\}/((f')^{p^{m+1}} T' - p)$. Since f' modulo π is not a zero divisor of $A_{\{f\}}$, then following 8.7.4.1.b, the canonical morphism $A_{\{f\}}\{T'\}/((f')^{p^{m+1}} T' - p) \to A_{\{ff'\}} = \Gamma(\mathfrak{U}'', \mathcal{O}_{\mathfrak{X}})$ is injective. Hence, we reduce to check $\widehat{B}_f$ is p-adically separated. We still denote by T, the image of T in $\widehat{B}$. Since T is a divisor of p in $B^{(m)}_{\mathfrak{X}}(Z)$ and therefore in $\widehat{B}_f$, then we reduce to check that $\widehat{B}_f$ is T-adically separated. Let $b, x \in \widehat{B}_f$ such that $(1 - bT)x = 0$. With Krull theorem (see [Mat89, Theorem 8.9]), it is enough to prove $x = 0$. By multiplying by a power of f large enough if necessary, we can suppose $b, x \in \widehat{B}$ and there exists $s \in \mathbb{N}$ large enough such that $(f^s - bT)x = 0$ in $\widehat{B}$. However, since $B^{(m)}_{\mathfrak{X}}(Z)/TB^{(m)}_{\mathfrak{X}}(Z) \xrightarrow{\sim} A\{T\}/(f^{p^{m+1}} T - p, T) = A\{T\}/(p, T) \xrightarrow{\sim} A/pA$, then we get the first isomorphism: $\widehat{B}/T\widehat{B} \xrightarrow{\sim} A/pA \otimes_A A\{T'\}/((f')^{p^{m+1}} T' - p) \xrightarrow{\sim} (A/pA)[T']/(\overline{f'}^{p^{m+1}} T') \xrightarrow{\sim} B^{(m)}_{X}(Z')$. Hence, since the image of f^s in $B^{(m)}_{X}(Z')$ is nonzero and is not a zero divisor (see the step a) of the proof), then the equality $(f^s - bT)x = 0$ implies that $x \in T\widehat{B}$. Since $\widehat{B}$ is p-torsion free, then it is T-torsion free. Hence, by iterating the reasoning, we get $x \in \cap_{n \in \mathbb{N}} T^n \widehat{B}$. With Krull theorem (see [Mat89, Theorem 8.9]), this yields there exists $c \in \widehat{B}$ such that $(1 - cT)x = 0$.

The relation $(1 - cT)x = 0$ in $\widehat{B}$ induces in $\widehat{B}/p\widehat{B}$ the equality $(1 - \overline{c}T)\overline{x} = 0$. On the other hand, $\widehat{B}/p\widehat{B} \xrightarrow{\sim} B^{(m)}_{X}(Z) \otimes_A B^{(m)}_{X}(Z') \xrightarrow{\sim} B^{(m)}_{X}(Z')[T]/(\overline{f}^{p^{m+1}} T)$. We can choose some elements $\widetilde{c}(T)$, $\widetilde{X}(T)$ of $B^{(m)}_{X}(Z')[T]$ inducing modulo $\overline{f}^{p^{m+1}} T$ the elements $\overline{c}$, $\overline{x}$. Hence, there exists $Q(T) \in B^{(m)}_{X}(Z')[T]$ such that $(1 - \widetilde{c}(T)T)\widetilde{X}(T) = \overline{f}^{p^{m+1}} TQ(T)$ in $B^{(m)}_{X}(Z')[T]$. This yields there exists $R(T) \in B^{(m)}_{X}(Z')[T]$ such that $\widetilde{X}(T) = TR(T)$. Hence we get in $B^{(m)}_{X}(Z')[T]$ the equality $(1 - \widetilde{c}(T)T)R(T) = \overline{f}^{p^{m+1}} Q(T)$. This implies that $\overline{f}^{p^{m+1}}$ divides $R(T)$ and therefore $\overline{x} = 0$, i.e. $x \in p\widehat{B}$. Since $\widehat{B}$ is p-torsion free, repeating the process we get $x \in \cap_{n \in \mathbb{N}} p^n \widehat{B} = \{0\}$ and we are done.

d) Since $Z, Z' \subset Z \cup Z'$, then we get the canonical morphism $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z') \to \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z \cup Z')$ and $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z) \to \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z \cup Z')$. This yields by extension $\alpha^{(\bullet)}$. The fact that this is a monomorphism is a consequence of $d)$. This yields that the construction Moreover, since $\sigma_{\mathcal{F},(\lambda,\chi)}$ is also a monomorphism (use 8.7.4.1), then the existence of such morphism $\beta^{(\bullet)}$ is local on $\mathfrak{X}$. Hence, we reduce to local situation of 0) and we keep its notations. Let $\gamma^{(m)} \colon \mathcal{O}_{\mathfrak{X}}[T] \to (\mathcal{B}^{(m+1)}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m+1)}_{\mathfrak{X}}(Z'))_{\mathbb{Q}}$ be the morphism of $\mathcal{O}_{\mathfrak{X}}$-algebras defined by setting $\gamma^{(m)}(T) := \frac{1}{p}(\frac{p}{f^{p^{m+1}}} \widehat{\otimes} \frac{p}{(f')^{p^{m+1}}})$. Let $n \in \mathbb{N}$, $q \in \mathbb{N}$, $r \in \mathbb{N}$ such that $0 \leq r < p$ and $n = pq + r$. We compute $\gamma^{(m)}(T^n) = \frac{1}{p^r}(\frac{p}{f^{p^{m+1}}} \widehat{\otimes} \frac{p}{(f')^{p^{m+1}}})^r \left(p^{p-2}(\frac{p}{f^{p^{m+2}}} \widehat{\otimes} \frac{p}{(f')^{p^{m+2}}}) \right)^q$. Hence, we get the factorisation $p^{p-1}\gamma^{(m)} \colon \mathcal{O}_{\mathfrak{X}}\{T\} \to (\mathcal{B}^{(m+1)}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{B}^{(m+1)}_{\mathfrak{X}}(Z'))$ of $\mathcal{O}_{\mathfrak{X}}\{T\}$-modules. Since $\gamma^{(m)}((ff')^{p^{m+1}} T - p) = 0$, then $p^{p-1}\gamma^{(m)}$ induces the desired morphism $\beta^{(m)}$. □

Proposition 9.1.3.2. *For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, the canonical functorial in Z, Z', $\mathcal{E}^{(\bullet)}$ morphism $({}^\dagger Z') \circ ({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \to (Z' \cup Z)(\mathcal{E}^{(\bullet)})$ is an isomorphism.*

Proof. By using 9.1.1.10, we can suppose Z and Z' are reduced. Let Z_1, Z_2, Z'' be some divisors whose irreducible components are two by two distinct and such that $Z = Z_1 \cup Z''$ et $Z' = Z_2 \cup Z''$. It follows from 9.1.3.1 the isomorphisms $({}^\dagger Z') \circ ({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z_2) \circ ({}^\dagger Z'') \circ ({}^\dagger Z'') \circ ({}^\dagger Z_1)(\mathcal{E}^{(\bullet)})$. It follows from 9.1.2.3 that we get $({}^\dagger Z'') \circ ({}^\dagger Z'') \xrightarrow{\sim} ({}^\dagger Z'')$. Using again 9.1.3.1, since $Z \cup Z' = Z_1 \cup Z'' \cup Z_2$, then we are done. □

Let us five the following corollary of 9.1.3.2.

Lemma 9.1.3.3. *Let* $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. *The canonical morphism* $\mathcal{G}^{(\bullet)}({}^\dagger Z') \to \mathcal{G}^{(\bullet)}({}^\dagger Z \cup Z')$ *is an isomorphism of* $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

Proof. Following 9.1.2.4, by omitting to indicate the forgetful functor, we have the isomorphism $\mathcal{G}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}({}^\dagger Z)$. Moreover, by 9.1.3.2, $({}^\dagger Z') \circ ({}^\dagger Z) \xrightarrow{\sim} ({}^\dagger Z \cup Z')$. We deduce the desired isomorphism $\mathcal{G}^{(\bullet)}({}^\dagger Z') \xrightarrow{\sim} \mathcal{G}^{(\bullet)}({}^\dagger Z \cup Z')$. □

Proposition 9.1.3.4. *Let* $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z'))$. *The canonical morphism:*

$$\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)}({}^\dagger Z \cup Z') \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z\cup Z')} \mathcal{E}^{(\bullet)}({}^\dagger Z \cup Z') \tag{9.1.3.4.1}$$

is an isomorphism of $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

Proof. Following 9.1.1.5.2, the morphism $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z \cup Z') \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{G}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z \cup Z') \widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{G}^{(\bullet)}$ is an isomorphism. In the same way, for $\mathcal{E}^{(\bullet)}$. Via the associativity properties of the derived complete tensor product for quasi-coherent complexes, this yields the canonical isomorphism: $({}^\dagger Z \cup Z') \left(\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}\right) \xrightarrow{\sim} \mathcal{G}^{(\bullet)}({}^\dagger Z \cup Z') \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z\cup Z')} \mathcal{E}^{(\bullet)}({}^\dagger Z \cup Z')$. Since we have the canonical morphisms $({}^\dagger Z) \left(\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}\right) \xrightarrow{\sim} ({}^\dagger Z)(\mathcal{G}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}$ and $({}^\dagger Z') \left(\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}\right) \to \mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} ({}^\dagger Z')(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}$, then by 9.1.3.2 the canonical morphism $\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)} \to ({}^\dagger Z \cup Z') \left(\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}\right)$ is an isomorphism. □

9.1.4 The case of pseudo quasi-coherent modules

We keep notation 9.1.3.

Notation 9.1.4.1. Let $\mathcal{E}^{(\bullet)} \in M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. We define the divisor extension functor $({}^\dagger Z, D)^0 \colon M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) \to M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ by putting $({}^\dagger Z, D)^0(\mathcal{E}^{(\bullet)}) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)}$. As for 9.1.1.3.2, we verify that the functor $({}^\dagger Z, D)^0$ factorizes into

$$({}^\dagger Z, D)^0 \colon \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)). \tag{9.1.4.1.1}$$

The canonical forgetful functor $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ factorizes into the functor which we denote by

$$\mathrm{forg}_{D,Z} \colon \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)). \tag{9.1.4.1.2}$$

It seems false that the functor 9.1.4.1.2 is fully faithful without finiteness hypothesis. To get satisfying properties we need to work with pseudo-coherent modules whose notion is recalled just below.

Definition 9.1.4.2. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ and $\mathcal{E}^{(\bullet)}_{\bullet} \in \underrightarrow{LM}_{\mathbb{Q}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$.

1. We say that $\mathcal{E}^{(\bullet)}$ is *pseudo-quasi-coherent* (as an object of $\underrightarrow{LM}_{\mathbb{Q}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$) if it is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)})$ to a complex $\mathcal{F}^{(\bullet)} \in \mathrm{Mod}_{\mathrm{pqc}}(\mathcal{D}^{(\bullet)})$ (see notation 7.2.3.5).

   We denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{pqc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ consisting of quasi-coherent complexes.

2. We say that $\mathcal{E}^{(\bullet)}$ is *of local presentation* (as an object of $\underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$) if it is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$ to a complex $\mathcal{F}^{(\bullet)} \in \mathrm{Mod}_{\mathrm{lp}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$ (see notation 7.1.3.9).

   We denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{lp}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$ consisting of local presentation.

9.1.4.3. The functors $\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}\colon \mathrm{Mod}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z)) \to \mathrm{Mod}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ and $\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}\colon \mathrm{Mod}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \mathrm{Mod}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$ send lim-ind-isogenies to lim-ind-isogenies. Hence, we get the functors $\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}\colon \underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z)) \to \underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ and $\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}\colon \underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$, which yields the adjoint functors ($\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}} \dashv \underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}$). It follows from 7.2.3.7 that for any $\mathcal{E}^{(\bullet)}_\bullet \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{lp}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$ the adjoint morphism $\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}} \circ \underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}(\mathcal{E}^{(\bullet)}_\bullet) \to \mathcal{E}^{(\bullet)}_\bullet$ is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{lp}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$. By using 7.2.1.5 and 7.2.2.1, this implies that the functor $\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}\colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{lp}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z)) \to \underrightarrow{LM}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ is fully faithful and its essential image is $\underrightarrow{LM}_{\mathbb{Q},\mathrm{pqc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. Moreover, the functors $\underleftarrow{l}_{\mathfrak{X}^{(\mathbb{N})},*}$ and $\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}$ induce canonically quasi-inverse equivalences of categories between $\underrightarrow{LM}_{\mathbb{Q},\mathrm{lp}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(Z))$ and $\underrightarrow{LM}_{\mathbb{Q},\mathrm{pqc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

9.1.4.4. As pseudo quasi-coherence is a notion which is independant of the choice of divisors, the forgetful functor factors into a functor of the form $\mathrm{forg}_{D,Z}\colon M_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to M_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. The factorization $({}^\dagger Z, D)^0\colon M_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) \to M_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ is even more obvious. As for 9.1.2.3 (i.e., it suffices to remove the "$\mathbb{L}$" in the proof), we deduce from 9.1.2.2 that, for all $\mathcal{E}'^{(\bullet)} \in M_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$, the functorial in $\mathcal{E}'^{(\bullet)}$ canonical morphisms:

$$\mathrm{forg}_{D,Z}(\mathcal{E}'^{(\bullet)}) \to \mathrm{forg}_{D,Z} \circ ({}^\dagger Z, D)^0 \circ \mathrm{forg}_{D,Z}(\mathcal{E}'^{(\bullet)}),$$
$$({}^\dagger Z, D)^0 \circ \mathrm{forg}_{D,Z}(\mathcal{E}'^{(\bullet)}) \to \mathcal{E}'^{(\bullet)} \qquad (9.1.4.4.1)$$

are isomorphisms. The functor $\mathrm{forg}_{D,Z}\colon M_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to M_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ is therefore fully faithful.

9.1.4.5. Similarly to 9.1.3.2, for any $\mathcal{E}^{(\bullet)} \in \mathrm{Mod}_{\mathrm{pqc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, the canonical functorial in Z, Z', $\mathcal{E}^{(\bullet)}$ morphism $({}^\dagger Z') \circ ({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \to (Z' \cup Z)(\mathcal{E}^{(\bullet)})$ is an isomorphism.

9.1.5 Theorem of type A in $LM_{\mathbb{Q},\mathrm{coh}}$

9.1.5.1. Let $\lambda \in L(\mathbb{N})$ and $m_0 = \lambda(0)$. We denote by $\mu_{m_0} \in L(\mathbb{N})$ so that $\mu_{m_0}(m) = m + m_0$, by $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z) := \mu^*_{m_0}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)|_{(m_0,X)}$. Then it follows from 8.4.2.1 that we have an equivalence of categories between the category of $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z)$-module of global finite presentation and that of $\lambda^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)$-module of global finite presentation.

Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. Hence, it follows from 8.4.5.10 that the property $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ is equivalent to saying that there exists $m_0 \in \mathbb{N}$ such that for any affine open $\mathfrak{U}^\sharp$ of $\mathfrak{X}^\sharp$, the object $\mathcal{E}^{(\bullet)}|\mathfrak{U}$ is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}^\sharp}(Z))$ to a $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{U}^\sharp}(Z \cap U)$-module $\mathcal{F}^{(\bullet)}$ having a global finite presentation.

9.1.5.2. Suppose that $\mathfrak{X}$ is affine.

(a) We have the global section functor $\Gamma(\mathfrak{X},-)\colon M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to M(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ defined by putting $\Gamma(\mathfrak{X},\mathcal{E}^{(\bullet)}) := E^{(\bullet)}$, where $E^{(m)} \to E^{(m+1)}$ is the image by the functor $\Gamma(\mathfrak{X},-)$ of the arrow $\mathcal{E}^{(m)} \to \mathcal{E}^{(m+1)}$. As the functor $\Gamma(\mathfrak{X},-)$ commutes canonically with the functor χ^*, the functor $\Gamma(\mathfrak{X},-)$ transforms the ind-isogenies of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ into ind-isogenies of $M(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. It induces therefore the functor $\Gamma(\mathfrak{X},-)\colon \underrightarrow{M}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{M}_{\mathbb{Q}}(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. Likewise, $\Gamma(\mathfrak{X},-)$ send a lim-ind-isogeny to a lim-ind-isogeny and we obtain the factorization $\Gamma(\mathfrak{X},-)\colon \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

(b) We have the functor $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -\colon M(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. We check in the same way that we obtains the factorization $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -\colon \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

Lemma 9.1.5.3. *Let* $\lambda \in L(\mathbb{N})$.

(a) *For all* $\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)$*-module* $\mathcal{E}^{(\bullet)}$*, the canonical morphisms* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \to \lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)}$ *and* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \to \lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)}$ *are isomorphisms of* $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

(b) *For all* $\lambda^* \widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)$*-module* $F^{(\bullet)}$*, the canonical morphisms* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)} \to \lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\lambda^* \widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)}$ *and* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)} \to \lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\lambda^* \widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)}$ *are isomorphisms of* $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

Proof. We have the factorization $\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \to \lambda^* \left(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \right)$ inscribed in the canonical commutative diagram

$$\begin{array}{ccc} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} & \longrightarrow & \lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \\ \downarrow & \swarrow & \downarrow \\ \lambda^* \left(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \right) & \longrightarrow & \lambda^* \left(\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\lambda^* \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \right), \end{array} \tag{9.1.5.3.1}$$

and the same in replacing "$\otimes$" by "$\widehat{\otimes}$". From this the first assertion follows. For the second assertion we proceed in the same manner. □

Lemma 9.1.5.4. *We have the following properties.*

(a) *The functor* $({}^\dagger Z, D)^0$ *factors through*

$$({}^\dagger Z, D)^0 \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)). \tag{9.1.5.4.1}$$

(b) *For all* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$*, the canonical morphism* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(\bullet)}$ *is an isomorphism of* $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

(c) *Suppose that* $\mathfrak{X}$ *is affine. For all* $F^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$*, the canonical morphism* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)}$ *is an isomorphism of* $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

Proof. It follows from 8.4.5.2 that the statement (a) and (b) are local on $\mathfrak{X}$. Hence, we can suppose $\mathfrak{X}$ is affine. According to lemma 8.4.5.10, to verify the preservation of coherence, we can suppose that there exists $m_0, n_0 \in \mathbb{N}$ such that $\mathcal{E}^{(\bullet)}$ (resp. $F^{(\bullet)}$) is a $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z)$-module having a global finite presentation (resp. a $\widetilde{D}^{(\bullet+n_0)}_{\mathfrak{X}^\sharp}(Z)$-module having a global finite presentation). Following Lemma 8.4.2.1, we thus obtain the equalities (up to canonical isomorphisms): $\mathcal{E}^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp}(Z)} \mathcal{E}^{(m_0)}$ and $F^{(\bullet)} = \widetilde{D}^{(\bullet+n_0)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(n_0)}_{\mathfrak{X}^\sharp}(Z)} F^{(n_0)}$. We conclude by using the lemma 9.1.5.3 in the case where $\lambda \in L(\mathbb{N})$ is defined by setting $\lambda(m) = m + m_0$. □

Proposition 9.1.5.5. *Suppose that* $\mathfrak{X}$ *is affine. Then the functor* $\Gamma(\mathfrak{X}, -)$ *and* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} -$ *factor trough the quasi-inverse equivalences of the categories* $\Gamma(\mathfrak{X}, -) \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ *and* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)} - \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

Proof. One proceeds in an analogous manner as in the proof of the lemma 9.1.5.4: by using 8.4.5.10 and 9.1.5.3 we reduce to the theorem of type A of the remark 8.4.2.2.b. □

9.1.5.6. We have the canonical commutative (up to canonical isomorphism) diagram

$$\begin{array}{ccccc} \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) & \xrightarrow{\cong} & \underrightarrow{LD}^0_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) & \xrightarrow[H^0]{\cong} & \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \\ \downarrow {\scriptstyle ({}^\dagger Z,D)^0} & & \downarrow {\scriptstyle ({}^\dagger Z,D)} & & \downarrow {\scriptstyle ({}^\dagger Z,D)^0} \\ \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) & \xrightarrow{\cong} & \underrightarrow{LD}^0_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) & \xrightarrow[H^0]{\cong} & \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \\ \downarrow {\scriptstyle \mathrm{forg}_{D,Z}} & & \downarrow {\scriptstyle \mathrm{forg}_{D,Z}} & & \downarrow {\scriptstyle \mathrm{forg}_{D,Z}} \\ \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) & \xrightarrow{\cong} & \underrightarrow{LD}^0_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) & \xrightarrow[H^0]{\cong} & \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) \end{array} \tag{9.1.5.6.1}$$

whose horizontal functors are the equivalence of categories of Lemma 8.4.5.5 or of Lemma 8.1.5.10. As the middle forgetful functor $\mathrm{forg}_{D,Z}$ is fully faithful (see 9.1.2.3), we deduce that it is the same for $\mathrm{forg}_{D,Z}\colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$.

The functor 9.1.1.12.1 is exact and induces the following functor for coherent modules:

$$({}^\dagger Z, D) := \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}} -\colon \mathrm{Coh}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \to \mathrm{Coh}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}). \tag{9.1.5.6.2}$$

The functors 9.1.5.4.1 and 9.1.5.6.2 are compatible with the equivalence of categories of 8.4.5.6.3 i.e. for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$ we have the isomorphism of $\mathrm{Coh}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$

$$({}^\dagger Z, D) \circ \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}} \circ ({}^\dagger Z, D)^0(\mathcal{E}^{(\bullet)}) \tag{9.1.5.6.3}$$

where $\underrightarrow{l}^*_{\mathbb{Q}}$ is the equivalence of categories of 8.4.5.6.3 of the form $\underrightarrow{l}^*_{\mathbb{Q}}\colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T)) \to \mathrm{Coh}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$ in the case where $T = Z$ or $T = D$.

9.1.6 A coherence stability criterion by localisation outside a divisor

Notation 9.1.6.1. Following 8.4.1.15 in this context where $\mathcal{D}^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$, the functor $\underrightarrow{l}^*_{\mathbb{Q}}\colon \underrightarrow{LD}^-_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to D^-(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ induces we have the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q}}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$. When we would like to clarify the divisor (specially when we consider a quasi-inverse functor), this latter equivalence of categories will be denoted by $\underrightarrow{l}^*_{\mathbb{Q},Z}$.

The functors $\underrightarrow{l}^*_{\mathbb{Q}}$ commute with the forgetful of the divisor functor, i.e. we have the commutative (up to canonical isomorphism) square

$$\begin{array}{ccc} \underrightarrow{LD}^-_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) & \xrightarrow{\underrightarrow{l}^*_{\mathbb{Q}}} & D^-(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \\ {\scriptstyle 9.1.1.4}\downarrow {\scriptstyle \mathrm{forg}_{D,Z}} & & {\scriptstyle 9.1.1.4}\downarrow {\scriptstyle \mathrm{forg}_{D,Z}} \\ \underrightarrow{LD}^-_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) & \xrightarrow{\underrightarrow{l}^*_{\mathbb{Q}}} & D^-(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}), \end{array} \tag{9.1.6.1.1}$$

which justifies why this harmless to write $\underrightarrow{l}^*_{\mathbb{Q}}$ instead of $\underrightarrow{l}^*_{\mathbb{Q},Z}$.

Theorem 9.1.6.2. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ and $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q},D}(\mathcal{E}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}})$. We suppose that the morphism $\mathcal{E} \to ({}^\dagger Z, D)(\mathcal{E})$ is an isomorphism of $D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}})$. Then, the canonical morphism $\mathcal{E}^{(\bullet)} \to ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)})$ is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$.*

Proof. 0) *We reduce to the case where $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$.*

For any integer $n \in \mathbb{Z}$, following the lemma 8.4.5.4, we have $\mathcal{H}^n(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. Moreover, following the corollary 8.1.5.11, the canonical morphism $\phi\colon \mathcal{E}^{(\bullet)} \to ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)})$ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$, if and only if, for any integer $n \in \mathbb{Z}$, the morphism $\mathcal{H}^n(\phi)\colon \mathcal{H}^n(\mathcal{E}^{(\bullet)}) \to \mathcal{H}^n(({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}))$ is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. Let $\psi_n\colon ({}^\dagger Z, D)^0(\mathcal{H}^n(\mathcal{E}^{(\bullet)})) \to \mathcal{H}^n(({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}))$ be the morphism of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ induced by adjunction from the morphism $\mathcal{H}^n(\phi)$.

a) Let us check that ψ_n is an isomorphism. Since the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ is fully faithful on $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$, we reduce to check that $\underrightarrow{l}^*_{\mathbb{Q}}(\psi_n)$ is an isomorphism. Moreover, since the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ commutes canonically to $\mathcal{H}^n$ up to canonical isomorphism (see the diagram 8.4.1.10.1), via the isomorphisms 9.1.1.12.2 and 9.1.5.6.3, we get that $\underrightarrow{l}^*_{\mathbb{Q}}(\psi_n)$ is canonically isomorphic to the canonical morphism $({}^\dagger Z, D)(\mathcal{H}^n\mathcal{E}) \to \mathcal{H}^n(({}^\dagger Z, D)(\mathcal{E}))$. Since the functor $({}^\dagger Z, D)\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ is exact, the morphism $({}^\dagger Z, D)(\mathcal{H}^n\mathcal{E}) \to \mathcal{H}^n(({}^\dagger Z, D)(\mathcal{E}))$ is therefore an isomorphism. Hence we are done.

b) If the theorem holds when $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$, then this impies in general context that the canonical morphism $\mathcal{H}^n(\mathcal{E}^{(\bullet)}) \to ({}^\dagger Z, D)^0(\mathcal{H}^n(\mathcal{E}^{(\bullet)}))$ is an isomorphism. By composing the latter isomorphism with ψ_n we get $\mathcal{H}^n(\phi)$ which is therefore an isomorphism. Hence, we are done.

1) It follows from 8.4.5.2 that the statement (a) and (b) are local on $\mathfrak{X}$. Hence, we can suppose $\mathfrak{X}$ is affine. According to lemma 8.4.5.10, since this theorem is closed under isomorphism of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$, we can suppose that there exists $m_0 \in \mathbb{N}$ such that $\mathcal{E}^{(\bullet)}$ is a $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)$-module having a global finite presentation, where we set $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)|_{(m_0,X)}$. Following Lemma 8.4.2.1, we thus obtain the equalities (up to canonical isomorphisms): $\mathcal{E}^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D) \otimes_{\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp}(D)} \mathcal{E}^{(m_0)}$. Put $E := \Gamma(\mathfrak{X}, \mathcal{E})$, $F := \Gamma(\mathfrak{X}, \mathcal{F})$, $E^{(\bullet)} = \Gamma(\mathfrak{X}, \mathcal{E}^{(\bullet)})$, $\mathcal{F}^{(\bullet)} := ({}^\dagger Z, D)^0(\mathcal{E}^{(\bullet)})$, $F^{(\bullet)} = \Gamma(\mathfrak{X}, \mathcal{F}^{(\bullet)})$. Let us check in this step 1) that the canonical morphism $E^{(\bullet)} \to F^{(\bullet)}$ of $M(\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$ is a lim-ind-isogeny, with $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp}(D) := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(D))$ for any $m \in \mathbb{N}$. (Recall that from 8.3.1.3.1, this means that the image of the morphism $E^{(\bullet)} \to F^{(\bullet)}$ via the composition of functor $M(\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)) \to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ is an isomorphism.)

a) Let $E := \varinjlim_m E^{(m)}$ and $N^{(m)}$ the kernel of the morphism canonical $E^{(m)} \to E$. It follows from the theorem of type A (see the second point of the remark 8.4.2.2) that, for any integer $m \in \mathbb{N}$, $E^{(m)}$ is a $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(D)$-module of finite type. By noetherianity of $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(D)$, the $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(D)$-module $N^{(m)}$ is therefore of finite type. This implies there exists $\lambda(m) \geq m$ such that $E^{(m)} \to E^{(\lambda(m))}$ factors through $E^{(m)}/N^{(m)} \to E^{(\lambda(m))}$. We can choose $\lambda\colon \mathbb{N} \to \mathbb{N}$ such that $\lambda \in L(\mathbb{N})$. This implies that $E^{(\bullet)} \to E^{(\bullet)}/N^{(\bullet)}$ is a lim-ind-isogeny. Replacing $E^{(\bullet)}$ by $E^{(\bullet)}/N^{(\bullet)}$ if necessary, we can therefore assume that the transition maps $E^{(m)} \to E^{(m+1)}$ are injective. Let $E^{(\bullet)}_t$ be the sub-$\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)$-module of $E^{(\bullet)}$ of p-torsion sections, since $E^{(m)}_t$ is a $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(D)$-module of finite type, then we can check that the morphism $E^{(\bullet)} \to E^{(\bullet)}/E^{(\bullet)}_t$ is an ind-isogeny. Hence, replacing $E^{(\bullet)}$ by $E^{(\bullet)}/E^{(\bullet)}_t$ if necessary, we can therefore assume that $E^{(m)}$ is p-torsion free for any $m \in \mathbb{N}$.

Put $F := \varinjlim_m F^{(m)}$ and, for any integer $m \geq 0$, let $G^{(m)}$ be the quotient of $F^{(m)}$ by the kernel of the canonical morphism $F^{(m)} \to F_{\mathbb{Q}}$. Hence, the transition maps $G^{(m)} \to G^{(m+1)}$ are injective and the $G^{(m)}$ are p-torsion free $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(Z)$-modules of finite type. As above, we see that the canonical arrow $F^{(\bullet)} \to G^{(\bullet)}$ is a lim-ind-isogeny of $M(\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z))$ and therefore of $M(\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$. Hence, we reduce to check that the canonical morphism $E^{(\bullet)} \to G^{(\bullet)}$ is a lim-ind-isogeny of $M(\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$.

b) Since the functor $\Gamma(\mathfrak{X}, -)$ commutes with filtrant inductive limites and with the functor $- \otimes_{\mathcal{D}} \mathbb{Q}$, then it commutes with $\underrightarrow{l}^*_{\mathbb{Q}}$. Moreover, it follows from 9.1.1.12.2 that the canonical morphism $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \to \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})$ is an isomorphism of $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-modules. Hence, the canonical morphism $E_{\mathbb{Q}} \to F_{\mathbb{Q}}$ is an isomorphism of $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-modules. Since $F^{(\bullet)} \to G^{(\bullet)}$ is a lim-ind-isogeny of $M(\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$ (see part a), then by applying $\underrightarrow{l}^*_{\mathbb{Q}}$ we get that the canonical morphism $F_{\mathbb{Q}} \to G_{\mathbb{Q}}$ is an isomorphism of $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-modules, where $G := \varinjlim_m G^{(m)}$. By composition, the canonical morphism $E_{\mathbb{Q}} \to G_{\mathbb{Q}}$ is thus an isomorphism of $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-modules.

c) The K-spaces $E^{(m)}_{\mathbb{Q}}$ and $G^{(m)}_{\mathbb{Q}}$ are endowed with canonical structure of Banach K-spaces induced respectively by their structure of $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(D)_{\mathbb{Q}}$-module of finite type and of $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(Z)_{\mathbb{Q}}$-module of finite type. For theses topologies, the canonical morphisms $E^{(m)}_{\mathbb{Q}} \to G^{(m)}_{\mathbb{Q}}$ are continuous morphisms of Banach K-spaces. Denote by $W := \varinjlim_m G^{(m)}_{\mathbb{Q}}$ endowed with the inductive limit topology of locally convex K-space. Denote by $i_m\colon E^{(m)}_{\mathbb{Q}} \to W$ the composite of continuous maps $E^{(m)}_{\mathbb{Q}} \to G^{(m)}_{\mathbb{Q}} \to W$. Moreover, following the part *b*), the canonical morphism $E_{\mathbb{Q}} \to W$ is an isomorphism of $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-

modules and is in particular bijective. Since $E^{(m)}_{\mathbb{Q}} \to E_{\mathbb{Q}}$ is injective, then so is i_m. We have also the equality of sets $W = \cup_{m\in\mathbb{N}} i_m(E^{(m)}_{\mathbb{Q}})$. Following [Sch02, 8.9], for any integer m, since $E^{(m)}_{\mathbb{Q}}$ and $G^{(m)}_{\mathbb{Q}}$ are both Banach K-spaces and since the canonical morphism $\alpha_m \colon G^{(m)}_{\mathbb{Q}} \to W$ is continuous, this yields there exists $\lambda(m) \geq m$ and a unique continuous morphism $\beta^{(m)} \colon G^{(m)}_{\mathbb{Q}} \to E^{(\lambda(m))}_{\mathbb{Q}}$ such that $\alpha_m = i_{\lambda(m)} \circ \beta^{(m)}$. We choose such a $\lambda(m) \geq m$ as small as possible. Since $i_{\lambda(m)}$ is injective, since $i_{\lambda(m)}$ and α_m are both $\widetilde{D}^{(m+m_0)}_{\mathfrak{X}^\sharp}(D)_{\mathbb{Q}}$-linear, then so is $\beta^{(m)}$. Moreover, by unicity of such factorisations, the morphisms $\beta^{(m)}$ are compatible with transition maps. Hence, we get the morphism of $\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)_{\mathbb{Q}}$-modules $\beta^{(\bullet)} \colon G^{(\bullet)}_{\mathbb{Q}} \to \lambda^* E^{(\bullet)}_{\mathbb{Q}}$.

Since the family $(p^n G^{(m)})_{n\in\mathbb{N}}$ forms a basis of neighborhood of 0, since $E^{(\lambda(m))}$ is an open of $E^{(\lambda(m))}_{\mathbb{Q}}$, (recall that $E^{(\lambda(m))}$ and $G^{(m)}$ are both p-torsion free), the fact that $\beta^{(m)}$ is continuous implies then there exists $\chi(m) \in \mathbb{N}$ large enough such that $\beta^{(m)}(p^{\chi(m)} G^{(m)}) \subset E^{(\lambda(m))}$ (or we can invoke the $\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)_{\mathbb{Q}}$-linearity of $\beta^{(m)}$ and the type finiteness of $G^{(m)}$). We can choose the $\chi(m)$ such that the induced map $\chi \colon \mathbb{N} \to \mathbb{N}$ is increasing. Denote by $\gamma^{(\bullet)}$ the composition of $\beta^{(\bullet)} \colon G^{(\bullet)}_{\mathbb{Q}} \to \lambda^* E^{(\bullet)}_{\mathbb{Q}}$ with the canonical morphism $\lambda^* E^{(\bullet)}_{\mathbb{Q}} \to \chi^* \lambda^* E^{(\bullet)}_{\mathbb{Q}}$. From what we have just seen, $\gamma^{(\bullet)}$ factors through (in a unique way) the morphism of the form $g^{(\bullet)} \colon G^{(\bullet)} \to \chi^* \lambda^* E^{(\bullet)}$. Denote by $f^{(\bullet)} \colon E^{(\bullet)} \to G^{(\bullet)}$ the canonical morphism. Since for any $m \in \mathbb{N}$, the canonical morphisms $E^{(m)} \to W$ and $G^{(m)} \to W$ are injective, we can check that $g^{(\bullet)} \circ f^{(\bullet)}$ and $\chi^* \lambda^* (f^{(\bullet)}) \circ g^{(\bullet)}$ are the canonical morphisms. Hence, we are done.

2) We deduce from the step 1) that the canonical morphism

$$\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D) \widehat{\otimes}_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)} E^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D) \widehat{\otimes}_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)} F^{(\bullet)}$$

is a lim-ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$.

3) By quasi-coherence of both sheaves $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}(D)$ and $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}(Z)$, we get that the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}(D) \otimes_{\widetilde{D}^{(m)}_{X_i}(D)} \widetilde{D}^{(m)}_{X_i}(Z) \to \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}(Z)$ is an isomorphism. This implies that the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}(D) \otimes_{\widetilde{D}^{(m)}_{X_i}(D)} F_i^{(m)} \to \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}(Z) \otimes_{\widetilde{D}^{(m)}_{X_i}(Z)} F_i^{(m)}$ is an isomorphism. Passing to the projective limit, this implies the canonical morphism

$$\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D) \widehat{\otimes}_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)} F^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)}$$

is an isomorphism of $M(\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$.

4) Il follows from the steps 2) and 3) that the canonical morphism

$$\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D) \widehat{\otimes}_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)} E^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z) \widehat{\otimes}_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)}$$

is a lim-ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$. Hence, it follows from Lemma 9.1.5.4.b (and also from the Lemma 9.1.5.3) that the top morphism of the canonical commutative diagram:

$$\begin{array}{ccc} \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D) \otimes_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D)} E^{(\bullet)} & \longrightarrow & \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z) \otimes_{\widetilde{D}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(Z)} F^{(\bullet)} \\ \downarrow & & \downarrow \\ \mathcal{E}^{(\bullet)} & \longrightarrow & \mathcal{F}^{(\bullet)} \end{array}$$

is a lim-ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$. Moreover, we deduce from the theorem of type A of the remark 8.4.2.2.b that the vertical morphisms are isomorphisms of $M(\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}(D))$. Hence we are done. □

Corollary 9.1.6.3. *Let* $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ *and* $\mathcal{E}' := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}'^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$. *If* $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}})$, *then* $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$.

Proof. Assume $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}})$. Then it follows from Theorem 8.4.1.15 there exists $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ and a $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-linear isomorphism of the form $\mathcal{E}' \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})$. Moreover, since the canonical morphism $\mathcal{E}' \to ({}^\dagger Z, D)(\mathcal{E}')$ is a morphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ which an isomorphism outside Z, this yields following 8.7.6.11 that it is an isomorphism. This implies that the canonical morphism $\mathcal{E}' \to ({}^\dagger Z, D)(\mathcal{E}')$ of $D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}})$ is an isomorphism. By applying the theorem 9.1.6.2 to $\mathcal{E}^{(\bullet)}$, this implies that the canonical morphism $\mathcal{E}^{(\bullet)} \to ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)})$ is therefore an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. Since $({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}),\ \mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ and since

$$\underrightarrow{l}^*_{\mathbb{Q}} \circ ({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}) \overset{9.1.1.12.2}{\underset{\sim}{\longrightarrow}} ({}^\dagger Z, D) \circ \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z, D)(\mathcal{E}') \xrightarrow{\sim} \mathcal{E}' \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}'^{(\bullet)},$$

by fully faithfulness of the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ we get that $({}^\dagger Z, D)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$. □

Corollary 9.1.6.4. *The equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q},Z}$ factors through the equivalence of categories*

$$\underrightarrow{l}^*_{\mathbb{Q}} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \cong D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}}). \qquad (9.1.6.4.1)$$

Proof. This is a straightforward consequence of 9.1.6.3 and of the full faithfulness of the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ (see Theorem 8.4.1.15). □

Proposition 9.1.6.5. *Suppose $D \subset Z \subset Z'$.*

(a) Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D)) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z'))$. Then $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$.

(b) Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z')_{\mathbb{Q}})$. Then $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$.

Proof. Using 9.1.2.3.1, we check that the canonical morphism $({}^\dagger Z,\, D) \circ \mathrm{forg}_{D,Z}(\mathrm{forg}_{Z,Z'}(\mathcal{E}^{(\bullet)})) \to \mathrm{forg}_{Z,Z'}(\mathcal{E}^{(\bullet)})$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ is an isomorphism. Hence, we get the first assertion. Using 9.1.6.4, we get (b) from (a). □

In order to define the bifunctor 9.1.6.8.1, we need to introduce the following notation.

Notation 9.1.6.6. Let $\mathfrak{X}^\sharp_1 \to \mathfrak{S}^\sharp$ and $\mathfrak{X}^\sharp_2 \to \mathfrak{S}^\sharp$ be two log smooth morphisms of log formal schemes. We suppose the underlying formal schemes $\mathfrak{X}_1$ and $\mathfrak{X}_2$ are p-torsion free, noetherian of finite Krull dimension. For $i = 1, 2$, for $T_i = D_i$, choose $(\underrightarrow{l}^*_{\mathbb{Q},T_1})^{-1} \colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_i}({}^\dagger T_i)_{\mathbb{Q}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_i}(T_i))$ a functor quasi-inverse functor of the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q},T_1}$ (see notation 9.1.6.1).

Let $D_1 \subset Z_1$ be two divisors of X_1, $D_2 \subset Z_2$ be two divisors of X_2. Let $\phi^{(\bullet)} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_1}(Z_1)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ be a functor and

$$\psi^{(\bullet)} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_1}(Z_1)) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_2}(Z_2)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$$

be a bifunctor. This yields a functor $\mathrm{Coh}_{Z_1}(\phi^{(\bullet)}) \colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}}) \to D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ by setting $\mathrm{Coh}_{Z_1}(\phi^{(\bullet)}) := \underrightarrow{l}^*_{\mathbb{Q}} \circ \phi^{(\bullet)} \circ (\underrightarrow{l}^*_{\mathbb{Q},Z_1})^{-1}$. In the same way, we obtain the bifunctor

$$\mathrm{Coh}_{Z_1,Z_2}(\psi^{(\bullet)}) \colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}}) \times D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp}({}^\dagger Z_2)_{\mathbb{Q}}) \to D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$$

by setting $\mathrm{Coh}_{Z_1,Z_2}(\psi^{(\bullet)}) := \underrightarrow{l}^*_{\mathbb{Q}} \circ \psi^{(\bullet)} \circ ((\underrightarrow{l}^*_{\mathbb{Q},Z_1})^{-1} \times (\underrightarrow{l}^*_{\mathbb{Q},Z_2})^{-1})$. Beware that these functors is only well defined up to non-canonical isomorphism. Hence, it is more convenient to work with categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$ than with $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$.

Remark 9.1.6.7. We keep notation 9.1.6.6. It follows from 9.1.6.4.1 that the functors $\mathrm{Coh}_{Z_1}(\phi^{(\bullet)})$ and $\mathrm{Coh}_{D_1}(\phi^{(\bullet)})$ are (non-canonically) isomorphic on $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_1}({}^\dagger D_1)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_1}({}^\dagger Z_1)_{\mathbb{Q}})$. Similarly, the bifunctors $\mathrm{Coh}_{Z_1,Z_2}(\psi^{(\bullet)})$ and $\mathrm{Coh}_{D_1,D_2}(\psi^{(\bullet)})$ are isomorphic on $(D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_1}({}^\dagger D_1)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_1}({}^\dagger Z_1)_{\mathbb{Q}})) \times (D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_2}({}^\dagger D_2)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_2}({}^\dagger Z_2)_{\mathbb{Q}}))$.

Notation 9.1.6.8. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, $\mathcal{M}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Let us denote by $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ and $\mathcal{M} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{M}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{*}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$. With the notations of 9.1.6.6, we get the bifunctor $-\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}} - := \mathrm{Coh}_{T,}(-\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} -)$ of the form:

$$-\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}} - \colon D^{\mathrm{b}}_{\mathrm{coh}}({}^{*}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \times D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D^{\mathrm{b}}({}^{*}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}). \tag{9.1.6.8.1}$$

Recall this functor is well defined up to non-canonical isomorphism. Via the equivalence 8.4.1.15, then we have the (non-canonical) functorial isomorphisms

$$\mathcal{M}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}}\mathcal{E} \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}\left(\mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}\right). \tag{9.1.6.8.2}$$

Proposition 9.1.6.9. *Let $\mathcal{E}, \mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^\dagger D)_{\mathbb{Q}})$. We have the canonical isomorphism*

$$\mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger D)_{\mathbb{Q}}}\mathcal{F} \xrightarrow{\sim} \mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}}\mathcal{F}. \tag{9.1.6.9.1}$$

Proof. Following 9.1.6.4.1, there exist $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(D)) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(Z))$ such that $\mathcal{E} \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})$, $\mathcal{F} \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})$. Then, this is a consequence of 9.1.2.8.1. □

Remark 9.1.6.10. (a) For any divisors $D \subset Z$, following 9.1.1.12.2, we have the isomorphism of functors $\mathrm{Coh}_D(({}^\dagger Z',\ D)) \xrightarrow{\sim} ({}^\dagger Z',\ D)$.

(b) Let Z and $D \subset D'$ be some divisors of X. Suppose X is regular. Following 9.1.3.3, the functors $({}^\dagger Z)$ and $({}^\dagger Z \cup D)$ are canonically isomorphic on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ and similarly replacing D by D'. We obtain the functor $({}^\dagger Z \cup D, D)\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp}({}^\dagger Z \cup D)_{\mathbb{Q}})$ is isomorphic to $\mathrm{Coh}_D(({}^\dagger Z))$, and similarly replacing D by D'. With the remark 9.1.6.7, this yields the functors $({}^\dagger Z \cup D, D)$ and $({}^\dagger Z \cup D', D')$ are (canonically) isomorphic over $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp}({}^\dagger D')_{\mathbb{Q}})$. Hence, it is harmless to remove D in the notation.

9.2 Extraordinary inverse image, direct image, duality, base change, exterior tensor product

9.2.1 Extraordinary inverse images

Let

$$\begin{array}{ccc} \mathfrak{X}'^\sharp & \xrightarrow{f} & \mathfrak{X}^\sharp \\ \downarrow{\scriptstyle p_{\mathfrak{X}'^\sharp}} & & \downarrow{\scriptstyle p_{\mathfrak{X}^\sharp}} \\ \mathfrak{S}'^\sharp & \xrightarrow{\phi} & \mathfrak{S}^\sharp, \end{array} \tag{9.2.1.0.1}$$

be a commutative diagram of very nice (see definition 3.3.1.10.(b)) fine $\mathcal{V}$-log formal schemes, where $p_{\mathfrak{X}^\sharp}$ and $p_{\mathfrak{X}'^\sharp}$ are log smooth morphisms. We suppose S, $S^\sharp$, S', $S'^\sharp$, X and X' are regular (to have an idea about theses hypotheses, see [GR, 12.5.19]) and noetherian. Let Z and Z' be some divisors of respectively X and X' such that $f(X' \setminus Z') \subset X \setminus Z$.

We suppose the underlying formal schemes of $\mathfrak{S}$, $\mathfrak{S}'$, $\mathfrak{X}$ and $\mathfrak{X}'$ are p-torsion free. Let $\mathfrak{a} := \pi^h \mathcal{O}_{\mathfrak{S}}$ for some integer h. By flatness of the structural morphism $\mathfrak{S} \to \mathrm{Spf}\,\mathcal{V}$ we get from 1.2.4.2.a that $\mathfrak{a}$ has a canonical m-PD-structure if $hp^m \geq e/(p-1)$, where e is the absolute ramification of $\mathcal{V}$. Choosing h large enough, we can endowing $\mathfrak{S}$ and $\mathfrak{S}'$ with these canonical m-PD-structures, the bottom arrow ϕ can be viewed as an m-PD-morphism.

We define in this section the extraordinary inverse image by f with overconvergent singularities along Z and Z'. We fix $\lambda_0 \in L(\mathbb{N})$. We set $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) := \lambda_0^* \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Finally, we set $\mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}(Z) := \mathcal{V}/\pi^{i+1} \otimes_{\mathcal{V}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) = \mathcal{B}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(Z) := \widetilde{\mathcal{B}}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$ for any $m \in \mathbb{N}$. We use similar notation by adding some primes, e.g. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(Z') :=$

$\mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}'}(Z')$. Recall also, following 7.3.2.1, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z)$ satisfy the conditions of 7.3.2, i.e. in particular $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$ is $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$-quasi-coherent in the sense of 8.5.1.6 and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S'^\sharp_\bullet}(Z)$ is $\mathcal{O}^{(\bullet)}_{X_\bullet}$-quasi-coherent in the sense of 8.5.1.7.

We denote by $\widetilde{\mathfrak{X}}^{(\bullet)} := (\mathfrak{X}^\sharp, \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z))$ and by $\widetilde{\mathfrak{X}}'^{\sharp(\bullet)} := (\mathfrak{X}'^\sharp, \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z'))$ the associated $\mathbb{N}$-ringed $\mathcal{V}$-log formal schemes (see 8.5.5.1). With notation 8.5.5.2, let $\tilde{f}^{(\bullet)} \colon \widetilde{\mathfrak{X}}'^{(\bullet)}/\mathfrak{S}'^\sharp \to \widetilde{\mathfrak{X}}^{(\bullet)}/\mathfrak{S}^\sharp$ be the morphism of relative $\mathbb{N}$-ringed $\mathcal{V}$-log formal schemes induced by the diagram 9.2.1.0.1 and by $f^*\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')$ (see definition 8.5.5.1). When $\phi\colon \mathfrak{S}'^\sharp \to \mathfrak{S}^\sharp$ in understood, by abuse of notation, we also denote by $\tilde{f}^{(\bullet)}$ the induced morphism $\widetilde{\mathfrak{X}}'^{(\bullet)}/\mathfrak{S}'^\sharp \to \widetilde{\mathfrak{X}}^{(\bullet)}/\mathfrak{S}^\sharp$ of $\mathbb{N}$-ringed $\mathcal{V}$-log formal schemes.

We denote by $\widetilde{X}^{(\bullet)}_\bullet := (X^\sharp_\bullet, \widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z))$ and $\widetilde{X}'^{(\bullet)}_\bullet := (X^\sharp_\bullet, \widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z))$ the induced ringed topoi. Let $\tilde{f}^{(\bullet)}_\bullet \colon \widetilde{X}'^{(\bullet)}_\bullet/S'^\sharp_\bullet \to \widetilde{\mathfrak{X}}^{(\bullet)}/S^\sharp_\bullet$ be the induced morphism of relative ringed topoi.

Following 8.7.4.2.(b), $\widetilde{\mathfrak{X}}^{(\bullet)}/\mathfrak{S}^\sharp$ and $\widetilde{\mathfrak{X}}'^{(\bullet)}/\mathfrak{S}^\sharp$ are strongly quasi-flat (see definition 8.5.5.3). In fact, using the proof of 8.7.4.2.(b) we can check that $\tilde{f}^{(\bullet)}$ is strongly quasi-flat (more precisely, in the definition 8.5.5.3, we can choose $\mathfrak{S}^\sharp = \operatorname{Spf}\mathcal{V}$). In particular, we can apply 8.5.4.5 and 8.5.4.15 in this context where $\mathcal{D}^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, or also similarly $\mathcal{D}'^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}$.

Let $\mathfrak{U} := \mathfrak{X}^{\sharp *}$ be the open of $\mathfrak{X}$ where $M_{\mathfrak{X}^\sharp}$ is trivial and $j_{\mathfrak{U}} \colon \mathfrak{U} \hookrightarrow \mathfrak{X}^\sharp$ be the canonical open immersion. Let $\mathfrak{U}' := \mathfrak{X}'^{\sharp *}$ be the open of $\mathfrak{X}'$ where $M_{\mathfrak{X}'^\sharp}$ is trivial and $j_{\mathfrak{U}'} \colon \mathfrak{U}' \hookrightarrow \mathfrak{X}'^\sharp$ be the canonical open immersion.

9.2.1.1 (Decomposition into a regular exact closed immersion and a log smooth morphism)**.** Suppose the morphism ϕ of the diagram 9.2.1.0.1 is the identity. Etale locally on $\mathfrak{X}$, there exists an exact closed immersion $\mathfrak{X}'^\sharp \hookrightarrow \mathfrak{X}''^\sharp$ and a log etale morphism $\mathfrak{X}''^\sharp \to \mathfrak{X}'^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{X}^\sharp$ whose composite map gives $\mathfrak{X}'^\sharp \hookrightarrow \mathfrak{X}'^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{X}^\sharp$, the graph of f (see 3.3.3.2). Since $\mathfrak{X}''^\sharp \to \mathfrak{S}^\sharp$ is log flat and since $\mathfrak{S}^\sharp$ is very nice, then so is $\mathfrak{X}''^\sharp$ is very nice. Since $X''^\sharp \to S^\sharp$ is log smooth, since $S^\sharp$ is regular, then it follows from [Ogu18, IV.3.5.3] (or [GR, 12.5.28]) that $X''^\sharp$ is regular. Hence, it follows from [GR, 12.5.14] that the underlying morphism of schemes of the exact closed immersion $X'^\sharp \hookrightarrow X''^\sharp$ is a regular closed immersion. Hence, following [Gro67, 19.1.2], the underlying scheme of $X''^\sharp$ is regular. Denoting by g the composite morphism $\mathfrak{X}''^\sharp \to \mathfrak{X}'^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{X}^\sharp \to \mathfrak{X}^\sharp$, since $f^{-1}(Z)$ is a divisor of X'' then $Z'' := g^{-1}(Z)$ is a divisor of X''. In other words, we can decompose f by a regular exact closed immersion and a log smooth morphism, both morphisms satisfying the hypotheses of 9.2.1.

Following [Liu02, 6.3.15], we get a similar decomposition $X'^\sharp_i \hookrightarrow X''^\sharp_i \to X'^\sharp_i \times_{S^\sharp_i} X^\sharp_i \to X^\sharp_i$ such that the underlying morphism of schemes of $X'^\sharp_i \hookrightarrow X''^\sharp_i$ is a regular closed immersion.

9.2.1.2 (Finite tor-dimension)**.** It follows from [Sta22, 066P], that since X is regular, then $f^{-1}\mathcal{O}_Y \to \mathcal{O}_X$ has finite tor dimension, i.e. the functor $\mathbb{L}f^* = \mathcal{O}_{X'} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}_X} f^{-1}-$ from the category of $\mathcal{O}_X$-modules to that of $\mathcal{O}_{X'}$-modules has bounded cohomological dimension (see definition 4.6.1.4). Since $\mathfrak{X}$ is noetherian and is flat over $\operatorname{Spf}\mathcal{V}$, since X is regular then so is $\mathfrak{X}$ and $f^{-1}\mathcal{O}_{\mathfrak{X}} \to \mathcal{O}_{\mathfrak{X}'}$ has finite tor dimension. Since the functor $\mathbb{L}f^* = \mathcal{O}_{\mathfrak{X}'} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}_{\mathfrak{X}}} f^{-1}-$ has finite cohomological dimension, then following 7.5.5.1 so is the functor $\widetilde{f}^*_\bullet = \mathcal{O}^{(\bullet)}_{X'_\bullet} \otimes_{f^{-1}\mathcal{O}^{(\bullet)}_{X_\bullet}} f^{-1}-$.

9.2.1.3. We have the functors

$$\mathbb{L}\widetilde{f}^{(\bullet)*}_{\mathrm{alg}} := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z') \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} f^{-1}(-) \colon D^-(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)) \to D^-(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')), \tag{9.2.1.3.1}$$

$$\mathbb{L}\widetilde{f}^{(\bullet)*}_\bullet = \widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z') \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} f^{-1}(-) \colon D^-(\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)) \to D^-(\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')). \tag{9.2.1.3.2}$$

Let $\mathcal{F}^{(\bullet)}_\bullet \in D^-(\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z))$. It follows from 7.1.3.6.1 that we have the isomorphism:

$$\big(\mathbb{L}\widetilde{f}^{(\bullet)*}_\bullet(\mathcal{F}^{(\bullet)}_\bullet)\big)^{(m)}_i \xrightarrow{\sim} \mathbb{L}\widetilde{f}^{(m)*}_i(\mathcal{F}^{(m)}_i). \tag{9.2.1.3.3}$$

Since $\widetilde{\mathcal{B}}^{(\bullet)}_{X'_i}(Z') \otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_{i+1}}(Z')} \mathbb{L}\widetilde{f}^{(\bullet)*}_{i+1}(\mathcal{F}^{(\bullet)}_{i+1}) \xrightarrow{\sim} \mathbb{L}\widetilde{f}^{(\bullet)*}_i(\widetilde{\mathcal{B}}^{(\bullet)}_{X_i}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_{i+1}}(Z)} \mathcal{F}^{(\bullet)}_{i+1})$, then it follows from 7.5.4.4 that the bottom functor of 9.2.1.3.1 preserves the quasi-coherence (in the sense of 8.5.1.7), i.e. induces the functor

$$\mathbb{L}\widetilde{f}^{(\bullet)*}_\bullet \colon D^-_{\mathrm{qc}}(\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)) \to D^-_{\mathrm{qc}}(\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')). \tag{9.2.1.3.4}$$

Since $\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$ is flat, then a K-flat complex of left $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$-modules is a K-flat complex of $\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)$-modules. Hence, we get the functor $\mathbb{L}\widetilde{f}^{(\bullet)*}_\bullet \colon D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$ making commutative the diagram:

$$\begin{array}{ccc} D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) & \xrightarrow{\mathbb{L}\widetilde{f}^{(\bullet)*}_\bullet} & D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')) \\ \downarrow & & \downarrow \\ D^-_{\mathrm{qc}}(\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)) & \xrightarrow{\mathbb{L}\widetilde{f}^{(\bullet)*}_\bullet} & D^-_{\mathrm{qc}}(\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')) \end{array} \quad (9.2.1.3.5)$$

where the vertical functors are the forgetful ones.

Notation 9.2.1.4. We deduce by functoriality from 7.5.5.2 that we get a structure of $(\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'), f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$-bimodule on $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z) := \widetilde{f}^{(\bullet)*}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) = \widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z') \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$. When $\mathfrak{S}'^\sharp \to \mathfrak{S}^\sharp$ is the identity, we may simply write $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet\to X^\sharp_\bullet/S'^\sharp_\bullet}(Z',Z)$ and when moreover there is no doubt about $\mathfrak{S}^\sharp$ we write $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet\to X^\sharp_\bullet}(Z',Z)$. By functoriality from 7.5.5.2 and 7.5.4.6, with notation 9.1.1.6, we get a structure of $(f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z), \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$-bimodule on

$$\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet\leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z') := \widetilde{\omega}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z') \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')} \widetilde{f}^{(\bullet)*}_{\bullet r}\left(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)^{-1}\right),$$

where the index "r" means that we have chosen the right (i.e. the twisted) structure of left $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$-module on $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)^{-1}$ to compute the structure of left $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')$-module via the functor $\widetilde{f}^{(\bullet)*}_\bullet$.

When $\mathfrak{S}'^\sharp \to \mathfrak{S}^\sharp$ is the identity, we can simply write $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet\leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z')$ and when moreover there is no doubt about $\mathfrak{S}^\sharp$ we write $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet\leftarrow X'^\sharp_\bullet}(Z,Z')$.

We have the isomorphism of left $(f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z), \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$-bimodules

$$\widetilde{f}^{(\bullet)*}_{\bullet r}\left(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)^{-1}\right) \underset{\widetilde{f}^{(\bullet)*}_\bullet(4.2.5.6.3)}{\xrightarrow{\sim}} \widetilde{f}^{(\bullet)*}_{\bullet l}\left(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)^{-1}\right),$$

where the index "l" (resp. "r ") means that we have chosen the left (resp. right) structure to compute $\widetilde{f}^{(\bullet)*}_\bullet$. By tensoring this latter isomorphism with $\widetilde{\omega}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z') \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')} -$, we get the isomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z), \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$-bimodules

$$\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet\leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z') \xrightarrow{\sim} \widetilde{\omega}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z') \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')} \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z) \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} f^{-1}\widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)^{-1}. \quad (9.2.1.4.1)$$

Definition 9.2.1.5. We keep notation 9.2.1.4. Set $d_f := \delta_{X'^\sharp/S'^\sharp} - \delta_{X^\sharp/S^\sharp}\circ f$, $\delta_{X'^\sharp/S'^\sharp}$, $\delta_{X^\sharp/S^\sharp}$ are respectively the rank (as a locally constant function on X' or X respectively) of the locally free modules $\Omega_{X'^\sharp/S'^\sharp}$ and $\Omega_{X^\sharp/S^\sharp}$.

(a) The (left version of the) extraordinary inverse image functor by $\widetilde{f}^{(\bullet)}_\bullet$ is the functor $\widetilde{f}^{(\bullet)!}_\bullet \colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$ which is defined by setting

$$\widetilde{f}^{(\bullet)!}_\bullet(\mathcal{F}^{(\bullet)}_\bullet) := \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z) \otimes^{\mathbb{L}}_{f^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} f^{-1}_\bullet\mathcal{F}^{(\bullet)}_\bullet\,[d_f],$$

where $\mathcal{F}^{(\bullet)}_\bullet \in D(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$.

(b) The (right version of the) extraordinary inverse image functor by $\widetilde{f}^{(\bullet)}$ is the functor $\widetilde{f}_{\bullet}^{(\bullet)!}\colon D({}^r\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to D({}^r\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$ which is defined by setting

$$\widetilde{f}_{\bullet}^{(\bullet)!}(\mathcal{M}_\bullet) := f_\bullet^{-1}\mathcal{M}_\bullet \otimes^{\mathbb{L}}_{f_\bullet^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet \leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z')\ [d_f],$$

where $\mathcal{M}_\bullet \in D({}^r\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$.

(c) For any $* \in \{r,l\}$, the extraordinary inverse image functor $\widetilde{f}^{(\bullet)!}\colon D({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to D({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$ by $\widetilde{f}$ is defined by setting

$$\widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)}) := \mathbb{R}\underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*} \circ \widetilde{f}_\bullet^{(\bullet)!} \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(\mathbb{N})}(\mathcal{F}^{(\bullet)})$$

where $\mathcal{F}^{(\bullet)} \in D({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$.

9.2.1.6 (Left to right)**.** For any $\mathcal{M}_\bullet \in D({}^r\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$, by copying the proof of 5.1.1.5.1 (replace the use of 5.1.1.2.1 by that of 9.2.1.4.1), we get the canonical isomorphism:

$$\widetilde{f}_{\bullet}^{(\bullet)!}(\mathcal{M}_\bullet \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)^{-1}) \xrightarrow{\sim} \widetilde{f}_{\bullet}^{(\bullet)!}(\mathcal{M}_\bullet) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')} \widetilde{\omega}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')^{-1}. \tag{9.2.1.6.1}$$

For any $\mathcal{E}_\bullet \in D({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$, this yields the isomorphism

$$\widetilde{f}_{\bullet}^{(\bullet)!}(\mathcal{E}_\bullet \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \xrightarrow{\sim} \widetilde{f}_{\bullet}^{(\bullet)!}(\mathcal{E}_\bullet) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')} \widetilde{\omega}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'). \tag{9.2.1.6.2}$$

Hence, for any $\mathcal{E} \in D^-({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ we get the isomorphisms

$$\begin{aligned}\widetilde{f}^{(\bullet)!}(\mathcal{E} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) &\underset{7.5.4.13.1}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*} \circ \widetilde{f}_\bullet^{(\bullet)!}(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(\mathbb{N})}(\mathcal{E}) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \widetilde{\omega}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \underset{9.2.1.6.2}{\xrightarrow{\sim}} \\ \mathbb{R}\underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*}(\widetilde{f}_\bullet^{(\bullet)!} \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(\mathbb{N})}(\mathcal{E}) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')} \widetilde{\omega}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')) &\underset{7.5.4.13.2}{\xrightarrow{\sim}} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*} \circ \widetilde{f}_\bullet^{(\bullet)!} \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(\mathbb{N})}(\mathcal{E}) \otimes_{\mathcal{B}_{\mathfrak{X}'}} \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z') \\ &= \widetilde{f}^{(\bullet)!}(\mathcal{E}) \otimes_{\mathcal{B}_{\mathfrak{X}'}} \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z').\end{aligned} \tag{9.2.1.6.3}$$

Notation 9.2.1.7. We have a structure of $(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'), f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$-bimodule on

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z',Z) := \underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet \to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet \to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z).$$

We get a structure of $(f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z), \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$-bimodule on

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \leftarrow \mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z,Z') := \underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet \leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z') \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet \leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z').$$

Proposition 9.2.1.8. *We have the following properties.*

(a) For any $\mathcal{F}^{(\bullet)} \in D({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, we have the canonical morphism

$$\widetilde{f}^{(\bullet)!}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z',Z) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}^{(\bullet)}\ [d_f] \to \widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)}). \tag{9.2.1.8.1}$$

(b) For any $\mathcal{F}^{(\bullet)} \in D({}^r\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, we have the canonical morphism

$$\widetilde{f}^{(\bullet)!}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) := f^{-1}\mathcal{F}^{(\bullet)} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \leftarrow \mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z,Z')\ [d_f] \to \widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)}). \tag{9.2.1.8.2}$$

(c) *For any* $* \in \{r, l\}$, *if* $\mathcal{F}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, *then the morphism 9.2.1.8.1 or 9.2.1.8.2 is an isomorphism.*

Proof. Let us construct 9.2.1.8.1. Denoting by $\mathcal{G}$ the left term of 9.2.1.8.1, we have the adjoint morphism $\mathcal{G} \to \mathbb{R}\underleftarrow{l}_{\mathfrak{X}'(\mathbb{N}),*} \circ \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}'(\mathbb{N})}(\mathcal{G})$. Since $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}'(\mathbb{N})}(\mathcal{G})$ is isomorphic to $\widetilde{f}^{(\bullet)!}_{\bullet}(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(\mathbb{N})}\mathcal{F}^{(\bullet)})$, we are done. Similarly, we construct 9.2.1.8.2. Finally, to check the last statement, we reduce to the case where $\mathcal{F}^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)$, which is obvious. □

Proposition 9.2.1.9. *For any* $\mathcal{F}^{(\bullet)} \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, *we have* $\widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)}) \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$. *For any* $\mathcal{F}^{(\bullet)}_{\bullet} \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$, *we have* $\widetilde{f}^{(\bullet)!}_{\bullet}(\mathcal{F}^{(\bullet)}_{\bullet}) \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$.

Proof. By using the equivalence of categories 8.5.1.10 and the isomorphims 9.2.1.6.2, we reduce to check that for any $\mathcal{F}^{(\bullet)}_{\bullet} \in D^-_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$, we have $\widetilde{f}^{(\bullet)!}_{\bullet}(\mathcal{F}^{(\bullet)}_{\bullet}) \in D^-_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$. Since the canonical morphism

$$\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z') \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet \to X^\sharp_\bullet/S^\sharp_\bullet}(Z', Z)$$

is an isomorphism, then so is the canonical morphism

$$\mathbb{L}\widetilde{f}^{(\bullet)*}_{\bullet}(\mathcal{F}^{(\bullet)}_{\bullet}) = \widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z') \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} f^{-1}\mathcal{F}^{(\bullet)}_{\bullet} \to \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet \to X^\sharp_\bullet/S^\sharp_\bullet}(Z', Z) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} f^{-1}\mathcal{F}^{(\bullet)}_{\bullet}. \tag{9.2.1.9.1}$$

Since the functor $\mathbb{L}\widetilde{f}^{(\bullet)*}_{\bullet}$ induces $\mathbb{L}\widetilde{f}^{(\bullet)*}_{\bullet} \colon D^-_{\mathrm{qc}}(\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)) \to D^-_{\mathrm{qc}}(\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z'))$ (see 9.2.1.3.4), then we are done. □

Lemma 9.2.1.10. *Let* $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. *With notation 9.2.1.15.3, the canonical morphism*

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z') \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} f^{-1}\mathcal{F}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z', Z) \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} f^{-1}\mathcal{F}^{(\bullet)} = \widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)})[-d_f]$$

is an isomorphism.

Proof. This follows from 9.2.1.9.1. □

9.2.1.11. It follows from 7.1.3.6.1 that we have the isomorphism for any $\mathcal{F}^{(\bullet)}_{\bullet} \in D^-({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$:

$$\left(\widetilde{f}^{(\bullet)!}_{\bullet}(\mathcal{F}^{(\bullet)}_{\bullet})\right)^{(m)}_i \xrightarrow{\sim} \widetilde{f}^{(m)!}_i(\mathcal{F}^{(m)}_i). \tag{9.2.1.11.1}$$

By using the equivalences of categories 7.3.3.3, it follows from 9.2.1.9 that for any $\mathcal{F}^{(\bullet)} \in D^-_{\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}'(\mathbb{N})}\widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \widetilde{f}^{(\bullet)!}_{\bullet}(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(\mathbb{N})}\mathcal{F}^{(\bullet)})$. Since $(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}(\mathbb{N})}\mathcal{F}^{(\bullet)})_i \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \mathcal{F}^{(\bullet)}$ and since we have the isomorphism $\left(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}'(\mathbb{N})}\widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)})\right)_i \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_i/S'^\sharp_i}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z)} \widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)})$, this yields

$$\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \widetilde{f}^{(\bullet)!}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \widetilde{f}^{(\bullet)!}_i(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \mathcal{F}^{(\bullet)}), \tag{9.2.1.11.2}$$

and similarly for right modules.

Notation 9.2.1.12. Let

$$\begin{array}{ccc} \mathfrak{X}''^\sharp & \xrightarrow{g} & \mathfrak{X}'^\sharp \\ \downarrow{\scriptstyle p_{\mathfrak{X}''^\sharp}} & & \downarrow{\scriptstyle p_{\mathfrak{X}'^\sharp}} \\ \mathfrak{S}''^\sharp & \xrightarrow{\phi'} & \mathfrak{S}'^\sharp, \end{array} \tag{9.2.1.12.1}$$

be a commutative diagram of nice fine $\mathcal{V}$-log formal schemes where $p_{\mathfrak{X}''^\sharp}$ is log smooth morphism. We suppose the underlying formal schemes of $\mathfrak{S}''$, $\mathfrak{X}'$ are p-torsion free. We suppose $S''^\sharp$, S'' are regular and that S'' is noetherian. We suppose X'' is regular. Let Z'' be some divisor of X'' such that $g(X'' \setminus Z'') \subset X' \setminus Z'$. We set $\widetilde{\mathfrak{X}}''^{\sharp(\bullet)} := (\mathfrak{X}''^\sharp, \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z''))$. We denote by $\widetilde{g}^{(\bullet)}$ the induced morphism $\widetilde{\mathfrak{X}}''^{(\bullet)}/\mathfrak{S}''^\sharp \to \widetilde{\mathfrak{X}}'^{(\bullet)}/\mathfrak{S}^\sharp$ of $\mathbb{N}$-ringed $\mathcal{V}$-log formal schemes.

Lemma 9.2.1.13. *We keep notation 9.2.1.12.*

(a) We have the canonical isomorphism of $D(\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet}(Z''), (f\circ g)^{-1}_\bullet \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$:

$$\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'',Z')\otimes^{\mathbb{L}}_{g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}} g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z)\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z'',Z). \tag{9.2.1.13.1}$$

(b) We have the canonical isomorphism of $D((f\circ g)^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z),\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet}(Z''))$:

$$g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet\leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z')\otimes^{\mathbb{L}}_{g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\leftarrow X''^\sharp_\bullet/S''^\sharp_\bullet}(Z',Z'')\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet\leftarrow X''^\sharp_\bullet/S''^\sharp_\bullet}(Z,Z''). \tag{9.2.1.13.2}$$

Proof. By quasi-flatness of $\widetilde{f}$, it follows from 5.1.1.3 that the morphisms are well defined. a) Let us check 9.2.1.13.1. i) We have the isomorphism of left $\mathcal{D}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet}(Z'')$-modules $\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'',Z')\otimes_{g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')}$ $g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z)\xrightarrow{\sim}\widetilde{g}^{(\bullet)*}_\bullet\widetilde{f}^*_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'',Z')\xrightarrow{\sim}(\widetilde{f}\circ\widetilde{g})^*_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$. Hence, it follows from 4.4.5.6 that we get the canonical isomorphism of left $\mathcal{D}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet}(Z'')$-modules

$$\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'',Z')\otimes_{g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')} g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z)\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z'',Z).$$

We obtain by functoriality the fact that this isomorphism is an isomorphism of $(\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet}(Z''),(f\circ g)^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$-bimodules.

ii) Moreover, since $\widetilde{f}^*_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)$ is $\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')$-flat then $\mathbb{L}\widetilde{g}^{(\bullet)*}_\bullet\left(\widetilde{f}^*_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)\right)\xrightarrow{\sim}\widetilde{g}^{(\bullet)*}_\bullet\left(\widetilde{f}^*_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)\right)$. Hence, it follows from 9.2.1.9.1 the isomorphism

$$\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'',Z')\otimes^{\mathbb{L}}_{g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')} f^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z)$$
$$\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(\bullet)}_{X''^\sharp_\bullet/S''^\sharp_\bullet\to X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'',Z')\otimes_{g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')} g^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet\to X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z).$$

b) Finally, we get the isomorphism 9.2.1.13.2 from 9.2.1.13.1 by twisting (use 9.2.1.4.1 and 4.3.5.6.1). □

Proposition 9.2.1.14. *With notation 9.2.1.12, let* $*\in\{r,l\}$.

(a) For any $\mathcal{E}_\bullet\in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$*, we have the canonical isomorphism*

$$\widetilde{g}^{(\bullet)!}_\bullet\circ\widetilde{f}^{(\bullet)!}_\bullet(\mathcal{E}_\bullet)\xrightarrow{\sim}(\widetilde{f\circ g})^{(\bullet)!}_\bullet(\mathcal{E}_\bullet). \tag{9.2.1.14.1}$$

(b) For any $\mathcal{E}\in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$*, we have the canonical isomorphism*

$$\widetilde{g}^{(\bullet)!}\circ\widetilde{f}^{(\bullet)!}(\mathcal{E})\xrightarrow{\sim}(\widetilde{f\circ g})^{(\bullet)!}(\mathcal{E}). \tag{9.2.1.14.2}$$

Proof. By using the equivalence of categories 8.5.1.10, we reduce to check the isomorphism 9.2.1.14.1. This latter one can be checked similarly to 5.1.1.13 by using 9.2.1.13. □

9.2.1.15. For any $*\in\{r,l\}$, similarly to 8.5.4.8.1, the extraordinary inverse image functors $\widetilde{f}^{(\bullet)!}_\bullet$ and $\widetilde{f}^{(\bullet)!}$ of 9.2.1.5 send lim-ind-isogenies to lim-ind-isogenies and preserve the quasi-coherence. This yields the factorizations denoted by:

$$(f,\phi)^{(\bullet)!}_{\bullet Z',Z}\colon \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))\to\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')), \tag{9.2.1.15.1}$$

$$(f,\phi)^{(\bullet)!}_{Z',Z}\colon \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))\to\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')). \tag{9.2.1.15.2}$$

They are called the *extraordinary inverse image* by (f,ϕ) (or simply f when ϕ is understood) with overconvergent singularities along Z and Z'. Remark that $(\mathrm{id},\phi)^{(\bullet)!}_{Z',Z}=({}^{\dagger}Z',Z)$. When $\phi=\mathrm{id}_{\mathfrak{S}^\sharp}$, we replace $\mathrm{id}_{\mathfrak{S}^\sharp}$ by $_{/\mathfrak{S}^\sharp}$ and $\mathrm{id}_{S^\sharp_\bullet}$ by $_{/S^\sharp_\bullet}$, e.g. $f^{(\bullet)!}_{\bullet/S^\sharp_\bullet,Z',Z}:=(f,\mathrm{id}_{S^\sharp_\bullet})^{(\bullet)!}_{\bullet Z',Z}$ and $f^{(\bullet)!}_{/\mathfrak{S}^\sharp,Z',Z}:=(f,\mathrm{id}_{\mathfrak{S}^\sharp})^{(\bullet)!}_{Z',Z}$. To lighten the notations, when ϕ is understood, we simply write f instead of (f,ϕ), e.g. $f^{(\bullet)!}_{Z',Z}$ instead of $(f,\phi)^{(\bullet)!}_{Z',Z}$. We also denote by

$$\mathbb{L}(f,\phi)^{*(\bullet)}_{\bullet Z',Z}:=(f,\phi)^{(\bullet)!}_{\bullet Z',Z}[-d_f]\qquad \mathbb{L}(f,\phi)^{*(\bullet)}_{Z',Z}:=(f,\phi)^{(\bullet)!}_{Z',Z}[-d_f], \tag{9.2.1.15.3}$$

or simply $\mathbb{L}f^{*(\bullet)}_{\bullet Z',Z}$ and $\mathbb{L}f^{*(\bullet)}_{Z',Z}$; when f is smooth, we remove $\mathbb{L}$. When $Z'=f^{-1}(Z)$, we remove Z' in the notation, e.g. $(f,\phi)^{(\bullet)!}_{Z}:=(f,\phi)^{(\bullet)!}_{f^{-1}(Z),Z}$. If moreover Z is empty, we remove Z in the notation.

For any $\mathcal{E}^{(\bullet)}\in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, $\mathcal{M}^{(\bullet)}\in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)))$ we have the isomorphisms of $D^{-}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$:

$$(f,\phi)^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)})\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z',Z)\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)}f^{-1}\mathcal{E}^{(\bullet)}[d_{\mathfrak{X}'/\mathfrak{X}}],$$

$$(f,\phi)^{(\bullet)!}_{Z',Z}(\mathcal{M}^{(\bullet)})\xrightarrow{\sim}\mathcal{M}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\leftarrow\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z,Z')[d_{\mathfrak{X}'/\mathfrak{X}}] \tag{9.2.1.15.4}$$

where the tensor product is defined at 8.5.4.8.3.

9.2.1.16. For any $*\in\{r,l\}$, the extraordinary inverse image functors $\widetilde{f}^{(\bullet)!}_{\mathrm{alg}}$ of 9.2.1.8 send lim-ind-isogenies to lim-ind-isogenies but beware they do not preserve the quasi-coherence. This yields the factorizations denoted by:

$$(f,\phi)^{(\bullet)!}_{\mathrm{alg}\,Z',Z}\colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))\to\underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')). \tag{9.2.1.16.1}$$

We can slightly improve 9.2.1.8.(c) with the following lemma. When ϕ is understood, we simply write f instead of (f,ϕ), etc.

Lemma 9.2.1.17. *Let $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. The canonical morphism $f^{(\bullet)!}_{\mathrm{alg}\,Z',Z}(\mathcal{E}^{(\bullet)})\to f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)})$ is an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$.*

Proof. By definition, there exist $\lambda\in L$ and an isomorphism $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ of the form $\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathcal{F}^{(\bullet)}$ such that $\mathcal{F}^{(m)}\in D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\lambda(m))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ (plus another condition that we do not need here). We reduce to check the lemma for $\mathcal{F}^{(\bullet)}$ in the place of $\mathcal{E}^{(\bullet)}$. Denote by $f^{!\lambda(\bullet)}_{\mathrm{alg}\,Z',Z}(\mathcal{F}^{(\bullet)}):=(f^{!(\lambda(m))}_{\mathrm{alg}\,Z',Z}(\mathcal{F}^{(m)}))_{m\in\mathbb{N}}\in D^{\mathrm{b}}(\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ and $f^{!\lambda(\bullet)}_{Z',Z}(\mathcal{F}^{(\bullet)}):=(f^{!(\lambda(m))}_{Z',Z}(\mathcal{F}^{(m)}))_{m\in\mathbb{N}}\in D^{\mathrm{b}}(\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Moreover, we have canonical morphism $f^{!\lambda(\bullet)}_{Z',Z}(\mathcal{F}^{(\bullet)})\to\lambda^{*}\left(f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)})\right)$ inducing the canonical commutative diagram:

$$\begin{array}{ccc}
f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)}) & \longrightarrow & f^{!\lambda(\bullet)}_{Z',Z}(\mathcal{F}^{(\bullet)}) \\
\downarrow & \swarrow & \downarrow \\
\lambda^{*}\left(f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)})\right) & \longrightarrow & \lambda^{*}\left(f^{!\lambda(\bullet)}_{Z',Z}(\mathcal{F}^{(\bullet)})\right).
\end{array}$$

This yields that $f^{!\lambda(\bullet)}_{Z',Z}(\mathcal{F}^{(\bullet)})$ is canonically isomorphic to $f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)})$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Similarly, we get that $f^{!\lambda(\bullet)}_{\mathrm{alg}\,Z',Z}(\mathcal{F}^{(\bullet)})$ is canonically isomorphic to $f^{(\bullet)!}_{\mathrm{alg}\,Z',Z}(\mathcal{F}^{(\bullet)})$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Hence, we reduce to check that the canonical morphism

$$f^{!\lambda(\bullet)}_{\mathrm{alg}\,Z',Z}(\mathcal{F}^{(\bullet)})\to f^{!\lambda(\bullet)}_{Z',Z}(\mathcal{F}^{(\bullet)}) \tag{9.2.1.17.1}$$

is an isomorphism of $D^{\mathrm{b}}(\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, which is a consequence of the fact that $\mathcal{F}^{(m)}\in D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\lambda(m))}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. □

Proposition 9.2.1.18. *Let D and D' be some divisors of respectively X and X' such that $f(X'\setminus D')\subset X\setminus D$, $D\subset Z$, and $D'\subset Z'$. Let $\mathcal{E}^{(\bullet)}\in D^{-}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$. We have the isomorphism in $D^{-}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$ of the form*

$$({}^\dagger Z',D')\circ f^{(\bullet)!}_{D',D}(\mathcal{E}^{(\bullet)})\xrightarrow{\sim} f^{(\bullet)!}_{Z',D}(\mathcal{E}^{(\bullet)})\xrightarrow{\sim} f^{(\bullet)!}_{Z',Z}\circ({}^\dagger Z,D)(\mathcal{E}^{(\bullet)}).$$

Proof. This is a consequence of the transitivity of the extraordinary inverse image (see 9.2.1.14). □

Proposition 9.2.1.19. *The functors 9.2.1.15.1 and 9.2.1.15.2 preserves bounded complexes, i.e. it induces*

$$f^{(\bullet)!}_{\bullet Z',Z}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))\to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')), \tag{9.2.1.19.1}$$

$$f^{(\bullet)!}_{Z',Z}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))\to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')). \tag{9.2.1.19.2}$$

Proof. Since the functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}'^{(\mathbb{N})},*}$ and $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}$ preserve the boundedness, then we reduce to only check 9.2.1.19.1. Let $\mathcal{E}^{(\bullet)}_\bullet\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$. We deduce from 9.2.1.18 the isomorphism $({}^\dagger Z')\circ f^{(\bullet)!}_\bullet(\mathrm{forg}_Z(\mathcal{E}^{(\bullet)}_\bullet))\xrightarrow{\sim} f^{(\bullet)!}_{\bullet Z',Z}\circ({}^\dagger Z)(\mathrm{forg}_Z(\mathcal{E}^{(\bullet)}_\bullet))$. Following 9.1.2.3.1, we have the isomorphism $({}^\dagger Z)(\mathrm{forg}_Z(\mathcal{E}^{(\bullet)}_\bullet)$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. Since the boundedness is preserved by the functors $({}^\dagger Z')$ (see 9.1.1.5) and $f^{(\bullet)!}_\bullet$ (see 9.2.1.2 and 9.2.1.9.1), then we are done. □

Notation 9.2.1.20. By passing to the limit on the level, we get the following bimodules.

(a) We get a $(\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z')_{\mathbb{Q}}, f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$-bimodule by setting

$$\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z',Z)_{\mathbb{Q}}:=\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z',Z)_{\mathbb{Q}}.$$

(b) We get the $(f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}},\, \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z')_{\mathbb{Q}})$-bimodule by setting

$$\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\leftarrow\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z,Z')_{\mathbb{Q}}:=\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\leftarrow\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z,Z')_{\mathbb{Q}}.$$

(c) By taking the projective limits and then inductive limits on the level, it follows from 5.1.1.2.1, that we have the isomorphism:

$$\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\leftarrow\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z,Z')_{\mathbb{Q}}\xrightarrow{\sim}\omega_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}\otimes_{\mathcal{O}_{\mathfrak{X}'}}\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z',Z)_{\mathbb{Q}}\otimes_{f^{-1}\mathcal{O}_{\mathfrak{X}}} f^{-1}\omega^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}. \tag{9.2.1.20.1}$$

Notation 9.2.1.21 (Extraordinary inverse image)**.** Let $*\in\{\mathrm{l},\mathrm{r}\}$.

(a) The extraordinary inverse image by (f,ϕ) (or simply f when ϕ is understood) with overconvergent singularities along Z and Z' is also a functor of the form $f^!_{Z',Z}\colon D^-({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})\to D^-({}^*\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z')_{\mathbb{Q}})$ which is defined for any $\mathcal{E}\in D^-({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ and $\mathcal{M}\in D^-({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ by setting:

$$f^!_{Z',Z}(\mathcal{E}):=\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z',Z)_{\mathbb{Q}}\otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}} f^{-1}\mathcal{E}[d_f], \tag{9.2.1.21.1}$$

$$f^!_{Z',Z}(\mathcal{M}):=f^{-1}\mathcal{M}\otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\leftarrow\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z,Z')_{\mathbb{Q}}[d_f]. \tag{9.2.1.21.2}$$

(b) We can also consider the functors $\mathbb{L}f^*_{Z',Z}:=f^!_{Z',Z}[-d_f]$, which is the left derived functor of the functor denoted by $f^*_{Z',Z}$ which corresponds to the above tensor product without $\mathbb{L}$ and shift.

(c) When $Z'=f^{-1}(Z)$, we simply write respectively $f^!_Z$ and $\mathbb{L}f^*_Z$. If moreover Z is empty, we write $f^!$ and $\mathbb{L}f^*$.

9.2.1.22 (Log-étale case)**.** Suppose the bottom square of 9.2.1.0.1 is the identity and f is log-étale. Then, following 5.1.3.6, the canonical morphism of left $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')$-modules $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z') \to \widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}\to X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}$ is an isomorphism and the composite induced map $f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}} \to \widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}\to X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}} \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')$ is a ring homomorphism. Taking the projective and inductive limits, tensoring with $\mathbb{Q}$, this yields that the canonical morphism $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}} \to \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}\to\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z',Z)_{\mathbb{Q}}$ is an isomorphism and the induced map $f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}} \to \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}}$ is a ring homomorphism. For any $\mathcal{E} \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$, we have therefore the isomorphism:

$$f^{!}_{Z',Z}(\mathcal{E}) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}} f^{-1}\mathcal{E}[d_f]. \tag{9.2.1.22.1}$$

Similarly, the canonical morphism of right $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')$-modules $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z') \to \widetilde{\mathcal{D}}^{(\bullet)}_{Y^{\sharp}_{\bullet}\leftarrow X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}$ is an isomorphism and the composite induced map $f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}} \to \widetilde{\mathcal{D}}^{(\bullet)}_{Y^{\sharp}_{\bullet}\leftarrow X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}} \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')$ is the ring homomorphism. For any $\mathcal{M} \in D^{-}({}^{\mathrm{r}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$, this yields the isomorphism:

$$f^{!}_{Z',Z}(\mathcal{M}) \xrightarrow{\sim} f^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}}[d_f]. \tag{9.2.1.22.2}$$

9.2.1.23. Similarly to 5.1.1.5.1, it follows from 9.2.1.20.1 that for any $\mathcal{E} \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$, we check the isomorphism

$$\omega_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} f^{!}_{Z',Z}(\mathcal{E}) \xrightarrow{\sim} f^{!}_{Z',Z}(\omega_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}). \tag{9.2.1.23.1}$$

Proposition 9.2.1.24. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$. The functors 9.2.1.15.2 and 9.2.1.21.1 are compatible with the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ (see notation 9.1.6.1), i.e. we have the functorial isomorphism:*

$$f^{!}_{Z',Z} \circ \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \underrightarrow{l}^{*}_{\mathbb{Q}} \circ f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)}).$$

Proof. This follows from 9.2.1.17. □

9.2.1.25. With notation 9.1.6.6, the proposition 9.2.1.24 means that we have the isomorphism of functors $\mathrm{Coh}_{Z}(f^{(\bullet)!}_{Z',Z}) \xrightarrow{\sim} f^{!}_{Z',Z}$.

Lemma 9.2.1.26 (Tor independence)**.** *Suppose $Z' := f^{-1}(Z)$. We have the canonical isomorphism*

$$\mathcal{O}_{X'_i} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}_{X_i}} f^{-1}\mathcal{B}^{(m)}_{X_i}(Z) \xrightarrow{\sim} \mathcal{B}^{(m)}_{X'_i}(Z').$$

We have also the canonical isomorphism $f^{(\bullet)!}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)) \xrightarrow{\sim} \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')[d_f]$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z'))$.

Proof. 1) To check the first isomorphism, since the canonical morphism $\mathcal{O}_{X'_i} \otimes_{f^{-1}\mathcal{O}_{X_i}} f^{-1}\mathcal{B}^{(m)}_{X_i}(Z) \xrightarrow{\sim} \mathcal{B}^{(m)}_{X'_i}(Z')$ is an isomorphism, we reduce to check that the canonical morphism $\mathcal{O}_{X'_i} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}_{X_i}} f^{-1}\mathcal{B}^{(m)}_{X_i}(Z) \to \mathcal{O}_{X'_i} \otimes_{f^{-1}\mathcal{O}_{X_i}} f^{-1}\mathcal{B}^{(m)}_{X_i}(Z)$ is an isomorphism. Since this is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ affine, integral and there exist $a \in \mathcal{O}_{\mathfrak{X}}$ lifting a local equation of $Z \subset X$. We get $a' := f^{*}(a) \in \mathcal{O}_{\mathfrak{X}'}$ a lifting of a local equation of $Z' \subset X'$. Since $\mathfrak{X}$ is p-torsion free, we have the short exact sequence $0 \to \mathcal{O}_{\mathfrak{X}}\{T\} \underset{a^{p^{m+1}}}{\longrightarrow} \mathcal{O}_{\mathfrak{X}}\{T\} \to \mathcal{B}^{(m)}_{\mathfrak{X}}(Z) \to 0$. Since $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)$ is p-torsion free (see 8.7.4.1), this yields the short exact sequence $0 \to \mathcal{O}_{X_i}[T] \underset{\overline{a}^{p^{m+1}}T-p}{\longrightarrow} \mathcal{O}_{X_i}[T] \to \mathcal{B}^{(m)}_{X_i}(Z) \to 0$ where $\overline{a}$ is the reduction of a modulo π^{i+1}, which is a resolution of $\mathcal{B}^{(m)}_{X_i}(Z)$ by free $\mathcal{O}_{X_i}$-modules. By applying $\mathcal{O}_{X'_i} \otimes_{f^{-1}\mathcal{O}_{X_i}} f^{-1}-$ to this resolution, we get the sequence $0 \to \mathcal{O}_{X'_i}[T] \underset{\overline{a'}^{p^{m+1}}T-p}{\longrightarrow} \mathcal{O}_{X'_i}[T] \to \mathcal{B}^{(m)}_{X'_i}(Z') \to 0$ where $\overline{a'}$ is the reduction of a' modulo π^{i+1}, which is exact (for the same reason as above) and we are done.

2) Since, for any nonnegative integer m, the $\mathcal{V}$-modules $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(Z')$ and $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z)$ are p-torsion free, we get the second isomorphism from the first one. □

Proposition 9.2.1.27. *Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$.*

(a) *We have the canonical isomorphism in* $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$*:*

$$f^{(\bullet)!}_{Z',Z}\left(\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}\right)[d_f] \xrightarrow{\sim} f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')}f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)}). \tag{9.2.1.27.1}$$

(b) *With notation 9.2.1.12, the isomorphisms of the form 9.2.1.27.1 are transitive, i.e., the following diagram*

$$\begin{array}{ccc} g^{(\bullet)!}_{Z'',Z'}\circ f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}\mathcal{F}^{(\bullet)})[d_{f\circ g}] & \xrightarrow{\sim} & (f\circ g)^{(\bullet)!}_{Z'',Z}(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}\mathcal{F}^{(\bullet)})[d_{f\circ g}] \\ \downarrow{\scriptstyle 9.2.1.27.1} & & \\ g^{(\bullet)!}_{Z'',Z'}(f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)}))[d_f] & & \downarrow{\scriptstyle 9.2.1.27.1} \\ \downarrow{\scriptstyle 9.2.1.27.1} & & \\ g^{(\bullet)!}_{Z'',Z'}\circ f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}g^{(\bullet)!}_{Z'',Z'}\circ f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & (f\circ g)^{(\bullet)!}_{Z'',Z}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}(f\circ g)^{(\bullet)!}_{Z'',Z}(\mathcal{F}^{(\bullet)}) \end{array} \tag{9.2.1.27.2}$$

is commutative.

Proof. Since pullback commutes with tensor products (see 7.5.5.9), we get

$$f^{(\bullet)!}_{\bullet Z',Z}\left(\mathcal{F}^{(\bullet)}_{\bullet}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}_{\bullet}\right)[d_f] \xrightarrow{\sim} f^{(\bullet)!}_{\bullet Z',Z}(\mathcal{F}^{(\bullet)}_{\bullet})\otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}(Z')}f^{(\bullet)!}_{\bullet Z',Z}(\mathcal{E}^{(\bullet)}_{\bullet}). \tag{9.2.1.27.3}$$

This yields the isomorphism 9.2.1.27.1 by construction.

Following 8.5.4.5, the functors $\mathbb{R}\underleftrightarrow{l}_{\mathfrak{X}^{(\mathbb{N})}*}$ and $\mathbb{L}\underleftrightarrow{l}^{*}_{\mathfrak{X}^{(\mathbb{N})}}$ induce canonically quasi-inverse equivalences of categories between $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ and $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$. Hence, to get the commutative diagram 9.2.1.27.2, we reduce to check that the isomorphisms of the form 9.2.1.27.3 is transitive, which is obvious. □

By using Lemma 9.2.1.26, we get a derived functor version of 4.4.5.2:

Proposition 9.2.1.28. *Suppose* $Z' = f^{-1}(Z)$*.*

(a) *Let* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$*. We have the canonical isomorphism* $f^{(\bullet)!}\circ \mathrm{forg}_Z \circ ({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathrm{forg}_{Z'}\circ({}^\dagger Z')\circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$*, which we can simply write* $f^{(\bullet)!}\circ({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z')\circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$*.*

(b) *Let* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$*. We have the canonical isomorphism* $\mathrm{forg}_{Z'}\circ f^{(\bullet)!}_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} f^{(\bullet)!}\circ \mathrm{forg}_Z(\mathcal{E}^{(\bullet)})$*. Hence, it is harmless to write by abuse of notation* $f^{(\bullet)!}$ *instead of* $f^{(\bullet)!}_Z$*.*

Proof. Using 9.2.1.27.1,9.2.1.26, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, we get the isomorphism

$$\begin{aligned} f^{(\bullet)!}\circ \mathrm{forg}_Z\circ({}^\dagger Z)(\mathcal{E}^{(\bullet)}) &= f^{(\bullet)!}\left(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)}\right) \\ &\xrightarrow{\sim} \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}'}}f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) = \mathrm{forg}_{Z'}\circ({}^\dagger Z')\circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)}). \end{aligned}$$

By using 9.1.2.3.1 and 9.2.1.18, we check the second part from the first one. □

Remark 9.2.1.29. With notation 9.2.1.28, using the remark 9.1.6.7 we check that the functors $\mathrm{Coh}_Z(f^{(\bullet)!}_Z)$ and $\mathrm{Coh}(f^{(\bullet)!})$ are isomorphic over $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})\cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$. Since we have the canonical isomorphisms of functors $\mathrm{Coh}_Z(f^{(\bullet)!}_Z)\xrightarrow{\sim} f^!_Z$ and $\mathrm{Coh}_Z(f^{(\bullet)!})\xrightarrow{\sim} f^!$ (9.2.1.25), then it is harmless to write $f^!$ instead of $f^!_Z$.

9.2.2 Glueing pullbacks

We keep notation 9.2.1 and 9.2.1.12. Let $f', f''\colon \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ be two other $\mathfrak{S}^\sharp$ morphisms such that $f_0 = f'_0 = f''_0$. Let $g', g''\colon \mathfrak{X}''^\sharp \to \mathfrak{X}'^\sharp$ be two other $\mathfrak{S}^\sharp$ morphisms such that $g_0 = g'_0 = g''_0$.

9.2.2.1. It follows from 4.4.5.3 that we have the canonical glueing isomorphism of functors $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z'))$ of the form

$$\tau^{(\bullet)}_{f,f'} \colon f'^{(\bullet)!}_{Z',Z} \xrightarrow{\sim} f^{(\bullet)!}_{Z',Z},$$

where to lighten notation we have avoid indicating Z and Z'. It follows from 4.4.5.9 that these isomorphisms satisfy the following formulas $\tau^{(\bullet)}_{f,f} = \mathrm{id}$, $\tau^{(\bullet)}_{f,f''} = \tau^{(\bullet)}_{f,f'} \circ \tau^{(\bullet)}_{f',f''}$, $g^{(\bullet)!}_{Z'',Z'} \circ \tau^{(\bullet)}_{f,f'} = \tau^{(\bullet)}_{f\circ g,f'\circ g}$ and $\tau^{(\bullet)}_{g,g'} \circ f^{(\bullet)!}_{Z',Z} = \tau^{(\bullet)}_{f\circ g,f\circ g'}$.

Proposition 9.2.2.2. *Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. We have the commutative diagram :*

$$\begin{array}{ccc} f^{(\bullet)!}_{Z',Z}\left(\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}\right)[d_f] & \xrightarrow[\sim]{9.2.1.27.1} & f^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')} f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)}) \\ \sim\downarrow \tau^{(\bullet)}_{f',f} & & \sim\downarrow \tau^{(\bullet)}_{f',f}\otimes\tau^{(\bullet)}_{f',f} \\ f'^{(\bullet)!}_{Z',Z}\left(\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}\right)[d_f] & \xrightarrow[\sim]{9.2.1.27.1} & f'^{(\bullet)!}_{Z',Z}(\mathcal{F}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')} f'^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)}), \end{array} \tag{9.2.2.2.1}$$

the isomorphisms of glueing $\tau^{(\bullet)}_{f',f}$ having been defined at 9.2.2.1.

Proof. This is a consequence of 4.4.5.8.2. □

Proposition 9.2.2.3. *We have the following properties.*

(a) There exists a canonical glueing isomorphism of functors $D(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D(\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z')_{\mathbb{Q}})$ of the form

$$\tau_{f,f'} \colon f'^{!}_{Z',Z} \xrightarrow{\sim} f^{!}_{Z',Z}, \tag{9.2.2.3.1}$$

such that $\tau_{f,f} = \mathrm{id}$, $\tau_{f,f''} = \tau_{f,f'}\circ\tau_{f',f''}$. For any $\mathcal{E} \in D(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$, we write $\tau_{f,f'}(\mathcal{E}) \colon f'^{!}_{Z',Z}(\mathcal{E}) \xrightarrow{\sim} f^{!}_{Z',Z}(\mathcal{E})$ or $\tau^{\mathcal{E}}_{f,f'}$ this corresponding canonical isomorphism.

(b) The diagram of functors $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)) \to D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z')_{\mathbb{Q}})$

$$\begin{array}{ccc} \underrightarrow{l}^*_{\mathbb{Q}} \circ f'^{(\bullet)!}_{Z',Z} & \xrightarrow[\underrightarrow{l}^*_{\mathbb{Q}}\circ\tau^{(\bullet)}_{f,f'}]{\sim} & \underrightarrow{l}^*_{\mathbb{Q}} \circ f^{(\bullet)!}_{Z',Z} \\ \downarrow\sim & & \downarrow\sim \\ f'^{!}_{Z',Z} \circ \underrightarrow{l}^*_{\mathbb{Q}} & \xrightarrow{\tau_{f,f'}\circ\underrightarrow{l}^*_{\mathbb{Q}}} & f^{!}_{Z',Z} \circ \underrightarrow{l}^*_{\mathbb{Q}} \end{array}$$

is commutative up to canonical isomorphism.

(c) Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z))$ such that $f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z))$. Set $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E})$. Then $g^{!}_{Z'',Z'}(\tau_{f,f'}(\mathcal{E})) = \tau_{f\circ g,f'\circ g}(\mathcal{E})$ and $\tau_{g,g'}(f^{!}_{Z',Z}(\mathcal{E})) = \tau_{f\circ g,f\circ g'}(\mathcal{E})$.

Proof. Let us prove a). Let $\mathcal{E} \in D(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$. Tensoring by $\mathbb{Q}$ the inductive limit on the level of the inverse limits on i of the glueing isomorphisms $\mathcal{D}^{(m)}_{X'^\sharp_i/S'^\sharp_i \xrightarrow{g_i} X^\sharp_i/S^\sharp_i}({}^\dagger Z) \xrightarrow{\sim} \mathcal{D}^{(m)}_{X'^\sharp_i/S'^\sharp_i \xrightarrow{f_i} X^\sharp_i/S^\sharp_i}({}^\dagger Z)$ of 4.4.5.3, we get the isomorphism $\tau_{f,g} \colon \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \xrightarrow{g} \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \xrightarrow{f} \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$. Finally, we construct $\tau_{f,g}(\mathcal{E})$ to be the composition $f'^{!}_{Z',Z}\mathcal{E} = \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \xrightarrow{g} \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f_0^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}} f_0^{-1}\mathcal{F}[d_f] \xrightarrow[\tau_{f,g}\otimes^{\mathbb{L}}\mathrm{id}]{\sim} \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \xrightarrow{f} \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f_0^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}} f_0^{-1}\mathcal{F}[d_f] = f^{!}_{Z',Z}\mathcal{E}$. It follows from 4.4.5.3 the desired properties of the part a).

By construction of both $\tau_{f,g}$ and $\tau^{(\bullet)}_{f,g}$, we can easily check b). The part c) follows from the part b) and from 9.2.1.24 and 9.2.2.1. □

9.2.2.4. To define pullbacks (or the pushforwards) with notation 9.2.1, we do not need that the morphism f_0 has a lifting. More precisely, let be the commutative diagram

$$\begin{array}{ccccc} X'^{\sharp} & \hookrightarrow & \mathfrak{X}'^{\sharp} & \xrightarrow{p_{\mathfrak{X}'^{\sharp}}} & \mathfrak{S}'^{\sharp} \\ \downarrow{\scriptstyle f_0} & & & & \downarrow{\scriptstyle \phi} \\ X^{\sharp} & \hookrightarrow & \mathfrak{X}^{\sharp} & \xrightarrow{p_{\mathfrak{X}^{\sharp}}} & \mathfrak{S}^{\sharp}, \end{array} \tag{9.2.2.4.1}$$

where $p_{\mathfrak{X}^{\sharp}}$ and $p_{\mathfrak{X}'^{\sharp}}$ are log smooth morphisms of very nice (see definition 3.3.1.10.(b)) fine $\mathcal{V}$-log formal schemes. We suppose S, $S^{\sharp}$, S', $S'^{\sharp}$, X and X' are regular (to have an idea about theses hypotheses, see [GR, 12.5.19]) and noetherian. Let Z and Z' be some divisors of respectively X and X' such that $f(X' \setminus Z') \subset X \setminus Z$. Then similarly to 9.2.1.15.1 and 9.2.1.15.2, it follows from 4.4.5.11 that we get the functors

$$(f_0,\phi)^{(\bullet)!}_{\bullet Z',Z} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')), \tag{9.2.2.4.2}$$

$$(f_0,\phi)^{(\bullet)!}_{Z',Z} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z')). \tag{9.2.2.4.3}$$

In the case where f_0 is the relative Frobenius, we will study more precisely later at 9.5.1.2.

9.2.2.5. Suppose f is finite and $Z' = f_0^{-1}(Z)$. Then using 7.2.1.4, we can check that the canonical morphism

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(Z') \otimes^{\mathbb{L}}_{f_0^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(Z)} f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z) \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp} \xrightarrow{f} \mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)$$

is an isomorphism. Tensoring by $\mathbb{Q}$ and taking the inductive limit over the level, this yields the canonical isomorphism

$$\mathcal{O}_{\mathfrak{X}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f_0^{-1}\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}} f_0^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp} \xrightarrow{f} \mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}.$$

Let $\mathcal{E} \in D^{-}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$. Hence, by associativity of the tensor product, so is the canonical morphism

$$\mathcal{O}_{\mathfrak{X}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f_0^{-1}\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}} f_0^{-1}\mathcal{E} \to \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp} \xrightarrow{f} \mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f_0^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}} f_0^{-1}\mathcal{F} = \mathbb{L}f^{*}_{Z}\mathcal{E} = f^{!}_{Z}\mathcal{E}[-d_f]$$

is an isomorphism. Hence, if $\mathcal{P}$ is a complex of left $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}$-modules which are $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$-flat, if $\mathcal{P} \to \mathcal{E}$ is a quasi-isomorphism of $K^{-}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$ then we get the isomorphism $f^{*}_{Z}(\mathcal{P}) \xrightarrow{\sim} \mathbb{L}f^{*}_{Z}\mathcal{E}$ of $D^{-}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$.

Remark 9.2.2.6. Let $\mathcal{E} \in D^{-}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$.

(a) Let $\mathcal{P}$ be a complex of flat left $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}$-modules endowed with a quasi-isomorphism $\mathcal{P} \to \mathcal{E}$. The isomorphism $\tau_{f,f'} \colon f'^{!}_{Z',Z}\mathcal{E} \xrightarrow{\sim} f^{!}_{Z',Z}\mathcal{E}$ is represented (up to the shift $[d_{f_0}]$) by the isomorphism of $\tau_{f,f'} \colon f'^{*}_{Z',Z}(\mathcal{P}) \xrightarrow{\sim} f^{*}_{Z',Z}(\mathcal{P})$ of $C(\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$ which is computed term by term.

(b) Suppose f and g are finite morphisms. Suppose $Z' = f_0^{-1}(Z)$ and $Z'' = g_0^{-1}(Z')$. Let $\mathcal{P}$ be a complex of flat left $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}$-modules which are $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$-flat together with a quasi-isomorphism $\mathcal{P} \to \mathcal{E}$. It follows from 9.2.2.5 that the isomorphism $\tau_{f,f'} \colon f'^{!}_{Z}\mathcal{E} \xrightarrow{\sim} f^{!}_{Z}\mathcal{E}$ is represented (up to the shift $[d_{f_0}]$) by the isomorphism of $\tau_{f,f'} \colon f'^{*}_{Z}(\mathcal{P}) \xrightarrow{\sim} f^{*}_{Z}(\mathcal{P})$ of $C(\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$ which is computed term by term.

9.2.3 Projection formula given by a ringed topoi morphism

We keep notation 9.2.1. In order to check later that the pushforwards are compatible with the quasi-inverse functors $- \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z)} \widetilde{\omega}^{(\bullet)-1}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}$ and $\widetilde{\omega}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z)} -$ exchanging left and right $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)$-module structures, we will need the following projection formula (see 9.2.4.8).

Proposition 9.2.3.1. Let $\mathcal{F}_\bullet^{(\bullet)} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$ and $\mathcal{G}_\bullet^{(\bullet)} \in D({}^{\mathrm{l}}f_\bullet^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$.

(i) We have the canonical morphism in $D(\mathbb{Z}_{X_\bullet})$:

$$\mathcal{F}_\bullet^{(\bullet)} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} \mathbb{R}f_{\bullet *}(\mathcal{G}_\bullet^{(\bullet)}) \to \mathbb{R}f_{\bullet *}\left(f_\bullet^{-1}\mathcal{F}_\bullet^{(\bullet)} \otimes^{\mathbb{L}}_{f_\bullet^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} \mathcal{G}_\bullet^{(\bullet)}\right). \tag{9.2.3.1.1}$$

Let $\mathcal{D}_\bullet$ be a sheaf of rings on $X_\bullet$ such that $(\mathcal{D}_\bullet, \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$ is solvable by $\mathcal{R}_\bullet$ and $\mathcal{F}_\bullet^{(\bullet)} \in D(\mathcal{D}_\bullet, \mathcal{R}_\bullet, \widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$ (see definition and notation 4.6.3.2). Then the morphism 9.2.3.1.1 can also be viewed as a morphism of $D(\mathcal{D}_\bullet)$.

(ii) Suppose f is quasi-compact and quasi-separated. Suppose moreover for any $i \in \mathbb{Z}$ one of the following conditions hold:

(a) either $\mathcal{F}_i^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$, and $\mathcal{G}_i^{(\bullet)} \in D({}^{\mathrm{l}}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$,

(b) or S_i is a noetherian scheme of finite Krull dimension, and $\mathcal{F}_i^{(\bullet)} \in D^{-}_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$, and $\mathcal{G}_i^{(\bullet)} \in D^{-}({}^{\mathrm{l}}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$.

Then the morphism 9.2.3.1.1 is an isomorphism.

Proof. We construct 9.2.3.1.1 as 5.1.2.5.1. The second statement is a consequence of 5.1.2.5.1. □

Remark 9.2.3.2. Inverting r and l, we get the morphism

$$\mathbb{R}f_{\bullet *}(\mathcal{G}_\bullet) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} \mathcal{F}_\bullet^{(\bullet)} \to \mathbb{R}f_{\bullet *}\left(\mathcal{G}_\bullet \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} f^{-1}\mathcal{F}_\bullet^{(\bullet)}\right), \tag{9.2.3.2.1}$$

which is an isomorphism when we invert the corresponding hypotheses.

Corollary 9.2.3.3. *Let $*, ** \in \{\mathrm{l}, \mathrm{r}\}$ such that both are not equal to* r. *Suppose f is quasi-compact and quasi-separated.*

(a) either $\mathcal{F}_i^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$, and $\mathcal{G}_i \in D({}^{**}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$,

(b) or S_i is a noetherian scheme of finite Krull dimension, and $\mathcal{F}_i^{(\bullet)} \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$, and $\mathcal{G}_i \in D^{-}({}^{**}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$.

Then we have the following isomorphism of $D^{-}({}^{**}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_i/S^\sharp_i}(Z))$:

$$\mathcal{F}_\bullet^{(\bullet)} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \mathbb{R}f_{\bullet *}(\mathcal{G}_\bullet) \xrightarrow{\sim} \mathbb{R}f_{\bullet *}\left(f^{-1}\mathcal{F}_\bullet^{(\bullet)} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{X_\bullet}(Z)} \mathcal{G}_\bullet\right). \tag{9.2.3.3.1}$$

Proof. As 5.1.2.8, this is a consequence of 9.2.3.1. □

Proposition 9.2.3.4. Let $\mathcal{F} \in D({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ and $\mathcal{G} \in D({}^{\mathrm{l}}f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$.

(i) We have the canonical morphism in $D(\mathbb{Z}_{\mathfrak{X}})$:

$$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}} \mathbb{R}f_*(\mathcal{G}) \to \mathbb{R}f_*\left(f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}} \mathcal{G}\right). \tag{9.2.3.4.1}$$

Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ such that $(\mathcal{D}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ is solvable by $\mathcal{R}$ and $\mathcal{F} \in D(\mathcal{D}, \mathcal{R}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$. Then the morphism 9.2.3.4.1 can also be viewed as a morphism of $D(\mathcal{D})$.

(ii) Suppose f is quasi-compact and quasi-separated. Suppose moreover $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$. Then the morphism 9.2.3.4.1 is an isomorphism.

Proof. We construct 9.2.3.4.1 as 5.1.2.5.1. The second statement is a consequence of 5.1.2.5.1. To check that this is an isomorphism, using the remark 5.1.2.1 and using [Har66, I.7.1 (ii), (iii) and (iv)] and 5.1.2.4, we reduce to the case where $\mathcal{F} = \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$, which is obvious. □

9.2.4 Direct image and duality

We keep notation 9.2.1. Assume that f is quasi-compact and quasi-separated, S, S', X, X' have finite Krull dimension,

Definition 9.2.4.1. We keep notation 9.2.1.4.

(a) The (left version of the) direct image functor of level m by $\widetilde{f}_\bullet$ is the functor $\widetilde{f}^{(\bullet)}_{\bullet +}\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$ which is defined by setting

$$\widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{E}'_\bullet) := \mathbb{R}f_{\bullet *}\left(\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet \leftarrow X'^\sharp_\bullet/S'^\sharp_\bullet}(Z,Z') \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')} \mathcal{E}'_\bullet\right),$$

where $\mathcal{E}'_\bullet \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$.

(b) The (right version of the) direct image functor of level m by $\widetilde{f}_\bullet$ is the functor $\widetilde{f}^{(\bullet)}_{\bullet +}\colon D({}^{r}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')) \to D({}^{r}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$ which is defined by setting

$$\widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{M}'_\bullet) := \mathbb{R}f_{\bullet *}\left(\mathcal{M}_\bullet \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')} \widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet \rightarrow X^\sharp_\bullet/S^\sharp_\bullet}(Z',Z)\right),$$

where $\mathcal{M}'_\bullet \in D({}^{r}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z'))$.

(c) For any $* \in \{r,l\}$, the direct image functor of level m by $\widetilde{f}$ of the form $\widetilde{f}^{(\bullet)}_{+}\colon D({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')) \to D({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ is defined by setting

$$\widetilde{f}^{(\bullet)}_{+}(\mathcal{E}') := \mathbb{R}\underleftarrow{l}_{Y *}(\widetilde{f}^{(\bullet)}_{\bullet +}(\mathbb{L}\underleftarrow{l}^{*}_{X}\mathcal{E}'))$$

where $\mathcal{E}' \in D({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$.

9.2.4.2. For any $\mathcal{E}'^{(\bullet)} \in D^{-}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$, we have the isomorphism of $D^{-}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$:

$$\widetilde{f}^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}f_{*}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}'^\sharp \leftarrow \mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z,Z') \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')} \mathcal{E}'^{(\bullet)}). \tag{9.2.4.2.1}$$

where the tensor product is defined at 8.5.4.8.3, and similarly for complexes of right modules.

Proposition 9.2.4.3. *We have the following properties.*

(a) For any $\mathcal{M}' \in D({}^{r}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$, we have the canonical morphism

$$\widetilde{f}^{(\bullet)}_{\mathrm{alg}\,+}(\mathcal{M}') := \mathbb{R}f_{*}\left(\mathcal{M}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \rightarrow \mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}\right) \to \widetilde{f}^{(\bullet)}_{+}(\mathcal{M}'). \tag{9.2.4.3.1}$$

(b) For any $\mathcal{E}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$, we have the canonical morphism

$$\widetilde{f}^{(\bullet)}_{\mathrm{alg}\,+}(\mathcal{E}') := \mathbb{R}f_{*}\left(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp \leftarrow \mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z,Z') \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')} \mathcal{E}'\right) \to \widetilde{f}^{(\bullet)}_{+}(\mathcal{E}'). \tag{9.2.4.3.2}$$

(c) For any $* \in \{r,l\}$, if $\mathcal{E}'$ and respectively $\mathcal{M}'$ belong to $D^{-}_{\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$, then the morphisms 9.2.4.3.1 and 9.2.4.3.2 are isomorphisms.

Proof. We can copy 7.5.8.2. □

9.2.4.4. We have the following boundedness preservation results.

(a) Since S is a noetherian scheme of finite Krull dimension, then it follows from 5.1.2.4.i that we get the factorization $\widetilde{f}^{(\bullet)}_{\bullet +}\colon D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')) \to D^{-}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z))$.

(b) Suppose log-structures are trivial. Then, by copying the proof of 5.3.2.4, we can check the right (resp. left) $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)$-module $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}\leftarrow X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z,Z')$ (resp. $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}\to X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z',Z)$) has finite tor-dimension. Hence, we get the induced functor

$$\widetilde{f}^{(\bullet)}_{\bullet +}\colon D^{\mathrm{b}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')) \to D^{\mathrm{b}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)). \tag{9.2.4.4.1}$$

Proposition 9.2.4.5. *Let $* \in \{r,l\}$. Then, we have the following properties.*

(a) For any $\mathcal{E}_{\bullet} \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z'))$, $\widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{E}_{\bullet}) \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z))$.

(b) For any $\mathcal{E} \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z'))$, $\widetilde{f}^{(\bullet)}_{+}(\mathcal{E}) \in D^{-}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$.

Proof. This is checked similarly to 7.5.8.7. □

9.2.4.6. For any $* \in \{r,l\}$, for any $\mathcal{E}^{(\bullet)}_{\bullet} \in D({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z'))$, it follows from 7.1.3.15.2 and 7.1.3.6.1 that we have for any $i, m \in \mathbb{N}$:

$$\big(\widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{E}^{(\bullet)}_{\bullet})\big)^{(m)}_{i} \xrightarrow{\sim} \widetilde{f}^{(m)}_{i+}(\mathcal{E}^{(m)}_{i}). \tag{9.2.4.6.1}$$

9.2.4.7. Suppose the bottom square of 9.2.1.0.1 is the identity and f is log-étale. Then, it follows from 9.2.1.22 that for any $\mathcal{M}'_{\bullet} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z'))$ and for any $\mathcal{E}'_{\bullet} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z'))$ we have the isomorphisms:

$$\widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{M}_{\bullet}) \xrightarrow{\sim} \mathbb{R}f_{\bullet *}(\mathcal{M}_{\bullet}), \qquad \widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{E}_{\bullet}) \xrightarrow{\sim} \mathbb{R}f_{\bullet *}(\mathcal{M}_{\bullet}).$$

9.2.4.8. The functors of 9.2.4.1 are compatible with the quasi-inverse functors $-\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z)} \widetilde{\omega}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)^{-1}$ and $\widetilde{\omega}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z)} -$ exchanging left and right $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)$-module structures. More precisely, similarly to 7.5.8.10.1, for any $\mathcal{E}'_{\bullet} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z'))$ we construct the canonical isomorphism

$$\widetilde{\omega}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z)} \widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{E}'_{\bullet}) \xrightarrow{\sim} \widetilde{f}^{(\bullet)}_{\bullet +}(\widetilde{\omega}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_{\bullet}}(Z')} \mathcal{E}'_{\bullet}). \tag{9.2.4.8.1}$$

Let $\star \in \{-,\mathrm{b}\}$, $\mathcal{E}' \in D^{\star}_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z'))$. Since $\mathbb{L}\underleftarrow{l}^{*}_{X'}(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z')\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')} \mathcal{E}') \xrightarrow{\sim} \widetilde{\omega}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_{\bullet}}(Z')} \mathcal{E}'_{\bullet}$ and since $\mathbb{L}\underleftarrow{l}^{*}_{X}(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} \widetilde{f}^{(\bullet)}_{+}(\mathcal{E}')) \xrightarrow{\sim} \widetilde{\omega}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X_{\bullet}}(Z)} \widetilde{f}^{(\bullet)}_{\bullet +}(\mathcal{E}'_{\bullet})$, then we deduce from 9.2.4.8.1 the canonical isomorphism

$$\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} \widetilde{f}^{(\bullet)}_{+}(\mathcal{E}') \xrightarrow{\sim} \widetilde{f}^{(\bullet)}_{+}(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z')\otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')} \mathcal{E}'). \tag{9.2.4.8.2}$$

Proposition 9.2.4.9. *With notation 9.2.1.12, we suppose X'' has finite Krull dimension and g is quasi-compact and quasi-separated. Let $* \in \{r,l\}$, and $\star \in \{-,\mathrm{b}\}$. We have the following properties.*

1. *For any $\mathcal{E}'_{\bullet} \in D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}})$, we have the canonical isomorphism of $D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X''^{\sharp}_{\bullet}/S''^{\sharp}_{\bullet}}(Z''))$:*

$$\widetilde{f}^{(\bullet)}_{\bullet +}\circ \widetilde{g}^{(\bullet)}_{\bullet +}(\mathcal{E}'_{\bullet}) \xrightarrow{\sim} \widetilde{(f\circ g)}^{(\bullet)}_{\bullet +}(\mathcal{E}'_{\bullet}). \tag{9.2.4.9.1}$$

2. *For any $\mathcal{E}' \in D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z'))$, we have the canonical isomorphism of $D^{\star}_{\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}''^{\sharp}/\mathfrak{S}''^{\sharp}}(Z''))$:*

$$\widetilde{f}^{(\bullet)}_{+}\circ \widetilde{g}^{(\bullet)}_{+}(\mathcal{E}') \xrightarrow{\sim} \widetilde{(f\circ g)}^{(\bullet)}_{+}(\mathcal{E}'). \tag{9.2.4.9.2}$$

Proof. By using 9.2.3.1 and 9.2.1.13.2, we can check 9.2.4.9.1 by copying the proof of 5.1.3.8. By using the equivalence of categories 8.5.1.10 (see also example 8.5.1.1), this yields 9.2.4.9.2. ☐

9.2.4.10. For any $* \in \{r, l\}$, similarly to 8.5.4.8.1, the pushforward functors $\widetilde{f}^{(\bullet)}_{\bullet +}$ and $\widetilde{f}^{(\bullet)}_{+}$ of 9.2.4.1 send lim-ind-isogenies to lim-ind-isogenies and preserve the quasi-coherence. This yields the factorizations denoted by:

$$(f,\phi)^{(\bullet)}_{Z,Z',\bullet +} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S'^{\sharp}_{\bullet}}(Z')) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z)), \tag{9.2.4.10.1}$$

$$(f,\phi)^{(\bullet)}_{Z,Z'+} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z')) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)). \tag{9.2.4.10.2}$$

They are called the *push forward* by (f,ϕ) (or simply f when ϕ is understood) with overconvergent singularities along Z and Z'. When $\phi = \mathrm{id}$, we will see that the functor $f^{(\bullet)}_{Z,Z+}$ preserves bounded complexes (see 9.4.2.3), even when log structures are not trivial.

9.2.4.11. For any $* \in \{r, l\}$, the pushforward functors $\widetilde{f}^{(\bullet)}_{\mathrm{alg}\,+}$ of 9.2.4.3 send lim-ind-isogenies to lim-ind-isogenies (but do not preserve the quasi-coherence). Hence, they induces the functors:

$$(f,\phi)^{(\bullet)}_{\mathrm{alg}\,Z,Z'+} \colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z')) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)). \tag{9.2.4.11.1}$$

The following lemma improves 9.2.4.3.(c).

Lemma 9.2.4.12. *Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{alg}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z'))$. The canonical morphism $f^{(\bullet)}_{\mathrm{alg}\,Z,Z'+}(\mathcal{E}'^{(\bullet)}) \to f^{(\bullet)}_{Z,Z'+}(\mathcal{E}'^{(\bullet)})$ is an isomorphism in $\underrightarrow{LD}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$.*

Proof. We proceed similarly to 9.2.1.17 (and use 7.5.8.2). ☐

Notation 9.2.4.13 (Pushforwards)**.** Let $* \in \{\mathrm{l}, \mathrm{r}\}$. The direct image by (f,ϕ) (or simply f when ϕ is understood) with overconvergent singularities along Z and Z' is also a functor of the form $f_{Z,Z',+} \colon D^{-}({}^{*}\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}}) \to D^{-}({}^{*}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$ which is defined for any $\mathcal{E}' \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$ and $\mathcal{M}' \in D^{-}({}^{\mathrm{r}}\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$ by setting:

$$(f,\phi)_{Z,Z'+}(\mathcal{E}') := \mathbb{R}f_{*}\left(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}\to\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z,Z')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}}} \mathcal{E}'\right), \tag{9.2.4.13.1}$$

$$(f,\phi)_{Z,Z'+}(\mathcal{M}') := \mathbb{R}f_{*}\left(\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}\to\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z',Z)_{\mathbb{Q}}\right). \tag{9.2.4.13.2}$$

Notation 9.2.4.14. In the notation 9.2.4.13 and 9.2.4.10 of the pushforwards, when $Z' = f^{-1}(Z)$, we simply write respectively $f^{(\bullet)}_{\bullet Z,+}$, $f^{(\bullet)}_{Z,+}$ and $f_{Z,+}$. If moreover Z is empty, we write $f^{(\bullet)}_{\bullet +}$, $f^{(\bullet)}_{+}$ and f_{+}.

When $Z' = f^{-1}(Z)$, we remove Z' in the notation, e.g. $(f,\phi)^{(\bullet)}_{Z,\bullet +} := (f,\phi)^{(\bullet)}_{Z,f^{-1}(Z),+}$. If moreover Z is empty, we remove Z in the notation.

When $\phi = \mathrm{id}_{\mathfrak{S}^{\sharp}}$, we replace $\mathrm{id}_{\mathfrak{S}^{\sharp}}$ by ${}_{/\mathfrak{S}^{\sharp}}$ and $\mathrm{id}_{S^{\sharp}_{\bullet}}$ by ${}_{/S^{\sharp}_{\bullet}}$, e.g. $f^{(\bullet)}_{\bullet/S^{\sharp}_{\bullet},Z,Z'+} := (f,\mathrm{id}_{S^{\sharp}_{\bullet}})^{(\bullet)}_{\bullet Z,Z'+}$ and $f^{(\bullet)}_{/\mathfrak{S}^{\sharp},Z,Z'+} := (f,\mathrm{id}_{\mathfrak{S}^{\sharp}})^{(\bullet)!}_{Z,Z'+}$. To lighten the notations, when ϕ is understood, by abuse of notation we simply write f instead of (f,ϕ), e.g. $f^{(\bullet)}_{Z,Z',\bullet +}$ instead of $(f,\phi)^{(\bullet)}_{Z,Z',\bullet +}$.

9.2.4.15 (Log-étale case)**.** Suppose the bottom square of 9.2.1.0.1 is the identity and f is log-étale. Then, using 9.2.1.22 we get the following properties:

(a) For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z'))$, we have the isomorphism:

$$f^{(\bullet)}_{Z,Z',+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}f_{*}\left(\mathcal{E}'^{(\bullet)}\right); \tag{9.2.4.15.1}$$

If f is moreover finite then the functor $f^{(\bullet)}_{Z,Z',+}$ is t-exact.

(b) For any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$, we have the isomorphism:

$$f_{Z,Z',+}(\mathcal{E}') \xrightarrow{\sim} \mathbb{R}f_*\mathcal{E}'. \tag{9.2.4.15.2}$$

If f is moreover finite then the functor $f_{Z,Z',+}$ is exact.

Remark 9.2.4.16. This is not clear (except when complexes are coherent thanks to 9.2.4.8.2) that the functors of 9.2.4.13 commute with the quasi-inverse functors $-\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}}$ and $\omega_{\mathfrak{X}}\otimes_{\mathcal{O}_{\mathfrak{X}}}-$ exchanging left and right $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}}$-module structures. However, when f is an exact closed immersion, this will be checked later (see 9.3.2.2.1).

Proposition 9.2.4.17. *Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z'))$. The functors 9.2.4.10.2 and 9.2.1.21.1 are compatible with the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ (see notation 9.1.6.1), i.e. we have the functorial isomorphism:*

$$f_{Z,Z',+}\circ \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \underrightarrow{l}^{*}_{\mathbb{Q}}\circ f^{(\bullet)}_{Z,Z'+}(\mathcal{E}'^{(\bullet)}).$$

Proof. This follows from 9.2.4.12. □

Remark 9.2.4.18. With notation 9.1.6.6, the proposition 9.2.4.17 means that we have the isomorphism of functors $\mathrm{Coh}_{Z'}(f^{(\bullet)}_{Z,Z',+}) \xrightarrow{\sim} f_{Z,Z',+}$.

Proposition 9.2.4.19. *Let $D \subset Z$ and $D' \subset Z'$ be some divisors of respectively X and X' such that $f(X'\setminus D') \subset X\setminus D$.*

(a) Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z'))$. We have the canonical isomorphism

$$\mathrm{forg}_{D,Z}\circ f^{(\bullet)}_{Z,Z',+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f^{(\bullet)}_{D,D',+}\circ \mathrm{forg}_{D',Z'}(\mathcal{E}'^{(\bullet)}).$$

Hence, it is harmless to write by abuse of notation $f^{(\bullet)}_{+}$ instead of $f^{(\bullet)}_{Z,Z',+}$.

(b) Let $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp},\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$. We have the canonical isomorphism

$$\mathrm{forg}_{D,Z}\circ f_{Z,Z',+}(\mathcal{E}') \xrightarrow{\sim} f_{D,D',+}\circ \mathrm{forg}_{D',Z'}(\mathcal{E}').$$

Hence, it is harmless to write by abuse of notation f_{+} instead of $f_{Z,Z',+}$ for coherent complexes.

Proof. It follows from 5.1.3.3 that we have the canonical isomorphism $\mathrm{forg}_{Z}\circ f^{(\bullet)}_{Z,Z',+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f^{(\bullet)}_{+}\circ \mathrm{forg}_{Z'}(\mathcal{E}'^{(\bullet)})$. Hence, we conclude the first part from 9.1.2.3. Using the remark 9.1.6.7 this yields that the functors $\mathrm{forg}_{D,Z}\circ \mathrm{Coh}_{Z'}(f^{(\bullet)}_{Z,Z',+})$ and $\mathrm{Coh}_{D'}(f^{(\bullet)}_{D,D',+})$ are isomorphic over $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'}({}^{\dagger}D')_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'}({}^{\dagger}Z')_{\mathbb{Q}})$. Since we have the canonical isomorphisms of functors $\mathrm{Coh}_{Z'}(f^{(\bullet)}_{Z,Z',+}) \xrightarrow{\sim} f_{Z,Z',+}$ and $\mathrm{Coh}_{D'}(f^{(\bullet)}_{D,D',+}) \xrightarrow{\sim} f_{D,D',+}$ (9.2.4.18), then we are done. □

Notation 9.2.4.20 (Duality in LD)**.** Suppose X is quasi-compact. With notation 8.6.2.7, we get the functor:

$$\mathbb{D}^{(\bullet)}_{Z} := \mathbb{R}_{\mathrm{LD}}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{(\bullet)-1}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})[\delta_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}]\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)), \tag{9.2.4.20.1}$$

$$\mathbb{D}^{(\bullet)}_{Z} := \mathbb{R}_{\mathrm{LD}}\mathscr{H}om_{\mathcal{D}^{(\bullet)}}(-,\omega^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))[\delta_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}]\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{r}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{r}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)), \tag{9.2.4.20.2}$$

that we call the dual functor. It follows from 5.1.4.3.1, that for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$ we get the isomorphism:

$$\mathbb{D}^{(\bullet)}_{Z}(\omega^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \omega^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathbb{D}^{(\bullet)}_{Z}(\mathcal{E}^{(\bullet)}). \tag{9.2.4.20.3}$$

By using 4.6.4.7.1, we can check that dual functors commute with extensions, i.e. for any divisor Z' containing Z, we have the isomorphism

$$\mathbb{D}^{(\bullet)}_{Z'}\circ({}^{\dagger}Z') \xrightarrow{\sim} ({}^{\dagger}Z')\circ\mathbb{D}^{(\bullet)}_{Z} \tag{9.2.4.20.4}$$

of functors $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z'))$.

9.2.4.21 (Empty divisor)**.** If follow from 8.7.7.10 that the dual functors of 9.2.4.20 are for any $* \in \{\mathrm{l}, \mathrm{r}\}$, we get the functor:

$$\mathbb{D}^{(\bullet)} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}), \tag{9.2.4.21.1}$$

Notation 9.2.4.22 (Duality)**.** Suppose X is quasi-compact.

(a) We have the $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-linear functor denoted by $\mathbb{D}^{\mathrm{alg}}_{\mathfrak{X}^\sharp,Z} \colon D_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ defined by setting for any $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$

$$\mathbb{D}^{\mathrm{alg}}_{\mathfrak{X}^\sharp,Z}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}))[d_{X/S}]. \tag{9.2.4.22.1}$$

If there is no risk of confusion, we simply write $\mathbb{D}^{\mathrm{alg}}_Z := \mathbb{D}^{\mathrm{alg}}_{\mathfrak{X}^\sharp,Z}$.

(b) We have the $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-linear functor denoted by $\mathbb{D}_{\mathfrak{X}^\sharp,Z} \colon D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ defined by setting for any $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$

$$\mathbb{D}_{\mathfrak{X}^\sharp,Z}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}))[d_{X/S}]. \tag{9.2.4.22.2}$$

If there is no risk of confusion, we simply write $\mathbb{D}_Z := \mathbb{D}_{\mathfrak{X}^\sharp,Z}$.

(c) Similarly to 8.7.7.3, we can check we have the biduality isomorphism $\mathbb{D}_{\mathfrak{X}^\sharp,Z} \circ \mathbb{D}_{\mathfrak{X}^\sharp,Z}(\mathcal{G}) \xrightarrow{\sim} \mathcal{G}$ for any $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$.

(d) We have the functor $({}^\dagger Z) \colon D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp\mathbb{Q}}) \to D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ defined by setting $({}^\dagger Z)(\mathcal{G}) := \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp\mathbb{Q}}} \mathcal{G}$ for any $\mathcal{G} \in D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp\mathbb{Q}})$. Dual functors commute with extensions (see 4.6.4.7.1), i.e. for any divisor Z' containing Z, we have the isomorphism

$$\mathbb{D}_{Z'} \circ ({}^\dagger Z', Z) \xrightarrow{\sim} ({}^\dagger Z', Z) \circ \mathbb{D}_Z \tag{9.2.4.22.3}$$

of functors $D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z')_{\mathbb{Q}})$.

(e) Following 8.7.7.9, when log structure are trivial, we get $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) = D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) = D_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ (recall X is quasi-compact).

(f) For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, it follows from 8.6.2.7.3 that we have the isomorphism

$$\underrightarrow{l}^*_{\mathbb{Q}} \circ \mathbb{D}^{(\bullet)}_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{D}_Z \circ \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}).$$

9.2.5 External tensor products

Let $\mathfrak{S}^\sharp$ be a nice (see definition 3.3.1.10) fine $\mathcal{V}$-log formal scheme. Assume that $\mathfrak{S}$ has finite Krull dimension. Let $\mathfrak{X}^\sharp$ and $\mathfrak{Q}^\sharp$ be two log smooth, quasi-compact and quasi-separated formal log schemes over $\mathfrak{S}^\sharp$, $p \colon \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp \to \mathfrak{X}^\sharp$, $q \colon \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp \to \mathfrak{Q}^\sharp$ be the structural maps. Let $* \in \{\mathrm{r}, \mathrm{l}\}$.

We suppose S, $S^\sharp$, X and Q are regular. Let Z_1 be a divisor of X, Z_2 be a divisor of Q and $Z := p^{-1}(Z_1) \cup q^{-1}(Z_2)$. Set $\mathfrak{R}^\sharp := \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp$ and $r \colon \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp \to \mathfrak{S}^\sharp$ be the structural map.

9.2.5.1. We get the bifunctor

$$- \boxtimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2} - \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z_1)) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{Q^\sharp_\bullet/S^\sharp_\bullet}(Z_2)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{R^\sharp_\bullet}(Z)), \tag{9.2.5.1.1}$$

for any $\mathcal{E}^{(\bullet)}_\bullet \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z_1))$, $\mathcal{F}^{(\bullet)}_\bullet \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{Q^\sharp_\bullet/S^\sharp_\bullet}(Z_2))$, we set

$$\mathcal{E}^{(\bullet)}_\bullet \boxtimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2} \mathcal{F}^{(\bullet)}_\bullet := p^{(\bullet)!}_{\bullet Z,Z_1}(\mathcal{E}^{(\bullet)}_\bullet) \otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)} q^{(\bullet)!}_{\bullet Z,Z_2}(\mathcal{F}^{(\bullet)}_\bullet)[d_R].$$

When Z_1 and Z_2 are empty, we simply write $-\boxtimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}}-$.

Using the tensor product defined in 9.1.2.6.2, we get the bifunctor

$$-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))\times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))\to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp}(Z)), \tag{9.2.5.1.2}$$

defined as follows: for any $\mathcal{E}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$, we set

$$\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}:=\mathbb{R}\underleftarrow{l}_{\mathfrak{R}^{(\mathbb{N})}*}\left(\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}\mathbb{L}\underleftarrow{l}^*_{\mathfrak{Q}^{(\mathbb{N})}}(\mathcal{F}^{(\bullet)})\right)\xrightarrow{\sim} p^{(\bullet)!}_{Z,Z_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{R}}(Z)}q^{(\bullet)!}_{Z,Z_2}(\mathcal{F}^{(\bullet)})[d_R]. \tag{9.2.5.1.3}$$

When Z_1 and Z_2 are empty, we simply write $-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}-$.

Similarly we define the functor:

$$-\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}-\colon \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))\times \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))\to \underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}(Z)), \tag{9.2.5.1.4}$$

defined as follows: for any $\mathcal{E}^{(\bullet)}\in \underrightarrow{LM}_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LM}_{\mathbb{Q}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$, we set

$$\mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}:=p^{*(\bullet)}_{Z,Z_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}_{\mathcal{B}^{(\bullet)}_{\mathfrak{R}}(Z)}q^{*(\bullet)}_{Z,Z_2}(\mathcal{F}^{(\bullet)}). \tag{9.2.5.1.5}$$

9.2.5.2. It follows from 7.5.9.4 (or from 9.1.2.7.1 and 9.2.1.18) that for any $\mathcal{E}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp})$, we have the isomorphism

$$({}^\dagger Z)\left(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{F}^{(\bullet)}\right)\xrightarrow{\sim}({}^\dagger Z_1)(\mathcal{E}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}({}^\dagger Z_2)(\mathcal{F}^{(\bullet)}). \tag{9.2.5.2.1}$$

9.2.5.3. Modulo the forgetful functors of divisors forg_{Z_1}, forg_{Z_2}, forg_{Z} which are fully faithful, the external tensor products do not depend on the divisors Z_1 or Z_2. Indeed, it follows from 9.1.2.8.1 and 9.2.1.28 that for any $\mathcal{E}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp})$, by omitting the indication of the functor forg_{Z_1}, forg_{Z_2} and forg_{Z} we get the isomorphisms

$$\begin{aligned}
\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{F}^{(\bullet)} &\overset{9.2.5.1.5}{\xrightarrow{\sim}} p^{(\bullet)!}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{R}}}q^{(\bullet)!}(\mathcal{F}^{(\bullet)})[d_R]\\
&\underset{9.2.1.28}{\xrightarrow{\sim}}\left(({}^\dagger p^{-1}Z_1)(p^{(\bullet)!}(\mathcal{E}^{(\bullet)}))\right)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{R}}}\left(({}^\dagger q^{-1}Z_2)(q^{(\bullet)!}(\mathcal{F}^{(\bullet)}))\right)[d_R]\\
&\underset{9.1.3.2}{\xrightarrow{\sim}}({}^\dagger Z)\left(p^{(\bullet)!}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{R}}}q^{(\bullet)!}(\mathcal{F}^{(\bullet)})\right)[d_R]\underset{9.2.5.1.5}{\xrightarrow{\sim}}({}^\dagger Z)(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{F}^{(\bullet)})\\
&\underset{9.2.5.2.1}{\xrightarrow{\sim}}({}^\dagger Z_1)(\mathcal{E}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}({}^\dagger Z_2)\mathcal{F}^{(\bullet)}\underset{9.1.2.3}{\xrightarrow{\sim}}\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}.
\end{aligned}\tag{9.2.5.3.1}$$

By abuse of notation, it is harmless to avoid indicating the divisors Z_1 and Z_2 in the notation $-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}-$.

9.2.5.4. Set $\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2):=\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)\underset{\mathrm{top}}{\boxtimes}\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2):=p^{-1}\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)\otimes_{\mathcal{O}_{S_\bullet}}q^{-1}\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2)$. Set $\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2):=\mathcal{D}^{(\bullet)}_{X^\sharp_\bullet}(Z_1)\underset{\mathrm{top}}{\boxtimes}\mathcal{D}^{(\bullet)}_{Q^\sharp_\bullet}(Z_2):=p^{-1}\mathcal{D}^{(\bullet)}_{X^\sharp_\bullet}(Z_1)\otimes_{\mathcal{O}_{S_\bullet}}q^{-1}\mathcal{D}^{(\bullet)}_{Q^\sharp_\bullet}(Z_2)$.

(a) Since $\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)$ and $\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2)$ are flat over $\mathcal{O}_{S_\bullet}$, then similarly to 5.1.5.4.2, for any $\mathcal{E}^{(\bullet)}_\bullet\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z_1))$, $\mathcal{F}^{(\bullet)}_\bullet\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{Q^\sharp_\bullet/S^\sharp_\bullet}(Z_2))$, we get the isomorphisms:

$$\begin{aligned}
\mathcal{E}^{(\bullet)}_\bullet\underset{\mathrm{top}}{\boxtimes}^{\mathbb{L}}\mathcal{F}^{(\bullet)}_\bullet &:=\left(\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)\otimes^{\mathbb{L}}_{p^{-1}\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\right)\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)}\left(\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)\otimes^{\mathbb{L}}_{q^{-1}\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2)}q^{-1}\mathcal{F}^{(\bullet)}_\bullet\right)\\
&\xrightarrow{\sim}\left(\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)\otimes^{\mathbb{L}}_{p^{-1}\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\right)\otimes^{\mathbb{L}}_{q^{-1}\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2)}q^{-1}\mathcal{F}^{(\bullet)}_\bullet\xrightarrow{\sim}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\otimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}}q^{-1}\mathcal{F}^{(\bullet)}_\bullet.
\end{aligned}\tag{9.2.5.4.1}$$

When $*=\mathrm{l}$, viewing $\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)$ as a $({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2),{}^{\mathrm{r}}p^{-1}\mathcal{D}^{(\bullet)}_{X^\sharp_\bullet}(Z_1),{}^{\mathrm{r}}q^{-1}\mathcal{D}^{(\bullet)}_{Q^\sharp_\bullet}(Z_2))$-trimodule, we get the $\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)$-linear isomorphism:

$$p^{-1}\mathcal{E}^{(\bullet)}_\bullet\otimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}}q^{-1}\mathcal{F}^{(\bullet)}_\bullet\xrightarrow{\sim}\left(\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)\otimes^{\mathbb{L}}_{p^{-1}\mathcal{D}^{(\bullet)}_{X^\sharp_\bullet}(Z_1)}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\right)\otimes^{\mathbb{L}}_{q^{-1}\mathcal{D}^{(\bullet)}_{Q^\sharp_\bullet}(Z_2)}q^{-1}\mathcal{F}^{(\bullet)}_\bullet. \tag{9.2.5.4.2}$$

(b) Similarly to 5.1.5.2.2, for any $\mathcal{E}^{(\bullet)}_\bullet \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z_1))$, $\mathcal{F}^{(\bullet)}_\bullet \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{Q^\sharp_\bullet/S^\sharp_\bullet}(Z_2))$, we get the isomorphism:

$$\mathcal{E}^{(\bullet)}_\bullet \underset{\mathrm{top}}{\boxtimes} \mathcal{F}^{(\bullet)}_\bullet := \left(\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)\otimes_{p^{-1}\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)} p^{-1}\mathcal{E}^{(\bullet)}_\bullet\right)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)}\left(\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)\otimes_{q^{-1}\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2)} q^{-1}\mathcal{F}^{(\bullet)}_\bullet\right)$$
$$\xrightarrow{\sim} p^{-1}\mathcal{E}^{(\bullet)}_\bullet \otimes_{\mathcal{O}_{S_\bullet}} q^{-1}\mathcal{F}^{(\bullet)}_\bullet. \tag{9.2.5.4.3}$$

9.2.5.5. The functor $\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)}-\colon \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2))\to\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{B}^{(\bullet)}_{R_\bullet}(Z))$ is exact. Moreover the functor $\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2))\to\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\mathcal{B}^{(\bullet)}_{R_\bullet}(Z))$ is well defined and is isomorphic to $\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)}-$. Indeed, setting $\mathcal{O}^{(\bullet)}_{R_\bullet,\mathrm{top}} := p^{-1}\mathcal{O}^{(\bullet)}_{X_\bullet}\otimes_{\mathcal{O}_{S^{(\bullet)}_\bullet}} q^{-1}\mathcal{O}^{(\bullet)}_{Q_\bullet}$, similarly to 5.1.5.2.2, we check the isomorphism

$$\mathcal{O}^{(\bullet)}_{R_\bullet}\otimes_{\mathcal{O}^{(\bullet)}_{R_\bullet,\mathrm{top}}}\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)\xrightarrow{\sim} p^*_\bullet\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)\otimes_{\mathcal{O}_{R_\bullet}} q^*_\bullet\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2) =: \mathcal{B}^{(\bullet)}_{R_\bullet}(Z_1,Z_2).$$

Since the extension $\mathcal{O}^{(\bullet)}_{R_\bullet,\mathrm{top}}\to\mathcal{O}^{(\bullet)}_{R_\bullet}$ is flat, then so is $\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)\to\mathcal{B}^{(\bullet)}_{R_\bullet}(Z_1,Z_2)$. Moreover, following 9.1.3.(d), the canonical ring homomorphism

$$\mathcal{B}^{(\bullet)}_{\mathfrak{R}}(Z_1,Z_2) := p^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z_1)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{R}}} q^*\mathcal{B}^{(\bullet)}_{\mathfrak{Q}}(Z_2)\xrightarrow{\sim}\mathcal{B}^{(\bullet)}_{\mathfrak{R}}(p^{-1}Z_1)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{R}}}\mathcal{B}^{(\bullet)}_{\mathfrak{R}}(q^{-1}Z_2)\to\mathcal{B}^{(\bullet)}_{\mathfrak{R}}(Z) \tag{9.2.5.5.1}$$

is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{qc}}(\mathcal{O}^{(\bullet)}_{\mathfrak{R}^\sharp})$. This yields that the canonical ring homomorphism

$$\mathcal{B}^{(\bullet)}_{R_\bullet}(Z_1,Z_2) := p^*_\bullet\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)\otimes_{\mathcal{O}_{R_\bullet}} q^*_\bullet\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2)\to\mathcal{B}^{(\bullet)}_{R_\bullet}(Z) \tag{9.2.5.5.2}$$

is an isomorphism of $\underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{O}}^{(\bullet)}_{R^\sharp_\bullet})$. Hence, we are done.

9.2.5.6. Similarly to 9.2.5.5, the functor $\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z)\otimes_{\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)}-\colon \underrightarrow{LM}_{\mathbb{Q}}(\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2))\to\underrightarrow{LM}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z))$ is exact. Moreover the functor $\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z)\otimes_{\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2))\to\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z))$ is well defined and is isomorphic to $\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z)\otimes^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)}-$. Moreover, for any $\mathcal{G}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2))$, the canonical morphism

$$\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)}\mathcal{G}^{(\bullet)}\to\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z)\otimes_{\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)}\mathcal{G}^{(\bullet)}$$

is an isomorphism.

9.2.5.7. Let $\mathcal{E}^{(\bullet)}_\bullet\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z_1))$, $\mathcal{F}^{(\bullet)}_\bullet\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{Q^\sharp_\bullet/S^\sharp_\bullet}(Z_2))$. We get the isomorphisms

$$\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z)\otimes_{\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)}\left(\mathcal{E}^{(\bullet)}_\bullet\underset{\mathrm{top}}{\boxtimes}{}^{\mathbb{L}}\mathcal{F}^{(\bullet)}_\bullet\right)\xrightarrow{\sim}\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet,\mathrm{top}}(Z_1,Z_2)}\left(\mathcal{E}^{(\bullet)}_\bullet\underset{\mathrm{top}}{\boxtimes}{}^{\mathbb{L}}\mathcal{F}^{(\bullet)}_\bullet\right)$$
$$\xrightarrow{\sim}\left(\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes^{\mathbb{L}}_{p^{-1}\mathcal{B}^{(\bullet)}_{X_\bullet}(Z_1)}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\right)\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)}\left(\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes^{\mathbb{L}}_{q^{-1}\mathcal{B}^{(\bullet)}_{Q_\bullet}(Z_2)}q^{-1}\mathcal{F}^{(\bullet)}_\bullet\right)$$
$$\xrightarrow{\sim} p^{(\bullet)!}_{\bullet Z,Z_1}(\mathcal{E}^{(\bullet)}_\bullet)\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)}q^{(\bullet)!}_{\bullet Z,Z_2}(\mathcal{F}^{(\bullet)}_\bullet)[d_R]=\mathcal{E}^{(\bullet)}_\bullet\boxtimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}\mathcal{F}^{(\bullet)}_\bullet. \tag{9.2.5.7.1}$$

Similarly, for any $\mathcal{E}^{(\bullet)}_\bullet\in\underrightarrow{LM}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z_1))$, $\mathcal{F}^{(\bullet)}_\bullet\in\underrightarrow{LM}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{Q^\sharp_\bullet/S^\sharp_\bullet}(Z_2))$, we get the isomorphism

$$\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z_1,Z_2)}(\mathcal{E}^{(\bullet)}_\bullet\underset{\mathrm{top}}{\boxtimes}\mathcal{F}^{(\bullet)}_\bullet)\xrightarrow{\sim}p^*_{\bullet Z,Z_1}(\mathcal{E}^{(\bullet)}_\bullet)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)}q^*_{\bullet Z,Z_2}(\mathcal{F}^{(\bullet)}_\bullet)=:\mathcal{E}^{(\bullet)}_\bullet\widehat{\boxtimes}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}\mathcal{F}^{(\bullet)}_\bullet.$$

By using the composition of 9.2.5.4.1 and 9.2.5.4.2, we get the last isomorphism

$$\mathcal{E}^{(\bullet)}_\bullet\boxtimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}\mathcal{F}^{(\bullet)}_\bullet\overset{9.2.5.7.1}{\xrightarrow{\sim}}\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z)\otimes_{\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet,\mathrm{top}}(Z_1,Z_2)}\left(\mathcal{E}^{(\bullet)}_\bullet\underset{\mathrm{top}}{\boxtimes}{}^{\mathbb{L}}\mathcal{F}^{(\bullet)}_\bullet\right)$$
$$\xrightarrow{\sim}\left(\mathcal{D}^{(\bullet)}_{R^\sharp_\bullet}(Z)\otimes^{\mathbb{L}}_{p^{-1}\mathcal{D}^{(\bullet)}_{X^\sharp_\bullet}(Z_1)}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\right)\otimes^{\mathbb{L}}_{q^{-1}\mathcal{D}^{(\bullet)}_{Q^\sharp_\bullet}(Z_2)}q^{-1}\mathcal{F}^{(\bullet)}_\bullet. \tag{9.2.5.7.2}$$

9.2.5.8 (Preservation of the coherence)**.** It follows from 7.5.9.3.1 that the bifunctor exterior tensor product of 9.2.5.1.2 induces the bifunctor

$$-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))\times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))\to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp}(Z)). \qquad (9.2.5.8.1)$$

Lemma 9.2.5.9. *Suppose $\mathfrak{S}^\sharp=\operatorname{Spf}\mathcal{V}$. The bifunctor 9.2.5.1.4 induces therefore the exact bifunctor*

$$-\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}-\colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))\times \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))\to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}(Z)).$$

Moreover, it is compatible with the functor 9.2.5.8.1, i.e., for any $\mathcal{E}^{(\bullet)}\in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$, we have the canonical isomorphism

$$\mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}\xrightarrow{\sim}\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}.$$

Proof. 1) Let $\mathcal{E}^{(\bullet)}\in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$. It follows from 8.4.5.12(a) that we can suppose $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ are p-torsion free. If no confusion is possible, the sheaf $r^{-1}\mathcal{O}_{S_\bullet}$ will be denoted by $\mathcal{O}_{S_\bullet}$. Since $\mathcal{E}^{(m)}$ and $\mathcal{F}^{(m)}$ are p-torsion free for any $m\geq 0$, then $\mathcal{E}^{(\bullet)}_\bullet:=\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)})\xrightarrow{\sim}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)})$ and $\mathcal{F}^{(\bullet)}_\bullet:=\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{F}^{(\bullet)})\xrightarrow{\sim}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{F}^{(\bullet)})$. Using again the p-torsion freeness, we get the middle isomorphism

$$\mathcal{E}^{(\bullet)}_\bullet\underset{\mathrm{top}}{\boxtimes}{}^{\mathbb{L}}\mathcal{F}^{(\bullet)}_\bullet\overset{9.2.5.4.1}{\xrightarrow{\sim}}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\otimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet}}q^{-1}\mathcal{F}^{(\bullet)}_\bullet\xrightarrow{\sim}p^{-1}\mathcal{E}^{(\bullet)}_\bullet\otimes_{\mathcal{O}_{S_\bullet}}q^{-1}\mathcal{F}^{(\bullet)}_\bullet\overset{9.2.5.4.3}{\xrightarrow{\sim}}\mathcal{E}^{(\bullet)}_\bullet\underset{\mathrm{top}}{\boxtimes}\mathcal{F}^{(\bullet)}_\bullet. \quad (9.2.5.9.1)$$

By using 9.2.5.9.1 and 9.2.5.7, we get

$$\mathcal{E}^{(\bullet)}_\bullet\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}\mathcal{F}^{(\bullet)}_\bullet\xrightarrow{\sim}\mathcal{E}^{(\bullet)}_\bullet\widehat{\boxtimes}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}\mathcal{F}^{(\bullet)}_\bullet. \qquad (9.2.5.9.2)$$

This yields the first isomorphism

$$\begin{aligned}\mathbb{R}\underleftarrow{l}_{\mathfrak{R}^{(\mathbb{N})}*}(\mathcal{E}^{(\bullet)}_\bullet\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}\mathcal{F}^{(\bullet)}_\bullet)&\overset{9.2.5.9.2}{\xrightarrow{\sim}}\mathbb{R}\underleftarrow{l}_{\mathfrak{R}^{(\mathbb{N})}*}(p^*_{\bullet Z,Z_1}(\mathcal{E}^{(\bullet)}_\bullet)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)}q^*_{\bullet Z,Z_2}(\mathcal{F}^{(\bullet)}_\bullet))\\ &\xrightarrow{\sim}\underleftarrow{l}_{\mathfrak{R}^{(\mathbb{N})}*}(p^*_{\bullet Z,Z_1}(\mathcal{E}^{(\bullet)}_\bullet)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)}q^*_{\bullet Z,Z_2}(\mathcal{F}^{(\bullet)}_\bullet))\xrightarrow{\sim}\mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}\end{aligned} \quad (9.2.5.9.3)$$

where the second one is checked by using Mittag-Leffler. □

Corollary 9.2.5.10. *Suppose $\mathfrak{S}^\sharp=\operatorname{Spf}\mathcal{V}$. We get the t-exact bifunctor*

$$\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\colon D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1)))\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2)))\to D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}(Z))). \quad (9.2.5.10.1)$$

Proposition 9.2.5.11. Suppose $\mathfrak{S}^\sharp=\operatorname{Spf}\mathcal{V}$ and $\mathfrak{X}$ affine. Let $\mathcal{E}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$. Choose $\mathscr{E}^{(\bullet)}\in D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1)))$, $\mathscr{F}^{(\bullet)}\in D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2)))$ such that $\mathfrak{e}(\mathcal{E}^{(\bullet)})\xrightarrow{\sim}\mathscr{E}^{(\bullet)}$ and $\mathfrak{e}(\mathcal{F}^{(\bullet)})\xrightarrow{\sim}\mathscr{F}^{(\bullet)}$ (see 8.4.5.11). Then we have the isomorphism of $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}(Z)))$:

$$\mathscr{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathscr{F}^{(\bullet)}\xrightarrow{\sim}\mathfrak{e}(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}). \qquad (9.2.5.11.1)$$

Proof. Following 8.4.5.13 there exist a representant $\mathcal{E}^{(\bullet)\bullet}\in K^{\mathrm{b}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$ of $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)n}$ is p-torsion free and $\mathfrak{e}(\mathcal{E}^{(\bullet)n})\in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$ for any $n\in\mathbb{Z}$. We can choose $\mathscr{E}^{(\bullet)\bullet}:=\mathfrak{e}(\mathcal{E}^{(\bullet)\bullet})\in K^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1)))$ as a representant of $\mathscr{E}^{(\bullet)}$; and similarly we choose such an $\mathcal{F}^{(\bullet)\bullet}$ and $\mathscr{F}^{(\bullet)\bullet}:=\mathfrak{e}(\mathcal{F}^{(\bullet)\bullet})$. Set $\mathcal{E}^{(\bullet)\bullet}_\bullet:=\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)\bullet})\xrightarrow{\sim}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{E}^{(\bullet)\bullet})$ and $\mathcal{F}^{(\bullet)\bullet}_\bullet:=\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{F}^{(\bullet)\bullet})\xrightarrow{\sim}\underleftarrow{l}^*_{\mathfrak{X}^{(\mathbb{N})}}(\mathcal{F}^{(\bullet)\bullet})$. We have the canonical morphism of $D^-(\widetilde{\mathcal{D}}^{(\bullet)}_{R^\sharp_\bullet/S^\sharp_\bullet}(Z))$:

$$p^{(\bullet)!}_{\bullet Z,Z_1}(\mathcal{E}^{(\bullet)\bullet}_\bullet)\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)}q^{(\bullet)!}_{\bullet Z,Z_2}(\mathcal{F}^{(\bullet)\bullet}_\bullet)[d_R]\to p^{*(\bullet)}_{\bullet Z,Z_1}(\mathcal{E}^{(\bullet)\bullet}_\bullet)\otimes_{\mathcal{B}^{(\bullet)}_{R_\bullet}(Z)}q^{*(\bullet)}_{\bullet Z,Z_2}(\mathcal{F}^{(\bullet)\bullet}_\bullet). \qquad (9.2.5.11.2)$$

To check that 9.2.5.11.2 is an isomorphism, by induction using exact triangles, we reduce to the case where $\mathcal{E}^{(\bullet)\bullet}$ and $\mathcal{F}^{(\bullet)\bullet}$ are modules, which was already checked (see 9.2.5.9.2). Using Mittag-Leffler, we conclude by applying the functor $\mathbb{R}\underleftarrow{l}_{\mathfrak{R}^{(\mathbb{N})}*}$. □

Proposition 9.2.5.12. (a) Let $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)))$, $\mathcal{F}^{(\bullet)} \in D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2)))$. We get the spectral sequence in $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp})$ of the form

$$H^r(\mathcal{E}^{(\bullet)})\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2} H^s(\mathcal{F}^{(\bullet)}) =: E_2^{r,s} \Rightarrow E^n := H^n\left(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}\right).$$

In particular, when $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, this yields $H^n\left(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}\right) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2} H^n(\mathcal{F}^{(\bullet)})$.

(b) Suppose $\mathfrak{S}^\sharp = \operatorname{Spf}\mathcal{V}$ and $\mathfrak{X}$ affine. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$. We have $H^n\left(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}\right) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2} H^n(\mathcal{F}^{(\bullet)})$.

Proof. The first statement is a consequence of the t-exactness of the functor 9.2.5.10.1. Moreover, when $\mathfrak{Q}^\sharp$ is affine, this follows from Proposition 9.2.5.11 and the commutativity of the diagram 8.4.5.7.1. □

We end this subsection with exterior tensor products for coherent complexes.

9.2.5.13 (Exterior tensor products of complexes coherent)**.** With the notations of 9.1.6.6, it follows from 9.2.5.8.1 that we get the bifunctor $-\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}- := \mathrm{Coh}_{Z_1,Z_2}(-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}-)$ of the form:

$$-\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}-\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z_1)_{\mathbb{Q}}) \times D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z_2)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z)_{\mathbb{Q}}). \tag{9.2.5.13.1}$$

For instance

$$\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z_1)_{\mathbb{Q}}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z_2)_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z)_{\mathbb{Q}}.$$

Remark 9.2.5.14. Let $D_1 \subset Z_1$ be a second divisor of X, $D_2 \subset Z_2$ be a second divisor of Q. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}D_1)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z_1)_{\mathbb{Q}})$ and $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp}({}^{\dagger}D_2)_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp}({}^{\dagger}Z_2)_{\mathbb{Q}})$. Following 9.1.6.6 and 9.2.5.3, the canonical morphism

$$\mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},D_1,D_2}\mathcal{F} \to \mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F} \tag{9.2.5.14.1}$$

is an isomorphism.

Remark 9.2.5.15. Let us suppose $\mathfrak{X}^\sharp = \mathfrak{Q}^\sharp$, $Z_1 = Z_2$. Denoting by $\delta\colon \mathfrak{X}^\sharp \hookrightarrow \mathfrak{X}^\sharp \times \mathfrak{X}^\sharp$ the diagonal immersion, for any $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, then we have the canonical isomorphism

$$\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z_1)}\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \delta_Z^{(\bullet)!}(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_1}\mathcal{F}^{(\bullet)})[-d_X]. \tag{9.2.5.15.1}$$

This yields, for any $\mathcal{E},\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z_1)_{\mathbb{Q}})$, the canonical isomorphism

$$\mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z_1)_{\mathbb{Q}}}\mathcal{F} \xrightarrow{\sim} \delta_Z^{!}(\mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_1}\mathcal{F})[-d_X]. \tag{9.2.5.15.2}$$

Lemma 9.2.5.16. *We have, for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^{\dagger}Z_1)_{\mathbb{Q}})$, $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp}({}^{\dagger}Z_2)_{\mathbb{Q}})$, of the canonical isomorphism in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp}({}^{\dagger}Z)_{\mathbb{Q}})$:*

$$\mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F} \xrightarrow{\sim} f^*_{Z,Z_1}(\mathcal{E})\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{R}}({}^{\dagger}Z)_{\mathbb{Q}}} g^*_{Z,Z_2}(\mathcal{F}). \tag{9.2.5.16.1}$$

Proof. For any complexes $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$ such that $\mathcal{E} = \underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)}$ and $\mathcal{F} = \underrightarrow{l}^*_{\mathbb{Q}}\mathcal{F}^{(\bullet)}$, as $({}^{\dagger}Z)\circ p^{*(\bullet)}(\mathcal{E}^{(\bullet)})$ and $({}^{\dagger}Z)\circ q^{*(\bullet)}(\mathcal{F}^{(\bullet)})$ are objects of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp}(Z))$, by applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ to 9.2.5.1.5, we get 9.2.5.16.1 from 9.2.5.8.1. □

Lemma 9.2.5.17. *Let $Z_1' \supset Z_1$ be a second divisor of X, $Z_2' \supset Z_2$ be a second divisor of Q and $Z' := p^{-1}(Z_1') \cup q^{-1}(Z_2')$.*

(a) *For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$, we have the canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp}(Z'))$:*

$$({}^{\dagger}Z')\left(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{F}^{(\bullet)}\right) \xrightarrow{\sim} ({}^{\dagger}Z_1')(\mathcal{E}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}({}^{\dagger}Z_2')(\mathcal{F}^{(\bullet)}). \tag{9.2.5.17.1}$$

(b) *We have, for any* $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}})$, $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp}({}^\dagger Z_2)_{\mathbb{Q}})$, *the canonical isomorphism in* $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp}({}^\dagger Z')_{\mathbb{Q}})$*:*

$$({}^\dagger Z')\left(\mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}\right) \xrightarrow{\sim} ({}^\dagger Z'_1)(\mathcal{E})\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z'_1,Z'_2}({}^\dagger Z'_2)(\mathcal{F}). \tag{9.2.5.17.2}$$

Proof. To check 9.2.5.17.1, we proceed similarly to 9.2.5.3. By applying the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ to 9.2.5.17.1, we obtain therefore 9.2.5.17.2. □

Proposition 9.2.5.18. *For any* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$, *we have the canonical isomorphism in* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp}(Z))$*:*

$$\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \left(\mathcal{D}^{(\bullet)}_{\mathfrak{R}^\sharp}(Z)\widehat{\otimes}^{\mathbb{L}}_{p^{-1}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z_1)}p^{-1}\mathcal{E}^{(\bullet)}\right)\widehat{\otimes}^{\mathbb{L}}_{q^{-1}\mathcal{D}^{(\bullet)}_{\mathfrak{Q}^\sharp}(Z_2)}q^{-1}\mathcal{F}^{(\bullet)}. \tag{9.2.5.18.1}$$

Proof. This follows from 9.2.5.7.2. □

Corollary 9.2.5.19. *For any* $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}})$, $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_2)_{\mathbb{Q}})$, *we have the canonical isomorphism in* $D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$*:*

$$\left(\mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}\otimes_{q^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_2)_{\mathbb{Q}}} q^{-1}\mathcal{F}\right)\otimes^{\mathbb{L}}_{p^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}}} p^{-1}\mathcal{E} \xrightarrow{\sim} \mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}. \tag{9.2.5.19.1}$$

Moreover, by taking $\mathcal{E} = \mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}}$, *the isomorphism*

$$\mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}\otimes_{q^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_2)_{\mathbb{Q}}} q^{-1}\mathcal{F} \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F} \tag{9.2.5.19.2}$$

is $(\mathcal{D}^{\dagger}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}, p^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}})$*-bilinear.*

9.2.6 Base change and their commutation with cohomological operations

We keep notation 9.2.1 and we suppose $\phi = \mathrm{id}$. Moreover, let

$$\begin{array}{ccc} \mathfrak{Y}^\sharp & \xrightarrow{\varpi} & \mathfrak{X}^\sharp \\ \downarrow{\scriptstyle p_{\mathfrak{Y}^\sharp}} & \square & \downarrow{\scriptstyle p_{\mathfrak{X}^\sharp}} \\ \mathfrak{T}^\sharp & \xrightarrow{\psi} & \mathfrak{S}^\sharp, \end{array} \tag{9.2.6.0.1}$$

be a commutative diagram of very nice fine $\mathcal{V}$-log formal schemes. We denote by $\mathfrak{Y}'^\sharp := \mathfrak{Y}^\sharp \times_{\mathfrak{X}^\sharp} \mathfrak{X}'^\sharp$ and by $\varpi' \colon \mathfrak{Y}'^\sharp \to \mathfrak{X}'^\sharp$, $g \colon \mathfrak{Y}'^\sharp \to \mathfrak{Y}^\sharp$ the projection. We suppose T, $T^\sharp$ are regular, $D := \varpi^{-1}(Z)$ is a divisor of Y and $D' := \varpi^{-1}(Z')$ is a divisor of Y'.

9.2.6.1. Let $\star \in \{-, \mathrm{b}\}$. With notation 9.2.1.15, it follows from 9.2.1.19 that we get the functors

$$\varpi^{(\bullet)!}_{\bullet Z} := (\varpi,\psi)^{(\bullet)!}_{\bullet Z} \colon \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{Y^\sharp_\bullet/T^\sharp_\bullet}(D)), \tag{9.2.6.1.1}$$

$$\varpi^{(\bullet)!}_{Z} := (\varpi,\psi)^{(\bullet)!}_{Z} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D)). \tag{9.2.6.1.2}$$

These functors are called the *base change by* $\psi \colon \mathfrak{S}^\sharp \to \mathfrak{T}^\sharp$ *with overconvergent singularities along* Z.

9.2.6.2. The morphisms appearing in the propositions 4.4.4.1 or 7.5.6.1 are compatible with the level change. In particular, we get the composite map

$$\varpi^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D,Z) \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D). \tag{9.2.6.2.1}$$

is a homomorphism of sheaves of rings which fits into the commutative diagram

$$\begin{array}{ccc} \varpi^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z) & \xrightarrow{9.2.6.2.1} & \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D) \\ \uparrow & & \uparrow \\ \varpi^{-1}\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z) & \longrightarrow & \mathcal{B}^{(\bullet)}_{\mathfrak{Y}}(D); \end{array} \tag{9.2.6.2.2}$$

and similarly by replacing gothic letters by their corresponding roman letter with a bullet as an index. For any $\mathcal{E}^{(\bullet)}_{\bullet} \in \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z))$ (resp. $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$), similarly to 4.4.4.1.4 (resp. 7.5.6.4.1) we get the first (resp. second) isomorphism of $D({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{Y^\sharp_\bullet/T^\sharp_\bullet}(D))$ (resp. $D({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D))$:

$$\widetilde{\mathcal{D}}^{(\bullet)}_{Y^\sharp_\bullet/T^\sharp_\bullet}(D) \otimes^{\mathbb{L}}_{\varpi^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)} \varpi^{-1}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \varpi^{(\bullet)!}_{Z}(\mathcal{E}^{(\bullet)}_{\bullet}), \tag{9.2.6.2.3}$$

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D) \widehat{\otimes}^{\mathbb{L}}_{\varpi^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \varpi^{-1}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \varpi^{(\bullet)!}_{Z}(\mathcal{E}^{(\bullet)}). \tag{9.2.6.2.4}$$

Remark this do have a meaning since the functors 9.2.6.1.1 and 9.2.6.1.2 are well defined before localising by lim-ind-isogenies. It follows from 5.1.1.15.3 and 7.5.6.4.2 the isomorphisms:

$$\mathcal{O}^{(\bullet)}_{T_\bullet} \otimes^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{S_\bullet}} \varpi^{-1}\mathcal{E}^{(\bullet)} := p^{-1}_{\mathfrak{Y}^\sharp}\mathcal{O}^{(\bullet)}_{T_\bullet} \otimes^{\mathbb{L}}_{\varpi^{-1}p^{-1}_{\mathfrak{X}^\sharp}\mathcal{O}^{(\bullet)}_{S_\bullet}} \varpi^{-1}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \varpi^{(\bullet)!}_{Z}(\mathcal{E}^{(\bullet)}_{\bullet}), \tag{9.2.6.2.5}$$

$$\mathcal{O}^{(\bullet)}_{\mathfrak{T}} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{S}}} \varpi^{-1}\mathcal{E}^{(\bullet)} := p^{-1}_{\mathfrak{Y}^\sharp}\mathcal{O}^{(\bullet)}_{\mathfrak{T}} \widehat{\otimes}^{\mathbb{L}}_{\varpi^{-1}p^{-1}_{\mathfrak{X}^\sharp}\mathcal{O}^{(\bullet)}_{\mathfrak{S}}} \varpi^{-1}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \varpi^{(\bullet)!}_{Z}(\mathcal{E}^{(\bullet)}). \tag{9.2.6.2.6}$$

9.2.6.3 (Preservation of the coherence)**.** For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, similarly to 9.2.1.17, we can check that the canonical morphism

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D) \otimes^{\mathbb{L}}_{\varpi^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \varpi^{-1}\mathcal{E}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D) \widehat{\otimes}^{\mathbb{L}}_{\varpi^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \varpi^{-1}\mathcal{E}^{(\bullet)} \tag{9.2.6.3.1}$$

is an isomorphism of $\underrightarrow{LD}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D))$. With 9.2.6.2.4, this yields the isomorphism

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D) \otimes^{\mathbb{L}}_{\varpi^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)} \varpi^{-1}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \varpi^{(\bullet)!}_{Z}(\mathcal{E}^{(\bullet)}). \tag{9.2.6.3.2}$$

We deduce from 9.2.6.3.2 that the base change preserves the coherence, i.e. the functor 9.2.6.1.2 induces:

$$\varpi^{(\bullet)!}_{Z} : \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(D)). \tag{9.2.6.3.3}$$

Via 9.2.1.24 and via the equivalence of categories 8.4.1.15, this yields

$$\varpi^{!}_{Z} : D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \tag{9.2.6.3.4}$$

9.2.6.4. Taking inductive limits, we deduce from 7.5.6.1 the following assertions : the canonical morphism

$$\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_{\mathbb{Q}} \to \mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D, Z)_{\mathbb{Q}} \tag{9.2.6.4.1}$$

is an isomorphism. Moreover, the composite map

$$\varpi^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \to \mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D, Z)_{\mathbb{Q}} \xleftarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_{\mathbb{Q}}. \tag{9.2.6.4.2}$$

is a homomorphism of sheaves of rings which fits into the commutative diagram

$$\begin{array}{ccc} \varpi^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} & \xrightarrow{9.2.6.4.2} & \mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_{\mathbb{Q}} \\ \uparrow & & \uparrow \\ \varpi^{-1}\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} & \longrightarrow & \mathcal{O}_{\mathfrak{Y}}({}^\dagger D)_{\mathbb{Q}}. \end{array} \tag{9.2.6.4.3}$$

The canonical morphism of left $\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-modules 9.2.6.4.1 is more precisely an isomorphism of $(\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_{\mathbb{Q}}, \varpi^{-1}\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})$-bimodules, where the structure of right $\varpi^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}$-module on $\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_{\mathbb{Q}}$ is given via 9.2.6.4.2.

9.2.6.5. For any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$, we get from 9.2.6.3.2 the isomorphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}})$:

$$\varpi^{!}_{Z}(\mathcal{E}) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\varpi^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}} \varpi^{-1}\mathcal{E}. \tag{9.2.6.5.1}$$

For any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)_{\mathbb{Q}})$, via 7.5.6.6.1 and 9.2.6.5.1 we get the isomorphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}})$:

$$\mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}',\mathbb{Q}}} \varpi^{(m)!}_{Z}(\mathcal{E}^{(m)}) \xrightarrow{\sim} \varpi^{!}_{Z}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)_{\mathbb{Q}}} \mathcal{E}^{(m)}). \tag{9.2.6.5.2}$$

Proposition 9.2.6.6. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$. With notation 9.2.1.15, there exists a canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^{\sharp}/\mathfrak{T}^{\sharp}})$ of the form:

$$\varpi'^{(\bullet)!}_{Z'} \circ f^{(\bullet)!}_{/\mathfrak{S}^{\sharp},Z',Z}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} g^{(\bullet)!}_{/\mathfrak{T}^{\sharp},D',D} \circ \varpi^{(\bullet)!}_{Z}(\mathcal{E}^{(\bullet)}). \tag{9.2.6.6.1}$$

Proof. This follows from 9.2.1.14 and 9.2.1.19. □

Proposition 9.2.6.7. For any $\mathcal{M}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$ and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$, we have the canonical isomorphism in $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}(D))$:

$$\varpi^{(\bullet)!}_{Z}(\mathcal{M}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)} \mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \varpi^{(\bullet)!}_{Z}(\mathcal{M}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{Y}}(D)} \varpi^{(\bullet)!}_{Z}(\mathcal{E}^{(\bullet)}). \tag{9.2.6.7.1}$$

Proof. This is a particular case of 9.2.1.27.1. □

Corollary 9.2.6.8. *Let $Z_1 \hookrightarrow Z_2$ be two divisor of X. Let $D_i := \varpi^{-1}(Z_i)$ for $i = 1, 2$. For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z_1))$, we have the isomorphism*

$$({}^{\dagger}D_2, D_1) \circ \varpi^{(\bullet)!}_{Z_1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \varpi^{(\bullet)!}_{Z_2} \circ ({}^{\dagger}Z_2, Z_1)(\mathcal{E}^{(\bullet)}) \tag{9.2.6.8.1}$$

Proof. This is contained in 9.2.1.18. □

Theorem 9.2.6.9. *Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z'))$. With notation 9.2.4.14, there exists a canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}(D))$ of the form:*

$$\varpi^{(\bullet)!}_{Z} \circ f^{(\bullet)}_{/\mathfrak{S}^{\sharp},Z,Z',+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} g^{(\bullet)}_{/\mathfrak{T}^{\sharp},D,D',+} \circ \varpi'^{(\bullet)!}_{Z'}(\mathcal{E}'^{(\bullet)}). \tag{9.2.6.9.1}$$

Proof. By using the equivalence of categories 8.5.4.5,

$$\varpi^{(\bullet)!}_{\bullet Z} \circ f^{(\bullet)}_{/S^{\sharp}_{\bullet},Z,Z',+}(\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}'^{(\mathbb{N})}}(\mathcal{E}'^{(\bullet)})) \xrightarrow{\sim} g^{(\bullet)}_{/T^{\sharp}_{\bullet},D,D',+} \circ \varpi'^{(\bullet)!}_{\bullet Z'}(\mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}'^{(\mathbb{N})}}(\mathcal{E}'^{(\bullet)})) \tag{9.2.6.9.2}$$

which follows from 5.3.3.3 (more precisely, the isomorphism is even valid in $D({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{Y^{\sharp}_{\bullet}/T^{\sharp}_{\bullet}}(D))$). □

9.2.6.10. It follows from 7.5.6.5.4 by going through to the limit on the level and tensorisation with $\mathbb{Q}$ the isomorphism:

$$\mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\varpi^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}})_{\mathrm{r}} \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}({}^{\dagger}D)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \omega^{-1}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}} \tag{9.2.6.10.1}$$

where the index r means that we take the right structure of left $\mathcal{D}$-module.

Proposition 9.2.6.11. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$. We have the canonical isomorphism

$$\varpi^{!}_{Z}(\mathbb{D}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(\mathcal{E})) \xrightarrow{\sim} \mathbb{D}_{\mathfrak{Y}^{\sharp}/\mathfrak{T}^{\sharp}}(\varpi^{!}_{Z}(\mathcal{E})). \tag{9.2.6.11.1}$$

Proof. Since $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}) = D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q})$, then we have the last canonical isomorphism

$$\varpi^!_Z(\mathbb{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(\mathcal{E})) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_\mathbb{Q} \otimes^\mathbb{L}_{\varpi^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}} \varpi^{-1}\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \omega^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})[d_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}]$$

$$\xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_\mathbb{Q} \otimes^\mathbb{L}_{\varpi^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}} \mathbb{R}\mathcal{H}om_{\varpi^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}}(\varpi^{-1}\mathcal{E}, \varpi^{-1}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \omega^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}))[d_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}]$$

$$\underset{4.6.3.6.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\varpi^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}}(\varpi^{-1}\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_\mathbb{Q} \otimes^\mathbb{L}_{\varpi^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}} (\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \omega^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_{\mathrm{r}})[d_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}]$$

$$\underset{9.2.6.10.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\varpi^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}}(\varpi^{-1}\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{Y}} \omega^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp})[d_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}]$$

$$\xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_\mathbb{Q}}(\varpi^!_Z\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}({}^\dagger D)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{Y}} \omega^{-1}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}))[d_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}] = \mathbb{D}_{\mathfrak{Y}^\sharp/\mathfrak{T}^\sharp}(\varpi^!_Z(\mathcal{E})).$$

□

Definition 9.2.6.12. We define the category $\mathrm{DVR}(\mathcal{V})$ as follows: an object is the data of a complete discrete valued ring $\mathcal{W}$ of mixed characteristic $(0,p)$ together with a morphism of local algebras $\mathcal{V} \to \mathcal{W}$. A morphism $\mathcal{W} \to \mathcal{W}'$ is the data of a morphism of local $\mathcal{V}$-algebras $\mathcal{W} \to \mathcal{W}'$.

Notation 9.2.6.13 (Base change of DVR)**.** Let $\alpha\colon \mathcal{W} \to \mathcal{W}'$ be a morphism of $\mathrm{DVR}(\mathcal{V})$ (see notation 9.2.6.12), $\mathfrak{T} := \mathrm{Spf}\,\mathcal{W}$, $\mathfrak{T}' := \mathrm{Spf}\,\mathcal{W}'$. let $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{T}})$, $\mathfrak{X}' := \mathfrak{X} \times_\mathfrak{T} \mathrm{Spf}\,\mathfrak{T}'$, and $\pi\colon \mathfrak{X}'/\mathfrak{T}' \to \mathfrak{X}/\mathfrak{T}$ be the morphism induced by the projection. The base change of $\mathcal{E}^{(\bullet)}$ by α is the object $\pi^{(\bullet)!}(\mathcal{E}^{(\bullet)})$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{T}'})$ According to notation 9.2.6.2.6, we can simply write

$$\mathcal{W}'\widehat{\otimes}^\mathbb{L}_\mathcal{W}\mathcal{E}^{(\bullet)} := \pi^{(\bullet)!}(\mathcal{E}^{(\bullet)}).$$

9.2.7 Coherence descent by base change of a finite morphism of complete DVR

Let $\mathcal{V}'$ be an object of $\mathrm{DVR}(\mathcal{V})$ and $\rho\colon \mathcal{V} \to \mathcal{V}'$ be its structural morphism. We set $\mathfrak{S}' := \mathrm{Spf}\,\mathcal{V}'$. Let $\mathfrak{X}^\sharp/\mathfrak{S}$ be a flat, log smooth very nice fine $\mathcal{V}$-log formal scheme, $\mathfrak{X}'^\sharp := \mathfrak{X} \times_\mathfrak{S} \mathfrak{S}'$, and $f\colon \mathfrak{X}' \to \mathfrak{X}$ be the canonical projection. We suppose X and X' are regular. Let Z be a divisor of X and $Z' := f^{-1}(Z)$. We denote by $f^!_Z$ the extraordinary inverse image of $\mathfrak{X}' \to \mathfrak{X}$ above $\mathfrak{S}' \to \mathfrak{S}$ with overconvergent singularities along Z, i.e. $f^!_Z$ is the base change functor via ρ (see 9.2.6.1).

Lemma 9.2.7.1. *We have the following properties.*

(a) For any open $\mathfrak{U}$ of $\mathfrak{X}$, setting $\mathfrak{U}' := f^{-1}(\mathfrak{U})$, the ring homomorphisms $\Gamma(\mathfrak{U}, \mathcal{D}^{(\bullet)}_{X^\sharp_\bullet/S_\bullet}(Z)) \to \Gamma(\mathfrak{U}', \mathcal{D}^{(\bullet)}_{X'^\sharp_\bullet/S'_\bullet}(Z'))$, $\Gamma(\mathfrak{U}, \mathcal{D}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}}(Z)) \to \Gamma(\mathfrak{U}', \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'}(Z'))$ and $\Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}}({}^\dagger Z)_\mathbb{Q}) \to \Gamma(\mathfrak{U}', \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'}({}^\dagger Z')_\mathbb{Q})$ are flat.

(b) For any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}}({}^\dagger Z)_\mathbb{Q})$, we have the isomorphism:

$$f^!_Z(\mathcal{E}) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'}({}^\dagger Z')_\mathbb{Q} \otimes_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}}({}^\dagger Z)_\mathbb{Q}} f^{-1}\mathcal{E}.$$

Proof. a) Since $\mathcal{V}'$ is ideally Hausdorff for the p-adic topology, then if follows from [Bou61a, Theorem 1 of III.§5.2] that $\mathcal{V}'$ is a flat $\mathcal{V}$-algebra. Hence $S'_\bullet \to S_\bullet$ is flat. It follows from 5.1.1.15.3 the isomorphism:

$$\mathcal{O}^{(\bullet)}_{S'_\bullet} \otimes^\mathbb{L}_{\mathcal{O}^{(\bullet)}_{S_\bullet}} \varpi^{-1}\mathcal{D}^{(\bullet)}_{X^\sharp_\bullet/S_\bullet}(Z) \xrightarrow{\sim} \mathcal{D}^{(\bullet)}_{X'^\sharp_\bullet/S'_\bullet}(Z'). \tag{9.2.7.1.1}$$

This yields the flatness of $\Gamma(\mathfrak{U}, \mathcal{D}^{(\bullet)}_{X^\sharp_\bullet/S_\bullet}(Z)) \to \Gamma(\mathfrak{U}', \mathcal{D}^{(\bullet)}_{X'^\sharp_\bullet/S'_\bullet}(Z'))$. Tensoring with $\mathbb{Q}$ and passing to the limits, we get the two other ones.

b) It follows from the part (a) that the ring homomorphism $f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}}({}^\dagger Z)_\mathbb{Q} \to \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'}({}^\dagger Z')_\mathbb{Q}$ is flat. Using 9.2.6.5.1, we are done. □

Lemma 9.2.7.2. *Suppose $\mathcal{V} \to \mathcal{V}'$ is finite.*

(a) *Suppose $\mathfrak{X}$ is affine. Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$-module. Then the canonical morphisms*

$$\mathcal{V}' \otimes_{\mathcal{V}} \Gamma(\mathfrak{X},\mathcal{E}) \to D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}} \Gamma(\mathfrak{X},\mathcal{E}) \to \Gamma(\mathfrak{X}', f^{!}_{Z}(\mathcal{E})) \qquad (9.2.7.2.1)$$

are isomorphisms. Moreover, $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}}$ is a faithfully flat $D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$-module for both left or right structure.

(b) *For any $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$-module $\mathcal{E}$, the canonical morphisms*

$$f^{*}(\mathcal{E}) := \mathcal{O}_{\mathfrak{X}'} \otimes_{f^{-1}\mathcal{O}_{\mathfrak{X}}} f^{-1}\mathcal{E} \to \mathcal{O}_{\mathfrak{X}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{f^{-1}\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}} f^{-1}\mathcal{E} \to \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}} f^{-1}\mathcal{E}$$

are isomorphisms.

(c) *Let $\phi\colon \mathcal{E}' \to \mathcal{E}$ be a morphism of $\mathcal{O}_{\mathfrak{X}}$-modules. Then ϕ is an isomorphism if and only if $f^{*}(\phi)$ is an isomorphism.*

Proof. a) i) Since $\mathcal{E}$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$-module and $f^{!}_{Z}(\mathcal{E})$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}}$, then via the corresponding theorems of type A the canonical morphisms $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}} \Gamma(\mathfrak{X},\mathcal{E}) \to \mathcal{E}$, and $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}}} \Gamma(\mathfrak{X}', f^{!}_{Z}(\mathcal{E})) \to f^{!}_{Z}(\mathcal{E})$ are isomorphisms. This yields by associativity of tensor products that the canonical morphism $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}} \Gamma(\mathfrak{X},\mathcal{E}) \to \Gamma(\mathfrak{X}', f^{!}_{Z}(\mathcal{E}))$ is an isomorphism.

ii) By associativity of tensor products, to check the first morphism of 9.2.7.2.1 is an isomorphism, we reduce to the case where $\mathcal{E} = \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$, which easily follows from the fact that the morphism $\mathcal{V} \to \mathcal{V}'$ is finite. Since the homomorphism $\mathcal{V} \to \mathcal{V}'$ is faithfully flat (e.g. use [Bou61a, I.3.5, Proposition 9 and III.5.2, Theorem 1]), then $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}}$ is a faithfully flat $D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$-module for both left or right structure.

b) By associativity of tensor products, to check the third statement we reduce to the case where $\mathcal{E} = \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$, which is easy.

c) Let us prove the forth assertion. Since $\mathcal{V}'$ is a finite faithfully flat $\mathcal{V}$-algebra, since $\mathcal{V}$ and $\mathcal{V}'$ are complete for the p-adic topology then $\mathcal{V}'$ is a free $\mathcal{V}$-module of finite type (e.g. use [Bou61a, II.3.2, Proposition 5]). Let $\mathfrak{U}$ be an affine open of $\mathfrak{X}$ and $\mathfrak{U}' := f^{-1}(\mathfrak{U})$. Then, $\Gamma(\mathfrak{U}',\mathcal{O}_{\mathfrak{X}'})$ is also a free $\Gamma(\mathfrak{U},\mathcal{O}_{\mathfrak{X}})$-module of finite type, and we can conclude.

□

Remark 9.2.7.3. Suppose $\mathfrak{X}$ is affine. It is likely that we do not need the finiteness of $\mathcal{V} \to \mathcal{V}'$ to get that $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}}$ is a faithfully flat $D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$-module for both left or right structure.

Proposition 9.2.7.4. *Suppose $\mathcal{V} \to \mathcal{V}'$ finite. Let $\mathcal{E}$ be a $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}$-coherent module. Then $\mathcal{E}$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}$-module if and only if $f^{!}_{Z}(\mathcal{E})$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-module.*

Proof. 1) Using Lemma 9.2.7.2.b (for both cases Z and the empty set), we check that the canonical morphism

$$\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}} f^{-1}\mathcal{E} \to \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}} f^{-1}\mathcal{E} = f^{!}_{Z}(\mathcal{E})$$

is an isomorphism. If $\mathcal{E}$ is also a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}$-module, this implies that $f^{!}_{Z}(\mathcal{E})$ is $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-coherent.

2) Conversely, suppose $f^{!}_{Z}(\mathcal{E})$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-module.

a) Since the $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}$-coherence of $\mathcal{E}$ is local on $\mathfrak{X}$, we can suppose $\mathfrak{X}$ is affine. Using theorem of type A, this yields that $\Gamma(\mathfrak{X}', f^{!}_{Z}(\mathcal{E}))$ is a $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-module of finite presentation. Set $E := \Gamma(\mathfrak{X},\mathcal{E})$. Following 9.2.7.2.a, this implies that $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}} E$ is a $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-module of finite presentation. Using again 9.2.7.2.a, we get both isomorphism $\mathcal{V}' \otimes_{\mathcal{V}} D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}} \xrightarrow{\sim} D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}}$, and

$\mathcal{V}'\otimes_{\mathcal{V}} D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}} \xrightarrow{\sim} D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$. Hence, the canonical morphisms $\mathcal{V}'\otimes_{\mathcal{V}} E \to D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}} E \to D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}}} E$ are isomorphisms. This yields that $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}} E$ is a $D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-module of finite presentation. By full faithfulness of $D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}} \to D^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$, then E is a $D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}$-module of finite presentation.

c) Let $E^{\Delta} := \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}} \otimes_{D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S},\mathbb{Q}}} E$. By applying the functor $f^* = \mathcal{O}_{\mathfrak{X}'} \otimes_{f^{-1}\mathcal{O}_{\mathfrak{X}}} -$ to the morphism $E^{\Delta} \to \mathcal{E}$, we get (up to canonical isomorphisms) the homomorphism of coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-modules $f^!(E^{\Delta}) \to f^!_Z(\mathcal{E})$. Since $\Gamma(\mathfrak{X}', f^!(E^{\Delta})) \xrightarrow{\sim} \mathcal{V}'\otimes_{\mathcal{V}} \Gamma(\mathfrak{X}, E^{\Delta}) \xrightarrow{\sim} \mathcal{V}'\otimes_{\mathcal{V}} E$ and $\Gamma(\mathfrak{X}', f^!_Z(\mathcal{E})) \xrightarrow{\sim} \mathcal{V}'\otimes_{\mathcal{V}} E$, then by applying the functor $\Gamma(\mathfrak{X}', -)$ to $f^!(E^{\Delta}) \to f^!_Z(\mathcal{E})$, we get an isomorphism. Since $\mathfrak{X}'^{\sharp}$ is affine, using the theorem of type A satisfied by coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-modules, this yields that the morphism $f^!(E^{\Delta}) \to f^!_Z(\mathcal{E})$ of coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}',\mathbb{Q}}$-modules is an isomorphism. Using 9.2.7.2.c, this implies that the morphism $E^{\Delta} \to \mathcal{E}$ is an isomorphism. □

9.3 Exact closed immersions

Let $\mathfrak{S}^{\sharp}$ be a p-torsion free noetherian nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10). Moreover, let $u\colon \mathfrak{Z}^{\sharp} \hookrightarrow \mathfrak{X}^{\sharp}$ be an exact closed immersion of p-torsion free log smooth $\mathfrak{S}^{\sharp}$-log formal schemes such that the underlying closed immersion of schemes of u_0 is regular. Let $\mathfrak{Y}^{\sharp}$ be the open of $\mathfrak{X}^{\sharp}$ complementary to the underlying topological space of $\mathfrak{Z}^{\sharp}$. Let $\mathcal{I}$ be the ideal defining u.

Suppose S_0, X_0, Z_0 are regular. Let D be some divisor of respectively X_0 such that $E := D\cap Z_0$ is a divisor of Z_0. We fix $\lambda_0 \in L(\mathbb{N})$. We set $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D) := \lambda_0^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(D)$, $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{Z}}(E) := \lambda_0^*\mathcal{B}^{(\bullet)}_{\mathfrak{Z}}(E)$, $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(D) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$, $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}(E) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{Z}}(E)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{Z}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}$. We denote by respectively $\widetilde{\mathfrak{X}}^{\sharp(m)}$ and $\widetilde{\mathfrak{Z}}^{\sharp(m)}$ the ringed $\mathcal{V}$-log formal scheme $(\mathfrak{X}^{\sharp}, \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D))$ and $(\mathfrak{Z}^{\sharp}, \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E))$, and by $u^{(m)}_D = \tilde{u}^{(m)}\colon \widetilde{\mathfrak{Z}}^{\sharp}/\mathfrak{S}^{\sharp(m)} \to \widetilde{\mathfrak{X}}^{\sharp}/\mathfrak{S}^{\sharp(m)}$ the induced morphism of relative ringed $\mathcal{V}$-log formal schemes. In this subsection, by $\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}$ we mean $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(D)$, resp. $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(D)_{\mathbb{Q}}$, resp. $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(D)_{\mathbb{Q}}$) ; and by $\widetilde{\mathcal{D}}_{\mathfrak{Z}^{\sharp}}$ we mean $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E)\otimes_{\mathcal{O}_{\mathfrak{Z}}}\mathcal{D}^{(m)}_{\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}(E)$, resp. $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}(E)_{\mathbb{Q}}$, resp. $\mathcal{D}^{\dagger}_{\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}(E)_{\mathbb{Q}}$). By $\mathcal{B}_{\mathfrak{X}}$ we means $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$ (resp. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$, resp. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)_{\mathbb{Q}}$, resp. $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}D)_{\mathbb{Q}}$) and by $\mathcal{B}_{\mathfrak{Z}}$ we means $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E)$ (resp. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E)$, resp. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E)_{\mathbb{Q}}$, resp. $\mathcal{O}_{\mathfrak{Z}}({}^{\dagger}E)_{\mathbb{Q}}$).

We get the $(\widetilde{\mathcal{D}}_{\mathfrak{Z}^{\sharp}}, u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}})$-bimodule $\widetilde{\mathcal{D}}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp}} := u^{-1}(\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}})$ (e.g. see 9.2.1.20 for the last respective case). We have the $(u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^{\sharp}})$-bimodule $\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}$ (resp. $\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp},\mathbb{Q}}$, resp. $\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}} := \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}(D)_{\mathbb{Q}}$).

9.3.1 The fundamental isomorphism for formal schemes

The following lemma implies that we can apply 5.2 in the case where $\widetilde{\mathcal{D}}_{\mathfrak{X}^{\sharp}}$ (resp. $\widetilde{\mathcal{D}}_{\mathfrak{Z}^{\sharp}}$) is equal to $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$ (resp. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E)\otimes_{\mathcal{O}_{\mathfrak{Z}}}\mathcal{D}^{(m)}_{\mathfrak{Z}^{\sharp}/\mathfrak{S}^{\sharp}}$)).

Lemma 9.3.1.1. *For any $m\in\mathbb{N}$, $\mathcal{O}_{\mathfrak{Z}}$ and $u^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$ are tor independent over $u^{-1}\mathcal{O}_{\mathfrak{X}}$. The sheaves $\mathcal{O}_{\mathfrak{Z}}$ and $u^{-1}\mathcal{O}_{\mathfrak{X}}({}^{\dagger}D)_{\mathbb{Q}}$ are tor independent over $u^{-1}\mathcal{O}_{\mathfrak{X}}$. For any $m,i\in\mathbb{N}$, $\mathcal{O}_{Z_i}$ and $u^{-1}\widetilde{\mathcal{B}}^{(m)}_{X_i}(D)$ are tor independent over $u^{-1}\mathcal{O}_{X_i}$.*

Proof. Since this is local on $\mathfrak{X}$, we can suppose $\mathfrak{X} = \operatorname{Spf} A$ affine, integral and there exist $f\in\mathcal{O}_{\mathfrak{X}}$ lifting a local equation of D in X_0. Since $\mathfrak{X}$ is p-torsion free, we have the short exact sequence $0\to\mathcal{O}_{\mathfrak{X}}\{T\} \underset{f^{p^{m+1}}T-p}{\longrightarrow} \mathcal{O}_{\mathfrak{X}}\{T\} \to \mathcal{B}^{(m)}_{\mathfrak{X}}(D)\to 0$, which gives a flat resolution $\mathcal{B}^{(m)}_{\mathfrak{X}}(D)$. By applying $\mathcal{O}_{\mathfrak{Z}}\otimes_{u^{-1}\mathcal{O}_{\mathfrak{X}}} u^{-1}(-)$, this yields the short exact sequence $0\to\mathcal{O}_{\mathfrak{Z}}\{T\} \underset{[f^{p^{m+1}}T-p]_{\mathfrak{Z}}}{\longrightarrow} \mathcal{O}_{\mathfrak{Z}}\{T\} \to \mathcal{B}^{(m)}_{\mathfrak{Z}}(E)\to 0$ where $[-]_{\mathfrak{Z}}$ is the reduction modulo $\mathcal{I}$ and we get the first tor independence. By flatness of the extension $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)\to\mathcal{O}_{\mathfrak{X}}({}^{\dagger}D)_{\mathbb{Q}}$, we get the second one. Finally, the last part was already checked (see 9.2.1.26). □

9.3.1.2 (Local description)**.** Suppose $\mathfrak{X}^\sharp$ is affine and there exist some integers $0 \leq r \leq d$ and a cartesian diagram of morphisms of p-torsion free nice fine log smooth $\mathfrak{S}^\sharp$-log-formal schemes) of the form:

$$\begin{array}{ccc} \mathfrak{X}^\sharp & \xrightarrow{\alpha} & A^{d,r}_{\mathfrak{S}^\sharp} \\ {\scriptstyle u}\uparrow & \square & \uparrow \\ \mathfrak{Z}^\sharp & \longrightarrow & A^{r,r}_{\mathfrak{S}^\sharp} \end{array}$$

such that the horizontal morphisms are log-étale and the right morphism is the canonical exact closed immersion whose ideal is generated by $t_{r+1}, \ldots, t_d$. Recall following 5.2.1.1, this is Zariski locally possible. We denote by straight letter, the global section of a sheaf on $\mathfrak{X}$ or on $\mathfrak{Z}$, e.g. $\widetilde{D}_{\mathfrak{X}^\sharp} := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$ and $\widetilde{D}_{\mathfrak{Z}^\sharp} := \Gamma(\mathfrak{Z}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$.

Let $\mathfrak{Y} := \alpha^{-1}(B^{n,r}_{\mathfrak{S}^\sharp})$ be the open $\mathfrak{S}^\sharp$-(formal) subscheme of $\mathfrak{X}^\sharp$ with trivial log-structure (see [Ogu18, III.1.2.8]). Let $t_1, \ldots, t_r \in M_{\mathfrak{X}^\sharp}$ and $t_{r+1}, \ldots, t_d \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ be the element given by α. Then $t_{r+1}, \ldots, t_d$ generate $I := \Gamma(\mathfrak{X}, \mathcal{I})$, $\bar{t}_1, \ldots, \bar{t}_r$ are semi-logarithmic coordinates of $\mathfrak{Z}^\sharp$ over $\mathfrak{S}^\sharp$, and $\bar{t}_{r+1}, \ldots, \bar{t}_d$ is a basis of $\mathcal{I}/\mathcal{I}^2$, where $\bar{t}_1, \ldots, \bar{t}_r \in \Gamma(\mathfrak{Z}, M_{\mathfrak{Z}^\sharp})$ (resp. $\bar{t}_{r+1}, \ldots, \bar{t}_d \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{Z}})$) are the images of $t_1, \ldots, t_r$ (resp. $t_{r+1}, \ldots, t_d$) via $\Gamma(\mathfrak{X}, M_{\mathfrak{X}^\sharp}) \to \Gamma(\mathfrak{Z}, M_{\mathfrak{Z}^\sharp})$ (resp. $\Gamma(\mathfrak{X}, \mathcal{I}) \to \Gamma(\mathfrak{Z}, \mathcal{O}_{\mathfrak{Z}})$). Remark that since the closed immersion $\underline{u}$ is regular then it follows from [Gro67, 16.9.3] that $t_{r+1}, \ldots, t_d$ is a quasi-regular sequence of $I := \Gamma(\mathfrak{X}, \mathcal{I})$ and then by noetherianity (see [Gro67, 16.9.10]) is a regular sequence of I.

We simply write $\tau_{i\sharp} := \mu^n_{(m),\gamma}(t_i) - 1 \in \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}$ for $i = 1, \ldots, r$ (see notation 3.2.2.4), $\tau_j := 1 \otimes t_j - t_j \otimes 1 \in \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}$ for $j = r+1, \ldots, d$. We write $\overline{\tau}_{i\sharp} := \mu^n_{(m),\gamma}(\bar{t}_i) - 1 \in \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E) \otimes_{\mathcal{O}_{\mathfrak{Z}}} \mathcal{P}^n_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,(m)}$ for $i = 1, \ldots, r$. The sheaf of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$-algebras $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,(m)}$ is a free $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$-module with the basis $\{\underline{\tau}_{(r)}{}^{\{(\underline{i},\underline{0})\}_{(m)}} = \underline{\tau}_{\sharp}{}^{\{(\underline{i},\underline{0})\}_{(m)}} \mid \underline{i} \in \mathbb{N}^r,$ such that $|\underline{i}| \leq n\}$, and $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^n_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,(m)}$ is a free $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E)$-module with the basis $\{\underline{\overline{\tau}}_{\sharp}^{\{\underline{i}\}_{(m)}} \mid \underline{i} \in \mathbb{N}^r$ such that $|\underline{i}|| \leq n\}$. According to 4.5.1.1, the corresponding dual basis of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,n}$ is denoted $\{\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} \mid \underline{k} \in \mathbb{N}^d,\ |\underline{k}| \leq n\}$ and the corresponding dual basis of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E) \otimes_{\mathcal{O}_{\mathfrak{Z}}} \mathcal{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,n}$ is denoted by $\{\underline{\partial}_{\sharp}^{\langle \underline{i} \rangle_{(m)}} \mid \underline{i} \in \mathbb{N}^r,\ |\underline{i}| \leq n\}$ The sheaf $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is a free $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$-module with the basis $\{\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} \mid \underline{k} \in \mathbb{N}^d\}$, and $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E) \otimes_{\mathcal{O}_{\mathfrak{Z}}} \mathcal{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$ is a free $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(E)$-module with the basis $\{\underline{\partial}_{\sharp}^{\langle \underline{i} \rangle_{(m)}} \mid \underline{i} \in \mathbb{N}^r\}$.

9.3.1.3. Let $\mathcal{I}$ (resp. $\mathcal{I}_i$) be the ideal of $\mathcal{O}_{\mathfrak{X}}$ (resp. $\mathcal{O}_{X_i}$) induced by the exact closed immersion $u \colon \mathfrak{Z}^\sharp \hookrightarrow \mathfrak{X}^\sharp$ (resp. $u_i \colon Z_i^\sharp \hookrightarrow X_i^\sharp$).

(a) Since $\mathcal{O}_{Z_i} = u^{-1}\mathcal{O}_{X_i}/u^{-1}\mathcal{I}_i$, then we check

$$\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp \to X_i^\sharp/S_i^\sharp}(D) = \widetilde{u}_i^* \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D) = u^{-1}(\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D)/\mathcal{I}_i \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D)).$$

Since $\mathcal{I}$ is $\mathcal{O}_{\mathfrak{X}}$-coherent, since $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ is a coherent ring, then $\mathcal{I} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ is a coherent right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module. Since $\mathcal{I}$ is $\mathcal{O}_{\mathfrak{X}}$-flat (recall X and Z are regular and use [Gro66, 15.4.2]), this yields that $\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \xrightarrow{\sim} \mathcal{I} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ are coherent right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-modules. Moreover, since $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \otimes_{\mathcal{V}} (\mathcal{V}/\pi^{i+1}\mathcal{V}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D)$, then we get the isomorphisms

$$\begin{aligned} \mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\pi^{i+1}\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) &\xrightarrow{\sim} (\mathcal{I} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\pi^{i+1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \\ &\xrightarrow{\sim} \mathcal{I} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D) \xrightarrow{\sim} \mathcal{I}_i \otimes_{\mathcal{O}_{X_i}} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D) \xrightarrow{\sim} \mathcal{I}_i\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D). \end{aligned}$$

Via 7.2.3.16.(i), this yields that the canonical morphism

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \to \varprojlim_i \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D)/\mathcal{I}_i\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp/S_i^\sharp}(D) \tag{9.3.1.3.1}$$

is an isomorphism.

Recall $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) := \varprojlim_i \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_i\to X^\sharp_i/S^\sharp_i}(D)$ (see 7.5.5.10). Since u_* commutes with projective limits, we deduced from 9.3.1.3.1 the isomorphism

$$u_*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D). \tag{9.3.1.3.2}$$

Recall $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}} := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)_{\mathbb{Q}}$ (see 9.2.1.20). Taking the tensor product by $\mathbb{Q}$ on $\mathbb{Z}$ and next to the inductive limit on the level, we get therefore:

$$\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}} \xrightarrow{\sim} u^{-1}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}/\mathcal{I}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \tag{9.3.1.3.3}$$

(b) Suppose $\mathfrak{X}$ is affine and put $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$. We prove similarly that $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ is a coherent right $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module. Since $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \otimes_{\mathcal{V}} (\mathcal{V}/\pi^{i+1}\mathcal{V}) \xrightarrow{\sim} \widetilde{D}^{(m)}_{X^\sharp_i/S^\sharp_i}(D)$, with 7.2.1.3, this implies that the canonical morphism

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \to \varprojlim_i \widetilde{D}^{(m)}_{X^\sharp_i/S^\sharp_i}(D)/I_i\widetilde{D}^{(m)}_{X^\sharp_i/S^\sharp_i}(D) \tag{9.3.1.3.4}$$

is an isomorphism. Since the functor $\Gamma(\mathfrak{X}, -)$ commutes with projective limits, the isomorphisms 9.3.1.3.1 and 9.3.1.3.4 induce $\Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)) \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$. This yields:

$$\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D). \tag{9.3.1.3.5}$$

Taking the tensor product by $\mathbb{Q}$ on $\mathbb{Z}$ and next to the inductive limit on the level, we get

$$D^\dagger_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}} \xrightarrow{\sim} D^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}/ID^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}. \tag{9.3.1.3.6}$$

9.3.1.4. Suppose we are in the local situation of 9.3.1.2.

(a) According to 5.2.2.3, we denote by $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}/\mathfrak{S}^\sharp}$ the free $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$-module with the basis $\{\underline{\partial}_{(r)}^{\langle(\underline{i},\underline{0})\rangle_{(m)}} \mid \underline{i} \in \mathbb{N}^r\}$, where $\underline{0} := (0, \ldots, 0) \in \mathbb{N}^{d-r}$. The sheaf $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}/\mathfrak{S}^\sharp}$ is equal to the sub-$\mathcal{O}_{\mathfrak{S}}$-algebra of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ which is generated by $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$, by $\partial_{\sharp,i}^{\langle p^h\rangle_{(m)}}$ and $\partial_j^{\langle p^h\rangle_{(m)}}$ for any $1 \le i \le r$, $r+1 \le j \le d$ and $0 \le h \le p^m$.

(b) Let $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$ be the p-adic completion of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}/\mathfrak{S}^\sharp}$. A section of the sheaf $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ can uniquely be written of the form $\sum_{\underline{k}\in\mathbb{N}^d} a_{\underline{k}}\underline{\partial}^{\langle\underline{k}\rangle_{(m)}}$ such that $a_{\underline{k}} \in \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$ converges to 0 when $|\underline{k}| \to \infty$. A section of the sheaf $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$ can uniquely be written of the form $\sum_{\underline{l}\in\mathbb{N}^r} b_{\underline{l}}\underline{\partial}^{\langle\underline{l}\rangle_{(m)}}$ such that $b_{\underline{l}} \in \mathcal{O}_{\mathfrak{Z}}$ converges to 0 when $|\underline{l}| \to \infty$. Then $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$ is a subring of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ whose elements can uniquely be written of the form $\sum_{\underline{l}\in\mathbb{N}^r} a_{\underline{l}}\underline{\partial}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}$ (recall $\underline{0} := (0, \ldots, 0) \in \mathbb{N}^{d-r}$) where $a_{\underline{l}} \in \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)$ converges to 0 when $|\underline{l}| \to \infty$. Taking p-adic completion of the diagram 5.2.2.5.7, with notation 7.5.5.10 we get the canonical diagram

$$\begin{array}{ccc} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D) & \hookrightarrow & \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \\ \sim\uparrow \vartheta & & \sim\uparrow 9.3.1.3 \\ u_*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E) & \xrightarrow{\theta} & u_*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \end{array} \tag{9.3.1.4.1}$$

where $\vartheta\colon u_*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$ is an isomorphism of $\mathcal{V}$-algebras.

(c) We set $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D) := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$. We get a similar diagram than 9.3.1.4.1 by replacing $\widetilde{\mathcal{D}}^{(m)}$ with $\mathcal{D}^\dagger$ and by adding applying the functor $\mathbb{Q} \otimes_{\mathbb{Z}} -$.

(d) By $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ we mean $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}/\mathfrak{S}^\sharp}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$, resp. $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)_{\mathbb{Q}}$, resp. $\mathcal{D}^{\dagger}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)_{\mathbb{Q}}$).

9.3.1.5. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module. We set $\widetilde{u}^{\flat 0}(\mathcal{M}) := u^{-1}\mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(u_*\mathcal{B}_{\mathfrak{Z}}, \mathcal{M})$.

(a) We endow $\widetilde{u}^{\flat 0}(\mathcal{M})$ with a structure of right $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-module as follows. Suppose $\mathfrak{X}$ affine. Let $x \in \Gamma(\mathfrak{Z}, \widetilde{u}^{\flat 0}(\mathcal{M}))$ and $Q \in \widetilde{D}_{\mathfrak{Z}}$. Choose $Q_{\mathfrak{X}} \in \widetilde{D}_{\mathfrak{X}}$ such that $\vartheta(Q) = \overline{Q_{\mathfrak{X}}}$ (see 9.3.1.4.1). We define $x \cdot Q$ so that we get the equality

$$\mathrm{ev}_1(x \cdot Q) := \mathrm{ev}_1(x) \cdot Q_{\mathfrak{X}}, \tag{9.3.1.5.1}$$

where $\mathrm{ev}_1 \colon \Gamma(\mathfrak{Z}, \widetilde{u}^{\flat 0}(\mathcal{M})) \hookrightarrow \Gamma(\mathfrak{X}, \mathcal{M})$ is the evaluation at 1 homomorphism (which is injective). Since I annihilates $\mathrm{ev}_1(x)$, we remark that this is well defined.

(b) When $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} = \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, we have a canonical way to endow $\widetilde{u}^{\flat 0}(\mathcal{M})$ with a canonical structure of right $\mathcal{D}^{(m)}_{\mathfrak{Z}}$-module (see 5.2.5.1). It follows from the computation 5.2.5.2.1 that both structures are identical.

9.3.1.6 (Local description of the right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module structure of $\widetilde{u}^{\flat 0}(\mathcal{M})$)**.** Suppose we are in the local situation of 9.3.1.2. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module. Since $\vartheta \colon u_*\mathcal{B}_{\mathfrak{Z}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \xrightarrow{\sim} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$, we have the isomorphism

$$\widetilde{u}^{\flat 0}(\mathcal{M}) \xrightarrow{\sim} u^{-1}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}, \mathcal{M}). \tag{9.3.1.6.1}$$

Following 9.3.1.4.1, we have the isomorphism of $\mathcal{O}_{\mathfrak{S}}$-algebras $\vartheta \colon u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ (see notation 9.3.1.4.1). Hence, we get from 9.3.1.6.1 the isomorphism

$$\widetilde{u}^{\flat 0}(\mathcal{M}) \xrightarrow{\sim} u^{-1}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, \mathcal{M}) \tag{9.3.1.6.2}$$

By using 9.3.1.5.1 formula, we compute that this isomorphism 9.3.1.6.2 is an isomorphism of right $u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-modules, and 9.3.1.6.1 is therefore an isomorphism of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-modules. If there is no ambiguity, we can avoid writing u^{-1} or u_*, e.g. we can simply write $\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, \mathcal{M})$ instead of $u^{-1}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, \mathcal{M})$.

9.3.1.7. Suppose we are in the local situation of 9.3.1.2. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}_{\mathfrak{X}/\mathfrak{S}}$-module.

(a) By derivating 9.3.1.6.2, we get the isomorphism of $D^{\mathrm{b}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}})$ of the form

$$\widetilde{u}^{\flat}(\mathcal{M}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}, \mathcal{M}). \tag{9.3.1.7.1}$$

Let $s := d - r$, and $f_1 = t_{r+1}, \ldots, f_s := t_d$. Let $K_\bullet(\underline{f})$ be the Koszul complex of $\underline{f} = (f_1, \ldots, f_s)$ (see notation 5.2.5.4). We set $\widetilde{K}_\bullet(\underline{f}) := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} K_\bullet(\underline{f})$.

Since $f_1, \ldots, f_s$ is a regular sequence of $\mathcal{I}$, since $\mathcal{O}_{\mathfrak{Z}}$ and $u^{-1}\mathcal{B}_{\mathfrak{X}}$ are tor independent over $u^{-1}\mathcal{O}_{\mathfrak{X}}$ (see 9.3.1.1), then the canonical morphism $\widetilde{K}_\bullet(\underline{f}) \to \mathcal{B}_{\mathfrak{X}}/\mathcal{I}\mathcal{B}_{\mathfrak{X}}$ (given by the canonical map $\widetilde{K}_0(\underline{f}) = \mathcal{B}_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X}}/\mathcal{I}\mathcal{B}_{\mathfrak{X}}$) is a quasi-isomorphism. Hence, we get the isomorphism of $D^{\mathrm{b}}(\mathcal{B}_{\mathfrak{X}})$

$$\phi_{\underline{f}} \colon \widetilde{u}^{\flat}(\mathcal{M}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{K}_\bullet(\underline{f}), \mathcal{M}).$$

Since $f_1, \ldots f_s$ are in the center of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ and since $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ is a flat $\mathcal{B}_{\mathfrak{X}}$-algebra, then the quasi-isomorphism $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{K}_\bullet(\underline{f}) \xrightarrow{\sim} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ in the category of complexes of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-bimodules. We get the commutativity of diagram

$$\begin{array}{ccc} \widetilde{u}^{\flat}(\mathcal{M}) & \xrightarrow[\sim]{\phi_{\underline{f}}} & \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\widetilde{K}_\bullet(\underline{f}), \mathcal{M}) \\ {\scriptstyle 9.3.1.7.1}\downarrow\wr & \searrow^{\phi_{\underline{t}}} & \downarrow\wr \\ \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}, \mathcal{M}) & \xleftarrow[\sim]{} & \mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{K}_\bullet(\underline{f}), \mathcal{M}), \end{array} \tag{9.3.1.7.2}$$

where $\phi_{\underline{t}}$ is the homomorphism making commutative the upper triangle. By commutativity of 5.2.5.4.2, $\phi_{\underline{t}}$ is an isomorphism of $D^{\mathrm{b}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}})$. Hence, we get the isomorphism of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-modules

$$\phi^s_{\underline{t}} := \mathcal{H}^s(\phi_{\underline{t}})\colon R^s\widetilde{u}^{\flat 0}(\mathcal{M}) \xrightarrow{\sim} \mathcal{H}^s\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{K}_\bullet(\underline{f}), \mathcal{M}). \tag{9.3.1.7.3}$$

We have the homomorphism of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-modules $\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{K}_s(\underline{f}), \mathcal{M}) \to \mathcal{M}$ (the structure of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-module on $\mathcal{M}$ comes from its structure of $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$ via ϑ) given by $\phi \mapsto \phi(e_1 \wedge \cdots \wedge e_s)$. Since $\mathcal{M} \to \mathcal{M}/\mathcal{I}\mathcal{M}$ is a morphism of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-modules, then this induces the morphism of complex of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-modules of the form $\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{K}_\bullet(\underline{f}), \mathcal{M}) \to \mathcal{M}/\mathcal{I}\mathcal{M}$. This yields the isomorphism of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$-modules

$$\mathcal{H}^s\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{K}_\bullet(\underline{f}), \mathcal{M}) \xrightarrow{\sim} \mathcal{M}/\mathcal{I}\mathcal{M}. \tag{9.3.1.7.4}$$

Notation 9.3.1.8. Let $\mathcal{E} \in D({}^l\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$. We set:

$$\widetilde{u}^!(\mathcal{E}) := \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp} \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} u^{-1}\mathcal{E}[d_u]. \tag{9.3.1.8.1}$$

Beware, in the first respective case, this notation has not to be confused with its completed version denoted by $\widetilde{u}^{(m)!}$ of 7.5.5.6. We will work with the completed version functor in the subsection 9.3.3. Using 9.3.1.3.2 and 9.3.1.3.3 for the less obvious cases, we can check the canonical morphism

$$\begin{aligned}\mathbb{L}\widetilde{u}^*(\mathcal{E}) &:= \mathcal{B}_{\mathfrak{Z}} \otimes^{\mathbb{L}}_{u^{-1}\mathcal{B}_{\mathfrak{X}}} u^{-1}\mathcal{E} \xrightarrow{\sim} u^{-1}(\mathcal{B}_{\mathfrak{X}}/\mathcal{I}\mathcal{B}_{\mathfrak{X}} \otimes^{\mathbb{L}}_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}) \\ &\xrightarrow{\sim} u^{-1}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{E}) \to \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp} \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} u^{-1}\mathcal{E}\end{aligned} \tag{9.3.1.8.2}$$

is an isomorphism, which yields $\mathbb{L}\widetilde{u}^*(\mathcal{E})[d_u] \xrightarrow{\sim} \widetilde{u}^!(\mathcal{E})$.

Suppose now we are in the local situation of 9.3.1.2. Let $Q \in \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$. Choose $Q_{\mathfrak{X}} \in \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ such that $[Q_{\mathfrak{X}}]_{\mathfrak{Z}} = \vartheta(Q)$ (use 9.3.1.4.1). For any section x of $\mathcal{E}$, we have the formula in $\widetilde{u}^*(\mathcal{E})$:

$$Q(\widetilde{u}^*(x)) = \widetilde{u}^*(Q_{\mathfrak{X}} \cdot x). \tag{9.3.1.8.3}$$

Indeed, by fonctoriality, we reduce to the case where $\mathcal{E} =$, which easily follows from 5.2.2.6.1 by p-adic completion (and inductive limits on the level). Via the monomorphism of rings $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \hookrightarrow \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$, we check the canonical homorphism

$$\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp} \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}} u^{-1}\mathcal{E} \to \mathbb{L}\widetilde{u}^*(\mathcal{E})$$

is an isomorphism of $D({}^l\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$. Via the isomorphisms $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_X} \widetilde{K}_\bullet(\underline{f}) \xrightarrow{\sim} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \overset{\vartheta}{\underset{\sim}{\longleftarrow}} \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$, this yields the isomorphism of $D(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}})$:

$$(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \otimes_{\mathcal{B}_X} \widetilde{K}_\bullet(\underline{f})) \otimes_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}} u^{-1}\mathcal{E} \xrightarrow{\sim} \mathbb{L}\widetilde{u}^*(\mathcal{E}). \tag{9.3.1.8.4}$$

9.3.1.9. Suppose we are in the local situation of 9.3.1.2. Since $u_*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} = \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$, then $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$ is a $(u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$-bimodule. Using the formula 9.3.1.8.3 applied to the case $\mathcal{E} = \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$, we compute that $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ is also a left $u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-submodule of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$, and then a $(u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}})$-sub-bimodule of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$.

Since $u_*\theta\colon u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp} \to u_*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ is a homomorphism of left $u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-modules, then via the commutativity of 9.3.1.4.1, this implies that the bijection $\vartheta\colon u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ is an isomorphism of left $u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-modules.

9.3.1.10 (Semi-logarithmic adjoint operator)**.** Suppose we are in the local situation of 9.3.1.2. Let $\underline{k} \in \mathbb{N}^d$. We still denote by ${}^\tau\underline{\partial}_{(r)}^{\langle \underline{k}\rangle_{(m)}}$ the image of the operator ${}^\tau\underline{\partial}_{(r)}^{\langle \underline{k}\rangle_{(m)}}$ defined at 4.5.1.1.2 via the ring homomorphism $D^{(m)}_{\mathfrak{A}^{d,r}_{\mathfrak{S}^\sharp}/\mathfrak{S}^\sharp} \to \widetilde{D}_{\mathfrak{X}^\sharp} \to \widetilde{D}_{\mathfrak{X}^\sharp}$.

Let $P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}\underline{\partial}_{(r)}^{\langle \underline{k}\rangle_{(m)}} \in \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$, with $b_{\underline{k}} \in B_X$ converging to 0 for the p-adic topology. We define the "semi-logarithmic adjoint operator" of P by setting ${}^\tau P := \sum_{\underline{k}} {}^\tau\underline{\partial}_{(r)}^{\langle \underline{k}\rangle_{(m)}} b_{\underline{k}}$, which is a mixed version of the logarithmic and non-logarithmic adjoint operator. By tensoring with or by taking the inductive limits on the level, we define the "semi-logarithmic adjoint operator" ${}^\tau\colon \widetilde{D}_{\mathfrak{X}^\sharp} \to \widetilde{D}_{\mathfrak{X}^\sharp}$.

Let P, Q be two differential operators of $\widetilde{D}_{\mathfrak{X}^\sharp}$. It follows from 9.3.1.10 (e.g. by p-adic completion, tensorisation by $\mathbb{Q}$ and inductive limits on the level if necessary) that the following properties hold:

(a) We have ${}^\tau({}^\tau P) = P$ and ${}^\tau(PQ) = {}^\tau Q {}^\tau P$

(b) We have the equality
$$\rho({}^\tau P) = \rho\left(\underline{t}_{(r)}{}^{\mathrm{t}}P\frac{1}{\underline{t}_{(r)}}\right), \tag{9.3.1.10.1}$$
where $\underline{t}_{(r)} = t_1 \cdots t_r$ and where ρ is the canonical map $\widetilde{D}_{\mathfrak{X}^\sharp} \to \widetilde{D}^{(m)}_{\mathfrak{Y}}$ (which is an inclusion when $\mathcal{B}_{\mathfrak{X}} = \mathcal{O}_{\mathfrak{X}}$).

Hence, ${}^\tau\colon (\widetilde{D}_{\mathfrak{X}^\sharp})^o \to \widetilde{D}_{\mathfrak{X}^\sharp}$ is an involution of $\mathcal{O}_T$-algebras, which is called the semi-logarithmic adjoint automorphism. Beware that this depends on the choice of the semi-logarithmic coordinates $t_1, \ldots, t_d$. This induces ${}^\tau\colon \widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \to \widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ such that ${}^\tau(I\widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}) = I\widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$. This yields the automorphism ${}^\tau\colon \widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/I\widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \to \widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/I\widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$. On the other hand, via the local logarithmic coordinates $\bar{t}_1, \ldots, \bar{t}_{r+s}$ of $Z^\sharp$ over $T^\sharp$, we get the logarithmic adjoint operator automorphism ${}^\tau\colon \widetilde{D}_{\mathfrak{Z}^\sharp} \to \widetilde{D}_{\mathfrak{Z}^\sharp}$ given by $Q = \sum_{\underline{i}\in\mathbb{N}^{r+s}} b_{\underline{i}}\underline{\partial}_{(r)}^{\langle \underline{i}\rangle_{(m)}} \mapsto {}^\tau(Q) := \sum_{\underline{i}\in\mathbb{N}^{r+s}} {}^\tau\underline{\partial}_{(r)}^{\langle \underline{i}\rangle_{(m)}} b_{\underline{i}}$.

Since $\vartheta(\underline{\partial}_{(r)}^{\langle \underline{i}\rangle_{(m)}}) = \underline{\partial}_{(r)}^{\langle (\underline{i},\underline{0})\rangle_{(m)}}$, $\vartheta({}^\tau\underline{\partial}_{(r)}^{\langle \underline{i}\rangle_{(m)}}) = {}^\tau\underline{\partial}_{(r)}^{\langle (\underline{i},\underline{0})\rangle_{(m)}}$ (use the formula 3.4.1.2.2) for any $\underline{i} \in \mathbb{N}^{r+s}$, then the following diagram
$$\begin{array}{ccc} \widetilde{D}_{\mathfrak{Z}^\sharp} & \xrightarrow[\vartheta]{\sim} & \widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/I\widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \\ \sim\downarrow{\scriptstyle\tau} & & \sim\downarrow{\scriptstyle\tau} \\ \widetilde{D}_{\mathfrak{Z}^\sharp}, & \xrightarrow[\vartheta]{\sim} & \widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}/I\widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}} \end{array} \tag{9.3.1.10.2}$$
is commutative.

Lemma 9.3.1.11. *The sheaf $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is a free $\mathcal{B}_{\mathfrak{X}}$-module of rank one with the basis $\widetilde{e}_0 := d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge t_d$ and $\widetilde{\omega}_{\mathfrak{Y}/\mathfrak{S}^\sharp}$ is a free $\mathcal{B}_Y$-module of rank one with the basis $dt_1 \wedge \cdots \wedge dt_d$.*

The sheaf $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is a right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-submodule of $j_*\widetilde{\omega}_{\mathfrak{Y}/\mathfrak{S}^\sharp}$. More precisely, the action of $P \in \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$ on the section $b\,\widetilde{e}_0$, where b is section of $\mathcal{B}_{\mathfrak{X}}$ is given by the formula
$$(b\ \widetilde{e}_0) \cdot P = {}^\tau P(b)\ \widetilde{e}_0. \tag{9.3.1.11.1}$$

Proof. This is a consequence of 4.5.1.6 (e.g. by p-adic completion, tensorisation by $\mathbb{Q}$ and inductive limits on the level if necessary). □

9.3.1.12. It follows from 4.2.5.5.1 (e.g. by p-adic completion, tensorisation by $\mathbb{Q}$ and inductive limits on the level if necessary, we get a structure of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-modules on $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$. It follows from 4.2.5.5.1 (e.g. by p-adic completion, tensorisation by $\mathbb{Q}$ and inductive limits on the level if necessary) that there exists a unique involution of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodules
$$\delta_{\widetilde{\omega}}\colon \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} \tag{9.3.1.12.1}$$
exchanging the two structures of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and such that, for each section m of $\mathcal{M}$, $\delta_{\widetilde{\omega}}(m \otimes 1) = m \otimes 1$. In semi-logarithmic coordinates, we have the following formula
$$\delta_{\mathcal{M}}(m \otimes {}^\tau\underline{\partial}_{(r)}^{\langle \underline{k}\rangle}) = \sum_{\underline{h}\leq\underline{k}} m\,{}^\tau\underline{\partial}_{(r)}^{\langle \underline{k}-\underline{h}\rangle} \otimes \underline{\partial}_{(r)}^{\langle \underline{h}\rangle}. \tag{9.3.1.12.2}$$

9.3.1.13 (Left to right $\mathcal{D}$-module)**.** Suppose now we are in the local situation of 9.3.1.2. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module. We denote by $\widetilde{e}_0 := d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge dt_d$ a basis of the free $\mathcal{B}_{\mathfrak{X}}$-module $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ has the basis, and by $\widetilde{e}_0^\vee$ its corresponding dual basis of the free $\mathcal{B}_{\mathfrak{X}}$-module $\widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

(a) We compute that the right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module structure on $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}$ (see its definition 7.5.1.13.(f) or 8.7.2) is given by the formula

$$(\widetilde{e}_0 \otimes x)P = \widetilde{e}_0 \otimes {}^\tau P x, \tag{9.3.1.13.1}$$

for any local section x of $\mathcal{E}$ and P of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$.

(b) On the other hand, the left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module structure on $\mathcal{M} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\omega}^{-1}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is given by the formula

$$P(y \otimes \widetilde{e}_0^\vee) = y^\tau P \otimes \widetilde{e}_0^\vee, \tag{9.3.1.13.2}$$

for any local section y of $\mathcal{M}$ and P of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$.

9.3.1.14. Suppose now we are in the local situation of 9.3.1.2. For any left (resp. right) $\widetilde{D}_{\mathfrak{X}^\sharp}$-module E (resp. M), we denote by $[-]_{\mathfrak{Z}} \colon E \to E/IE$ (resp. $[-]'_{\mathfrak{Z}} \colon M \to M/MI$) the canonical surjections. Remark we add a prime to avoid some confusion in the case of a bimodule.

It follows from 5.2.2.14.1 (e.g. by p-adic completion, tensorisation by $\mathbb{Q}$ and inductive limits on the level if necessary) that we get the isomorphism of abelian sheaves:

$$\iota_{\widetilde{t}} \colon u_*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}\mathcal{I}. \tag{9.3.1.14.1}$$

Via this map, we get a structure of $(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}, u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$-bimodule on $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}\mathcal{I}$. By functoriality of the construction of the structure of $(u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$-bimodule of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}$, we check that the underlying structure of left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module on $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}\mathcal{I}$ is equal to its natural structure. The structure of right $u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-module of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}\mathcal{I}$ is characterized by the following formula:

$$[y]'_{\mathfrak{Z}} \cdot Q = [y \cdot Q_{\mathfrak{X}}]'_{\mathfrak{Z}}, \tag{9.3.1.14.2}$$

where $y \in M$, $Q \in \widetilde{D}_{\mathfrak{Z}^\sharp}$ and $Q_{\mathfrak{X}} \in \widetilde{D}_{\mathfrak{X}^\sharp, \mathfrak{Z}^\sharp, \underline{t}}$ is an element such that $[Q_{\mathfrak{X}}]_{\mathfrak{Z}} = \vartheta(Q)$ (use 9.3.1.4.1). Moreover, we compute that $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp, \mathfrak{Z}^\sharp, \underline{t}}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp, \mathfrak{Z}^\sharp, \underline{t}}$ is also a left $u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-submodule of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$, and therefore a $(u_*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp, \mathfrak{Z}^\sharp, \underline{t}})$-sub-bimodule of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$.

Proposition 9.3.1.15. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module (resp. a $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-bimodule). Set $n := -d_u \in \mathbb{N}$. We have the canonical isomorphism of right $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-modules (resp. of right $(\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$-bimodules):*

$$R^n\widetilde{u}^{\flat 0}(\omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \xrightarrow{\sim} \omega_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{Z}}} \widetilde{u}^*(\mathcal{E}). \tag{9.3.1.15.1}$$

Proof. Using 9.3.1.7 and 9.3.1.8, thanks to respectively 7.5.1.13 or 8.7.2.2, we can proceed as in 5.2.5.6. □

Remark 9.3.1.16. Since complexes are not coherent, Proposition 9.3.1.15 is not a straightforward consequence of Theorem 5.2.5.6 (but the check is similar).

Theorem 9.3.1.17. *Let $* \in \{\mathrm{l}, \mathrm{r}\}$ and let $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$ (resp. $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}, {}^*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$). With notation 9.3.1.8, we have the canonical isomorphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ (resp. $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, {}^*u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$) of the form*

$$\omega_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{Z}}} \widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^\flat(\omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}). \tag{9.3.1.17.1}$$

Proof. Using [Har66, I.7.4], this is a consequence of 9.3.1.15 and of the isomorphism $\mathbb{L}\widetilde{u}^*(\mathcal{E})[d_u] \xrightarrow{\sim} \widetilde{u}^!(\mathcal{E})$ (see 9.3.1.8). □

9.3.1.18. By using the same arguments as in 9.3.1.3, it follows from 5.2.2.14.1 that we have the canonical isomorphism

$$\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} u^{-1}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}\mathcal{I}). \tag{9.3.1.18.1}$$

We get the functor $\widetilde{u}^!\colon D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ by setting for any $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$,

$$\widetilde{u}^!(\mathcal{M}) := u^{-1}\mathcal{E} \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}[d_u]. \tag{9.3.1.18.2}$$

With notation 9.3.1.17, following 5.1.1.5.1 or 9.2.1.23.1, the functor $\widetilde{u}^!\colon D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ (resp. $\widetilde{u}^!\colon D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}, {}^{*}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, {}^{*}u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$) satisfies the isomorphism

$$\omega_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{Z}}} \widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^!(\omega_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}). \tag{9.3.1.18.3}$$

Hence, with 9.3.1.17.1, we get the isomorphism

$$\widetilde{u}^\flat \xrightarrow{\sim} \widetilde{u}^! \tag{9.3.1.18.4}$$

of functors $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ (resp. $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}, {}^{*}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}) \to D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, {}^{*}u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$).

Corollary 9.3.1.19. *(a) We have the canonical isomorphism of right $(\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}, u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$-bimodules of the form*

$$\omega_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{Z}}} \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp} \xrightarrow{\sim} \widetilde{u}^\flat_{\mathrm{l}}(\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})[-d_u], \tag{9.3.1.19.1}$$

where "l" means that in we have chosen the left structure of right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module of the right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-bimodule $\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$.

(b) We have the canonical isomorphism of $(u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$-bimodules of the form

$$\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \xrightarrow{\sim} \widetilde{u}^\flat(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})[-d_u]. \tag{9.3.1.19.2}$$

Proof. By applying Theorem 9.3.1.17 in the case $\mathcal{E} = \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$, we get the isomorphism 9.3.1.19.1. By applying Theorem 9.3.1.17 in the case $\mathcal{E} = \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}}^{-1}$, and by using the transposition isomorphism $\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}}^{-1}) \xrightarrow{\sim} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$, we get the isomorphism 9.3.1.19.2. □

9.3.1.20. Suppose we are in the local situation of 9.3.1.2. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module. Following 5.2.5.7.1 we have the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules:

$$\widetilde{\omega}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Z}}} H^0\widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^{\flat 0}(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}). \tag{9.3.1.20.1}$$

The sheaf $\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is a free $\mathcal{B}_{\mathfrak{X}}$-module of rank one with the basis $d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge t_d$ and $\widetilde{\omega}_{Y/T^\sharp}$ is a free $\mathcal{B}_Y$-module of rank one with the basis $dt_1 \wedge \cdots \wedge dt_d$ (see 4.5.1.6). Using these bases, we get the isomorphism of $\mathcal{B}_{\mathfrak{Z}}$-modules:

$$u_* H^0\widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{B}_{\mathfrak{X}}/\mathcal{I}\mathcal{B}_{\mathfrak{X}}, \mathcal{E}) = \cap_{s=r+1}^{d} \ker(\mathcal{E} \xrightarrow{t_s} \mathcal{E}). \tag{9.3.1.20.2}$$

This yields on $\mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{B}_{\mathfrak{X}}/\mathcal{I}\mathcal{B}_{\mathfrak{X}}, \mathcal{E})$ a structure of left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module extending its structure of $\mathcal{B}_{\mathfrak{X}}$ (beware this structure depends a priori on the choice of the semi-logarithmic coordinates). Let us denote by $\mathrm{ev}_1\colon \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{B}_{\mathfrak{X}}/\mathcal{I}\mathcal{B}_{\mathfrak{X}}, \mathcal{E}) \hookrightarrow \mathcal{E}$ the canonical inclusion (this is the evaluation at 1) and by $\mathrm{ev}_1\colon H^0\widetilde{u}^!(\mathcal{E}) \hookrightarrow \mathcal{E}$ its composition with 9.3.1.20.2. Let $x \in \Gamma(Z, H^0 u^!(\mathcal{E}))$, $y \in \mathcal{H}om_{\mathcal{B}_{\mathfrak{X}}}(\mathcal{B}_{\mathfrak{X}}/\mathcal{I}\mathcal{B}_{\mathfrak{X}}, \mathcal{E})$ and $Q \in \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$. Choose any $Q_{\mathfrak{X}} \in \widetilde{D}_{\mathfrak{X}^\sharp, \mathfrak{Z}^\sharp, \underline{t}}$ such that $\vartheta(Q) = [Q_{\mathfrak{X}}]_Z$ (see 5.2.2.5.7 or 9.3.1.4.1). It follows from 5.2.5.2.1 or 9.3.1.5.1 that we have the formula

$$\mathrm{ev}_1(Q \cdot x) = Q_{\mathfrak{X}} \cdot \mathrm{ev}_1(x), \qquad \mathrm{ev}_1(Q \cdot y) = Q_{\mathfrak{X}} \cdot \mathrm{ev}_1(y). \tag{9.3.1.20.3}$$

9.3.2 Adjunction, relative duality isomorphism

Notation 9.3.2.1. For any $* \in \{\mathrm{r}, \mathrm{l}\}$, we get the acyclic functor $\widetilde{u}_+ : D({}^*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}) \to D({}^*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$ by setting for any $\mathcal{F} \in D({}^l\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ and $\mathcal{N} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$,

$$\widetilde{u}_+(\mathcal{F}) := u_*(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \otimes_{\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}} \mathcal{F}), \tag{9.3.2.1.1}$$

$$\widetilde{u}_+(\mathcal{N}) := u_*(\mathcal{M} \otimes_{\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}} \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}) \xrightarrow{\sim} u_*(\mathcal{M}) \otimes_{\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}} (\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}) \tag{9.3.2.1.2}$$

These functors preserve the coherence. Beware, in the first respective case, this notation has not to be confused with its completed version denoted by $\widetilde{u}^{(m)!}$ (see 7.5.8.1). We will work with the completed version functor in the subsection 9.3.3.

9.3.2.2. Let $\mathcal{G} \in D({}^{\mathrm{l}}u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$. Via the isomorphism

$$u^{-1}\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{u^{-1}\mathcal{B}_{\mathfrak{X}}} \mathcal{G} \xrightarrow{\sim} \left(u^{-1}\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{u^{-1}\mathcal{B}_{\mathfrak{X}}} u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}\right) \otimes_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{G} \xrightarrow{\sim} u^{-1}\left(\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}\right) \otimes_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{G},$$

we get $u^{-1}\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{u^{-1}\mathcal{B}_{\mathfrak{X}}} \mathcal{G} \in D({}^{\mathrm{r}}u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$. Similarly to 5.1.2.8.1, we have the isomorphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$

$$\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} u_*(\mathcal{G}) \xrightarrow{\sim} u_*\left(u^{-1}\widetilde{\omega}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{G}\right). \tag{9.3.2.2.1}$$

By using 8.7.2.5.1 (resp. 9.3.2.2.1) instead of 4.3.5.6.1 (resp. 5.1.2.8.1), by copying the proof of 5.1.3.2.1, for any $\mathcal{F} \in D({}^l\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ we get the canonical isomorphism

$$\widetilde{\omega}_{\mathfrak{X}} \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{u}_+(\mathcal{F}) \xrightarrow{\sim} \widetilde{u}_+(\widetilde{\omega}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{Z}}} \mathcal{F}). \tag{9.3.2.2.2}$$

Proposition 9.3.2.3. *Let $\mathcal{M}$ be a right (resp. left) $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module, $\mathcal{N}$ be a right (resp. left) $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-module.*

(a) We have the canonical adjunction morphisms $\mathrm{adj}\colon \widetilde{u}_+ H^0\widetilde{u}^!(\mathcal{M}) \to \mathcal{M}$ *and* $\mathrm{adj}\colon \mathcal{N} \to H^0\widetilde{u}^!\widetilde{u}_+(\mathcal{N})$. *Moreover, the compositions* $H^0\widetilde{u}^!(\mathcal{M}) \xrightarrow{\mathrm{adj}} H^0\widetilde{u}^!\widetilde{u}_+H^0\widetilde{u}^!(\mathcal{M}) \xrightarrow{\mathrm{adj}} H^0\widetilde{u}^!(\mathcal{M})$ *and* $\widetilde{u}_+(\mathcal{N}) \xrightarrow{\mathrm{adj}} \widetilde{u}_+H^0\widetilde{u}^!\widetilde{u}_+(\mathcal{N}) \xrightarrow{\mathrm{adj}} \widetilde{u}_+(\mathcal{N})$ *are the identity.*

(b) Using the above adjunction morphisms, we construct maps

$$\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}}(\widetilde{u}_+(\mathcal{N}), \mathcal{M}) \to u_*\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}}(\mathcal{N}, H^0\widetilde{u}^!(\mathcal{M})),\ u_*\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}}(\mathcal{N}, H^0\widetilde{u}^!(\mathcal{M})) \to \mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}}(\widetilde{u}_+(\mathcal{N}), \mathcal{M}),$$

which are inverse of each other.

(c) If $\mathcal{M}$ is an injective right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module, then $H^0\widetilde{u}^!(\mathcal{M})$ is an injective right $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}$-module.

Proof. We can copy the proof of 5.2.6.1. □

Remark 9.3.2.4. The local computations of the adjunction morphisms in the left case detailed at 5.2.6.2 still hold in the context 9.3.2.3.

Corollary 9.3.2.5. *Let $* \in \{\mathrm{r}, \mathrm{l}\}$. Let $\mathcal{M} \in D^+({}^*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$, $\mathcal{N} \in D({}^*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$. We have the isomorphisms:*

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}}(\widetilde{u}_+(\mathcal{N}), \mathcal{M}) \xrightarrow{\sim} u_*\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp}}(\mathcal{N}, \widetilde{u}^!(\mathcal{M})). \tag{9.3.2.5.1}$$

Proof. Taking a K-injective object representing $\mathcal{M}$, this isomorphism is a consequence of 9.3.2.3.b–c. □

Notation 9.3.2.6. Moreover, we get the functor $\mathbb{D}\colon D({}^*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}) \to D({}^*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$ by setting for any $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$, $\mathcal{E} \in D({}^l\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$

$$\mathbb{D}(\mathcal{M}) := \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}}(\mathcal{M}, \omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})[d_X], \mathbb{D}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}}(\mathcal{E}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}}^{-1})[d_X], \tag{9.3.2.6.1}$$

which are computed respectively by taking an injective resolution of $\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$ and $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}}^{-1}$. These functors preserve the perfectness and commute with the quasi-inverse functors $- \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}}^{-1}$ and $\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} -$ exchanging left and right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}$-module structures, i.e. similarly to 9.2.4.20.3, we get the isomorphisms:

$$\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathbb{D}(\mathcal{E}) \xrightarrow{\sim} \mathbb{D}(\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}). \tag{9.3.2.6.2}$$

Lemma 9.3.2.7. *Let $\mathcal{N} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ with $* = r$ or $* = l$. We have $\widetilde{u}_+(\mathcal{N}) \in D^{\mathrm{b}}_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$.*

Proof. We can copy 5.2.6.4. □

Corollary 9.3.2.8. *Let $\mathcal{N} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp})$ with $* = r$ or $* = l$. We have the isomorphism of $D^{\mathrm{b}}_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp})$:*

$$\mathbb{D} \circ \widetilde{u}_+(\mathcal{N}) \xrightarrow{\sim} \widetilde{u}_+ \circ \mathbb{D}(\mathcal{N}). \tag{9.3.2.8.1}$$

Proof. Using 9.3.1.19.1 and 9.3.2.5, we can copy the proof of 5.2.6.6. □

We can complete the subsection with the case of quasi-coherent complexes as follows.

Proposition 9.3.2.9. *Let $\mathcal{M}^{(\bullet)}_\bullet$ be a right (resp. left) $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module, $\mathcal{N}^{(\bullet)}_\bullet$ be a right (resp. left) $\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet/S^\sharp_\bullet}$-module.*

(a) There exists a canonical functorial $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-linear morphism $\mathrm{adj}\colon \widetilde{u}^{(\bullet)}_{\bullet+} H^0 \widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet) \to \mathcal{M}^{(\bullet)}_\bullet$ and a canonical functorial $\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet/S^\sharp_\bullet}$-linear morphism $\mathrm{adj}\colon \mathcal{N}^{(\bullet)}_\bullet \to H^0\widetilde{u}^{(\bullet)!}_\bullet \widetilde{u}^{(\bullet)}_{\bullet+}(\mathcal{N}^{(\bullet)}_\bullet)$ so that the compositions $H^0\widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet) \xrightarrow{\mathrm{adj}} H^0\widetilde{u}^{(\bullet)!}_\bullet \widetilde{u}^{(\bullet)}_{\bullet+} H^0\widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet) \xrightarrow{\mathrm{adj}} H^0\widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet)$ and $\widetilde{u}^{(\bullet)}_{\bullet+}(\mathcal{N}^{(\bullet)}_\bullet) \xrightarrow{\mathrm{adj}} \widetilde{u}^{(\bullet)}_{\bullet+} H^0\widetilde{u}^{(\bullet)!}_\bullet \widetilde{u}^{(\bullet)}_{\bullet+}(\mathcal{N}^{(\bullet)}_\bullet) \xrightarrow{\mathrm{adj}} \widetilde{u}^{(\bullet)}_{\bullet+}(\mathcal{N}^{(\bullet)}_\bullet)$ are the identity.

(b) Using the above adjoint morphisms, we construct maps

$$\mathrm{Hom}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}}(\widetilde{u}^{(\bullet)}_{\bullet+}(\mathcal{N}^{(\bullet)}_\bullet), \mathcal{M}^{(\bullet)}_\bullet) \to \mathrm{Hom}_{\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet/S^\sharp_\bullet}}(\mathcal{N}^{(\bullet)}_\bullet, H^0\widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet)),$$
$$\mathrm{Hom}_{\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet/S^\sharp_\bullet}}(\mathcal{N}^{(\bullet)}_\bullet, H^0\widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet)) \to \mathrm{Hom}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}}(\widetilde{u}^{(\bullet)}_{\bullet+}(\mathcal{N}^{(\bullet)}_\bullet), \mathcal{M}^{(\bullet)}_\bullet),$$

which are inverse of each other.

(c) If $\mathcal{M}^{(\bullet)}_\bullet$ is an injective right (resp. left) $\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}$-module, then $H^0\widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet)$ is an injective right (resp. left) $\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet/S^\sharp_\bullet}$-module.

Proof. It follows from the fact that the adjunction morphisms of 5.2.6.1 are compatible with base changes and level changes. □

Corollary 9.3.2.10. *Let $* \in \{\mathrm{r}, \mathrm{l}\}$, $\mathcal{M}^{(\bullet)}_\bullet \in D({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet})$, $\mathcal{N}^{(\bullet)}_\bullet \in D({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet/S^\sharp_\bullet})$. We have the isomorphisms*

$$\mathbb{R}\mathrm{Hom}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}}(\widetilde{u}^{(\bullet)}_{\bullet+}(\mathcal{N}^{(\bullet)}_\bullet), \mathcal{M}^{(\bullet)}_\bullet) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet/S^\sharp_\bullet}}(\mathcal{N}^{(\bullet)}_\bullet, \widetilde{u}^{(\bullet)!}_\bullet(\mathcal{M}^{(\bullet)}_\bullet)).$$

Proof. Taking an injective resolution of $\mathcal{M}$, this is a consequence of 9.3.2.9.b–c. □

Corollary 9.3.2.11. *Let $* \in \{\mathrm{r}, \mathrm{l}\}$, $\mathcal{N}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$, $\mathcal{M}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. We have the isomorphisms*

$$\mathrm{Hom}_{\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))}(\widetilde{u}^{(\bullet)}_+(\mathcal{N}^{(\bullet)}), \mathcal{M}^{(\bullet)}) \xrightarrow{\sim} \mathrm{Hom}_{\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))}(\mathcal{N}^{(\bullet)}, \widetilde{u}^{(\bullet)!}(\mathcal{M}^{(\bullet)})).$$

Proof. It follows by localisation from 9.3.2.10 that we have the adjoint paire $((\widetilde{u}^{(\bullet)}_{\bullet+}, \widetilde{u}^{(\bullet)!}_\bullet)$ with respect to categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet}(D))$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{Z^\sharp_\bullet}(E))$. We conclude with the equivalence of categories of 8.5.4.5. □

9.3.3 pushforwards and extraordinary pullbacks of p-torsion free separated complete modules, adjunction

We suppose in this subsection that we are in the local context of 9.3.1.2. When we deal with complexes of $\widetilde{\mathcal{D}}^{(m)}$-modules which are only quasi-coherent and not necessarily coherent, the extraordinary pullbacks and the pushforwards we prefer to work with are that defined respectively at 7.5.5.6 and 7.5.8.1 instead of 9.3.1.8.1 and 9.3.2.1. To consider the case of quasi-coherent complexes of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-modules which are in fact a $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-modules, the notion of p-torsion free, separated and complete (for the topology p-adic topology) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module appears naturally. Unfortunately, this category is a priori not stable by the functor $H^0 u_D^{(m)!}$ (see 9.3.3.2). To overcome this problem, in this subsection we focus on the categories of p-torsion free, separated and complete (for the topology p-adic) $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-modules (or $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-modules), where $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$. We define on these categories the notion of direct image (resp. of extraordinary inverse image) of level m with overconvergent singularities along D by u denoted by $u^{(m)}_{D+}$ and (resp. $H^0 u_D^{(m)!}$). We also check the adjunction morphisms are still valid in this context, which extends 9.3.2. The results of this subsections will be useful in order to prove the key lemma 15.3.5.3.

9.3.3.1. We explain in this paragraph why the functor $u^{(m)}_{D,+}$ preserves p-torsion free quasi-coherent left $\widetilde{\mathcal{D}}^{(m)}$-modules.

Let $\mathcal{F}$ be a p-torsion free quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module (see 7.2.3.5 and 7.3.1.7). We have the ringed topoi morphism $\underleftarrow{l}_{\mathfrak{X}} \colon (X_\bullet, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_\bullet/S^\sharp_\bullet}(D)) \to (\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, and $\underleftarrow{l}_{\mathfrak{Z}} \colon (Z_\bullet, \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/S^\sharp_\bullet}(E)) \to (\mathfrak{Z}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E))$. We get the quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/S^\sharp_\bullet}(E)$-module by setting

$$\mathcal{F}_\bullet := \mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}}(\mathcal{F}) = \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/S^\sharp_\bullet}(E) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} \mathcal{F} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp_\bullet/S^\sharp_\bullet}(E) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} \mathcal{F}.$$

By definition (see 7.5.8.1, here $u_D = \widetilde{u}$), the direct image of level m with overconvergent singularities along D of $\mathcal{F}$ by u is defined by setting

$$u^{(m)}_{D,+}(\mathcal{F}) := \mathbb{R}\underleftarrow{l}_{\mathfrak{Z}*}(u^{(m)}_{\bullet D,+}(\mathcal{F}_\bullet)) \tag{9.3.3.1.1}$$

Now, applying the base change isomorphisms (5.2.5.11), for any integer $i' \geq i$, we get an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i}(D)$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i}(D) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_{i'}/S^\sharp_{i'}}(D)} u_{i'D+}(\mathcal{F}_{i'}{}^{(m)}) \xrightarrow{\sim} u_{iD+}(\mathcal{F}_i{}^{(m)})$ (recall the functor u_{iD+} is exact following 5.2.5.11). By Mittag-Leffler of 7.3.1.3, we get the first isomorphism below

$$u^{(m)}_{D,+}(\mathcal{F}) \xleftarrow{\sim} \underleftarrow{l}_{\mathfrak{Z}*}(u^{(m)}_{\bullet D,+}(\mathcal{F}_\bullet)) = \varprojlim u_{iD,+}\mathcal{F}_i{}^{(m)} \xleftarrow{\sim} u_*\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(D) \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} \mathcal{F}\right), \tag{9.3.3.1.2}$$

whilst the second isomorphism follows from the fact that u_* commutes with projective limit. According to the stability of quasi-coherence under direct image by u (resp. via the local description of 9.3.3), we deduce that $u^{(m)}_{D,+}(\mathcal{F})$ is a quasi-coherent (resp. p-torsion free) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module, and we are done.

9.3.3.2. We have defined the extraordinary inverse image functor of level m with overconvergent singularities along D by u (see 7.5.5.6) that we denote by $u_D^{(m)!} \colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E))$ for any $* \in \{r, l\}$, which preserves the boundedness and quasi-coherence (see 9.2.1.9). Let $\mathcal{E}$ be a p-torsion free quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module.

(a) As $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, by stability of quasi-coherence (see 9.2.1.9), we get $u_D^{(m)!}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E))$.

(b) The canonical morphism

$$H^0 u_D^{(m)!}(\mathcal{E}) \to \varprojlim_i H^0 u_{iD}^{(m)!}(\mathcal{E}_i) \tag{9.3.3.2.1}$$

is an isomorphism. Indeed, this follows from the isomorphism $u_D^{(m)!}(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}\varprojlim_i u_{iD}^{(m)!}(\mathcal{E}_i)$, to which we apply the functor H^0. As $u_{iD}^{(m)!}(\mathcal{E}_i) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp/S_i^\sharp}(E) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} u_D^{(m)!}(\mathcal{E})$, we obtain the isomorphism $H^0 u_{iD}^{(m)!}(\mathcal{E}_i) \xrightarrow{\sim} H^0(\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp/S_i^\sharp}(E) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} u_D^{(m)!}(\mathcal{E}))$. In particular, the $\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp/S_i^\sharp}(E)$-modules appearing in the projective limit 9.3.3.2.1 are quasi-coherent. We recall that $u_* H^0 u_{iD}^{(m)!}(\mathcal{E}_i) = \cap_{s=r+1}^d \ker(\mathcal{E}_i \xrightarrow{t_s} \mathcal{E}_i)$ (see 9.3.1.20.2). Hence, we get the inclusion:

$$H^0 u_D^{(m)!}(\mathcal{E}) \xrightarrow{\sim} \varprojlim_i H^0 u_{iD}^!(\mathcal{E}_i) \subset \varprojlim_i \mathcal{E}_i = \mathcal{E}. \tag{9.3.3.2.2}$$

This yields that $H^0 u_D^{(m)!}(\mathcal{E})$ is p-torsion free and we compute $u_* H^0 u_D^{(m)!}(\mathcal{E}) = \cap_{s=r+1}^d \ker(\mathcal{E} \xrightarrow{t_s} \mathcal{E})$. Notice this is not clear that the isomorphism 9.3.3.2.1 is still valid by replacing $H^0 u^{(m)!}$ by u^*. But, we further finiteness condition hypothesis, we have such an equality after applying the global section functor (see 9.3.4.9).

(c) Since $H^0 u_D^{(m)!}(\mathcal{E})$ is p-torsion free then we get

$$(H^0 u_D^{(m)!}(\mathcal{E}))_i := \widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp/S_i^\sharp}(E) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} H^0 u_D^{(m)!}(\mathcal{E}) \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp/S_i^\sharp}(E) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} H^0 u_D^{(m)!}(\mathcal{E}).$$

It seems false that $(H^0 u_D^{(m)!}(\mathcal{E}))_i$ is a quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp/S_i^\sharp}(E)$-module (beware this has not to be confused with $H^0 u_{iD}^!(\mathcal{E}_i)$ which is quasi-coherent: see 9.3.3.11). Hence, we have a priori $H^0 u_D^{(m)!}(\mathcal{E}) \notin D^{\mathrm{b}}_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E))$. This means that the category of p-torsion free quasi-coherent $\mathcal{D}$-modules is not stable under the functor $H^0 u^{(m)!}$. It is for this reason why we will work in this section with global sections and not with the whole sheaves. In the next section (see 9.3.3.10), we will have locally some stability of the separated completeness p-torsion free for global sections (see also 7.2.3.13.(ii) to recall the link with pseudo quasi-coherence).

Notation 9.3.3.3. We denote by $\mathcal{V}\{\partial_{r+1}, \ldots, \partial_d\}^{(m)}$ the sub-$\mathcal{V}$-algebra of $\Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \subset \Gamma(\mathfrak{X}, \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ generated by the elements $\{\partial_{r+1}^{\langle j_1\rangle_{(m)}}, \partial_{r+2}^{\langle j_2\rangle_{(m)}}, \ldots, \partial_d^{\langle j_{d-r}\rangle_{(m)}} \mid j_1, \ldots, j_{d-r} \in \mathbb{N}\}$. It is equal to the free $\mathcal{V}$-module whose basis is given by $\{\underline{\partial}_{(r)}^{\langle(\underline{0},\underline{j})\rangle_{(m)}} \mid \underline{j} \in \mathbb{N}^{d-r}\}$, where $\underline{0} := (0, \ldots, 0) \in \mathbb{N}^r$.

9.3.3.4 (p-adic completed maps)**.** By taking global section of the isomorphism ϑ of 5.2.2.1, we get the isomorphism of $\mathcal{V}$-algebras

$$\widehat{\vartheta} \colon \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E) \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)/I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D) \tag{9.3.3.4.1}$$

where $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$ are the global sections of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$. Remark that for unified notation reason $\widehat{\vartheta}$ was simply denoted by ϑ in 9.3.1.4 ; we hope this will not be too much confusing. We denote by $[-]_{\mathfrak{Z}} \colon \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ and by $[-]'_{\mathfrak{Z}} \colon \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)I$ the canonical projections.

By taking the global section of the p-adic completion of 5.2.2.5.3, we get the homomorphism of $\widetilde{B}^{(m)}_{\mathfrak{X}}(D)$ and of $\mathcal{V}$-algebras (see 5.2.2.7):

$$\widehat{\sigma}^{(m)}_{\mathfrak{Z}^\sharp,\mathfrak{X}^\sharp,\widetilde{t}} \colon \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}/\mathfrak{S}^\sharp}(D) \to \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E), \tag{9.3.3.4.2}$$

which is given by the formula $\widehat{\sigma}^{(m)}_{\mathfrak{Z}^\sharp,\mathfrak{X}^\sharp,\widetilde{t}}(\sum_{\underline{i}\in\mathbb{N}^r} b_{\underline{i}} \underline{\partial}_{(r)}^{\langle(\underline{i},\underline{0})\rangle_{(m)}}) = \sum_{\underline{i}\in\mathbb{N}^r} [b_{\underline{i}}]_{\mathfrak{Z}} \underline{\partial}_{(r)}^{\langle\underline{i}\rangle_{(m)}}$, where $b_{\underline{i}} \in \widetilde{B}^{(m)}_{\mathfrak{X}}(D)$. The map $\widehat{\sigma}^{(m)}_{\mathfrak{Z}^\sharp,\mathfrak{X}^\sharp,\widetilde{t}}$ is surjective with kernel equal to $I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$; the induced factorisation is an inverse of $\widehat{\vartheta}$.

By taking the global section of the bijection 9.3.1.18.1, we get

$$\widehat{\iota}_{\widetilde{t}} \colon \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(D) \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)I. \tag{9.3.3.4.3}$$

Via this bijection, we get a structure of $(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D), \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(D))$-bimodule on $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)I$ such that the underlying structure of left $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module is equal to its natural structure.

By taking the global section of the p-adic completion of the morphism 5.2.2.16.1, we get the $\widetilde{B}^{(m)}_{\mathfrak{X}}(D)$-linear homomorphism

$$(\varsigma^{(m)}_{\mathfrak{X}^\sharp,\underline{\widetilde{t}}})^\frown\colon \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D) \to \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E). \tag{9.3.3.4.4}$$

Moreover, $(\overline{\varsigma}^{(m)}_{\mathfrak{X}^\sharp,\underline{\widetilde{t}}})^\frown$ is surjective with kernel equal to $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)I$ and we denote by

$$(\overline{\varsigma}^{(m)}_{\mathfrak{X}^\sharp,\underline{\widetilde{t}}})^\frown\colon \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)I \xrightarrow{\sim} \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E) \tag{9.3.3.4.5}$$

the induced $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-linear isomorphism (use 5.2.2.18).

The elements of $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ can be written uniquely of the form $\sum_{\underline{j}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}P_{\underline{j}}$, with $P_{\underline{j}}\in\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}/\mathfrak{S}^\sharp}(D)$, the sequence $P_{\underline{j}}$ converges to 0 for the p-adic topology. It follows from 5.2.2.16.3 that we get the formula

$$(\varsigma^{(m)}_{\mathfrak{X}^\sharp,\underline{\widetilde{t}}})^\frown\left(\sum_{\underline{j}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}P_{\underline{j}}\right) = (\varsigma^{(m)}_{\mathfrak{X}^\sharp,\underline{\widetilde{t}}})^\frown\left(\left[\sum_{\underline{j}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}P_{\underline{j}}\right]'_{\mathfrak{Z}}\right) = \sum_{\underline{j}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}\otimes\widehat{\sigma}^{(m)}_{\mathfrak{Z}^\sharp,\mathfrak{X}^\sharp,\underline{\widetilde{t}}}(P_{\underline{j}}). \tag{9.3.3.4.6}$$

In particular, we get the formula $\varsigma^{(m)}_{\mathfrak{X}^\sharp,\underline{\widetilde{t}}}(\underline{\partial}^{\langle(\underline{i},\underline{j})\rangle_{(m)}}_{(r)}) = \overline{\varsigma}^{(m)}_{\mathfrak{X}^\sharp,\underline{\widetilde{t}}}(\underline{\xi}^{\langle(\underline{i},\underline{j})\rangle_{(m)}}_{(r)}) = \underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}\otimes\underline{\partial}^{\langle\underline{i}\rangle_{(m)}}_{(r)}$, for any $\underline{i}\in\mathbb{N}^r$ and $\underline{j}\in\mathbb{N}^{d-r}$.

9.3.3.5 (Local computation of the pushforward)**.** By composing 9.3.3.4.3 with 9.3.3.4.5, we get the isomorphism:

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(D) \xrightarrow{\sim} \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E). \tag{9.3.3.5.1}$$

This yields the isomorphism

$$\Gamma(\mathfrak{X}, u^{(m)}_+(\mathcal{F})) \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{X}\leftarrow\mathfrak{Z}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)}F \underset{9.3.3.5.1}{\xrightarrow{\sim}} \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}F. \tag{9.3.3.5.2}$$

Notation 9.3.3.6. Let F be a p-torsion free $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module which is separated and complete for the p-adic topology. We define the direct image of F by u of level m as

$$u^{(m)}_{D,+}(F) := \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(D)\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)}F \underset{9.3.3.5.1}{\xrightarrow{\sim}} \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}F. \tag{9.3.3.6.1}$$

The formula 9.3.3.5.2 justifies the notation. The set $u^{(m)}_{D,+}(F)$ is endowed with a p-torsion free left $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module structure which is separated and complete for the p-adic topology. Since F is p-torsion free, separated and complete, then it follows from 9.3.3.6.1 that the elements of $u^{(m)}_{D,+}(F)$ can uniquely be written as $\sum_{\underline{k}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\otimes x_{\underline{k}}$, with $x_{\underline{k}}\in F$ and $\lim_{|\underline{k}|\to\infty}x_{\underline{k}}=0$ (for the p-adic topology of F). The elements of $\left(u^{(m)}_{D,+}(F)\right)_{\mathbb{Q}}$ can be uniquely written as $\sum_{\underline{k}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\otimes x_{\underline{k}}$, with $x_{\underline{k}}\in F_{\mathbb{Q}}$ and $\lim_{|\underline{k}|\to\infty}x_{\underline{k}}=0$ (for the topology of $F_{\mathbb{Q}}$ induced by the p-adic topology of F).

Lemma 9.3.3.7. *Let $F\hookrightarrow G$ be a monomorphism of p-torsion free separated and complete (for the p-adic topology) $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-modules.*

(a) The morphism $u^{(m)}_{D,+}(F)\to u^{(m)}_{D,+}(G)$ (resp. $(u^{(m)}_{D,+}(F))_{\mathbb{Q}}\to(u^{(m)}_{D,+}(G))_{\mathbb{Q}}$) is a monomorphism.

(b) The canonical morphism $u^{(m)}_{D,+}(F)\to u^{(m)}_{D,+}(G)$ (resp. $(u^{(m)}_{D,+}(F))_{\mathbb{Q}}\to(u^{(m)}_{D,+}(G))_{\mathbb{Q}}$) is an isomorphism if and only if the canonical morphism $F\hookrightarrow G$ (resp. $F_{\mathbb{Q}}\hookrightarrow G_{\mathbb{Q}}$) is an isomorphism.

Proof. It follows from the description of the writing of the elements of $u^{(m)}_{D,+}(F)$ given at 9.3.3.6. □

Lemma 9.3.3.8. *Let F be a p-torsion free $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module which is separated and complete for the p-adic topology. Then F is a coherent $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module if and only if $u^{(m)}_{D,+}(F)$ is a coherent $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module.*

Proof. Since the functor $u^{(m)}_{D,+}$ defined at 9.3.3.1.1 for the sheaves preserve the coherence, since we have the theorems of type A (see 7.2.3.10), the isomorphism 9.3.3.5.2 allows us to conclude the necessity of the assertion of the lemma. Conversely, suppose that F is not a coherent $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module. Then there exists a strictly increasing sequence $(F_n)_{n\in\mathbb{N}}$ of coherent $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-submodule of F. Then it comes from the lemma 9.3.3.7.(b) that we get the strictly increasing sequence $(u^{(m)}_{D,+}(F_n))_{n\in\mathbb{N}}$ of coherent $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-submodule of $u^{(m)}_{D,+}(F)$. Since $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$ is noetherian, this last one is not a coherent $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module. □

Remark 9.3.3.9. Let $H^{(m)}$ be a $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)_{\mathbb{Q}}$-module such that there exists a p-torsion free , separated and complete (for the topology p-adic) $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module $\mathring{H}^{(m)}$, endowed with an isomorphism of $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)_{\mathbb{Q}}$-modules of the form $\mathring{H}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} H^{(m)}$. We remark that the topology on $H^{(m)}$ induced by the basis of neighborhood of $p^n\mathring{H}^{(m)}$ makes $H^{(m)}$ a Banach K-vector space.

Moreover, if $H^{(m)}$ is a coherent $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module, then this topology is independent of the choice of such a $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module $\mathring{H}^{(m)}$ and this latter is necessarily $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-coherent. Indeed, this comes from the theorem of Banach (e.g. see [BGR84, 2.8.1]) and from the noetherianity of $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$.

This implies that if $H^{(m)}$ is a coherent $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module then $\left(u^{(m)}_{D,+}(\mathring{H}^{(m)})\right)_{\mathbb{Q}}$ is a coherent $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module and does not depend of the $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module separated complete $\mathring{H}^{(m)}$ p-torsion free , such that $\mathring{H}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} H^{(m)}$. Then we write $u^{(m)}_{D,+}(H^{(m)})$.

Notation 9.3.3.10. Let E be a p-torsion free, separated and complete for the p-adic topology $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module Put $E_i := D^{(m)}_{X^\sharp_i/S^\sharp_i}(D) \otimes_{\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} E \xleftarrow{\sim} D^{(m)}_{X^\sharp_i/S^\sharp_i}(D) \otimes^{\mathbb{L}}_{\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)} E$. We define the extraordinary inverse image of E by u by setting

$$H^0u^{(m)!}_D(E) := \varprojlim_i H^0u^!_{iD}(E_i) \subset \varprojlim_i E_i = E. \tag{9.3.3.10.1}$$

It follows from 9.3.3.2.1 that for any p-torsion free quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module $\mathcal{E}$, by applying the functor $\Gamma(\mathfrak{Z}, -)$ to 9.3.3.2.2, we get the isomorphism

$$\Gamma(\mathfrak{Z}, H^0u^{(m)!}_D(\mathcal{E})) \xrightarrow{\sim} H^0u^{(m)!}_D(\Gamma(\mathfrak{Z}, \mathcal{E})), \tag{9.3.3.10.2}$$

which justifies the notation 9.3.3.10.1.

We calculate $H^0u^{(m)!}_D(E) \xrightarrow{\sim} \cap^d_{s=r+1} \ker(E \xrightarrow{t_s} E)$. By composing with the canonical inclusion in E, this yields the map denoted by $\mathrm{ev}_1\colon H^0\widetilde{u}^{(m)!}(E) \hookrightarrow E$. We equip $H^0u^{(m)!}_D(E)$ with a canonical structure of left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module as follows: for any $Q \in \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$, for any $x \in H^0u^{(m)!}_D(E)$, put

$$\mathrm{ev}_1(Q \cdot x) := Q_{\mathfrak{X}} \cdot \mathrm{ev}_1(x) \tag{9.3.3.10.3}$$

where $Q_{\mathfrak{X}} \in \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$ is such that $[Q_{\mathfrak{X}}]_{\mathfrak{Z}} = \widehat{\vartheta}(Q)$ where $[-]_{\mathfrak{Z}}$ is the canonical projection $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D) \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)/I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}(D)$ and where $\widehat{\vartheta}$ is the isomorphism 9.3.3.4.1. Indeed, since I is generated by $t_{r+1}, \dots, t_d$, this definition do not depend on the choice of such $Q_{\mathfrak{X}}$. By using 9.3.1.20.3, we remark that the isomorphism 9.3.3.10.2 becomes an isomorphism of left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-modules, which explains the definition.

Since for $s = r+1, \dots, d$ the maps $t_s\colon E \to E$ are continuous (for the p-adic topology), since $H^0u^{(m)!}_D(E) \xrightarrow{\sim} \cap^d_{s=r+1} \ker(E \xrightarrow{t_s} E)$, then $H^0u^{(m)!}_D(E)$ is separated and complete for the topology induced by the p-adic topology of E. Since E is p-torsion free, then we deduce from $H^0u_D^{(m)!}(E) = \cap_{s=r+1}^d \ker(E \xrightarrow{t_s} E)$ the equality $H^0u_D^{(m)!}(E) \cap p^{i+1}E = p^{i+1}H^0u_D^{(m)!}(E)$. In particular, the p-adic topology of $H^0u_D^{(m)!}(E)$ and the topology of $H^0u_D^{(m)!}(E)$ induced by the p-adic topology of E are identical. This yields that $H^0u_D^{(m)!}(E)$ is a p-torsion free, separated and complete left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module.

9.3.3.11. Let E be a p-torsion free, separated and complete for the p-adic topology $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module. Put $\left(H^0u_D^{(m)!}(E)\right)_i := D^{(m)}_{Z_i^\sharp/S_i^\sharp}(E) \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)} H^0u_D^{(m)!}(E)$, as $H^0u_D^{(m)!}(E) \cap p^{i+1}E = p^{i+1}H^0u_D^{(m)!}(E)$, we get the inclusion

$$\left(H^0u_D^{(m)!}(E)\right)_i \subset H^0u_{iD}^{(m)!}(E_i). \tag{9.3.3.11.1}$$

When we take the structure of $D^{(m)}_{Z_i^\sharp/S_i^\sharp}(E)$-module on $\left(H^0u_D^{(m)!}(E)\right)_i$ induced by the structure of $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module of $H^0u_D^{(m)!}(E)$ defined by the formula (9.3.3.10.3) and the structure of $D^{(m)}_{Z_i^\sharp/S_i^\sharp}(E)$-module of $H^0u_{iD}^{(m)!}(E_i)$ given by (9.3.1.20.3), we check that the inclusion 9.3.3.11.1 is $D^{(m)}_{Z_i^\sharp/S_i^\sharp}(E)$-linear.

Beware, it seems false that the map 9.3.3.11.1 is bijective in general. However, this becomes a bijection by taking projective limits (see 9.3.3.12).

Remark 9.3.3.12. With the notations of 9.3.3.11, the canonical morphism

$$u_+H^0u_D^{(m)!}(E) = \varprojlim_i u_{iD,+}\left(H^0u_D^{(m)!}(E)\right)_i \to \varprojlim_i u_{iD,+}H^0u_{iD}^{(m)!}(E_i)$$

is an isomorphism, i.e. that the canonical morphism

$$\mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}H^0u_D^{(m)!}(E) \to \varprojlim_i(O_{S_i}\{\partial_{r+1},\dots,\partial_d\}^{(m)} \otimes_{O_{S_i}} H^0u_i^{(m)!}(E_i))$$

is an isomorphism. Indeed, the elements $x \in \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}H^0u_D^{(m)!}(E)$ can be uniquely written of the form $x = \sum_{\underline{l}\in\mathbb{N}^{d-r}} \underline{\partial}^{\langle(\underline{0},\underline{l})\rangle} \otimes x_{\underline{l}}$, with $x_{\underline{l}} \in H^0u_D^{(m)!}(E)$ (and converging to 0). Let $(x_i)_i \in \varprojlim_i(O_{S_i}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\otimes_{O_{S_i}} H^0u_i^{(m)!}(E_i))$. We can write uniquely x_i of the form $x_i = \sum_{\underline{l}\in\mathbb{N}^{d-r}} \underline{\partial}^{\langle(\underline{0},\underline{l})\rangle}\otimes x_{\underline{l},i}$, with $x_{\underline{l},i} \in H^0u_D^{(m)!}(E_i)$ and the sum being this time finite. By unicity, we get that $(x_{\underline{l},i})_i \in \varprojlim_i H^0u_{iD}^{(m)!}(E_i)$. The equality $H^0u^{(m)!}(E) = \varprojlim_i H^0u_{iD}^{(m)!}(E_i)$ allows us then to conclude.

Proposition 9.3.3.13 (Adjunction morphism I)**.** *Let $F^{(m)}$ be a p-torsion free, separated and complete left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module. By identifying $H^0u_D^{(m)!}\left(u_{D+}^{(m)}(F^{(m)})\right)$ with*

$$\cap_{s=r+1}^d \ker\left(\mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}F \xrightarrow{t_s} \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}F\right) \subset \mathcal{V}\{\partial_{r+1},\dots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}}F$$

(see 9.3.3.6.1 and 9.3.3.10), we define the canonical adjunction morphism

$$\mathrm{adj}\colon F^{(m)} \to H^0u_D^{(m)!}\left(u_{D+}^{(m)}(F^{(m)})\right), \tag{9.3.3.13.1}$$

by putting $\mathrm{adj}(x) = 1\otimes x$ *for any* $x \in F^{(m)}$*. The morphism* adj *is an isomorphism of* $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$*-modules.*

Proof. a) Let us prove that adj is $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-linear. For any left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module G, we write $[-]_i$ for the canonical morphism $G \to G/\pi^{i+1}G$. We have the commutative diagram:

$$\begin{array}{ccccc} F^{(m)} & \xrightarrow{\mathrm{adj}} & H^0u_D^{(m)!}\circ u_{D+}^{(m)}(F^{(m)}) & & \\ \downarrow{\scriptstyle [-]_i} & & \downarrow{\scriptstyle [-]_i} & & \\ F_i{}^{(m)} & \longrightarrow & \left(H^0u_D^{(m)!}\circ u_{D+}^{(m)}(F^{(m)})\right)_i & \hookrightarrow & H^0u_{iD}^{(m)!}\circ u_{iD+}^{(m)}(F_i{}^{(m)}), \end{array} \tag{9.3.3.13.2}$$

Here the bottom right arrow is derived from (9.3.3.11.1).- We compute that the composition of the bottom two morphisms is the morphism adj of (5.2.6.1) (see 5.2.6.2.4) which is $D^{(m)}_{Z^\sharp_i/S^\sharp_i}(E)$-linear. As the inclusion (9.3.3.11.1) is $D^{(m)}_{Z^\sharp_i/S^\sharp_i}(E)$-linear, it follows that the bottom left arrow of 9.3.3.13.2 is also $D^{(m)}_{Z^\sharp_i/S^\sharp_i}(E)$-linear. By passing to projective limit, we get that the top morphism of 9.3.3.13.2 is $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-linear.

b) Let us check that adj is bijective. Since the injectivity is clear, we reduce to prove the surjectivity as follows. Modulo the isomorphism 9.3.3.6, an element of $u^{(m)}_{D,+}(F^{(m)})$ can uniquely be written in form $\sum_{\underline{k}\in\mathbb{N}^{d-r}} \underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\otimes x_{\underline{k}}$ with $x_{\underline{k}}\in F^{(m)}$ and $\lim_{|\underline{k}|\to\infty} x_{\underline{k}}=0$. For $r+1\leq i\leq d$, we compute in $u^{(m)}_{D,+}(F^{(m)})$ the relation

$$t_i\cdot \sum_{\underline{k}\in\mathbb{N}^{d-r}} (\underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\otimes x_{\underline{k}}) = -\sum_{\underline{k}\in\mathbb{N}^{d-r}|k_{i-r}\geq 1} \left\{ {k_{i-r} \atop 1} \right\} \underline{\partial}^{\langle(\underline{0},\underline{k})-1_i\rangle}\otimes x_{\underline{k}},$$

where $1_i=(0,\ldots,0,1,0,\ldots,0)$ with 1 at the i-th place (in fact, il suffices to verify the equality modulo π^{i+1}, which follows from the formulas 1.4.2.7 and 9.3.3.4.6. Since $F^{(m)}$ is p-torsion free, then this yields that any element of $H^0u^{(m)!}_D\circ u^{(m)}_{D+}(F^{(m)})$ must be of the form $1\otimes x$ with $x\in F^{(m)}$. □

Proposition 9.3.3.14 (Adjunction morphism II). *Let $E^{(m)}$ be a p-torsion free $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module which is separated and complete for the p-adic topology. By identifying $u^{(m)}_{D+}\circ H^0u^{(m)!}_D(E^{(m)})$ with*

$$\mathcal{V}\{\partial_{r+1},\ldots,\partial_d\}^{(m)}\widehat{\otimes}_{\mathcal{V}} \cap_{s=r+1}^d \ker\left(E\xrightarrow{t_s}\mathcal{V}E\right),$$

we define the map

$$\mathrm{adj}\colon u^{(m)}_{D+}\circ H^0u^{(m)!}_D(E^{(m)})\to E^{(m)} \tag{9.3.3.14.1}$$

by setting $\mathrm{adj}(\sum_{\underline{k}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\otimes x_{\underline{k}})=\sum_{\underline{k}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\cdot x_{\underline{k}}$, *with* $x_{\underline{k}}\in H^0u^{(m)!}_D(E^{(m)})$ *and* $\lim_{|\underline{k}|\to\infty}x_{\underline{k}}=0$. *The map* adj *is a morphism of* $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$*-modules.*

Proof. Consider the following canonical diagram

$$\begin{array}{ccccc} u^{(m)}_{D+}\circ H^0u^{(m)!}_D(E^{(m)}) & & \xrightarrow[9.3.3.14.1]{\mathrm{adj}} & & E^{(m)} \\ \downarrow{\scriptstyle [-]_i} & & & & \downarrow{\scriptstyle [-]_i} \\ u^{(m)}_{iD,+}\left(H^0u^{(m)!}_D(E^{(m)})\right)_i & \xrightarrow{9.3.3.11.1} & u^{(m)}_{iD,+}\circ H^0u^!_{iD}(E_i{}^{(m)}) & \xrightarrow[5.2.6.1]{\mathrm{adj}} & E_i{}^{(m)}. \end{array} \tag{9.3.3.14.2}$$

We already know both morphisms of the bottom of the diagram (9.3.3.14.2) are $D^{(m)}_{X^\sharp_i/S^\sharp_i}(D)$-linear. Moreover, by using the description of 5.2.6.2.3, we get the commutativity of (9.3.3.14.2) by calculating the map carrying an element of the form $\sum_{\underline{k}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\otimes x_{\underline{k}}$ to $\sum_{\underline{k}\in\mathbb{N}^{d-r}}\underline{\partial}^{\langle(\underline{0},\underline{k})\rangle}\cdot[x_{\underline{k}}]_i$ along the two possible paths of the diagram. The proposition now follows by passage to projective limit. □

9.3.3.15. Let E (resp. F) be a p-torsion free ,separated and complete $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module (resp. $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-module). Via the adjunction morphism 9.3.3.13.1, the functor $H^0u^{(m)!}_D$ induces the application

$$\mathrm{Hom}_{\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)}(u^{(m)}_{D+}(F),E)\to\mathrm{Hom}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)}(F,H^0u^{(m)!}_DE). \tag{9.3.3.15.1}$$

Via the adjunction morphism 9.3.3.14.1, the functor $u^{(m)}_{D+}$ induces the application

$$\mathrm{Hom}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)}(F,H^0u^{(m)!}_DE)\to\mathrm{Hom}_{\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)}(u^{(m)}_{D+}(F),E). \tag{9.3.3.15.2}$$

We compute that the composition morphism

$$u^{(m)}_{D+}(F)\overset{9.3.3.13.1}{\longrightarrow}u^{(m)}_{D+}\circ H^0u^{(m)!}_D\circ u^{(m)}_{D+}(F)\overset{9.3.3.14.1}{\longrightarrow}u^{(m)}_{D+}(F), \tag{9.3.3.15.3}$$

whose first arrow is the image by $u_{D+}^{(m)}$ of 9.3.3.13.1 and whose second one is 9.3.3.14.1 used for $E = u_{D+}^{(m)}(F)$, is the identity. Since the first arrow is an isomorphism, so is the second one. By a computation, we check moreover that the composition morphism

$$H^0 u_D^{(m)!}(E) \overset{9.3.3.14.1}{\longrightarrow} H^0 u_D^{(m)!} \circ u_{D+}^{(m)} \circ H^0 u_D^{(m)!}(E) \overset{9.3.3.13.1}{\longrightarrow} H^0 u_D^{(m)!}(E)$$

is the identity. This implies that the applications 9.3.3.15.1 and 9.3.3.15.2 above are converse one from the other.

Remark 9.3.3.16. By lack of stability of the category of quasi-coherent sheaves highlighted in the section 9.3, we do not have a priori an analogue in this context.

9.3.4 Inverse image by an exact closed immersion of affine $\mathcal{V}$-formal schemes

We suppose $\mathfrak{X}$ is affine. We denote by straight letter, the global section of a sheaf on $\mathfrak{X}$, e.g. $\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

9.3.4.1. For any left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{G}$, for any left $\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module G, we define a complex of left $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$-modules or respectively of left $\widetilde{D}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$-modules by setting

$$\mathbb{L}\widetilde{u}^*(\mathcal{G}) := \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} u^{-1}\mathcal{G}, \tag{9.3.4.1.1}$$

$$\mathbb{L}\widetilde{u}^*(G) := \widetilde{D}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} G. \tag{9.3.4.1.2}$$

We define in the same way the functor $\mathbb{L}\widetilde{u}_i^*$ on the category of left $\mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}(D)$-modules (resp. of left $D^{(m)}_{X_i^\sharp/S_i^\sharp}(D)$-modules).

9.3.4.2. Let $\mathcal{G}$ be a left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Let G be a left $\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. In accordance with notation 9.2.1.21 (in the $\mathcal{D}^\dagger$ case), we have the isomorphisms:

$$u^!_D(\mathcal{G})[d_u] = \mathbb{L}\widetilde{u}^*(\mathcal{G}) \overset{9.3.1.3.(a)}{\underset{\sim}{\longrightarrow}} u^{-1}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{G}), \tag{9.3.4.2.1}$$

$$\mathbb{L}\widetilde{u}^*(G) \overset{9.3.1.3.(b)}{\underset{\sim}{\longrightarrow}} \widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/I\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} G. \tag{9.3.4.2.2}$$

9.3.4.3. It follows from 9.3.1.3.6 that the canonical morphism

$$u^* D^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}} \to \Gamma(\mathfrak{X}, u^*\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}) \tag{9.3.4.3.1}$$

is an isomorphism. We extend later this commutation isomorphism (see 9.3.4.9.1).

9.3.4.4. For any right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module $\mathcal{M}$, for any right $\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module M, we define a complex of right $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-modules or respectively of right $\widetilde{D}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)$-modules by setting

$$\mathbb{L}\widetilde{u}^*_{\mathrm{r}}(\mathcal{M}) := u^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(D), \tag{9.3.4.4.1}$$

$$\mathbb{L}\widetilde{u}^*_{\mathrm{r}}(M) := M \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)} \widetilde{D}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(D). \tag{9.3.4.4.2}$$

We define in the same way the functor $\mathbb{L}\widetilde{u}^*_{i,\mathrm{r}}$ on the category of right $\mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}(D)$-modules (resp. of right $D^{(m)}_{X_i^\sharp/S_i^\sharp}(D)$-modules).

9.3.4.5. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. Let M be a right $\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module. In accordance with notation 9.2.1.21, we have the isomorphisms:

$$u^!_D(\mathcal{M})[d_u] = \mathbb{L}\widetilde{u}^*_{\mathrm{r}}(\mathcal{M}) \overset{9.3.1.18.1}{\underset{\sim}{\longrightarrow}} u^{-1}(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{M}), \tag{9.3.4.5.1}$$

$$\mathbb{L}\widetilde{u}^*_{\mathrm{r}}(M) \overset{9.3.3.4.3}{\underset{\sim}{\longrightarrow}} \widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/I\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} M. \tag{9.3.4.5.2}$$

9.3.4.6 (Inverse image for bimodules)**.** By functoriality, the functor $\mathbb{L}u^*$ defined at 9.3.4.1 induces a functor $\mathbb{L}u^*\colon D(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D(\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ etc. To avoid confusion with the functor $\mathbb{L}u^*_{\mathrm{r}}\colon D(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to D(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp})$ we prefer to denote $\mathbb{L}u^*$ by $\mathbb{L}u^*_{\mathrm{l}}$.

Lemma 9.3.4.7. *For any integer $q \geq 1$, we have $H^q(\mathfrak{Z}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) = 0$.*

Proof. Let $q \geq 1$. Recall $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} = u^{-1}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$. Since the functor $H^q(\mathfrak{Z}, -)$ commutes with projective limits, then it follows from Theorem B for quasi-coherent modules that $H^q(\mathfrak{Z}, \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(D)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) = 0$. As the functor $H^q(\mathfrak{Z}, -)$ and the tensor product commute with the tensorization by $\mathbb{Q}$ (because $\mathfrak{Z}$ is noetherian) and with filtrant inductive limits of sheaves on $\mathfrak{Z}$, this yields the two other vanishing formulas. □

Lemma 9.3.4.8. *The functors $\mathbb{R}\Gamma(\mathfrak{Z}, -)$ and $\mathbb{L}u^*$ commute : For any left $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{G}$, we have the canonical isomorphism*

$$\mathbb{L}u^*(G) \xrightarrow{\sim} \mathbb{R}\Gamma(\mathfrak{Z}, \mathbb{L}u^*(\mathcal{G})). \tag{9.3.4.8.1}$$

Proof. Let $P^\bullet$ be a left resolution of G by free $\widetilde{D}_{\mathfrak{X}^\sharp}$-modules of finite type (see 4.6.1.7). The complex $\mathcal{P}^\bullet := \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widetilde{D}_{\mathfrak{X}^\sharp}} P^\bullet$ is then a left resolution of $\mathcal{G}$ by free finite type $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules. Hence we get the canonical isomorphisms:

$$\widetilde{D}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{D}_{\mathfrak{X}^\sharp}} G \xleftarrow{\sim} \widetilde{D}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widetilde{D}_{\mathfrak{X}^\sharp}} P^\bullet$$
$$\xrightarrow{\sim} \Gamma(\mathfrak{Z}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widetilde{D}_{\mathfrak{X}^\sharp}} P^\bullet) \xrightarrow{\sim} \Gamma(\mathfrak{Z}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} u^{-1}\mathcal{P}^\bullet) \xrightarrow{\sim}$$
$$\mathbb{R}\Gamma(\mathfrak{Z}, \widetilde{\mathcal{D}}^\dagger_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} u^{-1}\mathcal{P}^\bullet) \xrightarrow{\sim} \mathbb{R}\Gamma(\mathfrak{Z}, \widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} u^{-1}\mathcal{G}),$$

the penultimate isomorphism resulting from the fact that $\Gamma(Z, -)$ has bounded cohomological dimension and that $(\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})^n$ is $\Gamma(\mathfrak{Z}, -)$-acyclic for any nonnegative integer n (see the lemma 9.3.4.7) which allows us to use 4.6.1.6. □

The following Lemma will be useful when we deal with overcoherent module (see 15.3.4.17.1).

Lemma 9.3.4.9. *Suppose that the ideal of $\mathcal{O}_{\mathfrak{X}}$ given by u is principal. Let $\mathcal{G}$ be a coherent $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module such that $H^0u^!_D(\mathcal{G})$ is a coherent $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$-module. Then we get the canonical isomorphism:*

$$\widetilde{u}^*(G) \xrightarrow{\sim} \Gamma(\mathfrak{Z}, \widetilde{u}^*(\mathcal{G})). \tag{9.3.4.9.1}$$

Proof. Let t be an element generating the ideal of definition of a. Via the flat resolution

$$0 \to \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{t\cdot} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/t\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to 0, \tag{9.3.4.9.2}$$

we deduced from 9.3.4.2.1 the two equalities $u_*\widetilde{u}^*(\mathcal{G}) = \mathcal{G}/t\mathcal{G}$ and $u_*H^0u^!_D(\mathcal{G}) = \ker(t\colon \mathcal{G} \to \mathcal{G})$. Likewise, since the sequence 9.3.4.9.2 is a sequence of coherent right $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules, then it remains exact after applying the functor $\Gamma(\mathfrak{X}, -)$. Hence, via 9.3.4.2.2, we get $\widetilde{u}^*(G) = G/tG$. Since $H^0u^!_D(\mathcal{G})$ is a coherent $\widetilde{\mathcal{D}}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$-module, it satisfies the theorems of type A and B. Since the functor u_* is exact and preserve injective objects (since its left adjoint u^{-1} is exact), this yields that, for any $i \geq 1$, $H^i(\mathfrak{X}, u_*H^0u^!_D(\mathcal{G})) = 0$. Since $\mathcal{G}$ satisfies also the theorem of type B, by applying the functor $\mathbb{R}\Gamma(\mathfrak{X}, -)$ to the exact sequence $0 \to u_*H^0u^!_D(\mathcal{G}) \to \mathcal{G} \to \mathcal{G}/u_*H^0u^!_D(\mathcal{G}) \to 0$, we obtain that, for any $i \geq 1$, $H^i(\mathfrak{X}, \mathcal{G}/u_*H^0u^!_D(\mathcal{G})) = 0$ and $\Gamma(\mathfrak{X}, \mathcal{G}/u_*H^0u^!_D(\mathcal{G})) = G/\Gamma(\mathfrak{Z}, H^0u^!_D(\mathcal{G}))$. This implies that by applying the functor $\Gamma(\mathfrak{X}, -)$ to the exact sequence $0 \to \mathcal{G}/u_*H^0u^!_D(\mathcal{G}) \xrightarrow{t} \mathcal{G} \to \mathcal{G}/t\mathcal{G} \to 0$, we get the isomorphism $\Gamma(\mathfrak{X}, \mathcal{G}/t\mathcal{G}) \xrightarrow{\sim} G/tG$. □

Lemma 9.3.4.10. *Let $\mathring{\mathcal{G}}^{(m)}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module such that for any $i \in \mathbb{N}$ the canonical morphism $\mathbb{L}\widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)}) \to \widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)})$ is an isomorphism. Set $\mathring{G}^{(m)} := \Gamma(\mathfrak{X}, \mathring{\mathcal{G}}^{(m)})$, $\mathring{\mathcal{G}}^{(m)}_i :=$*

$\mathring{\mathcal{G}}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{V}} \mathcal{V}/\pi^{i+1}\mathcal{V} \xleftarrow{\sim} \mathring{\mathcal{G}}^{(m)} \otimes_{\mathcal{V}} \mathcal{V}/\pi^{i+1}\mathcal{V}$, $\mathring{G}^{(m)}_i := \Gamma(\mathfrak{X}, \mathring{\mathcal{G}}^{(m)}_i)$. *Then we have the canonical isomorphisms:*

$$\mathbb{L}\widetilde{u}^*(\mathring{\mathcal{G}}^{(m)}) \xrightarrow{\sim} \widetilde{u}^*(\mathring{\mathcal{G}}^{(m)}) \xrightarrow{\sim} \varprojlim_i \widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)}), \tag{9.3.4.10.1}$$

$$\mathbb{L}\widetilde{u}^*(\mathring{G}^{(m)}) \xrightarrow{\sim} \widetilde{u}^*(\mathring{G}^{(m)}) \xrightarrow{\sim} \varprojlim_i \widetilde{u}^*_i(\mathring{G}_i{}^{(m)}), \tag{9.3.4.10.2}$$

$$\widetilde{u}^*(\mathring{G}^{(m)}) \xrightarrow{\sim} \Gamma(\mathfrak{Z}, \widetilde{u}^*(\mathring{\mathcal{G}}^{(m)})). \tag{9.3.4.10.3}$$

Proof. Following 7.5.5.13.(c), since $\mathring{\mathcal{G}}^{(m)}$ is a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module then we have the isomorphism $\mathbb{L}\widetilde{u}^*(\mathring{\mathcal{G}}^{(m)}) \xrightarrow{\sim} \mathbb{R}\varprojlim_i \mathbb{L}\widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)})$. By using the two other properties satisfied by $\mathring{\mathcal{G}}^{(m)}$ and by using Mittag-Leffler, we obtain therefore the canonical isomorphisms

$$\widetilde{u}^*(\mathring{\mathcal{G}}^{(m)}) \xleftarrow{\sim} \mathbb{L}\widetilde{u}^*(\mathring{\mathcal{G}}^{(m)}) \xrightarrow{\sim} \mathbb{R}\varprojlim_i \mathbb{L}\widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)}) \xrightarrow{\sim} \mathbb{R}\varprojlim_i \widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)}) \xleftarrow{\sim} \varprojlim_i \widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)}). \tag{9.3.4.10.4}$$

Hence, we get the isomorphisms 9.3.4.10.1.

Now let us deal with the second isomorphism. Via the theorem of type A for quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i/S^\sharp_i}(D)$-modules, we get by associativity of the tensor product the canonical isomorphism $\mathbb{L}\widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)}) \xrightarrow{\sim} \mathcal{D}^{(m)}_{Z^\sharp_i/S^\sharp_i}(E) \otimes_{D^{(m)}_{Z^\sharp_i/S^\sharp_i}(E)} \mathbb{L}\widetilde{u}^*_i(\mathring{G}_i{}^{(m)})$. Via the theorem of type A for quasi-coherent complexes of $\mathcal{D}^{(m)}_{Z^\sharp_i/S^\sharp_i}(E)$-modules (see 4.6.1.7), since $\mathbb{L}\widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)}) \xrightarrow{\sim} \widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)})$, this yields the isomorphism $\mathbb{L}\widetilde{u}^*_i(\mathring{G}_i{}^{(m)}) \xrightarrow{\sim} \widetilde{u}^*_i(\mathring{G}_i{}^{(m)})$. Moreover, we have following 7.2.3.13.1 the canonical isomorphism $\mathring{G}^{(m)}_i \xrightarrow{\sim} \mathring{G}^{(m)} \otimes_{\mathcal{V}} \mathcal{V}/\pi^{i+1}\mathcal{V}$. Then we obtain analogously (we use the appendice B of [BO78] instead of 7.5.5.13.(c)) the isomorphisms 9.3.4.10.4 with some straight letters. In particular, we have checked 9.3.4.10.2. Since the functor $\Gamma(\mathfrak{Z}, -)$ commutes with projective limits, since $\Gamma(\mathfrak{Z}, \widetilde{u}^*_i(\mathring{\mathcal{G}}_i{}^{(m)})) \xrightarrow{\sim} \widetilde{u}^*_i(\mathring{G}_i{}^{(m)})$, we can deduce the isomorphism 9.3.4.10.3 from 9.3.4.10.1 and 9.3.4.10.2. □

9.3.5 Berthelot-Kashiwara theorem

In this subsection, we give a proof of Berthelot-Kashiwara theorem (see 9.3.5.9). Suppose $\mathfrak{X}$ is noetherian of finite Krull dimension.

9.3.5.1. Let $(\mathcal{B}^{(m)})_{m\in\mathbb{N}}$ be an inductive system of commutative p-torsion free $\mathcal{O}_{\mathfrak{X}}$-algebras satisfying the conditions of 7.5.1.1. We suppose that $\mathcal{B}^{(m)}$ is endowed with a compatible structure of left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module such that the homomorphism of $\mathcal{O}_{\mathfrak{X}}$-algebra $\mathcal{B}^{(m)} \to \mathcal{B}^{(m+1)}$ is flat and is a monomorphism of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules. We set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}^{(m)} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} := (u^*\mathcal{B}^{(m)}) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$. We suppose that for any affine open formal subscheme $\mathfrak{U}$ of $\mathfrak{X}$, the extensions $\Gamma(\mathfrak{U}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \to \Gamma(\mathfrak{U}, \widetilde{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and $\Gamma(\mathfrak{U}\cap\mathfrak{Z}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}) \to \Gamma(\mathfrak{U}\cap\mathfrak{Z}, \widetilde{\mathcal{D}}^{(m+1)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp})$ are flat for any $m \in \mathbb{N}$. Recall, following 7.2.3.3 and 7.2.3.16, for any $m \in \mathbb{N}$, the ring $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}^{(m)} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is coherent and satisfies the theorems of type A and B.

Example 9.3.5.2. We can choose $\mathcal{B}^{(m)} = \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(D)$ (e.g. see 8.7.5.2).

Notation 9.3.5.3. Suppose the local condition of 9.3.1.2 are satisfied in the case where $r = d - 1$. We simply denoting by $t := t_d$ and $\partial := \partial_d$. We write $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and similarly we use straight letter to mean the global sections.

Lemma 9.3.5.4 (Berthelot's key lemma)**.** *With the notation 9.3.5.3, let* $m \in \mathbb{N}$, $s \geq 1$ *be an integer,* $R \in M_s(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ *be a matrix. There exists a large enough integer* $m' \geq m$ *and a matrix* $P \in M_s(\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ *such that the following properties hold:*

(a) $P \equiv I_s \mod \pi M_s(\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$*, where* I_s *is the identity matrix ;*

(b) $t^{p^m} P = P(t^{p^m} I_s - \pi R)$*, where* R *is viewed as an element of* $M_s(\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ *via the inclusion* $M_s(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}) \subset M_s(\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

Proof. Since the proof for $s > 1$ is identical, we shall suppose that $s = 1$.

0) i) *Notations.* Let $Q \in \widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$ (beware that $\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$ is a $(\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, B^{(m)})$-bimodule but not a $B^{(m)}$-algebra). The element Q can uniquely be written of the form $Q = \sum_{\underline{i}\in\mathbb{N}^d} \underline{\partial}_{(r)}^{[\underline{i}]} b_{\underline{i}}$, with $b_{\underline{i}} \in B^{(m)}$ converging π-adically to 0 when $|\underline{i}|$ goes to infinity and where the term $\underline{\partial}_{(r)}^{[\underline{i}]}$ is defined at the end of 4.5.1.1. Put $c_{\underline{i}}(Q) := b_{\underline{i}}$. When $Q \in D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)}$, the sum is finite and we can therefore define $\mathrm{ord}(Q)$ to be the maximal of the elements $|\underline{i}|$ such that $c_{\underline{i}}(Q) \neq 0$. Put $[Q]_l := \pi^{-l}\sum_{\underline{i}\in E_l} \underline{\partial}_{(r)}^{[\underline{i}]} c_{\underline{i}}(Q)$, where E_l is the (finite) sub-set of $\mathbb{N}^d$ consisting of the elements $\underline{i}$ such that $v_\pi(c_{\underline{i}}(Q)) = l$, where v_π means the π-adic valuation on $B^{(m)}$. Put $\sigma_l(Q) := \sum_{l'\leq l} \pi^{l'}[Q]_{l'}$.

ii) *a-boundedness.* Let $Q \in \widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$. Similarly to 8.7.1.8, we can check that the following properties:

(i) there exists an integer $m' \geq m$ such that $Q \in \widehat{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$;

(ii) there exists a real number $a > 0$ such that $\mathrm{ord}(\sigma_l(Q)) \leq a(l+1)$ for any $l \in \mathbb{N}$;

(iii) there exists a real number $a > 0$ such that $\mathrm{ord}([Q]_l) \leq a(l+1)$ for any $l \in \mathbb{N}$

are equivalent. If $a > 0$ is a real number, we say then that Q is a-bounded if, for any $\underline{i} \in \mathbb{N}^d$, the following unequality is satisfied: $v_\pi(c_{\underline{i}}(Q)) \geq \frac{|\underline{i}|}{a} - 1$. We notice that Q is a-bounded if and only if we have $\mathrm{ord}([Q]_l) \leq a(l+1)$ for any integer l.

1) By using the left unequality of 8.7.1.7.1 and the right formula of 8.7.1.5.2, we compute that for any $a > p^m(p-1)$, there exists $b \geq a$ large enough such that for any $P \in \widehat{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$ we have $v_\pi(c_{\underline{i}}(P)) \geq \frac{|\underline{i}|}{a} - \frac{b}{a}$ for any $\underline{i} \in \mathbb{N}^d$ (which is equivalent to saying that $\mathrm{ord}([Q]_l) \leq al + b$ for any $l \in \mathbb{N}$). This implies there exists a large enough real number α (e.g. $a+b$) such that for any $P \in \widehat{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$, P is α-bounded. We fix now such an α and we set $\beta := \alpha + p^m$.

2) Let P be a β-bounded element of $D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)} \subset \widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$. It is straightforward that Pb is β-bounded for any $b \in B^{(m)}$. Moreover, by using the formula 4.2.5.7.3 (in the case where $m = \infty$ with the constant coefficient $\mathcal{B}_X = \mathcal{O}_X$), we get that for any $a \in O_{\mathfrak{X}}$ the element aP is still β-bounded.

3) Let $P \in D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)}$.

i) We have $PR \in \widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$. Indeed since $\widehat{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$ is a ring, then for any $b \in B^{(m)}$, $bR \in \widehat{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)} \subset \widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$. Since $D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)}$ is a left $D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module generated by the elements of $B^{(m)}$, then we are done.

ii) Suppose that P is β-bounded. The operator P is therefore a finite sum of elements of the form $\pi^{l_2}\underline{\partial}_{(r)}^{[\underline{i}_2]} b$, with $b \in B^{(m)}$ and $|\underline{i}_2| \leq \beta(l_2+1)$. Since $bR \in \widehat{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$ (because $\widehat{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$ is a ring), then following the part 2) the element bR is α-bounded. We can therefore write bR as a sum of elements of the form $\pi^{l_1}\underline{\partial}_{(r)}^{[\underline{i}_1]} b'$ with $b' \in B^{(m)}$ and $|\underline{i}_1| \leq \alpha(l_1+1)$. Hence, PR is equal to a sum of elements of the form $\pi^{l_1+l_2}\underline{\partial}_{(r)}^{[\underline{i}_1]}\underline{\partial}_{(r)}^{[\underline{i}_2]} b'$ with $b' \in B^{(m)}$, $|\underline{i}_1| \leq \alpha(l_1+1)$ and $|\underline{i}_2| \leq \beta(l_2+1)$. Since $\alpha \leq \beta$, by using the formula 1.1.4.4.1 and 3.2.3.13.1 (this latter is still available for $m = +\infty$), PR is therefore equal to a sum of elements of the form $\pi^l\underline{\partial}_{(r)}^{[\underline{i}]} b''$ with $b'' \in B^{(m)}$ and $|\underline{i}| \leq \alpha + \beta(l+1)$. Remark PR is only a priori "almost" β-bounded.

4) We can easily check the formula for any $N \in \mathbb{N}$:

$$t^{p^m}\partial^{[N+p^m]} - \partial^{[N+p^m]}t^{p^m} \equiv -\partial^{[N]} \mod \pi D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}.$$

This implies that for any operator $U \in D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)}$ there exists an operator $Q \in D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)}$ such that

$$t^{p^m}Q - Qt^{p^m} \equiv U \mod \pi\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_{\mathfrak{X}}} B^{(m)}$$

and $\mathrm{ord}(Q) \leq \mathrm{ord}(U) + p^m$.

5) In this step, let us build by induction on $l \geq 0$, some operators $P_l \in D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)}$ satisfying for any $l \geq 0$ the following conditions:

(i) $P_0 = 1$ and for $l \geq 1$ on a $P_l \equiv P_{l-1} \mod \pi^1 D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_{\mathfrak{X}}} B^{(m)}$,

(ii) P_l is β-bounded,

(iii) $t^{p^m} P_l \equiv P_l(t^{p^m} - \pi R) \mod \pi^{l+1}\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}$.

Remark that following the step 3), the elements of the congruence of the property (iii) belong to $\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}$. We have necessarily $P_0 = 1$. Let $l \in \mathbb{N}$ and suppose built $P_0, \ldots, P_l$ satisfying the conditions (i), (ii) and (iii). Put $U := -[t^{p^m} P_l - P_l(t^{p^m} - \pi R)]_{l+1} \in D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_\mathfrak{X}} B^{(m)}$. Following the property (iii) satisfied by P_l, we have $t^{p^m} P_l - P_l(t^{p^m} - \pi R) \equiv 0 \mod \pi^{l+1}\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}$. This implies the congruence:

$$-\pi^{l+1}U \equiv t^{p^m} P_l - P_l(t^{p^m} - \pi R) \mod \pi^{l+2}\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}. \tag{9.3.5.4.1}$$

Following the step 3.ii), since P_l is β-bounded then $\sigma_{l+1}(\pi P_l R) = \pi\sigma_l(P_l R)$ is a differential operator of order bounded by $\alpha + \beta(l+1)$. It follows from that the step 2), that $\mathrm{ord}(\sigma_l(t^{p^m} P_l - P_l(t^{p^m}) \leq \beta(l+1)$. This yields $\mathrm{ord}(U) \leq \beta(l+1) + \alpha$. Following the part 4) of the proof, there exists therefore $Q \in D_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \otimes_{O_\mathfrak{X}} B^{(m)}$ such that $t^{p^m} Q - Q t^{p^m} \equiv U \mod \pi\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}$ and $\mathrm{ord}(Q) \leq \mathrm{ord}(U) + p^m$. This implies $\mathrm{ord}(Q) \leq \beta(l+1) + \alpha + p^m = \beta(l+2)$ (recall that $\beta := \alpha + p^m$). Hence, $\pi^{l+1}Q$ is β-bounded.

Following the step 3.i), $QR \in \widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}$. By using 9.3.5.4.1, we get the congruences

$$\begin{aligned} t^{p^m}(P_l + \pi^{l+1}Q) - (P_l + \pi^{l+1}Q)(t^{p^m} - \pi R) &= t^{p^m} P_l - P_l(t^{p^m} - \pi R) + \pi^{l+1}(t^{p^m} Q - Q t^{p^m}) + \pi^{l+2} QR \\ &\equiv -\pi^{l+1}U + \pi^{l+1}(t^{p^m} Q - Q t^{p^m}) \mod \pi^{l+2}\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)} \\ &\equiv 0 \mod \pi^{l+2}\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}. \end{aligned}$$

Hence, $P_{l+1} := P_l + \pi^{l+1}Q$ is β-bounded and the equality $t^{p^m} P_{l+1} \equiv P_{l+1}(t^{p^m} - \pi R) \mod \pi^{l+2}\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}$ holds.

6) Finally, following the step 5), we get the element $P := \lim_{l\to\infty} P_l$ of $\widehat{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)}$ which is β-bounded and $t^{p^m} P = P(t^{p^m} - \pi R)$ holds. Following the step 0.ii), since P is β-bounded, there exists therefore $m' \geq m$ such that $P \in \widehat{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{O_\mathfrak{X}} B^{(m)} \subset \widehat{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Such operator P verifies the required properties. □

Notation 9.3.5.5. According to the notation 7.5.5.14 (this is also a respective case of 9.3.1.8), for any $\mathcal{E} \in ({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ we set

$$\widetilde{u}^{(m)!}(\mathcal{E}) := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} u^{-1}(\mathcal{E})[d_u].$$

According to 7.5.8.3 (or a respective case of 9.3.2.1) for any $\mathcal{F} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$, we set

$$\widetilde{u}^{(m)}_{+}(\mathcal{F}) := u_*\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{F}\right).$$

For coherent complexes, both functors are compatible with that of the subsection 9.3.3. More precisely, on one hand for any $\mathcal{G} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$, following 7.5.5.16.(b) we have the isomorphism

$$\widetilde{u}^{(m)!}(\mathcal{G}_\mathbb{Q}) \xrightarrow{\sim} (\widetilde{u}^{(m)!}(\mathcal{G}))_\mathbb{Q}, \tag{9.3.5.5.1}$$

where $\widetilde{u}^{(m)!}(\mathcal{G})$ is the usual pullbacks (see definition 7.5.5.6.(c). On the other hand for any $\mathcal{H} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp})$ following 7.5.8.4.(b)

$$\widetilde{u}^{(m)}_{+}(\mathcal{H}_\mathbb{Q}) \xrightarrow{\sim} (\widetilde{u}^{(m)}_{+}(\mathcal{H}))_\mathbb{Q}, \tag{9.3.5.5.2}$$

where $\widetilde{u}^{(m)}_{+}(\mathcal{H})$ is the usual pushforward (see definition 7.5.8.1.(c)).

Notation 9.3.5.6. Suppose the local condition of 9.3.1.2 are satisfied. Following 9.3.1.14.1, we have the isomorphism

$$\widetilde{u}_{+}^{(m)}(\mathcal{F}) \xrightarrow[\iota_t \otimes \mathrm{id}]{\sim} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}/\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}\mathcal{I}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} u_*\mathcal{F}.$$

By taking the global section of the bijection 9.3.1.18.1, we get $\Gamma(\mathfrak{Z}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} I$, which yields a structure of $(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}, \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp})$-bimodule on this latter term. Hence, for any left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$-module G, we get a left $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module by setting:

$$\widetilde{u}_{+}^{(m)}(G) := \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} I \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} G, \tag{9.3.5.6.1}$$

i.e. this is a global version of the notation 9.3.2.1 (do not confuse with 9.3.3.6.1). By setting $\mathcal{G} := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}} G$, we get the isomorphism

$$\Gamma(\mathfrak{X}, \widetilde{u}_{+}^{(m)}(\mathcal{G})) \xrightarrow{\sim} \widetilde{u}_{+}^{(m)}(G). \tag{9.3.5.6.2}$$

Indeed, by associativity of the tensor product, we reduce to the case where $G = \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$, which is easy.

Following 9.3.1.20.2, for any left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module $\mathcal{E}$, we have the isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules:

$$H^0\widetilde{u}^{(m)!}(\mathcal{E}) \xrightarrow{\sim} \cap_{s=r+1}^{d} \ker(\mathcal{E} \xrightarrow{t_s} \mathcal{E}). \tag{9.3.5.6.3}$$

For any left $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module E, we set

$$H^0\widetilde{u}^{(m)!}(E) := \mathrm{Hom}_{B_{\mathfrak{X}}}(B_{\mathfrak{X}}/IB_{\mathfrak{X}}, E) \cap_{s=r+1}^{d} \ker(E \xrightarrow{t_s} E). \tag{9.3.5.6.4}$$

Then $H^0\widetilde{u}^{(m)!}(E)$ is endowed with a structure of left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module which is (well) defined by the formula

$$Q \cdot x := Q_{\mathfrak{X}} \cdot x. \tag{9.3.5.6.5}$$

for any $x \in H^0u^{(m)!}(E)$, $Q \in \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}$ and any choice $Q_{\mathfrak{X}} \in \widetilde{D}_{\mathfrak{X}^\sharp,\mathfrak{Z}^\sharp,\underline{t}}$ such that $\vartheta(Q) = [Q_{\mathfrak{X}}]_Z$ (see 5.2.2.5.7). Comparing 9.3.1.20.3 and 9.3.5.6.5, for any left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module $\mathcal{E}$, we have the isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules:

$$\Gamma(\mathfrak{X}, H^0\widetilde{u}^{(m)!}(\mathcal{E})) \xrightarrow{\sim} \Gamma(\mathfrak{X}, \cap_{s=r+1}^{d} \ker(\mathcal{E} \xrightarrow{t_s} \mathcal{E})) \xrightarrow{\sim} H^0\widetilde{u}^{(m)!}(\Gamma(\mathfrak{X}, \mathcal{E})). \tag{9.3.5.6.6}$$

Lemma 9.3.5.7. *Let $\mathcal{F}$ be a coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module with support in $\mathfrak{Z}$. Then $\widetilde{u}_{+}^{(m)}(\mathcal{F})$ is a coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module with support in $\mathfrak{Z}$. Moreover, we have a canonical isomorphism*

$$H^0\widetilde{u}^{(m)!}\widetilde{u}_{+}^{(m)}(\mathcal{F}) \xrightarrow{\sim} (\mathcal{F}). \tag{9.3.5.7.1}$$

Proof. The stability of the coherence comes from the fact that u is proper (see 7.5.11.4). The morphism 9.3.5.7.1 is constructed in 9.3.2.3. The fact that this is an isomorphism is local and we can therefore suppose the local condition of 9.3.1.2 are satisfied. Hence, via 7.5.8.4.(b), this is a consequence of 9.3.3.13 (see also 9.3.5.6 and use theorem of type A). □

Theorem 9.3.5.8 (Berthelot)**.** *Let $\mathcal{E}$ be a coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module with support in $\mathfrak{Z}$ (i.e. such that $\mathcal{E}|\mathfrak{Y} = 0$).*

Then there exist a large enough integer $m' \geq m$, a coherent $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module $\mathcal{F}$ and an isomorphism of $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules of the form

$$\widetilde{u}_{+}^{(m')}(\mathcal{F}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}.$$

Proof. 0) For any coherent $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module $\mathcal{G}$, we have the canonical isomorphism $H^0\widetilde{u}^{!(m')}\widetilde{u}^{(m')}_+(\mathcal{G}) \xrightarrow{\sim} \mathcal{G}$ (see 9.3.5.7). This implies that the functor $\widetilde{u}^{(m')}_+$ is fully faithful. The theorem is therefore local, and thanks to 5.2.1.1 we can suppose $\mathfrak{X}$ is affine and there exist some integers $d \geq r$ and a cartesian diagram of formal log $\mathfrak{S}$-schemes of the form:

$$\begin{array}{ccc} \mathfrak{X}^\sharp & \longrightarrow & \mathfrak{A}^{d,r}_{\mathfrak{S}^\sharp} \\ {\scriptstyle u}\uparrow & \square & \uparrow \\ \mathfrak{Z}^\sharp & \longrightarrow & \mathfrak{A}^{r,r}_{\mathfrak{S}^\sharp} \end{array}$$

such that horizontal morphisms are log-étale and the right morphism is the canonical exact closed immersion. By proceeding by induction on d, we can suppose $d = r+1$, i.e. $\mathfrak{Z}^\sharp = V(t)$ where t is the section of $\mathcal{O}_{\mathfrak{X}}$ image of t_n via $\mathfrak{X}^\sharp \to \mathfrak{A}^{d,d-1}_{\mathfrak{S}^\sharp}$. In other words, we reduce to the context 9.3.5.3 and we will use its notation.

1) Let $\overset{\circ}{\mathcal{E}}$ be a π-torsion free coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module endowed with a $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-linear isomorphism of the form $\overset{\circ}{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ (see 7.4.5.2). Since $\mathfrak{X}$ is affine, we can choose some generators $e_1, \ldots, e_s$ of $\overset{\circ}{\mathcal{E}}$ as $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module (use theorem of type A of 7.2.3.10). Put $\underline{e} := \begin{pmatrix} e_1 \\ \vdots \\ e_s \end{pmatrix}$. Since $\overset{\circ}{\mathcal{E}}/\pi\overset{\circ}{\mathcal{E}}$ is a quasi-coherent $\mathcal{O}_X$-module with support in Z (i.e. $(\overset{\circ}{\mathcal{E}}/\pi\overset{\circ}{\mathcal{E}})|Y = 0$), then $t^{p^m}e_i \equiv 0 \mod \pi\overset{\circ}{\mathcal{E}}$ (by increasing m if necessary). There exists therefore a matrix $R \in M_s(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ such that $t^{p^m}\underline{e} = \pi R\underline{e}$. Let m' and $P \in M_s(\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ satisfying the conditions of the Lemma 9.3.5.4. Put $E^{(m')} := \widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} E$. We denote by $1\otimes e_1, \ldots, 1 \otimes e_s$ the images of $e_1, \ldots, e_s$ in $E^{(m')}$. Put $\underline{e}' := P(1\otimes \underline{e})$. We compute $t^{p^m}\underline{e}' = t^{p^m}P(1\otimes\underline{e}) = P(t^{p^m}I_s - \pi R)(1\otimes\underline{e}) = P(1\otimes(t^{p^m}\underline{e} - \pi R\underline{e})) = 0$.

2) Recall $H^0\widetilde{u}^{!(m')}(E^{(m')})$ is the set some elements of $E^{(m')}$ which are killed by t. Denote by $K^{(m')}$ the sub-$\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module of $E^{(m')}$ generated by $H^0\widetilde{u}^{!(m')}(E^{(m')})$. Let us check by induction on $i \geq 1$ that for any $x \in E^{(m')}$ if $t^i x = 0$ then $x \in K^{(m')}$. When $i = 1$, this is straightforward. Suppose $i \geq 2$ and the property holds for $i-1$. Let $x \in E^{(m')}$ such that $t^i x = 0$. From the formula $\partial t^{i-1} = t^{i-1}\partial + (i-1)t^{i-2}$, we get by right multiplication by t the following equality $\partial t^i = t^{i-1}\partial t + (i-1)t^{i-1} = t^{i-1}(\partial t + (i-1))$. Since $\partial t^i \cdot x = 0$, by induction hypothesis, we get $(\partial t + (i-1)) \cdot x \in K^{(m')}$ (resp. $t \cdot x \in K^{(m')}$ and therefore $\partial t \cdot x \in K^{(m')}$). This yields $(i-1)x \in K^{(m')}$ and therefore $x \in K^{(m')}$, which concludes the induction. Since $E^{(m')}$ is generated as $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module by some elements killed by t^{p^m} (see the step 1), then this implies that $K^{(m')} = E^{(m')}$, i.e. that $E^{(m')}$ is generated as $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module by some elements killed by t.

3) Following 9.3.2.3 (still valid in our coefficient $\mathcal{B}^{(m')}_{\mathfrak{X}}$) and more explicitly following 9.3.2.4 the description given at 5.2.6.2.a) is still valid in our context, i.e., we get the morphism of $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules given by

$$\mathrm{adj}\colon \widetilde{u}^{(m')}_+ \circ H^0\widetilde{u}^{!(m')}(E^{(m')}) \to E^{(m')} \tag{9.3.5.8.1}$$

given by $\sum_k [P_k] \otimes x_k \mapsto \sum_k P \cdot x_k$, with $x_k \in H^0\widetilde{u}^{!(m')}(E^{(m')})$, such that $\lim_{|k|\to\infty} x_k = 0$ (where $[\partial^{\langle k\rangle}]'$ is the image of $\partial^{\langle k\rangle}$ in the bimodule $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \xrightarrow{\sim} \widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}/\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}I$). Since $E^{(m')}$ is generated as $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module by a finite number of elements of $H^0\widetilde{u}^{!(m')}(E^{(m')})$, this yields a surjective morphism of (coherent) $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules of the form $\widetilde{u}^{(m')}_+(L) \to E^{(m')}$ where L is a free $\widetilde{D}^{(m')}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module of finite rank and which splits of the form $\widetilde{u}^{(m')}_+(L) \to \widetilde{u}^{(m')}_+ \circ H^0\widetilde{u}^{!(m')}(E^{(m')}) \to E^{(m')}$, where the last map is 9.3.5.8.1. This yields the map $\widetilde{u}^{(m')}_+ \circ H^0\widetilde{u}^{!(m')}(E^{(m')}) \to E^{(m')}$ is surjective.

4) Denote by N the kernel of the surjection $\widetilde{u}^{(m')}_+(L) \to E^{(m')}$. Since N is the global section of the kernel of a morphism of coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules with support in $\mathfrak{Z}$ (see theorem of type A and B), then N is the global section of a coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules with support in $\mathfrak{Z}$. Hence, by proceeding

as above (see the step 3) and increasing m' if necessary (use 7.5.8.15 and the fact that the extension $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(m'')}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ is flat for any $m' \leq m''$), the adjunction morphism $\widetilde{u}^{(m')}_{+} H^0 \widetilde{u}^{!(m')}(N) \to N$ is surjective. Since $H^0 \widetilde{u}^{!(m')}(N)$ is a sub-module of L, then $H^0 \widetilde{u}^{!(m')}(N)$ is a coherent $\widetilde{D}^{(m')}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module and the composite $\widetilde{u}^{(m')}_{+} H^0 \widetilde{u}^{!(m')}(N) \to N \to \widetilde{u}^{(m')}_{+} L$ is injective (because $\widetilde{u}^{(m')}_{+}$ is exact). In particular, $\widetilde{u}^{(m')}_{+} H^0 \widetilde{u}^{!(m')}(N) \to N$ is also injective. Since this latter map is also surjective, then the canonical arrow $\widetilde{u}^{(m')}_{+} H^0 \widetilde{u}^{!(m')}(N) \to N$ is an isomorphism. Hence, by exactness of $\widetilde{u}^{(m')}_{+}$, we get $E^{(m')} \xrightarrow{\sim} \widetilde{u}^{(m')}_{+}(L)/N \xrightarrow{\sim} \widetilde{u}^{(m')}_{+}(L)/\widetilde{u}^{(m')}_{+} H^0 \widetilde{u}^{!(m')}(N) \xrightarrow{\sim} \widetilde{u}^{(m')}_{+}(L/H^0 \widetilde{u}^{!(m')}(N))$. □

Theorem 9.3.5.8 is false if you fix m, i.e. do not allow m to increase; for example $\mathcal{D}^{(0)}_{\mathfrak{X}}/\mathcal{D}^{(0)}_{\mathfrak{X}}(t^p - p)$. This theorem is the first step in the proof of the Berthelot-Kashiwara theorem, it shows that essential surjectivity is true asymptotically.

Theorem 9.3.5.9 (Berthelot-Kashiwara)**.** *The extraordinary inverse image $u^!_D$ and the direct image u_{D+} functors (see 9.2.1.21.1 and 9.2.4.13) induce quasi-inverse equivalences between the category of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-modules with support in Z and that of coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}({}^\dagger E)_{\mathbb{Q}}$-modules. Theses functors $u^!_D$ and u_{D+} are exact on theses categories.*

Proof. We reduce to the geometical situation of the step 1) of the proof of 9.3.5.8. For any coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-module $\mathcal{F}$ with support in Z, it follows from 9.3.5.7 that we have the canonical isomorphism $H^0 u^!_D u_{D+}(\mathcal{F}) \xrightarrow{\sim} \mathcal{F}$. By using theorem 9.3.5.8, this yields that the functors $H^0 u^!_D$ and u_{D+} induce some equivalences quasi-inverse between the category of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-modules with support in Z and that of coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}({}^\dagger E)_{\mathbb{Q}}$-modules. The acyclicity of u_{D+} follows from a computation in local coordinates. It remains to check the acyclicity of $\widetilde{u}^!$. Following 1.4.2.5.2, the morphism $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ sends $\sum_{k\in\mathbb{N}} b_k \partial^{\langle k\rangle_{(m)}}$ to $\sum_{k\in\mathbb{N}} b_k \frac{q^{(m)}_k!}{q^{(m+1)}_k!} \partial^{\langle k\rangle_{(m+1)}}$. Via the formula 1.4.2.7.1 (still valid for formal schemes), we compute $t\partial^{\langle k+1\rangle_{(m+1)}} - \partial^{\langle k+1\rangle_{(m+1)}} t = \left\{ {k+1 \atop 1} \right\}_{(m+1)} \partial^{\langle k\rangle_{(m+1)}} = \frac{q^{(m+1)}_{k+1}!}{q^{(m+1)}_k!} \partial^{\langle k\rangle_{(m+1)}}$ By using 8.7.1.7.1, $v_p(\frac{q^{(m+1)}_{k+1}!}{q^{(m+1)}_k!}) < \log_p(k+1) + \frac{1}{p^{m+1}(p-1)} + \frac{p}{(p-1)}$ and $v_p(\frac{q^{(m)}_k!}{q^{(m+1)}_k!}) > \frac{k}{p^m(p-1)} - \log_p(k+1) - \frac{p}{(p-1)} - \frac{k}{p^{m+1}(p-1)} = \frac{k}{p^{m+1}(p-1)} - \log_p(k+1) - \frac{p}{(p-1)}$. Hence, there exists $N \in \mathbb{N}$ large enough such that for any $k \geq N$ we get $b_k \frac{q^{(m)}_k!}{q^{(m+1)}_k!} \partial^{\langle k\rangle_{(m+1)}} = b'_k \frac{q^{(m+1)}_{k+1}!}{q^{(m+1)}_k!} \partial^{\langle k\rangle_{(m+1)}}$, with $b'_k \in \mathcal{B}^{(m+1)}_{\mathfrak{X}}$ converging to zero for the p-adic topology. Hence, $\sum_{k\geq N} b_k \frac{q^{(m)}_k!}{q^{(m+1)}_k!} \partial^{\langle k\rangle_{(m+1)}} = \sum_{k\geq N} b'_k \frac{q^{(m+1)}_{k+1}!}{q^{(m+1)}_k!} \partial^{\langle k\rangle_{(m+1)}} = t\left(\sum_{k\geq N} b'_k \partial^{\langle k+1\rangle_{(m+1)}}\right) - \left(\sum_{k\geq N} b'_k \partial^{\langle k+1\rangle_{(m+1)}}\right) t \in I\widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} + \widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} I$. Similarly, since the sum is finite, we get $\sum_{k\geq N} b_k \frac{q^{(m)}_k!}{q^{(m+1)}_k!} \partial^{\langle k\rangle_{(m+1)}} \in I\widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} + \widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} I$. Hence, for any coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module $\mathcal{F}^{(m)}$, denoting by $\mathcal{F}^{(m+1)} := \widetilde{\mathcal{D}}^{(m+1)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{F}^{(m)}$, the canonical arrow $\mathcal{H}^1 \widetilde{u}^{(m)!} \circ \widetilde{u}^{(m)}_{+}(\mathcal{F}^{(m)}) \to \mathcal{H}^1 \widetilde{u}^{(m+1)!} \circ \widetilde{u}^{(m+1)}_{+}(\mathcal{F}^{(m+1)})$ is the zero morphism. Indeed, by using $\mathcal{H}^1 \widetilde{u}^{(m)!} = \mathcal{H}^1 \widetilde{u}^{(m+1)!} = \widetilde{u}^*$ for coherent modules, this latter morphism corresponds to the map

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/(I\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} + \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} I) \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} F^{(m)} \to \widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}/(I\widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} + \widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} I) \otimes_{\widetilde{D}^{(m+1)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} F^{(m+1)}.$$

This implies that $\mathcal{H}^1 u^!_D \circ u_{D+}(\mathcal{F}) = 0$. Since we have $\mathcal{H}^i u^!_D \circ u_{D+}(\mathcal{F}) = 0$ for $i \notin \{0,1\}$, then this implies the acyclicity of $u^!_D$. □

Remark 9.3.5.10. C. Huyghe and T. Schmidt establish Kashiwara's theorem for twisted arithmetic differential operators, which is a variation of 9.3.5.9 (see [HS24]).

Corollary 9.3.5.11. *With notation 9.3.5.9, let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-modules with support in Z. Then we have the isomorphism of coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}({}^\dagger E)_{\mathbb{Q}}$-modules:*

$$\mathbb{D}_{\mathfrak{Z}^\sharp,E} \circ u^!_D(\mathcal{E}) \xrightarrow{\sim} u^!_D \circ \mathbb{D}_{\mathfrak{X}^\sharp,D}(\mathcal{E}). \qquad (9.3.5.11.1)$$

Proof. We have the isomorphisms of coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}({}^\dagger E)_\mathbb{Q}$-modules:

$$u_{D+}\circ \mathbb{D}_{\mathfrak{Z}^\sharp,E}\circ u^!_D(\mathcal{E}) \underset{9.3.2.8}{\xrightarrow{\sim}} \mathbb{D}_{\mathfrak{Z}^\sharp,E}\circ u_{D+}\circ u^!_D(\mathcal{E}) \underset{9.3.5.9}{\xrightarrow{\sim}} \mathbb{D}_{\mathfrak{Z}^\sharp,E}(\mathcal{E}) \underset{9.3.5.9}{\xrightarrow{\sim}} u_{D+}\circ u^!_D\circ \mathbb{D}_{\mathfrak{Z}^\sharp,E}(\mathcal{E}).$$

Since the functor u_{D+} is fully faithful on the category of coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}({}^\dagger E)_\mathbb{Q}$-modules, then we are done. □

9.3.5.12. For any $\mathcal{E}^{(\bullet)}\in D^-(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, we have the isomorphism of $D^-(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E)))$

$$\mathcal{B}_{\mathfrak{Z}}(E)^{(\bullet)}\otimes^{\mathbb{L}}_{u^{-1}\mathcal{B}_{\mathfrak{X}}(D)^{(\bullet)}} u^{-1}\mathcal{E}^{(\bullet)}[d_u] \xrightarrow{\sim} u^{(\bullet)!}_{D\,\mathrm{alg}}(\mathcal{E}^{(\bullet)}) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)\otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)} f^{-1}\mathcal{F}^{(\bullet)}\ [d_u]. \tag{9.3.5.12.1}$$

Moreover, for any left $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D)$-module $\mathcal{E}^{(\bullet)}$, it follows from the local computation 9.3.1.8.4 that $H^i(u^{(\bullet)!}_{D\,\mathrm{alg}}(\mathcal{E}^{(\bullet)}))=0$ for any integer $i\notin[0,-d_u]$. Hence, by using 9.2.1.17, this yields that for any object of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, we have $H^i(u^{(\bullet)!}_D(\mathcal{E}^{(\bullet)}))=0$ in $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}(E))$ for any integer $i\notin[0,-d_u]$. defined by setting,

Beware that this functor do not preserve the quasi-coherence. We benefit for any $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$ from a canonical morphism $u^{(\bullet)!}_{D,\mathrm{alg}}(\mathcal{E}^{(\bullet)})\to u^{(\bullet)!}_D(\mathcal{E}^{(\bullet)})$ (this morphism is even build in $D(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(D))$, i.e. before the localisation).

Theorem 9.3.5.13 (LD-version of Berthelot-Kashiwara Theorem). *Let $\mathcal{F}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$, $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ such that $\mathcal{E}^{(\bullet)}|\mathfrak{U}\xrightarrow{\sim}0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}^\sharp}(D))$.*

(a) We have the canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$:

$$\mathcal{F}^{(\bullet)}\xrightarrow{\sim}u^{(\bullet)!}_D\circ u^{(\bullet)}_{D+}(\mathcal{F}^{(\bullet)}). \tag{9.3.5.13.1}$$

(b) We have $u^{(\bullet)!}_D(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$ and we benefit from the canonical isomorphism

$$u^{(\bullet)}_{D+}\circ u^{(\bullet)!}_D(\mathcal{E}^{(\bullet)})\xrightarrow{\sim}\mathcal{E}^{(\bullet)}. \tag{9.3.5.13.2}$$

(c) The functors $u^{(\bullet)}_{D+}$ and $u^{(\bullet)!}_D$ induce t-exact quasi-inverse equivalences between the category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$ and the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ consisting of complexes $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}|\mathfrak{U}\xrightarrow{\sim}0$.

Proof. 1) Let us check the isomorphism 9.3.5.13.1. It follows from 5.2.6.3 that we have the canonical adjunction morphism $\mathcal{F}^{(\bullet)}\to u^{(\bullet)!}_D\circ u^{(\bullet)}_{D+}(\mathcal{F}^{(\bullet)})$ of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$. It is a question of checking that this arrow is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$. Following the proposition 8.3.3.5, this is local. By transitivity of the adjunction morphisms, we reduce to the case where $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ is endowed with logarithmic coordinates $t_1,\dots,t_d$ such that $\mathfrak{Z}^\sharp=V(t_1)$. In this case, it follows from 9.3.5.12 that, for any integer $l\notin\{0,1\}$, we have $H^l u^{(\bullet)!}_D=0$ on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$. Since the functor $u^{(\bullet)}_{D+}$ preserves the coherence and is exact, the functor $u^{(\bullet)!}_D\circ u^{(\bullet)}_{D+}$ is therefore left way-out (this has a meaning by using the equivalence of categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))\cong D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E)))$ of 8.4.5.6). By copying the beginning of the proof of 8.4.5.3, we reduce therefore to the case where $\mathcal{F}^{(\bullet)}=\lambda^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E)$, for some $\lambda\in L$. Hence, following 9.3.3.13, we get the canonical isomorphism $\mathcal{F}^{(\bullet)}\xrightarrow{\sim}H^0u^{(\bullet)!}_D\circ u^{(\bullet)}_{D+}(\mathcal{F}^{(\bullet)})$ is an isomorphism of $D(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$. Moreover, following the proof of 9.3.5.8, the canonical arrow $H^1u^{(m)!}_D\circ u^{(m)}_{D+}(\mathcal{F}^{(m)})\to H^1u^{(m+1)!}\circ u^{(m+1)}_+(\mathcal{F}^{(m+1)})$ is the zero morphism. This implies $H^1u^{(\bullet)!}_D\circ u^{(\bullet)}_{D+}(\mathcal{F}^{(\bullet)})=0$ in $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$. Hence, we are done.

2) Now, let us check 9.3.5.13.2. Put $\mathcal{E}:=\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})$. Following the theorem of Berthelot-Kashiwara of 9.3.5.9, since $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger D)_\mathbb{Q})$ and is with support in Z, then $u^!_D(\mathcal{E})\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger E)_\mathbb{Q})$. Let $\mathcal{H}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$ such that $u^!_D(\mathcal{E})\xrightarrow{\sim}\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{H}^{(\bullet)})$. Via 9.2.4.17, this implies $u_{D+}(u^!_D(\mathcal{E}))\xrightarrow{\sim}$

$\underrightarrow{l}^*_{\mathbb{Q}} u^{(\bullet)}_{D+}\mathcal{H}^{(\bullet)}$. Since following the theorem of Berthelot-Kashiwara $\mathcal{E} \xrightarrow{\sim} u_{D+}(u^!_D(\mathcal{E}))$, since $\mathcal{E}^{(\bullet)}$, $u^{(\bullet)}_{D+}\mathcal{H}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$ and since the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ is fully faithful on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(D))$, this implies $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} u^{(\bullet)}_{D+}\mathcal{H}^{(\bullet)}$. This yields $u^{(\bullet)!}_D(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)!}_D \circ u^{(\bullet)}_{D+}\mathcal{H}^{(\bullet)} \underset{9.3.5.13.1}{\xrightarrow{\sim}} \mathcal{H}^{(\bullet)}$. By applying the functor $u^{(\bullet)}_{D+}$ to this composite morphism, we get the desired isomorphism 9.3.5.13.2.

3) The third point is straightforward from the first two. □

Remark 9.3.5.14. Let $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$. It is not clear that the property $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{F}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}({}^\dagger E)_{\mathbb{Q}})$ implies $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp}(E))$. Hence, the version 9.3.5.13 is slightly more precise than 9.3.5.9.

Remark 9.3.5.15. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}(D))$. Then $\mathcal{E}^{(\bullet)}|\mathfrak{U} \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}^\sharp}(D\cap U))$ if and only if the cohomology spaces of $\underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)}$ are $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp}({}^\dagger D)_{\mathbb{Q}}$-coherent with support in X, i.e. $\underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)}|\mathfrak{U} = 0$.

9.3.6 Adjunction morphism associated to the base change of an exact closed immersion by log smooth morphisms, transitivity, compatibility with glueing isomorphisms

Proposition 9.3.6.1. *Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Consider the following diagram of fine log formal schemes which are log smooth over $\mathfrak{S}^\sharp$:*

$$\begin{array}{ccccc} \mathfrak{P}''^\sharp & \xrightarrow{g} & \mathfrak{P}'^\sharp & \xrightarrow{f} & \mathfrak{P}^\sharp \\ {\scriptstyle u''}\uparrow & & {\scriptstyle u'}\uparrow & & {\scriptstyle u}\uparrow \\ \mathfrak{X}''^\sharp & \xrightarrow{\mathrm{b}} & \mathfrak{X}'^\sharp & \xrightarrow{a} & \mathfrak{X}^\sharp, \end{array} \tag{9.3.6.1.1}$$

where f, g, a and b are log-smooth, where u, u' and u'' are exact closed immersions. We suppose that the diagram 9.3.6.1.1 is commutative modulo π. Moreover, let T be a divisor of P such that $T' := f^{-1}(T)$ (resp. $T'' := g^{-1}(T')$, $Z := u^{-1}(T)$, $Z' := u'^{-1}(T')$ and $Z'' := u''^{-1}(T'')$) is a divisor of P' (resp. P'', X, X' and X'').

(a) We have the canonical adjunction morphisms

$$u'_+ \circ a^! \to f^! \circ u_+, \qquad u'^{(\bullet)}_+ \circ a^{(\bullet)!} \to f^{(\bullet)!} \circ u^{(\bullet)}_+ \tag{9.3.6.1.2}$$

of functors of respectively of the form $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}'^\sharp/\mathfrak{S}^\sharp}({}^\dagger T')_{\mathbb{Q}})$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'^\sharp/\mathfrak{S}^\sharp}(T'))$). If the right square of 9.3.6.1.1 is cartesian modulo π then both morphisms 9.3.6.1.2 are isomorphisms.

(b) Denoting by $\phi\colon u'_+ \circ a^! \to f^! \circ u_+$, (resp. $\phi'\colon u''_+ \circ b^! \to g^! \circ u'_+$, resp. $\phi''\colon u''_+ \circ (a\circ b)^! \to (f\circ g)^! \circ u_+$) the morphism of adjunction of the right square 9.3.6.1.1 (resp. the left square, resp. the outer of 9.3.6.1.1), then the following diagram

$$\begin{array}{ccc} u''_+ \circ (a\circ b)^! & \underset{\sim}{\longrightarrow} & u''_+ \circ b^! \circ a^! \\ \downarrow{\scriptstyle \phi''} & & \downarrow{\scriptstyle (g^!\circ\phi)\circ(\phi'\circ a^!)} \\ (f\circ g)^! \circ u_+ & \underset{\sim}{\longrightarrow} & g^! \circ f^! \circ u_+, \end{array}$$

is commutative ; and similarly the $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$ is valid. By abuse of notation, we get the transitivity equality $\phi'' = (g^! \circ \phi) \circ (\phi' \circ a^!)$.

(c) Let $a'\colon \mathfrak{X}' \to \mathfrak{X}$ (resp. $f'\colon \mathfrak{X}' \to \mathfrak{X}$) be a morphism whose reduction $X' \to \mathfrak{X}$ (resp. $P' \to \mathfrak{X}$) is equal to that of a (resp. f). Then the following diagram

$$\begin{array}{ccc} u'_+ a^! & \xrightarrow{\phi} & f^! \circ u_+ \\ {\scriptstyle u'_+(\tau_{a,a'})}\uparrow\wr & & {\scriptstyle \tau_{f,f'}u_+}\uparrow\wr \\ u'_+ a'^! & \xrightarrow{\psi} & f'^! \circ u_+, \end{array}$$

where ψ means the morphism of adjunction of the right square of 9.3.6.1.1 whose a and f have been replaced respectively by a' and f', is commutative. Similarly the $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$ is valid

Proof. a) Since we have the equivalence of categories $\underset{\rightarrow\mathbb{Q}}{l^*}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z)) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ (and the other similar ones), it follows from the compatibility of the pullbacks and pushforwards of 9.2.1.24 and 9.2.4.17 and from their coherence stability properties of 9.4.1.7 and 9.4.2.4 that we reduce to check the respective case.

Let $\mathcal{E}^{(\bullet)} \in \underset{\rightarrow\mathbb{Q}}{l^*}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(Z))$. Let'sconstruct the morphism $\phi(\mathcal{E}^{(\bullet)})\colon u'^{(\bullet)}_+ \circ a^{(\bullet)!} \to f^{(\bullet)!} \circ u^{(\bullet)}_+$. By applying the functor $u'^{(\bullet)}_+ \circ a^{(\bullet)!}$ to the adjunction morphism of u applied to $\mathcal{E}^{(\bullet)}$ (see 9.3.2.11), we obtain: $u'_+ a^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \to u'^{(\bullet)}_+ a^{(\bullet)!} u^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$. Now, as $(f\circ u')^{(\bullet)!} \xrightarrow{\sim} u'^{(\bullet)!} f^{(\bullet)!}$ and $(u\circ a)^{(\bullet)!} \xrightarrow{\sim} a^{(\bullet)!} u^{(\bullet)!}$, we have isomorphism $u'^{(\bullet)}_+ \tau^{(\bullet)}_{f\circ u', u\circ a} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})\colon u'^{(\bullet)}_+ a^{(\bullet)!} u^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u'^{(\bullet)}_+ u'^{(\bullet)!} f^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$ (notations of 9.2.2.1). Following 9.3.2.11, we have the adjunction morphism of u' applied to $f^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$: $u'^{(\bullet)}_+ u'^{(\bullet)!} f^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)}) \to f^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$. By composing these three morphisms, it comes: $\phi(\mathcal{E}^{(\bullet)}) := u'^{(\bullet)}_+ a^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \to f^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$.

Now let us establish that the morphism $\phi(\mathcal{E}^{(\bullet)})$ is an isomorphism when the right diagram of 9.3.6.1.1 is Cartesian. First, since u is an exact closed immersion, the first arrow in the construction of $\phi(\mathcal{E}^{(\bullet)})$ is an isomorphism. Furthermore, the cartesian hypothesis implies than the complex $f^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$ has support in X' and therefore the adjunction morphism of u' in $f^{(\bullet)!} u^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$ is an isomorphism (see 9.3.5.13).

b) Let us now prove the transitivity formula of (b). For this, since the respective case is checked similarly, to simplify notation we consider the non-respective one. We have the following diagram:

$$\begin{array}{ccccccccc}
u''_+(a\circ b)^! & \longrightarrow & u''_+ b^! a^! & \xrightarrow{\mathrm{adj}_{u'}} & u''_+ b^! u'^! u'_+ a^! & \xrightarrow{\tau} & u''_+ u''^! g^! u'_+ a^! & \xrightarrow{\mathrm{adj}_{u''}} & g^! u'_+ a^! \\
\downarrow \mathrm{adj}_u & & \downarrow \mathrm{adj}_u & & \downarrow \mathrm{adj}_u & & \downarrow \mathrm{adj}_u & & \downarrow \mathrm{adj}_u \\
u''_+(a\circ b)^! u^! u_+ & \longrightarrow & u''_+ b^! a^! u^! u_+ & \xrightarrow{\mathrm{adj}_{u'}} & u''_+ b^! u'^! u'_+ a^! u^! u_+ & \xrightarrow{\tau} & u''_+ u''^! g^! u'_+ a^! u^! u_+ & \xrightarrow{\mathrm{adj}_{u''}} & g^! u'_+ a^! u^! u_+ \\
\Big| & & \downarrow \tau & & \downarrow \tau & & \downarrow \tau & & \downarrow \tau \\
\Big| & & u''_+ b^! u'^! f^! u_+ & \xrightarrow{\mathrm{adj}_{u'}} & u''_+ b^! u'^! u'_+ u'^! f^! u_+ & \xrightarrow{\tau} & u''_+ u''^! g^! u'_+ u'^! f^! u_+ & \xrightarrow{\mathrm{adj}_{u''}} & g^! u'_+ u'^! f^! u_+ \\
\Big| \tau & & \| & & \downarrow \mathrm{adj}_{u'} & & \downarrow \mathrm{adj}_{u'} & & \downarrow \mathrm{adj}_{u'} \\
\Big| & & u''_+ b^! u'^! f^! u_+ & = & u''_+ b^! u'^! f^! u_+ & \xrightarrow{\tau} & u''_+ u''^! g^! f^! u_+ & \xrightarrow{\mathrm{adj}_{u''}} & g^! f^! u_+ \\
\downarrow & & \downarrow \tau & & \downarrow \tau & & \| & & \| \\
u''_+ u''^!(f\circ g)^! u_+ & \longrightarrow & u''_+ u''^! g^! f^! u_+ & = & u''_+ u''^! g^! f^! u_+ & = & u''_+ u''^! g^! f^! u_+ & \xrightarrow{\mathrm{adj}_{u''}} & g^! f^! u_+ \\
\downarrow \mathrm{adj}_{u''} & & \downarrow \mathrm{adj}_{u''} & & \downarrow \mathrm{adj}_{u''} & & \downarrow \mathrm{adj}_{u''} & & \| \\
(f\circ g)^! u_+ & \longrightarrow & g^! f^! u_+ & = & g^! f^! u_+ & = & g^! f^! u_+ & = & g^! f^! u_+ .
\end{array} \tag{9.3.6.1.3}$$

The commutativity of the rectangle (the only rectangle: on the left and in the middle) from 9.3.6.1.3 is deduced of all the properties, given in 9.2.2.3, isomorphisms of the form τ, as well as from the following diagram

$$\begin{array}{ccccccc}
\mathfrak{X}''^\sharp & \xrightarrow{b} & \mathfrak{X}'^\sharp & \xrightarrow{a} & \mathfrak{X}^\sharp & \xrightarrow{u} & \mathfrak{P}^\sharp \\
\wr\downarrow \tau & & \wr\downarrow \tau & & & & \| \\
\mathfrak{X}''^\sharp & \xrightarrow{b} & \mathfrak{X}'^\sharp & \xrightarrow{u'} & \mathfrak{P}'^\sharp & \xrightarrow{f} & \mathfrak{P} \\
\wr\downarrow \tau & & & & \| & & \| \\
\mathfrak{X}''^\sharp & \xrightarrow{u''} & \mathfrak{P}''^\sharp & \xrightarrow{g} & \mathfrak{P}'^\sharp & \xrightarrow{f} & \mathfrak{P}^\sharp .
\end{array}$$

Moreover, we notice that the composite morphism $u'^! \xrightarrow{\mathrm{adj}_{u'}} u'^! u'_+ u'^! \xrightarrow{\mathrm{adj}_{u'}} u'^!$ is the identity. Indeed, this results from the bifunctor adjunction isomorphism θ: $\mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T_{P'})}(u'_+(-), -) \xrightarrow{\sim} \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger T_{X'})}(-, u'^!(-))$ (we will only use the right functoriality), and because the identity morphism $u'_+ u'^! \xrightarrow{Id} u'_+ u'^!$ is sent via θ on $u'^! \xrightarrow{\mathrm{adj}_{u'}} u'^! u'_+ u'^!$ while $u'_+ u'^! \xrightarrow{\mathrm{adj}_{u'}}$ id is sent over $u'^! \xrightarrow{Id} u'^!$. This results in the commutativity of the left square of the third row of 9.3.6.1.3.

We then check, by definition or by functoriality, the commutativity of the other squares of 9.3.6.1.3. This diagram is therefore commutative.

However, we note that the left composite morphism of 9.3.6.1.3, $u''_+ \circ (a\circ b)^! \xrightarrow{\sim} (f\circ g)^! \circ u_+$, is none other than ϕ'', while the one constructing taking the path that goes from the top then to the right of the contour of 9.3.6.1.3, $u''_+ \circ b^! \circ a^! \xrightarrow{\sim} g^! \circ f^! \circ u_+$, matches $(g^! \circ \phi) \circ (\phi' \circ a^!)$. Hence (i).

Let us now prove (c). It follows from 9.2.2.3 that the diagram below

$$\begin{array}{ccccccc}
u'_+ a^!(\mathcal{E}) & \xrightarrow{\mathrm{adj}_u} & u'_+ a^! u^! u_+(\mathcal{E}) & \xrightarrow{u'_+ \tau_{f\circ u', u\circ a} u_+} & u'_+ u'^! f^! u_+(\mathcal{E}) & \xrightarrow{\mathrm{adj}_{u'}} & f^! u_+(\mathcal{E}) \\
{\scriptstyle u'_+(\tau_{a,a'})}\uparrow & & {\scriptstyle u'_+\tau_{u\circ a, u\circ a'} u_+}\uparrow & & \uparrow{\scriptstyle u'_+\tau_{f\circ u', f'\circ u'} u_+} & & {\scriptstyle \tau_{f,f'} u_+}\uparrow \\
u'_+ a'^{!(\mathcal{E})} & \xrightarrow[\mathrm{adj}_u]{} & u'_+ a'^! u^! u_+(\mathcal{E}) & \xrightarrow[u'_+ \tau_{f'\circ u', u\circ a'} u_+]{} & u'_+ u'^! f'^! u_+(\mathcal{E}) & \xrightarrow[\mathrm{adj}_{u'}]{} & f'^! u_+(\mathcal{E}).
\end{array}$$

is commutative. We conclude by noting that its contour corresponds to the diagram of (ii). □

9.3.7 Coherent arithmetic $\mathcal{D}$-modules over a realizable log smooth scheme

Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Let $\mathfrak{P}^\sharp$ be a log smooth separated formal scheme over $\mathfrak{S}^\sharp$. Let $u_0 \colon X^\sharp \to P^\sharp$ be an exact closed immersion of log smooth schemes over $S^\sharp$. Let T be a divisor of P such that $Z := T \cap X$ is a divisor of X. We set $Y^\sharp := X^\sharp \setminus Z$. Let $(\mathfrak{P}^\sharp_\alpha)_{\alpha\in\Lambda}$ be an open covering of $\mathfrak{P}^\sharp$. We set $\mathfrak{P}^\sharp_{\alpha\beta} := \mathfrak{P}^\sharp_\alpha \cap \mathfrak{P}^\sharp_\beta$, $\mathfrak{P}^\sharp_{\alpha\beta\gamma} := \mathfrak{P}^\sharp_\alpha \cap \mathfrak{P}^\sharp_\beta \cap \mathfrak{P}^\sharp_\gamma$, $X^\sharp_\alpha := X^\sharp \cap P_\alpha$, $X^\sharp_{\alpha\beta} := X^\sharp_\alpha \cap X^\sharp_\beta$ and $X^\sharp_{\alpha\beta\gamma} := X^\sharp_\alpha \cap X^\sharp_\beta \cap X^\sharp_\gamma$. We denote by $Y^\sharp_\alpha := X^\sharp_\alpha \cap Y^\sharp$, $Y^\sharp_{\alpha\beta} := Y^\sharp_\alpha \cap Y^\sharp_\beta$, $Y^\sharp_{\alpha\beta\gamma} := Y^\sharp_\alpha \cap Y^\sharp_\beta \cap Y^\sharp_\gamma$, $Z_\alpha := X_\alpha \cap Z$, $Z_{\alpha\beta} := Z_\alpha \cap Z_\beta$, $Z_{\alpha\beta\gamma} := Z_\alpha \cap Z_\beta \cap Z_\gamma$, $j_\alpha \colon Y^\sharp_\alpha \hookrightarrow X^\sharp_\alpha$, $j_{\alpha\beta} \colon Y^\sharp_{\alpha\beta} \hookrightarrow X^\sharp_{\alpha\beta}$ and $j_{\alpha\beta\gamma} \colon Y^\sharp_{\alpha\beta\gamma} \hookrightarrow X^\sharp_{\alpha\beta\gamma}$ the canonical open immersions. We suppose that for every $\alpha \in \Lambda$, $X^\sharp_\alpha$ is affine, (for instance when the covering $(\mathfrak{P}^\sharp_\alpha)_{\alpha\in\Lambda}$ is affine). Since P is separated, for any $\alpha, \beta, \gamma \in \Lambda$, $X^\sharp_{\alpha\beta}$ and $X^\sharp_{\alpha\beta\gamma}$ are also affine.

For any 3uple $(\alpha, \beta, \gamma) \in \Lambda^3$, fix $\mathfrak{X}^\sharp_\alpha$ (resp. $\mathfrak{X}^\sharp_{\alpha\beta}$, $\mathfrak{X}^\sharp_{\alpha\beta\gamma}$) some log smooth formal $\mathfrak{S}^\sharp$-schemes lifting $X^\sharp_\alpha$ (resp. $X^\sharp_{\alpha\beta}$, $X^\sharp_{\alpha\beta\gamma}$), $p_1^{\alpha\beta} \colon \mathfrak{X}^\sharp_{\alpha\beta} \to \mathfrak{X}^\sharp_\alpha$ (resp. $p_2^{\alpha\beta} \colon \mathfrak{X}^\sharp_{\alpha\beta} \to \mathfrak{X}^\sharp_\beta$) some flat lifting of $X^\sharp_{\alpha\beta} \to X^\sharp_\alpha$ (resp. $X^\sharp_{\alpha\beta} \to X^\sharp_\beta$).

Similarly, for any $(\alpha, \beta, \gamma) \in \Lambda^3$, fix some lifting $p_{12}^{\alpha\beta\gamma} \colon \mathfrak{X}^\sharp_{\alpha\beta\gamma} \to \mathfrak{X}^\sharp_{\alpha\beta}$, $p_{23}^{\alpha\beta\gamma} \colon \mathfrak{X}^\sharp_{\alpha\beta\gamma} \to \mathfrak{X}^\sharp_{\beta\gamma}$, $p_{13}^{\alpha\beta\gamma} \colon \mathfrak{X}^\sharp_{\alpha\beta\gamma} \to \mathfrak{X}^\sharp_{\alpha\gamma}$, $p_1^{\alpha\beta\gamma} \colon \mathfrak{X}^\sharp_{\alpha\beta\gamma} \to \mathfrak{X}^\sharp_\alpha$, $p_2^{\alpha\beta\gamma} \colon \mathfrak{X}^\sharp_{\alpha\beta\gamma} \to \mathfrak{X}^\sharp_\beta$, $p_3^{\alpha\beta\gamma} \colon \mathfrak{X}^\sharp_{\alpha\beta\gamma} \to \mathfrak{X}^\sharp_\gamma$, $u_\alpha \colon \mathfrak{X}^\sharp_\alpha \hookrightarrow \mathfrak{P}^\sharp_\alpha$, $u_{\alpha\beta} \colon \mathfrak{X}^\sharp_{\alpha\beta} \hookrightarrow \mathfrak{P}^\sharp_{\alpha\beta}$ and $u_{\alpha\beta\gamma} \colon \mathfrak{X}^\sharp_{\alpha\beta\gamma} \hookrightarrow \mathfrak{P}^\sharp_{\alpha\beta\gamma}$.

Definition 9.3.7.1. For any $\alpha \in \Lambda$, let $\mathcal{E}_\alpha$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_\alpha/\mathfrak{S}^\sharp}({}^\dagger Z_\alpha)_{\mathbb{Q}}$-module. A *glueing data* on $(\mathcal{E}_\alpha)_{\alpha\in\Lambda}$ is the data for any $\alpha, \beta \in \Lambda$ of a $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_{\alpha\beta}/\mathfrak{S}^\sharp}({}^\dagger Z_{\alpha\beta})_{\mathbb{Q}}$-linear isomorphism

$$\theta_{\alpha\beta} \colon p_2^{\alpha\beta!}(\mathcal{E}_\beta) \xrightarrow{\sim} p_1^{\alpha\beta!}(\mathcal{E}_\alpha),$$

satisfying the cocycle condition: $\theta_{13}^{\alpha\beta\gamma} = \theta_{12}^{\alpha\beta\gamma} \circ \theta_{23}^{\alpha\beta\gamma}$, where $\theta_{12}^{\alpha\beta\gamma}$, $\theta_{23}^{\alpha\beta\gamma}$ and $\theta_{13}^{\alpha\beta\gamma}$ are the isomorphisms making commutative the following diagram

$$\begin{array}{ccccccccc}
p_{12}^{\alpha\beta\gamma!} p_2^{\alpha\beta!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\tau} & p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta) & p_{23}^{\alpha\beta\gamma!} p_2^{\beta\gamma!}(\mathcal{E}_\gamma) & \xrightarrow[\sim]{\tau} & p_3^{\alpha\beta\gamma!}(\mathcal{E}_\gamma) & p_{13}^{\alpha\beta\gamma!} p_2^{\alpha\gamma!}(\mathcal{E}_\gamma) & \xrightarrow[\sim]{\tau} & p_3^{\alpha\beta\gamma!}(\mathcal{E}_\gamma) \\
\sim\downarrow{\scriptstyle p_{12}^{\alpha\beta\gamma!}(\theta_{\alpha\beta})} & & \downarrow{\scriptstyle \theta_{12}^{\alpha\beta\gamma}} & \sim\downarrow{\scriptstyle p_{23}^{\alpha\beta\gamma!}(\theta_{\beta\gamma})} & & \downarrow{\scriptstyle \theta_{23}^{\alpha\beta\gamma}} & \sim\downarrow{\scriptstyle p_{13}^{\alpha\beta\gamma!}(\theta_{\alpha\gamma})} & & \downarrow{\scriptstyle \theta_{13}^{\alpha\beta\gamma}} \\
p_{12}^{\alpha\beta\gamma!} p_1^{\alpha\beta!}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\tau} & p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha), & p_{23}^{\alpha\beta\gamma!} p_1^{\beta\gamma!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\tau} & p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta), & p_{13}^{\alpha\beta\gamma!} p_1^{\alpha\gamma!}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\tau} & p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha),
\end{array} \tag{9.3.7.1.1}$$

where τ are the glueing isomorphisms defined in 9.2.2.3.1.

Definition 9.3.7.2. We define the category $\mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp)$ as follows:

(a) an object is a family $(\mathcal{E}_\alpha)_{\alpha\in\Lambda}$ of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_\alpha/\mathfrak{S}^\sharp}({}^\dagger Z_\alpha)_{\mathbb{Q}}$-modules together with a glueing data $(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}$,

(b) a morphism $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \to ((\mathcal{E}'_\alpha)_{\alpha\in\Lambda}, (\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ is a family of morphisms $f_\alpha \colon \mathcal{E}_\alpha \to \mathcal{E}'_\alpha$ of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_\alpha/\mathfrak{S}^\sharp}({}^\dagger Z_\alpha)_{\mathbb{Q}}$-modules commuting with glueing data, i.e., such that the following diagrams are commutative:

$$\begin{array}{ccc}
p_2^{\alpha\beta!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\theta_{\alpha\beta}} & p_1^{\alpha\beta!}(\mathcal{E}_\alpha) \\
{\scriptstyle p_2^{\alpha\beta!}(f_\beta)}\downarrow & & \downarrow{\scriptstyle p_1^{\alpha\beta!}(f_\alpha)} \\
p_2^{\alpha\beta!}(\mathcal{E}'_\beta) & \xrightarrow[\sim]{\theta'_{\alpha\beta}} & p_1^{\alpha\beta!}(\mathcal{E}'_\alpha).
\end{array} \tag{9.3.7.2.1}$$

Remark 9.3.7.3. For all $\alpha, \beta \in \Lambda$, let $f_\alpha\colon \mathcal{E}_\alpha \to \mathcal{E}'_\alpha$ a morphism of $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_\alpha}({}^\dagger Z_\alpha)_\mathbb{Q}$-coherent modules, $\theta_{\alpha\beta}\colon p_2^{\alpha\beta !}(\mathcal{E}_\beta) \xrightarrow{\sim} p_1^{\alpha\beta !}(\mathcal{E}_\alpha)$ and $\theta'_{\alpha\beta}\colon p_2^{\alpha\beta !}(\mathcal{E}'_\beta) \xrightarrow{\sim} p_1^{\alpha\beta !}(\mathcal{E}'_\alpha)$ isomorphisms $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_{\alpha\beta}}({}^\dagger Z_{\alpha\beta})_\mathbb{Q}$-linear. It is further assumed that the morphisms f_α and the isomorphisms $\theta_{\alpha\beta}$ and $\theta'_{\alpha\beta}$ induce the commutative diagram 9.3.7.2.1.

Then, the isomorphisms $\theta_{\alpha\beta}$ satisfy the cocycle condition if and only if the same is true of the isomorphisms $\theta'_{\alpha\beta}$. Indeed, by transforming, via 9.3.7.2.1, the squares 9.3.7.1.1 in three commutative cubes, we get the following commutative squares for any $1 \le i < j \le 3$:

$$\begin{array}{ccc} p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta) & \xrightarrow{p_2^{\alpha\beta\gamma!}(f_\beta)} & p_2^{\alpha\beta\gamma!}(\mathcal{E}'_\beta) \\ \sim\downarrow\theta_{12}^{\alpha\beta\gamma} & & \sim\downarrow\theta_{12}'^{\alpha\beta\gamma} \\ p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha) & \xrightarrow{p_1^{\alpha\beta\gamma!}(f_\alpha)} & p_1^{\alpha\beta\gamma!}(\mathcal{E}'_\alpha), \end{array} \quad \begin{array}{ccc} p_3^{\alpha\beta\gamma!}(\mathcal{E}_\gamma) & \xrightarrow{p_3^{\alpha\beta\gamma!}(f_\gamma)} & p_3^{\alpha\beta\gamma!}(\mathcal{E}'_\gamma) \\ \sim\downarrow\theta_{23}^{\alpha\beta\gamma} & & \sim\downarrow\theta_{23}'^{\alpha\beta\gamma} \\ p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta) & \xrightarrow{p_2^{\alpha\beta\gamma!}(f_\beta)} & p_2^{\alpha\beta\gamma!}(\mathcal{E}'_\beta), \end{array} \quad \begin{array}{ccc} p_3^{\alpha\beta\gamma!}(\mathcal{E}_\gamma) & \xrightarrow{p_3^{\alpha\beta\gamma!}(f_\gamma)} & p_3^{\alpha\beta\gamma!}(\mathcal{E}'_\gamma) \\ \sim\downarrow\theta_{13}^{\alpha\beta\gamma} & & \sim\downarrow\theta_{13}'^{\alpha\beta\gamma} \\ p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha) & \xrightarrow{p_1^{\alpha\beta\gamma!}(f_\alpha)} & p_1^{\alpha\beta\gamma!}(\mathcal{E}'_\alpha). \end{array}$$

Definition 9.3.7.4. We denote by $\mathrm{Coh}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$ the category of coherent $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_\mathbb{Q}$-modules with support in X. When T is the empty divisor, we simply write $\mathrm{Coh}(X, \mathfrak{X}^\sharp/\mathfrak{S}^\sharp)$.

Lemma 9.3.7.5 (Construction of $u_0^!$)**.** *There exists a canonical functor*

$$u_0^!\colon \mathrm{Coh}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp) \to \mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp)$$

extending the usual functor $u_0^!$ when $X^\sharp$ has a log smooth formal $\mathfrak{S}^\sharp$-scheme lifting.

Proof. Let $\mathcal{E} \in \mathrm{Coh}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$. Thanks to Berthelot-Kashiwara's theorem (see 9.3.5.9), we get a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_\alpha/\mathfrak{S}^\sharp}({}^\dagger Z_\alpha)_\mathbb{Q}$-module by setting $\mathcal{E}_\alpha := H^0 u_\alpha^!(\mathcal{E}|\mathfrak{X}^\sharp_\alpha) \xrightarrow{\sim} u_\alpha^!(\mathcal{E}|\mathfrak{X}^\sharp_\alpha)$. Via the isomorphisms of the form τ (9.2.2.3.1), we obtain the glueing $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_{\alpha\beta}/\mathfrak{S}^\sharp}({}^\dagger Z_{\alpha\beta})_\mathbb{Q}$-linear isomorphism $\theta_{\alpha\beta}\colon p_2^{\alpha\beta!}(\mathcal{E}_\beta) \xrightarrow{\sim} p_1^{\alpha\beta!}(\mathcal{E}_\alpha)$, as the single arrow making the following diagram commutative

$$\begin{array}{ccc} p_2^{\alpha\beta!}u_\beta^!(\mathcal{E}|_{\mathfrak{P}^\sharp_\beta}) & \xrightarrow[\sim]{\tau} & u_{\alpha\beta}^!((\mathcal{E}|_{\mathfrak{P}^\sharp_\beta})|_{\mathfrak{P}^\sharp_{\alpha\beta}}) \\ \downarrow\theta_{\alpha\beta} & & \| \\ p_1^{\alpha\beta!}u_\alpha^!(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}) & \xrightarrow[\sim]{\tau} & u_{\alpha\beta}^!((\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha})|_{\mathfrak{P}^\sharp_{\alpha\beta}}). \end{array} \tag{9.3.7.5.1}$$

Via the isomorphism τ: $p_{12}^{\alpha\beta\gamma!}u_{\alpha\beta}^!((\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha})|_{\mathfrak{P}^\sharp_{\alpha\beta}}) \xrightarrow{\sim} u_{\alpha\beta\gamma}^!((\mathcal{E}|_{\mathfrak{P}^\sharp_\beta})|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}})$, by applying the functor $p_{12}^{\alpha\beta\gamma!}$ squared 9.3.7.5.1 and with 9.3.7.1.1, we get the commutative diagram:

$$\begin{array}{ccc} p_2^{\alpha\beta\gamma!}(u_\beta^!(\mathcal{E}|_{\mathfrak{P}^\sharp_\beta})) & \xrightarrow[\sim]{\tau} & u_{\alpha\beta\gamma}^!((\mathcal{E}|_{\mathfrak{P}^\sharp_\beta})|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}) \\ \sim\downarrow\theta_{12}^{\alpha\beta\gamma} & & \| \\ p_1^{\alpha\beta\gamma!}(u_\alpha^!(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha})) & \xrightarrow[\sim]{\tau} & u_{\alpha\beta\gamma}^!((\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha})|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}), \end{array}$$

where the horizontal isomorphisms are of the form τ, thanks to the transitivity formula and its commutation with extraordinary inverse images of isomorphisms of the form τ (9.2.2.3.1). Similarly, we construct the two other analogous diagrams. With these three diagrams, we verify that $u_0^!(\mathcal{E}) := ((u_\alpha^!(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ satisfies the cocycle condition $\theta_{13}^{\alpha\beta\gamma} = \theta_{12}^{\alpha\beta\gamma} \circ \theta_{23}^{\alpha\beta\gamma}$ and is thus an object of $\mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp)$.

Also, if $f\colon \mathcal{E} \to \mathcal{E}'$ is a morphism of $\mathrm{Coh}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$, then, by functoriality in $\mathcal{E}$ of 9.3.7.5.1 (we transform the square 9.3.7.5.1 into a cube), the family $(u_\alpha^!(f|_{\mathfrak{P}^\sharp_\alpha}))_{\alpha\in\Lambda}$ commutes with the glueing data. □

Lemma 9.3.7.6. *There exists a canonical functor*

$$u_{0+}\colon \mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp) \to \mathrm{Coh}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$$

extending the usual functor u_{0+} when $X^\sharp$ has a log smooth formal $\mathfrak{S}^\sharp$-scheme lifting.

Proof. Let $(\mathcal{E}_\alpha)_{\alpha\in\Lambda}$ be a family of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp_\alpha/\mathfrak{S}^\sharp}({}^\dagger Z_\alpha)_{\mathbb{Q}}$-modules together with a gluing data $(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}$. Let's prove that $(u_{\alpha+}(\mathcal{E}_\alpha))_{\alpha\in\Lambda}$ glues via $(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}$ to a coherent $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module with support in X. Let $\phi_1^{\alpha\beta}$ (resp. $\phi_2^{\alpha\beta}$) be the adjunction morphism (see the definition 9.3.6.1) of the left (resp. the right) square of

$$\begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta} & \longrightarrow & \mathfrak{P}^\sharp_\alpha \\ {\scriptstyle u_{\alpha\beta}}\uparrow & & \uparrow{\scriptstyle u_\alpha} \\ \mathfrak{X}^\sharp_{\alpha\beta} & \xrightarrow{p_1^{\alpha\beta}} & \mathfrak{X}^\sharp_\alpha, \end{array} \qquad \begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta} & \longrightarrow & \mathfrak{P}^\sharp_\beta \\ {\scriptstyle u_{\alpha\beta}}\uparrow & & \uparrow{\scriptstyle u_\beta} \\ \mathfrak{X}^\sharp_{\alpha\beta} & \xrightarrow{p_2^{\alpha\beta}} & \mathfrak{X}^\sharp_\beta. \end{array} \tag{9.3.7.6.1}$$

For every $\alpha,\beta\in\Lambda$ we define the isomorphism $\tau_{\alpha\beta}\colon (u_{\beta+}(\mathcal{E}_\beta))|_{\mathfrak{X}^\sharp_{\alpha\beta}} \xrightarrow{\sim} (u_{\alpha+}(\mathcal{E}_\alpha))|_{\mathfrak{X}^\sharp_{\alpha\beta}}$ to be the one making commutative the following diagram:

$$\begin{array}{ccc} u_{\alpha\beta+}\circ p_1^{\alpha\beta!}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\phi_1^{\alpha\beta}(\mathcal{E}_\alpha)} & (u_{\alpha+}(\mathcal{E}_\alpha))|_{\mathfrak{X}^\sharp_{\alpha\beta}} \\ {\scriptstyle u_{\alpha\beta+}(\theta_{\alpha\beta})}\uparrow\wr & & \uparrow{\scriptstyle \tau_{\alpha\beta}} \\ u_{\alpha\beta+}\circ p_2^{\alpha\beta!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\phi_2^{\alpha\beta}(\mathcal{E}_\beta)} & (u_{\beta+}(\mathcal{E}_\beta))|_{\mathfrak{X}^\sharp_{\alpha\beta}}. \end{array} \tag{9.3.7.6.2}$$

It now remains to establish that the isomorphisms $\tau_{\alpha\beta}$ satisfy the condition of reattachment. To this end, note $\phi_{12}^{\alpha\beta\gamma}$ (resp. $\phi_{23}^{\alpha\beta\gamma}$ and $\phi_{13}^{\alpha\beta\gamma}$) the adjunction morphism (always 9.3.6.1) of the next left (resp. center and right) square

$$\begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta\gamma} & \longrightarrow & \mathfrak{P}^\sharp_{\alpha\beta} \\ {\scriptstyle u_{\alpha\beta\gamma}}\uparrow & & \uparrow{\scriptstyle u_{\alpha\beta}} \\ \mathfrak{X}^\sharp_{\alpha\beta\gamma} & \xrightarrow{p_{12}^{\alpha\beta\gamma}} & \mathfrak{X}^\sharp_{\alpha\beta}, \end{array} \quad \begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta\gamma} & \longrightarrow & \mathfrak{P}^\sharp_{\beta\gamma} \\ {\scriptstyle u_{\alpha\beta\gamma}}\uparrow & & \uparrow{\scriptstyle u_{\beta\gamma}} \\ \mathfrak{X}^\sharp_{\alpha\beta\gamma} & \xrightarrow{p_{23}^{\alpha\beta\gamma}} & \mathfrak{X}^\sharp_{\beta\gamma}, \end{array} \quad \begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta\gamma} & \longrightarrow & \mathfrak{P}^\sharp_{\alpha\gamma} \\ {\scriptstyle u_{\alpha\beta\gamma}}\uparrow & & \uparrow{\scriptstyle u_{\alpha\gamma}} \\ \mathfrak{X}^\sharp_{\alpha\beta\gamma} & \xrightarrow{p_{13}^{\alpha\beta\gamma}} & \mathfrak{X}^\sharp_{\alpha\gamma}, \end{array} \tag{9.3.7.6.3}$$

and $\phi_1^{\alpha\beta\gamma}$ (resp. $\phi_2^{\alpha\beta\gamma}$ and $\phi_3^{\alpha\beta\gamma}$) that of the diagram from the left (resp. from the center and from the right):

$$\begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta\gamma} & \longrightarrow & \mathfrak{P}^\sharp_{\alpha} \\ {\scriptstyle u_{\alpha\beta\gamma}}\uparrow & & \uparrow{\scriptstyle u_{\alpha}} \\ \mathfrak{X}^\sharp_{\alpha\beta\gamma} & \xrightarrow{p_{1}^{\alpha\beta\gamma}} & \mathfrak{X}^\sharp_{\alpha}, \end{array} \quad \begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta\gamma} & \longrightarrow & \mathfrak{P}^\sharp_{\beta} \\ {\scriptstyle u_{\alpha\beta\gamma}}\uparrow & & \uparrow{\scriptstyle u_{\beta}} \\ \mathfrak{X}^\sharp_{\alpha\beta\gamma} & \xrightarrow{p_{2}^{\alpha\beta\gamma}} & \mathfrak{X}^\sharp_{\beta}, \end{array} \quad \begin{array}{ccc} \mathfrak{P}^\sharp_{\alpha\beta\gamma} & \longrightarrow & \mathfrak{P}^\sharp_{\gamma} \\ {\scriptstyle u_{\alpha\beta\gamma}}\uparrow & & \uparrow{\scriptstyle u_{\gamma}} \\ \mathfrak{X}^\sharp_{\alpha\beta\gamma} & \xrightarrow{p_{3}^{\alpha\beta\gamma}} & \mathfrak{X}^\sharp_{\gamma}. \end{array} \tag{9.3.7.6.4}$$

Consider the following commutative diagram

$$\begin{array}{ccccc} u_{\alpha\beta\gamma+}p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{u_{\alpha\beta\gamma+}(\tau)} & u_{\alpha\beta\gamma+}\circ p_{12}^{\alpha\beta\gamma!}(p_1^{\alpha\beta!}(\mathcal{E}_\alpha)) & \xrightarrow[\sim]{\phi_{12}^{\alpha\beta\gamma}(p_1^{\alpha\beta!}(\mathcal{E}_\alpha))} & u_{\alpha\beta+}(p_1^{\alpha\beta!}(\mathcal{E}_\alpha))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}} \\ {\scriptstyle u_{\alpha\beta\gamma+}(\theta_{12}^{\alpha\beta\gamma})}\uparrow\wr & & {\scriptstyle u_{\alpha\beta\gamma+}\circ p_{12}^{\alpha\beta\gamma!}(\theta_{\alpha\beta})}\uparrow\wr & & \wr\uparrow{\scriptstyle u_{\alpha\beta+}(\theta_{\alpha\beta})|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}} \\ u_{\alpha\beta\gamma+}p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{u_{\alpha\beta\gamma+}(\tau)} & u_{\alpha\beta\gamma+}\circ p_{12}^{\alpha\beta\gamma!}(p_2^{\alpha\beta!}(\mathcal{E}_\beta)) & \xrightarrow[\sim]{\phi_{12}^{\alpha\beta\gamma}(p_2^{\alpha\beta!}(\mathcal{E}_\beta))} & u_{\alpha\beta+}(p_2^{\alpha\beta!}(\mathcal{E}_\beta))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}. \end{array} \tag{9.3.7.6.5}$$

Thanks to 9.3.6.1.a) and 9.3.6.1.b), we then obtain

$$(\phi_1^{\alpha\beta}(\mathcal{E}_\alpha)|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}})\circ\phi_{12}^{\alpha\beta\gamma}(p_1^{\alpha\beta!}(\mathcal{E}_\alpha))\circ u_{\alpha\beta\gamma+}(\tau) = \phi_1^{\alpha\beta\gamma}(\mathcal{E}_\alpha), \tag{9.3.7.6.6}$$

$$(\phi_2^{\alpha\beta}(\mathcal{E}_\beta)|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}})\circ\phi_{12}^{\alpha\beta\gamma}(p_2^{\alpha\beta!}(\mathcal{E}_\beta))\circ u_{\alpha\beta\gamma+}(\tau) = \phi_2^{\alpha\beta\gamma}(\mathcal{E}_\beta), \tag{9.3.7.6.7}$$

$$(\phi_1^{\beta\gamma}(\mathcal{E}_\beta)|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}})\circ\phi_{23}^{\alpha\beta\gamma}(p_1^{\beta\gamma!}(\mathcal{E}_\beta))\circ u_{\alpha\beta\gamma+}(\tau) = \phi_2^{\alpha\beta\gamma}(\mathcal{E}_\beta), \tag{9.3.7.6.8}$$

$$(\phi_2^{\beta\gamma}(\mathcal{E}_\gamma)|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}})\circ\phi_{23}^{\alpha\beta\gamma}(p_2^{\beta\gamma!}(\mathcal{E}_\gamma))\circ u_{\alpha\beta\gamma+}(\tau) = \phi_3^{\alpha\beta\gamma}(\mathcal{E}_\gamma), \tag{9.3.7.6.9}$$

$$(\phi_1^{\alpha\gamma}(\mathcal{E}_\alpha)|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}})\circ\phi_{13}^{\alpha\beta\gamma}(p_1^{\alpha\gamma!}(\mathcal{E}_\alpha))\circ u_{\alpha\beta\gamma+}(\tau) = \phi_1^{\alpha\beta\gamma}(\mathcal{E}_\alpha), \tag{9.3.7.6.10}$$

$$(\phi_2^{\alpha\gamma}(\mathcal{E}_\gamma)|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}})\circ\phi_{13}^{\alpha\beta\gamma}(p_2^{\alpha\gamma!}(\mathcal{E}_\gamma))\circ u_{\alpha\beta\gamma+}(\tau) = \phi_3^{\alpha\beta\gamma}(\mathcal{E}_\gamma). \tag{9.3.7.6.11}$$

By composing 9.3.7.6.2 restricted to $\mathfrak{P}^\sharp_{\alpha\beta\gamma}$ and 9.3.7.6.5, via equalities 9.3.7.6.6 and 9.3.7.6.7, we get the commutative square:

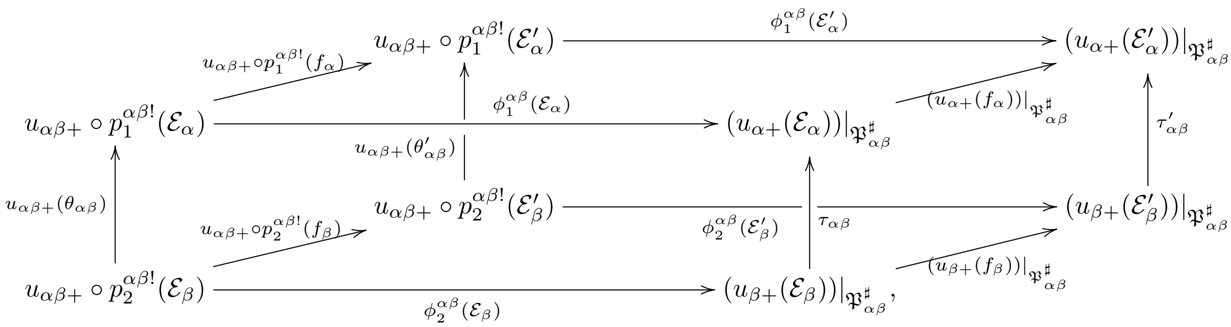
$$\begin{array}{ccc} u_{\alpha\beta\gamma+} p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\phi_1^{\alpha\beta\gamma}(\mathcal{E}_\alpha)} & (u_{\alpha+}(\mathcal{E}_\alpha))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}} \\ {\scriptstyle u_{\alpha\beta\gamma+}(\theta_{12}^{\alpha\beta\gamma})}\uparrow\wr & & \wr\uparrow{\scriptstyle \tau_{\alpha\beta}|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}} \\ u_{\alpha\beta\gamma+} p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\phi_2^{\alpha\beta\gamma}(\mathcal{E}_\beta)} & (u_{\beta+}(\mathcal{E}_\beta))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}. \end{array} \tag{9.3.7.6.12}$$

Analogously, using 9.3.7.6.8 and 9.3.7.6.9 (resp. 9.3.7.6.10 and 9.3.7.6.11) we obtain the following commutative diagrams:

$$\begin{array}{ccc} u_{\alpha\beta\gamma+}\circ p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\phi_2^{\alpha\beta\gamma}(\mathcal{E}_\beta)} & (u_{\beta+}(\mathcal{E}_\beta))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}} \\ {\scriptstyle u_{\alpha\beta\gamma+}(\theta_{23}^{\alpha\beta\gamma})}\uparrow\wr & & \wr\uparrow{\scriptstyle \tau_{\beta\gamma}|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}} \\ u_{\alpha\beta\gamma+}\circ p_3^{\alpha\beta\gamma!}(\mathcal{E}_\gamma) & \xrightarrow[\sim]{\phi_3^{\alpha\beta\gamma}(\mathcal{E}_\gamma)} & (u_{\gamma+}(\mathcal{E}_\gamma))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}, \end{array} \qquad \begin{array}{ccc} u_{\alpha\beta\gamma+}\circ p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\phi_1^{\alpha\beta\gamma}(\mathcal{E}_\alpha)} & (u_{\alpha+}(\mathcal{E}_\alpha))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}} \\ {\scriptstyle u_{\alpha\beta\gamma+}(\theta_{13}^{\alpha\beta\gamma})}\uparrow\wr & & \wr\uparrow{\scriptstyle \tau_{\alpha\gamma}|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}} \\ u_{\alpha\beta\gamma+}\circ p_3^{\alpha\beta\gamma!}(\mathcal{E}_\gamma) & \xrightarrow[\sim]{\phi_3^{-}\alpha\beta\gamma(\mathcal{E}_\gamma)} & (u_{\gamma+}(\mathcal{E}_\gamma))|_{\mathfrak{P}^\sharp_{\alpha\beta\gamma}}. \end{array} \tag{9.3.7.6.13}$$

Of these last three diagrams, since the functor $u_{\alpha\beta\gamma+}$ is (fully) faithful (for coherent modules), it follows that the isomorphisms $\theta_{\alpha\beta}$ verify the condition of cocycle if and only if the isomorphisms $\tau_{\alpha\beta}$ stick together.

Let $f=(f_\alpha)_{\alpha\in\Lambda}\colon ((\mathcal{E}_\alpha)_{\alpha\in\Lambda},(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})\to((\mathcal{E}'_\alpha)_{\alpha\in\Lambda},(\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda})$, be a morphism of $\mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda},Z/\mathfrak{S}^\sharp)$. We associate the family $u_{0+}(f)\colon (u_{\alpha+}(f_\alpha))_{\alpha\in\Lambda}$. By noting $\tau_{\alpha\beta}$ (resp. $\tau'_{\alpha\beta}$) the isomorphism making 9.3.7.6.2 commutative for $\theta_{\alpha\beta}$ (resp. $\theta'_{\alpha\beta}$), we get the cube



(9.3.7.6.14)

whose front, back, bottom and top squares are commutative by functoriality or thanks to 9.3.7.6.2. As the one on the left is (via 9.3.7.2.1), it follows that it is the same for the square on the right. The morphisms $u_{\alpha+}(f_\alpha)$ therefore stick together.

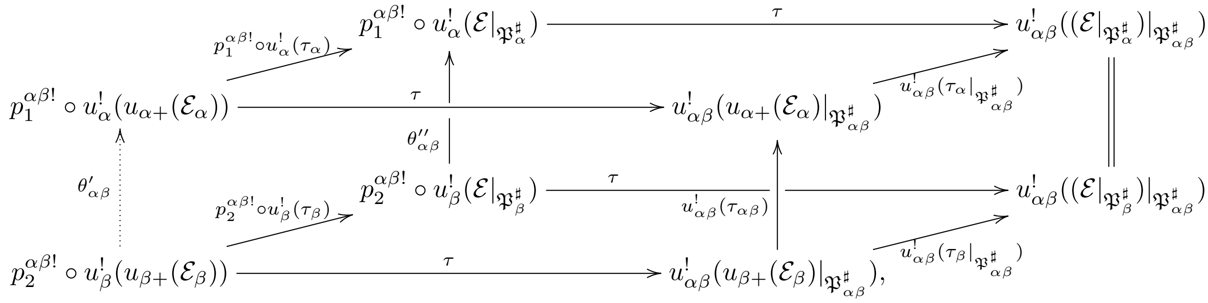
□

Theorem 9.3.7.7. *The functors $u_0^!$ and u_{0+} constructed in respectively 9.3.7.5 and 9.3.7.6 are quasi-inverse equivalences of categories between* $\mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda},Z/\mathfrak{S}^\sharp)$ *and* $\mathrm{Coh}(X^\sharp,\mathfrak{P}^\sharp,T/\mathfrak{S}^\sharp)$.

Proof. Let $((\mathcal{E}_\alpha)_{\alpha\in\Lambda},(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ an object of $\mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda},Z/\mathfrak{S}^\sharp)$. At first, it is a question of establishing a functorial isomorphism $u_0^!\circ u_{0+}((\mathcal{E}_\alpha)_{\alpha\in\Lambda},(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})\xrightarrow{\sim}((\mathcal{E}_\alpha)_{\alpha\in\Lambda},(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$.

Note $\mathcal{E}:=u_{0+}((\mathcal{E}_\alpha)_{\alpha\in\Lambda},(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$, $u_0^!(\mathcal{E})=((u_\alpha^!(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))_{\alpha\in\Lambda},(\theta''_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ and $\tau_\alpha\colon u_{\alpha+}(\mathcal{E}_\alpha)\xrightarrow{\sim}\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}$ the canonical isomorphisms satisfying $\tau_{\alpha\beta}=\tau_\alpha^{-1}|_{\mathfrak{P}^\sharp_{\alpha\beta}}\circ\tau_\beta|_{\mathfrak{P}^\sharp_{\alpha\beta}}$, where $\tau_{\alpha\beta}$ was defined via 9.3.7.6.2.

Consider the following diagram



(9.3.7.7.1)

where the arrow $\theta'_{\alpha\beta}$ is by definition the one making the front square commutative. The bottom and right squares are commutative by definition and the top and bottom are commutative by functoriality. Thanks to the remark 9.3.7.3, we deduce that the isomorphisms $\theta'_{\alpha\beta}$ satisfy the cocycle condition and we are reduced to proving that the adjunction isomorphism $\mathcal{E}_\alpha \xrightarrow{\sim} u^!_\alpha \circ u_{\alpha+}(\mathcal{E}_\alpha)$ is compatible with the respective glueing data, i.e., that the following left square

$$\begin{array}{ccccc}
p_1^{\alpha\beta!}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\mathrm{adj}_{u_\alpha}} & p_1^{\alpha\beta!}\circ u^!_\alpha \circ u_{\alpha+}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\tau} & u^!_{\alpha\beta}(u_{\alpha+}(\mathcal{E}_\alpha)|_{\mathfrak{P}^\sharp_{\alpha\beta}}) \\
{\scriptstyle \theta_{\alpha\beta}}\uparrow{\scriptstyle \sim} & & {\scriptstyle \theta'_{\alpha\beta}}\uparrow{\scriptstyle \sim} & & {\scriptstyle u^!_{\alpha\beta}(\tau_{\alpha\beta})}\uparrow{\scriptstyle \sim} \\
p_2^{\alpha\beta!}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\mathrm{adj}_{u_\beta}} & p_2^{\alpha\beta!}\circ u^!_\beta \circ u_{\beta+}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\tau} & u^!_{\alpha\beta}(u_{\beta+}(\mathcal{E}_\beta)|_{\mathfrak{P}^\sharp_{\alpha\beta}})
\end{array} \qquad (9.3.7.7.2)$$

is commutative. However, by applying the functor $u_{\alpha\beta+}$ to the diagram 9.3.7.7.2 and composing with the commutative diagram

$$\begin{array}{ccc}
u_{\alpha\beta+}u^!_{\alpha\beta}(u_{\alpha+}(\mathcal{E}_\alpha)|_{\mathfrak{P}^\sharp_{\alpha\beta}}) & \xrightarrow[\sim]{\mathrm{adj}_{u_{\alpha\beta}}} & u_{\alpha+}(\mathcal{E}_\alpha)|_{\mathfrak{P}^\sharp_{\alpha\beta}} \\
{\scriptstyle u_{\alpha\beta+}u^!_{\alpha\beta}(\tau_{\alpha\beta})}\uparrow{\scriptstyle \sim} & & {\scriptstyle \tau_{\alpha\beta}}\uparrow{\scriptstyle \sim} \\
u_{\alpha\beta+}u^!_{\alpha\beta}(u_{\beta+}(\mathcal{E}_\beta)|_{\mathfrak{P}^\sharp_{\alpha\beta}}) & \xrightarrow[\sim]{\mathrm{adj}_{u_{\alpha\beta}}} & u_{\beta+}(\mathcal{E}_\beta)|_{\mathfrak{P}^\sharp_{\alpha\beta}},
\end{array}$$

we obtain 9.3.7.6.2 (by construction of the addition arrow of the proposition 9.3.6.1), which is commutative. The functor $u_{\alpha\beta+}$ being faithful, we thus demonstrate the commutativity of the contour of 9.3.7.7.2. Since the right square of 9.3.7.7.2 is commutative (it corresponds to the front square from 9.3.7.7.1), it follows that of the left square.

Conversely, let $\mathcal{E}$ be a $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp}({}^\dagger T)_\mathbb{Q}$-coherent module with support in X. Let us check that we have the isomorphism $u_{0+}\circ u^!_0(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}$ functorial in $\mathcal{E}$. Note $(\theta_{\alpha\beta})_{\alpha\beta\in\Lambda}$, the gluing data of $(u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))_{\alpha\in\Lambda}$ defined in 9.3.7.5.1 and $(\tau_{\alpha\beta})_{\alpha\beta\in\Lambda}$, the glueing data of $(u_{\alpha+}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))_{\alpha\in\Lambda}$ deduced from that of $(u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))_{\alpha\in\Lambda}$ via 9.3.7.6.2. Let us now prove that the adjunction isomorphisms $u_{\alpha+}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}) \to \mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}$ are compatible with the respective glueing data, i.e., than the following square on the right (the commutativity of the other two is tautological)

$$\begin{array}{ccccccc}
u_{\alpha\beta+}\circ u^!_{\alpha\beta}(\mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}}) & \xrightarrow[\sim]{u_{\alpha\beta+}(\tau)} & u_{\alpha\beta+}\circ p_1^{\alpha\beta!}(u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha})) & \xrightarrow[\sim]{\phi_1^{\alpha\beta}(u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))} & (u_{\alpha+}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))|_{\mathfrak{P}^\sharp_{\alpha\beta}} & \xrightarrow[\sim]{\mathrm{adj}_{u_\alpha}|_{\mathfrak{P}^\sharp_{\alpha\beta}}} & \mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}} \\
\| & & {\scriptstyle u_{\alpha\beta+}\theta_{\alpha\beta}}\uparrow{\scriptstyle \sim} & & {\scriptstyle \tau_{\alpha\beta}}\uparrow{\scriptstyle \sim} & & \| \\
u_{\alpha\beta+}\circ u^!_{\alpha\beta}(\mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}}) & \xrightarrow[\sim]{u_{\alpha\beta+}(\tau)} & u_{\alpha\beta+}\circ p_2^{\alpha\beta!}(u^!_\beta(\mathcal{E}|_{\mathfrak{P}^\sharp_\beta})) & \xrightarrow[\sim]{\phi_2^{\alpha\beta}(u^!_\beta(\mathcal{E}|_{\mathfrak{P}^\sharp_\beta}))} & (u_{\beta+}u^!_\beta(\mathcal{E}|_{\mathfrak{P}^\sharp_\beta}))|_{\mathfrak{P}^\sharp_{\alpha\beta}} & \xrightarrow[\sim]{\mathrm{adj}_{u_\beta}|_{\mathfrak{P}^\sharp_{\alpha\beta}}} & \mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}}
\end{array}$$

(9.3.7.7.3)

is commutative. Moreover, we have the following commutative diagram:

$$\begin{array}{ccccccc}
u_{\alpha\beta+}p_1^{\alpha\beta!}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}) & \xrightarrow[\sim]{\mathrm{adj}_{u_\alpha}} & u_{\alpha\beta+}p_1^{\alpha\beta!}u^!_\alpha u_{\alpha+}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}) & \xrightarrow[\sim]{u_{\alpha\beta+}\tau} & u_{\alpha\beta+}u^!_{\alpha\beta}(u_{\alpha+}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))|_{\mathfrak{P}^\sharp_{\alpha\beta}} & \xrightarrow[\sim]{\mathrm{adj}_{u_{\alpha\beta}}} & u_{\alpha+}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha})|_{\mathfrak{P}^\sharp_{\alpha\beta}} \\
\| & & {\scriptstyle \sim}\downarrow{\scriptstyle \mathrm{adj}_{u_\alpha}} & & {\scriptstyle \sim}\downarrow{\scriptstyle \mathrm{adj}_{u_\alpha}} & & {\scriptstyle \sim}\downarrow{\scriptstyle \mathrm{adj}_{u_\alpha}} \\
u_{\alpha\beta+}p_1^{\alpha\beta!}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}) & = & u_{\alpha\beta+}p_1^{\alpha\beta!}u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}) & \xrightarrow[\sim]{u_{\alpha\beta+}\tau} & u_{\alpha\beta+}u^!_{\alpha\beta}(\mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}}) & \xrightarrow[\sim]{\mathrm{adj}_{u_{\alpha\beta}}} & \mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}}.
\end{array}$$

(9.3.7.7.4)

Indeed, the two squares on the right of 9.3.7.7.4 are commutative by functoriality, while the one on the left is so for the same reasons as that of the second square from the left of the third row of 9.3.6.1.3. However, the morphism $\phi_1^{\alpha\beta}(u^!_\alpha(\mathcal{E}|_{\mathfrak{P}^\sharp_\alpha}))$ is, by construction (see the proof of 9.3.6.1), equal to the horizontal composite morphism from the top of 9.3.7.7.4. Via the commutativity of the diagram 9.3.7.7.4, it follows that the horizontal composite morphism from the top of 9.3.7.7.3 is the adjunct morphism $u_{\alpha\beta+}u^!_{\alpha\beta}(\mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}}) \to \mathcal{E}|_{\mathfrak{P}^\sharp_{\alpha\beta}}$. Similarly, we verify that the bottom horizontal composite morphism of 9.3.7.7.3 is equal to the adjunction morphism by $u_{\alpha\beta}$. □

Definition 9.3.7.8. For any $\alpha \in \Lambda$, let $\mathcal{E}^{(\bullet)}_\alpha \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^1\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_\alpha}(Z_\alpha))$ A *glueing data* on $(\mathcal{E}^{(\bullet)}_\alpha)_{\alpha\in\Lambda}$ is the data for any α, $\beta \in \Lambda$ of an isomorphism in $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^1\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_\alpha}(Z_\alpha))$ of the form

$$\theta_{\alpha\beta} \colon p_2^{\alpha\beta(\bullet)!}(\mathcal{E}^{(\bullet)}_\beta) \xrightarrow{\sim} p_1^{\alpha\beta(\bullet)!}(\mathcal{E}^{(\bullet)}_\alpha),$$

satisfying the cocycle condition: $\theta_{13}^{\alpha\beta\gamma} = \theta_{12}^{\alpha\beta\gamma} \circ \theta_{23}^{\alpha\beta\gamma}$, where $\theta_{12}^{\alpha\beta\gamma}$, $\theta_{23}^{\alpha\beta\gamma}$ and $\theta_{13}^{\alpha\beta\gamma}$ are the isomorphisms making commutative the similar to 9.3.7.1.1 square, e.g.

$$\begin{array}{ccc} p_{12}^{\alpha\beta\gamma(\bullet)!}p_2^{\alpha\beta(\bullet)!}(\mathcal{E}^{(\bullet)}_\beta) & \xrightarrow[\sim]{\tau^{(\bullet)}} & p_2^{\alpha\beta\gamma(\bullet)!}(\mathcal{E}^{(\bullet)}_\beta) \\ \sim\downarrow p_{12}^{\alpha\beta\gamma(\bullet)!}(\theta_{\alpha\beta}) & & \downarrow \theta_{ij}^{\alpha\beta\gamma} \\ p_{12}^{\alpha\beta\gamma(\bullet)!}p_1^{\alpha\beta(\bullet)!}(\mathcal{E}^{(\bullet)}_\alpha) & \xrightarrow[\sim]{\tau^{(\bullet)}} & p_1^{\alpha\beta\gamma(\bullet)!}(\mathcal{E}^{(\bullet)}_\alpha), \end{array} \tag{9.3.7.8.1}$$

where $\tau^{(\bullet)}$ are the glueing isomorphisms defined in 9.2.2.1.

Definition 9.3.7.9. We define the category $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp)$ as follows:

(a) an object is a family $(\mathcal{E}^{(\bullet)}_\alpha)_{\alpha\in\Lambda}$ of objects of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^1\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_\alpha}(Z_\alpha))$ together with a glueing data $(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}$,

(b) a morphism $((\mathcal{E}^{(\bullet)}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \to ((\mathcal{E}'^{(\bullet)}_\alpha)_{\alpha\in\Lambda}, (\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ is a family of morphisms $f^{(\bullet)}_\alpha \colon \mathcal{E}^{(\bullet)}_\alpha \to \mathcal{E}'^{(\bullet)}_\alpha$ of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^1\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp_\alpha}(Z_\alpha))$ commuting with glueing data, i.e., such that the following diagrams are commutative:

$$\begin{array}{ccc} p_2^{\alpha\beta(\bullet)!}(\mathcal{E}^{(\bullet)}_\beta) & \xrightarrow[\sim]{\theta_{\alpha\beta}} & p_1^{\alpha\beta(\bullet)!}(\mathcal{E}^{(\bullet)}_\alpha) \\ p_2^{\alpha\beta(\bullet)!}(f^{(\bullet)}_\beta)\downarrow & & \downarrow p_1^{\alpha\beta(\bullet)!}(f^{(\bullet)}_\alpha) \\ p_2^{\alpha\beta(\bullet)!}(\mathcal{E}'^{(\bullet)}_\beta) & \xrightarrow[\sim]{\theta'_{\alpha\beta}} & p_1^{\alpha\beta(\bullet)!}(\mathcal{E}'^{(\bullet)}_\alpha). \end{array} \tag{9.3.7.9.1}$$

9.3.7.10. With notation 9.3.7.9, via the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q}} \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp) \cong \mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp)$ (see 8.7.5.4.1), we get the (still denoted by $\underrightarrow{l}^*_{\mathbb{Q}}$) equivalence of categories

$$\underrightarrow{l}^*_{\mathbb{Q}} \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp) \cong \mathrm{Coh}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp). \tag{9.3.7.10.1}$$

Definition 9.3.7.11. We denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^1\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}(T))$ consisting of objects with support in X. When T is the empty divisor, we simply write $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{X}^\sharp/\mathfrak{S}^\sharp)$. We have the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q}}$ (see 8.7.5.4.1) induces $\underrightarrow{l}^*_{\mathbb{Q}} \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp) \cong \mathrm{Coh}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$.

Theorem 9.3.7.12. *We have the following properties.*

(a) There exists a canonical functor

$$u_0^{(\bullet)!} \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}^\sharp_\alpha)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp)$$

extending the usual functor $u^!_0$ when $X^\sharp$ has a log smooth formal $\mathfrak{S}^\sharp$-scheme lifting. Via notation 9.3.7.5 and 9.3.7.10.1, we have the canonical isomorphism $\underrightarrow{l}^*_{\mathbb{Q}} \circ u_0^{(\bullet)!} \xrightarrow{\sim} u^!_0 \circ \underrightarrow{l}^*_{\mathbb{Q}}$.

(b) *There exists a canonical functor*

$$u_{0+}^{(\bullet)}\colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}_\alpha^\sharp)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$$

extending the usual functor u_{0+} when $X^\sharp$ has a log smooth formal $\mathfrak{S}^\sharp$-scheme lifting. Via notation 9.3.7.6 and 9.3.7.10.1, we have the canonical isomorphism $\underrightarrow{l}^*_{\mathbb{Q}} \circ u_{0+}^{(\bullet)} \xrightarrow{\sim} u_{0+} \circ \underrightarrow{l}^*_{\mathbb{Q}}$.

(c) *The functors $u_0^{(\bullet)!}$ and $u_{0+}^{(\bullet)}$ are quasi-inverse equivalences of categories between $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}_\alpha^\sharp)_{\alpha\in\Lambda}, Z/\mathfrak{S}^\sharp)$ and $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X^\sharp, \mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$.*

Proof. Since extraordinary pullback by open immersions preserves the categories of the form $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}(T))$, using the LD-version of Berthelot-Kashiwara Theorem (see 9.3.5.13), we can copy word by word the proof of 9.3.7.5, 9.3.7.6 and 9.3.7.7. □

9.4 Stability of the coherence, base change, relative duality, Fourier transform

9.4.1 Log smooth morphisms: Spencer resolutions, stability of the coherence by pullbacks, pushforwards as relative de Rham complexes complexes

We keep notation 9.2.1 and we suppose f is a log-smooth and $\phi = \mathrm{id}$. We suppose T is a noetherian scheme of finite Krull dimension.

Notation 9.4.1.1. For all integers $m \le m'$, we set $\mathcal{D}^{(m,m')}_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}(Z') := \mathcal{B}^{(m')}_{\mathfrak{X}'^\sharp}(Z') \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{D}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}$, $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'^\sharp}(Z') := \mathcal{B}^{(n_m)}_{\mathfrak{X}'^\sharp}(Z')$, $\widetilde{\omega}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}(Z') := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'^\sharp}(Z') \otimes_{\mathcal{O}_{\mathfrak{X}'}} \omega_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}(Z') := \widehat{\mathcal{D}}^{(m,n_m)}_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}(Z')$.

9.4.1.2. It follows from 8.4.2.8 and from 7.5.10.1.3 that the canonical morphism

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z')} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z') \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z', Z)$$

is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'))$. Hence $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z', Z) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'))$. Since the (induced by extension from 7.5.10.2.1) morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'))$

$$\widetilde{\mathrm{Sp}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}(Z', Z) \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z', Z) \tag{9.4.1.2.1}$$

is an isomorphism after applying the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q}}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z')) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z')_{\mathbb{Q}})$ (see 8.7.5.4.1), then 9.4.1.2.1 is an isomorphism (of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'))$).

Notation 9.4.1.3. Let $\mathcal{M}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'))$. The canonical map

$$\mathcal{M}'^{(\bullet)} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z')} \widetilde{\mathrm{Sp}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{X}}(Z', Z) \to \mathcal{M}'^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z')} \widetilde{\mathrm{Sp}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{X}}(Z', Z) \tag{9.4.1.3.1}$$

is an isomorphism and will be denoted by $\mathcal{M}'^{(\bullet)} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{T}^{\bullet}_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp}$.

9.4.1.4. Let us denote by $\widetilde{\mathrm{DR}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{X}}(Z, Z')$ the complex

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp} \underset{d}{\longrightarrow} \Omega^1_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp} \underset{d}{\longrightarrow} \cdots \underset{d}{\longrightarrow} \omega_{\mathfrak{X}'^\sharp/\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp},$$

where $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}$ is the 0th term. By using the similar to 9.4.1.2.1 argument, we get by extension from 7.5.10.3.1 the canonical isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'))$ of the form

$$\widetilde{\mathrm{DR}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{X}}(Z, Z')[d_f] \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z, Z'). \tag{9.4.1.4.1}$$

Notation 9.4.1.5. Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z'))$. The canonical map

$$\widetilde{\mathrm{DR}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{X}}(Z,Z') \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z')} \mathcal{E}'^{(\bullet)} \to \widetilde{\mathrm{DR}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{X}}(Z,Z') \widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(Z')} \mathcal{E}'^{(\bullet)} \tag{9.4.1.5.1}$$

is an isomorphism and will be denoted by $\Omega^{\bullet}_{\mathfrak{X}'^{\sharp}/\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{E}'^{(\bullet)}$.

Proposition 9.4.1.6. *Assume f is a quasi-compact and quasi-separated morphism.*

(a) For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z'))$, we have the isomorphism:

$$f^{(\bullet)}_{Z,Z',+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}f_* \left(\Omega^{\bullet}_{\mathfrak{X}'^{\sharp}/\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{E}'^{(\bullet)}\right)[d_f]; \tag{9.4.1.6.1}$$

For any $\mathcal{E}' \in D({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$, we have the isomorphism:

$$f_{Z,Z',+}(\mathcal{E}') \xrightarrow{\sim} \mathbb{R}f_* \left(\Omega^{\bullet}_{\mathfrak{X}'^{\sharp}/\mathfrak{X}^{\sharp}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{E}'\right)[d_f]; \tag{9.4.1.6.2}$$

(b) For any $\mathcal{M}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z'))$, we have the isomorphism:

$$f^{(\bullet)}_{Z,Z',+}(\mathcal{M}'^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}f_* \left(\mathcal{M}'^{(\bullet)} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{T}^{\bullet}_{\mathfrak{X}'^{\sharp}/\mathfrak{X}^{\sharp}}\right). \tag{9.4.1.6.3}$$

For any $\mathcal{M} \in D({}^{\mathrm{r}}\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$, we have the isomorphism:

$$f_{Z,Z',+}(\mathcal{M}') \xrightarrow{\sim} \mathbb{R}f_* \left(\mathcal{M}' \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathcal{T}^{\bullet}_{\mathfrak{X}'^{\sharp}/\mathfrak{X}^{\sharp}}\right). \tag{9.4.1.6.4}$$

Proof. By using 9.2.4.2.1, the isomorphism 9.4.1.6.1 (resp. 9.4.1.6.3) is a consequence of 9.4.1.2.1 (resp. 9.4.1.4.1). Recalling the definition 9.2.4.13, we get the other isomorphisms by using the isomorphism equal to the image via $\underrightarrow{l}^*_{\mathbb{Q}}$ of 9.4.1.2.1 (resp. 9.4.1.4.1) □

Proposition 9.4.1.7. *Suppose moreover f is flat (e.g. when log structures are trivial).*

(a) The functor $f^{(\bullet)!}_{Z',Z}$ sends $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$ to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z'))$.

(b) For any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}})$, we have $f^{!}_{Z',Z}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$.

(c) For any $\mathcal{E}^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z))$ we have in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}})$ the canonical isomorphism:

$$\mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}}({}^{\dagger}Z')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z')} f^{(m)!}_{Z',Z}(\mathcal{E}^{(m)}) \xrightarrow{\sim} f^{!}_{Z',Z}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}Z)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z)} \mathcal{E}^{(m)}). \tag{9.4.1.7.1}$$

Proof. Since f is flat, then the functor $f^{(\bullet)!}$ preserves the boundedness. It follows from 9.2.1.18 and 9.2.1.28 that we have the isomorphism $f^{(\bullet)!}_{Z',Z} \xrightarrow{\sim} ({}^{\dagger}Z') \circ f^{(\bullet)!} \circ \mathrm{forg}_Z$. Hence, the functor $f^{(\bullet)!}_{Z',Z}$ preserves boundedness. The first part is therefore a consequence of 7.5.10.8. The second and third parts are a consequence of the previous one, of 7.5.10.8 and of the isomorphism of 9.2.1.24. □

9.4.2 Pushforwards: way-out properties, stability of the coherence, tor dimension finiteness, perfectness

We keep notation 9.2.1.

Lemma 9.4.2.1. *We suppose f is a (non necessary exact) closed immersion and $\phi = \mathrm{id}$.*

(a) The left (resp. right) $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z')$-module $\widetilde{\mathcal{D}}^{(\bullet)}_{X'^{\sharp}_{\bullet}\to X^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z',Z)$ (resp. $\widetilde{\mathcal{D}}^{(\bullet)}_{X^{\sharp}_{\bullet}\leftarrow X'^{\sharp}_{\bullet}/S^{\sharp}_{\bullet}}(Z,Z')$) is locally free.

(b) The left (resp. right) $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z')$-module $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}\to\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(Z',Z)$ (resp. $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{X}'^{\sharp}/\mathfrak{S}^{\sharp}}(Z,Z')$) is flat.

Proof. This is checked similarly to 7.5.11.1. □

Proposition 9.4.2.2. We have $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z',Z) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'))$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp\leftarrow\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z,Z') \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{tdf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$.

Proof. By using 9.4.2.1, we can copy the proof of 7.5.11.2. □

Corollary 9.4.2.3. *Assume that $\mathfrak{S}$ and $\mathfrak{T}$ are noetherian of finite Krull dimension, f is quasi-compact and quasi-separated.*

$$f^{(\bullet)}_{Z,Z',\bullet+}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X'^\sharp_\bullet/S'^\sharp_\bullet}(Z')) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{X^\sharp_\bullet/S^\sharp_\bullet}(Z)), \tag{9.4.2.3.1}$$

$$f^{(\bullet)}_{Z,Z'+}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)). \tag{9.4.2.3.2}$$

Proof. This follows from 9.4.2.2, 8.5.4.14.2 and 9.2.4.2.1. □

Proposition 9.4.2.4. *Suppose f is proper and $Z' = f^{-1}(Z)$. Let $\star \in \{-, \mathrm{b}\}$ and $* \in \{\mathrm{r}, \mathrm{l}\}$.*

(a) The functor $f^{(\bullet)}_{Z,+}$ sends $\underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$ to $\underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$.

(b) For any $\mathcal{E}'^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')_{\mathbb{Q}})$, we have in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$ the canonical isomorphism:

$$\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)_{\mathbb{Q}}} f^{(m)}_{Z,+}(\mathcal{E}'^{(m)}) \xrightarrow{\sim} f_{Z,+}(\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}({}^\dagger Z')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')_{\mathbb{Q}}} \mathcal{E}'^{(m)}) \tag{9.4.2.4.1}$$

(c) For any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}'^\sharp}({}^\dagger Z')_{\mathbb{Q}})$, we have $f_{Z,+}(\mathcal{E}') \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$.

Proof. The first part is a consequence of 7.5.11.4 and 7.5.8.14.1 (which can be applied in the case of overconvergent coefficients thanks to 9.2.1.26) and of 9.4.2.3 when $\star = \mathrm{b}$. For any $\mathcal{F}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}'^\sharp}({}^\dagger Z'))$. We get the isomorphism:

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z)_{\mathbb{Q}}} f^{(m)}_{Z,+}(\mathcal{E}'^{(m)}) \xrightarrow{\sim} f^{(\bullet)}_{+}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z')_{\mathbb{Q}}} \mathcal{E}'^{(m)}) \tag{9.4.2.4.2}$$

Using the equivalence of categories of 7.4.6.6.1 and 8.4.1.15, using the comparison isomorphism between both pushforwards 9.2.4.17, by applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ to 9.4.2.4.2, we get 9.4.2.4.1. The third part is a consequence of the second one. □

Proposition 9.4.2.5. *Suppose $Z' = f^{-1}(Z)$ and $\phi = \mathrm{id}$. Suppose S is a noetherian scheme of finite Krull dimension, f is quasi-compact and quasi-separated. Let $* \in \{\mathrm{r}, \mathrm{l}\}$. The functor $f^{(\bullet)}_{Z,+}$ sends $\underrightarrow{LD}_{\mathbb{Q},\mathrm{qc},\mathrm{tdf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$ to $\underrightarrow{LD}_{\mathbb{Q},\mathrm{qc},\mathrm{tdf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$ (see notation 8.5.4.11).*

Proof. This is a consequence of 7.3.2.15 (and 7.1.3.6) and 5.3.2.12 (and the fact that the tor amplitude does not depend on i). □

Proposition 9.4.2.6. *Suppose $Z' = f^{-1}(Z)$ and $\phi = \mathrm{id}$. Suppose S and X are noetherian scheme of finite Krull dimension, f is proper. Let $* \in \{\mathrm{r}, \mathrm{l}\}$. With notation 8.6.1.4, the functor $f^{(\bullet)}_{Z,+}$ sends $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$ to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$.*

Proof. Following [Sta22, 08G8], a complex is perfect if and only if it is pseudo-coherent and locally has finite tor dimension. Hence, this is a consequence of (the proofs of) 9.4.2.4 and 9.4.2.5. □

9.4.3 Projection formula: commutation of pushforwards with localization functors outside of a divisor

We keep notation 9.2.1.

Proposition 9.4.3.1. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$, and $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(Z'))$. We have the following isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$*

$$f^{(\bullet)}_{Z,Z',+}(\mathcal{E}'^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}[d_f] \xrightarrow{\sim} f^{(\bullet)}_{Z,Z',+}\left(\mathcal{E}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')} f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)})\right). \tag{9.4.3.1.1}$$

Proof. This is a consequence of 5.3.4.1. □

Corollary 9.4.3.2. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$. We have the isomorphism*

$$f^{(\bullet)}_{Z,Z',+}\left(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')\right)\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}\mathcal{E}^{(\bullet)}[d_f] \xrightarrow{\sim} f^{(\bullet)}_{Z,Z',+}\circ f^{(\bullet)!}_{Z',Z}(\mathcal{E}^{(\bullet)}). \tag{9.4.3.2.1}$$

Proof. We apply 9.4.3.1 to the case where $\mathcal{E}'^{(\bullet)} = \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')$. □

Corollary 9.4.3.3. *Let $* \in \{\mathrm{l}, \mathrm{r}\}$, $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp})$. We suppose $Z' = f^{-1}(Z)$. We have the isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z))$:*

$$f^{(\bullet)}_{Z+}\circ({}^\dagger Z')(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z)\circ f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}).$$

Proof. It follows from 9.1.1.7.4 and 9.2.4.8.2 that we reduce to the case $* = \mathrm{l}$. Using 9.4.3.1 (in the case where Z and Z' are empty and $\mathcal{E}^{(\bullet)} = \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$) and 9.2.1.26, we get the isomorphism

$$f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \xrightarrow{\sim} f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}'}}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')). \tag{9.4.3.3.1}$$

We conclude using 9.2.4.19. □

Remark 9.4.3.4. Using 9.2.4.19, the isomorphism of 9.4.3.3 could be written $f^{(\bullet)}_{+}\circ({}^\dagger Z')(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z)\circ f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)})$. Moreover, this isomorphism is also a consequence of 5.1.3.4 and 9.2.1.26.

Corollary 9.4.3.5. *With the notations of 9.4.3.1, We suppose that f is an exact closed immersion and $\phi = \mathrm{id}$. Then we have, for any $\mathcal{F}^{(\bullet)}$, $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}(Z'))$, of the canonical isomorphism*

$$f^{(\bullet)}_{Z,Z',+}(\mathcal{F}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} f^{(\bullet)}_{Z,Z',+}(\mathcal{G}^{(\bullet)})[d_f] \xrightarrow{\sim} f^{(\bullet)}_{Z,Z',+}(\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')}\mathcal{G}^{(\bullet)}). \tag{9.4.3.5.1}$$

Proof. We have the canonical isomorphism:

$$f^{(\bullet)}_{Z,Z',+}(\mathcal{F}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)} f^{(\bullet)}_{Z,Z',+}(\mathcal{G}^{(\bullet)})[d_f] \underset{9.4.3.1.1}{\xrightarrow{\sim}} f^{(\bullet)}_{Z,Z',+}(\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(Z')} f^{(\bullet)!}_{Z',Z}\circ f^{(\bullet)}_{Z,Z',+}(\mathcal{G}^{(\bullet)})).$$

Moreover, as f is a closed immersion, we deduce from 9.3.5.13.1 the canonical isomorphism $\mathcal{G}^{(\bullet)} \xrightarrow{\sim} f^{(\bullet)!}_{Z',Z}\circ f^{(\bullet)}_{Z,Z',+}(\mathcal{G}^{(\bullet)})$. Hence we are done. □

9.4.4 Base change isomorphism in the projection case and relative duality isomorphism in the projective case

Let $\mathfrak{S}^\sharp$ be a nice (see definition 3.3.1.10) fine $\mathcal{V}$-log formal scheme. Assume that $\mathfrak{S}$ is noetherian of finite Krull dimension. Let $\mathfrak{X}^\sharp$ and $\mathfrak{Q}^\sharp$ be two log smooth, quasi-compact and quasi-separated formal log schemes over $\mathfrak{S}^\sharp$, $p\colon \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp \to \mathfrak{X}^\sharp$, $q\colon \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp \to \mathfrak{Q}^\sharp$ be the structural maps. Let $* \in \{\mathrm{r}, \mathrm{l}\}$.

We suppose S, $S^\sharp$, X and Q are regular. Let Z_1 be a divisor of X, Z_2 be a divisor of Q and $Z := p^{-1}(Z_1)\cup q^{-1}(Z_2)$. Set $\mathfrak{R} := \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp$ and $r\colon \mathfrak{X}^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp \to \mathfrak{S}^\sharp$ be the structural map.

Proposition 9.4.4.1. Let $u\colon \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ and $v\colon \mathfrak{Q}'^\sharp \to \mathfrak{Q}^\sharp$ be two morphisms of log smooth formal $\mathfrak{S}^\sharp$-schemes. Let $\mathfrak{R}'^\sharp := \mathfrak{X}'^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}'^\sharp$, and $w := (u, v)\colon \mathfrak{R}'^\sharp \to \mathfrak{R}^\sharp$ be the induced morphism. Suppose $Z_1' := u^{-1}(Z_1)$ is a divisor of X' and $Z_2' := v^{-1}(Z_2)$ is a divisor of Q'. Set $Z' := w^{-1}(Z)$.

(a) For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(Z_1))$ and $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}(Z_2))$, with notation 9.2.1.15.3, we have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}'^\sharp/\mathfrak{S}^\sharp}(Z'))$ the isomorphism:

$$\mathbb{L}w_Z^{*(\bullet)}(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}u_{Z_1}^{*(\bullet)}(\mathcal{E}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z'_1,Z'_2}\mathbb{L}v_{Z_2}^{*(\bullet)}(\mathcal{F}^{(\bullet)}). \tag{9.4.4.1.1}$$

(b) For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'_1))$ and $\mathcal{F}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}'^\sharp/\mathfrak{S}^\sharp}(Z'_2))$, we have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}(Z))$ the isomorphism:

$$w_{Z+}^{(\bullet)}(\mathcal{E}'^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z'_1,Z'_2}\mathcal{F}'^{(\bullet)}) \xrightarrow{\sim} u_{Z_1+}^{(\bullet)}(\mathcal{E}'^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}v_{Z_2+}^{(\bullet)}(\mathcal{F}'^{(\bullet)}). \tag{9.4.4.1.2}$$

Proof. The first statement is a consequence of 5.3.5.2 and 9.2.5.1.5 (use also 9.2.5.5.2). The second one is a consequence of 5.3.5.13 and 9.2.5.1.5. □

Corollary 9.4.4.2. *We keep notation 9.4.4.1.*

(a) We suppose u and v smooth. For any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_1)_{\mathbb{Q}})$, $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Q}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z_2)_{\mathbb{Q}})$, then we have the isomorphism in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{R}'^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z')_{\mathbb{Q}})$:

$$w^*_{Z,+}(\mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^\dagger_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\ \mathcal{F}) \xrightarrow{\sim} u^*_{Z_1,+}(\mathcal{E})\overset{\mathbb{L}}{\boxtimes}{}^\dagger_{\mathcal{O}_{\mathfrak{S}},Z'_1,Z'_2}\ v^*_{Z_2,+}(\mathcal{F}). \tag{9.4.4.2.1}$$

(b) We suppose u and v proper. Then, for any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z'_1)_{\mathbb{Q}})$, $\mathcal{F}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Q}'^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z'_2)_{\mathbb{Q}})$, then we have the isomorphism in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}({}^\dagger Z)_{\mathbb{Q}})$:

$$w_{Z,+}(\mathcal{E}'\overset{\mathbb{L}}{\boxtimes}{}^\dagger_{\mathcal{O}_{\mathfrak{S}},Z'_1,Z'_2}\ \mathcal{F}') \xrightarrow{\sim} u_{Z_1,+}(\mathcal{E}')\overset{\mathbb{L}}{\boxtimes}{}^\dagger_{\mathcal{O}_{\mathfrak{S}},Z_1,Z_2}\ v_{Z_2,+}(\mathcal{F}'). \tag{9.4.4.2.2}$$

Proof. Via 9.2.5.13, 9.2.1.24 and 9.2.4.17, this is a consequence of Proposition 9.4.4.1. □

Corollary 9.4.4.3. *We keep notation 9.4.4.1 and we suppose v is the identity. Let $p'\colon \mathfrak{X}'^\sharp \times_{\mathfrak{S}^\sharp} \mathfrak{Q}^\sharp \to \mathfrak{X}'^\sharp$ be the natural projection. Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}^\sharp}(Z'_1))$. There exists a canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}^\sharp/\mathfrak{S}^\sharp}(Z))$ of the form:*

$$p^{(\bullet)!}_{Z,Z_1} \circ u^{(\bullet)}_{Z_1+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} w^{(\bullet)}_{Z,+} \circ p'^{(\bullet)!}_{Z',Z'_1}(\mathcal{E}'^{(\bullet)}). \tag{9.4.4.3.1}$$

Proof. We construct the isomorphism by compositing the following isomorphisms:

$$\begin{aligned} p^{(\bullet)!}_{Z,Z_1} \circ u^{(\bullet)}_{Z_1+}(\mathcal{E}'^{(\bullet)}) &\xrightarrow{\sim} u^{(\bullet)}_{Z_1+}(\mathcal{E}'^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z'_1,Z_2}\mathcal{B}^{(\bullet)}_{\mathfrak{Q}}(Z_2) \\ \underset{\sim}{\overset{9.4.4.1.2}{\longrightarrow}}\ & w^{(\bullet)}_{Z+}(\mathcal{E}'^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}},Z'_1,Z_2}\mathcal{B}^{(\bullet)}_{\mathfrak{Q}}(Z_2)) \xrightarrow{\sim} w^{(\bullet)}_{Z,+} \circ p'^{(\bullet)!}_{Z',Z'_1}(\mathcal{E}'^{(\bullet)}). \end{aligned}$$

□

Remark 9.4.4.4. We will prove later (see 13.2.3.7) a coherent version of Corollary 9.4.4.3. In this version, we can use for instance Berthelot-Kashiwara theorem which allow us to extend geometrically the context.

The following corollary is weaker than 9.4.5.2 but the reader can check that is the proof is much easier.

Corollary 9.4.4.5. *We assume the log structure of $\mathfrak{S}^\sharp$ is trivial (and we simply write $\mathfrak{S}$). Let $\mathfrak{X} \to \mathfrak{Y}$ be a morphism of smooth formal $\mathfrak{S}$-schemes which is the composition of a closed immersion of the form $\mathfrak{X} \hookrightarrow \widehat{\mathbb{P}}^d_{\mathfrak{Y}}$ and of the projection $\widehat{\mathbb{P}}^d_{\mathfrak{Y}} \to \mathfrak{Y}$.*

(a) For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$, we have a canonical isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}})$ of the form:

$$\mathbb{D}^{(\bullet)} \circ f^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} f^{(\bullet)}_{+} \circ \mathbb{D}^{(\bullet)}(\mathcal{E}^{(\bullet)}). \tag{9.4.4.5.1}$$

(b) Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}})$, and $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}})$. We have the isomorphisms

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}}(f_{+}(\mathcal{E}),\mathcal{F}) \xrightarrow{\sim} \mathbb{R}f_{*}\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}}(\mathcal{E},f^{!}(\mathcal{F})), \tag{9.4.4.5.2}$$

$$\mathbb{R}\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}}(f_{+}(\mathcal{E}),\mathcal{F}) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}}(\mathcal{E},f^{!}(\mathcal{F})). \tag{9.4.4.5.3}$$

Proof. The first statement is a consequence of 5.3.8.4. Similarly to 9.4.5.4, we check that 9.4.4.5.1 implies the second statement. □

Remark 9.4.4.6. Following Virrion (see [Vir04]), we have the relative duality isomorphisms and adjoint pairs $(f_{+}, f^{!})$ for proper morphisms f. In the projective case (see 9.4.4.5), we have retrieve theses theorems. They are at least four reasons for this specific study: because this case is much easier than Virrion's one, because in the case of a closed immersion we can remove the coherence hypotheses to build the adjunction morphisms and these adjunction morphisms have a clear description and will be used in chapter 9.3.5 (or also Proposition 9.3.6.1), and because the case of projective morphisms is enough for instance to check the coherence of the constant coefficient in 12.2.7.1).

9.4.5 Relative duality isomorphism in the case of a proper morphism with overconvergent singularities

We complete below Virrion's relative duality isomorphisms by adding some overconvergent singularities.

Let $\mathfrak{S}$ be a noetherian of finite Krull dimension $\mathcal{V}$-formal scheme. Let $f\colon \mathfrak{X}' \to \mathfrak{X}$ be a proper morphism of smooth formal schemes over $\mathfrak{S}$, Z and Z' be some divisors of respectively X and X' such that $Z' := f^{-1}(Z)$. We will extend later for realizable morphisms the following theorem and its first corollary (see 13.2.4.1, 13.2.4.2). Recall that we only get a priori a fully faithful functor $\underrightarrow{l}^{*}_{\mathbb{Q}}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}({}^{*}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(Z)) \to D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$ following (see 8.7.7.10).

Proposition 9.4.5.1. With notations 9.1.1.6, there exists in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{r}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(Z))$ a natural trace morphism:

$$f^{(\bullet)}_{Z,+}(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'}(Z'))[d_{X'}] = \mathbb{R}f_{*}(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'}(Z')\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}(Z')}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}(Z',Z))[d_{X'}] \to \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}}(Z)[d_{X}].$$

Proof. Following [Vir04, III.7.1], we have the trace morphism

$$f^{(\bullet)}_{+}(\omega^{(\bullet)}_{\mathfrak{X}'})[d_{X'}] = \mathbb{R}f_{*}(\omega^{(\bullet)}_{\mathfrak{X}'}\widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}})[d_{X'}] \to \omega^{(\bullet)}_{\mathfrak{X}}[d_{X}]. \tag{9.4.5.1.1}$$

Since the functor $({}^{\dagger}Z)$ commutes with pushforwards (see 9.4.3.3), since $({}^{\dagger}Z)(\omega^{(\bullet)}_{\mathfrak{X}}) \xrightarrow{\sim} \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}}(Z)$ and $({}^{\dagger}Z')(\omega^{(\bullet)}_{\mathfrak{X}'}) \xrightarrow{\sim} \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'}(Z')$, then by applying $({}^{\dagger}Z)$ to 9.4.5.1.1, this results in a morphism

$$f^{(\bullet)}_{Z+}(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'}(Z'))[d_{X'}] = \mathbb{R}f_{*}(\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'}(Z')\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(\bullet)}_{\mathfrak{X}'}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}})[d_{X'}] \to \widetilde{\omega}^{(\bullet)}_{\mathfrak{X}}(Z)[d_{X}].$$

□

Theorem 9.4.5.2. *Let $* \in \{\mathrm{l},\mathrm{r}\}$. Let $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'}({}^{\dagger}Z')_{\mathbb{Q}})$. We have in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$ the isomorphism*

$$f_{Z+} \circ \mathbb{D}_{Z'}(\mathcal{E}') \xrightarrow{\sim} \mathbb{D}_{Z} \circ f_{Z+}(\mathcal{E}'). \tag{9.4.5.2.1}$$

Proof. We construct the morphism 9.4.5.2.1 similarly to that of 5.3.7.4: We can suppose $* = \mathrm{r}$. To simplify notations, let us drope (Z), (Z') and (Z',Z), e.g. let us denote by $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}} := \widehat{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$, $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'} := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}(Z')$, $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}} := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}(Z',Z)$. Moreover, set $\widetilde{\mathcal{B}}_{\mathfrak{X}} := \mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$, $\widetilde{\omega}_{\mathfrak{X}} := \omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$, $\widetilde{\mathcal{D}}_{\mathfrak{X}} := \mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$, $\widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}} := \mathcal{D}^{\dagger}_{\mathfrak{X}'\to\mathfrak{X}/\mathfrak{S}}(Z',Z)_{\mathbb{Q}}$ (and similarly with some primes). We construct the composite morphism:

$$\begin{aligned}
f_{Z,+} \circ \mathbb{D}_{\mathfrak{X}',Z'}(\mathcal{E}') &\xrightarrow{\sim} \mathbb{R}f_{*}\left(\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}}(\mathcal{E}',\widetilde{\omega}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}\right)[d_{X'}] \\
&\underset{4.6.3.6.1}{\xrightarrow{\sim}} \mathbb{R}f_{*}\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}}(\mathcal{E}',\widetilde{\omega}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}})[d_{X'}] \\
&\to \mathbb{R}f_{*}\mathbb{R}\mathcal{H}om_{f^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}}}(\mathcal{E}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}},(\widetilde{\omega}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}})[d_{X'}] \\
&\underset{4.6.5.7.1}{\longrightarrow} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}}}\left(\mathbb{R}f_{*}(\mathcal{E}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}),\mathbb{R}f_{*}\left((\widetilde{\omega}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}\right)\right)[d_{X'}].
\end{aligned} \tag{9.4.5.2.2}$$

According to notation 8.4.1.8, we have the functors $\underset{\rightarrow X',\mathbb{Q}}{l^*}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}) \to D^{\mathrm{b}}({}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}_{\mathfrak{X}})$ and $\underset{\rightarrow X,\mathbb{Q}}{l^*}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}) \to D^{\mathrm{b}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}_{\mathfrak{X}})$. We get the morphisms

$$\mathbb{R}f_*\left((\widetilde{\omega}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}\right) \xrightarrow{\sim} \mathbb{R}f_*\circ \underset{\rightarrow X',\mathbb{Q}}{l^*}\left((\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}\right)$$
$$\xrightarrow{\sim} \underset{\rightarrow X,\mathbb{Q}}{l^*}\circ \mathbb{R}f_*\left((\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}\right). \quad (9.4.5.2.3)$$

We have the ringed topoi morphisms $\underset{\leftarrow X'(\bullet)}{l}\colon (X'^{(\bullet)}_{\bullet}, f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}) \to (\mathfrak{X}'^{(\bullet)}, f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ and $\underset{\leftarrow X(\bullet)}{l}\colon (X_\bullet, \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}) \to (\mathfrak{X}, \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ such that $\mathbb{R}\underset{\leftarrow X(\bullet)*}{l}\circ \mathbb{R}f_* \xrightarrow{\sim} \mathbb{R}f_*\circ \mathbb{R}\underset{\leftarrow X'(\bullet)*}{l}$. This yields by adjunction the first morphism:

$$\mathbb{R}f_*\left((\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}\right) \to \mathbb{R}f_*\circ\mathbb{R}\underset{\leftarrow X'(\bullet)*}{l}\circ\mathbb{L}\underset{\leftarrow X'(\bullet)}{l^*}\left((\widetilde{\omega}^{(\bullet)}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'\to\mathfrak{X}}\right)$$
$$\xrightarrow{\sim} \mathbb{R}\underset{\leftarrow X(\bullet)*}{l}\circ\mathbb{R}f_*\left((\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}\right). \quad (9.4.5.2.4)$$

By using flat resolutions, it follows by functoriality from 4.2.6.1.1 that we have the isomorphism of complexes of right $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}$-bimodules:

$$\mathbb{R}f_*\left((\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}\right) \xrightarrow{\sim} \mathbb{R}f_*\left(\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} (\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet})\right). \quad (9.4.5.2.5)$$

We have the isomorphism of left $\widetilde{\mathcal{D}}_{X'_\bullet} \otimes_{\mathcal{O}_{S_\bullet}} f^{-1}(\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet})^{\mathrm{op}} \otimes_{\mathcal{O}_{S_\bullet}} f^{-1}(\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet})^{\mathrm{op}}$-modules

$$\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet} \otimes_{\mathcal{B}_{X'_\bullet}} \mathcal{D}^{(\bullet)}_{X'_\bullet\to X_\bullet} \xrightarrow{\sim} \widetilde{f}^*_\bullet(\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet} \otimes^{\mathrm{l,l}}_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}) \underset{\gamma}{\xleftarrow{\sim}} \widetilde{f}^*_\bullet(\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet} \otimes^{\mathrm{r,l}}_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet})$$
$$\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet} \otimes_{f^{-1}_\bullet\mathcal{B}_{X_\bullet}} f^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}, \quad (9.4.5.2.6)$$

where "l" and "r" mean that we choose respectively the left and the right structure to define the tensor product (we get by functoriality two others structures of $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}$-module and more precisely left, right, right $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}$-trimodules), $\widetilde{f}^*_\bullet$ of a left, right, right $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}$-trimodule gives a $({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}, {}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}, {}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet})$-trimodule and where γ is the transposition isomorphism of $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}$ (see 4.2.5.1.1). This yields

$$\mathbb{R}f_*\left(\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} (\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet})\right) \xrightarrow{\sim} \mathbb{R}f_*\left((\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}) \otimes_{f^{-1}_\bullet\mathcal{B}_{X_\bullet}} f^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}\right). \quad (9.4.5.2.7)$$

By applying the projection isomorphism 7.5.7.3, we get

$$\mathbb{R}f_*\left((\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}) \otimes_{f^{-1}_\bullet\mathcal{B}_{X_\bullet}} f^{-1}_\bullet\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet})\right) \xrightarrow{\sim} \mathbb{R}f_*\left(\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}\right) \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}. \quad (9.4.5.2.8)$$

By applying the functor $(-\otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet})\circ \mathbb{L}\underset{\leftarrow X(\bullet)}{l^*}$ to the trace map 9.4.5.1, we get

$$\mathbb{R}f_*\left(\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}\right) \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet} \to \widetilde{\omega}^{(\bullet)}_{X_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}[-d_{X'/X}] \quad (9.4.5.2.9)$$

By composing 9.4.5.2.5, 9.4.5.2.7, 9.4.5.2.8, 9.4.5.2.9, we get

$$\mathbb{R}f_*\left((\widetilde{\omega}^{(\bullet)}_{X'_\bullet} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet\to X_\bullet}\right) \to \widetilde{\omega}^{(\bullet)}_{X_\bullet} \otimes_{\mathcal{B}_{X_\bullet}} \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet}[-d_{X'/X}]. \quad (9.4.5.2.10)$$

By applying the functor $\underset{\rightarrow X,\mathbb{Q}}{l^*}\circ\mathbb{R}\underset{\leftarrow X(\bullet)*}{l}$ to 9.4.5.2.10 and composing it with 9.4.5.2.3, we get

$$\mathbb{R}f_*\left((\widetilde{\omega}_{\mathfrak{X}'} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}\right)[d_{X'}] \to \widetilde{\omega}_{\mathfrak{X}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}}[d_X]. \quad (9.4.5.2.11)$$

By applying the functor $\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}}}(\mathbb{R}f_*(\mathcal{E}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}), -)$ to 9.4.5.2.11 and composing it to 9.4.5.2.2, we get the first morphism:

$$f_{Z,+} \circ \mathbb{D}_{\mathfrak{X}',Z'}(\mathcal{E}') \to \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}_{\mathfrak{X}}}(\mathbb{R}f_*(\mathcal{E}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}'}} \widetilde{\mathcal{D}}_{\mathfrak{X}'\to\mathfrak{X}}), \widetilde{\omega}_{\mathfrak{X}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}} \widetilde{\mathcal{D}}_{\mathfrak{X}})[d_X] \xrightarrow{\sim} \mathbb{D}_{\mathfrak{X},Z} \circ f_{Z,+}(\mathcal{E}'). \quad (9.4.5.2.12)$$

To verify that 9.4.5.2.12 is an isomorphism, according to 8.7.6.11, we reduce to check it above $\mathfrak{X} \setminus Z$, i.e. to the case where the divisor is empty. This then results by p-adic completion and inductive limit on the level from 5.3.7.4 (see [Vir04, IV.3.1]).

□

Remark 9.4.5.3. When the divisor Z is not empty, it is not clear that the categories used in [Vir04] correspond to complexes with bounded and coherent cohomology. This is precisely what we had led to check 9.4.5.2 for $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$.

Moreover, when f is a closed immersion, we have checked in [Car09d, 2.4.3] that 9.4.5.2 commutes with Frobenius (more precisely, with the inverse images by Frobenius F^*).

Corollary 9.4.5.4. *Let $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$, and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$. We have the isomorphisms*

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}}(f_{Z+}(\mathcal{E}'), \mathcal{E}) \xrightarrow{\sim} \mathbb{R}f_*\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}}(\mathcal{E}', f^!_Z(\mathcal{E})). \quad (9.4.5.4.1)$$

$$\mathbb{R}\mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}}(f_{Z+}(\mathcal{E}'), \mathcal{E}) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}}(\mathcal{E}', f^!_Z(\mathcal{E})). \quad (9.4.5.4.2)$$

Proof. Similarly to 5.3.7.5, this is a formal consequence of the relative duality isomorphism 9.4.5.2: following 8.7.7.9, we have $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}}) = D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}})$. Hence, using 4.6.3.6.1, we construct the canonical isomorphism:

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}}(f_{Z+}(\mathcal{E}'), \mathcal{E}) \xrightarrow{\sim} (\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}}\left(f_{Z+}(\mathcal{E}'), \mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}}\right).$$

It follows from 9.4.5.2 that we get by composition the isomorphism

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}}(f_{Z+}(\mathcal{E}'), \mathcal{E}) \xrightarrow{\sim} (\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}} f_{Z+}\left(\mathbb{D}_Z(\mathcal{E}')\right)[-d_X]. \quad (9.4.5.4.3)$$

Using the projection formula of 9.2.3.4, the right term of 9.4.5.4.3 is isomorphic to

$$\mathbb{R}f_*\left(f^{-1}\left(\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}\right) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{X}\leftarrow\mathfrak{X}'}({}^\dagger Z)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}} \mathbb{D}_Z(\mathcal{E}')\right)[-d_X]. \quad (9.4.5.4.4)$$

Using the isomorphisms $\left(f^{-1}\left(\omega_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}\right) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{X}\leftarrow\mathfrak{X}'}({}^\dagger Z)_{\mathbb{Q}}\right) \otimes_{\mathcal{O}_{\mathfrak{X}'}} \omega^{-1}_{\mathfrak{X}'}[d_f] \underset{9.2.1.23.1}{\xrightarrow{\sim}} f^!_Z(\mathcal{E})$ and $\omega_{\mathfrak{X}'} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \mathbb{D}_Z(\mathcal{E}')[-d_{X'}] \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}}(\mathcal{E}', \mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$, the term of 9.4.5.4.4 is isomorphic to

$$\mathbb{R}f_*\left(\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}}(\mathcal{E}', \mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}} f^!_Z(\mathcal{E})\right) \underset{4.6.3.6.1}{\xrightarrow{\sim}} \mathbb{R}f_*\left(\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}}(\mathcal{E}', f^!_Z(\mathcal{E})\right).$$

□

Corollary 9.4.5.5. *We have the following properties.*

(a) Let $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$. We have the adjunction morphism $\mathcal{E}' \to f^!_Z f_{Z+}(\mathcal{E}')$.

(b) Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$ such that $f^!_Z(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$. We have the adjunction morphism $f_{Z+}f^!_Z(\mathcal{E}) \to \mathcal{E}$.

(c) Suppose f is proper and smooth. Then $f_{Z+}\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$ is a right adjoint functor of $f^!_Z\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$.

9.4.6 Fourier transform

Let N now be an integer, $\mathfrak{X}$ be the formal projective space of dimension N over $\mathcal{V}$, Z be the hyperplane at infinity of X, and $\mathfrak{Y} = \mathfrak{X} \setminus Z$ the formal affine space of dimension N on $\mathcal{V}$. Let $t_1, \ldots, t_N$ be the canonical coordinates on the affine space, $\partial_1, \ldots, \partial_N$ the corresponding derivations. The K-algebra of global sections of $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ is then identified with the "p-adic weak completion" of the Weyl algebra:

Proposition 9.4.6.1. *There exists a canonical isomorphism of K-algebras*

$$\Gamma(\mathfrak{X}, \mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}) \xrightarrow{\sim} A_N(K)^\dagger,$$

where $A_N(K)^\dagger$ is the K-algebra of differential operators defined by

$$A_N(K)^\dagger := \left\{ \sum_{\underline{i},\underline{k}} a_{\underline{i},\underline{k}} \in K \parallel \exists c, \lambda \text{ such that } \eta < 1 \text{ and } \forall \underline{i}, \underline{k}, |a_{\underline{i},\underline{k}}| \leq c\eta^{|\underline{i}|+|\underline{k}|} \right\}.$$

9.4.6.2. Now suppose that K contains an element ϖ such that $\varpi^{p-1} = -p$. and fix such an element. We easily verify that there exists a unique automorphism ϕ of the K-algebra $A_N(K)^\dagger$ such that

$$\phi(\partial) = \varpi t_i, \phi(t_i) = -\partial_i/\varpi.$$

For all $A_N(K)^\dagger$-module E, we therefore obtain by making $A_N(K)^\dagger$ act on E via ϕ a new $A_N(K)^\dagger$-module, which we denote by $\phi_* E$. The functor which associates $\phi_* E$ with E is the naive Fourier transformation (defined by ϖ). Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$-module, and $E = \Gamma(\mathfrak{X}, \mathcal{E})$. According to 9.4.6.1, E has a canonical $A_N(K)^\dagger$-module structure, for which it is coherent according to 8.7.3.31. As the $A_N(K)^\dagger$-module $\phi_* E$ is still coherent, it exists, thanks to the theorem 8.7.3.31, a unique $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$-coherent module $\mathcal{E}^\phi$ such that $\Gamma(\mathfrak{X}, \mathcal{E}^\phi) = \phi_* E$.

The problem of the geometric Fourier transformation is to give an interpretation of the functor $\mathcal{E} \mapsto \mathcal{E}^\phi$ by means of the cohomological operations of the theory of $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-modules, in a manner analogous to the geometric Fourier transformation of Malgrange in characteristic 0 [Mal88], or to the Fourier l-adique transformation of Deligne-Katz-Laumon [KL85].

9.4.6.3. Let us first specify how the data of ϖ determines the kernel $\mathcal{N}_\varpi$ of the geometric Fourier transform. Let $\mathfrak{P}^1$ (resp. $\mathfrak{A}^1$) be the formal projective (resp. affine) space of dimension 1 on $\mathcal{V}$. We denote by $\mathcal{L}_\varpi = \mathrm{sp}_* L_\varpi$ the $\mathcal{D}^\dagger_{\mathfrak{P}^1}({}^\dagger\infty)_{\mathbb{Q}}$-coherent module defined by the Dwork F-isocrystal L_ϖ associated with ϖ: the $\mathcal{O}_{\mathfrak{P}^1}({}^\dagger\infty)_{\mathbb{Q}}$-module underlying $\mathcal{L}_\varpi$ is equal to $\mathcal{O}_{\mathfrak{P}^1}({}^\dagger\infty)_{\mathbb{Q}}$, and its structure of $\mathcal{D}^\dagger_{\mathfrak{P}^1}({}^\dagger\infty)_{\mathbb{Q}}$-module compatible with that of $\mathcal{O}_{\mathfrak{P}^1}({}^\dagger\infty)_{\mathbb{Q}}$-module is given by the formula $\partial \cdot 1 = -\varpi$ (see [Ber90]).

Let $\mathfrak{X}'$ (resp. $\mathfrak{Y}'$) be the dual projective (resp. affine) space, $Z' := X' \setminus Y'$ and let $\mu \colon \mathfrak{Y} \times \mathfrak{Y}' \to \mathfrak{A}^1$ be the duality pairing. There exists a smooth formal scheme $\mathfrak{U}$, and a projective morphism $f \colon \mathfrak{U} \to \mathfrak{X} \times \mathfrak{X}'$ such that, if we denote by $\mathfrak{W} = f^{-1}(\mathfrak{Y} \times \mathfrak{Y}')$, the morphism $\mathfrak{W} \to \mathfrak{Y} \times \mathfrak{Y}'$ induced by f is an isomorphism, and the composite morphism $\mu \circ f$ is extended to a morphism $\lambda \colon \mathfrak{U} \to \mathfrak{P}^1$. Let Z'' be the reduced divisor of $X \times X'$ which is complementary to $Y \times Y'$ and $T = f^{-1}(Z'') \subset U$. Following Katz-Laumon [KL85], we agree to consider $\mathcal{L}_\varpi$ as a complex reduced to a single module, placed in degree 1. If we apply the functor

$$\lambda^!_{T,\infty} \colon D^-_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^1}({}^\dagger\infty)_{\mathbb{Q}}) \to D^-_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{U}}({}^\dagger T)_{\mathbb{Q}}),$$

to $\mathcal{L}_\varpi[-1]$, we verify, thanks to the fact that $\mathcal{L}_\varpi$ is defined by an overconvergent isocrystal, that $\lambda^!_{T,\infty}(\mathcal{L}_\varpi[-1])$ reduces to a single coherent $\mathcal{D}^\dagger_{\mathfrak{U}}({}^\dagger T)_{\mathbb{Q}}$-module, placed in degree $2-2N$. Using the equivalence of Theorem 8.7.3.32, we identify it via $f_{Z'',T+}$ to a coherent $\mathcal{D}^\dagger_{\mathfrak{X}\times\mathfrak{X}'}({}^\dagger Z'')_{\mathbb{Q}}$-module, placed in degree $2-2N$, we will set

$$\mathcal{N}_\varpi := f_{Z'',T+}\lambda^!_{T,\infty}(\mathcal{L}_\varpi[-1]).$$

Let p_1, p_2 be the projections of $\mathfrak{X} \times \mathfrak{X}'$ onto $\mathfrak{X}$ and $\mathfrak{X}'$. The geometric Fourier transform then associates with a complex $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$ the complex

$$\phi_+\mathcal{E} := p_{2,Z',Z'',+}(\mathcal{N}_\varpi \otimes_{\mathcal{O}_{\mathfrak{X}\times\mathfrak{X}'}(Z'')_{\mathbb{Q}}} p^!_{1,Z'',Z}(\mathcal{E}[-2N])).$$

By describing the calculation of these functors, Huyghe proves that we thus obtain a transformation associating to any coherent $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$-module a coherent $\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}$-module (up to shift), and establishes the relation with the naive Fourier transformation on global sections:

Theorem 9.4.6.4. *With the previous notations, let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$-module. So:*

(a) The complex $\phi_*\mathcal{E}$ is reduced to a single $\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}$-module, coherent and placed in degree $N-2$.

(b) There exists a canonical isomorphism of $\Gamma(\mathfrak{X}', \mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$-modules

$$\Gamma(\mathfrak{X}', \phi_*\mathcal{E}[2-N]) \xrightarrow{\sim} \phi_*\Gamma(\mathfrak{X}, \mathcal{E})$$

The transform $\mathcal{E}^\phi$ constructed in 9.4.6.2 is therefore identified with the module $\phi_*\mathcal{E}[2-N]$.

9.4.6.5. There is also a Fourier transform with compact supports. To define it, we provide $\mathfrak{X} \times \mathfrak{X}'$ with the divisor $Z' := p_2^{-1}(Z')$ (by abuse of notation). Huyghe then shows that, for all coherent $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$-module the complex $\mathbb{D}_{Z''}(\mathcal{N}_\varpi \otimes_{\mathcal{O}_{\mathfrak{X}\times\mathfrak{X}'}(Z'')_{\mathbb{Q}}} p^!_{1,Z'',Z}(\mathcal{E})$ has coherent cohomology on $\mathcal{D}^\dagger_{\mathfrak{X}\times\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}$. We can then take its dual $\mathbb{D}_{Z'}$. The functor $\mathbb{D}_{Z'} \circ \mathbb{D}_{Z''}$ here plays the role of direct image with compact support for the open immersion $\mathfrak{Y} \times \mathfrak{Y}' \hookrightarrow \mathfrak{X} \times \mathfrak{Y}'$. We therefore define the Fourier transform with compact supports by setting, for $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$

$$\phi_!\mathcal{E} := p_{2,Z',+}(\mathbb{D}_{Z'} \circ \mathbb{D}_{Z''}(\mathcal{N}_\varpi \otimes_{\mathcal{O}_{\mathfrak{X}\times\mathfrak{X}'}(Z'')_{\mathbb{Q}}} p^!_{1,Z'',Z}(\mathcal{E}[-2N]))).$$

Using the relative duality theorem, we can then show, as in characteristic 0 or in l-adic cohomology, the equality of Fourier transforms with or without support conditions:

Theorem 9.4.6.6. *There exists on $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$ a functorial isomorphism*

$$\phi_!\mathcal{E} \xrightarrow{\sim} \phi_*\mathcal{E}.$$

9.4.6.7. In 1996, Rothstein and Laumon simultaneously constructed a Fourier-Mukai transform for $\mathcal{D}$-modules over a locally noetherian base of characteristic 0. This functor induces an equivalence of categories between quasi-coherent sheaves of $\mathcal{D}$-modules over an abelian variety A and quasi-coherent sheaves of $\mathcal{O}$-modules over its universal vectorial extension $A^\natural$. In the article [Vig22], F. Viguier defines a Fourier-Mukai transform for arithmetic $\mathcal{D}$-modules on an abelian formal scheme $\mathcal{A}$ over $\mathrm{Spf}(\mathcal{V})$ and get some extensions of some classical results of Fourier-Mukai transform to this arithmetic case.

9.5 Frobenius structure

9.5.1 F-complexes

Let $\mathfrak{S}$ be a flat $\mathcal{V}$-formal scheme. Let $\mathfrak{a} \subset \mathfrak{m}$ be an ideal containing p. Fix a PD-ideal $\mathfrak{b} \subset \mathfrak{a}$ (e.g. $\mathfrak{b} = (p)$). Let $m_0 \in \mathbb{N}$ be large enough such that $\mathfrak{b}$ endows $\mathfrak{a}$ with an m_0-PD-structure (see 1.2.4.2.a). Replacing m_0 by m_0+1 if necessary, we can suppose that this structure is topologically m_0-PD-nilpotent. By flatness of the structural morphism $\mathfrak{S} \to \mathrm{Spf}\,\mathcal{V}$ we get that $\mathfrak{b}\mathcal{O}_{\mathfrak{S}}$ endows $\mathfrak{a}\mathcal{O}_{\mathfrak{S}}$ with an m_0-PD-structure. For any integer $i \in \mathbb{N}$, for any flat formal $\mathfrak{S}$-scheme $\mathfrak{X}$, we denote in this subsection by X_i the reduction of $\mathfrak{S}$ modulo $\mathfrak{a}^{i+1}$ (and not $\mathfrak{m}^{i+1}$).

Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. Suppose there exists an automorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining. We denote by $\mathfrak{X}' := \mathfrak{X}^\sigma$ the $\mathcal{V}$-formal scheme deduced from $\mathfrak{X}$ by the base change defined by σ. We denote by $Z' := Z^\sigma$.

Let I be the set the integers $\geq m_0$. We fix $\lambda_0 \in L(I)$. We get the inductive systems indexed by I of the form $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) := \lambda_0^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}$. Finally, we set $\mathcal{D}^{(m)}_{X_i/S_i}(Z) := \mathcal{V}/\pi^{i+1} \otimes_{\mathcal{V}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}(Z) = \mathcal{B}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i/S_i}$ and $\widetilde{\mathcal{D}}^{(m)}_{X_i/S_i}(Z) := \widetilde{\mathcal{B}}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i/S_i}$ for any $m \in \mathbb{N}$. We use similar notation by adding some primes, e.g. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(Z') := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}'}(Z')$.

9.5.1.1. Following 6.1.5.3, for any $i \in \mathbb{N}$, we have the functor $(F^s_{X_0/S_0})^*$ (resp. $(F^s_{X_0/S_0})^\flat$) from the category of left (resp. right) $\mathcal{D}^{(m)}_{X'_i/S_i}(Z')$-modules to that of left (resp. right) $\mathcal{D}^{(m+s)}_{X_i/S_i}(Z)$-modules. To avoid confusion (since m and i vary), we denote this functor by $\widetilde{F}^{*(m)}_{X_i}$ (resp. $\widetilde{F}^{\flat(m)}_{X_i}$).

(a) We set $\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet \to X'_\bullet/S_\bullet}(Z, Z') := \widetilde{F}^{*(\bullet)}_{X_\bullet} \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z)$. Hence, $\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet \to X_\bullet/S_\bullet}(Z', Z)$ is endowed with a structure of $(\widetilde{\mathcal{D}}^{(\bullet+s)}_{X_\bullet/S_\bullet}(Z), \widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z'))$-bimodule. This yields the functor: $\widetilde{F}^{*(\bullet)}_{X_\bullet} \colon D({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z)) \to D({}^{1}\widetilde{\mathcal{D}}^{(\bullet+s)}_{X'_\bullet/S'_\bullet}(Z'))$ which is defined by setting

$$\widetilde{F}^{*(\bullet)}_{X_\bullet}(\mathcal{E}'^{(\bullet)}_\bullet) := \widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet \to X'_\bullet/S_\bullet}(Z, Z') \otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z)} \mathcal{E}'^{(\bullet)}_\bullet, \tag{9.5.1.1.1}$$

where $\mathcal{E}'^{(\bullet)}_\bullet \in D(\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z))$.

(b) For any $* \in \{r, l\}$, the inverse image by Frobenius functor $\widetilde{F}^{(\bullet)}_{\mathfrak{X}} \colon D({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \to D({}^{1}\widetilde{\mathcal{D}}^{(\bullet+s)}_{\mathfrak{X}/\mathfrak{S}}(Z))$ is defined by setting

$$\widetilde{F}^{*(\bullet)}_{\mathfrak{X}}(\mathcal{E}'^{(\bullet)}) := \mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)},*} \circ \widetilde{F}^{*(\bullet)}_{X_\bullet} \circ \mathbb{L}\underleftarrow{l}^{*}_{\mathfrak{X}'^{(I)}}(\mathcal{E}'^{(\bullet)}) \tag{9.5.1.1.2}$$

for any $\mathcal{E}'^{(\bullet)} \in D({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$.

(c) We have a non-completed version of the pullback under Frobenius. With notations 8.8.1.4, we get the $(\widetilde{\mathcal{D}}^{(\bullet+s)}_{\mathfrak{X}/\mathfrak{S}}(Z), \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$-bimodule $(F^{s}_{X_0/S_0})^{*}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$, where $(F^{s}_{X_0/S_0})^{*}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$ is the inductive system with transitive maps $(F^{s}_{X_0/S_0})^{*}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \to (F^{s}_{X_0/S_0})^{*}(\widetilde{\mathcal{D}}^{(m+1)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$ given by functoriality from 8.8.1.4.1. We set

$$(F^{s}_{X_0/S_0})^{*}\mathcal{E}'^{(\bullet)} := (F^{s}_{X_0/S_0})^{*}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \otimes_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')} \mathcal{E}'^{(\bullet)}, \tag{9.5.1.1.3}$$

for any $\mathcal{E}'^{(\bullet)} \in D({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$.

(d) For any $\mathcal{E}'^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$, the canonical morphism

$$(F^{s}_{X_0/S_0})^{*}\mathcal{E}'^{(\bullet)} \to \widetilde{F}^{*(\bullet)}_{\mathfrak{X}}(\mathcal{E}'^{(\bullet)}) \tag{9.5.1.1.4}$$

is an isomorphism, i.e. both functors 9.5.1.1.2 and 9.5.1.1.3 are canonically isomorphic with coherent complexes.

Notation 9.5.1.2. We keep notation 9.5.1.1. The functors 9.5.1.1.1, 9.5.1.1.2, 9.5.1.1.3 induce

$$\widetilde{F}^{*(\bullet)}_{X_\bullet} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z')) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z)). \tag{9.5.1.2.1}$$

$$\widetilde{F}^{*(\bullet)}_{\mathfrak{X}} \colon \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \to \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)), \tag{9.5.1.2.2}$$

$$(F^{s}_{X_0/S_0})^{*} \colon \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \to \underrightarrow{LD}^{-}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)). \tag{9.5.1.2.3}$$

The functors 9.5.1.2.1 and 9.5.1.2.2 are some particular cases of the functors 9.2.2.4. This is not straightforward (but this is likely true) that the functor 9.5.1.2.3 preserves the quasi-coherence. By construction of both functors $(F^{s}_{X_0/S_0})^{*}$ of 9.5.1.2.3 and 8.8.2.4.1, we get for any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$ the canonical isomorphism

$$\underrightarrow{l}^{*}_{\mathbb{Q}} \circ (F^{s}_{X_0/S_0})^{*}\mathcal{E}'^{(\bullet)} \xrightarrow{\sim} (F^{s}_{X_0/S_0})^{*} \circ \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}'^{(\bullet)}). \tag{9.5.1.2.4}$$

Moreover, it follows from 9.5.1.1.4 that, for any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$, the canonical morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$:

$$(F^{s}_{X_0/S_0})^{*}\mathcal{E}'^{(\bullet)} \to \widetilde{F}^{*(\bullet)}_{\mathfrak{X}}(\mathcal{E}'^{(\bullet)}) \tag{9.5.1.2.5}$$

is an isomorphism.

Notation 9.5.1.3. With notation 9.5.1.2, suppose $\mathfrak{S} = \operatorname{Spf} \mathcal{V}$ and $\mathcal{V}$ satisfies properties of 8.8.3.1. Let $\mathcal{E}^{(\bullet)}_\bullet \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$. We denote by $\mathcal{E}^{(\bullet)\sigma}_\bullet$ the object of $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z'))$ induced from $\mathcal{E}^{(\bullet)}_\bullet$ by base change via σ. We set $F^{*}\mathcal{E}^{(\bullet)}_\bullet := \widetilde{F}^{*(\bullet)}_{X_\bullet}(\mathcal{E}^{(\bullet)\sigma}_\bullet)$.

Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$. We denote by $\mathcal{E}^{(\bullet)\sigma}$ the object of $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$ induced from $\mathcal{E}^{(\bullet)}$ by base change via σ. We set $F^{*}\mathcal{E}^{(\bullet)} := \widetilde{F}^{*(\bullet)}_{\mathfrak{X}}(\mathcal{E}^{(\bullet)\sigma})$.

Definition 9.5.1.4. With notation and hypotheses of 9.5.1.3, a "F-complex (or F^s-complex if there is a risk of confusion) of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$" is the data of an object $\mathcal{E}^{(\bullet)}_\bullet \in \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$ together with an isomorphism $\Phi\colon \mathcal{E}^{(\bullet)}_\bullet \xrightarrow{\sim} F^*\mathcal{E}^{(\bullet)}_\bullet$ of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$. A morphism $u\colon (\mathcal{E}^{(\bullet)}_\bullet, \Phi) \to (\mathcal{F}^{(\bullet)}_\bullet, \Psi)$ of F-complexes of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$ is a morphism of complexes of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$ of the form $u\colon \mathcal{E}^{(\bullet)}_\bullet \to \mathcal{F}^{(\bullet)}_\bullet$ such that $\Psi \circ u = F^*(u) \circ \Phi$.

Similarly a "F-complex (or F^s-complex if there is a risk of confusion) of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$" is the data of an object $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$ together with an isomorphism $\Phi\colon \mathcal{E}^{(\bullet)} \xrightarrow{\sim} F^*\mathcal{E}^{(\bullet)}$ of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$. A morphism $u\colon (\mathcal{E}^{(\bullet)}, \Phi) \to (\mathcal{F}^{(\bullet)}, \Psi)$ of F-complexes of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$ is a morphism of complexes of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$ of the form $u\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ such that $\Psi \circ u = F^*(u) \circ \Phi$.

We denote by $F\text{-}\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$ (resp. $F\text{-}\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$) the corresponding category of F-complexes. The functors $\mathbb{R}\underleftarrow{l}_{\mathfrak{X}^{(I)},*}$ and $\mathbb{L}\underleftarrow{l}^*_{\mathfrak{X}^{(I)}}$ induce equivalences of categories between $F\text{-}\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$ and $F\text{-}\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$.

With notation 8.8.3.2, by using 9.5.1.2.4 and 9.5.1.2.5, the equivalence of categories 8.4.1.15 commutes with Frobenius and we get the equivalence of categories:

$$\underrightarrow{l}^*_{\mathbb{Q}}\colon F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)) \cong F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}({}^l\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}}). \tag{9.5.1.4.1}$$

Definition 9.5.1.5 (Tate twist). Let $(\mathcal{E}^{(\bullet)}, \Phi)$ be a F-complex of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$. For any integer d, we define an F-complex of $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$ denoted by $(\mathcal{E}^{(\bullet)}, \Phi)(d) = (\mathcal{E}^{(\bullet)}, \Phi(d))$ called the dth Tate twist of $(\mathcal{E}^{(\bullet)}, \Phi)$ as follows: the underlying complex is $\mathcal{E}^{(\bullet)}$ and $\Phi(d) := q^{-d}\Phi$. The F-complex $(\mathcal{E}^{(\bullet)}, \Phi)(d)$ is called the dth Tate twist of $(\mathcal{E}^{(\bullet)}, \Phi)$. The equivalence of categories 9.5.1.4.1 commutes with the Tate twist (see definition 8.8.3.3), i.e., for any $(\mathcal{E}^{(\bullet)}, \Phi) \in F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^l\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$, we have $\underrightarrow{l}^*_{\mathbb{Q}}((\mathcal{E}^{(\bullet)}, \Phi)(d)) = (\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}, \Phi))(d)$.

9.5.2 Commutations to Frobenius of pullbacks, push forwards, duality, internal or external tensor products for (quasi-)coherent complexes

Let

$$\begin{array}{ccc} \mathfrak{Y} & \xrightarrow{f} & \mathfrak{X} \\ \downarrow{\scriptstyle p_{\mathfrak{Y}}} & & \downarrow{\scriptstyle p_{\mathfrak{X}}} \\ \mathfrak{T} & \xrightarrow{\phi} & \mathfrak{S}, \end{array} \tag{9.5.2.0.1}$$

be a commutative diagram of $\mathcal{V}$-formal schemes, where $p_{\mathfrak{X}}$ and $p_{\mathfrak{Y}}$ are smooth morphisms. We suppose S, T are regular and of finite Krull dimension. Let Z and D be some divisors of respectively X and Y such that $f(Y \setminus D) \subset X \setminus Z$.

We suppose $\mathfrak{S}$, $\mathfrak{T}$ are p-torsion free. Let $\mathfrak{a} \subset \mathfrak{m}$ be an ideal containing p. Fix a PD-ideal $\mathfrak{b} \subset \mathfrak{a}$ (e.g. $\mathfrak{b} = (p)$). Let $m_0 \in \mathbb{N}$ be large enough such that $\mathfrak{b}$ endows $\mathfrak{a}$ with an m_0-PD-structure (see 1.2.4.2.a). Replacing m_0 by m_0+1 if necessary, we can suppose that this structure is topologically m_0-PD-nilpotent. The bottom arrow ϕ can be viewed as an m_0-PD-morphism.

For any integer $i \in \mathbb{N}$, for any flat formal $\mathfrak{V}$-scheme $\mathfrak{E}$, we denote here E_i the reduction of $\mathfrak{S}$ modulo $\mathfrak{a}^{i+1}$ (and not $\mathfrak{m}^{i+1}$).

Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. Suppose there exists an automorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining. We denote by $\mathfrak{X}' := \mathfrak{X}^\sigma$ (resp. $\mathfrak{Y}' := \mathfrak{Y}^\sigma$) the $\mathcal{V}$-formal scheme deduced from $\mathfrak{X}$ (resp. $\mathfrak{Y}$) by the base change defined by σ. We denote by $Z' := (F^s_{X_0/S_0})^{-1}(Z)$, $D' := (F^s_{Y_0/T_0})(D)$, $f'\colon \mathfrak{Y}' \to \mathfrak{X}'$ the morphism induced from f by base change via σ.

Let I be the set the integers $\geq m_0$. We fix $\lambda_0 \in L(I)$. We get the inductive systems indexed by I of the form $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) := \lambda_0^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(Z)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}$. Finally, we set $\mathcal{D}^{(m)}_{X_i/S_i}(Z) := \mathcal{V}/\pi^{i+1} \otimes_{\mathcal{V}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}(Z) = \mathcal{B}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i/S_i}$ and $\widetilde{\mathcal{D}}^{(m)}_{X_i/S_i}(Z) := \widetilde{\mathcal{B}}^{(m)}_{X_i}(Z) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i/S_i}$ for any $m \in \mathbb{N}$.

We use similar notation by adding some primes, e.g. $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(Z') := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}'}(Z')$, or replacing $\mathfrak{X}$ by $\mathfrak{Y}$ and Z by D etc. We keep notation 9.5.1.2 with respect to $\mathfrak{X}/\mathfrak{S}$ and the analogous one for $\mathfrak{Y}/\mathfrak{T}$.

9.5.2.1 (Extraordinary inverse images)**.** With notation 9.5.1.2.1, it follows from 6.2.4.2.1 that for any $\mathcal{E}'^{(\bullet)}_{\bullet} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z'))$ we have the functorial commutation isomorphism in $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{Y_\bullet/T_\bullet}(D))$:

$$(f,\phi)^{(\bullet)!}_{\bullet D,Z} \circ \widetilde{F}^{*}_{X_\bullet}(\mathcal{E}'^{(\bullet)}_{\bullet}) \xrightarrow{\sim} \widetilde{F}^{*}_{Y_\bullet} \circ (f',\phi)^{(\bullet)!}_{\bullet D',Z'}(\mathcal{E}'^{(\bullet)}_{\bullet}). \tag{9.5.2.1.1}$$

Hence, when $\phi = \mathrm{id}$, $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$ and $\mathcal{V}$ satisfies properties of 8.8.3.1, the extraordinary inverse image functor 9.2.1.15.1 induces

$$f^{(\bullet)!}_{\bullet D,Z} \colon F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z)) \to F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{Y_\bullet/T_\bullet}(D)). \tag{9.5.2.1.2}$$

With notation 9.5.1.2.2, it follows from 9.5.2.1.1 that we get for any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$ the isomorphism of $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{T}}(D))$:

$$(f,\phi)^{(\bullet)!}_{D,Z} \circ \widetilde{F}^{*(\bullet)}_{\mathfrak{X}}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \widetilde{F}^{*(\bullet)}_{\mathfrak{Y}} \circ (f',\phi)^{(\bullet)!}_{D',Z'}(\mathcal{E}'^{(\bullet)}). \tag{9.5.2.1.3}$$

Suppose $\phi = \mathrm{id}$, f is smooth, $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$ and $\mathcal{V}$ satisfies properties of 8.8.3.1. We get the functor

$$f^{(\bullet)!}_{D,Z} \colon F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)) \to F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{S}}(D)). \tag{9.5.2.1.4}$$

Moreover, with 9.5.1.4.1, it follows from 9.4.1.7 that we get the functors:

$$f^{(\bullet)!}_{D,Z} \colon F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)) \to F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{T}}(D)), \tag{9.5.2.1.5}$$

$$f^{!}_{D,Z} \colon F\text{-}D_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}(Z)_{\mathbb{Q}}) \to F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{Y}/\mathfrak{T}}(D)_{\mathbb{Q}}). \tag{9.5.2.1.6}$$

9.5.2.2 (Pushforwards)**.** It follows from 6.2.6.2 that for any $\mathcal{F}'^{(\bullet)}_{\bullet} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{Y'_\bullet/T_\bullet}(D'))$ (resp. $\mathcal{F}'^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'/\mathfrak{T}}(D'))$) we have the first (resp. second) functorial commutation isomorphism in $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z'))$ (resp. $\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$):

$$(f,\phi)^{(\bullet)}_{\bullet+Z,D} \circ F^{*}_{Y_\bullet}(\mathcal{F}'^{(\bullet)}_{\bullet}) \xrightarrow{\sim} F^{*}_{X_\bullet} \circ (f',\phi)^{(\bullet)}_{\bullet+Z',D'}(\mathcal{F}'^{(\bullet)}_{\bullet}), \tag{9.5.2.2.1}$$

$$(f,\phi)^{(\bullet)}_{+Z,D} \circ \widetilde{F}^{*(\bullet)}_{\mathfrak{Y}}(\mathcal{F}'^{(\bullet)}) \xrightarrow{\sim} \widetilde{F}^{*(\bullet)}_{\mathfrak{X}} \circ (f',\phi)^{(\bullet)}_{+Z',D'}(\mathcal{F}'^{(\bullet)}). \tag{9.5.2.2.2}$$

Suppose $\phi = \mathrm{id}$, $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$ and $\mathcal{V}$ satisfies properties of 8.8.3.1. This yields the functors of 9.2.4.10 commutes with Frobenius and induce

$$f^{(\bullet)}_{\bullet+Z,D} \colon F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{Y_\bullet/T_\bullet}(D)) \to F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z));$$

$$f^{(\bullet)}_{+Z,D} \colon F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{T}}(D)) \to F\text{-}\underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)).$$

9.5.2.3 (Pushforwards: proper case)**.** Suppose $\phi = \mathrm{id}$, f is proper and $D = f^{-1}(Z)$. Since the coherence is stable under f_{+Z} (see 9.4.2.4), we get from 9.5.2.2.2 and 9.5.1.2.5 the isomorphisms:

$$f^{(\bullet)}_{+Z} \circ (F^{s}_{Y_0/S_0})^{*}(\mathcal{F}'^{(\bullet)}) \xrightarrow{\sim} (F^{s}_{X_0/S_0})^{*} \circ f'^{(\bullet)}_{+Z'}(\mathcal{F}'^{(\bullet)}), \tag{9.5.2.3.1}$$

for any $\mathcal{F}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'/\mathfrak{S}}(D'))$. By using 9.2.4.17 and the equivalence of categories of 8.4.1.15, this yields the isomorphism

$$f_{+Z} \circ (F^{s}_{Y_0/S_0})^{*}(\mathcal{F}') \xrightarrow{\sim} (F^{s}_{X_0/S_0})^{*} \circ f'_{+Z'}(\mathcal{F}'), \tag{9.5.2.3.2}$$

for any $\mathcal{F}' \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{Y}'/\mathfrak{S}}(D')_{\mathbb{Q}})$. With 9.5.1.4.1, when $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$ we get the functors:

$$f^{(\bullet)}_{+Z,D} \colon F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{S}}(D)) \to F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)) \tag{9.5.2.3.3}$$

$$f_{+Z,D} \colon F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{Y}/\mathfrak{S}}(D)_{\mathbb{Q}}) \to F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}(Z)_{\mathbb{Q}}). \tag{9.5.2.3.4}$$

9.5.2.4. The dual functor $\mathbb{D}_{\mathfrak{X},Z}$ (see notation 9.2.4.22.2 commutes canonically with Frobenius. More precisely, denoting by $\widetilde{\mathbb{D}}_{\mathfrak{X}',Z'} = \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}}(Z')_\mathbb{Q}}(-,\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}}(Z')_\mathbb{Q})$, which is canonically isomorphic to the composition of the functors $\mathbb{D}_{\mathfrak{X}',Z'}$ (see notation 9.2.4.22.2), and $-\otimes_{\mathcal{O}_X}\omega_\mathfrak{X}$, we have for any $\mathcal{E}'\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}}(Z')_\mathbb{Q})$ the isomorphisms

$$F^\flat\mathbb{D}_{\mathfrak{X}',Z'}(\mathcal{E}') \underset{4.6.3.6.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}}(Z')_\mathbb{Q}}(\mathcal{E}',F^\flat\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}}(Z')_\mathbb{Q}) \underset{F^*}{\xrightarrow{\sim}}$$
$$\underset{F^*}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}(Z)_\mathbb{Q}}(F^*\mathcal{E}',F^*F^\flat\mathcal{D}^\dagger_{\mathfrak{X}'/\mathfrak{S}}(Z')_\mathbb{Q}) \xrightarrow{\sim} \widetilde{\mathbb{D}}_{\mathfrak{X},Z}(F^*\mathcal{E}'). \tag{9.5.2.4.1}$$

This yields:

$$F^*\mathbb{D}_{\mathfrak{X}',Z'}(\mathcal{E}') \overset{8.8.2.3.1}{\xrightarrow{\sim}} F^\flat\mathbb{D}_{\mathfrak{X}',Z'}(\mathcal{E}')\otimes_{\mathcal{O}_\mathfrak{X}}\omega^{-1}_{\mathfrak{X}/\mathfrak{S}} \overset{9.5.2.4.1}{\xrightarrow{\sim}} \mathbb{D}_{\mathfrak{X},Z}(F^*\mathcal{E}')\otimes_{\mathcal{O}_\mathfrak{X}}\omega^{-1}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} \mathbb{D}_{\mathfrak{X},Z}(F^*\mathcal{E}'). \tag{9.5.2.4.2}$$

9.5.2.5 (Internal tensor products)**.** It follows from 6.2.2.1.1 that for any $\mathcal{E}'^{(\bullet)}_\bullet,\mathcal{F}'^{(\bullet)}_\bullet\in \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{X'_\bullet/S_\bullet}(Z'))$, we have the functorial commutation isomorphism in $\underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))$:

$$F^*_{X_\bullet}(\mathcal{E}'^{(\bullet)}_\bullet)\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_\bullet}(Z)}F^*_{X_\bullet}(\mathcal{F}'^{(\bullet)}_\bullet)\xrightarrow{\sim}F^*_{X_\bullet}(\mathcal{E}'^{(\bullet)}_\bullet\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X'_\bullet}(Z)}\mathcal{F}'^{(\bullet)}_\bullet).$$

When $\mathfrak{S}=\operatorname{Spf}\mathcal{V}$, this yields that the functor of 9.1.1.3.1 induces the following ones:

$$-\otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{X_\bullet}(Z)}-\colon F\text{-}\underrightarrow{LD}^-_\mathbb{Q}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))\times F\text{-}\underrightarrow{LD}^-_\mathbb{Q}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z))\to F\text{-}\underrightarrow{LD}^-_\mathbb{Q}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z)), \tag{9.5.2.5.1}$$
$$-\widehat{\otimes}^{\mathbb{L}}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)}-\colon F\text{-}\underrightarrow{LD}^-_\mathbb{Q}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))\times F\text{-}\underrightarrow{LD}^-_\mathbb{Q}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))\to F\text{-}\underrightarrow{LD}^-_\mathbb{Q}({}^\mathrm{l}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)). \tag{9.5.2.5.2}$$

9.5.2.6 (External tensor products)**.** Let $\mathfrak{X}$ and $\mathfrak{Q}$ be two smooth, quasi-compact and quasi-separated formal schemes over $\mathfrak{S}=\operatorname{Spf}\mathcal{V}$, $p\colon\mathfrak{X}\times_\mathfrak{S}\mathfrak{Q}\to\mathfrak{X}$, $q\colon\mathfrak{X}\times_\mathfrak{S}\mathfrak{Q}\to\mathfrak{Q}$ be the structural maps. Let Z_1 be a divisor of X, Z_2 be a divisor of Q and $Z:=p^{-1}(Z_1)\cup q^{-1}(Z_2)$. Set $\mathfrak{R}:=\mathfrak{X}\times_\mathfrak{S}\mathfrak{Q}$ and $r\colon\mathfrak{X}\times_\mathfrak{S}\mathfrak{Q}\to\mathfrak{S}$ be the structural map.

It follows from 9.5.2.1.2 and 9.5.2.5.1 (resp. 9.5.2.1.4 and 9.5.2.5.2) that for any $\star\in\{\mathrm{qc},\mathrm{coh}\}$, the bifunctor 9.2.5.1.1 (resp. 9.2.5.1.2) induces the bifunctor:

$$-\boxtimes^{\mathbb{L}}_{\mathcal{O}_{S_\bullet},Z_1,Z_2}-\colon F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{X_\bullet/S_\bullet}(Z_1))\times F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{Q_\bullet/S_\bullet}(Z_2))\to F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{R_\bullet}(Z)); \tag{9.5.2.6.1}$$
$$-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_\mathfrak{S},Z_1,Z_2}-\colon F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z_1))\times F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}/\mathfrak{S}}(Z_2))\to F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}}(Z)). \tag{9.5.2.6.2}$$

Via 9.5.1.4.1, this yields the functor:

$$-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_\mathfrak{S},Z_1,Z_2}-\colon F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z_1)_\mathbb{Q})\times F\text{-}D^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}/\mathfrak{S}}(Z_2)_\mathbb{Q})\to F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}({}^\mathrm{l}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{R}}(Z)_\mathbb{Q}). \tag{9.5.2.6.3}$$

9.5.3 Commutation with Frobenius of the pullbacks for complexes of $\mathcal{D}^\dagger$-modules

We keep notation 9.5.2.

9.5.3.1. Let $\mathcal{E}'$ be a p-adically complete (and separated) left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')$-module.

(a) Suppose $F^s_{X_0/S_0}$ has a lifting $F\colon\mathfrak{X}\to\mathfrak{X}'$. The canonical map

$$\mathcal{O}_\mathfrak{X}\otimes_{\mathcal{O}_{\mathfrak{X}'}}\mathcal{E}'\to F^*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')\otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')}\mathcal{E}'$$

is an isomorphism (where the extension $\mathcal{O}_{\mathfrak{X}'}\to\mathcal{O}_\mathfrak{X}$ is given by F). Since F is finite and $\mathcal{E}'$ is p-adically complete (and separated), then the canonical morphism

$$F^*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')\otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')}\mathcal{E}'\to F^*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')\widehat{\otimes}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')}\mathcal{E}' \tag{9.5.3.1.1}$$

is an isomorphism of left $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}/\mathfrak{S}}(Z')$-modules.

(b) Since this is local, we get from (a) that the canonical morphism

$$(F^s_{X_0/S_0})^* \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z') \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')} \mathcal{E}' \to (F^s_{X_0/S_0})^* \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z') \widehat{\otimes}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'/\mathfrak{S}}(Z')} \mathcal{E}' \tag{9.5.3.1.2}$$

is an isomorphism.

9.5.3.2. Since $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')$ is coherent, then following 9.5.1.2.5 we have the isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$:

$$(F^s_{X_0/S_0})^* (\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \to \widetilde{F}^{*(\bullet)}_{\mathfrak{X}} (\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$$

Since $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}(D',Z')$ is (in particular) a p-torsion free, separated complete left $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'/\mathfrak{T}}(D')$-module, then it follows from 9.5.3.1.2 that the canonical morphism

$$(F^s_{Y_0/T_0})^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'/\mathfrak{T}}(D') \otimes_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'/\mathfrak{T}}(D')} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}(D',Z') \to \widetilde{F}^{*(\bullet)}_{\mathfrak{Y}} (\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}(D',Z')), \tag{9.5.3.2.1}$$

where $\widetilde{F}^{*(\bullet)}_{\mathfrak{Y}}$ is the functor defined at 9.5.1.1.2 and $(F^s_{Y_0/T_0})^*$ is that defined at 9.5.1.2.3, is an isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet+s)}_{\mathfrak{Y}/\mathfrak{T}}(D), f'^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$. We have the following isomorphisms of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{T}}(D), f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))$

$$\begin{aligned}
\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}\to\mathfrak{X}/\mathfrak{T}\to\mathfrak{S}}(D,Z) \otimes^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z)} f^{-1}(F^s_{X_0/S_0})^*(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z'))[d_f] &\xrightarrow{\sim} (f,\phi)^{(\bullet)!}_{\mathrm{alg}\,D,Z} \circ \widetilde{F}^{*(\bullet)}_{\mathfrak{X}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \\
\underset{9.2.1.17}{\xrightarrow{\sim}} (f,\phi)^{(\bullet)!}_{D,Z} \circ \widetilde{F}^{*(\bullet)}_{\mathfrak{X}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) &\underset{9.5.2.1.3}{\xrightarrow{\sim}} \widetilde{F}^{*(\bullet)}_{\mathfrak{Y}} \circ (f',\phi)^{(\bullet)!}_{D',Z'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}}(Z')) \\
\underset{9.2.1.17}{\xleftarrow{\sim}} \widetilde{F}^{*(\bullet)}_{\mathfrak{Y}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}(D',Z'))[d_f] &\underset{9.5.3.2.1}{\xleftarrow{\sim}} (F^s_{Y_0/T_0})^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'/\mathfrak{T}}(D') \otimes_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'/\mathfrak{T}}(D')} \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}(D',Z')[d_f].
\end{aligned}$$

By applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$, with notation 8.8.3.1 we get the isomorphism:

$$\begin{aligned}
&\mathcal{D}^{\dagger}_{\mathfrak{Y}\to\mathfrak{X}/\mathfrak{T}\to\mathfrak{S}}({}^{\dagger}D,Z)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Y}/\mathfrak{T}}({}^{\dagger}D)_{\mathbb{Q}}} f^{-1}(F^s_{X_0/S_0})^* \mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}} \\
&\xrightarrow{\sim} (F^s_{Y_0/T_0})^* \mathcal{D}^{\dagger}_{\mathfrak{Y}'/\mathfrak{S}}({}^{\dagger}D')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}'/\mathfrak{S}}({}^{\dagger}D')_{\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}({}^{\dagger}D',Z')_{\mathbb{Q}}.
\end{aligned} \tag{9.5.3.2.2}$$

Lemma 9.5.3.3. *The functor $(f,\phi)^!_{D,Z}$ defined at 9.2.1.21.1 commutes with Frobenius in the sense that we have (with notation 8.8.3.1) the canonical isomorphism*

$$(F^s_{Y_0/T_0})^*(f',\phi)^!_{D',Z'}(\mathcal{E}') \xrightarrow{\sim} (f,\phi)^!_{D,Z}((F^s_{X_0/S_0})^*(\mathcal{E}')), \tag{9.5.3.3.1}$$

for any $\mathcal{E}' \in D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{X}'}({}^{\dagger}Z')_{\mathbb{Q}})$.

Proof. We build 9.5.3.3.1 by composition as follows:

$$\begin{aligned}
&(F^s_{Y_0/T_0})^*(f',\phi)^!_{D',Z'}(\mathcal{E}')[-d_f] \\
&\xrightarrow{\sim} (F^s_{Y_0/T_0})^* \mathcal{D}^{\dagger}_{\mathfrak{Y}'/\mathfrak{T}}({}^{\dagger}D')_{\mathbb{Q}} \otimes_{\mathcal{D}^{\dagger}_{\mathfrak{Y}'/\mathfrak{T}}({}^{\dagger}D')_{\mathbb{Q}}} \left(\mathcal{D}^{\dagger}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}({}^{\dagger}D',Z')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f'^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}}} f'^{-1}\mathcal{E}'\right) \\
&\xrightarrow{\sim} \left((F^s_{Y_0/T_0})^* \mathcal{D}^{\dagger}_{\mathfrak{Y}'/\mathfrak{T}}({}^{\dagger}D')_{\mathbb{Q}} \otimes_{\mathcal{D}^{\dagger}_{\mathfrak{Y}'/\mathfrak{T}}({}^{\dagger}D')_{\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{Y}'\to\mathfrak{X}'/\mathfrak{T}\to\mathfrak{S}}({}^{\dagger}D',Z')_{\mathbb{Q}}\right) \otimes^{\mathbb{L}}_{f'^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}}} f'^{-1}\mathcal{E}' \\
&\underset{9.5.3.2.2}{\xleftarrow{\sim}} \left(\mathcal{D}^{\dagger}_{\mathfrak{Y}\to\mathfrak{X}/\mathfrak{T}\to\mathfrak{S}}({}^{\dagger}D,Z)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Y}/\mathfrak{T}}({}^{\dagger}D)_{\mathbb{Q}}} f^{-1}(F^s_{X_0/S_0})^* \mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}}\right) \otimes^{\mathbb{L}}_{f'^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}}} f'^{-1}\mathcal{E}' \\
&\xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{Y}\to\mathfrak{X}/\mathfrak{T}\to\mathfrak{S}}({}^{\dagger}D,Z)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Y}/\mathfrak{T}}({}^{\dagger}D)_{\mathbb{Q}}} f^{-1}\left((F^s_{X_0/S_0})^* \mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S}}({}^{\dagger}Z')_{\mathbb{Q}}} \mathcal{E}'\right) \\
&\xrightarrow{\sim} (f,\phi)^!_{D,Z}((F^s_{X_0/S_0})^*(\mathcal{E}'))[-d_f].
\end{aligned}$$

□

9.5.3.4. Suppose $\phi = \mathrm{id}$, f is proper, $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$ and $\mathcal{V}$ satisfies properties of 8.8.3.1. Let $\mathcal{E} \in D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$. With notation 8.8.3.1, it follows from 9.5.3.3.1 that we have the isomorphism of $D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}})$:

$$\theta_{f,D,Z} \colon F^* f^!_{D,Z}(\mathcal{E}) \xrightarrow{\sim} f^!_{D,Z}(F^*(\mathcal{E})). \tag{9.5.3.4.1}$$

When $D=f^{-1}(Z)$, we simply write $\theta_{f,Z}$.

Let $g\colon \mathfrak{P}\to\mathfrak{Y}$ be a morphism of smooth $\mathcal{V}$-formal schemes. Let T be a divisor of P such that $g(P\setminus T)\subset Y\setminus D$. Then the canonical isomorphism $g^{!}_{T,D}f^{!}_{D,Z}(\mathcal{E})\xrightarrow{\sim}(f\circ g)^{!}_{T,Z}(\mathcal{E})$ is compatible with Frobenius, i.e., we have the following commutative diagram:

$$\begin{array}{ccccc} F^{*}g^{!}_{T,D}f^{!}_{D,Z}(\mathcal{E}) & \xrightarrow{\theta_{g,T,D}\circ f^{!}_{D,Z}} & g^{!}_{T,D}F^{*}f^{!}_{D,Z}(\mathcal{E}) & \xrightarrow{g^{!}_{T,D}\circ\theta_{f,D,Z}} & g^{!}_{T,D}f^{!}_{D,Z}(F^{*}(\mathcal{E})) \\ \downarrow\wr & & & & \downarrow\wr \\ F^{*}(f\circ g)^{!}_{T,Z}(\mathcal{E}) & & \xrightarrow{\theta_{g\circ f,T,Z}} & & (f\circ g)^{!}_{T,Z}F^{*}(\mathcal{E}). \end{array} \tag{9.5.3.4.2}$$

9.5.4 Compatibility with Frobenius: relative duality isomorphism, adjunction $(f_{+},f^{!})$ for proper morphisms and coherent complexes

With notation 9.5.2, suppose $\phi=\mathrm{id}$, f is proper, $D=f^{-1}(Z)$, $\mathfrak{S}=\operatorname{Spf}\mathcal{V}$ and $\mathcal{V}$ satisfies properties of 8.8.3.1. We have already constructed the isomorphism of commutation to Frobenius of the direct image by f for coherent complexes of $\mathcal{D}^{\dagger}$-modules (see 9.5.2.3.2). We will redefine this isomorphism in paragraph 9.5.2.3.2. The aim of this change is to obtain automatically the Frobenius compatibility of adjunction morphisms between the direct image and the extraordinary inverse image (see 9.5.4.4 and 9.5.4.5) We further obtain the compatibility with the composition of the commutation to Frobenius isomorphism of the direct image (9.5.4.8).

9.5.4.1. Let $\mathcal{F}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}})$, $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$. Following 9.4.5.4.2, we have the functorial in $\mathcal{E}$ and $\mathcal{F}$ canonical adjonction isomorphism of abelian groups:

$$\mathrm{adj}_{f,Z}:\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}}(f_{Z,+}(\mathcal{F}),\mathcal{E})\xrightarrow{\sim}\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}}}(\mathcal{F},f^{!}_{Z}(\mathcal{E})), \tag{9.5.4.1.1}$$

where we set $\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}}}(-,-):=H^{0}\circ\mathbb{R}\mathrm{Hom}_{D(\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}}}(-,-)=\mathrm{Hom}_{D(\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}})}(-,-)$.

Lemma 9.5.4.2. *For any $\mathcal{F}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}})$, we uniquely define a functorial isomorphism in $\mathcal{F}$:*

$$\sigma_{f,Z}\colon F^{*}\circ f_{Z,+}(\mathcal{F})\xrightarrow{\sim}f_{Z,+}\circ F^{*}(\mathcal{F}) \tag{9.5.4.2.1}$$

as being the only one making commutative, for all $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$, the following diagram

$$\begin{array}{ccccc} \mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}}}(\mathcal{F},f^{!}_{Z}\mathcal{E}) & \underset{\sim}{\xrightarrow{F^{*}}} & \mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}}}(F^{*}\mathcal{F},F^{*}\circ f^{!}_{Z}\ E) & \underset{\mathrm{Hom}(\mathrm{id},\theta_{f,Z})}{\xrightarrow{\sim}} & \mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}D)_{\mathbb{Q}}}(F^{*}\mathcal{F},f^{!}_{Z}\circ F^{*}\ E) \\ \mathrm{adj}\uparrow\wr & & & & \mathrm{adj}\uparrow\wr \\ \mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}}(f_{Z,+}\mathcal{F},\mathcal{E}) & \underset{\sim}{\xrightarrow{F^{*}}} & \mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}}(F^{*}\circ f_{Z,+}\mathcal{F},F^{*}\mathcal{E}) & \underset{\mathrm{Hom}(\sigma_{f,Z},\mathrm{id})}{\longleftarrow} & \mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}}(f_{Z,+}\circ F^{*}\mathcal{F},F^{*}\mathcal{E}) \end{array} \tag{9.5.4.2.2}$$

where all arrows are isomorphisms of abelian groups.

Proof. With $\mathcal{F}$ fixed, denote $\phi_{\mathcal{E}}$: $\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}({}^{\dagger}Z)}(F^{*}\circ f_{Z,+}\mathcal{F},F^{*}\mathcal{E})\to\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}({}^{\dagger}Z)}(f_{Z,+}\circ F^{*}\mathcal{F},F^{*}\mathcal{E})$, the unique bijection making the diagram 9.5.4.2.2 commutative. We set $\rho_{f,\,Z}:=\phi_{f_{Z,+}\mathcal{F}}\circ F^{*}(\mathrm{id}_{f_{Z,+}\mathcal{F}})$: $f_{Z,+}F^{*}\mathcal{F}\to F^{*}f_{Z,+}\mathcal{F}$. It remains to verify that $\rho_{f,\,Z}$ is an isomorphism (and then we set $\sigma_{f,\,Z}:=\rho^{-1}_{f,\,Z}$). Now, by functoriality in $\mathcal{E}$, for any morphism u: $f_{Z,+}\mathcal{F}\to\mathcal{E}$, $\phi_{\mathcal{E}}\circ F^{*}(u)$ is the composite morphism: $f_{Z,+}F^{*}\mathcal{F}\xrightarrow{\rho_{f,\,Z}}F^{*}\circ f_{Z,+}\mathcal{F}\xrightarrow{F^{*}(\phi)}F^{*}\mathcal{E}$. Furthermore, as the functor F^{*} induces an equivalence of categories, there exists an object $\mathcal{E}_{0}$ of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}({}^{\dagger}Z))$ and an isomorphism ϵ: $f_{Z,+}F^{*}\mathcal{F}\xrightarrow{\sim}F^{*}\mathcal{E}_{0}$. There is thus a unique morphism u_{0}: $f_{Z,+}\mathcal{F}\to\mathcal{E}_{0}$ such that $F^{*}(u_{0})\circ\rho_{f,\,Z}=\epsilon$. However, noting $\tau_{f,\,Z}:=\epsilon^{-1}\circ F^{*}(u_{0})$: $F^{*}f_{Z,+}\mathcal{F}\to f_{Z,+}F^{*}\mathcal{F}$, it follows: $\tau_{f,\,Z}\circ\rho_{f,\,Z}=\mathrm{id}_{f_{Z,+}F^{*}\mathcal{F}}$. We deduce: $\rho_{f,\,Z}\circ\tau_{f,\,Z}\circ\rho_{f,\,Z}=\rho_{f,\,Z}$ and therefore $\rho_{f,\,Z}\circ\tau_{f,\,Z}=\mathrm{id}_{F^{*}f_{Z,+}\mathcal{F}}$ (by injectivity of $\phi_{f_{Z,+}\mathcal{F}}\circ F^{*}$). □

Remark 9.5.4.3. The lemma 9.5.4.2 corresponds to second way to build the commutation to Frobenius isomorphism $f_{Z+}F^*(\mathcal{E}) \xrightarrow{\sim} F^* f_{Z+}(\mathcal{E})$. This is not clear that both constructions 9.5.2.3.2 and 9.5.4.2.1 coincide. However, when f is a closed immersion, this is already known (see [Car09d, 2.5.4]). Moreover, still when f is a closed immersion, we have established (see [Car09d, 2.4.3]) that, for any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$, the relative duality isomorphism

$$f_{Z,+} \circ \mathbb{D}_D(\mathcal{E}') \xrightarrow{\sim} \mathbb{D}_Z \circ f_{Z,+}(\mathcal{E}')$$

of 9.4.5.2 is compatible with Frobenius.

Since we mainly work with proper morphisms of $\mathcal{V}$-formal scheme, we prefer in this book to use the isomorphism $f_{Z+}F^*(\mathcal{E}) \xrightarrow{\sim} F^* f_{Z+}(\mathcal{E})$ constructed in 9.5.4.2.1

Lemma 9.5.4.4. *Let $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Y}}({}^\dagger D)_{\mathbb{Q}})$. Let us denote by $\mathrm{adj}_{\mathcal{F}} \colon \mathcal{F} \to f^!_Z f_{Z,+}(\mathcal{F})$ the adjunction isomorphism given by 9.5.4.1.1. The morphism $\mathrm{adj}_{\mathcal{F}}$ is compatible with Frobenius, i.e. the following diagram:*

$$\begin{array}{ccc} F^*\mathcal{F} & \xrightarrow{F^*\mathrm{adj}_{\mathcal{F}}} & F^* f^!_Z f_{Z+}\mathcal{F} \\ \| & & \sim\downarrow (f^!_Z\sigma_{f,Z})\circ(\theta_{f,\,Z}f_{Z,+}) \\ F^*\mathcal{F} & \xrightarrow{\mathrm{adj}_{F^*\mathcal{F}}} & f^!_Z f_{Z+}F^*\mathcal{F} \end{array} \tag{9.5.4.4.1}$$

is commutative.

Proof. We have the commutative diagram:

$$\begin{array}{ccccccc} \mathrm{Hom}(\mathcal{F}, f^!_Z, f_{Z+}\mathcal{F}) & \xrightarrow[\sim]{F^*} & \mathrm{Hom}(F^*\mathcal{F}, F^* f^!_Z f_{Z+}\mathcal{F}) & \xrightarrow[\sim]{} & \mathrm{Hom}(F^*\mathcal{F}, f^!_Z F^* f_{Z+}\mathcal{F}) & \xrightarrow[\sim]{} & \mathrm{Hom}(F^*\mathcal{F}, f^!_Z f_{Z+}F^*\mathcal{F}) \\ \mathrm{adj}\uparrow\sim & & & & \mathrm{adj}\uparrow\sim & & \mathrm{adj}\uparrow\sim \\ \mathrm{Hom}(f_{Z+}\mathcal{F}, f_{Z+}\mathcal{F}) & \xrightarrow[\sim]{F^*} & \mathrm{Hom}(F^* f_{Z+}\mathcal{F}, F^* f_{Z+}\mathcal{F}) & \xrightarrow[\sim]{} & \mathrm{Hom}(f_{Z+}F^*\mathcal{F}, F^* f_{Z+}\mathcal{F}) & \xrightarrow[\sim]{} & \mathrm{Hom}(f_{Z+}F^*\mathcal{F}, f_{Z+}F^*\mathcal{F}), \end{array}$$

where the top right arrow is $\mathrm{Hom}(id, f^!_Z\sigma_{f,Z})$ and the bottom right arrow is $\mathrm{Hom}(id, \sigma_{f,Z})$. Indeed, the rectangle on the left is commutative by construction of $\rho_{f,Z}$ (see the diagram 9.5.4.2.2), while the one on the right is verified by functoriality in $\mathcal{E}$ of the adjunction isomorphism $\mathrm{adj}_{f,\,Z}$ (9.5.4.1.1). The application $\mathrm{Hom}(f_{Z+}\mathcal{F}, f_{Z+}\mathcal{F}) \to \mathrm{Hom}(F^*\mathcal{F}, f^!_Z f_{Z+}F^*\mathcal{F})$ induced by the bottom and right path, sends the identity to $\mathrm{adj}_{F^*\mathcal{F}}$. The arrow $\mathrm{Hom}(f_{Z+}\mathcal{F}, f_{Z+}\mathcal{F}) \to \mathrm{Hom}(F^*\mathcal{F}, F^* f^!_Z f_{Z+}\mathcal{F})$ induced by the left vertical and the left top maps sends the identity to $F^*\mathrm{adj}_{\mathcal{F}}$. This results in the commutativity of 9.5.4.4.1. □

Lemma 9.5.4.5. *If $f^!_Z(\mathcal{E})$ has $\mathcal{D}^\dagger_{\mathfrak{Y}}({}^\dagger D)_{\mathbb{Q}}$-coherent cohomology (e.g. if f is smooth) we get from 9.5.4.1.1 the adjunction morphism $\mathrm{adj}_{\mathcal{E}} \colon f_{Z,+}f^!_Z(\mathcal{E}) \to \mathcal{E}$. The morphism $\mathrm{adj}_{\mathcal{E}}$ is compatible with Frobenius, i.e., that the following canonical diagram is commutative:*

$$\begin{array}{ccc} F^* f_{Z+} f^!_Z\mathcal{E} & \xrightarrow{F^*\mathrm{adj}_{\mathcal{E}}} & F^*\mathcal{E} \\ (f_{Z,+}\theta_{f,\,Z})\circ(\sigma_{f,Z})f^!_Z\downarrow\sim & & \| \\ f_{Z+}f^!_Z F^*\mathcal{E} & \xrightarrow{\mathrm{adj}_{F^*\mathcal{E}}} & F^*\mathcal{E}. \end{array}$$

Proof. This is checked similarly to 9.5.4.4. □

We know that the direct image of the composition of two morphisms is isomorphic to the composition of the direct image of these two morphisms. However, the compatibility with Frobenius of this isomorphism does not seem easy. In order to obtain it tautologically (see 9.5.4.8), we will first rebuild this in the context of the proposition which follows.

Proposition 9.5.4.6. Let g: $\mathfrak{P} \to \mathfrak{Y}$ and h: $\mathfrak{Q} \to \mathfrak{P}$ be two proper morphisms of $\mathcal{V}$-smooth formal schemes such that $g^{-1}(D)$ (resp. $h^{-1}g^{-1}(D)$) is a divisor of P (resp. Q). By abuse of notation, we set $D := g^{-1}(D)$ (resp. $D := h^{-1}(D)$). We further assume f smooth.

For all $\mathcal{G} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}(^\dagger D))$, there exists a unique isomorphism $(f \circ g)_{Z,+}(\mathcal{G}) \xrightarrow{\sim} f_{Z,+}g_{D,+}(\mathcal{G})$ functorial in $\mathcal{G}$ and inducing, for all $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(^\dagger Z))$, the commutative diagram:

$$\begin{array}{ccccc}
\mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(^\dagger Z)}((f\circ g)_{D+}\mathcal{G},\mathcal{E}) & & \xrightarrow[\sim]{\mathrm{adj}_{f\circ g}} & & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}(^\dagger D)}(\mathcal{G},(f\circ g)^!_Z\mathcal{E}) \\
\uparrow & & & & \uparrow\wr \\
\mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(^\dagger Z)}(f_{Z+}g_{D+}\mathcal{G},\mathcal{E}) & \xrightarrow[\sim]{\mathrm{adj}_f} & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(^\dagger Z)}(g_{Z+}\mathcal{G},f^!_Z\mathcal{E}) & \xrightarrow[\sim]{\mathrm{adj}_g} & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}(^\dagger D)}(\mathcal{G},g^!_Df^!_Z\mathcal{E})
\end{array}$$

Furthermore, these are "transitive", i.e., if f and g are smooth then, for all $\mathcal{H} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Q}}(^\dagger D')_{\mathbb{Q}})$, the two composite morphisms $(f\circ g\circ h)_{Z,+}(\mathcal{H}) \xrightarrow{\sim} (f\circ g)_{Z,+}\circ h_{D,+}(\mathcal{H}) \xrightarrow{\sim} f_{Z,+}g_{D,+}h_{D,+}(\mathcal{H})$ and $(f\circ g\circ h)_{Z,+}(\mathcal{H}) \xrightarrow{\sim} f_{Z,+}(g\circ h)_{D,+}(\mathcal{H}) \xrightarrow{\sim} f_{Z,+}g_{D,+}h_{D,+}(\mathcal{H})$ are equal.

Proof. First of all, we notice that the diagram of 9.5.4.6 makes sense because, as f is smooth, $f^!_Z(\mathcal{E})$ is $\mathcal{D}^\dagger_{\mathfrak{Y}}(^\dagger D)_{\mathbb{Q}}$-coherent. The first assertion of the proposition is then immediate. Next, consider the following diagram:

$$\begin{array}{ccccccc}
 & & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{Q}}(^\dagger D')_{\mathbb{Q}}}(\mathcal{H},h^!_D(f\circ g)^!_Z\mathcal{E}) & \longrightarrow & & & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{Q}}(^\dagger D')_{\mathbb{Q}}}(\mathcal{H},(f\circ g\circ h)^!_Z\mathcal{E}) \\
 & \nearrow^{\mathrm{adj}_h\circ\mathrm{adj}_{f\circ g}} & \uparrow & & & \nearrow^{\mathrm{adj}_{f\circ g\circ h}} & \uparrow \\
\mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}}((f\circ g)_{Z+}h_{D+}\mathcal{H},\mathcal{E}) & & \longrightarrow & & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}}((f\circ g\circ h)_{Z+}\mathcal{H},\mathcal{E}) & & \\
\uparrow & & & & \uparrow & & \\
 & & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{Q}}(^\dagger D')_{\mathbb{Q}}}(\mathcal{H},h^!_Dg^!_Df^!_Z\mathcal{E}) & \longrightarrow & & & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{Q}}(^\dagger D')_{\mathbb{Q}}}(\mathcal{H},(g\circ h)^!_Df^!_Z\mathcal{E}) \\
 & \nearrow^{\mathrm{adj}_h\circ\mathrm{adj}_g\circ\mathrm{adj}_f} & & & & \nearrow^{\mathrm{adj}_{g\circ h}\circ\mathrm{adj}_f} & \\
\mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}}(f_{Z+}g_{D+}h_{D+}\mathcal{H},\mathcal{E}) & & \longrightarrow & & \mathrm{Hom}_{\mathcal{D}^\dagger_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}}(f_{Z+}(g\circ h)_{D+}\mathcal{H},\mathcal{E}). & &
\end{array}$$

The commutativity of the left square follows from that of the following diagram:

$$\begin{array}{ccccccc}
\mathrm{Hom}((f\circ g)_{D+}h_{D+}\mathcal{H},\mathcal{E}) & & \xrightarrow[\sim]{\mathrm{adj}_{f\circ g}} & & \mathrm{Hom}(h_{D+}\mathcal{H},(f\circ g)^!_Z\mathcal{E}) & \xrightarrow[\sim]{\mathrm{adj}_h} & \mathrm{Hom}(\mathcal{H},h^!_D(f\circ g)^!_Z\mathcal{E}) \\
\uparrow\wr & & & & \uparrow\wr & & \uparrow\wr \\
\mathrm{Hom}(f_{Z+}g_{D+}h_{D+}\mathcal{H},\mathcal{E}) & \xrightarrow[\sim]{\mathrm{adj}_f} & \mathrm{Hom}(g_{D+}h_{D+}\mathcal{H},f^!_Z\mathcal{E}) & \xrightarrow[\sim]{\mathrm{adj}_g} & \mathrm{Hom}(h_{D+}\mathcal{H},g^!_Df^!_Z\mathcal{E}) & \xrightarrow[\sim]{\mathrm{adj}_h} & \mathrm{Hom}(\mathcal{H},h^!_Dg^!_Df^!_Z\mathcal{E}),
\end{array}$$

where, substituting $h_{D+}\mathcal{H}$ for $\mathcal{G}$, the rectangle on the left is, by construction, that of the proposition 9.5.4.6, while the commutativity of the right square is verified by functoriality of the isomorphism $g^!_Df^!_Z\mathcal{E} \xrightarrow{\sim} (f\circ g)^!_Z\mathcal{E}$.

In the same way, we see that the right, top and bottom squares are commutative. As the one at the bottom is also and the arrow at the top right is an isomorphism, this results in the commutativity of the square in front. $\square$

Remark 9.5.4.7. We keep the notations of 9.5.4.6, but we replace the hypothesis that "f smooth" by the fact property "$f^!_Zf_{Z,+}g_{D,+}(\mathcal{G})$ is $\mathcal{D}^\dagger_{\mathfrak{Y}}(^\dagger D)_{\mathbb{Q}}$-coherent". (For example, if $\mathcal{G}$ is a complex $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger D)_{\mathbb{Q}}$-overcoherent (see 15.3.6) then the condition "$f^!_Zf_{Z,+}g_{D,+}(\mathcal{G})$ is $\mathcal{D}^\dagger_{\mathfrak{Y}}(^\dagger D)_{\mathbb{Q}}$-coherent" is checked.) With this hypothesis, the diagram of 9.5.4.6 is still valid if we choose $\mathcal{E} = f_{Z,+}g_{D,+}(\mathcal{G})$. Hence, the image of the identity of $f_{Z,+}g_{D,+}(\mathcal{G})$ by the left bijection of diagram 9.5.4.6 provides a morphism $(f\circ g)_{Z,+}(\mathcal{G}) \to f_{Z,+}g_{D,+}(\mathcal{G})$. Furthermore, since $f^!_Z(f\circ g)_{Z,+}(\mathcal{G})$ is also $\mathcal{D}^\dagger_{\mathfrak{Y}}(^\dagger D)_{\mathbb{Q}}$-coherent, by taking $\mathcal{E} = (f\circ g)_{Z,+}(\mathcal{G})$ in the diagram 9.5.4.6, we construct an inverse. Modulo this condition, the proposition 9.5.4.6 (and also 9.5.4.8) then still remains valid when f and g are any two proper morphisms.

Proposition 9.5.4.8. Let g: $\mathfrak{P} \to \mathfrak{Y}$ be a proper morphism of $\mathcal{V}$-smooth formal schemes such that $g^{-1}(D)$ is a divisor of P. We assume f smooth. The isomorphism $(f\circ g)_{Z,+} \xrightarrow{\sim} f_{Z,+}\circ g_{D,+}$ constructed in 9.5.4.6 is then compatible with Frobenius, i.e. ,

$$\begin{array}{ccccc} F^* f_{Z+} g_{D,+}(\mathcal{E}) & \xrightarrow{\sigma_{f,Z}\circ g_{D,+}} & f_{Z,+}F^* g_{D,+}(\mathcal{E}) & \xrightarrow{f_{Z,+}\circ\sigma_{g,D}} & f_{Z,+}g_{D,+}F^*(\mathcal{E}) \\ \downarrow\sim & & & & \downarrow\sim \\ F^*(f\circ g)_{Z,+}(\mathcal{E}) & & \xrightarrow{\sigma_{f\circ g,Z}} & & (f\circ g)_{Z,+}F^*(\mathcal{E}) \end{array} \tag{9.5.4.8.1}$$

which can be translated (by abuse of notation) by the following equality: $(f_{Z,+}\circ\sigma_{g,D})\circ(\sigma_{f,Z}\circ g_{D,+}) = \sigma_{f\circ g,Z}$.

Proof. For all $\mathcal{G}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}D)_{\mathbb{Q}})$ and $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}})$, we verify that the following diagram

$$\begin{array}{ccccc}
\mathrm{Hom}(F^*(f\circ g)_{Z+}\mathcal{G},F^*\mathcal{E}) & & \xrightarrow{F^*\mathrm{adj}_{f\circ g}} & & \mathrm{Hom}(F^*\mathcal{G},F^*(f\circ g)^!_Z\mathcal{E}) \\
\downarrow & & & & \downarrow \\
\mathrm{Hom}(F^*f_{Z+}g_{D+}(\mathcal{G}),F^*\mathcal{E}) & \xrightarrow{F^*\mathrm{adj}_f} & \mathrm{Hom}(F^*g_+\mathcal{G},F^*f^!_Z\mathcal{E}) & \xrightarrow{F^*\mathrm{adj}_g} & \mathrm{Hom}(F^*\mathcal{G},F^*g^!_Df^!_Z\mathcal{E}) \\
 & & \searrow & & \searrow \\
 & & & \mathrm{Hom}(g_{D+}F^*\mathcal{G},F^*f^!_Z\mathcal{E}) \xrightarrow{\mathrm{adj}_g} & \mathrm{Hom}(F^*\mathcal{G},g^!_DF^*f^!_Z\mathcal{E}) \\
\downarrow & & \downarrow & \downarrow & \downarrow \\
\mathrm{Hom}(f_{Z+}F^*g_{D+}(\mathcal{G}),F^*\mathcal{E}) & \xrightarrow{\mathrm{adj}_f} & \mathrm{Hom}(F^*g_{D+}\mathcal{G},f^!_ZF^*\mathcal{E}) & & \\
\searrow & & \searrow & & \\
\mathrm{Hom}(f_{Z+}g_{D+}F^*\mathcal{G},F^*\mathcal{E}) & \xrightarrow{\mathrm{adj}_f} & \mathrm{Hom}(g_{D+}F^*\mathcal{G},f^!_ZF^*\mathcal{E}) & \xrightarrow{\mathrm{adj}_g} & \mathrm{Hom}(F^*\mathcal{G},g^!_Df^!_ZF^*\mathcal{E}) \\
\downarrow & & & & \downarrow \\
\mathrm{Hom}((f\circ g)_{Z+}F^*\mathcal{G},F^*\mathcal{E}) & & \xrightarrow{\mathrm{adj}_{f\circ g}} & & \mathrm{Hom}(F^*\mathcal{G},(f\circ g)^!_ZF^*\mathcal{E}),
\end{array} \tag{9.5.4.8.2}$$

is commutative. Indeed, the top and bottom rectangles are commutative by construction (9.5.4.6), the middle and left diamond as well as the right square are by functoriality while that of the left square and the right diamond results from 9.5.4.2.2. Now, the isomorphism $(f\circ g)_{Z+}F^*(\mathcal{G})\xrightarrow{\sim}F^*(f\circ g)_{Z+}(\mathcal{G})$ is the unique morphism making commutative the following diagram:

$$\begin{array}{ccc} \mathrm{Hom}(F^*(f\circ g)_{Z+}\mathcal{G},F^*\mathcal{E}) & \underset{\sim}{\xrightarrow{F^*\mathrm{adj}_{f\circ g}}} & \mathrm{Hom}(F^*\mathcal{G},F^*(f\circ g)^!_Z\mathcal{E}) \\ \vdots & & \downarrow\sim \\ \mathrm{Hom}((f\circ g)_{Z+}F^*\mathcal{G},F^*\mathcal{E}) & \underset{\sim}{\xrightarrow{\mathrm{adj}_{f\circ g}}} & \mathrm{Hom}(F^*\mathcal{G},(f\circ g)^!_ZF^*\mathcal{E}). \end{array} \tag{9.5.4.8.3}$$

It results from the Frobenius compatibility of the canonical isomorphism $g^!_D\circ f^!_Z\xrightarrow{\sim}(f\circ g)^!_Z$ (see 9.5.3.4.2) that the right arrow of 9.5.4.8.3 is the right composite morphism of 9.5.4.8.2. Hence we are done. □

Chapter 10

Overconvergent isocrystals

Let $\mathfrak{S}$ be a $\mathcal{V}$-formal scheme locally of finite type and S be its special fiber. For rigid geometry we refer to [BGR84], [Ber96b, §0] , [LS07] or [dJ95, §7] .

10.1 Overconvergent sections

In this section, we summarize the construction and consequences of the functor $j^{\dagger}$. These results are due to Berthelot [Ber90], [Ber96b] which contain all the proofs; but see also Le Stum [LS07].

10.1.1 Specialisation morphism, tubes, strict neighborhood

10.1.1.1. For a $\mathcal{V}$-formal scheme $\mathcal{X}$ locally of finite type, let $\mathcal{X}_K$ be the set of closed subschemes Z of $\mathfrak{X}$ which are integral, finite and flat over $\mathcal{V}$. The support of such a subscheme Z is closed point of $\mathfrak{X}$, which we call the specialization of the point $x \in \mathfrak{X}$ corresponding to Z. This yields the map

$$\mathrm{sp}\colon \mathfrak{X}_K \to \mathfrak{X}. \tag{10.1.1.1.1}$$

We define on $\mathfrak{X}_K$ a structure of rigid analytic space as follows:

Proposition 10.1.1.2. *Let $\mathfrak{X}$ be a $\mathcal{V}$-formal scheme locally of finite type.*

(i) There exists on $\mathfrak{X}_K$ a unique structure of quasi-separated rigid analytic variety over K and a map $sp : \mathfrak{X}_K \to \mathfrak{X}$ satisfying the following:

- *(a) the inverse image by the map $\mathrm{sp} : \mathfrak{X}_K \to \mathfrak{X}$ of any open (resp. open covering) of $\mathfrak{X}$ is an open (resp. admissible covering) of $\mathfrak{X}_K$;*
- *(b) for any affine open $\mathfrak{U} = \mathrm{Spf}\, A \subset \mathfrak{X}$, the structure induced by $\mathfrak{X}_K$ on $\mathfrak{U}_K = \mathrm{sp}^{-1}U$ coincide with that defined by $Spm(\, A \otimes K)$.*

(ii) The application sp of 10.1.1.1.1 defines in a natural way a morphism of ringed sites ([SGA4.2, IV 4.9]) .

(iii) Let $\mathfrak{X}, \mathfrak{X}'$ be two $\mathcal{V}$-formal schemes locally of finite presentation. For any formal scheme morphism $u : \mathfrak{X} \to \mathfrak{X}'$ the diagram of ringed topoi commutes

$$\begin{array}{ccc} \mathfrak{X} & \xleftarrow{\mathrm{sp}} & \mathfrak{X}_K \\ {\scriptstyle u}\downarrow & & \downarrow{\scriptstyle u_K} \\ \mathfrak{X}' & \xleftarrow{\mathrm{sp}} & \mathfrak{X}'_K \end{array} .$$

10.1.1.3 (Tubes)**.** Let $\mathfrak{P}$ be a $\mathcal{V}$-formal scheme locally of finite type. Let X (resp. U) be a closed (resp. open) subscheme of P. Set $Y = X \cap U$. We write $]Y[_{\mathfrak{P}}$ (or sometimes simply $]Y[$) for the inverse image $\mathrm{sp}^{-1}(Y)$ which we shall call the tube of Y where $\mathrm{sp}\colon \mathfrak{P}_K \to \mathfrak{P}$ is the specialization morphism (see 10.1.1.1.1). We say that $]Y[_{\mathfrak{P}}$ is the tube of Y in $\mathfrak{P}$. This tube is a rigid analytic subvariety of $\mathfrak{P}_K$ which has the following local description: suppose $\mathfrak{P} = \operatorname{Spf} A$ is a formal affine $\mathfrak{S}$-scheme and there exist sections $f_1, \ldots, f_r,\ g_1, \ldots, g_s \in \Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P}})$ with reductions $\bar{f}_1, \ldots, \bar{f}_r,\ \bar{g}_1, \ldots, \bar{g}_s \in \Gamma(P, \mathcal{O}_P)$ such that $Y = X \cap U$ with $X = V(\bar{f}_1, \ldots, \bar{f}_r)$ and $U = D(\bar{g}_1) \cup \ldots \cup D(\bar{g}_s)$, then

$$]Y[_{\mathfrak{P}} := \{x \in \mathfrak{P}_K, |f_1(x)|, \ldots, |f_r(x)| < 1 \text{ and } \exists\, j \in \{1, \ldots, s\}, |g_j(x)| = 1\}.$$

For any real $|\pi| \leq \eta < 1$ (resp. $|\pi| \leq \eta < 1$), we can define by gluing the closed (resp. open) tube of radius η of X in P, which is a rigid analytic subvariety of $\mathfrak{P}_K$. More precisely, in the above local description, we define

$$[X]_{\mathfrak{P}\eta} := \{x \in \mathfrak{P}_K, |f_1(x)|, \ldots, |f_r(x)| \leq \eta\}$$

and

$$]X[_{\mathfrak{P}\eta} := \{x \in \mathfrak{P}_K, |f_1(x)|, \ldots, |f_r(x)| < \eta\}.$$

Since $|\pi| \leq \eta < 1$ (resp. $|\pi| \leq \eta < 1$), we check that the closed (resp. open) tube of radius η do not depend on the choice of such $f_1, \ldots, f_r$ and therefore we can glue.

Definition 10.1.1.4. We define the category of $\mathfrak{S}$-frames as follows:

(a) By an $\mathfrak{S}$-frame we shall mean a commutative diagram

$$\begin{array}{ccccc} Y & \overset{j}{\hookrightarrow} & X & \overset{i}{\hookrightarrow} & \mathfrak{P} \\ \downarrow{\scriptstyle w} & & \downarrow{\scriptstyle v} & & \downarrow{\scriptstyle u} \\ S & = & S & \longrightarrow & \mathfrak{S} \end{array}$$

where u is an adic morphism of formal schemes of finite type, i is a closed immersion of formal schemes, j is an open immersion of S-schemes, v and w are of finite type. When u is affine we say that this an affine $\mathfrak{S}$-frame. We write this data as $(Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ or simply $(Y, X, \mathfrak{P})/\mathfrak{S}$ or even $(Y, X, \mathfrak{P})$.

(b) A morphism $f = (w, v, u)\colon (Y' \xrightarrow{j'} X' \xrightarrow{i'} \mathfrak{P}')/\mathfrak{S} \to (Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ of $\mathfrak{S}$-frames is a commutative diagram (over $\mathfrak{S}$)

$$\begin{array}{ccccc} Y' & \overset{j'}{\hookrightarrow} & X' & \overset{i'}{\hookrightarrow} & \mathfrak{P}' \\ {\scriptstyle w}\downarrow & & \downarrow{\scriptstyle v} & & \downarrow{\scriptstyle u} \\ Y & \overset{j}{\hookrightarrow} & X & \overset{i}{\hookrightarrow} & \mathfrak{P}. \end{array} \tag{10.1.1.4.1}$$

When u is smooth in a neighbourhood of Y' (resp. u is quasi-compact, resp. u is affine) we say that the morphism (w, v, u) is weakly smooth (resp. quasi-compact, resp. affine). Beware in [LS07, 3.3.5] this is called "smooth" and not weakly smooth (in order to get a coherent notion with smooth d-frames of 12.2.1.1 or of c-frames of 16.2.1.8). When v is proper (resp. finite, resp. projective), we say that f is proper (resp. finite, resp. projective).

The category of $\mathfrak{S}$-frames as the final object $(S, S, \mathfrak{S})$. By definition, an $\mathfrak{S}$-frame is weakly smooth (resp. quasi-compact, resp. affine, resp. proper) if so is its structural morphism toward the final object.

10.1.1.5. Let $(Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ be an $\mathfrak{S}$-frame. We say an admissible open subset V of $]X[$ is a "strict neighborhood of $]Y[_{\mathfrak{P}}$ in $]X[_{\mathfrak{P}}$" if $]X[= V \cup]X \setminus Y[$ is an admissible covering in the rigid topology.

Example 10.1.1.6. Let $(Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ be a quasi-compact $\mathfrak{S}$-frame and Z be the complement for X in Y Then, for $\lambda < 1$, $]X[_{\mathfrak{P}} \setminus]Z[_{\mathfrak{P}\lambda}$ is a strict neighborhood of $]Y[_{\mathfrak{P}}$ in $]X[_{\mathfrak{P}}$ (see [LS07, 3.3.1]).

The proposition 10.1.1.7 below describes strict neighborhoods.

Proposition 10.1.1.7. *Let* $(Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ *be a quasi-compact* $\mathfrak{S}$*-frame and* Z *be the complement for* X *in* Y*. For any* $\lambda, \eta < 1$*, we write*

$$V^\lambda :=]X[_{\mathfrak{P}} \backslash]Z[_{\mathfrak{P}\lambda}, \qquad V^\lambda_\eta := [X]_{\mathfrak{P}\eta} \cap V^\lambda.$$

If V *is an admissible open subset of* $]X[_{\mathfrak{P}}$*, the following are equivalent:*

(a) V *is a strict neighborhood of* $]Y[_{\mathfrak{P}}$ *in* $]X[_{\mathfrak{P}}$*.*

(b) For any affinoid open subset $W \subset]X[_{\mathfrak{P}}$*, there exists* $\lambda < 1$ *such that*

$$V^\lambda \cap W \subset V.$$

(c) For any quasi-compact admissible open subset $W \subset]X[_{\mathfrak{P}}$*, there exists* $\lambda < 1$ *such that*

$$V^\lambda \cap W \subset V.$$

(d) For any $\eta < 1$*, there exists* $\lambda < 1$ *such that*

$$V^\lambda_\eta \subset V.$$

Proof. A proof is given at [LS07, 3.3.2]. □

10.1.2 Adding overconvergent singularities: the functor $j^\dagger$

10.1.2.1. Suppose we have a frame $Y \xrightarrow{j} X \to \mathfrak{P}$. Let V be an admissible open subset of $]X[$, A be a sheaf of (not necessarily commutative) ring on V and $\mathcal{E}$ an A-module. Define

$$j^\dagger_V \mathcal{E} := \varinjlim j_{VV'*} j^{-1}_{VV'} \mathcal{E}$$

where V' runs through all the strict neighborhoods of $]Y[$ in $]X[$ and

$$j_{VV'} : V \cap V' \hookrightarrow V$$

denotes the inclusion map. This sheaf $j^\dagger_V \mathcal{E}$ on V is called the "sheaf of germs of sections of the sheaf $\mathcal{E}$ on V overconvergent along $Z := X \setminus Y$". If W is a quasi-compact open subset of V then

$$\Gamma(W, j^\dagger_V \mathcal{E}) = \varinjlim_{V' \subset V} \Gamma(W \cap V', \mathcal{E}), \tag{10.1.2.1.1}$$

where V' runs through all the strict neighborhoods of $]Y[$ in $]X[$.

Let $j_V : V \to]X[$, define $j^\dagger \mathcal{E} := j_{V*} j^\dagger_V \mathcal{E}$. Suppose we have strict neighborhoods $W \subset V$ of $]Y[$ in $]X[$. Then the functor $j^\dagger$ does not change if we replace V by W.

Example 10.1.2.2. Let $\mathfrak{X}$ be a $\mathcal{V}$-formal scheme. Let Z be a divisor of X, $\mathfrak{Y}$ be the open of $\mathfrak{X}$ complementary to the support of Z and $j \colon \mathfrak{Y} \to \mathfrak{X}$ be the canonical morphism. We have $\mathfrak{Y}_{\mathfrak{X}} =]Y[_{\mathfrak{X}}$ and $\mathfrak{X}_K =]X[_{\mathfrak{X}}$. For any $m \in \mathbb{N}$, we set $\lambda_m := p^{-1/p^{m+1}}$, $V_m := \mathfrak{X}_K \backslash]Z[_{\mathfrak{X}\lambda_m}$ and $j_m \colon V_m \to \mathfrak{X}_K$ be the canonical immersion. Then it follows from 10.1.1.7 that the family V_m forms a basis of strict neighborhoods of $\mathfrak{Y}_K$ in $\mathfrak{X}_K$.

Let V be a strict neighborhood of $]Y[_{\mathfrak{P}}$ in $]X[_{\mathfrak{P}}$ and E be an $\mathcal{O}_V$-module. Hence, by definition of the functor $j^\dagger$ (see 10.1.2.1), we get

$$j^\dagger E \xrightarrow{\sim} \varinjlim_m j_{m*}(E|V_m \cap V). \tag{10.1.2.2.1}$$

Proposition 10.1.2.3. We keep notation 10.1.2.2.

(a) There exist canonical isomorphisms of $\mathcal{O}_{\mathfrak{X}}$-algebras

$$\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}} \xrightarrow{\sim} \mathrm{sp}_* j_{m*} j^*_m \mathcal{O}_{\mathfrak{X}_K}, \qquad \mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \xrightarrow{\sim} \mathrm{sp}_* j^\dagger \mathcal{O}_{\mathfrak{X}_K}. \tag{10.1.2.3.1}$$

(b) The functor $(\mathrm{sp} \circ j_m)_*$ induces a equivalence between coherent (resp. locally free of finite type) $\mathcal{O}_{V_m}$-modules and coherent (resp. locally projective of finite type) $\mathcal{B}^{(m)}_{\mathfrak{X}}(Z)_{\mathbb{Q}}$-modules.

(c) The functors sp_* and sp^* induce quasi-inverse equivalences between coherent (resp. locally free of finite type) $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-modules and coherent (resp. locally projective of finite type) $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$-modules.

(d) Let E be a coherent $j^\dagger \mathcal{O}_{]X[_{\mathfrak{X}}}$-module, let E_m be a coherent $\mathcal{O}_{V_m}$-module. For any integer $n \neq 0$,

$$H^n \mathbb{R}(\mathrm{sp} \circ j_m)_*(E_m) = 0, \qquad H^n \mathbb{R}\mathrm{sp}_*(E) = 0. \tag{10.1.2.3.2}$$

Proof. By copying the proof of [Ber96c, 4.3.2 and 4.4.2], we get the first statements. The check of the last one is similar: when $\mathfrak{X}$ is affine and there exists $\overline{f} \in \mathcal{O}_X$ giving an equation of Z in X, then $\mathfrak{X}_K$ and V_m are affinoid. Hence, using Kiehl's theorem A and B (see [Kie67]), we get 10.1.2.3.2. □

Notation 10.1.2.4. Let $f = (w, v, u)\colon (Y' \xrightarrow{j'} X' \xrightarrow{i'} \mathfrak{P}')/\mathfrak{S} \to (Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ be a morphism of $\mathfrak{S}$-frames. We denote by $(v,u)_K \colon]X'[_{\mathfrak{P}'} \to]X[_{\mathfrak{P}}$. By abuse of notation (when u is understood), we can write v_K instead of $(v,u)_K$. This yields the inverse image by setting for any $\mathcal{O}_{]X[_{\mathfrak{P}}}$-module E

$$v_K^* E = \mathcal{O}_{]X'[_{\mathfrak{P}'}} \otimes_{v_K^{-1}\mathcal{O}_{]X[_{\mathfrak{P}}}} v_K^{-1} E. \tag{10.1.2.4.1}$$

When i and i' are the canonical inclusions of the special fibers $P \hookrightarrow \mathfrak{P}$ and $P' \hookrightarrow \mathfrak{P}'$, then $u_K^* = v_K^*$.

Proposition 10.1.2.5. *Given a frame $Y \subset X \subset \mathfrak{P}$. Let V be a strict neighbourhood of $]Y[$ in $]X[$ and E be an $\mathcal{O}_V$-module.*

(a) (i) The canonical homomorphism $E \to j_V^\dagger E$ is an epimorphism. If E is a $j_V^\dagger \mathcal{O}_V$-module then this is an isomorphism.

(ii) The canonical homomorphism $E \otimes_{\mathcal{O}_V} j_V^\dagger \mathcal{O}_V \to j_V^\dagger E$ is an isomorphism.

(iii) The functors $j_V^\dagger$ and $j^\dagger$ are exact on the category of $\mathcal{O}_V$-modules.

(b) Let $f = (w, v, u)\colon (Y' \xrightarrow{j'} X' \xrightarrow{i'} \mathfrak{P}')/\mathfrak{S} \to (Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ be a morphism of $\mathfrak{S}$-frames, V' a strict neighborhood of $]Y'[_{\mathfrak{P}'}$ in $]X'[_{\mathfrak{P}'}$ such that $u_K(V') \subset V$. Let $f_{V',V} \colon V' \to V$ be the morphism induced by u_K. Then there exist canonical $\mathcal{O}_V$-linear homomorphisms

$$j_V^\dagger E \to f_{V'V*} j'^\dagger_{V'} f_{V'V}^{-1} E, \qquad j^\dagger E \to v_{K*} j'^\dagger f_{V'V}^{-1} E. \tag{10.1.2.5.1}$$

If moreover we suppose that $Y' = Y \times_X X'$, then the induced homomorphisms

$$f_{V'V*} j_V^\dagger E \to j'^\dagger_{V'} f_{V'V}^* E, \qquad v_K^* j^\dagger E \to j'^\dagger f_{V'V}^* E \tag{10.1.2.5.2}$$

are isomorphisms.

(c) Suppose we have a morphism of frames

$$\begin{array}{ccccc} Y' & \xhookrightarrow{j'} & X' & \xhookrightarrow{i'} & \mathfrak{X}' \\ \downarrow{\scriptstyle w} & & \downarrow{\scriptstyle v} & & \downarrow{\scriptstyle u} \\ Y & \xhookrightarrow{j} & X & \xhookrightarrow{i} & \mathfrak{X} \end{array},$$

where i, i' are the canonical inclusions of the special fibers and $u : \mathfrak{X}' \to \mathfrak{X}$ is an open immersion. Let F be an $\mathcal{O}_{\mathfrak{X}'_K}$-module. Then the canonical homomorphism

$$u_{K*} j'^\dagger F \to j^\dagger u_{K*} j'^\dagger F \tag{10.1.2.5.3}$$

is an isomorphism. Moreover if $Y' = Y \cap \mathfrak{X}'$ then we have canonical isomorphism

$$j^\dagger u_{K*} F \to u_{K*} j'^\dagger F. \tag{10.1.2.5.4}$$

Proof. See [Ber96b, 2.1.3-4] and [Ber90, 4.1.2]. □

Definition 10.1.2.6. Let $f = (w, v, u)\colon (Y' \xrightarrow{j'} X' \xrightarrow{i'} \mathfrak{P}')/\mathfrak{S} \to (Y \xrightarrow{j} X \xrightarrow{i} \mathfrak{P})/\mathfrak{S}$ be a morphism of $\mathfrak{S}$-frames. With notation 10.1.2.4.1, we get a functor f_K^*, from the category of $j^\dagger \mathcal{O}_{]X[_{\mathfrak{P}}}$-modules to that of $j'^\dagger \mathcal{O}_{]X'[_{\mathfrak{P}'}}$-modules which is defined for any $j^\dagger \mathcal{O}_{]X[_{\mathfrak{P}}}$-module E by setting

$$f_K^* E := j'^\dagger v_K^* E. \qquad (10.1.2.6.1)$$

The functor f_K^* is the *(overconvergent) pullback by the morphism of frames f*. By abuse of notation (when v and w are understood), we can write $u^\dagger E$ instead of $f_K^* E$.

10.1.3 Sheaves of section supported on a tube

Proposition 10.1.3.1. *Given a frame $Y \subset X \subset \mathfrak{P}$. Let V be a strict neighbourhood of $]Y[$ in $]X[$ and E a coherent $\mathcal{O}_V$-module. Write $u :]Y[\to V$ for the immersion. Then the canonical homomorphism $j_V^\dagger E \to u_* u^* E$ is injective.*

Proof. Exercice. □

Definition 10.1.3.2. Given a frame $Y \subset X \subset \mathfrak{P}$, put $Z = X \setminus Y$. Let V be a strict neighbourhood of $]Y[$ in $]X[$, A a sheaf of rings on V and E an A-module. Define a subsheaf $\underline{\Gamma}^\dagger_{]Z[_\mathcal{P}} E$ of E by the following exact sequence

$$0 \longrightarrow \underline{\Gamma}^\dagger_{]Z[_\mathcal{P}}(E) \longrightarrow E \longrightarrow j_V^\dagger E \longrightarrow 0. \qquad (10.1.3.2.1)$$

That is $\underline{\Gamma}^\dagger_{]Z[_\mathcal{P}} E = \mathrm{Ker}(E \to j_V^\dagger E)$ and we say $\underline{\Gamma}^\dagger_{]Z[_\mathcal{P}} E$ is the sheaf of sections of E with support in $]Z[$. We can simply write $\underline{\Gamma}^\dagger_{]Z[}$ instead of $\underline{\Gamma}^\dagger_{]Z[_\mathcal{P}}$.

It follows from Proposition 10.1.2.5.a.iii) that the functor $\underline{\Gamma}^\dagger_{]Z[}$ is exact.

Lemma 10.1.3.3. *Let Y_1, Y_2 be two open subschemes of X with complements Z_1, Z_2 and let $Y = Y_1 \cup Y_2$, $Z = Z_1 \cap Z_2$, $Y' = Y_1 \cap Y_2$, $Z' = Z_1 \cup Z_2$, j_1, j_2, j' the immersions of Y_1, Y_2, Y' in X. Let V be a strict neighbourhood of $]Y[$ (so also of $]Y_1[$, $]Y_2[$, $]Y'[$) in $]X[$, A a sheaf of rings on V. Then there exists isomorphisms of functors:*
(i) $j_1^\dagger \circ j_2^\dagger = j_2^\dagger \circ j_1^\dagger = j'^\dagger$
(ii) $\underline{\Gamma}^\dagger_{]Z_1[} \circ \underline{\Gamma}^\dagger_{]Z_2[} = \underline{\Gamma}^\dagger_{]Z_2[} \circ \underline{\Gamma}^\dagger_{]Z_1[} = \underline{\Gamma}^\dagger_{]Z[}$.

Proof. Exercice. □

Proposition 10.1.3.4. *Given a frame $Y \subset X \subset \mathfrak{P}$. Let $\mathscr{Y} := \{Y_i\}_{i=1,\dots,n}$ be a finite open covering of Y. Let $j_{i_1 \cdots i_k} : Y_{i_1} \cap \dots \cap Y_{i_k} \to Y$ be the inclusions. Let V be a strict neighbourhood of $]Y[$, A a sheaf of rings on V and E an A-module. Then we have the exact sequence*

$$0 \to j^\dagger E \to \prod_i j_i^\dagger E \to \prod_{i_1 < i_j} j_{i_i i_j}^\dagger E \to \dots \to j_{1\cdots n}^\dagger E \to 0 \qquad (10.1.3.4.1)$$

Proof. Put $Z = X \setminus Y$. As the sequence is null on $]Z[$, it suffices to prove the exactness for the restriction to V. We shall keep the same notation $j_{i_i \cdots i_k}^\dagger E$ for its restriction to V. The proof will be by induction on n.

Put $Y' = Y_2 \cup \dots \cup Y_n$, $Z' = X - Y'$, $j' : Y' \to X$. Let $K^\bullet$ be the complex

$$0 \to E \to \prod_{1<i} j_i^\dagger E \to \dots \to j_{2\cdots n}^\dagger E \to 0.$$

By induction hypothesis and proposition 10.1.2.5.(a), $K^\bullet$ is a resolution of $\underline{\Gamma}^\dagger_{]Z'[} E$. According to Definition 10.1.3.2 we have an exact sequence of complexes

$$0 \to \underline{\Gamma}^\dagger_{]Z_1[} K^\bullet \to K^\bullet \to j_1^\dagger K^\bullet \to 0.$$

By 10.1.3.3 (i) we identify the complex $j_1^\dagger K^\bullet$ with the complex

$$0 \to j_1^\dagger E \to \prod_{1<i} j_{1i}^\dagger E \to \cdots \to j_{1\cdots n}^\dagger E \to 0$$

and so we identify the complex associated to the double complex $K^\bullet \to j_1^\dagger K^\bullet$ with the complex

$$0 \to E \to \prod_i j_i^\dagger E \to \cdots \to j_{1\cdots n}^\dagger E \to 0.$$

By 10.1.3.2 $\underline{\Gamma}^\dagger_{]Z_1[} K^\bullet$ is a resolution of $\underline{\Gamma}^\dagger_{]Z_1[}(\underline{\Gamma}^\dagger_{]Z'[} E)$ which is $\underline{\Gamma}^\dagger_{]Z[} E$ (10.1.3.3 (ii)). Thus the sequence

$$0 \to \underline{\Gamma}^\dagger_{]Z[} E \to E \to \prod_i j_i^\dagger E \to \cdots \to j_{1\cdots n}^\dagger E \to 0$$

is exact and the proof is completed. □

Notation 10.1.3.5. With notation 10.1.3.4, we denote by $\check{C}^{\dagger\bullet}(\mathfrak{X}, \mathscr{Y}, E)$ the unordered (by default) version of the Cech complex

$$\cdots \to 0 \to \prod_{i=1}^n j_i^\dagger E \to \prod_{1\le i_0, i_1 \le n} j_{i_0 i_1}^\dagger E \to \cdots \to \prod_{1 \le i_0, \ldots, i_h \le n} j_{i_1 \ldots i_n}^\dagger E \to \ldots, \qquad (10.1.3.5.1)$$

whose $0th$ term is $\prod_{i=1}^n j_i^\dagger E$. The exactness of 10.1.3.4.1 (i.e. of the ordered version) means that $\check{C}^{\dagger\bullet}(\mathfrak{X}, \mathscr{Y}, E)$ is a resolution of $j_Y^\dagger E$.

Proposition 10.1.3.6. *Given a frame $Y \subset X \subset \mathfrak{P}$. Let E, F be coherent $j^\dagger \mathcal{O}_{]X[}$-modules.*
(i) There exists a strict neighbourhood V of $]Y[$ and coherent $\mathcal{O}_V$-modules $\mathcal{E}, \mathscr{F}$ such that $E = j^\dagger \mathcal{E}$, $F = j^\dagger \mathscr{F}$.
(ii) We have a natural isomorphism

$$\varinjlim_{V'} \mathrm{Hom}_{\mathcal{O}_V}(\mathcal{E}|_{V'}, \mathscr{F}|_{V'}) \to \mathrm{Hom}_{j^\dagger \mathcal{O}_{]Y[}}(E, F)$$

where V' runs through the strict neighbourhoods of $]Y[$ contained in V.

Proof. Exercice. □

10.1.4 Resolution of $j^\dagger$ by Čech complexes

Let $\mathfrak{X}$ be a smooth $\mathcal{V}$-formal scheme, E be an abelian sheaf on $\mathfrak{X}_K$, $\mathfrak{X} = \{\mathfrak{X}_i\}_{i \in I}$ be a finite open covering of $\mathfrak{X}$. Let Y be an open subscheme of X and $j \colon Y \hookrightarrow \mathfrak{X}$ be the open immersion. Let $\mathscr{Y}_i = \{Y_{ij} : j \in J_i\}$ be a finite open covering of $Y_i = Y \cap \mathfrak{X}_i$.

Fix $h, k \in \mathbb{N}$. For $\underline{i} = (i_0, \ldots, i_h) \in I^{h+1}$, put $\mathfrak{X}_{\underline{i}} = \mathfrak{X}_{i_0} \cap \cdots \cap \mathfrak{X}_{i_h}$ and $u_{\underline{i}} : \mathfrak{X}_{\underline{i}} \hookrightarrow \mathfrak{X}$. For $\underline{j} = (j_0, \ldots, j_h) \in J_{i_0} \times \cdots \times J_{i_h}$, put $Y_{\underline{i}\underline{j}} = Y_{i_0 j_0} \cap \cdots \cap Y_{i_h j_h}$. Then $\mathscr{Y}_{\underline{i}} = \{Y_{\underline{i}\underline{j}}\}_{\underline{j} \in J_{i_0} \times \cdots \times J_{i_h}}$ is a finite open covering of $Y_{\underline{i}} = Y \cap \mathfrak{X}_{\underline{i}}$. The intersection of $k+1$-opens of the covering $\mathscr{Y}_{\underline{i}}$ will be denoted by

$$Y_{\underline{i}\underline{\underline{j}}} = \cap_{\alpha=0}^k \cap_{\beta=0}^h Y_{i_\beta j_{\alpha\beta}},$$

where $\underline{\underline{j}} = (\underline{j}_0, \cdots, \underline{j}_k)$ and $\underline{j}_\alpha = (j_{\alpha 0}, \ldots, j_{\alpha h}) \in J_{i_0} \times \cdots \times J_{i_h}$ for $\alpha = 0, \ldots, h$. We denote the corresponding open immersions by

$$j_{\underline{i}} \colon Y_{\underline{i}} \hookrightarrow \mathfrak{X}_{\underline{i}}, \qquad j_{\underline{i}\underline{\underline{j}}} \colon Y_{\underline{i}\underline{\underline{j}}} \hookrightarrow \mathfrak{X}_{\underline{i}}.$$

Set $E_{\underline{i}} := u_{\underline{i}}^*(E)$. According to notation 10.1.3.5, we get a resolution for $j_{\underline{i}}^\dagger E_{\underline{i}}$ by the Čech complex on $\mathfrak{X}_{\underline{i}K}$

$$\cdots \to 0 \to \prod_{\underline{i}} j_{\underline{i}\underline{j}}^\dagger E_{\underline{i}} \to \prod_{\underline{j}_0 \underline{j}_1} j_{\underline{i}(\underline{j}_0 \underline{j}_1)}^\dagger E_{\underline{i}} \to \cdots \to \prod_{\underline{\underline{j}}} j_{\underline{i}\underline{\underline{j}}}^\dagger E_{\underline{i}} \to \cdots$$

which is denoted by $\check{C}^{\dagger\bullet}(\mathfrak{X}_{\underline{i}}, \mathscr{Y}_{\underline{i}}, E_{\underline{i}})$ or simply $\check{C}^{\dagger\bullet}(\mathscr{Y}_{\underline{i}}, E_{\underline{i}})$.

If $\underline{i} = (i_0, \ldots, i_h)$ and $\underline{i}_{\check{\alpha}} = (i_0, \ldots, \check{i}_\alpha, \ldots, i_h)$, then we can define a morphism of complexes

$$\rho^{\bullet}_{\underline{i}\,\underline{i}_{\check{\alpha}}} : u_{\underline{i}_{\check{\alpha}}K*}\check{C}^{\dagger\bullet}(\mathfrak{X}_{\underline{i}_{\check{\alpha}}}, \mathscr{Y}_{\underline{i}_{\check{\alpha}}}, E_{\underline{i}_{\check{\alpha}}}) \to u_{\underline{i}K*}\check{C}^{\dagger\bullet}(\mathfrak{X}_{\underline{i}}, \mathscr{Y}_{\underline{i}}, E_{\underline{i}})$$

extending the morphism $u_{\underline{i}_{\check{\alpha}}K*}E_{\underline{i}_{\check{\alpha}}} \to u_{\underline{i}K*}E_{\underline{i}}$. For any $\underline{\underline{j}} = (\underline{j}_0, \cdots, \underline{j}_h)$, we put $\underline{\underline{j}}_{\check{\alpha}} = (\underline{j}_{0\check{\alpha}}, \cdots, \underline{j}_{h\check{\alpha}})$. For any section s of $u_{\underline{i}_{\check{\alpha}}K*}\check{C}^{\dagger\bullet}(\mathfrak{X}_{\underline{i}_{\check{\alpha}}}, \mathscr{Y}_{\underline{i}_{\check{\alpha}}}, E_{\underline{i}_{\check{\alpha}}})$, we put

$$\rho^{\bullet}_{\underline{i}\,\underline{i}_{\check{\alpha}}}(s)_{\underline{i}\underline{\underline{j}}} := \rho_{\underline{\underline{j}}\,\underline{\underline{j}}_{\check{\alpha}}}(s_{\underline{i}_{\check{\alpha}}\underline{\underline{j}}_{\check{\alpha}}})$$

where $\rho_{\underline{\underline{j}}\,\underline{\underline{j}}_{\check{\alpha}}}$ comes from the immersion $\mathfrak{X}_{\underline{i}} \hookrightarrow \mathfrak{X}_{\underline{i}_{\check{\alpha}}}$ which carries $Y_{\underline{i}\underline{\underline{j}}}$ into $Y_{\underline{i}_{\check{\alpha}}\underline{\underline{j}}_{\check{\alpha}}}$. As $\underline{i}$ varies, these morphisms give rise to a bicomplex $\check{C}^{\dagger\bullet\bullet}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$, which has the following term in degree (h,k) -

$$\check{C}^{\dagger hk}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) = \prod_{\underline{i}=(i_0,\ldots,i_h)} u_{\underline{i}K*}(\prod_{\underline{\underline{j}}=(\underline{j}_0,\cdots,\underline{j}_h)} j^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}}).$$

Examples 10.1.4.1. Let us give the two extreme examples. On one hand, when J_i has only one element for any $i \in I$, then $\check{C}^{\dagger\bullet\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$ is equal to the usual topological Check complex $\check{C}^{\dagger\bullet}(\mathscr{X}, E)$ given by $\check{C}^{\dagger h}(\mathscr{X}, E) := \prod_{\underline{i}\in I^{1+h}} u_{\underline{i}K*}u^*_{\underline{i}K}(E)$. On the other hand, when $I = \{i\}$ has only one element, the complex $\check{C}^{\dagger\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$ is equal to the complex $\check{C}^{\dagger\bullet}(\mathfrak{X}, \mathscr{Y}_i, E)$.

Proposition 10.1.4.2. *Let E be an abelian sheaf on $\mathfrak{X}_K$. The simple complex associated to the Čech bicomplex $\check{C}^{\dagger\bullet\bullet}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$ is a resolution of $j^\dagger E$.*

Proof. Consider the complex $j^\dagger E \to j^\dagger E \to j^\dagger E \to \cdots$ in which the differential in even degree is 0 and in odd degree is $Id_{j^\dagger E}$. A morphism from this complex to the complex $\check{C}^{\dagger 0*}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$ is given by the canonical morphisms $j^\dagger E \to \check{C}^{\dagger 0k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$ which are defined by the family of morphisms $j^\dagger E \to u_{iK*}j^\dagger_{i\underline{j}}E_i$. Thus we only need to show that

$$\check{C}^{\dagger 0k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \to \check{C}^{\dagger 1k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \to \cdots \tag{10.1.4.2.1}$$

is a resolution of $j^\dagger E$.

As the $\mathfrak{X}_{iK} \overset{u_{iK}}{\hookrightarrow} \mathfrak{X}_K$ form an admissible covering of $\mathfrak{X}_K$, it suffices to prove the assertion on $\mathfrak{X}_{iK}$. We have $u^*_{iK}(j^\dagger E) = j^\dagger_i E_i$ and the functor $\check{C}^{\dagger\bullet}(\mathscr{Y}_i, -)$ applied to the complex $u^*_{iK}\check{C}^{\dagger\bullet k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$ gives a bicomplex $\check{C}^{\dagger\bullet}(\mathscr{Y}_i, u^*_{iK}(\check{C}^{\dagger\bullet k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)))$. By Proposition 10.1.3.4, for any sheaf F on $\mathfrak{X}_{iK}$, $\check{C}^{\dagger\bullet}(\mathscr{Y}_i, F)$ is a resolution of $j^\dagger_i F$. The simple complex associated to the bicomplex $\check{C}^{\dagger\bullet}(\mathscr{Y}_i, u^*_{iK}(\check{C}^{\dagger\bullet k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)))$ is quasi-isomorphic to $j^\dagger_i u^*_{iK}\check{C}^{\dagger\bullet k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$. Similarly, the complex $\check{C}^{\dagger\bullet}(\mathscr{Y}_i, j^\dagger_i E_i)$ is a resolution of $j^\dagger_i j^\dagger_i E_i$. By Proposition 10.1.2.5.(a), for any $j^\dagger_i\mathcal{O}_{\mathfrak{X}_{iK}}$- module F, we have $F \xrightarrow{\sim} j^\dagger_i F$ and so it remains to prove the following assertions:
(a) for any i, h, k, we have

$$u^*_{iK}\check{C}^{\dagger hk}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \xrightarrow{\sim} j^\dagger_i u^*_{iK}\check{C}^{\dagger hk}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$$

(b) for all $\underline{j} = (j_0, \ldots, j_k)$ the complex

$$j^\dagger_{i\underline{j}} u^*_{iK}\check{C}^{\dagger 0k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \to j^\dagger_{i\underline{j}} u^*_{iK}\check{C}^{\dagger 1k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \to \cdots$$

is a resolution of $j^\dagger_{i\underline{j}} j^\dagger_i E_i$.

Let $\underline{i} = (i_0, \ldots, i_h)$, $\underline{i'} = (i, i_0, \ldots, i_h)$, $u'_{\underline{i}K} : \mathfrak{X}_{\underline{i'}K} = \mathfrak{X}_{iK} \cap \mathfrak{X}_{\underline{i}K} \to \mathfrak{X}_{iK}$ the inclusion, $u'_{iK} : \mathfrak{X}_{\underline{i'}K} \hookrightarrow \mathfrak{X}_{\underline{i}K}$, $Y'_{\underline{i}\underline{\underline{j}}} = \mathfrak{X}_{iK} \cap Y_{\underline{i}\underline{\underline{j}}}$, and $j'_{\underline{i}\underline{\underline{j}}} : Y'_{\underline{i}\underline{\underline{j}}} \to \mathfrak{X}_{\underline{i'}K}$. Then, it follows from 10.1.2.5.3 that we get the isomorphisms

$$j^\dagger_i u^*_{iK}\check{C}^{\dagger hk}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \simeq \prod_{\underline{i}=(i_0,\ldots,i_h)} \prod_{\underline{\underline{j}}=(\underline{j}_0,\cdots,\underline{j}_h)} j^\dagger_i u'_{\underline{i}K*} u'^*_{iK} j^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}})$$

$$11 \simeq \prod_{\underline{i}=(i_0,\ldots,i_h)} \prod_{\underline{\underline{j}}=(\underline{j}_0,\cdots,\underline{j}_h)} j^\dagger_i u'_{\underline{i}K*} j'^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}} \simeq \prod_{\underline{i}=(i_0,\ldots,i_h)} \prod_{\underline{\underline{j}}=(\underline{j}_0,\cdots,\underline{j}_h)} u'_{\underline{i}K*} j'^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}} \simeq u^*_{iK}\check{C}^{\dagger hk}(\mathfrak{X}, (\mathscr{Y}_i)_i, E).$$

This implies the assertion (a) holds.

To prove (b) we construct a homotopy on the complex

$$0 \to j^\dagger_{\underline{i}\underline{\underline{j}}} j^\dagger_i E_i \to j^\dagger_{\underline{i}\underline{\underline{j}}} u^*_{iK} \check{C}^{\dagger 0k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \to j^\dagger_{\underline{i}\underline{\underline{j}}} u^*_{iK} \check{C}^{\dagger 1k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E) \to \cdots$$

which is going to be a endomorphism κ on $j^\dagger_{\underline{i}\underline{\underline{j}}} u^*_{iK}(\prod_{\underline{i}=(i_0,\ldots,i_h)} u_{\underline{i}K*}(\prod_{\underline{\underline{j}}=(\underline{j}_0,\cdots,\underline{j}_h)} j^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}}))$.

Claim: For any $\underline{\underline{j}} \in (J_{i_0} \times \cdots \times J_{i_h})^{k+1}$, the next morphism is an isomorphism

$$j^\dagger_{\underline{i}\underline{\underline{j}}} u^*_{iK} u_{\underline{i}K*} j^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}} \longrightarrow j^\dagger_{\underline{i}\underline{\underline{j}}} u^*_{iK} u_{\underline{i'}K*} j^\dagger_{\underline{i'}\underline{\underline{j'}}} E_{\underline{i'}}$$

First we have

$$j^\dagger_{\underline{i}\underline{\underline{j}}} u^*_{iK} u_{\underline{i}K*} j^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}} \xrightarrow{\sim} j^\dagger_{\underline{i}\underline{\underline{j}}} u'_{\underline{i}K*} u'^*_{iK} j^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i}} \xrightarrow{\sim} j^\dagger_{\underline{i}\underline{\underline{j}}} u'_{\underline{i}K*} j'^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i'}},$$

and also

$$j^\dagger_{\underline{i}\underline{\underline{j}}} u^*_{iK} u_{\underline{i'}K*} j^\dagger_{\underline{i'}\underline{\underline{j'}}} E_{\underline{i'}} \xrightarrow{\sim} j^\dagger_{\underline{i}\underline{\underline{j}}} u'_{\underline{i}K*} j^\dagger_{\underline{i'}\underline{\underline{j'}}} E_{\underline{i'}}.$$

As $Y_{\underline{i'}\underline{\underline{j'}}} = Y'_{\underline{i}\underline{j}} \cap Y'_{\underline{i}\underline{\underline{j}}}$, we get $j^\dagger_{\underline{i'}\underline{\underline{j'}}} \simeq j'^\dagger_{\underline{i}\underline{j}} j'^\dagger_{\underline{i}\underline{\underline{j}}}$. Using (10.1.2.5.4) we get the isomorphisms

$$j^\dagger_{\underline{i}\underline{\underline{j}}} u'_{\underline{i}K*} j^\dagger_{\underline{i'}\underline{\underline{j'}}} E_{\underline{i'}} \xrightarrow{\sim} j^\dagger_{\underline{i}\underline{\underline{j}}} u'_{\underline{i}K*} j'^\dagger_{\underline{i}\underline{j}} j'^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i'}} \xrightarrow{\sim} j^\dagger_{\underline{i}\underline{\underline{j}}} u'_{\underline{i}K*} j'^\dagger_{\underline{i}\underline{\underline{j}}} E_{\underline{i'}}$$

This proves the claim. Hence we can define for $s \in j^\dagger_{\underline{i}\underline{\underline{j}}} \check{C}^{\dagger h+1\, k}(\mathfrak{X}, (\mathscr{Y}_i)_i, E)$, $\kappa(s)_{\underline{i}\underline{\underline{j}}} := s_{\underline{i'}\underline{\underline{j'}}}$. It remains to check that κ is a well-defined homotopy, which is easy. □

10.2 Isocrystals

10.2.1 Stratification, integrable connection and left $\mathcal{D}$-module structure

Notation 10.2.1.1 (nth infinitesimal neighborhood)**.** Let $p\colon V \to \mathfrak{S}_K$ be a morphism of rigid varieties. Let $\delta : V \hookrightarrow V \times_{\mathfrak{S}_K} V$ be the diagonal embedding. For any $n \in \mathbb{N}$, write $V^{(n)}$ for the n-th infinitesimal neighborhood of V in $V \times_{\mathfrak{S}_K} V$ so that we have the factorisation $V \to V^{(n)} \to V \times_{\mathfrak{S}_K} V$ and projections $p^{(n)}_1, p^{(n)}_2 : V^{(n)} \to V$. Remark that $V^{(n)}$ depends a priori on the base $\mathfrak{S}_K$ but since the base is fixed we do not care in the notation. For any $n \in \mathbb{N}$, write $V^{(n)}_2$ for the n-th infinitesimal neighborhood of V in $V \times_{\mathfrak{S}_K} V \times_{\mathfrak{S}_K} V$, and $p_{ij} : V^{(n)}_2 \to V^{(n)}$ is the homomorphism corresponding to the projection of $V \times_{\mathfrak{S}_K} V \times_{\mathfrak{S}_K} V$ to $V \times_{\mathfrak{S}_K} V$ along the i and j factors.

10.2.1.2 (Stratification, integrable connection and $\mathcal{D}$-module)**.** Let $p\colon V \to \mathfrak{S}_K$ be a *smooth* morphism of rigid varieties . We denote by $\mathcal{D}_{V/\mathfrak{S}_K}$ (or simply $\mathcal{D}_V$ is there is no doubt on the base), the sheaf of differential operators on $V/\mathfrak{S}_K$. Let $\mathcal{E}$ be an $\mathcal{O}_V$-module.

(a) A *relative to* $V/\mathfrak{S}_K$ *stratification* on $\mathcal{E}$ is a compatible sequence of linear isomorphisms called the Taylor isomorphisms

$$\{\varepsilon^{(n)} : p^{(n)*}_2 \mathcal{E} \cong p^{(n)*}_1 \mathcal{E}\}_{n \in \mathbb{N}}$$

on $V^{(n)}$ with $\varepsilon^{(0)} = \mathrm{id}_{\mathcal{E}}$ that satisfy the following cocycle condition: for all $n \in \mathbb{N}$, we have

$$p^*_{12}(\varepsilon^{(n)}) \circ p^*_{23}(\varepsilon^{(n)}) = p^*_{13}(\varepsilon^{(n)}).$$

(b) A *relative to* $V/\mathfrak{S}_K$ *connection* on $\mathcal{E}$ is an $\mathcal{O}_{\mathfrak{S}_K}$-linear map

$$\nabla : \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_V} \Omega^1_{V/\mathfrak{S}_K}$$

satisfying the Leibniz rule. Say it is an integrable connection if $\nabla^2 = 0$.

Similarly to 2.3.2.6 and 2.1.1.5, the following data are equivalent:

(i) a relative to $V/\mathfrak{S}_K$ stratification on $\mathcal{E}$

(ii) a relative to $V/\mathfrak{S}_K$ integrable connection on $\mathcal{E}$;

(iii) a left $\mathcal{D}_{V/\mathfrak{S}_K}$-module structure on $\mathcal{E}$ which extends its structure of $\mathcal{O}_V$-module.

Notation 10.2.1.3 (MIC($V/\mathfrak{S}_K$))**.** A ∇-module on $V/\mathfrak{S}_K$ is defined to be a coherent $\mathcal{O}_V$-module $\mathcal{E}$ on V, equipped with a relative to $\mathfrak{S}_K$ integrable connection. Denote by MIC($V/\mathfrak{S}_K$) the category of ∇-module on $V/\mathfrak{S}_K$.

10.2.1.4 (MIC($Y, X, \mathfrak{P}/\mathfrak{S}$))**.** Let $(Y \overset{j}{\hookrightarrow} X \hookrightarrow \mathfrak{P})$ be a weakly smooth $\mathfrak{S}$-frame. Let E be coherent $j^\dagger\mathcal{O}_{]X[_P}$-module. A "relative to $(Y, X, \mathfrak{P}/\mathfrak{S})$ integrable connection" on E is the data of

(i) a strict neighbourhood V of $]Y[_P$ in $]X[_P$, a coherent $\mathcal{O}_V$-module $\mathcal{E}$ such that $V/\mathfrak{S}_K$ is smooth, $E = j_Y^\dagger \mathcal{E}$,

(ii) an integrable connection $\nabla : \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_V} \Omega^1_{V/\mathfrak{S}_K}$.

This is equivalent to saying that E has a structure of left $j^\dagger\mathcal{D}_{V/\mathfrak{S}_K}$-module which extends its structure of $j^\dagger\mathcal{O}_{]X[_P}$-module. The category of such modules E will be denoted by MIC($Y, X, \mathfrak{P}/\mathfrak{S}$).

10.2.2 Overconvergent stratification, overconvergent connections

Definition 10.2.2.1. Let $(Y \hookrightarrow X \hookrightarrow \mathfrak{P})$ be a weakly smooth $\mathfrak{S}$-frame and Z the complement of Y in X. Let V be a strict neighborhood of $]Y[_\mathfrak{P}$ in $]X[_\mathfrak{P}$ which is smooth over $\mathfrak{S}_K$. With notation 10.2.1.1, for any $n \in \mathbb{N}$, $V'' := (V \times_{\mathfrak{S}_K} V) \cap]X[_{\mathfrak{P}\times_\mathfrak{S}\mathfrak{P}}$ is a strict neighborhood of $]Y[_{\mathfrak{P}\times_\mathfrak{S}\mathfrak{P}}$ in $]X[_{\mathfrak{P}\times_\mathfrak{S}\mathfrak{P}}$, and $V'' \cap]X[^{(n)}_\mathfrak{P} = V^{(n)}$ (see [LS07, 4.3.2]). Let $\mathcal{E}$ be an $\mathcal{O}_V$-module.

(a) An *overconvergent (along Z) stratification* on $\mathcal{E}$ is a relative to $V/\mathfrak{S}_K$ stratification $\{\varepsilon^{(n)}\}_{n\in\mathbb{N}}$ on $\mathcal{E}$ for which there exists a strict neighbourhood

$$V' \subset V'' = (V \times_{\mathfrak{S}_K} V) \cap]X[_{\mathfrak{P}\times_\mathfrak{S}\mathfrak{P}}$$

of $]Y[_{\mathfrak{P}\times_\mathfrak{S}\mathfrak{P}}$ in $]X[_{\mathfrak{P}\times_\mathfrak{S}\mathfrak{P}}$ and an isomorphism

$$\epsilon : (p_2^*\mathcal{E})|_{V'} \cong (p_1^*\mathcal{E})|_{V'}$$

such that the Taylor isomorphisms of $\mathcal{E}$ is induced on $U_n := V' \cap]X[^{(n)}_\mathfrak{P}$ by ϵ for each n, i.e., $\varepsilon^{(n)}|_{U_n} = \epsilon|_{U_n}$. When $X = Y$ we say the stratification is "convergent".

(b) An *overconvergent (along Z) connection* on $\mathcal{E}$ is a relative to $V/\mathfrak{S}_K$ integrable connection $\nabla : \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_V} \Omega^1_{V/\mathfrak{S}_K}$ whose associated stratification (see 10.2.1.2) is overconvergent along Z. When $X = Y$ we say the connection is "convergent".

Definition 10.2.2.2. A "local frame" on $\mathfrak{S}$ is a (weakly smooth) affine $\mathfrak{S}$-frame $(Y \subset X \subset \mathfrak{P})$ endowed with some elements $t_1, \ldots, t_m \in \Gamma(\mathfrak{P}, \mathcal{O}_\mathfrak{P})$ which induce étale coordinates on $\mathfrak{U}/\mathfrak{S}$, where $\mathfrak{U}$ is an open of $\mathfrak{P}$ containing Y. We will simply say that $t_1, \ldots, t_m$ is a set of coordinates on the local frame. The local frame is said to be "strictly local" if the closed complement Z of Y in X is a hypersurface.

10.2.2.3. Any weakly smooth $\mathfrak{S}$-frame $(Y \subset X \subset \mathfrak{P})$ has an open covering

$$\begin{array}{ccccc} Y_i & \hookrightarrow & X_i & \hookrightarrow & \mathfrak{P}_i \\ \downarrow & & \downarrow & & \downarrow \\ Y & \hookrightarrow & X & \hookrightarrow & \mathfrak{P} \end{array}$$

by strictly local frame (see [LS07, 4.3.8]).

Theorem 10.2.2.4. *Let $(Y \subset X \subset \mathfrak{P})$ be a strictly local $\mathfrak{S}$-frame with coordinates $t_1, \ldots, t_m$ (see definition 10.2.2.2) and corresponding derivations $\partial_1, \ldots, \partial_m$. Let Z be the closed complement of Y in X and $\lambda, \eta < 1$. We write*

$$V^\lambda :=]X[_\mathfrak{P} \setminus]Z[_{\mathfrak{P}\lambda}, \qquad V^\lambda_\eta := [X]_{\mathfrak{P}\eta} \cap V^\lambda.$$

Let V be a smooth strict neighbourhood of $]Y[_{\mathfrak{P}}$ in $]X[_{\mathfrak{P}}$ and $\mathcal{E}$ a coherent $\mathcal{O}_V$-module with an integrable connection ∇.

Then ∇ is overconvergent if and only if for each $\eta < 1$, there exists $\eta \leq \delta < \lambda_0 < 1$ such that for all $\lambda_0 \leq \lambda < 1$, we have

$$\forall\, s \in \Gamma(V_\delta^\lambda, \mathcal{E}), \qquad \|\underline{\partial}^{[\underline{k}]}(s)\|\eta^{|k|} \to 0$$

with $\|\cdot\|$ a Banach norm on $\Gamma(V_\delta^\lambda, \mathcal{E})$.

If $t_1, \ldots, t_m$ are actually étale in a neighborhood of X (i.e. are étale coordinates on $\mathfrak{U}/\mathfrak{S}$, where $\mathfrak{U}$ is an open of $\mathfrak{P}$ containing X), we may choose $\delta = \eta$.

Proof. See a proof at [LS07, Theorem 4.3.9]. □

Corollary 10.2.2.5. *Let $\mathfrak{P}$ be smooth affine formal $\mathfrak{S}$-scheme with étale coordinates in the neighbourhood of a closed subvariety X of P. An integrable connection ∇ on a coherent $\mathcal{O}_{]X[_{\mathfrak{P}}}$-module $\mathcal{E}$ is convergent if and only if for each $\eta < 1$, we have*

$$\forall\, s \in \Gamma([X]_{\mathfrak{P}\eta}, \mathcal{E}), \qquad \|\underline{\partial}^{[\underline{k}]}(s)\|\eta^{|\underline{k}|} \to 0, \text{ as } |\underline{k}| \to \infty$$

Proof. This is simply the particular case $Y = X$. □

10.2.2.6 ($\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K)$)**.** Let $(Y \overset{j}{\hookrightarrow} X \hookrightarrow \mathfrak{P})$ be a weakly smooth $\mathfrak{S}$-frame. Let E be a coherent $j^\dagger\mathcal{O}_{]X[_P}$-module.

(a) A "(relative to $(Y, X, \mathfrak{P}/\mathfrak{S})$) overconvergent stratification" on E is an isomorphism of $j^\dagger\mathcal{O}_{]X[_{\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}}}$-modules $\epsilon\colon p_2^*E \xrightarrow{\sim} p_1^*E$ such that the cocycle condition $p_{13}^*(\epsilon) = p_{12}^*(\epsilon) \circ p_{23}^*(\epsilon)$ holds, where $p_i\colon]X[_{\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}} \to]X[_{\mathfrak{P}}$ is the ith projection and $p_{ij}\colon]X[_{\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}} \to]X[_{\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}}$ is the projection along the i and j factors.

(b) A "(relative to $(Y, X, \mathfrak{P}/\mathfrak{S})$) overconvergent connection" on E is the data of

  (i) a strict neighborhood V of $]Y[_P$ in $]X[_P$, a coherent $\mathcal{O}_V$-module $\mathcal{E}$ such that $V/\mathfrak{S}_K$ is smooth, $E = j_Y^\dagger\mathcal{E}$,

  (ii) an overconvergent connection $\nabla : \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_V} \Omega^1_{V/\mathfrak{S}_K}$.

We have a canonical bijection between the data of an overconvergent stratification on E and of an overconvergent connexion on E (this is almost by definition 10.2.2.1). We denoted by $\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K)$ the category of coherent $j^\dagger\mathcal{O}_{]X[_P}$-module endowed with a (relative to $(Y, X, \mathfrak{P}/\mathfrak{S})$) overconvergent connection.

Notation 10.2.2.7. Let $(Y \overset{j}{\hookrightarrow} X \hookrightarrow \mathfrak{P})$ be a weakly smooth $\operatorname{Spf}\mathcal{V}$-frame. We write $\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$ instead of $\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/(\operatorname{Spf}\mathcal{V})_K)$. Then (similarly to 1.1.4.5) any object of $\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$ is a locally free $j^\dagger\mathcal{O}_{]X[_P}$-module (finite type). Beware this is not true for more general $\mathfrak{S}$. Since the category $\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$ is independent (up to canonical isomorphism) on the weakly smooth $\operatorname{Spf}\mathcal{V}$-frame enclosing $Y \overset{j}{\hookrightarrow} X$, then we can simply $\mathrm{MIC}^\dagger(Y, X/K)$.

10.2.2.8. Let $f = (a, b, u)\colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$ be a morphism of weakly smooth $\mathfrak{S}$-frames. The functor 10.1.2.6.1 induces the functor $f_K^*\colon \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K) \to \mathrm{MIC}^\dagger(Y', X', \mathfrak{P}'/\mathfrak{S}_K)$, *the pullback by* f, which is defined for an object $E_{\mathfrak{P}} \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K)$ by setting

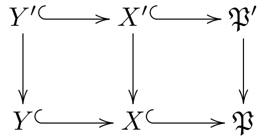
$$f_K^*(E_{\mathfrak{P}}) := j'^\dagger\mathcal{O}_{]X'[_{\mathfrak{P}'}} \otimes_{v_K^{-1}j^\dagger\mathcal{O}_{]X[_{\mathfrak{P}}}} v_K^{-1}E_{\mathfrak{P}}, \tag{10.2.2.8.1}$$

where $v_K\colon]X'[_{\mathfrak{P}'} \to]X[_{\mathfrak{P}}$ is the morphism of ringed spaces induced by f. When $X' = u^{-1}(X)$ and $Y' = u^{-1}(Y)$, the functor f_K^* can simply be denoted by u_K^*.

10.2.3 Isocrystals

Definition 10.2.3.1. According to [LS07, 7.1.1], a finitely presented overconvergent isocrystal E on an $\mathfrak{S}$-frame $(Y \hookrightarrow X \hookrightarrow \mathfrak{P})$ consists of the following data:

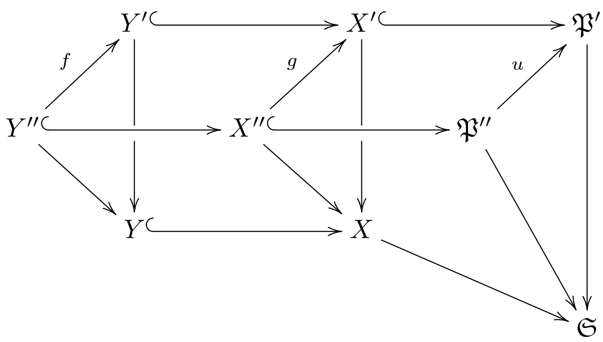
(i) a family of coherent $j^\dagger\mathcal{O}_{]X'[_{\mathfrak{P}'}}$-modules $E_{\mathfrak{P}'}$ for each morphism of $\mathfrak{S}$-frames



(ii) a family of isomorphisms

$$\varphi_u \colon u^\dagger E_{\mathfrak{P}'} \cong E_{\mathfrak{P}''} \tag{10.2.3.1.1}$$

for each commutative diagram



subject to the cocyle condition

$$\varphi_{v\circ u} = \varphi_v \circ v^*\varphi_u. \tag{10.2.3.1.2}$$

We call $E_{\mathfrak{P}'}$ the realization of E on $(Y' \hookrightarrow X' \hookrightarrow \mathfrak{P}'/\mathfrak{S})$.

A morphism of overconvergent isocrystals is a family of compatible morphisms of $j^\dagger\mathcal{O}_{]X'[_{\mathfrak{P}}}$-modules. When $X = Y$ we say E is a convergent isocrystal.

The category of finitely presented overconvergent isocrystal on $(Y \hookrightarrow X \hookrightarrow \mathfrak{P})$ is denoted by $\mathrm{Isoc}^\dagger(Y, X, \mathfrak{P}/K)$.

Proposition 10.2.3.2. *If $(Y \subset X \subset \mathfrak{P})$ is a weakly smooth $\mathfrak{S}$-frame, then the realisation functor on the frame $(Y \subset X \subset \mathfrak{P})/\mathfrak{S}$ induces an equivalence of categories*

$$\mathrm{real}_{(Y\subset X\subset\mathfrak{P})/\mathfrak{S}} \colon \mathrm{Isoc}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K) \cong \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K). \tag{10.2.3.2.1}$$

We can simply write this functor $\mathrm{real}_{\mathfrak{P}}$.

Proof. This realization functor is constructed as follows. Let $E \in \mathrm{Isoc}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K)$ and $E_{\mathfrak{P}} := \mathrm{real}_{(Y\subset X\subset\mathfrak{P})\mathfrak{S}}(E)$. Let $q_0, q_1 \colon \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{P} \to \mathfrak{P}$ be the left and the right projections. This yields the morphisms of frames $p_0 := (id, id, q_0), p_1 := (id, id, q_1) \colon (Y, X, \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{P}) \to (Y, X, \mathfrak{P})$. We denote by $E_{\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}}$ the realization of E on the frame $(Y, X, \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{P})$. We get the isomorphisms $\phi_{p_0} \colon p_0^* E_{\mathfrak{P}} \xrightarrow{\sim} E_{\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}}$ and $\phi_{p_1} \colon p_1^* E_{\mathfrak{P}} \xrightarrow{\sim} E_{\mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}}$ (see notation 10.2.3.1.1). This yields the Taylor isomorphism of $E_{\mathfrak{P}}$

$$\epsilon = \phi_{p_0}^{-1} \circ \phi_{p_1} \colon p_1^* E_{\mathfrak{P}} \xrightarrow{\sim} p_0^* E_{\mathfrak{P}}, \tag{10.2.3.2.2}$$

which corresponds to the overconvergent stratification on $E_{\mathfrak{P}}$. The check that this is an equivalence is left to the reader. ☐

10.2.3.3. Let $f = (a, b, u) \colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$ be a morphism of weakly smooth $\mathfrak{S}$-frames. This yields a functor

$$f^* \colon \mathrm{Isoc}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K) \to \mathrm{Isoc}^\dagger(Y', X', \mathfrak{P}'/\mathfrak{S}_K). \tag{10.2.3.3.1}$$

The functor $\mathrm{real}_{\mathfrak{P}}$ of 10.2.3.2.1 commutes with both pullbacks by f (see 10.2.2.8.1): for any $E \in \mathrm{Isoc}^\dagger(Y, X, \mathfrak{P}/\mathfrak{S}_K)$ we have the natural isomorphism $f_K^* \circ \mathrm{real}_{\mathfrak{P}}(E) \xrightarrow{\sim} \mathrm{real}_{\mathfrak{P}'} \circ f^*(E)$ which can also be written $f_K^*(E_{\mathfrak{P}}) \xrightarrow{\sim} f^*(E)_{\mathfrak{P}'}$.

10.2.4 Glueing data

10.2.4.1. Let $f = (a, b, u)$ and $g = (a, b, v)$ be two morphisms of weakly smooth $\mathfrak{S}$-frames of the form $(Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$.

(a) The morphism $(u, v)\colon \mathfrak{P}' \to \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{P}$ induce the morphism of frames $\delta_{u,v} = (b, a, (u, v))\colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{P})$. We get the morphisms of frames $f = p_0 \circ \delta_{u,v}$ and $g = p_1 \circ \delta_{u,v}$. Let $E_{\mathfrak{P}} \in \mathrm{MIC}^{\dagger}(Y, X, \mathfrak{P}/K)$. From the isomorphism $\epsilon\colon p_1^* E_{\mathfrak{P}} \xrightarrow{\sim} p_0^* E_{\mathfrak{P}}$ (see the construction at 10.2.3.2.2), we get the glueing isomorphism

$$\epsilon_{u,v} := \delta_{u,v}^*(\epsilon)\colon g^* E_{\mathfrak{P}} \xrightarrow{\sim} f^* E_{\mathfrak{P}}. \qquad (10.2.4.1.1)$$

Using the transitivity of the isomorphism ϕ (see 10.2.3.1.2), we have the equality $\epsilon_{u,v} := \delta_{u,v}^*(\epsilon) = \phi_f^{-1} \circ \phi_g$. In particular, $\epsilon_{u,u} = \mathrm{id}$.

(b) Let $w\colon \mathfrak{P}' \to \mathfrak{P}$ be a third morphism of formal schemes over $\mathfrak{S}$ such that we get the morphism of smooth $\mathfrak{S}$-frames $h := (b,\, a,\, w)\colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$. We have the transitive formula $\epsilon_{u,\,w} = \epsilon_{u,\,v} \circ \epsilon_{v,\,w}$.

(c) Let $f' = (a', b', u')$ and $g' = (a', b', v')$ be two morphisms of weakly smooth $\mathfrak{S}$-frames of the form $(Y'', X'', \mathfrak{P}'') \to (Y', X', \mathfrak{P}')$. We check the formulas $\epsilon_{u \circ u', v \circ u'} = f_K'^* \circ \epsilon_{u,v}$ and $\epsilon_{u',v'} \circ f_K^* = \epsilon_{u \circ u', u \circ v'}$.

10.2.4.2. We suppose $\mathfrak{S} = \mathrm{Spf}\, \mathcal{V}$. Let $(Y \hookrightarrow X \hookrightarrow \mathfrak{P})$ be an $\mathfrak{S}$-frame and Z the complement of Y in X. We suppose $\mathfrak{P}/\mathfrak{S}$ and X/S are smooth and $\mathfrak{P}$ is separated. Let $(\mathfrak{P}_\alpha)_{\alpha \in \Lambda}$ be an open covering of $\mathfrak{P}$. We set $\mathfrak{P}_{\alpha\beta} := \mathfrak{P}_\alpha \cap \mathfrak{P}_\beta$, $\mathfrak{P}_{\alpha\beta\gamma} := \mathfrak{P}_\alpha \cap \mathfrak{P}_\beta \cap \mathfrak{P}_\gamma$, $X_\alpha := X \cap P_\alpha$, $X_{\alpha\beta} := X_\alpha \cap X_\beta$ and $X_{\alpha\beta\gamma} := X_\alpha \cap X_\beta \cap X_\gamma$. We denote by $Y_\alpha := X_\alpha \cap Y$, $Y_{\alpha\beta} := Y_\alpha \cap Y_\beta$, $Y_{\alpha\beta\gamma} := Y_\alpha \cap Y_\beta \cap Y_\gamma$. $j_\alpha\colon Y_\alpha \hookrightarrow X_\alpha$, $j_{\alpha\beta}\colon Y_{\alpha\beta} \hookrightarrow X_{\alpha\beta}$ and $j_{\alpha\beta\gamma}\colon Y_{\alpha\beta\gamma} \hookrightarrow X_{\alpha\beta\gamma}$ the canonical open immersions. We suppose that for every $\alpha \in \Lambda$, X_α is affine, (for instance when the covering $(\mathfrak{P}_\alpha)_{\alpha \in \Lambda}$ is affine).

For any triple $(\alpha,\, \beta,\, \gamma) \in \Lambda^3$, fix $\mathfrak{X}_\alpha$ (resp. $\mathfrak{X}_{\alpha\beta}$, $\mathfrak{X}_{\alpha\beta\gamma}$) some smooth formal $\mathfrak{S}$-schemes lifting X_α (resp. $X_{\alpha\beta}$, $X_{\alpha\beta\gamma}$), $p_1^{\alpha\beta}\colon \mathfrak{X}_{\alpha\beta} \to \mathfrak{X}_\alpha$ (resp. $p_2^{\alpha\beta}\colon \mathfrak{X}_{\alpha\beta} \to \mathfrak{X}_\beta$) some flat lifting of $X_{\alpha\beta} \to X_\alpha$ (resp. $X_{\alpha\beta} \to X_\beta$).

Similarly, for any $(\alpha,\, \beta,\, \gamma) \in \Lambda^3$, fix some lifting $p_{12}^{\alpha\beta\gamma}\colon \mathfrak{X}_{\alpha\beta\gamma} \to \mathfrak{X}_{\alpha\beta}$, $p_{23}^{\alpha\beta\gamma}\colon \mathfrak{X}_{\alpha\beta\gamma} \to \mathfrak{X}_{\beta\gamma}$, $p_{13}^{\alpha\beta\gamma}\colon \mathfrak{X}_{\alpha\beta\gamma} \to \mathfrak{X}_{\alpha\gamma}$, $p_1^{\alpha\beta\gamma}\colon \mathfrak{X}_{\alpha\beta\gamma} \to \mathfrak{X}_\alpha$, $p_2^{\alpha\beta\gamma}\colon \mathfrak{X}_{\alpha\beta\gamma} \to \mathfrak{X}_\beta$, $p_3^{\alpha\beta\gamma}\colon \mathfrak{X}_{\alpha\beta\gamma} \to \mathfrak{X}_\gamma$, $u_\alpha\colon \mathfrak{X}_\alpha \hookrightarrow \mathfrak{P}_\alpha$, $u_{\alpha\beta}\colon \mathfrak{X}_{\alpha\beta} \hookrightarrow \mathfrak{P}_{\alpha\beta}$ and $u_{\alpha\beta\gamma}\colon \mathfrak{X}_{\alpha\beta\gamma} \hookrightarrow \mathfrak{P}_{\alpha\beta\gamma}$.

Definition 10.2.4.3. With notation 10.2.4.2, we define the category $\mathrm{MIC}^{\dagger}(Y, (\mathfrak{X}_\alpha)_{\alpha \in \Lambda}/K)$ as follows.

- An object of $\mathrm{MIC}^{\dagger}(Y, (\mathfrak{X}_\alpha)_{\alpha \in \Lambda}/K)$ is a family $(E_\alpha)_{\alpha \in \Lambda}$ of objects E_α of $\mathrm{MIC}^{\dagger}((Y_\alpha, X_\alpha, \mathfrak{X}_\alpha)/K)$ together with a *glueing data*, i.e., a collection of isomorphisms in $\mathrm{MIC}^{\dagger}((Y_{\alpha\beta}, X_{\alpha\beta}, \mathfrak{X}_{\alpha\beta})/K)$ of the form $\eta_{\alpha\beta}\ \ p_{2K}^{\alpha\beta *}(E_\beta) \xrightarrow{\sim} p_{1K}^{\alpha\beta *}(E_\alpha)$ satisfying the cocycle condition: $\eta_{13}^{\alpha\beta\gamma} = \eta_{12}^{\alpha\beta\gamma} \circ \eta_{23}^{\alpha\beta\gamma}$, where $\eta_{12}^{\alpha\beta\gamma}$, $\eta_{23}^{\alpha\beta\gamma}$ and $\eta_{13}^{\alpha\beta\gamma}$ are defined so that the following diagrams

$$\begin{array}{ccc} p_{12K}^{\alpha\beta\gamma *} p_{2K}^{\alpha\beta *}(E_\beta) & \underset{\sim}{\xrightarrow{\epsilon}} & p_{2K}^{\alpha\beta\gamma *}(E_\beta) \\ \sim\downarrow p_{12K}^{\alpha\beta\gamma *}(\eta_{\alpha\beta}) & & \downarrow \eta_{12}^{\alpha\beta\gamma} \\ p_{12K}^{\alpha\beta\gamma *} p_{1K}^{\alpha\beta *}(E_\alpha) & \underset{\sim}{\xrightarrow{\epsilon}} & p_{1K}^{\alpha\beta\gamma *}(E_\alpha), \end{array} \quad \begin{array}{ccc} p_{23K}^{\alpha\beta\gamma *} p_{2K}^{\beta\gamma *}(E_\gamma) & \underset{\sim}{\xrightarrow{\epsilon}} & p_{3K}^{\alpha\beta\gamma *}(E_\gamma) \\ \sim\downarrow p_{23K}^{\alpha\beta\gamma *}(\eta_{\beta\gamma}) & & \downarrow \eta_{23}^{\alpha\beta\gamma} \\ p_{23K}^{\alpha\beta\gamma *} p_{1K}^{\beta\gamma *}(E_\beta) & \underset{\sim}{\xrightarrow{\epsilon}} & p_{2K}^{\alpha\beta\gamma *}(E_\beta), \end{array} \quad \begin{array}{ccc} p_{13K}^{\alpha\beta\gamma *} p_{2K}^{\alpha\gamma *}(E_\gamma) & \underset{\sim}{\xrightarrow{\epsilon}} & p_{3K}^{\alpha\beta\gamma *}(E_\gamma) \\ \sim\downarrow p_{13K}^{\alpha\beta\gamma *}(\eta_{\alpha\gamma}) & & \downarrow \eta_{13}^{\alpha\beta\gamma} \\ p_{13K}^{\alpha\beta\gamma *} p_{1K}^{\alpha\gamma *}(E_\alpha) & \underset{\sim}{\xrightarrow{\epsilon}} & p_{1K}^{\alpha\beta\gamma *}(E_\alpha), \end{array} \qquad (10.2.4.3.1)$$

  where the isomorphisms ϵ are those of the form 10.2.4.1.1, are commutative.

- A morphism $f = (f_\alpha)_{\alpha \in \Lambda}\colon ((E_\alpha)_{\alpha \in \Lambda},\, (\eta_{\alpha\beta})_{\alpha,\beta \in \Lambda}) \to ((E'_\alpha)_{\alpha \in \Lambda},\, (\eta'_{\alpha\beta})_{\alpha,\beta \in \Lambda})$ of $\mathrm{MIC}^{\dagger}(Y, (\mathfrak{X}_\alpha)_{\alpha \in \Lambda}/K)$ is by definition a family of morphisms $f_\alpha\colon E_\alpha \to E'_\alpha$ commuting with glueing data.

Proposition 10.2.4.4. *With notation 10.2.4.3, there exists a canonical equivalence of categories*

$$u_{0K}^*\colon \mathrm{MIC}^{\dagger}(Y, X, \mathfrak{P}/K) \cong \mathrm{MIC}^{\dagger}(Y, (\mathfrak{X}_\alpha)_{\alpha \in \Lambda}/K). \qquad (10.2.4.4.1)$$

Proof. 1) Let $\phi_\alpha := (id, id, u_\alpha)\colon (Y_\alpha, X_\alpha, \mathfrak{X}_\alpha) \to (Y_\alpha, X_\alpha, \mathfrak{P}_\alpha)$ be the proper morphism of frames. We remark that ϕ_α is the composition of the morphism of frames $\gamma_{u_\alpha}\colon (Y_\alpha, X_\alpha, \mathfrak{X}_\alpha) \to (Y_\alpha, X_\alpha, \mathfrak{X}_\alpha \times_{\mathfrak{S}} \mathfrak{P}_\alpha)$ induced by the graph of u_α and of $p_2\colon (Y_\alpha, X_\alpha, \mathfrak{X}_\alpha \times_{\mathfrak{S}} \mathfrak{P}_\alpha) \to (Y_\alpha, X_\alpha, \mathfrak{P}_\alpha)$ induced by the second projection. Since p_2 is proper and weakly smooth (see Definitions 10.1.1.4), then following Theorem

[LS07, 7.1.8] we get the equivalence of categories $p_{2K}^*\colon \mathrm{MIC}^\dagger((Y_\alpha, X_\alpha, \mathfrak{P}_\alpha)/K) \cong \mathrm{MIC}^\dagger((Y_\alpha, X_\alpha, \mathfrak{X}_\alpha \times_{\mathfrak{S}} \mathfrak{P}_\alpha)/K)$. Since γ_{u_α} has a retraction (the first projection), then using Corollary [LS07, 7.1.7] we get that $\gamma_{u_\alpha K}^*$ is also an equivalence of categories. Hence, by composition, so is $\phi_{\alpha K}^*\colon \mathrm{MIC}^\dagger((Y_\alpha, X_\alpha, \mathfrak{P}_\alpha)/K) \cong \mathrm{MIC}^\dagger((Y_\alpha, X_\alpha, \mathfrak{X}_\alpha)/K)$.

1') Let $\phi_{\alpha\beta} := (id, id, u_{\alpha\beta})\colon (Y_{\alpha\beta}, X_{\alpha\beta}, \mathfrak{X}_{\alpha\beta}) \to (Y_{\alpha\beta}, X_{\alpha\beta}, \mathfrak{P}_{\alpha\beta})$ be the morphism of frames. Using the same arguments than in 1), we get the equivalence of categories $\phi_{\alpha\beta K}^*\colon \mathrm{MIC}^\dagger((Y_{\alpha\beta}, X_{\alpha\beta}, \mathfrak{P}_{\alpha\beta})/K) \cong \mathrm{MIC}^\dagger((Y_{\alpha\beta}, X_{\alpha\beta}, \mathfrak{X}_{\alpha\beta})/K)$.

2) Let $E_{\mathfrak{P}} \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$. Using the properties of the glueing isomorphisms 10.2.4.1.1, we get canonically on the object $(\phi_{\alpha K}^*(E_{\mathfrak{P}}|_{]X_\alpha[_{\mathfrak{P}_\alpha}}))_{\alpha\in\Lambda}$ a glueing data making it an object of $\mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$. The functoriality is obvious and this yields the canonical functor $u_{0K}^*\colon \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) \cong \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$. Since $\phi_{\alpha K}^*$ is fully faithful and $\phi_{\alpha\beta K}^*$ is faithful, we easily check that the functor u_{0K}^* is fully faithful. The proof of the essential surjectivity is left as an exercise for the reader. □

10.3 Log-isocrystals

10.3.1 Shiho's convergent log-isocrystals

10.3.1.1. Let (X, M) be a log scheme of finite type over k. This yields $(X, M) \to \operatorname{Spec} k \hookrightarrow \operatorname{Spf} \mathcal{V}$.[1] Let τ be the Zariski or the etale topology. We denote by $I_{\mathrm{conv},\tau}((X, M)/\operatorname{Spf}\mathcal{V})$ the category of isocrystals on the log convergent site $((X, M)/\operatorname{Spf}\mathcal{V})_{\mathrm{conv},\tau}$ (see [Shi02, Definition 2.1.5]. We denote by $I_{\mathrm{conv}}((X, M)/\operatorname{Spf}\mathcal{V})$ the category of isocrystals on the log convergent site $((X, M)/\operatorname{Spf}\mathcal{V})_{\mathrm{conv}}$ defined at [Shi00]. Following [Shi02, 2.1.7], we have the equivalences of categories

$$I_{\mathrm{conv}}((X, M)/\operatorname{Spf}\mathcal{V}) \cong I_{\mathrm{conv,et}}((X, M)/\operatorname{Spf}\mathcal{V}).$$

10.3.1.2 (Logarithmic tube)**.** Let (X, M) be a fine log scheme over k, and let $i : (X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L})$ be a closed immersion into a noetherian fine log formal scheme $(\mathfrak{P}, \mathfrak{L})$ over $\operatorname{Spf}\mathcal{V}$ and P_k is of finite type over k. Shiho defines the logarithmic tube $](X, M)[^{\log}_{(\mathfrak{P},\mathfrak{L})}$ as follows.

(a) Assume that there exists a factorization of i of the form

$$(X, M) \xrightarrow{i'} (\mathfrak{P}', \mathfrak{L}') \xrightarrow{f'} (\mathfrak{P}, \mathfrak{L}) \qquad (10.3.1.2.1)$$

in which i' is an exact closed immersion and f is a formally log etale morphism. Let $\mathfrak{Q}$ be the completion of $\mathfrak{P}'$ along X. Then following [Shi02, Lemma 2.2.2], the rigid analytic space $\mathfrak{Q}_K$ is independent of the choice of the factorization, up to canonical isomorphism. Denote $\mathfrak{Q}_K$ by $](X, M)[^{\log}_{(\mathfrak{P},\mathfrak{L})}$.

(b) Following [Shi02, Remark 2.2.6], since our log structures are of Zariski type, then Zariski locally in $\mathfrak{P}$, there exists a factorization of i of the form of 10.3.1.2.1. A. Shiho checked at [Shi02, Proposition 2.2.4] that the tube $](X, M)[^{\log}_{(\mathfrak{P},\mathfrak{L})}$ admits a natural sheafification for the Zariski topology, i.e. we get by gluing the construction of $](X, M)[^{\log}_{(\mathfrak{P},\mathfrak{L})}$.

(c) By abuse of notation, we might simply write $]X[^{\log}_{\mathfrak{P}}$ instead of $](X, M)[_{(\mathfrak{P},\mathfrak{L})}$.

10.3.1.3. Suppose given the following commutative diagram

$$\begin{array}{ccc} (X, M) & \xrightarrow{\ i\ } & (\mathfrak{P}, \mathfrak{L}) \\ {\scriptstyle f}\downarrow & & \downarrow{\scriptstyle g} \\ \operatorname{Spec}\ k & \xrightarrow{\ \iota\ } & \operatorname{Spf}\ \mathcal{V} \end{array} \qquad (10.3.1.3.1)$$

where the bottom row has trivial log structure, $(\mathfrak{P}, \mathfrak{L})$ is a fine log formal scheme over $\operatorname{Spf}\mathcal{V}$, its structural morphism g is formally log smooth, i is a (non necessarily exact) closed immersion. For an integer j, let

[1] We might add logarithmic structures on $\mathcal{V}$ but we will not need it here.

$(\mathfrak{P}(j), \mathfrak{L}(j))$ denote the $(j+1)$-th fibre product of $(\mathfrak{P}, \mathfrak{L})$ over Spf $\mathcal{V}$, and let $i(j) : (X, M) \to (\mathfrak{P}(j), \mathfrak{L}(j))$ be the locally closed immersion induced by i (and the diagonal $\mathfrak{P} \to \mathfrak{P}(j)$). Moreover, the projections

$$p'_i \colon (\mathfrak{P}(1), \mathfrak{L}(1)) \to (\mathfrak{P}, \mathfrak{L}) \qquad (i = 1, 2),$$
$$p'_{ij} \colon (\mathfrak{P}(2), \mathfrak{L}(2)) \to (\mathfrak{P}(1), \mathfrak{L}(1)) \qquad (1 \leq i < j \leq 3),$$

and the diagonal morphism

$$\Delta' \colon (\mathfrak{P}, \mathfrak{L}) \to (\mathfrak{P}(1), \mathfrak{L}(1)),$$

induce the morphisms of rigid analytic spaces

$$p_i \colon]X[^{\log}_{\mathfrak{P}(1)} \to]X[^{\log}_{\mathfrak{P}} \qquad (i = 1, 2),$$
$$p_{ij} \colon]X[^{\log}_{\mathfrak{P}(2)} \to]X[^{\log}_{\mathfrak{P}(1)} \qquad (1 \leq i < j \leq 3),$$
$$\Delta \colon]X[^{\log}_{\mathfrak{P}} \to]X[^{\log}_{\mathfrak{P}(1)}.$$

Following [Shi02, 2.2.6], we denote by $\mathrm{Str}''((X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L}) / \operatorname{Spf} \mathcal{V})$ the category of pairs (E, ϵ), where E is a coherent $\mathcal{O}_{]X[^{\log}_{\mathfrak{P}}}$-module and $\epsilon \colon p_2^*(\mathcal{E}) \xrightarrow{\sim} p_1^*(\mathcal{E})$ is an isomorphism of $\mathcal{O}_{]X[^{\log}_{\mathfrak{P}(1)}}$-modules such that $\Delta^*(\epsilon) = id_{\mathcal{E}}$, and the cocycle condition $p_{12}^*(E) \circ p_{23}^*(E) = p_{13}^*(E)$ holds on $]X[^{\log}_{\mathfrak{P}(2)}$. Following [Shi02, 2.2.7], we have the canonical and functorial equivalence of categories

$$I_{\mathrm{conv}}((X, M) / \operatorname{Spf} \mathcal{V}) \cong \mathrm{Str}''((X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L}) / \operatorname{Spf} \mathcal{V}).$$

In particular, the category $\mathrm{Str}''((X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L}) / \operatorname{Spf} \mathcal{V})$ does not depend, up to canonical equivalence of categories, on the choice of the diagram 10.3.1.3.1 factorising $(X, M) \to \operatorname{Spec} k \hookrightarrow \operatorname{Spf} \mathcal{V}$. The objects of $\mathrm{Str}''((X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L}) / \operatorname{Spf} \mathcal{V})$ are called "convergent log-isocrystals on $(X, M) / \operatorname{Spf} \mathcal{V}$ with respect to i" or "convergent log-isocrystals on $(X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L}) / \operatorname{Spf} \mathcal{V}$".

If (E, ϵ) is a pair of $\mathrm{Str}''((X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L}) / \operatorname{Spf} \mathcal{V})$ such that E is a locally free $\mathcal{O}_{]X[^{\log}_{\mathfrak{P}}}$-module, then (E, ϵ) is called a "locally free convergent log-isocrystal on $(X, M) / \operatorname{Spf} \mathcal{V}$ with respect to i" or "locally free convergent log-isocrystal on $(X, M) \hookrightarrow (\mathfrak{P}, \mathfrak{L}) / \operatorname{Spf} \mathcal{V}$". The corresponding isocrystal on the log convergent site $((X, M) / \operatorname{Spf} \mathcal{V})_{\mathrm{conv}, \tau}$ will be said to be "locally free". Beware that following Kedlaya's terminology a convergent log-isocrystal is by definition locally free (see [Ked07, 6.1.7]), but we prefer to add "locally free" to remember this property.

10.3.2 Log-isocrystal with overconvergent singularities: the lifted case of relative strict normal crossing divisors

We will mostly need later, specially when working with the arithmetic $\mathcal{D}$-module analogue, to deal with convergent log-isocrystals in the specific context where the log structure is given by relative SNCD. We will also need to add overconvergent singularities.

We will fix some notation: let $g : \mathfrak{X} \to \mathfrak{S}$ be a smooth morphism of smooth $\mathcal{V}$-formal schemes, of pure relative dimension d, let $\mathfrak{Z}$ be a relative $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor, let $\mathfrak{X}^*$ be the complement of $\mathfrak{Z}$ in $\mathfrak{X}$, let T be a divisor of X and $\mathfrak{Y}$ the complement of T in $\mathfrak{X}$. Let $\mathfrak{X}^\sharp = (\mathfrak{X}, M(\mathfrak{Z}))$ be the logarithmic formal $\mathcal{V}$-scheme with the logarithmic structure associated to $\mathfrak{Z}$ (see 4.5.2.14), $j \colon Y \hookrightarrow X$ the open immersion and $\mathfrak{Y}^\sharp$ the restriction of $\mathfrak{X}^\sharp$ on $\mathfrak{Y}$.

10.3.2.1 (Specialization and log connections)**.** We have the specialization morphism of locally ringed spaces: $\mathrm{sp} \colon \mathfrak{X}_K \to \mathfrak{X}$. For any coherent $\mathcal{O}_{\mathfrak{X}_K}$-module E, the $\mathcal{O}_{\mathfrak{X}, \mathbb{Q}}$-module $\mathrm{sp}_* E$ is coherent and the adjunction morphism $\mathrm{sp}^* \mathrm{sp}_* E \to E$ is an isomorphism. Indeed, a coherent sheaf on an affinoid rigid space (resp. an affine formal scheme) is determined by its global sections, and for any affine open $\mathfrak{U} = \operatorname{Spf} A \subset \mathfrak{X}$, $\mathrm{sp}^{-1}(\mathfrak{U}) = \operatorname{Spm} A \otimes K$ is affinoid. For any coherent $\mathcal{O}_{\mathfrak{X}, \mathbb{Q}}$-module $\mathcal{E}$, the $\mathcal{O}_{\mathfrak{X}_K}$-module $\mathrm{sp}^* E$ is coherent and the adjunction morphism $\mathcal{E} \to \mathrm{sp}_* \mathrm{sp}^* \mathcal{E}$ is an isomorphism. Moreover, the functors sp_* and sp^* induce quasi-inverse equivalences between locally free of finite type $\mathcal{O}_{\mathfrak{X}_K}$-modules and locally projective of finite type $\mathcal{O}_{\mathfrak{X}, \mathbb{Q}}$-modules.

We get the locally free of finite type $\mathcal{O}_{\mathfrak{X}_K}$-module $\Omega^\bullet_{\mathfrak{X}^\sharp_K / \mathfrak{S}_K} := \mathrm{sp}^*(\mathcal{O}_{\mathfrak{X}, \mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \Omega^\bullet_{\mathfrak{X}^\sharp / \mathfrak{S}})$. From the morphism $d_{\mathcal{O}_{\mathfrak{X}, \mathbb{Q}}} \colon \mathcal{O}_{\mathfrak{X}} \to \Omega^1_{\mathfrak{X}^\sharp / \mathfrak{S}}$ (see notation 4.7.1.5.(c)), we get the map $d \colon \mathcal{O}_{\mathfrak{X}_K} \to \Omega^1_{\mathfrak{X}^\sharp_K / \mathfrak{S}_K}$.

Let V be an open of $\mathfrak{X}_K$. We set $\Omega^1_{V^\sharp/\mathfrak{S}_K} := \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|V$. Let E be an $\mathcal{O}_V$-module. A "logarithmic connection relative to $V^\sharp/\mathfrak{S}_K$" on E is an additive map $\nabla : E \to E \otimes_{\mathcal{O}_V} \Omega^1_{V^\sharp/\mathfrak{S}_K}$ such that for any open $W \subseteq V$, the map $\nabla_W : E(W) \to (E \otimes_{\mathcal{O}_V} \Omega^1_{V^\sharp/\mathfrak{S}_K})(W)$ satisfies the condition : for $x \in E(W)$, $a \in \mathcal{O}_V(W)$ we have

$$\nabla(ax) = a\nabla(x) + x \otimes d(a). \tag{10.3.2.1.1}$$

When $V = \mathfrak{X}_K$, the functors sp_* and sp^* induce quasi-inverse equivalences between coherent (resp. locally free of finite type) $\mathcal{O}_{\mathfrak{X}_K}$-modules together with a logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ and coherent (resp. locally projective of finite type) $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-modules together with a logarithmic connection relative to $\mathfrak{X}^\sharp/\mathfrak{S}$ with coefficients in $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ (compare 4.7.1.8 and 10.3.2.1.1). Via this correspondance, we say that a logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ on E is integrable if the connexion on $\mathrm{sp}_*(E, \nabla)$ is integrable.

10.3.2.2 (Integrable log-connections with overconvergent singularities)**.** Let E be a coherent $j^\dagger\mathcal{O}_{\mathfrak{X}_K}$-module. A "logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ with overconvergent singularities along T" on E is an additive map $\nabla : E \to E \otimes_{j^\dagger\mathcal{O}_{\mathfrak{X}_K}} j^\dagger\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}$ such that for any open $V \subseteq \mathfrak{X}_K$, the map $\nabla_V : E|V \to E|V \otimes_{j^\dagger_V\mathcal{O}_V} j^\dagger\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|V$ satisfies the condition : for $x \in E(V)$, $b \in j^\dagger\mathcal{O}_{\mathfrak{X}_K}(V)$ we have

$$\nabla(bx) = b\nabla(x) + x \otimes d(b), \tag{10.3.2.2.1}$$

where $d : j^\dagger\mathcal{O}_{\mathfrak{X}_K} \to j^\dagger\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}$ is the map induced by applying $j^\dagger$ to $d : \mathcal{O}_{\mathfrak{X}_K} \to \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}$

The functors sp_* and sp^* induce exact quasi-inverse equivalences between coherent (resp. locally free of finite type) $j^\dagger\mathcal{O}_{\mathfrak{X}_K}$-modules together with a logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ with overconvergent singularities along T and coherent (resp. locally projective of finite type) $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_\mathbb{Q}$-modules together with a logarithmic connection relative to $\mathfrak{X}^\sharp/\mathfrak{S}$ with coefficients in $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_\mathbb{Q}$ (use 10.1.2.3 and compare 4.7.1.8 and 10.3.2.1.1). Via this correspondance, we say that a logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ with overconvergent singularities along T on E is integrable if so is the connexion on $\mathrm{sp}_*(E, \nabla)$.

Definition 10.3.2.3 (Convergent connections: local context)**.** Suppose T is empty. Suppose $\mathfrak{S}$ is affine, $\mathfrak{X}$ is affine and endowed with nice coordinates $t_1, \dots, t_n$ (see definition 4.5.2.15) such that $\mathfrak{Z}$ is the zero locus of $t_1 \dots t_m$ on $\mathfrak{X}$ with $m \leq n$ and let us keep the notations of 4.5.2.18. The $\mathcal{O}_{\mathfrak{X}_K}$-module $\Omega^1_{\mathfrak{X}^\sharp_K/K}$ is free with the basis $d\log t_1, \dots, d\log t_m, dt_{m+1}, \dots, dt_n$.

Let (E, ∇) be a coherent $\mathcal{O}_{\mathfrak{X}_K}$-module E endowed with an integrable logarithmic connection ∇ relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$. The logarithmic connection $\nabla : E \to \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} E$ is "convergent" if it satisfies the following convergence condition: for any $\eta \in |K^\times|_\mathbb{Q} \cap]0, 1[$, for any $e \in \Gamma(\mathfrak{X}_K, E)$, we have

$$\| \underline{\partial}^{[\underline{k}]}_\sharp e \| \, \eta^{|\underline{k}|} \to 0 \text{ for } |\underline{k}| \to \infty, \tag{10.3.2.3.1}$$

with $\| \cdot \|$ a Banach norm on $\Gamma(\mathfrak{X}_K, \mathcal{E})$.

Definition 10.3.2.4 (Overconvergent connections: local context)**.** Suppose $\mathfrak{S}$ is affine, $\mathfrak{X}$ is affine and endowed with nice coordinates $t_1, \dots, t_n$ (see definition 4.5.2.15) such that $\mathfrak{Z}$ is the zero locus of $t_1 \dots t_m$ on $\mathfrak{X}$ with $m \leq n$ and let us keep the notations of 4.5.2.18. The $\mathcal{O}_{\mathfrak{X}_K}$-module $\Omega^1_{\mathfrak{X}^\sharp_K/K}$ is free with the basis $d\log t_1, \dots, d\log t_m, dt_{m+1}, \dots, dt_n$. We suppose T is a divisor which is defined by $f = 0$ in X for $f \in \Gamma(\mathfrak{X}, \mathcal{O}_\mathfrak{X})$. For any $0 \leq \lambda < 1$, set $Y_\lambda := \{x \in \mathfrak{X}_K \mid |f(x)| \geq \lambda\}$.

Let (E, ∇) be a coherent $j^\dagger\mathcal{O}_{\mathfrak{X}_K}$-module E endowed with an integrable logarithmic connection ∇ relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ with overconvergent singularities along T. The logarithmic connection $\nabla : E \to j^\dagger\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j^\dagger\mathcal{O}_{]X[_\mathfrak{X}}} E$ is "overconvergent" if there exist a strict neighborhood V of $]Y[_\mathfrak{X}$ in $]X[_\mathfrak{X}$ and a coherent $\mathcal{O}_V$-module $\mathcal{E}_V$ of finite type furnished with an integrable logarithmic connection $\nabla_V : \mathcal{E}_V \to (\Omega^1_{V^\sharp/\mathfrak{S}_K}) \otimes_{\mathcal{O}_V} \mathcal{E}_V$ such that $j^\dagger(\mathcal{E}_V, \nabla_V) = (E, \nabla)$, which satisfies the following overconvergence condition: for any $\eta \in |K^\times|_\mathbb{Q} \cap]0, 1[$, there exist $0 \leq \lambda_\eta < 1$ such that such that $Y_{\lambda_\eta} \subset V$ and such that for any $\lambda_\eta \leq \lambda < 1$ and each section $e \in \Gamma(Y_\lambda, E)$, we have

$$\| \underline{\partial}^{[\underline{k}]}_\sharp e \| \, \eta^{|\underline{k}|} \to 0 \text{ for } |\underline{k}| \to \infty, \tag{10.3.2.4.1}$$

with $\| \cdot \|$ a Banach norm on $\Gamma(Y_\lambda, \mathcal{E})$.

Remark that the convergent condition of 10.3.2.3 is simply the overconvergent condition in the case where the divisor T is empty.

Definition 10.3.2.5. Let (E, ∇) be a coherent $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-module endowed with an integrable logarithmic connection relative to $\mathfrak{X}^\sharp_K/K$ with overconvergent singularities along T. We say the logarithmic connection $\nabla : E \to j^\dagger \Omega^1_{\mathfrak{X}^\sharp_K/K} \otimes_{j^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E$ is "overconvergent over T" if for any affine open $\mathfrak{S}'$ of $\mathfrak{S}$ and $\mathfrak{X}'$ of $\mathfrak{X}$ such that $\mathfrak{X}' \subset f^{-1}(\mathfrak{S}')$ and $T \cap X'$ is defined by the vanishing of a section of $\mathcal{O}_X(X')$, the connection $\nabla | \mathfrak{X}'_K$ is overconvergent in the sense of 10.3.2.4.

A "locally free log-isocrystal on $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ overconvergent along T" is by definition a coherent $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-module endowed with an overconvergent along T logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ with overconvergent singularities along T.

We denote by $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}_K)$ the category of log-isocrystals on $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ overconvergent along T. When T is empty, we simply write $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K/\mathfrak{S}_K)$ and its objects are called "convergent log-isocrystal on $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$". An object (E, ∇) of $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}_K)$ is said to be locally free (of finite type) if E is locally free.

When T is empty, we say the connection or the log-isocrystal is "convergent" to say it is overconvergent along the empty set.

Example 10.3.2.6. We keep notation 10.3.2.5.

(a) It follows from [Ked07, 6.3.4 and 6.4.1] (see definitions [Ked07, 2.3.7 and 6.3.1]), when T is empty and when $\mathfrak{S} = \operatorname{Spf} \mathcal{V}$, the full subcategory of $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K/\mathfrak{S}_K)$ consisting in locally free objects is equivalent to full subcategory of $I_{\mathrm{conv}}(X^\sharp/\operatorname{Spf} \mathcal{V})$ consisting in locally free isocrystals on the log convergent site $((X, M)/\operatorname{Spf} \mathcal{V})_{\mathrm{conv}}$ (see 10.3.1.1).

(b) When $\mathfrak{Z}$ is empty, the category $\mathrm{MIC}^\dagger(\mathfrak{X}_K, T/\mathfrak{S}_K)$ is equivalent to the category $\mathrm{MIC}^\dagger(Y, X, \mathfrak{X}/\mathfrak{S}_K)$ of coherent $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-module endowed with a (relative to $(Y, X, \mathfrak{X}/\mathfrak{S})$) overconvergent connection (indeed, the overconvergent conditions of 10.2.2.4 and 10.3.2.4 are the same).

Proposition 10.3.2.7. *Suppose T is empty. Let (E, ∇) be a locally free of finite type $\mathcal{O}_{\mathfrak{X}_K}$-module endowed with an integrable logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$. The logarithmic connection $\nabla : E \to \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{\mathcal{O}_{\mathfrak{X}_K}} E$ is convergent if and only if $\nabla | \mathfrak{X}^*_K : E | \mathfrak{X}^*_K \to \Omega^1_{\mathfrak{X}^*_K/\mathfrak{S}_K} \otimes_{\mathcal{O}_{\mathfrak{X}^*_K}} E$ is convergent in the sense of 10.2.2.5.*

Proof. If ∇ is convergent, then this is obvious that so is $\nabla | \mathfrak{X}^*_K$. Let us check the converse. Since this is local, we can suppose $\mathfrak{S}$ is affine, $\mathfrak{X}$ is affine and endowed with nice coordinates $t_1, \dots, t_n$ (see definition 4.5.2.15) such that $\mathfrak{Z}$ is the zero locus of $t_1 \dots t_m$ on $\mathfrak{X}$ with $m \leq n$ and let us keep the notations of 4.5.2.18. The $\mathcal{O}_{\mathfrak{X}_K}$-module $\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}$ is free with the basis $d \log t_1, \dots, d \log t_m, dt_{m+1}, \dots, dt_n$. Let $\eta \in |K^\times|_\mathbb{Q} \cap]0, 1[$. By hypotheses, the connection $\nabla | \mathfrak{X}^*_K : \mathcal{E} | \mathfrak{X}^*_K \to \Omega^1_{\mathfrak{X}^*_K/\mathfrak{S}_K} \otimes_{\mathcal{O}_{\mathfrak{X}^*_K}} \mathcal{E} | \mathfrak{X}^*_K$ satisfies the condition 10.3.2.3.1, i.e., for any $e \in \Gamma(\mathfrak{X}^*_K, \mathcal{E})$, we have

$$\| \underline{\partial}^{[\underline{k}]} e \| \, \eta^{|\underline{k}|} \to 0 \text{ for } |\underline{k}| \to \infty, \tag{10.3.2.7.1}$$

with $\| \cdot \|$ a Banach norm on $\Gamma(\mathfrak{X}^*_K, \mathcal{E})$. Since the logarithmic coordinates $t_1, \dots, t_n$ are invertible on $\mathfrak{X}^*$, then it follows from 3.2.3.9.4 that we can replace $\| \underline{\partial}^{[\underline{k}]} e \|$ by $\| \underline{\partial}^{[\underline{k}]}_\sharp e \|$ in the convergent condition 10.3.2.7.1. Since X^* is dense in X, this yields that for any $e \in \Gamma(\mathfrak{X}_K, \mathcal{E})$, we have

$$\| \underline{\partial}^{[\underline{k}]}_\sharp e \| \, \eta^{|\underline{k}|} \to 0 \text{ for } |\underline{k}| \to \infty, \tag{10.3.2.7.2}$$

with $\| \cdot \|$ a Banach norm on $\Gamma(\mathfrak{X}_K, \mathcal{E})$. □

Remark 10.3.2.8. Beware that the case where T is not empty, the proposition 10.3.2.7 seems false (e.g. take $T = Z$).

10.3.2.9 (Local computations, residues, exponents)**.** Suppose we are in the local situation 10.3.2.4. Let E be a locally free log-isocrystal on $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ overconvergent along T. Let $\mathfrak{Z}_i = V(t_i)$ be an irreducible component of $\mathfrak{Z}$ which is not included in T. For any $i = 1, \ldots, m$, by composition ∇ with the projection $E \otimes_{j^\dagger \mathcal{O}_{\mathfrak{X}_K}} j^\dagger \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \to E \otimes_{j^\dagger \mathcal{O}_{\mathfrak{X}_K}} d \log t_i j^\dagger \mathcal{O}_{\mathfrak{X}_K} \xrightarrow{\sim} E$ we get the map $\partial_{\sharp i} \colon E \to E$ given by $x \mapsto \partial_{\sharp i}(x)$. Since $\partial_{\sharp i} t_i = t_i \partial_{\sharp i} + t_i$, then the map $\partial_{\sharp i} \colon E \to E$ preserves $t_i E$.

(a) The "residue of ∇ along $V(t_i)$" is the map $\mathrm{res}_i \colon E/t_iE \to E/t_iE$, given by the reduction modulo t_i of the map $\partial_{\sharp i} \colon E \to E$ corresponding to the action of $\partial_{\sharp i}$.

(b) The eigenvalues of the residue of ∇ along $\mathfrak{Z}_{iK}$, i.e., the eigenvalues of the matrix of res_i contained in an algebraic closure of the field of fractions of $\Gamma(\mathfrak{Z}_{iK}, j^\dagger_{Z_i \cap Y} \mathcal{O}_{\mathfrak{Z}_{iK}})$, are called "exponent of E along Z_i".

(c) We say "E has nilpotent residues" if the residue of ∇ along each irreducible component of $\mathfrak{Z}$ which is not contained in T is nilpotent. An "exponent of E" is an exponent of E along some irreducible component of $\mathfrak{Z}$ which is not contained in T. Any exponent is contained in $\mathbb{Z}_p$ by 10.3.2.4.1.

Definition 10.3.2.10. Let X be a smooth scheme over $\operatorname{Spec} k$, let Z be a strict normal crossing divisor of X, $X^\sharp = (X, M_Z)$ be the logarithmic $\operatorname{Spec} k$-scheme with the logarithmic structure associated to Z. Let E be a locally free convergent log-isocrystal of $I_{\mathrm{conv}}(X^\sharp/\operatorname{Spf} \mathcal{V})$.

(a) Suppose there exists a lifting of X (resp. Z) in a smooth over $\operatorname{Spf} \mathcal{V}$ formal scheme $\mathfrak{X}$ (resp. $\mathfrak{Z}$ in a relative strict normal crossing divisor of $\mathfrak{X}$ over $\operatorname{Spf} \mathcal{V}$. Let $\mathfrak{X}^\sharp = (\mathfrak{X}, M(\mathfrak{Z}))$ be the logarithmic formal $\mathcal{V}$-scheme (see 4.5.2.14). We say that E has nilpotent residues if so is the corresponding object (via the equivalence 10.3.2.6.(a)) of $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K/K)$ in the sense of 10.3.2.9. Moreover, an "exponent of E" is an exponent of the corresponding object of $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K/K)$ in the sense of 10.3.2.9.

(b) Locally, such liftings of X (resp. Z) exist. We say that E has nilpotent residues, if E has locally nilpotent residues. An exponent of E is an exponent of the restriction of E on some open subset (where it has a meaning).

10.3.3 Kedlaya's semistable reduction theorem

We recall the following Kedlaya's definitions (see [Ked08, 3.2.1, 3.2.4]):

Definition 10.3.3.1. Let X be a smooth irreducible variety over $\operatorname{Spec} k$, Z be a strict normal crossing divisor of X, M_Z the induced log-structure and let E be a convergent isocrystal on $X \setminus Z$. We say that E is *log-extendable* on X if there exists a locally free convergent isocrystal of $I_{\mathrm{conv}}((X, M_Z)/\operatorname{Spf} \mathcal{V})$ having nilpotent residues (in the sense of 10.3.2.10) whose induced convergent isocrystal on $X \setminus Z$ is E.

Definition 10.3.3.2. Let Y be a smooth irreducible variety over $\operatorname{Spec} k$, let X be a partial compactification of Y, and let E be an F-isocrystal on Y overconvergent along $X \setminus Y$. We say that E *admits semistable reduction* if there exists

(a) a proper, surjective, generically étale morphism $f \colon X_1 \to X$,

(b) an open immersion $X_1 \hookrightarrow \overline{X}_1$ into a smooth projective variety over k such that $T_1 := f^{-1}(X \setminus Y) \cup (\overline{X}_1 \setminus X_1)$ is a strict normal crossing divisor of $\overline{X}_1$

such that the isocrystal $f^*(E)$ on $Y_1 := f^{-1}(Y)$ overconvergent along $T_1 \cap X_1$ is log-extendable on X_1 (see 10.3.3.1).

With the previous definitions, Kedlaya has proved in [Ked11, 2.4.4] (see also [Ked07], [Ked08], [Ked09]) the following theorem which answers positively to Shiho's conjecture in [Shi02, 3.1.8]:

Theorem 10.3.3.3 (Kedlaya)**.** *Let Y be a smooth irreducible k-variety, X be a partial compactification of Y, $Z := X \setminus Y$, E be an F-isocrystal on Y overconvergent along Z. Then E admits semistable reduction.*

Remark 10.3.3.4. This conjecture was previously checked by Tsuzuki when E is unit-root in [Tsu02].

10.3.4 A comparison theorem between relative log-rigid cohomology and relative rigid cohomology

Let $g : \mathfrak{X} \to \mathfrak{S}$ be a smooth morphism of smooth $\mathcal{V}$-formal schemes, of pure relative dimension d, let $\mathfrak{Z}$ be a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor, let $\mathfrak{X}^*$ be the complement of $\mathfrak{Z}$ in $\mathfrak{X}$, let D be a closed subscheme of X and $\mathfrak{Y}$ the complement of D in $\mathfrak{X}$. Let $\mathfrak{X}^\sharp = (\mathfrak{X}, M(\mathfrak{Z}))$ be the logarithmic formal $\mathcal{V}$-scheme with the logarithmic structure associated to $\mathfrak{Z}$ (see 4.5.2.14), and $\mathfrak{Y}^\sharp$ the restriction of $\mathfrak{X}^\sharp$ on $\mathfrak{Y}$. If $\mathfrak{U}$ is an open of $\mathfrak{X}$, we denote by $j_U : U \hookrightarrow X$ the induced open immersion and $j_U^\dagger E$ the sheaf of germs of sections of a sheaf E on $\mathfrak{X}_K$ overconvergent along $X \setminus U$ (see 10.1.2.1).

Let $\mathcal{I}_{\mathfrak{Z}}$ be the sheaf of ideals of $\mathfrak{Z}$ in $\mathfrak{X}$. Since $\mathcal{I}_{\mathfrak{Z}}$ is invertible, $\mathcal{I}_{\mathfrak{Z},\mathbb{Q}}$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp,\mathbb{Q}}$-module which is an invertible $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-module. Hence, $I_{\mathfrak{Z},\mathbb{Q}} = \mathrm{sp}^*\mathcal{I}_{\mathfrak{Z},\mathbb{Q}}$ is a convergent isocrystal on X/K with logarithmic pole along Z. Let E be a locally free log-isocrystal on $Y^\sharp/\mathfrak{S}_K$ overconvergent along D. For an integer m, we put

$$E(m\mathfrak{Z}) = E \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} j_Y^\dagger I_{\mathfrak{Z},\mathbb{Q}}^{\otimes -m}.$$

$E(m\mathfrak{Z})$ is a locally free overconvergent log-isocrystal and the exponents of $E(m\mathfrak{Z})$ are the exponents of E minus m. Then there is a natural commutative diagram

$$\begin{array}{ccc} E & \overset{\subset}{\longrightarrow} & E(m\mathfrak{Z}) \\ =\downarrow & & \downarrow \\ E & \longrightarrow & j^\dagger_{X^*\cap Y} E \end{array} \tag{10.3.4.0.1}$$

for any nonnegative integer m.

Definition 10.3.4.1. A p-adic integer α is a "p-adic Liouville number" if the radius of convergence of formal power series, either $\sum_{n\in\mathbb{Z}_{\geq 0}, n\neq\alpha} x^n/(n-\alpha)$ or $\sum_{n\in\mathbb{Z}_{\geq 0}, n\neq -\alpha} x^n/(n+\alpha)$, is less than 1. Note that (1) a p-adic integer which is an algebraic number is not a p-adic Liouville number and (2) a p-adic integer α is a p-adic Liouville number if and only if so is $-\alpha$ (resp. $\alpha + m$ for any integer m). For p-adic Liouville numbers, we refer to [DGS94, VI, 1] and [BC92, 1.2].

Theorem 10.3.4.2. *With the above notation, let E be a locally free log-isocrystal on $\mathfrak{X}_K^\sharp/\mathfrak{S}_K$ overconvergent along D. Suppose that*

(a) *none of differences of exponents of E is a p-adic Liouville number, and*

(b) *none of exponents of E is a p-adic Liouville number*

along each irreducible component Z_i of Z such that $Z_i \not\subset D$. Let c be the nonnegative integer defined by

$c = \max\{e \,|\, e$ *is a positive integral exponent of E along some irreducible component Z_i of Z such that $Z_i \not\subset D$*$\} \cup \{0\}$

Then the diagram 10.3.4.0.1 induces an isomorphism

$$\mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}_K^\sharp/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E) \cong \mathbb{R}g_{K*}\mathrm{Cone}\left(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}_K^\sharp/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E \to j_Y^\dagger \Omega^\bullet_{\mathfrak{X}_K^\sharp/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E(m\mathcal{Z})\right)[-1] \tag{10.3.4.2.1}$$

for any $m \geq c$. In particular, if none of exponents along each irreducible component Z_i of Z such that $Z_i \not\subset D$ is a positive integer, then the restriction induces an isomorphism

$$\mathbb{R}g_{K*}(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}_K^\sharp/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E) \xrightarrow{\sim} \mathbb{R}g_{K*}(j^\dagger_{X^*\cap Y} \Omega^\bullet_{\mathfrak{X}_K/\mathfrak{S}_K} \otimes_{j^\dagger_{X^*\cap Y} \mathcal{O}_{]X[_\mathfrak{X}}} j^\dagger_{X^*\cap Y} E). \tag{10.3.4.2.2}$$

Remark 10.3.4.3. (a) In fact, we will see in 18.3.1.13 that the comparison homomorphism corresponding to 10.3.4.2.2 is an isomorphism on the formal scheme side without the functor $g_+^\sharp$. But the first step towards this result is to establish 10.3.4.2.

(b) Note that $j^\dagger_{X^*\cap Y} E$ is a locally free isocrystal on $X^* \cap Y/\mathfrak{S}_K$ overconvergent along $Z \cup D$ and the right handside of the isomorphism in the theorem above is a relative rigid cohomology with respect to the closed immersion $S \to \mathfrak{S}$. It is independent of the choice of $\mathfrak{X}$ which is smooth over $\mathfrak{S}$ around Y [CT03, sect. 10]. The left handside of 10.3.4.2.2 in the theorem above is regarded as a relative logarithmic rigid cohomology.

(c) This type of comparison theorem between p-adic cohomology with logarithmic pole and rigid cohomology was studied in [BC94, 3.1], [Tsu99, 3.5.1], [Shi02, 2.2.4 and 2.2.13] (see also the definition [Shi02, 2.1.5]) and [BB04, A.1]BC94. They suppose that an overconvergent isocrystal is locally free on the formal side or for [Shi02, 2.2.4 and 2.2.13] it concerns the absolute case. In the theorem above we relax this assumption and suppose that an overconvergent isocrystal is locally free only on the analytic side.

(d) One can also prove the comparison theorem in the case g is smooth around Y replacing 10.3.4.9 and 10.3.4.19 (the weak fibration theorem) by the strong forms (the strong fibration theorem) with modifications.

Remark 10.3.4.4. For a locally free log-isocrystal E on $\mathfrak{X}^{\sharp}_K/\mathfrak{S}_K$ overconvergent along D, we denote by $\mathrm{Exp}(E) \subset \mathbb{Z}_p$ (resp. $\mathrm{Exp}(E)^{\mathrm{gr}} \subset \mathbb{Z}_p$) the monoid (resp. abelian group) generated by all exponents along irreducible components Z_i of Z such that $Z_i \not\subset D$. $\mathrm{Exp}(E)$ and $\mathrm{Exp}(E)^{\mathrm{gr}}$ do not depend on the choice of local coordinates.

(a) Let $\mathfrak{X}^{\sharp} = (\mathfrak{X}, \mathfrak{Z})$ and $\mathfrak{X}'^{\sharp} = (\mathfrak{X}', \mathfrak{Z}')$ be smooth $\mathcal{V}$-formal schemes with relative strict normal crossing divisors over $\mathfrak{S}$, let $\mathfrak{Y}, D, \mathfrak{Y}^{\sharp}, \mathfrak{Y}', D', \mathfrak{Y}'^{\sharp}$ as above, and let $h : \mathfrak{X}' \to \mathfrak{X}$ be a morphism over $\mathfrak{S}$ such that $h^{-1}(D \cup Z) \subset D' \cup Z'$. Suppose that h induces a log-morphism $(h|_{\mathfrak{Y}'})^{\sharp} : \mathfrak{Y}'^{\sharp} \to \mathfrak{Y}^{\sharp}$. Then the inverse image $h^{\sharp *}_K E$ is a locally free log-isocrystal on $\mathfrak{X}'^{\sharp}_K/\mathfrak{S}_K$ overconvergent along D' because h_K induces a log-morphism of rigid analytic spaces between suitable strict neighborhoods by our assumption. Suppose furthermore that none of elements in $\mathrm{Exp}(E)$ (resp. $\mathrm{Exp}(E)^{\mathrm{gr}}$) is a p-adic Liouville number. Then the same holds for the inverse image $h^{\sharp *}_K E$. Indeed, for a suitable choice of local coordinates z_i $(1 \leq i \leq s)$ and z'_j $(1 \leq j \leq s')$ along the normal crossing divisors $\mathfrak{Z}$ and $\mathfrak{Z}'$ of $\mathfrak{X}$ and $\mathfrak{X}'$ respectively, we have $z_i = u_i {z'_1}^{m_{i1}} \cdots {z'_{s'}}^{m_{is'}}$ locally at a generic point of $\mathfrak{Z}'$. Here u_i is a unit of $\mathcal{O}_{\mathfrak{Y}'}$ and m_{ij} is a nonnegative integer. Since the residues of E with respect to Z_{i_1} and Z_{i_2} commute with each other by the integrability of the log-connection and $dz_i/z_i \equiv \sum_j m_{ij} dz'_j/z'_j \pmod{\Omega^1_{\mathfrak{Y}'/\mathfrak{S}}}$, $\mathrm{Exp}(h^{\sharp *}_K E)$ is a submonoid of $\mathrm{Exp}(E)$. (See [AB01, 6.2.5].)

Even if any exponent of E is not a positive integer, it might happen that some exponent of the inverse image $h^{\sharp *}_K E$ is a positive integer. Since $\mathrm{Exp}(E) \cap \mathbb{Q}_{\geq 0}$ is finitely generated as a monoid where $\mathbb{Q}_{\geq 0}$ is the monoid consisting of nonnegative rational numbers, $\mathrm{Exp}(E(m\mathfrak{Z}))$ does not contain any positive rational numbers for a sufficiently large integer m. Therefore, none of exponents of an arbitrary inverse image $h^{\sharp *}_K E(m\mathfrak{Z})$ is a positive integer.

(b) Let $h^{\sharp} : \mathfrak{X}'^{\sharp} \to \mathfrak{X}^{\sharp}$ be a log-morphism such that $h^{-1}(D) = D'$ and $h^{-1}(\mathfrak{Z}) = \mathfrak{Z}'$. Suppose that the underlying morphism h is finite étale. Note that local parameters of $\mathfrak{X}^{\sharp}$ becomes local parameters of $\mathfrak{X}'^{\sharp}$. Then, for a locally free log-isocrystal E' on $\mathfrak{X}'^{\sharp}_K/\mathfrak{S}_K$ overconvergent along D', $h^{\sharp}_{K*}E'$ is a locally free log-isocrystal on $\mathfrak{X}^{\sharp}_K/\mathfrak{S}_K$ overconvergent along D. Moreover, for an irreducible component Z_i of Z such that $Z_i \not\subset D$, the exponents of $h^{\sharp}_{K*}E'$ along Z_i coincide with the exponents of E' along $h^{-1}(Z)$ (including multiplicities). In particular, $\mathrm{Exp}(h^{\sharp}_{K*}E') = \mathrm{Exp}(E')$. (See [AB01, 6.5.4].) The first part easily follows from our geometric situation and we have $\mathrm{rank}_{j^{\dagger}\mathcal{O}_{]\overline{X}[_{\mathfrak{X}}}} h^{\sharp}_{K*}E' = \deg(h)\mathrm{rank}_{j^{\dagger}\mathcal{O}_{]\overline{X}'[_{\mathfrak{X}'}}} E'$, where $\deg(h)$ is the degree of the underlying morphism of h. The second part is a problem only along the generic point of $\mathfrak{Z}_i$. We may assume that $\mathfrak{X}$ and $\mathfrak{X}'$ are affine, Z is irreducible and is not included in D. Let $\widehat{(j^{\dagger}\mathcal{O}_{]\overline{X}[_{\mathfrak{X}}})}_{\mathfrak{Z}}$ be the completion along $\mathfrak{Z}_K$. Then there is a natural K-algebra homomorphism from the ring of global sections of $\widehat{(j^{\dagger}\mathcal{O}_{]\overline{X}[_{\mathfrak{X}}})}_{\mathfrak{Z}}$ into $K(\mathfrak{Z})[[z]]$, where $K(\mathfrak{Z})$ is the field of fractions of $\Gamma(\mathfrak{Z}, j^{\dagger}\mathcal{O}_{\mathfrak{Z}})$ and z is a local coordinate of $\mathfrak{Z}$. This K-algebra homomorphism naturally extends to a K-algebra homomorphism from the ring of global sections of $\widehat{(j^{\dagger}\mathcal{O}_{]\overline{X}'[_{\mathfrak{X}'}})}_{\mathfrak{Z}'}$ into a direct sum of finite unramified extensions of $K(\mathfrak{Z})[[z]]$. We may replace the residue field $K(\mathfrak{Z})$ of $K(\mathfrak{Z})[[z]]$ by its algebraic closure $\overline{K(\mathfrak{Z})}$ since all exponents are contained in $\mathbb{Z}_p$ and invariant under any automorphism of $\overline{K(\mathfrak{Z})}$. Hence, $\widehat{(j^{\dagger}\mathcal{O}_{]\overline{X}'[_{\mathfrak{X}'}})}_{\mathfrak{Z}'}$ goes to a direct sum of $\deg(h)$ copies of $\overline{K(\mathfrak{Z})}[[z]]$. Now our second assertion is clear.

First we prove a special case.

Proposition 10.3.4.5. *Under the hypothesis in 10.3.4.2, suppose that $\mathfrak{Z}$ is irreducible such that $Z \not\subset D$, and that the composition $g \circ i : \mathfrak{Z} \to \mathfrak{S}$ of the closed immersion $i : \mathfrak{Z} \to \mathfrak{X}$ and $g : \mathfrak{X} \to \mathfrak{S}$ is an isomorphism. If we define $S \cap Y = Z \cap Y$ through the isomorphism $g \circ i : Z \to S$, then $g_{K*}\nabla : g_{K*}(E(m\mathfrak{Z})/E) \to g_{K*}(j_Y^\dagger \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E(m\mathfrak{Z})/E)$ is a $j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}}$-homomorphism of locally free $j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}}$-modules of finite type and the natural morphism 10.3.4.2.1 induces an isomorphism*

$$\mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E) \cong \left[g_{K*}(E(m\mathfrak{Z})/E) \overset{g_{K*}\nabla}{\longrightarrow} g_{K*}(j_Y^\dagger \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E(m\mathfrak{Z})/E)\right][-1] \tag{10.3.4.5.1}$$

for any $m \geq c$ in the derived category of complexes of $j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}}$-modules. Here $[A \to B]$ means a complex consisting of the terms of degree 0 and degree 1.

We will see that, in 10.3.4.23, the overconvergence of the induced Gauss-Manin connection on $g_{K*}(E(m\mathfrak{Z})/E)$ in the relative case. An example such that the cokernel of $g_{K*}\nabla : g_{K*}(E(m\mathfrak{Z})/E) \to g_{K*}(j_Y^\dagger \Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E(m\mathfrak{Z})/E)$ is not locally free is also given in 10.3.4.24.

Proof. At first we shall define $j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}}$-module structures we both sides of 10.3.4.5.1.
