We shall prove that $\mathbb{R}^q g_{K*}(E(\mathfrak{Z})/E) = 0$ for $q \neq 0$ and the locally freeness of $g_{K*}(E(\mathfrak{Z})/E)$. Since $i^{-1}(X \setminus Y) = Z \setminus Y$ as underlying topological spaces, $i_K^* E(\mathfrak{Z}) = j^\dagger_{Z\cap Y}\mathcal{O}_{]Z[_\mathfrak{Z}} \otimes_{i_K^{-1} j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} i_K^{-1}E(\mathfrak{Z})$ is a locally free $j^\dagger_{Z\cap Y}\mathcal{O}_{]Z[_\mathfrak{Z}}$-module of finite type and the adjoint gives an isomorphism $i_{K*}i_K^*E(\mathfrak{Z}) \cong E(\mathfrak{Z})/E$. Because i is a closed immersion, $i_K :]Z[_\mathfrak{Z} \to]X[_\mathfrak{X}$ is an affinoid morphism. Hence $\mathbb{R}i_{K*}\mathcal{M} = i_{K*}\mathcal{M}$ for any coherent $j^\dagger_{Z\cap Y}\mathcal{O}_{]Z[_\mathfrak{Z}}$-module $\mathcal{M}$ by $i^{-1}(X \setminus Y) = Z \setminus Y$ [CT03, 5.2.2]. Since $g \circ i$ is an isomorphism, we have

$$\mathbb{R}g_{K*}(E(\mathfrak{Z})/E) = \mathbb{R}g_{K*}(i_{K*}i_K^*E(\mathfrak{Z})) = \mathbb{R}g_{K*}\mathbb{R}i_{K*}i_K^*E(\mathfrak{Z}) = \mathbb{R}(g \circ i)_{K*}i_K^*E(\mathfrak{Z}) = (g \circ i)_{K*}i_K^*E(\mathfrak{Z})$$

and the two assertions above. Therefore, we show, for $m \geq 0$, $\mathbb{R}^q g_{K*}(E(m\mathfrak{Z})/E) = 0$ for $q \neq 0$ and $g_{K*}(E(m\mathfrak{Z})/E)$ is a locally free $j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}}$-module of finite type by induction on m.

For a $j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}$-module $\mathcal{H}$, the $j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}$-module $\underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_Y^\dagger \mathcal{H})$ is not a priori a $g_K^{-1}(j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}})$-module because $Y \subset g^{-1}(S \cap Y)$ might not hold. The following lemma says that $\underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_Y^\dagger \mathcal{H})$ has a $g_K^{-1}(j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}})$-module structure. Hence the left hand side of 10.3.4.5.1 belongs to the derived category of complexes of $j^\dagger_{S\cap Y}\mathcal{O}_{]S[_\mathfrak{S}}$-modules.

Lemma 10.3.4.6. *Ynder the hypothesis in 10.3.4.5, let us put $Y' = g^{-1}(S \cap Y) \cap Y$. If $\mathcal{A}$ is a sheaf of rings on $]X[_\mathfrak{X}$, then the restriction morphism*

$$\underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_Y^\dagger \mathcal{H}) \to \underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_{Y'}^\dagger \mathcal{H})$$

is an isomorphism for any $\mathcal{A}$-module $\mathcal{H}$.

Proof. Since $S \cap Y = Z \cap Y$ via $g \circ i$ and $X^* \cap Y = Y \setminus Z$, we have $(Z \cap Y) \subset Y'$ and $Y = Y' \cup (X^* \cap Y)$. Hence, the natural morphism $[j_Y^\dagger \mathcal{H} \to j^\dagger_{X^*\cap Y}\mathcal{H}] \to [j^\dagger_{Y'}\mathcal{H} \to j^\dagger_{X^*\cap Y'}\mathcal{H}]$ of complexes is an isomorphism by [Ber96b, 2.1.8]. □

We divide the proof of 10.3.4.5 into 7 parts.

0° *Reduce to the case where none of the exponents of E along $\mathfrak{Z}$ is a positive integer, that is, $c = 0$.*

Since the natural morphism $j^\dagger_{X^*\cap Y}E \to j^\dagger_{X^*\cap Y}E(m\mathfrak{Z})$ is an isomorphism, the natural morphism of complexes induces a triangle

$$\begin{array}{c} \mathbb{R}g_{K*}\mathrm{Cone}\left(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E \to j_Y^\dagger \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E(m\mathfrak{Z})\right)[-1] \\ \swarrow \qquad\qquad \nwarrow +1 \\ \mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E) \to \mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z[_\mathfrak{X}}(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_\mathfrak{X}}} E(m\mathfrak{Z})) \end{array}$$

for any $m \geq 0$. If we prove the vanishing $\mathbb{R}g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}}}(j^{\dagger}_{Y}\Omega^{\bullet}_{\mathfrak{X}^{\sharp}_{K}/\mathfrak{S}_{K}} \otimes_{j^{\dagger}_{Y}\mathcal{O}_{]X[_{\mathfrak{X}}}} E) = 0$ for $c = 0$, then, for any c, the triangle above induces the desired isomorphism when $m \geq c$. Hence, we may assume $m = c = 0$ and we shall prove the vanishing.

1° *Local problem on X and Y.*

By the Čech spectral sequences associated to a finite open covering $\{\mathfrak{X}_i\}$ of $\mathfrak{X}$ (resp. a finite open covering $\{\mathfrak{Y}_{ij}\}$ of each $\mathfrak{X}_i \cap \mathfrak{Y}$) 10.1.4.2 [CT03, 8.3.3], the vanishing is local on X and Y. Since the vanishing of $\mathbb{R}g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}}}(j^{\dagger}_{Y}\Omega^{\bullet}_{\mathfrak{X}^{\sharp}_{K}/\mathfrak{S}_{K}} \otimes_{j^{\dagger}_{Y}\mathcal{O}_{]X[_{\mathfrak{X}}}} E)$ is trivial in the case where $Z = \emptyset$, we may assume that $\mathfrak{X}$ is affine, D is defined by a single equation $f = 0$ in X for some $f \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$, and there is a coordinate z of $\mathfrak{X}$ over $\mathfrak{S}$ such that $\mathfrak{Z}$ is defined by $z = 0$ in $\mathfrak{X}$. Indeed, it is enough to take a certain covering consisting of $\mathfrak{X} \setminus \mathfrak{Z}$ and a covering of $\mathfrak{Z}$.

2° *Reduction to the local case by rigid analytic geometry.*

Let us add some notation. Let us put $]Y[_{\mathfrak{X},\lambda}= \{x \in]X[_{\mathfrak{X}} \,|\, |f(x)| \geq \lambda\}$ (resp. $]X^*[_{\mathfrak{X},\lambda}= \{x \in]X[_{\mathfrak{X}} \,|\, |z(x)| \geq \lambda\}$, resp. $]Z \cap Y[_{\mathfrak{Z},\lambda}= \{x \in]Z[_{\mathfrak{Z}} \,|\, |\overline{f}(x)| \geq \lambda\}$, resp. $[Z]_{\mathfrak{X},\lambda} = \{x \in]Z[_{\mathfrak{X}} \,|\, |z(x)| \leq \lambda\}$) for $\lambda \in |K^{\times}|_{\mathbb{Q}} \cap]0, 1[$, where $\overline{f}$ is the reduction of f in $\Gamma(\mathfrak{Z}, \mathcal{O}_{\mathfrak{Z}})$. We define $]S \cap Y[_{\mathfrak{S},\lambda}=]Z \cap Y[_{\mathfrak{Z},\lambda}$ by the identification through $g \circ i$. Note that the set $\{]Y[_{\mathfrak{X},\lambda}\}_{\lambda \in |K^{\times}|_{\mathbb{Q}} \cap]0,1[}$ forms a fundamental system of strict neighborhoods of $]Y[_{\mathfrak{X}}$ in $]X[_{\mathfrak{X}}$. Let $\alpha_V : V \to]X[_{\mathfrak{X}}$ denote the canonical morphism for admissible open subsets V in $]X[_{\mathfrak{X}}$.

Take $\nu \in |K^{\times}|_{\mathbb{Q}} \cap]0, 1[$ such that there is a locally free $\mathcal{O}_{]Y[_{\mathfrak{X},\nu}}$-module $\mathcal{E}$ of finite type endowed with a logarithmic connection $\nabla : \mathcal{E} \to (\Omega^1_{\mathfrak{X}^{\sharp}_{K}/\mathfrak{S}_{K}}|_{]Y[_{\mathfrak{X},\nu}}) \otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\nu}}} \mathcal{E}$ which satisfies the overconvergence condition 10.3.2.4.1. Hence, there exist a strictly increasing sequence $\underline{\xi} = (\xi_l)$ in $|K^{\times}|_{\mathbb{Q}} \cap]0, 1[$ with $\xi_l \to 1^-$ as $l \to \infty$ and an increasing sequence $\underline{\lambda} = (\lambda_l)$ in $|K^{\times}|_{\mathbb{Q}} \cap [\nu, 1[$ such that, for any l,

$$||\partial^{[n]}_{\sharp}(e)||\xi^n_l \to 0 \ \text{(as } n \to \infty) \tag{10.3.4.6.1}$$

for any section $e \in \Gamma(]Y[_{\mathfrak{X},\lambda_l}, \mathcal{E})$. Here $\partial_{\sharp} = \nabla(z\frac{d}{dz})$ and $\partial^{[l]}_{\sharp} = \frac{1}{l!}\prod_{j=0}^{l-1}(\partial_{\sharp} - j)$.

Let $\mathcal{A}$ be a sheaf of rings on $]X[_{\mathfrak{X}}$. Let $\eta \in |K^{\times}|_{\mathbb{Q}} \cap]0, 1[$. We define a functor $\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}$ from the category of $\mathcal{A}$-modules to itself by the exact sequence

$$0 \longrightarrow \underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}(\mathcal{H}) \longrightarrow \mathcal{H} \longrightarrow \lim_{\mu \to \eta^-} \alpha_{]X^*[_{\mathfrak{X},\mu}*}(\mathcal{H}|_{]X^*[_{\mathfrak{X},\mu}}) \longrightarrow 0 \tag{10.3.4.6.2}$$

for any $\mathcal{A}$-module $\mathcal{H}$. Here the morphism $\mathcal{H} \to \lim_{\mu \to \eta^-} \alpha_{]X^*[_{\mathfrak{X},\mu}*}(\mathcal{H}|_{]X^*[_{\mathfrak{X},\mu}})$ is an epimorphism for the same reason than for the epimorphism $\mathcal{H} \to j^{\dagger}_{X^*}\mathcal{H}$. One can easily see that $\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}(\mathcal{H})|_{]X^*[_{\mathfrak{X},\eta}} = 0$ and $\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}$ is an exact functor by the snake lemma. For $\xi \in |K^{\times}|_{\mathbb{Q}} \cap [\eta, 1[$, the restriction induces a morphism

$$\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}(\mathcal{H}) \to \underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\xi}(\mathcal{H})$$

of $\mathcal{A}$-modules. By definition we have

Proposition 10.3.4.7. *With the same notation as above, the inductive system induces an isomorphism*

$$\lim_{\eta \to 1^-} \underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}(\mathcal{H}) \cong \underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}}}(\mathcal{H}).$$

Proposition 10.3.4.8. *Let $\lambda \in |K^{\times}|_{\mathbb{Q}} \cap]0, 1[$.*

(a) The functor $\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}$ commutes with direct limits. Also, for any $\mathcal{A}$-module $\mathcal{H}$, the natural morphism

$$\alpha_{]Y[_{\mathfrak{X},\lambda}*}(\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}(\mathcal{H})|_{]Y[_{\mathfrak{X},\lambda}}) \to \underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}(\mathcal{H}|_{]Y[_{\mathfrak{X},\lambda}}))$$

is an isomorphism. Moreover, $j^{\dagger}_{Y}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta} = \underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}j^{\dagger}_{Y}$.

(b) For any coherent $\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}$-module $\mathcal{H}_{\lambda}$ and any $q \geq 1$ we have $\mathbb{R}^q\alpha_{]Y[_{\mathfrak{X},\lambda}*}(\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}},\eta}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}\mathcal{H}_{\lambda})|_{]Y[_{\mathfrak{X},\lambda}}) = 0$.

Proof. (1) Since the morphism $\alpha_{]X^*[_{\mathfrak{X},\mu}}$ is quasi-compact and quasi-separated, we obtain from 10.3.4.6.2 the first assertion. By applying the functor $\alpha_{]Y[_{\mathfrak{X},\lambda}*}\alpha^{-1}_{]Y[_{\mathfrak{X},\lambda}}$ to the exact sequence 10.3.4.6.2, we get the sequence

$$0 \longrightarrow \alpha_{]Y[_{\mathfrak{X},\lambda}*}(\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\mathcal{H})|_{]Y[_{\mathfrak{X},\lambda}}) \longrightarrow \alpha_{]Y[_{\mathfrak{X},\lambda}*}(\mathcal{H}|_{]Y[_{\mathfrak{X},\lambda}}) \longrightarrow \alpha_{]Y[_{\mathfrak{X},\lambda}*}\left(\left(\varinjlim_{\mu\to\eta^-}\alpha_{]X^*[_{\mathfrak{X},\mu}*}(\mathcal{H}|_{]X^*[_{\mathfrak{X},\mu}})\right)|_{]Y[_{\mathfrak{X},\lambda}}\right) \longrightarrow 0,$$

which is exact by a similar proof to that of [Ber96b, 2.1.3.(i)]. The quasi-compactness and quasi-separateness of $\alpha_{]Y[_{\mathfrak{X},\lambda}}$ implies the assertions.

(2) Because $\mathcal{H}_\lambda$ is a coherent $\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}$-module and both $]Y[_{\mathfrak{X},\lambda}$ and $]X^*[_{\mathfrak{X},\mu}$ are affinoid subdomains of the affinoid $]X[_{\mathfrak{X}}$, $\mathbb{R}^q\alpha_{]Y[_{\mathfrak{X},\lambda}*}(\mathcal{H}_\lambda) = 0$ and $\mathbb{R}^q\alpha_{]Y[_{\mathfrak{X},\lambda}*}\left(\left(\varinjlim_{\mu\to\eta^-}\alpha_{]X^*[_{\mathfrak{X},\mu}*}(\mathcal{H}_\lambda|_{]X^*[_{\mathfrak{X},\mu}})\right)|_{]Y[_{\mathfrak{X},\lambda}}\right) = 0$ for $q \geq 1$ by Kieh the Theorem B [Kie67, 2.4]. These facts and the exactness of the sequence in the proof of (1) imply the vanishing of higher direct images. □

Since g_K is an affinoid morphism, it is quasi-compact and $\mathbb{R}g_{K*}$ commutes with direct limits [Ber96b, 0.1.8]. Hence we have

$$\begin{aligned}
&\mathbb{R}^q g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}}}(j^{\dagger}_Y\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}\otimes_{j^{\dagger}_Y\mathcal{O}_{]X[_{\mathfrak{X}}}} E)\\
&\qquad\cong \mathbb{R}^q g_{K*}\left(\varinjlim_{\eta\to 1^-}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(j^{\dagger}_Y(\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}\otimes_{\mathcal{O}_{]X[_{\mathfrak{X}}}}\alpha_{]Y[_{\mathfrak{X},\nu}*}\mathcal{E}))\right)\\
&\qquad\cong \varinjlim_{\eta\to 1^-}\mathbb{R}^q g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}\left(\varinjlim_{\lambda\to 1^-}\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}})\right)\\
&\qquad\cong \varinjlim_{\eta\to 1^-}\varinjlim_{\lambda\to 1^-}\mathbb{R}^q g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}}))\\
&\qquad\cong \varinjlim_{\eta,\lambda\to 1^-}\mathbb{R}^q g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}}))
\end{aligned}$$

for any q. Indeed, the first isomorphism follows from 10.3.4.7 and the other ones from the commutation of the functors $\mathbb{R}g_{K*}$ and $\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}$ (by 10.3.4.8) with direct limits. We will consider the family of open subsets indexed by the directed set

$$\Lambda_{\underline{\xi},\underline{\lambda}} = \left\{(\lambda,\eta)\in\left(|K^\times|_{\mathbb{Q}}\cap]0,1[\right)^2 \;\middle|\; \begin{array}{l}\lambda>\eta, \lambda\geq\max\{\lambda_l,\nu\},\\ \eta<\xi_l \text{ for some } l\end{array}\right\}. \qquad (10.3.4.8.1)$$

Here the condition $\lambda\rangle\eta$ comes from 10.3.4.9 (2). This family is cofinal for $\eta,\lambda\to 1^-$, so that the limit with respect to $\Lambda_{\underline{\xi},\underline{\lambda}}$ is the same as the original one.

Let $g_\lambda:]Y[_{\mathfrak{X},\lambda}\to]S[_{\mathfrak{S}}$ and $g_{\lambda,\eta}:]Y[_{\mathfrak{X},\lambda}\cap[Z]_{\mathfrak{X},\eta}\to]S[_{\mathfrak{S}}$ denote the restrictions of g for $(\lambda,\eta)\in\Lambda_{\underline{\xi},\underline{\lambda}}$. Then

$$\begin{aligned}
&\mathbb{R}g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}}))\\
&\qquad\cong \mathbb{R}g_{\lambda*}(\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}}))|_{]Y[_{\mathfrak{X},\lambda}})
\end{aligned}$$

by 10.3.4.8. Since $\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E})|_{]X^*[_{\mathfrak{X},\eta}} = 0$ and $\{]Y[_{\mathfrak{X},\lambda}\cap]X^*[_{\mathfrak{X},\eta},]Y[_{\mathfrak{X},\lambda}\cap[Z]_{\mathfrak{X},\eta}\}$ is an admissible covering of $]Y[_{\mathfrak{X},\lambda}$, we have

$$\begin{aligned}
&\mathbb{R}g_{\lambda*}(\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}}))|_{]Y[_{\mathfrak{X},\lambda}})\\
&\qquad\cong \mathbb{R}g_{\lambda,\eta*}(\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}}))|_{]Y[_{\mathfrak{X},\lambda}\cap[Z]_{\mathfrak{X},\eta}}).
\end{aligned}$$

Hence, in order to prove the vanishing $\mathbb{R}g_{K*}\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X}}}(j^{\dagger}_Y\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}\otimes_{j^{\dagger}_Y\mathcal{O}_{]X[_{\mathfrak{X}}}} E) = 0$, we have only to prove the vanishing

$$\mathbb{R}g_{\lambda,\eta*}(\underline{\Gamma}^{\dagger}_{]Z[_{\mathfrak{X},\eta}}(\alpha_{]Y[_{\mathfrak{X},\lambda}*}((\Omega^{\bullet}_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\lambda}})\otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\lambda}}}\mathcal{E}|_{]Y[_{\mathfrak{X},\lambda}}))|_{]Y[_{\mathfrak{X},\lambda}\cap[Z]_{\mathfrak{X},\eta}}) = 0 \qquad (10.3.4.8.2)$$

for any $(\lambda,\eta)\in\Lambda_{\underline{\xi},\underline{\lambda}}$.

3° *Reduce to the local computations.*

Let us denote the 1-dimensional open (resp. closed) unit disk over $\operatorname{Spm} K$ of radius $\eta\in|K^\times|_{\mathbb{Q}}$ by $D(0,\eta^-)$ (resp. $D(0,\eta^+)$). Since $Z\not\subset D$, we have the lemma below by the weak fibration theorem [Ber96b, 1.3.1, 1.3.2] (see also [BC94, 4.3].).

Lemma 10.3.4.9. *With the notation as above, we have*

(a) There is an admissible covering $\{V_\beta\}_\beta$ *of* $]S[_{\mathfrak{S}}$ *such that there exists an isomorphism*

$$g_K^{-1}(V_\beta)\cap]Z[_{\mathfrak{X}} \cong V_\beta \times_{\mathrm{Spm}\,K} D(0,1^-)$$

of rigid analytic K-vector spaces, under which the coordinate of $D(0,1^-)$ *is* z *as above.*

(b) Under the isomorphism in (1),

$$g_{\lambda,\eta}^{-1}(V_\beta) \;\cong\; (V_\beta\cap]S\cap Y[_{\mathfrak{S},\lambda}) \times_{\mathrm{Spm}\,K} D(0,\eta^+)$$

for any $\lambda,\eta \in |K^\times|_{\mathbb{Q}}\cap]0,1[$ *with* $\lambda\rangle\eta$.

In order to prove 10.3.4.9 (2), the condition $\lambda\rangle\eta$ is needed because of using $\overline{f}$ for the definition of $]S\cap Y[_{\mathfrak{S},\lambda}$.

Let $S = \mathrm{Spm}\,R$ be an integral smooth K-affinoid subdomain of $V_\beta\cap]S\cap Y[_{\mathfrak{S},\lambda}$ with a complete K-algebra norm $|\text{-}|_R$ on R. Since R is an integral K-Banach algebra, all complete K-algebra norms are equivalent [BGR84, 3.8.2, Cor. 4]. In order to prove the vanishing 10.3.4.8.2, it is sufficient to prove the vanishing

$$\mathbb{R}\Gamma\left(g_{\lambda,\eta}^{-1}(S),\, \underline{\Gamma}^\dagger_{]Z[_{\mathfrak{X}},\eta}\left(\left[\mathcal{E} \xrightarrow{\nabla} (\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\nu}}) \otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\nu}}} \mathcal{E}\right]\right)\right) = \mathbb{R}\Gamma\left(g_{\lambda,\eta}^{-1}(S),\, \underline{\Gamma}^\dagger_{]Z[_{\mathfrak{X}},\eta}\left(\left[\mathcal{E} \xrightarrow{\partial_\sharp} \mathcal{E}\right]\right)\right) = 0$$

of hypercohomology for any such S by 10.3.4.9 (2) since $]S[_{\mathfrak{S}}=]Z[_{\mathfrak{Z}}$ is integral and smooth and $\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}$ is a free $\mathcal{O}_{]X[_{\mathfrak{X}}}$-module of rank 1 generated by $\frac{dz}{z}$. The hypercohomology above can be computation ated by

$$\mathbb{R}^q\Gamma\left(g_{\lambda,\eta}^{-1}(S), \underline{\Gamma}^\dagger_{]Z[_{\mathfrak{X}},\eta}\left(\left[\mathcal{E} \xrightarrow{\partial_\sharp} \mathcal{E}\right]\right)\right) \cong H^q\left(\mathrm{Tot}\begin{bmatrix} \Gamma(g_{\lambda,\eta}^{-1}(S),\mathcal{E}) & \to & \lim\limits_{\mu\to\eta^-} \Gamma(g_{\lambda,\eta}^{-1}(S)\cap]X^*[_{\mathfrak{X},\mu},\mathcal{E}) \\ \partial_\sharp\downarrow & & \downarrow\partial_\sharp \\ \Gamma(g_{\lambda,\eta}^{-1}(S),\mathcal{E}) & \to & \lim\limits_{\mu\to\eta^-} \Gamma(g_{\lambda,\eta}^{-1}(S)\cap]X^*[_{\mathfrak{X},\mu},*\mathcal{E}) \end{bmatrix}\right).$$

Here Tot means the total complex induced by the commutative bicomplex, the left top item in the bicomplex is located at degree $(0,0)$ and the horizontal arrows in the bicomplex are the natural injections. Indeed, the cohomological functor commutes with filtered direct limits since $g_{\lambda,\eta}$ is an affinoid morphism, and the vanishings $H^q(g_{\lambda,\eta}^{-1}(S),\mathcal{E}) = 0$ and $H^q(g_{\lambda,\eta}^{-1}(S)\cap]X^*[_{\mathfrak{X},\mu},\mathcal{E}) = 0$ for $q \geq 1$ hold by Kieh the Theorem B [Kie67, 2.4] since $g_{\lambda,\eta}^{-1}(S)$ and $g_{\lambda,\eta}^{-1}(S)\cap]X^*[_{\mathfrak{X},\mu}$ are affinoid.

More explicitly, the following formula 10.3.4.9.1 holds when $\mathcal{E}|_{g_{\lambda,\eta}^{-1}(S)}$ is a free $\mathcal{O}_{g_{\lambda,\eta}^{-1}(S)}$-module of rank r. We will prove the freeness in the next step 4°. Put R-algebras

$$\begin{aligned}
\mathcal{A}_R(\eta) &= \Gamma(g_{\lambda,\eta}^{-1}(S),\mathcal{O}_{]X[_{\mathfrak{X}}}) = \left\{\sum_{n=0}^\infty a_n z^n \,\middle|\, a_n\in R,\ |a_n|_R\eta^n \to 0 \text{ as } n\to\infty\right\} \\
\mathcal{A}_R(\eta^-) &= \Gamma\left(\bigcup_{\mu<\eta} g_{\lambda,\mu}^{-1}(S),\mathcal{O}_{]X[_{\mathfrak{X}}}\right) = \left\{\sum_{n=0}^\infty a_n z^n \,\middle|\, a_n\in R,\ |a_n|_R\mu^n \to 0 \text{ as } n\to\infty \text{ for any } \mu<\eta\right\} \\
\mathcal{R}_R(\eta) &= \lim_{\mu\to\eta^-} \Gamma(g_{\lambda,\eta}^{-1}(S), \alpha_{]X^*[_{\mathfrak{X},\mu}*}\mathcal{O}_{]X^*[_{\mathfrak{X}.\mu}}) \\
&= \left\{\sum_{n=-\infty}^\infty a_n z^n \,\middle|\, a_n\in R,\ \begin{array}{l}|a_n|_R\eta^n \to 0 \text{ as } n\to\infty \\ |a_n|_R\mu^n \to 0 \text{ as } n\to-\infty \text{ for some } \mu<\eta\end{array}\right\},
\end{aligned}$$

and define a norm on $\mathcal{A}_R(\eta)$ by $|\sum_n a_n z^n|_{\mathcal{A}_R(\eta)} = \sup_n |a_n|\eta^n$. $\mathcal{A}_R(\eta), \mathcal{A}_R(\eta^-)$ and $\mathcal{R}_R(\eta)$ are independent of the choice of complete K-algebra norms on R since there exist positive real numbers ρ_1 and ρ_2 such that $\rho_1|\text{-}| \leq |\text{-}|' \leq \rho_2|\text{-}|$ for equivalent norms $|\text{-}|$ and $|\text{-}|'$ by [BGR84, 2.1.8, Cor. 4]. Let $\underline{v}$ be a basis of vectors of $\Gamma(g_{\lambda,\eta}^{-1}(S),\mathcal{E})$ over $\mathcal{A}_R(\eta)$ such that the derivation along z is given by $\partial_\sharp(\underline{v}) = \underline{v}G$ for a matrix G with entries in $\mathcal{A}_R(\eta)$. Then we have

$$\begin{aligned}
\mathbb{R}^q\Gamma\left(g_{\lambda,\eta}^{-1}(S), \underline{\Gamma}^\dagger_{]Z[_{\mathfrak{X}},\eta}\left(\left[\mathcal{E} \xrightarrow{\partial_\sharp} \mathcal{E}\right]\right)\right) &\cong H^q\left(\mathrm{Tot}\begin{bmatrix} \mathcal{A}_R(\eta)^r & \to & \mathcal{R}_R(\eta)^r \\ \partial_\sharp + G\downarrow & & \downarrow \partial_\sharp + G \\ \mathcal{A}_R(\eta)^r & \to & \mathcal{R}_R(\eta)^r \end{bmatrix}\right) \\
&\cong H^q\left(\left[(\mathcal{R}_R(\eta)/\mathcal{A}_R(\eta))^r \xrightarrow{\partial_\sharp+G} (\mathcal{R}_R(\eta)/\mathcal{A}_R(\eta))^r\right][-1]\right).
\end{aligned} \tag{10.3.4.9.1}$$

4° *Local classification of logarithmic connections along a smooth divisor.*

Proposition 10.3.4.10. *Let $S = \operatorname{Spm} R$ be a smooth integral K-affinoid variety, and let $W = S \times_{\operatorname{Spm} K} D(0, \xi^-)$ be a quasi-Stein space over S for some $\xi \in |K^\times|_{\mathbb{Q}} \cap]0, 1]$. Let $\mathcal{M}$ be a locally free $\mathcal{O}_W$-module of finite type furnished with an R-derivation $\partial_\sharp = z\frac{d}{dz} : M \to M$, where $M = \Gamma(W, \mathcal{M})$, such that*

(i) *for any $\eta \in |K^\times|_{\mathbb{Q}} \cap]0, \xi[$, if $W_\eta = S \times_{\operatorname{Spm} K} D(0, \eta^+)$ is an affinoid subdomain of W and if $||\text{-}||$ is a Banach $\mathcal{A}_R(\eta)$-norm on $M_\eta = \Gamma(W_\eta, \mathcal{M})$, then $||\frac{1}{n!}\prod_{j=0}^{n-1}(\partial_\sharp - j)(e)||\mu^n \to 0\,(n \to \infty)$ for any $e \in M_\eta$ and $0 < \mu < 1$, and*

(ii) *any difference of exponents of $(\mathcal{M}, \partial_\sharp)$ along $z = 0$ is neither a p-adic Liouville number nor a non-zero integer.*

Then there are a projective R-module L of finite type furnished with a linear R-operator $N : L \to L$ such that $||\frac{1}{n!}\prod_{j=0}^{n-1}(N - j)(e)||\mu^n \to 0\,(n \to \infty)$ for any $e \in L$ and $0 < \mu < 1$, where $||\text{-}||$ is a Banach R-norm on L, and an isomorphism $(\mathcal{M}, \partial_\sharp) \cong (\mathcal{O}_W \otimes_R L, \partial_{\sharp N})$ in which the R-derivation $\partial_{\sharp N}$ on $\mathcal{O}_W \otimes_R L$ is defined by $\partial_{\sharp N}(a \otimes e) = \partial_\sharp(a) \otimes e + a \otimes N(e)$.

If $\mathcal{M}$ is a free $\mathcal{O}_W$-module in the proposition above, then the assertion is a part of Christo the transfer theorem [Chr84, Thm. 2] and its generalization in [BC92]. Christol's transfer theorem is in the case where R is a field K. By the argument in [BC92, 4.1], the transfer theorem also works on an integral K-affinoid algebra R. A part means that we consider solutions not in meromorphic functions but only in holomorphic functions. When M is free, one has a formal matrix solution by the hypothesis that any difference of exponents is not an integer except 0, and then all entries are contained in $\mathcal{A}_R(\xi^-)$ because of the conditions (i) and (ii).

Lemma 10.3.4.11. *Let R be an integral K-affinoid algebra.*

(a) There exists a finite injective morphism $T_l \to R$ of K-affinoid algebras from a free Tate K-algebra T_l of some dimension l.

(b) Suppose furthermore that R is Cohen-Macaulay. Then, for any finite injective morphism $T_l \to R$ of K-affinoid algebras, R is projective of finite type over T_l. Moreover, if M is a projective R-module of finite type, then M is free over T_l.

Proof. (1) The assertion is the Noether normalization theorem [BGR84, 6.1.2 Cor. 2].

(2) Since T_l is regular and R is Cohen-Macaulay,[Ked04a] R is projective over T_l by [Nag, 25.16]. If M is a projective R-module of finite type, then M is also projective of finite type over T_l, hence M is free over T_l by [Ked04a, 6.5]. □

With the notation as in 10.3.4.10, let us fix a finite injective morphism $T_l \to R$ of K-affinoid algebras 10.3.4.11 (1). Considering the norm on R which is defined by the maximum of norms of tuple under an identification $R \cong T_l^m$ by 10.3.4.11 (2), we regard M_η as an $\mathcal{A}_{T_l}(\eta)[\partial_\sharp]$-module by the natural finite injective morphism $\mathcal{A}_{T_l}(\eta) \to \mathcal{A}_R(\eta)$ of K-affinoid algebras for $\eta \in |K^\times|_{\mathbb{Q}} \cap]0, \xi[$. Moreover, $\mathcal{A}_{T_l}(\eta)[\partial_\sharp]$-module M_η satisfies the hypothesis in 10.3.4.10 (see b) and M_η is a free $\mathcal{A}_{T_l}(\eta)$-module 10.3.4.11 (2). Fix a basis $\underline{v}$ of M_η over $\mathcal{A}_{T_l}(\eta)$ and let G_η be a matrix with entries in $\mathcal{A}_{T_l}(\eta)$ such that $\partial_\sharp(\underline{v}) = \underline{v}G_\eta$. By applying a generalization of Christol's transfer theorem (as we explain after 10.3.4.10), there is an invertible matrix Y with entries in $\mathcal{A}_{T_l}(\eta^-)$ such that

$$\partial_\sharp Y + G_\eta Y = Y G_\eta(0), \tag{10.3.4.11.1}$$

where $G_\eta(0) = G_\eta \,(\operatorname{mod} z\mathcal{A}_{T_l}(\eta))$ is a matrix with entries in T_l. Then there is a free T_l-module L_η with a T_l-linear homomorphism N_η defined by the matrix $G_\eta(0)$ such that $(\mathcal{A}_{T_l}(\eta^-) \otimes_{\mathcal{A}_{T_l}(\eta)} M_\eta, \partial_\sharp) \cong (\mathcal{A}_{T_l}(\eta^-) \otimes_{T_l} L_\eta, \partial_{\sharp N_\eta})$. If we put $H^0(M_\eta) = \operatorname{Ker}(\partial_\sharp : M_\eta \to M_\eta)$, then $H^0(M_\eta) \cong \operatorname{Ker}(N_\eta : L_\eta \to L_\eta)$.

Lemma 10.3.4.12. *With the notation as above, the followings hold.*

(a) The pair (L_η, N_η) is independent of the choices of $\eta \in |K^\times|_{\mathbb{Q}} \cap]0, \xi[$ up to canonical isomorphisms. Moreover, $(M, \partial_\sharp) \cong (\mathcal{A}_{T_l}(\xi^-) \otimes_{T_l} L_\eta, \partial_{\sharp N_\eta})$ for any η.

(b) If we put $H^0(M) = \operatorname{Ker}(\partial_\sharp : M \to M)$, then the natural R-homomorphism $H^0(M) \to H^0(M_\eta)$ (not only the T_l structure) induced by the restriction is an isomorphism.

Proof. (1) For $\eta' \leq \eta$, there is an invertible matrix Q with entries in $\mathcal{A}_{T_l}(\eta')$ such that $\partial_\sharp Q + G_{\eta'}(0)Q = QG_\eta(0)$ by the restriction. Since none of the differences of exponents is an integer except 0, Q is an invertible matrix with entries in T_l. Hence the pair is independent of the choices of η. Note that $\{W_\eta\}_{\eta \in |K^\times|_{\mathbb{Q}} \cap]0,\xi[}$ is an affinoid covering of the quasi-Stein space W and M is the projective limit of M_η ($\eta \in |K^\times|_{\mathbb{Q}} \cap]0,\xi[$). Therefore, the assertion holds.

(2) follows from (1). □

Lemma 10.3.4.13. *Let R be an integral domain over $\mathbb{Q}_p$ with field of fractions F, and let (L, N) be a pair such that L is a free R-module of finite rank and $N : L \to L$ is an R-linear endomorphism. Suppose that $e_1, \cdots, e_s$ are distinct eigenvalues of $N \otimes F$ with multiplicities $m_1, \cdots, m_s$, respectively, such that $e_1, \cdots, e_s$ are contained in $\mathbb{Z}_p$ and let $\varphi_N(x) = (x - e_1)^{m_1} \cdots (x - e_s)^{m_s} \in \mathbb{Z}_p[x]$ the characteristic polynomial of N. If we put $L(e_i) = \varphi_i(N)L$ where $\varphi_i(x) = \varphi_N(x)/(x - e_i)^{m_i}$, then L is a direct sum of R-sub module $L(e_1), \cdots, L(e_s)$ of L such that all eigenvalues of $N|_{L(e_i)} \otimes F$ are e_i for any i. Such a decomposition is unique.*

Lemma 10.3.4.14. *With the notation in 10.3.4.10, let $e_1, \cdots, e_s$ be distinct exponents of $(M, \partial_\sharp)$ along $z = 0$. Then M is a direct sum of $\mathcal{A}_R(\xi^-)[\partial_\sharp]$-submodules $M(e_1), \cdots, M(e_s)$ of M such that all exponents of $(M(e_i), \partial_\sharp)$ are e_i for any i.*

Proof. With the notation in 10.3.4.12 and 10.3.4.13, take a free T_l-module L of finite type furnished with a T_l-linear homomorphism N such that $(M, \partial_\sharp) \cong (\mathcal{A}_{T_l}(\xi^-) \otimes_{T_l} L, \partial_{\sharp N})$. Since $L(e_i)$ is a direct summand of the free T_l-module L, $L(e_i)$ is free. Put $M(e_i) = (\mathcal{A}_{T_l}(\xi^-) \otimes_{T_l} L(e_i), \partial_{\sharp N|_{L(e_i)}})$. Then M is a direct sum of $M(e_1), \cdots, M(e_s)$ as $\mathcal{A}_{T_l}(\xi^-)[\partial_\sharp]$-modules. Since any $\mathcal{A}_{T_l}(\xi^-)[\partial_\sharp]$-homomorphism between $M(e_i)$ and $M(e_j)$ for $i \neq j$ is a zero map, $M(e_i)$ is an $\mathcal{A}_R(\xi^-)[\partial_\sharp]$-module for all i. Hence, the decomposition is the desired one. □

Lemma 10.3.4.15. *Let $S = \operatorname{Spm} R$ be a K-affinoid variety, $W = S \times_{\operatorname{Spm} K} D(0, \xi^+)$ for some $\xi \in |K^\times|_{\mathbb{Q}}$, and let $\mathcal{M}$ be a locally free $\mathcal{O}_W$-module of finite type. Then there exist a finite affinoid covering $\{S_i\}$ of S and a real number $\xi' \in |K^\times|_{\mathbb{Q}} \cap]0, \xi]$ such that, if $W_{S_i,\xi'}$ denotes the affinoid subdomain $S_i \times D(0, \xi'^+)$ of W, then $\mathcal{M}|_{W_{S_i,\xi'}}$ is a free $\mathcal{O}_{W_{S_i,\xi'}}$-module for all i.*

Proof. Since $\mathcal{M}/z\mathcal{M}$ is regarded as a locally free $\mathcal{O}_S$-module, there is a finite affinoid covering $\{S_i\}$ of S such that $(\mathcal{M}/z\mathcal{M})|_{S_i}$ is a free $\mathcal{O}_{S_i}$-module for all i. Since $W_i = S_i \times_{\operatorname{Spm} K} D(0, \xi^+)$ is an affinoid, $\mathcal{M}/z\mathcal{M}$ is generated by $\Gamma(W_i, \mathcal{M})$ by Kieh the Theorems A and B [Kie67, 2.4]. Let $v_1, \cdots, v_r \in \Gamma(W_i, \mathcal{M})$ be elements whose reductions form a basis of $(\mathcal{M}/z\mathcal{M})|_{S_i}$ over $\mathcal{O}_{S_i}$. The support of $\mathcal{M}|_{W_i}/(v_1, \cdots, v_r)$ is an analytic closed subset of W_i which does not intersect with the closed subspace defined by $z = 0$. Since $\mathcal{M}$ is locally free, there is a real number $\xi'_i \in |K^\times|_{\mathbb{Q}} \cap]0, \xi[$ such that $\mathcal{M}|_{S_i \times_{\operatorname{Spm} K} D(0, \xi'^+_i)}$ is free and is generated by $v_1, \cdots, v_r$ because of the maximum modulus principle [BGR84, 6.2.1, Prop.4]. Then it is enough to take $\xi' = \min_i \xi'_i$. □

Proof of 10.3.4.10. We may assume that any exponent of $\mathcal{M}$ along $z = 0$ is 0 by 10.3.4.14 and by twisting by an object of rank 1 with a suitable exponent. We may also assume that $\mathcal{M}|_{W_{\xi'}}$ is a free $\mathcal{O}_{W_{\xi'}}$-module for some $\xi' \in |K^\times|_{\mathbb{Q}} \cap]0, \xi[$ by 10.3.4.15. By applying the transfer theorem 10.3.4.10 for the free cases with the conditions (i) and (ii), if one takes an $\eta \in |K^\times|_{\mathbb{Q}} \cap]0, \xi'[$, then there is a free R-module L furnished with an R-linear operator $N : L \to L$ such that $\beta_\eta : (\mathcal{M}, \partial_\sharp)|_{W_\eta} \xrightarrow{\sim} (\mathcal{O}_{W_\eta} \otimes_R L, \partial_{\sharp N})$. Denote the dual of $\mathcal{M}$ by $(\mathcal{M}^\vee, -\partial_\sharp)$. Then we have a natural commutative diagram

$$\begin{array}{ccc} \operatorname{Hom}_{\mathcal{O}_W[\partial_\sharp]}(\mathcal{M}, \mathcal{O}_W \otimes_R L) & \longrightarrow & \operatorname{Hom}_{\mathcal{O}_{W_\eta}[\partial_\sharp]}(\mathcal{M}|_{W_\eta}, \mathcal{O}_{W_\eta} \otimes_R L) \\ \cong\downarrow & & \downarrow\cong \\ H^0(M^\vee \otimes_R L) & \xrightarrow{\sim} & H^0(M^\vee_\eta \otimes_R L), \end{array}$$

where the vertical arrows are isomorphisms since $\mathcal{M}$ is locally free and the bottom horizontal arrow is an isomorphism by 10.3.4.12 (2) since all differences of exponents of $(\mathcal{M}^\vee \otimes_R L, -\partial_\sharp \otimes 1 + 1 \otimes \partial_N)$ along $z = 0$ are 0.

Let $\beta : (\mathcal{M}, \partial_\sharp) \to (\mathcal{O}_W \otimes_R L, \partial_{\sharp N})$ be the $\mathcal{O}_W[\partial_\sharp]$-homomorphism corresponding to β_η via the isomorphisms above. We will prove that β is an isomorphism. In the case where R is a field, β is an isomorphism since the support of an $\mathcal{A}_R(\xi^-)[\partial_\sharp]$-module, which is finitely generated over $\mathcal{A}_R(\xi^-)$, is either W or one point $z = 0$ by Bézout property of $\mathcal{A}_R(\xi^-)$ [Cre98, 4.6]. Let us return to the case of general R. For a maximal ideal x of R, the induced homomorphism $\beta \pmod{x}$ is an isomorphism by the case where R is a field. Hence, β is an isomorphism around $x \times_{\mathrm{Spm}\, K} D(0, \xi^-)$ by Nakayama's lemma. Since both sides of β are coherent, β is an isomorphism [BGR84, 9.4.2, Corollary 7]. □

5° *The vanishing 10.3.4.8.2 in special cases: any difference of exponents is neither a p-adic Liouville number nor an integer except* 0.

Let us first suppose that (ii) in 10.3.4.10 and $c = 0$ for the exponents along $z = 0$ by 0°.

Lemma 10.3.4.16. *With the notation in 10.3.4.13, the followings hold.*

(a) Let j be an integer. Then there is a monic polynomial $g_j(x) \in \mathbb{Z}_p[x]$ of degree $r-1$ such that $(N-j)g_j(N) + \varphi_N(j)I_L = 0$. Here I_L is the identity of L.

(b) If all of $e_1, \cdots, e_s$ are neither p-adic Liouville numbers nor positive integers, then $(N-j)$ is invertible and, for any $0 < \eta < 1$, $|\varphi_N(j)^{-1}|\eta^j \to 0$ as $j \to \infty$

Take $(\lambda, \eta) \in \Lambda_{\underline{\xi},\underline{\lambda}}$ such that $\lambda \geq \lambda_m$ and $\eta < \xi_m$ for some m. Then the restriction $(\mathcal{E}, \partial_\sharp)$ on $S \times_{\mathrm{Spm} K} D(0, \xi_m^-)$ for an integral smooth K-affinoid $S = \mathrm{Spm}\, R$ in $V_\beta \cap]Z \cap Y[_{3,\lambda_m}$ satisfies the assumption of 10.3.4.10 by the overconvergence condition in 2°. Considering an admissible affinoid covering of S, we may assume that there is a basis of $\Gamma(g_{\lambda,\eta}^{-1}(S), \mathcal{E})$ over $\mathcal{A}_R(\eta)$ such that G is a matrix with entries in R.

Since any eigenvalue of G is not a positive integer, $\partial_\sharp + G$ is injective on $(\mathcal{R}_R(\eta)/\mathcal{A}_R(\eta))^r$. Since any eigenvalue of G is neither a p-adic Liouville nor a positive integer, $\partial_\sharp + G$ is surjective on $(\mathcal{R}_R(\eta)/\mathcal{A}_R(\eta))^r$. Indeed, with the notation in 10.3.4.16 (1), $\partial_\sharp + G$ maps $-\sum_{j=1}^\infty \varphi_G(j)^{-1} g_j(G)\underline{a}_j z^{-j}$ to $\sum_{j=1}^\infty \underline{a}_j z^{-j}$ and $\sum_{j=1}^\infty \varphi_G(j)^{-1} g_j(G)\underline{a}_j z^{-j}$ is contained in $(\mathcal{R}_R(\eta)/\mathcal{A}_R(\eta))^r$ by 10.3.4.16 (2). Hence, the cohomology groups in 10.3.4.9.1 vanish for any q and it implies the vanishing 10.3.4.8.2.

6° *The vanishing 10.3.4.8.2 in general cases: any difference of exponents is not a p-adic Liouville number.*

Let us suppose the conditions (a) in 10.3.4.2 and $c = 0$ for the exponents along $z = 0$ by 0°.

Proposition 10.3.4.17. *With the notation as in 10.3.4.10, we assume the conditions (i) in 10.3.4.10, (a) in 10.3.4.2 and $c = 0$ for exponents of $(\mathcal{M}, \partial_\sharp)$ along $z = 0$. Then there is a locally free $\mathcal{O}_W$-submodule $\mathcal{M}'$ of $\mathcal{M}$ which is stable under $\partial_\sharp$ such that (1) $(\mathcal{M}', \partial_\sharp)$ satisfies the conditions (i) and (ii) in 10.3.4.10, (2) none of exponents of $(\mathcal{M}', \partial_\sharp)$ along $z = 0$ is a positive integer, (3) the support of $\mathcal{M}/\mathcal{M}'$ is included in the closed subset defined by $z = 0$ and it is a locally free O_S-module of finite type, and (4) the induced homomorphism $\overline{\partial}_\sharp : \mathcal{M}/\mathcal{M}' \to \mathcal{M}/\mathcal{M}'$ is an isomorphism.*

Lemma 10.3.4.18. *Let R be an integral K-affinoid algebra and let $\eta \in |K^\times|_{\mathbb{Q}}$. Suppose that M is a free $\mathcal{A}_R(\eta)$-module of finite rank furnished with an R-derivation $\partial_\sharp = z\frac{d}{dz} : M \to M$ such that $e_1, \cdots, e_s$ are distinct exponents of $(M, \partial_\sharp)$ along $z = 0$ with multiplicities $m_1, \cdots, m_s$, respectively.*

(a) There exists a basis $\underline{v}$ of M such that, if G is the matrix with entries in $\mathcal{A}_R(\xi)$ defined by $\partial_\sharp(\underline{v}) = \underline{v}G$, then $G(0) = \begin{pmatrix} G_1(0) & & 0 \\ & \ddots & \\ 0 & & G_s(0) \end{pmatrix}$ and all eigenvalues of the R-matrix $G_i(0)$ of degree m_i are e_i for any i.

(b) Let $\underline{v}_i$ be the part bottom is as in (1) corresponding to the i-th direct summand modulo z, that is, $\partial_\sharp(\underline{v}_i) \equiv \underline{v}_i G_i(0) \pmod{z\mathcal{A}_R(\eta)}$. Let M' be the $\mathcal{A}_R(\eta)$-submodule of M generated by $z\underline{v}_1, \underline{v}_2, \cdots, \underline{v}_s$. Then M' is stable under $\partial_\sharp$ with exponents $e_1 + 1, e_2, \cdots, e_s$ and multiplicities $m_1, m_2, \cdots, m_s$, respectively. Moreover, M/M' is a free R-module of rank m_1, and, if $e_1 \neq 0$, then the induced R-homomorphism $\overline{\partial}_\sharp : M/M' \to M/M'$ is an isomorphism.

Proof. (1) follows from 10.3.4.13.

(2) The stability follows from (1). If we denote the matrix which represents the derivation of M' by G', then

$$G' = P^{-1} z \frac{d}{dz} P + P^{-1} G P \equiv \begin{pmatrix} G_1(0) + I_{m_1} & & & * \\ & G_2(0) & & \\ & & \ddots & \\ 0 & & & G_s(0) \end{pmatrix} \pmod{z\mathcal{A}_R(\eta)}$$

for $P = \begin{pmatrix} zI_{m_1} & 0 \\ 0 & I_{r-m_1} \end{pmatrix}$. Here $r = m_1 + \cdots + m_s$ and I_t is the identity matrix of degree t. The induced R-homomorphism $\overline{\partial}_\sharp : M/M' \to M/M'$ is given by the matrix $G_1(0)$. □

Proof of 10.3.4.17. We use the induction on the largest integral difference of exponents and its multiplicity. By 10.3.4.15 we may assume that $\mathcal{M}|_{W_\eta}$ is free for some $\eta \in |K^\times|_{\mathbb{Q}} \cap]0, \xi[$. We have an $\mathcal{O}_{W_\eta}$-submodule $\mathcal{M}'_\eta$ of $\mathcal{M}|_{W_\eta}$ such that exponents are improved by 10.3.4.18. Indeed, we apply 10.3.4.18 to an exponent which is neither a positive integer nor 0 because of the condition $c = 0$. Since the support of $\mathcal{M}|_{W_\eta}/\mathcal{M}'_\eta$ is included in $z = 0$, one can glue $\mathcal{M}'_\eta$ and $\mathcal{M}|_{W \setminus \{z=0\}}$. Hence, the induction works. □

We use the same notation in 5°. Considering an admissible affinoid covering of S, we may assume that $\mathcal{E}|_{g^{-1}_{\lambda,\mu}(S)}$ is free for some $\mu \in |K^\times|_{\mathbb{Q}} \cap]0, \xi_m]$ by 10.3.4.15 and, then, we can apply 10.3.4.17. Let $\mathcal{E}'$ be a locally free $\mathcal{O}_{g^{-1}_{\lambda,\xi_m}(S)}$-submodule of $\mathcal{E}|_{g^{-1}_{\lambda,\xi_m}(S)}$ which is stable under $\partial_\sharp$ such that it satisfies the condition (1), (2) and (3) in 10.3.4.17. Now we computation ate the difference of the local computation of cohomology between $\mathcal{E}$ and $\mathcal{E}'$ by the module version of the second form of 10.3.4.8.2. If $E_\eta = \Gamma(g^{-1}_{\lambda,\eta}(S), \mathcal{E})$ and $E'_\eta = \Gamma(g^{-1}_{\lambda,\eta}(S), \mathcal{E})$, then $E' \otimes \mathcal{R}_R(\eta) = E \otimes \mathcal{R}_R(\eta)$ by the condition (2) on the support of $\mathcal{E}/\mathcal{E}'$. The difference is computation ated by the complex

$$\mathrm{Tot} \begin{bmatrix} E'_\eta & \to & E_\eta \\ \partial_\sharp \downarrow & & \downarrow \partial_\sharp \\ E'_\eta & \to & E_\eta \end{bmatrix} \cong \left[E_\eta/E'_\eta \xrightarrow{\partial_\sharp} E_\eta/E'_\eta \right],$$

and it is 0 by (3). Hence, the vanishing 10.3.4.8.2 for $\mathcal{E}$ follows from the vanishing for $\mathcal{E}'$ by 5°.

This completes the proof of Proposition 10.3.4.5. □

Proof of Theorem 10.3.4.2. By the same reason of 0° in the proof of 10.3.4.5, we may assume $c = 0$ and have only to prove the vanishing $\mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z[_{\mathfrak{X}}}(j^\dagger_Y \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j^\dagger_Y \mathcal{O}_{]X[_{\mathfrak{X}}}} E) = 0$.

By the Čech spectral sequence the problem of the vanishing is local on X and Y as in 1° in the proof of 10.3.4.5. We may assume that $\mathfrak{X}$ is affine, D is defined by a single equation $f = 0$ in X for some $f \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$, and there is a system of relative local coordinates $z_1, z_2, \cdots, z_d \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ of $\mathfrak{X}$ over $\mathfrak{S}$ such that each irreducible component $\mathfrak{Z}_i$ of the relative strict normal crossing divisor $\mathfrak{Z} = \cup_{i=1}^s \mathfrak{Z}_i$ is defined by $z_i = 0$. Let us denote by Z_i (resp. X_i^*) the closed subscheme of X defined by $z_i = 0$ (resp. the complement of Z_i in X).

Let us define $]Y[_{\mathfrak{X},\lambda}$ (resp. $]X_i^*[_{\mathfrak{X},\lambda}$, resp. $[Z_i]_{\mathfrak{X},\lambda}$) as in 2° of the proof of 10.3.4.5 (resp. replacing $\mathfrak{Z}$, Z by $\mathfrak{Z}_i$, Z_i).

By the hypothesis on (E, ∇) there exist a strict neighborhood $]Y[_{\mathfrak{X},\nu}$ of $]Y[_{\mathfrak{X}}$ in $]X[_{\mathfrak{X}}$ for some $\nu \in |K^\times|_{\mathbb{Q}} \cap]0, 1[$ and a locally free $\mathcal{O}_{]Y[_{\mathfrak{X},\nu}}$-module $\mathcal{E}$ of finite type furnished with a logarithmic connection $\nabla : \mathcal{E} \to (\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K}|_{]Y[_{\mathfrak{X},\nu}}) \otimes_{\mathcal{O}_{]Y[_{\mathfrak{X},\nu}}} \mathcal{E}$ such that $j^\dagger_Y(\mathcal{E}, \nabla) = (E, \nabla)$, which satisfies the overconvergence condition 10.3.2.4.1.

7° *Induction on the number s of irreducible components of the strict normal crossing divisor Z.*

If $s = 0$, then the assertion is trivial. Put $Z' = \cup_{i=2}^s Z_i$. Applying the natural exact sequence

$$0 \longrightarrow \underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(\mathcal{H}) \longrightarrow \underline{\Gamma}^\dagger_{]Z[_{\mathfrak{X}}}(\mathcal{H}) \longrightarrow \underline{\Gamma}^\dagger_{]Z'[_{\mathfrak{X}}}(j^\dagger_{X_1^*}\mathcal{H}) \longrightarrow 0$$

for a sheaf $\mathcal{H}$ of abelian groups on $]X[_{\mathfrak{X}}$ (see the proof of [Ber96b, 2.1.7]), we have a triangle

$$\begin{array}{ccc} & \mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z'[_{\mathfrak{X}}}(j^\dagger_{X_1^*\cap Y}\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j^\dagger_{X_1^*\cap Y}\mathcal{O}_{]X[_{\mathfrak{X}}}} j^\dagger_{X_1^*\cap Y}E) & \\ & {}^{+1}\swarrow \qquad \nwarrow & \\ \mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j^\dagger_Y\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j^\dagger_Y\mathcal{O}_{]X[_{\mathfrak{X}}}} E) & \longrightarrow & \mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z[_{\mathfrak{X}}}(j^\dagger_Y\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j^\dagger_Y\mathcal{O}_{]X[_{\mathfrak{X}}}} E). \end{array}$$

Hence we have only to prove the vanishing

$$\mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j^\dagger_Y\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j^\dagger_Y\mathcal{O}_{]X[_{\mathfrak{X}}}} E) = 0$$

by the induction on s. If $Z_1 \subset D$, the vanishing is trivial. Hence, we may assume that Z_1 is not included in D.

8° *Reduction to the case of sections.*

Let us denote the formal affine space of relative dimension r over $\mathfrak{S}$ by $\widehat{\mathbb{A}}^r_{\mathfrak{S}}$. By our hypothesis there is a commutative diagram

$$\begin{array}{ccccc} \mathfrak{Z}_1 & \longrightarrow & \mathfrak{X} & & \\ \downarrow & & \downarrow & & \\ \widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}} & \longrightarrow & \widehat{\mathbb{A}}^{d}_{\mathfrak{S}} & \longrightarrow & \widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}} \end{array} \tag{10.3.4.18.1}$$

of $\mathcal{V}$-formal schemes such that the vertical arrow $\mathfrak{X} \to \widehat{\mathbb{A}}^d_{\mathfrak{S}}$, which is étale, (resp. $\mathfrak{Z}_1 \to \widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}}$) is induced by $z_1, \cdots, z_d$ (resp. $z_2, \cdots, z_d$) and the composition of bottom arrows is the identity. Since the diagonal morphism $\Delta : \mathfrak{Z}_1 \to \mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}}} \mathfrak{Z}_1$ is étale and a closed immersion, $\widetilde{\mathfrak{X}} = \mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}}} \mathfrak{X} \setminus (\mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}}} \mathfrak{Z}_1 \setminus \Delta(\mathfrak{Z}_1))$ is an open formal subscheme of $\mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}}} \mathfrak{X}$. Let now us consider the commutative diagram

$$\begin{array}{ccccc} & & \widetilde{\mathfrak{X}} & & \\ & \overset{\Delta}{\nearrow} & \downarrow & \overset{h}{\searrow} & \\ \mathfrak{Z}_1 & \overset{\Delta}{\longrightarrow} & \mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathcal{V}}} \mathfrak{X} & \underset{\mathrm{pr}_2}{\longrightarrow} & \mathfrak{X} \\ =\downarrow & & \downarrow & & \\ \mathfrak{Z}_1 & \underset{\mathrm{pr}_1}{\longleftarrow} & \mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathcal{V}}} \widehat{\mathbb{A}}^d_{\mathcal{V}} & & \end{array} \tag{10.3.4.18.2}$$

of formal $\mathfrak{S}$-schemes, and define $h : \widetilde{\mathfrak{X}} \to \mathfrak{X}$ (resp. $\widetilde{g}_1 : \widetilde{\mathfrak{X}} \to \mathfrak{Z}_1$, $\widetilde{g}' : \mathfrak{Z}_1 \to \mathfrak{S}$, resp. $\widetilde{g} = \widetilde{g}' \circ \widetilde{g}_1$) as in the diagram (resp. by the composition $\widetilde{\mathfrak{X}} \to \mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathcal{V}}} \mathfrak{X} \to \mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathcal{V}}} \widehat{\mathbb{A}}^d_{\mathcal{V}} \to \mathfrak{Z}_1$, resp. by the canonical morphism, resp. by the composition). We identify $\Delta(\mathfrak{Z}_1)$ (resp. $\Delta(Z_1)$) with $\mathfrak{Z}_1$ (resp. Z_1), and denote the special fiber of $\widetilde{\mathfrak{X}}$ (resp. the complement of Z_1, resp. the inverse image of Y by h) by $\widetilde{X}$ (resp. $\widetilde{X}_1^*$, resp. $\widetilde{Y}$). $\mathfrak{Z}_1$ is a smooth divisor over $\mathfrak{S}$ and note that, étale locally, $h^{-1}(\mathfrak{Z})$ is a relative normal crossing divisor. $\widetilde{\mathfrak{X}}^\sharp_K$ denotes the $\mathcal{V}$-formal scheme with the logarithmic structure over $\mathfrak{S}_K$ which is induced by the logarithmic structure of $\mathfrak{X}^\sharp_K$, and $\Omega^1_{\widetilde{\mathfrak{X}}^\sharp_K/\mathfrak{S}_K}$ denotes the sheaf of logarithmic Kähler differentials on $\widetilde{\mathfrak{X}}^\sharp_K$ over $\mathfrak{S}_K$. Then $h_K^* \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \cong \Omega^\bullet_{\widetilde{\mathfrak{X}}^\sharp_K/\mathfrak{S}_K}$.

Let us define $]\widetilde{Y}[_{\widetilde{\mathfrak{X}},\lambda}$ (resp. $]\widetilde{X}_1^*[_{\widetilde{\mathfrak{X}},\lambda}$, resp. $[Z_1]_{\widetilde{\mathfrak{X}},\lambda}$) as in 2° of the proof of 10.3.4.5.

Lemma 10.3.4.19. *With the notation as above, we have*

(a) $h_K^{-1}(]Z_1[_{\mathfrak{X}}) =]Z_1[_{\widetilde{\mathfrak{X}}}$.

(b) The restriction of h_K *gives an isomorphism* $]Z_1[_{\widetilde{\mathfrak{X}}} \xrightarrow{\sim}]Z_1[_{\mathfrak{X}}$.

(c) Under the isomorphism in (2),

$$]\widetilde{Y}[_{\widetilde{\mathfrak{X}},\lambda} \cap [Z_1]_{\widetilde{\mathfrak{X}},\eta} \xrightarrow{\sim}]Y[_{\mathfrak{X},\lambda} \cap [Z_1]_{\mathfrak{X},\eta}$$

for any $\lambda, \eta \in |K^\times|_{\mathbb{Q}} \cap]0,1[$.

Proof. Since $(\mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}^{d-1}_{\mathfrak{S}}} \mathfrak{Z}_1 \setminus \Delta(\mathfrak{Z}_1))$ is removed, we get (1). The other assertion (2) (resp. (3)) follow from [Ber96b, 1.3.1] and the fact that h is étale (resp. and $Z_1 \not\subset D$). □

Proposition 10.3.4.20. *With the notation as above, we have the followings.*

(a) If $\mathcal{H}$ *is a sheaf of Abelian groups on* $]\widetilde{X}[_{\widetilde{\mathfrak{X}}}$*, then*

$$\mathbb{R} h_{K*} \underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(\mathcal{H}) \cong h_{K*} \underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(\mathcal{H}).$$

(b) *Let $\mathcal{A}$ and $\mathcal{B}$ be a sheaf of rings on $]X[_{\mathfrak{X}}$ and $]\widetilde{X}[_{\widetilde{\mathfrak{X}}}$, respectively, with a morphism $h_K^{-1}\mathcal{A} \to \mathcal{B}$ of rings such that $\mathcal{A}|_{]Z_1[_{\mathfrak{X}}} \xrightarrow{\sim} \mathcal{B}|_{]Z_1[_{\widetilde{\mathfrak{X}}}}$ under the isomorphism in 10.3.4.19 (2). If $\mathcal{H}$ is an $\mathcal{A}$-module, then the adjoint map*

$$\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(\mathcal{H}) \to h_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(\mathcal{B} \otimes_{h_K^{-1}\mathcal{A}} h_K^{-1}\mathcal{H}).$$

is an isomorphism of $\mathcal{A}$-modules.

Proof. Let us define a functor

$$\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{X}},\eta}(\mathcal{H}) = \mathrm{Ker}\left(\mathcal{H} \to \lim_{\mu\to\eta^-} \alpha_{]\widetilde{X}_1^*[_{\widetilde{\mathfrak{X}},\mu}}{}_*(\mathcal{H}|_{]\widetilde{X}_1^*[_{\widetilde{\mathfrak{X}},\mu}})\right)$$

as in 2° of the proof of 10.3.4.5, where $\alpha_{]\widetilde{X}_1^*[_{\widetilde{\mathfrak{X}},\mu}} :]\widetilde{X}_1^*[_{\widetilde{\mathfrak{X}},\mu} \to]\widetilde{X}[_{\widetilde{\mathfrak{X}}}$ is the canonical open immersion. Then the analog of 10.3.4.7 and 10.3.4.8 hold.

(1) Since $\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{X}},\eta}(\mathcal{H})|_{]X_1^*[_{\widetilde{X},\eta}} = 0$, we have $\mathbb{R}^q h_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{X}},\eta}(\mathcal{H}) = 0$ for any $q \geq 1$ by 10.3.4.19 (2). Because the cohomological functor $\mathbb{R}^q h_{K*}$ commutes with filtered inductive limits by the quasi-compactness and quasi-separateness of h_K, we have

$$\mathbb{R}^q h_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(\mathcal{H}) \cong \mathbb{R}^q h_{K*}\left(\lim_{\eta\to 1^-}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}},\eta}(\mathcal{H})\right) \cong \lim_{\eta\to 1^-}\mathbb{R}^q h_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}},\eta}(\mathcal{H}) = 0$$

for any $q \geq 1$ by 10.3.4.7.

(2) Since $\mathcal{H}|_{[Z_1]_{\mathfrak{X},\eta}} \xrightarrow{\sim} (\mathcal{B} \otimes_{h_K^{-1}\mathcal{A}} h_K^{-1}\mathcal{H})|_{[Z_1]_{\widetilde{\mathfrak{X}},\eta}}$, the assertion follows from 10.3.4.7 and 10.3.4.19. □

Let $(\widetilde{E}, \widetilde{\nabla})$ be the inverse image of (E, ∇) by h_k, i.e.,

$$\widetilde{E} = h_K^* E = j_{\widetilde{Y}}^\dagger \mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}} \otimes_{h_K^{-1}(j_Y^\dagger \mathcal{O}_{]X[_{\mathfrak{X}}})} h_K^{-1}E$$
$$\widetilde{\nabla} : \widetilde{E} \to j_{\widetilde{Y}}^\dagger \Omega^1_{\widetilde{\mathfrak{X}}_K^\sharp/\mathfrak{S}_K} \otimes_{j_{\widetilde{Y}}^\dagger \mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}} \widetilde{E},$$

where $\widetilde{\nabla}$ is the induced $\mathcal{O}_{]S[_{\mathfrak{S}}}$-linear connection by ∇ because of the étaleness of h. We also denote the induced basis of $\Omega^1_{\widetilde{\mathfrak{X}}_K^\sharp/\mathfrak{S}_K}$ by $\frac{dz_1}{z_1}, \cdots, \frac{dz_s}{z_s}, dz_{s+1}, \cdots, dz_d$ and the dual basis of derivations by $z_1\frac{\partial}{\partial z_1}, \cdots, z_s\frac{\partial}{\partial z_s}, \frac{\partial}{\partial z_{s+1}}, \cdots, \frac{\partial}{\partial z_d}$.

Proposition 10.3.4.21. *(a) If we put $(\widetilde{\mathcal{E}}, \widetilde{\nabla}) = h_K^*(\mathcal{E}, \nabla)$, then the natural morphism $j_{\widetilde{Y}}^\dagger(\widetilde{\mathcal{E}}, \widetilde{\nabla}) \to (\widetilde{E}, \widetilde{\nabla})$ is an isomorphism.*

(b) The derivation $\widetilde{\partial}_{\sharp 1} = \nabla(z_1\frac{\partial}{\partial z_1})$ on $\widetilde{\mathcal{E}}$ satisfies the overconvergence condition 10.3.4.6.1.

Proof. (1) easily follows from the fact $\mathcal{E}$ is locally free.

(2) It is enough to check the overconvergence condition for $\mathrm{pr}_{2K}^*(\mathcal{E}, \nabla)$ along $z_1 = 0$. Fix a complete K-algebra norm on the affinoid algebra associated to $]X[_{\mathfrak{X}}$. Then one can take a contractive complete K-algebra norm on the affinoid algebra associated to $]Z_1 \times_{\mathbb{A}_k^{d-1}} X[_{\mathfrak{Z}_1 \times_{\widehat{\mathbb{A}}_{\mathfrak{S}}^{d-1}} \mathfrak{X}}$ [BGR84, 6.1.3, Prop. 3]. The induced norms $||\text{-}||_{\mathfrak{X}}$ on $\Gamma(]Y[_{\mathfrak{X},\lambda}, \mathcal{E})$ and $||\text{-}||_{\mathfrak{Z}_1\times\mathfrak{X}}$ on $\Gamma\left(\mathrm{pr}_{2K}^{-1}(]Y[_{\mathfrak{X},\lambda}), \mathrm{pr}_{2K}^*\mathcal{E}\right)$ satisfy the inequality $||e||_{\mathfrak{Z}_1\times\mathfrak{X}} \leq ||e||_{\mathfrak{X}}$ for any $e \in \Gamma(]Y[_{\mathfrak{X},\lambda}, \mathcal{E})$. The overconvergence condition for $\mathrm{pr}_{2K}^*(\mathcal{E}, \nabla)$ along $z_1 = 0$ follows from the inequality. □

Remark 10.3.4.22. The connection $(\widetilde{\mathcal{E}}, \widetilde{\nabla})$ satisfies the overconvergence condition 10.3.2.4.1. It should be called a locally free log-isocrystal on $\mathfrak{X}_K^\sharp/\mathfrak{S}_K$ overconvergent along $\widetilde{D}$.

Since $(j_Y^\dagger \mathcal{O}_{]X[_{\mathfrak{X}}})|_{]Z_1[_{\mathfrak{X}}} \xrightarrow{\sim} (j_{\widetilde{Y}}^\dagger \mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}})|_{]Z_1[_{\widetilde{\mathfrak{X}}}}$, we have

$$\begin{aligned}
\mathbb{R}g_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j_Y^\dagger \Omega^\bullet_{\mathfrak{X}_K^\sharp/\mathfrak{S}_K} \otimes_{j_Y^\dagger \mathcal{O}_{]X[_{\mathfrak{X}}}} E) &\cong \mathbb{R}g_{K*}(h_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(j_{\widetilde{Y}}^\dagger \Omega^\bullet_{\widetilde{\mathfrak{X}}_K^\sharp/\mathfrak{S}_K} \otimes_{j_{\widetilde{Y}}^\dagger \mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}} \widetilde{E})) \\
&\cong \mathbb{R}g_{K*}\mathbb{R}h_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(j_{\widetilde{Y}}^\dagger \Omega^\bullet_{\widetilde{\mathfrak{X}}_K^\sharp/\mathfrak{S}_K} \otimes_{j_{\widetilde{Y}}^\dagger \mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}} \widetilde{E}) \\
&\cong \mathbb{R}\widetilde{g}_{K*}\underline{\Gamma}^\dagger_{]Z_1[_{\widetilde{\mathfrak{X}}}}(j_{\widetilde{Y}}^\dagger \Omega^\bullet_{\widetilde{\mathfrak{X}}_K^\sharp/\mathfrak{S}_K} \otimes_{j_{\widetilde{Y}}^\dagger \mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}} \widetilde{E})
\end{aligned}$$

by 10.3.4.20. Hence we have only to prove the vanishing

$$\mathbb{R}\widetilde{g}_{K*}\underline{\Gamma}^{\dagger}_{]Z_1[_{\widetilde{\mathfrak{X}}}}(j^{\dagger}_{\widetilde{Y}}\Omega^{\bullet}_{\widetilde{\mathfrak{X}}^{\sharp}_K/\mathfrak{S}_K}\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E}) = 0.$$

9° *An argument of Gauss-Manin type.*

Let Ω^q_0 (resp. Ω^q_1) be the free $\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}$-submodule of $\Omega^q_{\widetilde{\mathfrak{X}}^{\sharp}_K/\mathfrak{S}_K}$ generated by wedge products of $\frac{dz_2}{z_2},\cdots,\frac{dz_s}{z_s},dz_{s+1},\cdots,dz_d$ (resp. $\frac{dz_1}{z_1}\wedge\omega$ for $\omega\in\Omega^{q-1}_{\widetilde{\mathfrak{X}}^{\sharp}_K/\mathfrak{S}_K}$). Then $\Omega^q_0 \xrightarrow{\sim} \Omega^{q+1}_1$ by $\omega\mapsto\frac{dz_1}{z_1}\wedge\omega$. Define

$$\begin{aligned}\widetilde{\nabla}_0 &= \textstyle\sum_{i=2}^{s}\frac{dz_i}{z_i}\otimes\partial_{\sharp i}+\sum_{i=s+1}^{d}dz_i\otimes\partial_i : \widetilde{E}\to j^{\dagger}_{\widetilde{Y}}\Omega^1_0\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E}\\ \widetilde{\nabla}_1 &= \mathrm{id}\otimes\partial_{\sharp 1} : j^{\dagger}_{\widetilde{Y}}\Omega^q_0\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E}\to j^{\dagger}_{\widetilde{Y}}\Omega^q_1\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E},\end{aligned} \qquad (10.3.4.22.1)$$

where id is the identity of $j^{\dagger}_{\widetilde{Y}}\Omega^q_0$. The definition of $\widetilde{\nabla}_0$ and $\widetilde{\nabla}_1$ is independent of the choices of local parameters $z_1,z_2,\cdots,z_d$ of $\mathfrak{X}$ over $\mathfrak{S}$ as above. Then the exterior power of $j^{\dagger}_{\widetilde{Y}}\Omega^1_0$ induces a complex $(j^{\dagger}_{\widetilde{Y}}\Omega^{\bullet}_0\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E},\widetilde{\nabla}_0)$ and there is an isomorphism

$$j^{\dagger}_{\widetilde{Y}}\Omega^{\bullet}_{\widetilde{\mathfrak{X}}^{\sharp}_K/\mathfrak{S}_K}\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E}\xrightarrow{\sim}\left[(j^{\dagger}_{\widetilde{Y}}\Omega^{\bullet}_0\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E},\widetilde{\nabla}_0)\xrightarrow{\widetilde{\nabla}_1}(j^{\dagger}_{\widetilde{Y}}\Omega^{\bullet}_1\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E},\frac{dz_1}{z_1}\wedge\widetilde{\nabla}_0)\right] \quad (10.3.4.22.2)$$

of complexes of $\mathcal{O}_{]S[_{\mathfrak{S}}}$-modules. Note that $\widetilde{\nabla}_1$ is the relative connection $\widetilde{E}\to j^{\dagger}_{\widetilde{Y}}\Omega^1_{\widetilde{\mathfrak{X}}^{\sharp}_K/\mathfrak{Z}^{\sharp}_{1K}}\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E}$ induced by $\widetilde{\nabla}$.

One can easily see that $(\widetilde{E},\widetilde{\nabla}_1)$ satisfies the hypothesis (a) and (b) along $z_1=0$ in 10.3.4.2 by 10.3.4.19 and the overconvergence condition in 10.3.4.5, so that

$$\mathbb{R}\widetilde{g}_{1K*}\underline{\Gamma}^{\dagger}_{]Z_1[_{\widetilde{\mathfrak{X}}}}\left(\left[j^{\dagger}_{\widetilde{Y}}\Omega^q_0\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E}\xrightarrow{\widetilde{\nabla}_1}j^{\dagger}_{\widetilde{Y}}\Omega^{q+1}_1\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E}\right]\right)=0$$

for any q by 10.3.4.5. Hence,

$$\mathbb{R}\widetilde{g}_{K*}\underline{\Gamma}^{\dagger}_{]Z_1[_{\widetilde{\mathfrak{X}}}}(j^{\dagger}_{\widetilde{Y}}\Omega^{\bullet}_{\widetilde{\mathfrak{X}}^{\sharp}_K/\mathfrak{S}_K}\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E})=\mathbb{R}\widetilde{g}'_{K*}\mathbb{R}\widetilde{g}_{1K*}\underline{\Gamma}^{\dagger}_{]Z_1[_{\widetilde{\mathfrak{X}}}}(j^{\dagger}_{\widetilde{Y}}\Omega^{\bullet}_{\widetilde{\mathfrak{X}}^{\sharp}_K/\mathfrak{S}_K}\otimes_{j^{\dagger}_{\widetilde{Y}}\mathcal{O}_{]\widetilde{X}[_{\widetilde{\mathfrak{X}}}}}\widetilde{E})=0.$$

This completes the proof of 10.3.4.2. □

Proposition 10.3.4.23. *With the notation in 10.3.4.2, we assume furthermore that $g:\mathfrak{X}\to\mathfrak{S}$ factors through an irreducible component $\mathfrak{Z}_1$ of $\mathfrak{Z}$ by a smooth morphism $g_1:\mathfrak{X}\to\mathfrak{Z}_1$ over $\mathfrak{S}$ such that the composition $g_1\circ i_1:\mathfrak{Z}_1\to\mathfrak{Z}_1$ of the closed immersion $i_1:\mathfrak{Z}_1\to\mathfrak{X}$ and g_1 is the identity of $\mathfrak{Z}_1$ and that the inverse image of the relative strict normal crossing divisor $\mathfrak{Z}'_1=\cup_{i=2}^{s}\mathfrak{Z}_1\cap\mathfrak{Z}_i$ of $\mathfrak{Z}_1$ by g_1 is $\cup_{i=2}^{s}\mathfrak{Z}_i$. Let E be a locally free log-isocrystal on $\mathfrak{X}^{\sharp}/\mathfrak{S}_K$ overconvergent along D. Then, for any nonnegative integer m, $g_{1K*}\widetilde{\nabla}_0$ (resp. $g_{1K*}(\frac{dz_1}{z_1}\wedge\widetilde{\nabla}_0)$) in 10.3.4.22.1 induces an integrable logarithmic $\mathcal{O}_{]S[_{\mathfrak{S}}}$-connection of the locally free $j^{\dagger}_{Z_1\cap Y}\mathcal{O}_{]Z_1[_{\mathfrak{Z}_1}}$-module $g_{1K*}(E(m\mathfrak{Z}_1)/E)$ (resp. $g_{1K*}(j^{\dagger}_Y\Omega^1_{\mathfrak{X}^{\sharp}_K/\mathfrak{Z}^{\sharp}_{1K}}\otimes_{j^{\dagger}_Y\mathcal{O}_{]X[_{\mathfrak{X}}}}E(m\mathfrak{Z}_1)/E)$) of finite type on $\mathfrak{Z}^{\sharp}_{1K}:=(\mathfrak{Z}_{1K},\mathfrak{Z}'_{1K})/\mathfrak{S}_K$ which satisfies the overconvergence condition as a log-isocrystal on $(Z_1\cap Y)^{\sharp}/\mathfrak{S}_K$ overconvergent along $Z_1\cap D$.*

Suppose furthermore that $Z_1\not\subset D$ and that E satisfies the conditions (a) and (b) in 10.3.4.2. Then

$$\mathbb{R}g_{1K*}\underline{\Gamma}^{\dagger}_{]Z_1[_{\mathfrak{X}}}(j^{\dagger}_Y\Omega^{\bullet}_{\mathfrak{X}^{\sharp}_K/\mathfrak{Z}^{\sharp}_{1K}}\otimes_{j^{\dagger}_Y\mathcal{O}_{]X[_{\mathfrak{X}}}}E)\cong\left[g_{1K*}(E(m\mathfrak{Z}_1)/E)\xrightarrow{g_{1K*}\nabla}g_{1K*}(j^{\dagger}_Y\Omega^1_{\mathfrak{X}^{\sharp}_K/\mathfrak{Z}^{\sharp}_{1K}}\otimes_{j^{\dagger}_Y\mathcal{O}_{]X[_{\mathfrak{X}}}}E(m\mathfrak{Z}_1)/E)\right][-1] \quad (10.3.4.23.1)$$

and $g_{1K*}(E(m\mathfrak{Z}_1)/E)$ (resp. $g_{1K*}(j^{\dagger}_Y\Omega^1_{\mathfrak{X}^{\sharp}_K/\mathfrak{Z}^{\sharp}_{1K}}\otimes_{j^{\dagger}_Y\mathcal{O}_{]X[_{\mathfrak{X}}}}E(m\mathfrak{Z}_1)/E)$) also satisfies the same conditions (a) and (b) for any $m\geq\max\{e\,|\,e$ is a positive integral exponent of ∇ along $Z_1\}\cup\{0\}$.

Proof. The locally freeness has been already proved at the beginning of the proof of 10.3.4.5. From the definition of $\widetilde{\nabla}_0$ in 10.3.4.22.1, it induces an integrable connection. Since $\mathfrak{Z}_1$ is a section of $\mathfrak{X}$ over $\mathfrak{S}$, one can use on an affinoid open subset of $]Z_1[_{\mathfrak{Z}_1}$ a Banach norm induced by a Banach norm on some affinoid open subset of $]X[_{\mathfrak{X}}$. Hence the logarithmic connections on $g_{1K*}(E(m\mathfrak{Z}_1)/E)$ and $g_{1K*}(j_Y^\dagger\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\sharp_{1K}} \otimes_{j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}} E(m\mathfrak{Z}_1)/E)$ satisfy the overconvergence condition. Their exponents along Z_i are m copies of those of E by the definition of $\widetilde{\nabla}_0$ for $i \neq 1$. Therefore, the conditions (a) and (b) also hold. □

Example 10.3.4.24. Let $\mathfrak{X}$ be the formal projective scheme $\widehat{\mathbb{P}}^1_{\mathcal{V}} \times_{\operatorname{Spf}\mathcal{V}} \widehat{\mathbb{P}}^1_{\mathcal{V}}$ over $\mathfrak{S} = \operatorname{Spf}\mathcal{V}$ with homogeneous coordinates $(x_0, x_1), (y_0, y_1)$, let $\mathfrak{Z}_1$ (resp. $\mathfrak{Z}_2$) be the divisor defined by $x_1 = 0$ (resp. $y_1 = 0$) in $\mathfrak{X}$, and put $\mathfrak{Z} = \mathfrak{Z}_1 \cup \mathfrak{Z}_2$ and $\mathfrak{X}^\sharp = (\mathfrak{X}, \mathfrak{Z})$. Let X (resp. Z, resp. Z_1, resp. Z_2) be the special fiber of $\mathfrak{X}$ (resp. $\mathfrak{Z}$, resp. $\mathfrak{Z}_1$, resp. $\mathfrak{Z}_2$), let D be a closed subscheme of X defined by $x_0 = 0$ or $y_0 = 0$, put $Y = X \setminus D$, and let $z_1 = x_1/x_0, z_2 = y_1/y_0$ be the affine coordinates. For integers $e > 0$ and $h \geq 0$, we define a locally free log-isocrystal E on $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ of rank 2 overconvergent along D ($E = j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}v_1 \oplus j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}v_2$) by

$$\nabla(v_1, v_2) = (v_1, v_2)\begin{pmatrix} e & z_2^h \\ 0 & e \end{pmatrix}\frac{dz_1}{z_1} + (v_1, v_2)\begin{pmatrix} 0 & 0 \\ 0 & h \end{pmatrix}\frac{dz_2}{z_2}$$

for some strict neighborhood of $]Y[_{\mathfrak{X}}$ in $]X[_{\mathfrak{X}}$. Indeed, since the exponents along Z_1 (resp. Z_2) are e and e (resp. 0 and h), the logarithmic connection satisfies the overconvergence condition and is overconvergent along D. Moreover, it satisfies the conditions (a) and (b) in 10.3.4.2. If $g_1 : \mathfrak{X} \to \mathfrak{Z}_1$ is the second projection (note that the coordinate of $\mathfrak{Z}_1 \cap \mathfrak{Y}$ is z_2), then

$$\begin{aligned}
&\mathbb{R}g_{1K*}\underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j_Y^\dagger\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\sharp_{1K}} \otimes_{j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}} E) \\
&\qquad \cong \left[g_{1K*}\left(E(m\mathfrak{Z}_1)/E\right) \overset{g_{K*}(\frac{dz_1}{z_1}\otimes\partial_{\sharp 1})}{\longrightarrow} g_{1K*}(j_Y^\dagger\Omega^1_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\sharp_{1K}} \otimes_{j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}} E(m\mathfrak{Z}_1)/E)\right][-1]
\end{aligned}$$

for $m \geq e$ by 10.3.4.5. Hence $\mathbb{R}^q g_{1K*}\underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j_Y^\dagger\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\sharp_{1K}} \otimes_{j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}} E) = 0$ for $q \neq 1, 2$ and

$$\mathbb{R}^q g_{1K*}\underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j_Y^\dagger\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\sharp_{1K}} \otimes_{j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}} E) \cong \begin{cases} j^\dagger_{Z_1\cap Y}\mathcal{O}_{]Z_1[_{\mathfrak{Z}_1}} z_1^{-e}v_1 & \text{if } q = 1, \\ (j^\dagger_{Z_1\cap Y}\mathcal{O}_{]Z_1[_{\mathfrak{Z}_1}}/z_2^h j^\dagger_{Z_1\cap Y}\mathcal{O}_{]Z_1[_{\mathfrak{Z}_1}})z_1^{-e}v_1 \oplus j^\dagger_{Z_1\cap Y}\mathcal{O}_{]Z_1[_{\mathfrak{Z}_1}} z_1^{-e}v_2 & \text{if } q = 2. \end{cases}$$

Therefore, $\mathbb{R}^2 g_{1K*}\underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j_Y^\dagger\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\sharp_{1K}} \otimes_{j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}} E)$ is not always locally free. By 10.3.4.22.2 and using a spectral sequence, the dimensions of total cohomology groups are as follow:

$$\dim_K \mathbb{H}^q(]X[_{\mathfrak{X}}, \underline{\Gamma}^\dagger_{]Z_1[_{\mathfrak{X}}}(j_Y^\dagger\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{S}_K} \otimes_{j_Y^\dagger\mathcal{O}_{]X[_{\mathfrak{X}}}} E)) = \begin{cases} 1 & \text{if } q = 1, \\ 2 & \text{if } q = 2, \\ 1 & \text{if } q = 3, \\ 0 & \text{if } q \neq 1, 2, 3. \end{cases}$$

10.4 Theorems of full faithfulness for overconvergent isocrystals

10.4.1 Pullback -restriction functor

The proper descent theorem of Shiho (see [Shi07, 7.3]) implies that the canonical functor of the theorem 10.4.1.1 below is fully faithful. When we have a Frobenius structure, we will establish that this functor induced an equivalence of categories (see 10.4.1.3).

Theorem 10.4.1.1. *Let $a\colon X^{(0)} \to X$ be a proper surjective morphism of k-varieties, Y a dense open subset of X, $j\colon Y \hookrightarrow X$ the open immersion, $Y^{(0)} := a^{-1}(Y)$. The canonical functor*

$$(a^*, j^*)\colon \mathrm{MIC}^\dagger(Y, X/K) \to \mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K) \times_{\mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}/K)} \mathrm{MIC}^\dagger(Y, Y/K) \qquad (10.4.1.1.1)$$

is fully faithful.

Proof. Since the canonical functor $\mathrm{MIC}^\dagger(Y, X/K) \to \mathrm{MIC}^\dagger(Y, Y/K)$ is faithful, this yields that so is the canonical functor of 10.4.1.1.1.

Let E_1, E_2 two objects of $\mathrm{MIC}^\dagger(Y, X/K)$. Denote by $E_1^{(0)}, E_2^{(0)}$ (resp. $\widehat{E}_1$, $\widehat{E}_2$) the associated objects of $\mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K)$ (resp. $\mathrm{MIC}^\dagger(Y, Y/K)$). Let $\alpha^{(0)} : E_1^{(0)} \to E_2^{(0)}$ be a morphism of $\mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K)$, $\beta : \widehat{E}_1 \to \widehat{E}_2$ be a morphism of $\mathrm{MIC}^\dagger(Y, Y/K)$ such that $\alpha^{(0)}$ and β induce canonically the same morphism of $\mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}/K)$ of the form $b^*(\widehat{E}_1) \to b^*(\widehat{E}_2)$. We have to build a morphism $\alpha : E_1 \to E_2$ of $\mathrm{MIC}^\dagger(Y, X/K)$ inducing $\alpha^{(0)}$ and β.

Denote by $b : Y^{(0)} \to Y$ the morphism induced by a and, for $i = 1, 2$, $a_i : X^{(0)} \times_X X^{(0)} \to X^{(0)}$ and $b_i : Y^{(0)} \times_Y Y^{(0)} \to Y^{(0)}$ the respectively left and right canonical projections. Consider the diagram of $\mathrm{MIC}^\dagger(Y^{(0)} \times_Y Y^{(0)}, X^{(0)} \times_X X^{(0)}/K)$ of left below

$$\begin{array}{ccccccc} a_1^*a^*(E_1) & = & a_1^*(E_1^{(0)}) & \xrightarrow{a_1^*(\alpha^{(0)})} & a_1^*(E_2^{(0)}) & = & a_1^*a^*(E_2) \\ \downarrow\wr & & \downarrow\wr & & \downarrow\wr & & \downarrow\wr \\ a_2^*a^*(E_1) & = & a_2^*(E_1^{(0)}) & \xrightarrow{a_2^*(\alpha^{(0)})} & a_2^*(E_2^{(0)}) & = & a_2^*a^*(E_2), \end{array} \quad \begin{array}{ccc} b_1^*b^*(\widehat{E}_1) & \xrightarrow{b_1^*b^*(\beta)} & b_1^*b^*(\widehat{E}_2) \\ \downarrow\wr & & \downarrow\wr \\ b_2^*b^*(\widehat{E}_1) & \xrightarrow{b_2^*b^*(\beta)} & b_2^*b^*(\widehat{E}_2) \end{array} \tag{10.4.1.1.2}$$

whose vertical isomorphisms follow from the equality $a \circ a_1 = a \circ a_2$. By applying the canonical functor of restriction $\mathrm{MIC}^\dagger(Y^{(0)} \times_Y Y^{(0)}, X^{(0)} \times_X X^{(0)}/K) \to \mathrm{MIC}^\dagger(Y^{(0)} \times_Y Y^{(0)}, Y^{(0)} \times_Y Y^{(0)}/K)$ to the left diagram of 10.4.1.1.2, we get the diagram to its right which is commutative by functoriality. Since this functor is faithful, this yields then the commutativity of the left diagram of 10.4.1.1.2. By using proper descent theorem of Shiho (see [Shi07, 7.3]), this yields the existence of one of the morphism $\alpha : E_1 \to E_2$ of $\mathrm{MIC}^\dagger(Y, X/K)$ inducing $\alpha^{(0)}$ and β. □

We will need later de Jong 's desingularisation theorem in the following form:

10.4.1.2 (Desingularization of de Jong)**.** Let X be a k-variety (always reduced by convention). Denote by $X_1, \ldots, X_r$ the irreducible components of X and $i \in \{1, \ldots, r\}$. Let Z be a subvariety of X that do not contain any X_i. Since k is perfect, since X_i is integral, following the de Jong 's desingularisation theorem (see [dJ96] or [Ber97a]), then there exists a projective, surjective, generically finite and etale morphism $f_i : X_i' \to X_i$ such that X_i' is integral and smooth and $f^{-1}(Z \cap X_i)$ is a normal crossing divisor of X_i'. Denoting by X' the disjoint union of X_i', this yields a projective, surjective morphism of the form $f : X' \to X$ which is moreover generically finite and etale (i.e, there exists a dense open set Y of X such that $f^{-1}(Y) \to Y$ is finite and etale) and such that $f^{-1}(Z)$ is the support a normal crossing divisor strict of X'.

With some Frobenius structures, we get thanks to theorem of full faithfulness of Kedlaya the theorem below which extends [Éte02, Theorem 2]:

Theorem 10.4.1.3. *Let $a : X^{(0)} \to X$ be a proper surjective morphism of k-varieties, Y an open set of X, $Y^{(0)} := a^{-1}(Y)$. The canonical functor*

$$(a^*, j^*) : F\text{-}\mathrm{MIC}^\dagger(Y, X/K) \to F\text{-}\mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K) \times_{F\text{-}\mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}/K)} F\text{-}\mathrm{MIC}^\dagger(Y, Y/K) \tag{10.4.1.3.1}$$

is an equivalence of categories.

Proof. (I) following 10.4.1.1, the functor is fully faithful. Denote by $X^{(1)} := X^{(0)} \times_X X^{(0)}$, $Y^{(1)} := Y^{(0)} \times_Y Y^{(0)}$, $X^{(2)} := X^{(0)} \times_X X^{(0)} \times_X X^{(0)}$, $Y^{(2)} := Y^{(0)} \times_Y Y^{(0)} \times_Y Y^{(0)}$ (following our conventions, these fibered products are computed In the category of schemes reduced). For $i = 1, 2$, let us denote by $a_i : X^{(1)} \to X^{(0)}$ the respectively left and right canonical projections.

(II) Let us establish now that this functor is essentiellement surjective.

Let $(E^{(0)}, \widehat{E}, \rho)$ an object of $F\text{-}\mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K) \times_{F\text{-}\mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}/K)} F\text{-}\mathrm{MIC}^\dagger(Y, Y/K)$. Following the de Jong 's desingularisation theorem (of the form 10.4.1.2 and by recalling that $X^{(1)}$ is reduced by convention), there exists $a' : X'' \to X^{(1)}$ be a morphism projective, surjective such that X'' is smooth. Denote by $Y'' := X'' \setminus a'^{-1}(Y^{(1)})$, $b' : Y'' \to Y^{(1)}$ the morphism induced by a', $j'' : Y'' \subset X''$ and, for $i = 0, 1, 2$, $j^{(i)} : Y^{(i)} \subset X^{(i)}$ the canonical open immersions. We denote by $j''^* : F\text{-}\mathrm{MIC}^\dagger(Y'', X''/K) \to F\text{-}\mathrm{MIC}^\dagger(Y'', Y''/K)$ and $j^{(i)*} : F\text{-}\mathrm{MIC}^\dagger(Y^{(i)}, X^{(i)}/K) \to F\text{-}\mathrm{MIC}^\dagger(Y^{(i)}, Y^{(i)}/K)$ the functors restrictions.

i) Construction of the glueing isomorphism $\theta\colon a_2^*(E^{(0)}) \xrightarrow{\sim} a_1^*(E^{(0)})$. To do so, we use the full faithfulness (checked in the part (I) of the denoting by) of the canonical functor below denoted by

$$\phi := (a'^*, j^{(1)*})\colon F\text{-MIC}^\dagger(Y^{(1)}, X^{(1)}/K) \to F\text{-MIC}^\dagger(Y'', X''/K) \times_{F\text{-MIC}^\dagger(Y'',Y''/K)} F\text{-MIC}^\dagger(Y^{(1)}, Y^{(1)}/K). \tag{10.4.1.3.2}$$

For $i = 1, 2$, denote by ρ_i the canonical isomorphism $j''^* \circ a'^*[a_i^*(E^{(0)})] \xrightarrow{\sim} b'^* \circ j^{(1)*}[a_i^*(E^{(0)})]$. Hence, the image of $a_i^*(E^{(0)})$ by ϕ is $\phi(a_i^*(E^{(0)})) = (a'^*[a_i^*(E^{(0)})], j^{(1)*}[a_i^*(E^{(0)})], \rho_i)$.

We define canonically the isomorphisms $\theta_{Y^{(1)}}\colon j^{(1)*}[a_2^*(E^{(0)})] \xrightarrow{\sim} j^{(1)*}[a_1^*(E^{(0)})]$ and $\widehat{\theta}\colon b_2^*(j^{(0)*}(E^{(0)})) \xrightarrow{\sim} b_1^*(j^{(0)*}(E^{(0)}))$ from ρ as that making commutative the canonical diagram below:

$$\begin{array}{ccccc} j^{(1)*}[a_2^*(E^{(0)})] & \xrightarrow{\sim} & b_2^*(j^{(0)*}(E^{(0)})) & \xrightarrow[b_2^*(\rho)]{\sim} & b_2^*(b^*(\widehat{E})) \\ \downarrow{\scriptstyle \theta_{Y^{(1)}}} & & \downarrow{\scriptstyle \widehat{\theta}} & & \downarrow{\scriptstyle \sim} \\ j^{(1)*}[a_1^*(E^{(0)})] & \xrightarrow{\sim} & b_1^*(j^{(0)*}(E^{(0)})) & \xrightarrow[b_1^*(\rho)]{\sim} & b_1^*(b^*(\widehat{E})). \end{array} \tag{10.4.1.3.3}$$

We define canonically the isomorphism $\theta_{Y''}\colon j''^* a'^*[a_2^*(E^{(0)})] \xrightarrow{\sim} j''^* a'^*[a_1^*(E^{(0)})]$ from ρ via the commutative diagram :

$$\begin{array}{ccc} j''^* a'^*[a_2^*(E^{(0)})] & \xrightarrow[\rho_2]{\sim} & b'^* j^{(1)*}[a_2^*(E^{(0)})] \\ \downarrow{\scriptstyle \theta_{Y''}} & & {\scriptstyle b'^*(\theta_{Y^{(1)}})}\downarrow{\scriptstyle \sim} \\ j''^* a'^*[a_1^*(E^{(0)})] & \xrightarrow[\rho_1]{\sim} & b'^* j^{(1)*}[a_1^*(E^{(0)})]. \end{array} \tag{10.4.1.3.4}$$

Since X'' is smooth, following the theorem [Ked08, 4.2.1], the functor j''^* is fully faithful. Then there exists one and only one isomorphism $\theta''\colon a'^* a_2^*(E^{(0)}) \xrightarrow{\sim} a'^* a_1^*(E^{(0)})$ such that $j''^*(\theta'') = \theta_{Y''}$. It follows from the commutativity of 10.4.1.3.4, that $(\theta'', \theta_{Y^{(1)}})$ induced an isomorphism of the form $\phi(a_2^*(E^{(0)})) \xrightarrow{\sim} \phi(a_1^*(E^{(0)}))$. By full faithfulness of ϕ, we get an isomorphism $\theta\colon a_2^*(E^{(0)}) \xrightarrow{\sim} a_1^*(E^{(0)})$ such that $a'^*(\theta) = \theta''$ and $j^{(1)*}(\theta) = \theta_{Y^{(1)}}$.

ii) Let us check now that θ satisfies the cocycle condition. Moreover, it is sufficient to check after applying the functor $j^{(2)*}$ since this is faithful. Since $j^{(1)*}(\theta) = \theta_{Y^{(1)}}$, this is a consequence of the construction of $\theta_{Y^{(1)}}$ (see 10.4.1.3.3).

iii) By using proper descent theorem of Shiho (see [Shi07, 7.3]), this yields the existence of an object $E \in F\text{-MIC}^\dagger(Y, X/K)$ (unique up to canonical isomorphism) and of an isomorphism $\rho_{(Y^{(0)},X^{(0)})}\colon a^*(E) \xrightarrow{\sim} E^{(0)}$ which can be included in the commutative diagram

$$\begin{array}{ccc} a_2^* a^*(E) & \xrightarrow[a_2^*\rho_{(Y^{(0)},X^{(0)})}]{\sim} & a_2^*(E^{(0)}) \\ \downarrow{\scriptstyle \sim} & & {\scriptstyle \theta}\downarrow{\scriptstyle \sim} \\ a_1^* a^*(E) & \xrightarrow[a_1^*\rho_{(Y^{(0)},X^{(0)})}]{\sim} & a_1^*(E^{(0)}). \end{array} \tag{10.4.1.3.5}$$

We define the isomorphism $\rho_{(Y^{(0)},Y^{(0)})}\colon b^* j^*(E) \xrightarrow{\sim} b^*\widehat{E}$ via the commutative diagram :

$$\begin{array}{ccc} j^{(0)*} a^*(E) & \xrightarrow[j^{(0)*}\rho_{(Y^{(0)},X^{(0)})}]{\sim} & j^{(0)*}(E^{(0)}) \\ {\scriptstyle \rho_{\mathrm{can}}}\downarrow{\scriptstyle \sim} & & {\scriptstyle \rho}\downarrow{\scriptstyle \sim} \\ b^* j^*(E) & \xrightarrow[\rho_{(Y^{(0)},Y^{(0)})}]{\sim} & b^*\widehat{E}, \end{array} \tag{10.4.1.3.6}$$

where ρ_{can} is the canonical isomorphism. Consider now the "cube A" whose face of the front side is the image by the functor b_2^* of 10.4.1.3.6, the face of the back is the image by the functor b_1^* of 10.4.1.3.6, the right face corresponds to the right square of 10.4.1.3.3 and whose isomorphisms of the left face are canonical. The left face of the cube A is canonically commutative. The right side (resp. of the front side, resp. of the back side) the is by definition. To ensure the commutativity of the cube A, then it is sufficient to validate that of the top face. For this Consider the "cube B" whose face of the bottom is the face of the top of the cube A, whose face of the top is the image by $j^{(1)*}$ of the commutative square 10.4.1.3.5, whose face of the front side (resp. of the back side) is the commutative square by functoriality in the isomorphism $j^{(1)*} \circ a_2^* \xrightarrow{\sim} b_2^* \circ j^{(0)*}$ (resp. $j^{(1)*} \circ a_1^* \xrightarrow{\sim} b_1^* \circ j^{(0)*}$). We remark that the right face of the cube B is the left square of 10.4.1.3.3 (this has a meaning since $j^{(1)*}(\theta) = \theta_{Y^{(1)}}$). Hence it is commutative. That of the left face of the cube B can be checked canonically. The cube B is then commutative. Hence so is the cube A. Hence, the face of the bottom of the cube A is commutative, i.e., the isomorphism $\rho_{(Y^{(0)},Y^{(0)})} \colon b^* j^*(E) \xrightarrow{\sim} b^* \widehat{E}$ commutes with glueing data. This yields there exists an isomorphism $\rho_{(Y,Y)} \colon j^*(E) \xrightarrow{\sim} \widehat{E}$ such that $\rho_{(Y^{(0)},Y^{(0)})} = b^*(\rho_{(Y,Y)})$. The commutativity of the diagram 10.4.1.3.6 means then that we have the isomorphism $(\rho_{(Y^{(0)},X^{(0)})}, \rho_{(Y,Y)}) \colon (a^*(E), j^*(E), \rho_{\mathrm{can}}) \xrightarrow{\sim} (E^{(0)}, \widehat{E}, \rho)$. Hence we are done.

□

10.4.2 Restriction functor

Theorem 10.4.2.1. *Let X be a k-variety, Y an open set of X and $j \colon Y \hookrightarrow X$ the corresponding open immersion. The functor $j^* \colon F\text{-MIC}^\dagger(Y, X/K) \to F\text{-MIC}^\dagger(Y, Y/K)$ is fully faithful.*

Proof. Since the faithfulness is well known, then it remains to prove that this one is full. Following the de Jong 's desingularisation theorem (of the form 10.4.1.2), there exists a morphism projective, surjective, generically finite and etale of k-varieties of the form $a \colon X^{(0)} \to X$ such that $X^{(0)}$ is smooth. Let $Y^{(0)} := a^{-1}(Y)$. Let $E_1, E_2 \in F\text{-MIC}^\dagger(Y, X/K)$ and $\widehat{\phi} \colon j^* E_1 \to j^* E_2$. Moreover, since $X^{(0)}$ is smooth, the canonical functor $F\text{-MIC}^\dagger(Y^{(0)}, X^{(0)}/K) \to F\text{-MIC}^\dagger(Y^{(0)}, Y^{(0)}/K)$ is fully faithful (see [Ked08, 4.2.1]). The morphism $\widehat{\phi}$ induced then canonically a morphism $\phi^{(0)} \colon a^*(E_1) \to a^*(E_2)$. Following theorem 10.4.1.3 there exists a morphism $\phi \colon E_1 \to E_2$ inducing $\phi^{(0)}$ and $\widehat{\phi}$. □

Remark 10.4.2.2. N. Tsuzuki conjecture (see the conjecture [Tsu02, 1.2.1]) that the functor j^* of 10.4.2.1 remains fully faithful without Frobenius structure.

10.4.3 Localisation and inverse image-localisation functors

10.4.3.1 (Reminders over the functor extension)**.** Let X be a variety over k, Y an open set of X with Y normal, $\widetilde{Y}$ a dense open subset of Y, $\widetilde{j} \colon \widetilde{Y} \hookrightarrow X$ the corresponding open immersion. Tsuzuki has proved in [Tsu09] t (see also [Tsu02, 4.1.1], [Ked07, 5.2.1] for previous versions) hat the canonical functor $\widetilde{j}^\dagger \colon \mathrm{MIC}^\dagger(Y, X/K) \to \mathrm{MIC}^\dagger(\widetilde{Y}, X/K)$ is fully faithful. This theorem was previously established by Tsuzuki when X is smooth (see [Tsu02, 4.1.1]), next extended by Kedlaya when Y is smooth in [Ked07, 5.2.1] (we will not need that in the case where the variety is smooth). We denote by $\mathrm{MIC}^\dagger(\widetilde{Y} \subset Y, X/K)$ the essential image of the functor $\widetilde{j}^\dagger \colon \mathrm{MIC}^\dagger(Y, X/K) \to \mathrm{MIC}^\dagger(\widetilde{Y}, X/K)$.

The lemma below is obvious considering the paragraph 10.4.3.1 and of its notations.

Lemma 10.4.3.2. *Let $a \colon X^{(0)} \to X$ be a proper surjective generically finite and etale morphism of integral k-varieties, Y of X, $\widetilde{Y}$ a dense open subset of Y, $\widetilde{j} \colon \widetilde{Y} \hookrightarrow X$ the corresponding open immersion, $Y^{(0)} := a^{-1}(Y)$, $\widetilde{Y}^{(0)} := a^{-1}(\widetilde{Y})$. We suppose moreover Y and $Y^{(0)}$ smooth. The canonical functor*

$$(a^*, \widetilde{j}^\dagger) \colon \mathrm{MIC}^\dagger(Y, X/K) \to \mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K) \times_{\mathrm{MIC}^\dagger(\widetilde{Y}^{(0)}, X^{(0)}/K)} \mathrm{MIC}^\dagger(\widetilde{Y} \subset Y, X/K) \quad (10.4.3.2.1)$$

is an equivalence of categories.

Chapter 11

Arithmetic $\mathcal{D}$-modules associated with overconvergent isocrystals: the lifted case with divisorial singularities

11.1 Convergent log-isocrystals as arithmetic $\mathcal{D}$-modules

Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{Y}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is p-torsion free, noetherian of finite Krull dimension. For any integer $i \geq 0$, set $Y_i^\sharp := \mathfrak{Y}^\sharp \times_{\mathrm{Spf}\, \mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$.

11.1.1 The category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S})$ of convergent log-isocrystals

Proposition 11.1.1.1. *Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-module. The following conditions are equivalent.*

(a) The structure of left $\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module extends to a structure of left $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules.

(b) For any open $\mathfrak{U}^\sharp$ endowed with logarithmic coordinates, for each $\eta < 1$, for all $e \in \Gamma(\mathfrak{U}^\sharp, \mathcal{E})$, the following convergent condition holds

$$\|\underline{\partial}_\sharp^{[\underline{k}]}(e)\|\eta^{|\underline{k}|} \to 0, \text{ as } |\underline{k}| \to \infty, \qquad (11.1.1.1.1)$$

where $\Gamma(\mathfrak{U}^\sharp, \mathcal{E})$ is endowed with the topology given by its structure of $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$-module of finite type.

Proof. Suppose (b) holds. Let $\mathfrak{U}^\sharp \subset \mathfrak{Y}^\sharp$ be an affine open endowed with logarithmic coordinates. Let $P \in \Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$. Then P can be written of the form $P = \sum_{\underline{k}} a_{\underline{k}} \underline{\partial}_\sharp^{[\underline{k}]}$ with $a_{\underline{k}} \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$ satisfying the growth condition of Proposition 8.7.1.8.(c). Hence, for any $e \in \Gamma(\mathfrak{U}, \mathcal{E})$, the convergence condition 11.1.1.1.1 implies that $a_{\underline{k}} \underline{\partial}_\sharp^{[\underline{k}]}(e) \to 0$ as $|\underline{k}| \to \infty$. This yields we can define $P(e)$ as the sum of the serie $P(e) = \sum_{\underline{k}} a_{\underline{k}} \underline{\partial}_\sharp^{[\underline{k}]}(e)$. This gives a pairing

$$\Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \times \Gamma(\mathfrak{U}, \mathcal{E}) \to \Gamma(\mathfrak{U}, \mathcal{E})$$

and a canonical structure of $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module on the given $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-module $\mathcal{E}$ which extends the structure of $\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module.

Suppose (a) holds. Take $\eta < 1$ and let $\mathfrak{U}^\sharp$ be an affine open endowed with logarithmic coordinates. By 8.7.1.7 and with notation 1.2.1.3.1, there exists $m \in \mathbb{N}$ such that $\eta^{|\underline{k}|} < c_{\underline{k}} |q_{\underline{k}}^{(m)}!|$, with $c_{\underline{k}} \to 0$. As $q_{\underline{k}}^{(m)}! \underline{\partial}_\sharp^{[\underline{k}]} = \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}$, it suffices to show that, for any m and any $e \in \Gamma(\mathfrak{U}, \mathcal{E}) = E$, the elements $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(e)$, $\underline{k} \in \mathbb{N}^d$, form a bounded family in E for its natural topology of an $A_{\mathbb{Q}}$-module of finite type.

Write $\widehat{D}^{(m)}_{\mathfrak{U}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} = \Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$. Take $P = \sum a_{\underline{k}} \underline{\partial}_\sharp^{\langle \underline{k}\rangle}$ with $a_{\underline{k}} \to 0$. We extend the Banach norm $\|\cdot\|$ on $A_\mathbb{Q} = \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$ to $\widehat{D}^{(m)}_{\mathfrak{U}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ by setting $\|P\| = \sup \|a_{\underline{k}}\|$. As the topology on E as $A_\mathbb{Q}$-module of finite type coincides with its topology as $\widehat{D}^{(m)}_{\mathfrak{U}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module of finite type (see 7.5.2.6), the elements $\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$ form a bounded family in $\widehat{D}^{(m)}_{\mathfrak{U}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$, the same holds for their images under the map $\widehat{D}^{(m)}_{\mathfrak{U}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to E$ given by $P \mapsto P(e)$. □

Corollary 11.1.1.2. *Suppose that $\mathfrak{S} \to \operatorname{Spf} \mathcal{V}$ is smooth, and suppose there exist a smooth $\mathfrak{S}$-formal scheme $\mathfrak{Y}$, a relative strict normal crossing divisor $\mathfrak{Z}$ of $\mathfrak{Y}$ over $\mathfrak{S}$, such that $\mathfrak{Y}^\sharp = (\mathfrak{Y}, M_\mathfrak{Z})$ is the logarithmic $\mathcal{V}$-formal scheme whose underlying logarithmic structure $M_\mathfrak{Z}$ is the one associated with $\mathfrak{Z}$. We have the morphism of ringed spaces $\mathrm{sp}\colon (\mathfrak{Y}_K, \mathcal{O}_{\mathfrak{Y}_K}) \to (\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$ induced by the specialization morphism. We get the inverse image functor sp^* by setting $\mathrm{sp}^*(\mathcal{E}) := \mathcal{O}_{\mathfrak{Y}_K} \otimes_{\mathrm{sp}^{-1}\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}} \mathrm{sp}^{-1}(\mathcal{E})$, for any $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-modules $\mathcal{E}$.*

The functors sp_* and sp^* induce quasi-inverse equivalences between the category of (locally free) coherent $\mathcal{O}_{\mathfrak{Y}_K}$-modules together with a convergent logarithmic connection relative to $\mathfrak{Y}^\sharp_K/\mathfrak{S}_K$ and that of left $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S},\mathbb{Q}}$-modules which are (locally projective) coherent as $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-module.

Proof. This is a consequence of 11.1.1.1 and of the fact that the convergent condition 10.3.2.5 corresponds to that of 11.1.1.1.1.. □

Notation 11.1.1.3. We denote by $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$ the full subcategory of the category of $\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules consisting of $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp,\mathbb{Q}}$-modules which are $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent. Its objects are called "convergent log-isocrystals on $\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp$". When log structures are trivial, we drop *log*, i.e. we say "convergent isocrystals on $\mathfrak{Y}/\mathfrak{S}$". Remark that any morphism $\mathcal{E} \to \mathcal{E}'$ of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$ is $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-linear. Indeed, for any affine open formal subscheme $\mathfrak{U} \subset \mathfrak{Y}$, the morphism $\Gamma(\mathfrak{U}, \mathcal{E}) \to \Gamma(\mathfrak{U}, \mathcal{E}')$ is continuous for the Banach space topology.

Proposition 11.1.1.4. *Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module which is locally projective of finite type over $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$. The object $\mathcal{E}$ is a convergent log-isocrystal on $\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp$ if and only if the structure of $\mathcal{D}_{\mathfrak{Y}^*,\mathbb{Q}}$-module of $\mathcal{E}|_{\mathfrak{Y}^*}$ extends to a structure of coherent $\mathcal{D}^\dagger_{\mathfrak{Y}^*,\mathbb{Q}}$-module.*

Proof. By using the translation 11.1.1.1.(b) of the objects of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$, we reduce to copy 10.3.2.7. □

Proposition 11.1.1.5. *Let $\mathcal{E}$ be a $\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module, coherent as $\mathcal{O}_\mathfrak{Y}$-module.*

(a) If $\mathfrak{Y}$ is affine then $\mathcal{E}$ is globally of finite presentation on $\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$.

(b) The sheaf $\mathcal{E}$ is coherent on $\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$.

(c) The canonical homomorphism $\mathcal{E} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{E}$ is an isomorphism.

Proof. This is a particular case of 7.5.2.1. □

Proposition 11.1.1.6. *Let $\mathcal{E}$ be an object of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. Let m be an integer.*

(a) There exists a p-torsion free $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module $\overset{\circ}{\mathcal{E}}$, coherent over $\mathcal{O}_\mathfrak{Y}$ together with a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-linear isomorphism $\overset{\circ}{\mathcal{E}}_\mathbb{Q} \xrightarrow{\sim} \mathcal{E}$.

(b) The sheaf $\mathcal{E}$ is a coherent $\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module and a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module. Moreover, the canonical homomorphism $\mathcal{E} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}$ is an isomorphism.

(c) The sheaf $\mathcal{E}$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module and the canonical homomorphisms $\mathcal{E} \to \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}$ is an isomorphism.

Proof. The assertion (a) (resp. (b)) is a particular case of 7.5.2.8.(a) (resp. 7.5.2.8.(b)). Taking the inductive limit on the level, we get the last statement. □

Proposition 11.1.1.7 (Theorem A)**.** *We assume that $\mathfrak{Y}^\sharp$ is affine and $\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp$ has coordinates. Set $A := \Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y}})$, $D_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} := \Gamma(\mathfrak{Y}, \mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ and $D^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} := \Gamma(\mathfrak{Y}, \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$. We denote by* $\mathrm{MIC}^\dagger(A_K/K)$ *the category of coherent $D^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,K}$-module which are also coherent as A_K-module.*

(a) The functors $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{D^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,K}} -$ and $\Gamma(\mathfrak{Y}, -)$ are quasi-inverse equivalences between $\mathrm{MIC}^\dagger(A_K/K)$ *and* $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$.

(b) For any $E \in \mathrm{MIC}^\dagger(A_K/K)$, the canonical morphisms

$$E \to D^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{D_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} E, \qquad \mathcal{O}_{\mathfrak{Y},\mathbb{Q}} \otimes_{A_K} E \to \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{D^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} E \tag{11.1.1.7.1}$$

are isomorphisms.

Proof. 1) Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{U}/\mathcal{V})$. It follows from Theorem of type A for coherent $\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}}$-modules and coherent $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-modules that $\Gamma(\mathfrak{U}, \mathcal{E}) \in \mathrm{MIC}^\dagger(A_K/K)$ (recall also definition 11.1.1.3).

2) Let $E \in \mathrm{MIC}^\dagger(A_K/K)$. Let us check that both morphisms of 11.1.1.7.1 are isomorphisms. By copying the demonstration of 11.1.1.1, we prove that for all $\eta < 1$, for all $e \in E$, we have

$$\| \underline{\partial}^{[\underline{k}]} \cdot e \| \, \eta^{|\underline{k}|} \to 0 \text{ for } |\underline{k}| \to \infty, \tag{11.1.1.7.2}$$

where $\| - \|$ denotes a Banach norm on E defined by its structure of $\Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$-module of finite type. This condition 11.1.1.7.2 is the convergence condition 10.3.2.4.1 (still valid without log structures). By copying the proof of 11.1.1.6, we then deduce that, for all $m \in \mathbb{N}$, there exists a $\Gamma(\mathfrak{Y}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$-module $\mathring{E}^{(m)}$, which is furthermore a $\Gamma(Y, \mathcal{O}_{\mathfrak{Y}})$-module of finite type together with an isomorphism $\mathring{E}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} E$. Now, it follows by p-adic completion from 4.3.4.6.1 that the canonical morphism

$$\mathcal{O}_{\mathfrak{Y}} \widehat{\otimes}_{\Gamma(Y,\mathcal{O}_{\mathfrak{Y}})} \mathring{E}^{(m)} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}_{\Gamma(\mathfrak{Y},\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})} \mathring{E}^{(m)}$$

is an isomorphism. Since $\mathring{E}^{(m)}$ is of finite type as $\Gamma(Y, \mathcal{O}_{\mathfrak{Y}})$-module and therefore as $\Gamma(\mathfrak{Y}, \mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$-module, the morphisms

$$\mathcal{O}_{\mathfrak{Y}} \otimes_{\Gamma(Y,\mathcal{O}_{\mathfrak{Y}})} \mathring{E}^{(m)} \to \mathcal{O}_{\mathfrak{Y}} \widehat{\otimes}_{\Gamma(Y,\mathcal{O}_{\mathfrak{Y}})} \mathring{E}^{(m)}, \ \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\Gamma(\mathfrak{Y},\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})} \mathring{E}^{(m)} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}_{\Gamma(\mathfrak{Y},\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})} \mathring{E}^{(m)}$$

are also isomorphisms. The morphism $\mathcal{O}_{\mathfrak{Y}} \otimes_{\Gamma(Y,\mathcal{O}_{\mathfrak{Y}})} \mathring{E}^{(m)} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\Gamma(\mathfrak{Y},\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})} \mathring{E}^{(m)}$ is therefore an isomorphism. Tensoring this isomorphism with $\mathbb{Q}$ and taking the inductive limit on m, this implies the canonical morphism:

$$\mathcal{O}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\Gamma(Y,\mathcal{O}_{\mathfrak{Y},\mathbb{Q}})} E \to \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}} \otimes_{\Gamma(\mathfrak{Y},\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})} E \tag{11.1.1.7.3}$$

is an isomorphism. Now, as $\mathring{E}^{(m)}$ is separated complete and of finite type as $\Gamma(\mathfrak{Y}, \mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$-module, the morphism $\mathring{E}^{(m)} \to \Gamma(\mathfrak{Y}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}) \otimes_{\Gamma(\mathfrak{Y},\mathcal{D}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})} \mathring{E}^{(m)}$ is an isomorphism. Tensoring with $\mathbb{Q}$ and taking the inductive limit on m, it follows that the canonical morphism

$$E \to \Gamma(\mathfrak{Y}, \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}) \otimes_{\Gamma(\mathfrak{Y},\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})} E \tag{11.1.1.7.4}$$

is an isomorphism and we have checked the first isomorphism of 11.1.1.7.1. From 11.1.1.7.3 and 11.1.1.7.4, we get the canonical morphism

$$\mathcal{O}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\Gamma(Y,\mathcal{O}_{\mathfrak{Y},\mathbb{Q}})} E \to \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\Gamma(\mathfrak{Y},\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})} E \tag{11.1.1.7.5}$$

is an isomorphism, and we are done.

3) Let $E \in \mathrm{MIC}^\dagger(A_K/K)$. Thanks to the isomorphism 11.1.1.7.1, it follows from Theorem of type A for coherent $\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}}$-modules and coherent $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-modules that $\mathcal{E} := \mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}} \otimes_{D^\dagger_{\mathfrak{U},K}} E \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. □

Corollary 11.1.1.8. *We assume that $\mathfrak{Y}^\sharp$ is affine and $\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp$ has coordinates. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module. Then $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent if and only if $\Gamma(\mathfrak{Y},\mathcal{E})$ is a $\Gamma(\mathfrak{Y},\mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$-module of finite type.*

Proposition 11.1.1.9. *Suppose that $\mathfrak{S}\to \operatorname{Spf}\mathcal{V}$ is smooth, and suppose there exist a smooth $\mathfrak{S}$-formal scheme $\mathfrak{Y}$, a relative strict normal crossing divisor $\mathfrak{Z}$ of $\mathfrak{Y}$ over $\mathfrak{S}$, such that $\mathfrak{Y}^\sharp=(\mathfrak{Y},M_{\mathfrak{Z}})$ is the logarithmic $\mathcal{V}$-formal scheme whose underlying logarithmic structure $M_{\mathfrak{Z}}$ is the one associated with $\mathfrak{Z}$.*

Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S},\mathbb{Q}}$-module which is locally projective of finite type on $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$. The following conditions are equivalent:

(a) $\mathcal{E}$ is a convergent log-isocrystal on $\mathfrak{Y}^\sharp/\mathfrak{S}$ (in the sense of 11.1.1.3) ;

(b) the structure of $\mathcal{O}_{\mathfrak{Y}}({}^\dagger Z)_{\mathbb{Q}}\otimes_{\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}}\mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S},\mathbb{Q}}$-module of $\mathcal{O}_{\mathfrak{Y}}({}^\dagger Z)_{\mathbb{Q}}\otimes_{\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}}\mathcal{E}$ extends to a structure of coherent $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}}$-module.

Proof. Since $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}}|\mathfrak{Y}^*=\mathcal{D}^\dagger_{\mathfrak{Y}^*/\mathfrak{S},\mathbb{Q}}$, then by using 11.1.1.4 we get the implication $(b)\Rightarrow(a)$. Conversely, suppose $\mathcal{E}$ be an object of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S})$. Since $\mathcal{E}$ is a topologically nilpotent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S},\mathbb{Q}}$-module which is coherent over $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$ (use 11.1.1.6 and 7.5.2.7), then it follows from 7.5.2.8.2 that the canonical homomorphism

$$\mathcal{B}^{(m)}_{\mathfrak{Y}}(Z)_{\mathbb{Q}}\otimes_{\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}}\mathcal{E}\to(\mathcal{B}^{(m)}_{\mathfrak{Y}}(Z)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}})_{\mathbb{Q}}\otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S},\mathbb{Q}}}\mathcal{E}$$

is an isomorphism. Taking the limit, this yields that the canonical homomorphism

$$\mathcal{O}_{\mathfrak{Y}}({}^\dagger Z)_{\mathbb{Q}}\otimes_{\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}}\mathcal{E}\to\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}}\otimes_{\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S},\mathbb{Q}}}\mathcal{E}$$

is an isomorphism. Hence, we are done. □

We finish the section with the following Lemmas which completes Theorems 11.1.1.2 and 11.1.1.6. They will also be useful in order to prove Berthelot's Theorem 11.2.1.12.

Lemma 11.1.1.10. *Let $m_0\in\mathbb{N}$, $\mathcal{E}^{(m_0)}$ be a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module. We put for any $m\geq m_0$, $\mathcal{E}^{(m)}:=\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}\otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}}\mathcal{E}^{(m_0)}$, and $\mathcal{E}:=\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}\otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}}\mathcal{E}^{(m_0)}$.*

If $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent, then there exists $m_1\geq m_0$ such that for any $m\geq m_1$ the canonical homomorphism $\mathcal{E}^{(m)}\to\mathcal{E}$ is an isomorphism.

Proof. This is a consequence of Proposition 8.4.1.11 and of 11.1.1.6. □

Lemma 11.1.1.11. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module which is $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent, and $\mathring{\mathcal{E}}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module together with a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-linear isomorphism of the form $\mathcal{E}\xrightarrow{\sim}\mathring{\mathcal{E}}_{\mathbb{Q}}$. Then $\mathring{\mathcal{E}}$ is $\mathcal{O}_{\mathfrak{Y}}$-coherent and $\mathring{\mathcal{E}}/\pi^{i+1}\mathring{\mathcal{E}}$ is a nilpotent $\widehat{\mathcal{D}}^{(m)}_{Y_i^\sharp/S_i^\sharp}$-module (see definition 4.2.1.11).*

Proof. Since $\mathcal{E}$ is a topologically nilpotent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module and is $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent (use 11.1.1.6), this is a particular case of 7.5.2.9. □

11.1.2 The category $\mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$

Notation 11.1.2.1. Below are some categories:

(a) According to 8.1.5.1, we denote by $M(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$ the category of $\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}$-modules. We get a canonical functor $\mathrm{cst}\colon M(\mathcal{O}_{\mathfrak{Y}})\to M(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$ defined by $\mathcal{F}\mapsto\mathcal{F}^{(\bullet)}$ so that $\mathcal{F}^{(m)}\to\mathcal{F}^{(m+1)}$ is the identity of $\mathcal{F}$. Since this functor is exact, this yields the t-exact functor $\mathrm{cst}\colon D(\mathcal{O}_{\mathfrak{Y}})\to D(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$. According to 8.1.5.1, we have the notion of ind-isogenies (resp. of lim-ind-isogenies) of $M(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$. Following 8.4.3.4, we denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$ the category localized by lim-ind-isogenies. We remark that $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$ is the subcategory of $\underrightarrow{LM}_{\mathbb{Q}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$ consisting of objects which are locally isomorphic to an object of the form $\mathrm{cst}(\mathcal{G})$ where $\mathcal{G}$ is a coherent $\mathcal{O}_{\mathfrak{Y}}$-module (use 8.4.2.1 and 8.4.3.2).

(b) Following notation 11.1.1.3, we denote by $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$ the category of $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules which are also $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent. Recall these objects are necessarily $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-coherent (see 11.1.1.6), and when $\mathfrak{S}^\sharp = \operatorname{Spf}\mathcal{V}$ and log structures are trivial, they are $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-locally projective of finite type. We denote by $\mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ consisting of objects $\mathcal{E}^{(\bullet)}$ such that $\underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)}$ are $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent.

Remark 11.1.2.2. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. Let $\widetilde{\mathcal{D}} := \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ or $\widetilde{\mathcal{D}} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$. Let $\mathcal{D} := \mathcal{D}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$ or $\mathcal{D} := \widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$. By using the isomorphisms of 11.1.1.6.(b-c), we check that both morphisms $\mathcal{E} \to \widetilde{\mathcal{D}} \otimes_{\mathcal{D}} \mathcal{E} \to \mathcal{E}$ are isomorphisms. This yields that the first morphism is in fact $\widetilde{\mathcal{D}}$-linear. Hence, if $\mathcal{F}$ is a $\widetilde{\mathcal{D}}$-module, then any $\mathcal{D}$-linear morphism $\mathcal{E} \to \mathcal{F}$ is necessarily $\widetilde{\mathcal{D}}$-linear.

Lemma 11.1.2.3. *Let $\mathcal{F}^{(m)}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module and $f\colon \mathcal{F}^{(m)} \to \mathcal{F}^{(m)}$ be a $\mathcal{V}$-linear morphism such that $f_{\mathbb{Q}}\colon \mathcal{F}^{(m)}_{\mathbb{Q}} \to \mathcal{F}^{(m)}_{\mathbb{Q}}$ is equal to $p^N \mathrm{id}$ for some $N \in \mathbb{N}$. Then, for $N' \in \mathbb{N}$ large enough, we have $p^{N'} f = p^{N'+N}\mathrm{id}$.*

Proof. Since $\mathfrak{X}$ is quasi-compact and $\mathcal{F}^{(m)}$ is a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module, then the p-torsion part of $\mathcal{F}^{(m)}$ is killed by some power of p. Hence, we are done. □

Proposition 11.1.2.4. *Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. Let $\mathcal{F}^{(0)}$ be a $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module, coherent over $\mathcal{O}_{\mathfrak{Y}}$ together with an isomorphism of $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules of the form $\mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$. For any $m \in \mathbb{N}$, let $\mathcal{G}^{(m)}$ be the quotient of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ by its p-torsion part. The following conditions hold.*

(a) The module $\mathcal{G}^{(m)}$ is $\mathcal{O}_{\mathfrak{Y}}$-coherent.

(b) The first (resp. second) canonical morphism

$$\mathcal{F}^{(0)} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)} \to \mathcal{G}^{(m)}$$

is an isogeny in the category of $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules (resp. of coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules).

(c) $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$ and $\underrightarrow{l}^*_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}) \xrightarrow{\sim} \mathcal{E}$.

Proof. a) Following 11.1.2.2, the canonical morphism $\mathcal{E} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}$ is an isomorphism of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules. The isomorphism $\mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ of $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules induces the last isomorphism of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules $\mathcal{G}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}$. Using 11.1.1.11, this yields $\mathcal{G}^{(m)}$ is $\mathcal{O}_{\mathfrak{Y}}$-coherent.

b) i) Let us denote by $\alpha^{(m)}\colon \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)} \to \mathcal{G}^{(m)}$ the canonical epimorphism of coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules. Since $\alpha^{(m)}$ is a morphism of coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules which is an isomorphism after tensoring by $\mathbb{Q}$, then this is an isogeny in the category of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules (use 7.4.5.2).

ii) Let $\iota^{(m)}\colon \mathcal{F}^{(0)} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ be the canonical morphism. It remains to check that $\iota^{(m)}$ is an isogeny. Using b.i) in the case $m = 0$, we get a morphism $\beta^{(0)}\colon \mathcal{G}^{(0)} \to \mathcal{F}^{(0)}$ of coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules such that $\alpha^{(0)} \circ \beta^{(0)} = p^N \mathrm{id}$ and $\beta^{(0)} \circ \alpha^{(0)} = p^N \mathrm{id}$ for some integer N. Since the canonical morphism $\mathcal{E} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}$ is an isomorphism, then the canonical morphism $\mathcal{G}^{(0)}_{\mathbb{Q}} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{G}^{(0)}_{\mathbb{Q}}$ is an isomorphism. Since the canonical morphism $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{G}^{(0)}_{\mathbb{Q}} \to \mathcal{G}^{(m)}_{\mathbb{Q}}$ is an isomorphism, this yields by composition that the canonical $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-linear morphism $\mathcal{G}^{(0)} \to \mathcal{G}^{(m)}$ is an isomorphism after tensoring by $\mathbb{Q}$. Let us denote by $\gamma^{(m)}\colon \mathcal{G}^{(0)} \to \mathcal{G}^{(m)}$

this morphism and by $\gamma^{(m)}_{\mathbb{Q}}\colon \mathcal{G}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{G}^{(m)}_{\mathbb{Q}}$ the induced isomorphism. Since $\gamma^{(m)}$ is $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-linear (and then $\mathcal{O}_{\mathfrak{Y}}$-linear), since $\mathcal{G}^{(m)}$ is $\mathcal{O}_{\mathfrak{Y}}$-coherent and $\mathcal{G}^{(0)}$ is p-torsion free, then, for N' large enough, $p^{N'}(\gamma^{(m)}_{\mathbb{Q}})^{-1}$ induces the morphism $\delta^{(m)}\colon \mathcal{G}^{(m)} \to \mathcal{G}^{(0)}$ of $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules. We get $\kappa^{(m)} := \beta^{(0)} \circ \delta^{(m)} \circ \alpha^{(m)}\colon \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)} \to \mathcal{F}^{(0)}$. Using the Lemma 11.1.2.3, increasing N or N' if necessary in the construction of $\kappa^{(m)}$, we get $\iota^{(m)} \circ \kappa^{(m)} = p^{N+N'}\,\mathrm{id}$ and $\kappa^{(m)} \circ \iota^{(m)} = p^{N+N'}\,\mathrm{id}$. Hence, this morphism $\iota^{(m)}\colon \mathcal{F}^{(0)} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ is an isogeny in the category of $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-modules.

c) Finally $\underrightarrow{l}^*_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp},\mathbb{Q}} \mathcal{F}^{(0)}_{\mathbb{Q}}$. Following the first part, the canonical morphism $\mathcal{F}^{(0)}_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp},\mathbb{Q}} \mathcal{F}^{(0)}_{\mathbb{Q}}$ is an isomorphism. We endow $\mathcal{F}^{(0)}_{\mathbb{Q}}$ with the structure of $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module making $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-linear the isomorphism $\mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$. Following the remark 11.1.2.2, this yields that the canonical isomorphism $\mathcal{F}^{(0)}_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp},\mathbb{Q}} \mathcal{F}^{(0)}_{\mathbb{Q}}$ is in fact $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-linear. Hence, we get the isomorphism $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp},\mathbb{Q}} \mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. □

Corollary 11.1.2.5. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$. The following conditions are equivalent:*

(a) The object $\mathcal{E}^{(\bullet)}$ belongs to $\mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$.

(b) There exists a $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{F}^{(0)}$, coherent over $\mathcal{O}_{\mathfrak{Y}}$ such that

(i) $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ to $\mathcal{E}^{(\bullet)}$

(ii) and the canonical morphism $\mathrm{cst}(\mathcal{F}^{(0)}) \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ is an ind-isogeny in $M(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$.

Moreover, when $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$, we can choose such $\mathcal{F}^{(0)}$ without p-torsion.

Proof. Let $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)}$ be the corresponding $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module. If such $\mathcal{F}^{(0)}$ exists, then $\mathcal{E}$ is in particular $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent and then by definition $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. Conversely, suppose $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. Then $\mathcal{E}$ is a $\mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module which is also $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent. Using 11.1.1.6, there exists a coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{F}^{(0)}$ without p-torsion, coherent over $\mathcal{O}_{\mathfrak{Y}}$ together with an isomorphism of $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules $\mathcal{E} \xrightarrow{\sim} \mathcal{F}^{(0)}_{\mathbb{Q}}$. Hence, we conclude by using 11.1.2.4. □

11.1.3 Stability under inverse images of convergent log-isocrystals

Let $f\colon \mathfrak{Y}'^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of log smooth over $\mathfrak{S}^\sharp$ log formal schemes.

Remark 11.1.3.1. This subsection is a particular case of 11.2.3 (when the divisor is empty). We have also stability under tensor products and duality of convergent isocrystals (see 11.2.4, 11.2.5 in the particular case where the divisor is empty). The convergent statements are left to the reader.

11.1.3.2. Let $\mathcal{E}^{(\bullet)} \in M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$. With similar to 9.2.1.8.1 notation (with locally projective isocrystals, we prefer to work with f^* instead of $f^!$), we get the functor $f^{*(\bullet)}_{\mathrm{alg}}\colon M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}) \to M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$ by setting $f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{E}^{(\bullet)}) := \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{S}}} f^{-1}\mathcal{E}^{(\bullet)}$. By left deriving the functor $f^{*(\bullet)}_{\mathrm{alg}}$, this yields the functor $\mathbb{L}f^{*(\bullet)}_{\mathrm{alg}}\colon D^-(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}) \to D^-(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$, defined by setting $\mathbb{L}f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) := \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}^{(\bullet)}$ for any $\mathcal{F}^{(\bullet)} \in D^-(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$. Since it preserves lim-ind-isogenies, this induces the functor $\mathbb{L}f^{*(\bullet)}_{\mathrm{alg}}\colon \underrightarrow{LD}^-_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}) \to \underrightarrow{LD}^-_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$. Remark $\mathbb{L}f^{*(\bullet)}_{\mathrm{alg}} = f^{(\bullet)!}_{\mathrm{alg}}[-d_f]$ where $f^{(\bullet)!}_{\mathrm{alg}}$ is the functor defined at 9.2.4.11.1 in the case where the divisors are empty and $\phi = \mathrm{id}$.

Following notation 9.2.1.15.3, we set $\mathbb{L}f^{*(\bullet)}(\mathcal{F}^{(\bullet)}) := \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}^{(\bullet)}$, for any $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$. We get the morphism $\mathbb{L}f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to \mathbb{L}f^{*(\bullet)}(\mathcal{F}^{(\bullet)})$ (beware the notation is slightly misleading since $\mathbb{L}f^{*(\bullet)}$ is not necessarily the left derived functor of a functor).

Lemma 11.1.3.3. *We have the following properties.*

(a) *Let* $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$*. With notation 9.2.1.15.3, the canonical morphism*

$$\mathcal{O}^{(\bullet)}_{\mathfrak{Y}'}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{F}^{(\bullet)} \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}^{(\bullet)} = \mathbb{L}f^{*(\bullet)}(\mathcal{F}^{(\bullet)})$$

is an isomorphism.

(b) *Let* $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$*. Then, the canonical morphism*

$$\mathcal{O}^{(\bullet)}_{\mathfrak{Y}'} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{G}^{(\bullet)} \to \mathcal{O}^{(\bullet)}_{\mathfrak{Y}'}\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{G}^{(\bullet)}$$

is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}'})$*.*

Proof. By using 4.3.4.6.1, we get (a). We check (b) similarly to Lemma 9.2.1.17. □

Proposition 11.1.3.4. *We have the following properties.*

(a) *Let* $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$*. Then the canonical morphism*

$$\mathcal{O}_{\mathfrak{Y}',\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}} f^{-1}\mathcal{E} \to \mathcal{D}^{\dagger}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} f^{-1}\mathcal{E}$$

is an isomorphism. Hence, we can set $f^*(\mathcal{E}) := \mathcal{D}^{\dagger}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} f^{-1}\mathcal{E}$ *without ambiguity. We have also* $f^*(\mathcal{E}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp)$*.*

(b) *Let* $\mathcal{F}$ *be a* $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$*-module, coherent over* $\mathcal{O}_{\mathfrak{Y}}$*. Then the morphisms*

$$\mathcal{O}_{\mathfrak{Y}'} \otimes_{f^{-1}\mathcal{O}_{\mathfrak{Y}}} f^{-1}\mathcal{F} \to \mathcal{O}_{\mathfrak{Y}'}\widehat{\otimes}_{f^{-1}\mathcal{O}_{\mathfrak{Y}}} f^{-1}\mathcal{F} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{f^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}$$
$$\leftarrow \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{f^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}$$

are isomorphisms. Hence, we can set $f^*(\mathcal{F}) := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{f^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}$ *without ambiguity. Moreover,* $f^*(\mathcal{F})$ *is a* $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}$*-module, coherent over* $\mathcal{O}_{\mathfrak{Y}'}$*.*

Proof. 1) Following 11.1.2.5, there exists $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}) \cap \underrightarrow{LD}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ such that $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}$. By applying Lemmas 9.2.1.17 and 11.1.3.3, this yields that the canonical morphism

$$\mathcal{O}^{(\bullet)}_{\mathfrak{Y}'} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{E}^{(\bullet)} \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp\to\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{E}^{(\bullet)}$$

is an isomorphism. By applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$, we get the desired isomorphism. Since $f^*(\mathcal{E})$ is $\mathcal{O}_{\mathfrak{Y}',\mathbb{Q}}$-coherent, this yields $f^*(\mathcal{E}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp)$.

2) Since $\mathcal{F}$ is both $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-coherent and $\mathcal{O}_{\mathfrak{Y}}$-coherent, the first and the last morphisms are isomorphisms. Since the modulo π^{n+1} reduction of the middle morphism is an isomorphism for any $n \in \mathbb{N}$ (see 4.3.4.6.1), since this is a morphism of separated complete modules for the p-adic topology, this implies that the middle morphism is an isomorphism. □

Proposition 11.1.3.5. *Let* $\mathcal{F}^{(0)}$ *be a* $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$*-module, coherent over* $\mathcal{O}_{\mathfrak{Y}}$ *and such that the canonical morphism* $\mathrm{cst}(\mathcal{F}^{(0)}) \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)} =: \mathcal{F}^{(\bullet)}$ *is an ind-isogeny in* $M(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$*. For any* $m \in \mathbb{N}$*, let* $\mathcal{G}^{(m)}$ *be the quotient of* $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ *by its p-torsion part.*

(a) *The canonical morphism* $\mathrm{cst}(f^*(\mathcal{F}^{(0)})) \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}} f^*(\mathcal{F}^{(0)})$ *is an ind-isogeny of* $M(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}'})$*. In particular,* $\mathrm{cst}(f^*(\mathcal{F}^{(0)}))$ *belongs to* $\mathrm{MIC}^{(\bullet)}(\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp)$*.*

(b) *The canonical morphisms* $f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)})$*, and* $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}} f^*(\mathcal{F}^{(0)}) \to f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)})$ *are ind-isogenies of* $M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$.

(c) *The canonical morphism* $\mathbb{L}f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to \mathbb{L}f^{*(\bullet)}(\mathcal{F}^{(\bullet)})$ *is an isomorphism of* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$.

(d) *If* $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})$ *is flat as* $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$*-module, then the canonical morphism* $\mathbb{L}f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)})$ *is an isomorphism of* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$.

Proof. a) Following 11.1.2.5, $\mathcal{F}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. Set $\mathcal{F} := \underrightarrow{l}^*_{\mathbb{Q}}\mathcal{F}^{(\bullet)} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. By applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ to the canonical morphism $\mathrm{cst}(\mathcal{F}^{(0)}) \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)} =: \mathcal{F}^{(\bullet)}$, we get the canonical morphism $\mathcal{F}^{(0)}_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}}$ is an isomorphism. Via this isomorphism, we can view $\mathcal{F}^{(0)}_{\mathbb{Q}}$ as an object of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$. This yields that $f^*(\mathcal{F}^{(0)})$ is a $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}$-module, coherent over $\mathcal{O}_{\mathfrak{Y}'}$ and such that $\left(f^*(\mathcal{F}^{(0)})\right)_{\mathbb{Q}} \xrightarrow{\sim} f^*(\mathcal{F}^{(0)}_{\mathbb{Q}})$ (see both notation 11.1.3.4.a and 11.1.3.4.b) is an object of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp)$. Hence, via 11.1.2.4, we get the first statement.

b) Since $\mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ is an ind-isogeny of $M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$, then $f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)})$ is an isogeny of $M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp})$. We have the commutative diagram with canonical morphisms

$$\begin{array}{ccccc} f^*(\mathcal{F}^{(0)}) & \longrightarrow & \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}} f^*(\mathcal{F}^{(0)}) & \longrightarrow & f^*(\mathcal{G}^{(m)}) \\ \downarrow \wr & & \downarrow \wr & & \downarrow \wr \\ f^{*(0)}_{\mathrm{alg}}(\mathcal{F}^{(0)}) & \longrightarrow & \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}} f^{*(0)}_{\mathrm{alg}}(\mathcal{F}^{(0)}) & \longrightarrow & f^{*(m)}_{\mathrm{alg}}(\mathcal{G}^{(m)}), \end{array} \tag{11.1.3.5.1}$$

where f^* is the functor defined at 11.1.3.4.(b). Since $\mathcal{F}^{(0)}$ and $\mathcal{G}^{(m)}$ are $\mathcal{O}_{\mathfrak{Y}}$-coherent (see 11.1.2.4, then following 11.1.3.4.(b), the vertical arrows are isomorphisms. From the first statement, the left horizontal arrows are isogenies of $\mathcal{O}_{\mathfrak{Y}'}$-modules. Since $\mathcal{F}^{(0)} \to \mathcal{G}^{(m)}$ are also isogenies, then the morphisms of the diagram 11.1.3.5.1 become isomorphisms after tensoring by $\mathbb{Q}$. Since $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}} f^*(\mathcal{F}^{(0)}) \to f^{*(m)}_{\mathrm{alg}}(\mathcal{G}^{(m)})$ is a morphism of coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}$-modules, this yields the second statement.

c) By using 11.1.3.3 and 9.2.1.17, since $\mathcal{F}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$ and $\mathcal{F}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$, three arrows of the diagram

$$\begin{array}{ccc} \mathbb{L}f^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & \mathbb{L}f^{*(\bullet)}(\mathcal{F}^{(\bullet)}) \\ \uparrow & & \uparrow \wr \\ \mathcal{O}^{(\bullet)}_{\mathfrak{Y}'} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{F}^{(\bullet)} & \xrightarrow{\sim} & \mathcal{O}^{(\bullet)}_{\mathfrak{Y}'} \widehat{\otimes}^{\mathbb{L}}_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{F}^{(\bullet)} \end{array}$$

are isomorphisms. Hence so is the forth.

d) It remains to check that the canonical morphism $\mathcal{O}^{(\bullet)}_{\mathfrak{Y}'} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{F}^{(\bullet)} \to \mathcal{O}^{(\bullet)}_{\mathfrak{Y}'} \otimes_{f^{-1}\mathcal{O}^{(\bullet)}_{\mathfrak{Y}}} f^{-1}\mathcal{F}^{(\bullet)}$ is an isomorphism under the flatness assumption. Since this is a morphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}'})$, we reduce to check it after applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$, which is a consequence of the flatness as $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-module. □

Corollary 11.1.3.6. *Let* $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp)$ *such that* $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)}$ *is flat as* $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$*-module.*

(a) $\mathbb{L}f^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp)$ *(i.e. is isomorphic to such an object) and* $\underrightarrow{l}^*_{\mathbb{Q}}\mathbb{L}f^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} f^*(\mathcal{E})$.

(b) Choose a $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{F}^{(0)}$, coherent over $\mathcal{O}_{\mathfrak{Y}}$ such that $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp})$ to $\mathcal{E}^{(\bullet)}$ and such that the canonical morphism $\mathrm{cst}(\mathcal{F}^{(0)}) \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp}} \mathcal{F}^{(0)}$ is an ind-isogeny in $M(\mathcal{O}^{(\bullet)}_{\mathfrak{Y}})$. Then $\mathbb{L}f^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Y}'^\sharp/\mathfrak{S}^\sharp}} f^*(\mathcal{F}^{(0)})$.

11.2 Overconvergent log-isocrystals as arithmetic $\mathcal{D}$-modules

11.2.1 $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$: Overconvergent connections and arithmetic $\mathcal{D}$-modules

Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, let $\mathfrak{X}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes. We suppose the underlying formal scheme $\mathfrak{X}$ is p-torsion free, noetherian of finite Krull dimension. For any integer $i \geq 0$, set $X_i^\sharp := \mathfrak{X}^\sharp \times_{\mathrm{Spf}\,\mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$. We suppose X_0 is regular. Let T be a divisor of X_0 and $\mathfrak{Y}^\sharp$ the open subset of $\mathfrak{X}^\sharp$ complementary to the support of T.

Definition 11.2.1.1 (Overconvergent connections)**.** Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module.

(a) Suppose $\mathfrak{X}$ is affine and endowed with logarithmic coordinates. We say that the induced connection of $\mathcal{E}$ is "overconvergent along T" if the following conditions holds: there exists $n_0 \in \mathbb{N}$, and a $\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{E}_0$ which is coherent as $\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module together with a $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism

$$\varinjlim_{n \geq n_0} \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_0 \xrightarrow{\sim} \mathcal{E}, \tag{11.2.1.1.1}$$

satisfying the following condition: for any $\eta \in |K^\times|_{\mathbb{Q}} \cap]0,1[$, there exist $n_0 \leq n_\eta$ such that for any $n_\lambda \leq n$ and each section $e \in \Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_0)$, we have

$$\| \underline{\partial}_\sharp^{[\underline{k}]} e \| \, \eta^{|\underline{k}|} \to 0 \text{ for } |\underline{k}| \to \infty, \tag{11.2.1.1.2}$$

with $\| \cdot \|$ a Banach norm on $\Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_0)$. Moreover, the isomorphism 11.2.1.1.1 is $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear.

(b) In general, the connection of $\mathcal{E}$ is overconvergent along T if and only if it is overconvergent on any affine open of $\mathfrak{X}^\sharp$ having logarithmic coordinates.

Definition 11.2.1.2. Suppose T is empty. Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-module. We say that induced connection of $\mathcal{E}$ is "convergent" if it is overconvergent along the empty set. We retrieve the convergent condition 11.1.1.1.1. In other word, the connection of $\mathcal{E}$ is convergent if and only if the structure of left $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module extends to a structure of left $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-modules.

11.2.1.3. Suppose that $\mathfrak{S} \to \mathrm{Spf}\,\mathcal{V}$ is smooth, and suppose there exist a smooth $\mathfrak{S}$-formal scheme $\mathfrak{X}$, a relative strict normal crossing divisor $\mathfrak{Z}$ of $\mathfrak{X}$ over $\mathfrak{S}$, such that $\mathfrak{X}^\sharp = (\mathfrak{X}, M_{\mathfrak{Z}})$ is the logarithmic $\mathcal{V}$-formal scheme whose underlying logarithmic structure $M_{\mathfrak{Z}}$ is the one associated with $\mathfrak{Z}$.

We have the morphism of ringed spaces $\mathrm{sp}\colon (\mathfrak{X}_K, j^\dagger \mathcal{O}_{\mathfrak{X}_K}) \to (\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$ induced by the specialization morphism. We get the inverse image functor sp^* by setting $\mathrm{sp}^*(\mathcal{E}) := j^\dagger \mathcal{O}_{\mathfrak{X}_K} \otimes_{\mathrm{sp}^{-1}\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathrm{sp}^{-1}(\mathcal{E})$, for any $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules $\mathcal{E}$. The overconvergent condition 11.2.1.1 corresponds to that of 10.3.2.5. More precisely, the functors sp_* and sp^* induce quasi-inverse equivalences between (locally free) coherent $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-modules together with an overconvergent logarithmic connection relative to $\mathfrak{X}^\sharp_K/\mathfrak{S}_K$ with overconvergent singularities along T and (locally projective) coherent $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules together with an overconvergent logarithmic connection relative to $\mathfrak{X}^\sharp/\mathfrak{S}$ with coefficients in $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$

Notation 11.2.1.4. Let $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ be the category of $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules which are coherent as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module and such that the underlying connection is overconvergent along T. Its objects are called " overconvergent along T log-isocrystal on $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$". When T is empty we remove it in the notation. When $\mathfrak{S}^\sharp = \mathrm{Spf}\,\mathcal{V}$, we also write $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/K)$.

Proposition 11.2.1.5. *Suppose that $\mathfrak{S} \to \operatorname{Spf} \mathcal{V}$ is smooth, and suppose there exist a smooth $\mathfrak{S}$-formal scheme $\mathfrak{X}$, a relative strict normal crossing divisor $\mathfrak{Z}$ of $\mathfrak{X}$ over $\mathfrak{S}$, such that $\mathfrak{X}^\sharp = (\mathfrak{X}, M_{\mathfrak{Z}})$ is the logarithmic $\mathcal{V}$-formal scheme whose underlying logarithmic structure $M_{\mathfrak{Z}}$ is the one associated with $\mathfrak{Z}$.*

(a) The functors sp_* and sp^* (see 11.2.1.3) induce quasi-inverse equivalences of categories between $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}^\sharp_K)$ and $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. Moreover, an object $\mathcal{E}$ of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ is a locally projective $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module if and only if $\mathrm{sp}^*(\mathcal{E})$ is a locally free $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-module.

(b) Suppose $\mathfrak{S} = \operatorname{Spf} \mathcal{V}$ (and the divisor T is empty). The full subcategory of $I_{\mathrm{conv}}(X^\sharp/\operatorname{Spf}\mathcal{V})$ consisting in locally free isocrystals on the log convergent site $((X, M)/\operatorname{Spf}\mathcal{V})_{\mathrm{conv}}$ (see 10.3.1.1) is equivalent to the full subcategory of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp/\mathfrak{S}^\sharp)$ consisting of locally projective $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-modules.

Proof. With notations 10.3.2.5 and 11.2.1.4, the first statement is a rewriting of 11.2.1.3. We get the last part with 10.3.2.6.(a). ☐

Remark 11.2.1.6. Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is locally projective of finite type as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module. It $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ then $\mathcal{E}|\mathfrak{X}^* \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^*, T \cap X^*/\mathfrak{S}^*)$. Beware that contrary to 11.1.1.4 the converse seems false in general.

Proposition 11.2.1.7. *Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module. The following are equivalent:*

(a) $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$;

(b) for $\lambda \in L(\mathbb{N})$ large enough, denoting by $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda^* \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, there exist a $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module $\mathcal{E}^{(0)}$ which is coherent as $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module satisfying the following both conditions:

(i) $\mathcal{E}^{(0)}$ is endowed with a $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism of the form

$$\varinjlim_m \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)} \xrightarrow{\sim} \mathcal{E}, \tag{11.2.1.7.1}$$

(ii) the structure of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module on $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)}$ (uniquely) extends to a structure of topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module so that the homomorphisms

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)} \to \widetilde{\mathcal{B}}^{(m+1)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)} \tag{11.2.1.7.2}$$

are $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-linear.

Proof. 1) Let us check $(a) \to (b)$. Suppose the connection is overconvergent along T. By using 8.4.1.11, there exists $n_{-1} \in \mathbb{N}$, and a coherent $\mathcal{B}^{(n_{-1})}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module $\mathcal{E}_{-1}$ together with an $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism

$$\varinjlim_{n \geq n_{-1}} \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_{-1})}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{-1} \xrightarrow{\sim} \mathcal{E}, \tag{11.2.1.7.3}$$

By using 11.2.1.1.1 (and 8.4.1.11), increasing n_{-1} if necessary, we can suppose that $\mathcal{E}_{-1}$ is endowed with a structure of left $\mathcal{B}^{(n_{-1})}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module inducing its structure of $\mathcal{B}^{(n_{-1})}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module and the isomorphism 11.2.1.7.3 is $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear.

Let $m \in \mathbb{N}$. Following 8.7.1.7, there exists $\eta < 1$, $c \in \mathbb{R}$ such that $|q^{(m)}_k!| \leq c\eta^k$ for all $k \in \mathbb{N}$. By using the condition 11.2.1.1.2, there exist $n_{-1} \leq n_m$ such that for any $n_m \leq n$, for any affine open $\mathfrak{U}^\sharp$ of $\mathfrak{X}^\sharp$ and endowed with logarithmic coordinates, and each section $e \in \Gamma(\mathfrak{U}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_0)$, we have

$$\| \underline{\partial}^{[\underline{k}]}_\sharp e \| \, \eta^{|\underline{k}|} \to 0 \text{ for } |\underline{k}| \to \infty. \tag{11.2.1.7.4}$$

Let $n_m \leq n$. Let $\mathfrak{U}^\sharp$ be an affine open of $\mathfrak{X}^\sharp$ and endowed with logarithmic coordinates. Let $P \in \Gamma(\mathfrak{U}^\sharp, (\mathcal{B}^{(n)}_{\mathfrak{X}}(T)\widehat{\otimes}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_{\mathbb{Q}})$. We can write $P = \sum_{\underline{k}} b_{\underline{k}}\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$, with $b_{\underline{k}} \in \Gamma(\mathfrak{U}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}})$ converging to 0 when $|\underline{k}|$ goes to infinity. Let $e \in \Gamma(\mathfrak{U}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n-1)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{-1})$. We get

$$\| b_{\underline{k}}\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}(e) \| = \| b_{\underline{k}} q^{(m)}_{\underline{k}}!\underline{\partial}_\sharp^{[\underline{k}]}(e) \| \leq c \| b_{\underline{k}} \| \| \underline{\partial}_\sharp^{[\underline{k}]}(e) \| \eta^{|\underline{k}|} \to 0$$

and we can define $P(e)$ as the image in $\Gamma(\mathfrak{U}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n-1)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{-1})$ of the converging sum of the series of general terms $b_{\underline{k}}\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}(e)$. This yields a structure of $\Gamma(\mathfrak{U}^\sharp, (\mathcal{B}^{(n)}_{\mathfrak{X}}(T)\widehat{\otimes}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_{\mathbb{Q}})$-module on $\Gamma(\mathfrak{U}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n-1)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{-1})$. It is clear that this does not depend on the choice of the logarithmic coordinates. Hence, this yields a structure of $(\mathcal{B}^{(n)}_{\mathfrak{X}}(T)\widehat{\otimes}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_{\mathbb{Q}}$-module on $\mathcal{B}^{(n)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n-1)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{-1}$.

We can suppose the sequence (n_m) is increasing. We set $\mathcal{E}^{(m)} := \mathcal{B}^{(n_{m+1})}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n-1)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{-1}$. We get a element $\lambda \in L(\mathbb{N})$ by setting $\lambda(m) = n_{m+1}$. Following 7.5.2.7, $\mathcal{E}^{(m)}$ is endowed with a structure of topologically nilpotent $(\mathcal{B}^{(n_{m+1})}_{\mathfrak{X}}(T)\widehat{\otimes}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_{\mathbb{Q}}$-module and is a coherent $\mathcal{B}^{(n_{m+1})}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module. Hence, we are done.

2) Conversely, suppose conditions 11.2.1.7.1 and 11.2.1.7.2 hold. Let $\mathfrak{U}^\sharp$ be an affine open of $\mathfrak{X}^\sharp$ and endowed with logarithmic coordinates. Take $\eta < 1$. By 8.7.1.7 and with notation 1.2.1.3.1, there exists $m \in \mathbb{N}$ such that $\eta^{|\underline{k}|} < c_{\underline{k}}|q^{(m)}_{\underline{k}}!|$, with $c_{\underline{k}} \to 0$. As $q^{(m)}_{\underline{k}}!\partial^{[\underline{k}]} = \partial^{\langle \underline{k}\rangle_{(m)}}$, it suffices to show that, for any m and any $e \in \Gamma(\mathfrak{U}, \mathcal{E}^{(m)})$, the elements $\partial^{\langle \underline{k}\rangle_{(m)}}(e)$ with $\underline{k} \in \mathbb{N}^d$, form a bounded family in $\Gamma(\mathfrak{U}, \mathcal{E}^{(m)})$ for its natural topology of $\Gamma(\mathfrak{U}, \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}})$-module of finite type. Following 7.5.2.6, the action of $\Gamma(\mathfrak{U}^\sharp, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}})$ on $\Gamma(\mathfrak{U}, \mathcal{E}^{(m)})$ is continuous. Since the elements $\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$ form a bounded family of $\Gamma(\mathfrak{U}^\sharp, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}})$, then we are done. □

Remark 11.2.1.8. Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module. When the connection of $\mathcal{E}$ has an overconvergent along T connection, then the structure of left $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$ of $\mathcal{E}$ extends (uniquely) to a structure of left $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module so that 11.2.1.7.1 is $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear. But, contrary to Proposition 11.1.1.1, this is not clear that if $\mathcal{E}$ is a left $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module then the connection of $\mathcal{E}$ is overconvergent.

Theorem 11.2.1.9. *Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. For $\lambda \in L(\mathbb{N})$ large enough, denoting by $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, let $\mathcal{E}^{(0)}$ be a topologically nilpotent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module, coherent as $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module satisfying both conditions of 11.2.1.7.(b). We get the $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module by setting $\mathcal{E}^{(\bullet)} := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)}$.*

(a) The canonical homomorphism

$$\mathcal{E}^{(m)} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)} \tag{11.2.1.9.1}$$

is an isomorphism.

(b) The sheaf $\mathcal{E}$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module.

(c) The sheaf $\mathcal{E}$ is $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-coherent and the canonical morphism

$$\mathcal{E} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} \tag{11.2.1.9.2}$$

is an isomorphism.

Proof. a) Since $\mathcal{E}^{(m)}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q}$-module, then following 7.5.2.8.2 (resp. 7.5.2.8.1) the above (resp. below) canonical homomorphism

$$\mathcal{E}^{(m)} = \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_\mathbb{Q} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_\mathbb{Q}} \mathcal{E}^{(0)} \to (\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_\mathbb{Q} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q}} \mathcal{E}^{(0)}$$

$$\mathcal{E}^{(m)} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q} \otimes_{(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})_\mathbb{Q}} \mathcal{E}^{(m)}$$

is an isomorphism. This yields 11.2.1.9.1 is an isomorphism.

b) As $\mathcal{E}^{(0)}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q}$-module, coherent on $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_\mathbb{Q}$, then following 7.5.2.8 it is coherent on $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q}$. Let

$$(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q})^s \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q} \to \mathcal{E}^{(0)}$$

be a local presentation of $\mathcal{E}^{(0)}$. Thanks to 11.2.1.9.1, this yields by extension the presentations

$$(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q})^s \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q} \to \mathcal{E}^{(m)}$$

which provide an analogous presentation of $\mathcal{E}$ on $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}$ by passing to the inductive limit.

c) As $\mathcal{E}^{(0)}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_\mathbb{Q}$-module, coherent on $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_\mathbb{Q}$, then following 7.5.2.8 $\mathcal{E}^{(0)}$ is $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T) \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-coherent. Moreover, via 4.3.4.6.1 and 11.2.1.7.1, we obtain

$$\mathcal{D}_\mathfrak{X}({}^\dagger T)_\mathbb{Q} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}^{(0)} \xrightarrow{\sim} \mathcal{E}.$$

The sheaf $\mathcal{E}$ is then $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_\mathbb{Q}$-coherent.

d) Using b) and c), we get that the map 11.2.1.9.2 is a morphism of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}$-modules. Following 11.1.1.6.(c), the morphism 11.2.1.9.2 is an isomorphism apart from T. We conclude via 8.7.6.11. □

Remark 11.2.1.10. Following the theorem 11.2.1.9, a log-isocrystal on $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$ overconvergent along T is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}$-module, coherent as $\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}$-module.

11.2.1.11 (Flatness, locally freeness, projectivity for coherent modules)**.** It follows from 1.4.3.21.(1) that a flat coherent $\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}$-module is therefore a locally projective of finite type $\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}$-module.

For any $x \in \mathfrak{X}$, beware that the sheaf $(\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q})_x$ is not a local ring (even when T is empy). Hence, we cannot apply 1.4.3.21.(2) and this is not clear that a flat coherent $\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}$-module is therefore a locally free of finite type $\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}$-module.

Theorem 11.2.1.12. *Suppose the log structures are trivial. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_\mathbb{Q}$-module. The following conditions are equivalent.*

(a) $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/\mathfrak{S})$ and is locally projective of finite type over $\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}$-module

(b) $\mathcal{E}|\mathfrak{Y}$ is locally projective of finite type over $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$.

Proof. 0) The implication $(a) \Rightarrow (b)$ is obvious.

I) Conversely, suppose $\mathcal{E}|\mathfrak{Y}$ is locally projective of finite type over $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$. For $n \geq m$, we set $\widehat{\mathcal{D}}^{(m,n)}_{\mathfrak{X}/\mathfrak{S}}(T) := \mathcal{B}^{(n)}_{\mathfrak{X}}(T)\widehat{\otimes}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}$, and $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}(T) := \widehat{\mathcal{D}}^{(m,m)}_{\mathfrak{X}/\mathfrak{S}}(T)$. For m_0 large enough, there exists a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{X}/\mathfrak{S}}(T)_\mathbb{Q}$-module $\mathcal{E}^{(m_0)}$ together with a $\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_\mathbb{Q}$-linear isomorphism $\mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_\mathbb{Q} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{X}/\mathfrak{S}}(T)} \mathcal{E}^{(m_0)} \xrightarrow{\sim} \mathcal{E}$ (use 8.4.1.11 and the isomorphism $\varinjlim_m \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}/\mathfrak{S}}(T) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_\mathbb{Q}$). Following 7.4.5.2, there exists a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{X}/\mathfrak{S}}(T)$-module $\mathcal{G}^{(m_0)}$ without p-torsion together with a $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{X}/\mathfrak{S}}(T)_\mathbb{Q}$-linear isomorphism $\mathcal{G}^{(m_0)}_\mathbb{Q} \xrightarrow{\sim} \mathcal{E}^{(m_0)}$. For any $n \geq m \geq m_0$, we put $\mathcal{G}^{(m,n)} := \widehat{\mathcal{D}}^{(m,n)}_{\mathfrak{X}/\mathfrak{S}}(T) \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{X}/\mathfrak{S}}(T)} \mathcal{G}^{(m_0)}/p\text{-torsion}$, $\mathcal{G}^{(m)} := \mathcal{G}^{(m,m)}$. Following 7.4.5.1, $\mathcal{G}^{(m,n)}$ is $\widehat{\mathcal{D}}^{(m,n)}_{\mathfrak{X}/\mathfrak{S}}(T)$-coherent. From 11.1.1.6, we get $\mathcal{G}^{(m,n)}_\mathbb{Q}|\mathfrak{Y} \xrightarrow{\sim} \mathcal{E}|\mathfrak{Y}$. From 11.1.1.11, this yields that $\mathcal{G}^{(m,n)}|\mathfrak{Y}$ is $\mathcal{O}_\mathfrak{Y}$-coherent.

II) Fix $m \geq m_0$. We will now prove that for n large enough $\mathcal{G}^{(m,n)}$ is $\mathcal{B}^{(n)}_{\mathfrak{X}}(T)$-coherent.

1) Since this is local, we can suppose $\mathfrak{X} = \mathrm{Spf}\, A$ is affine, there exist $f \in A$ such that $T = \mathrm{Spec}\, \overline{A}/(\overline{f})$ and local coordinates $t_1, \dots, t_d \in A$ of $\mathfrak{X}/\mathfrak{S}$. Let $\partial_1, \dots, \partial_d$ be the induced derivations. Following 7.5.2.3, we reduce to check that for n large enough, $\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)})$ is a $\Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T))$-module of finite type.

Put $\mathcal{D}^{(m)}_{X/S}(T) := \mathcal{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}(T)/\pi\mathcal{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}}(T)$, $\overline{\mathcal{G}}^{(m)} := \mathcal{G}^{(m)}/\pi\mathcal{G}^{(m)}$, and $\overline{\mathcal{G}}^{(m,n)} := \mathcal{G}^{(m,n)}/\pi\mathcal{G}^{(m,n)}$. Let $\overline{x}_1, \dots, \overline{x}_r \in \Gamma(X, \overline{\mathcal{G}}^{(m_0)})$ which generate $\overline{\mathcal{G}}^{(m_0)}$ as $\mathcal{D}^{(m_0)}_{X/S}(T)$-module.

From Lemma 11.1.1.11, $\overline{\mathcal{G}}^{(m)}|Y$ is a nilpotent $\mathcal{D}^{(m)}_{Y/S}$-module. Hence, there exists $h \in \mathbb{N}$ large enough so that we get in $\Gamma(Y, \overline{\mathcal{G}}^{(m)})$ the relation

$$\forall i = 1, \dots, r, \forall j = 1, \dots, d, \forall l = 1, \dots, m,\ (\partial_j^{[p^l]})^h \cdot \overline{x}_i = 0,$$

where by abuse of notation we still denote by $\overline{x}_i$ (resp. $(\partial_j^{[p^l]})^h$) the image of $\overline{x}_i$ (resp. $(\partial_j^{[p^l]})^h$) via the canonical map $\Gamma(X, \overline{\mathcal{G}}^{(m_0)}) \to \Gamma(Y, \overline{\mathcal{G}}^{(m)})$ (resp. $\Gamma(X, \mathcal{D}^{(m)}_{X/S}) \to \Gamma(Y, \mathcal{D}^{(m)}_{Y/S})$). Hence, for $n_m > m$ large enough, we get in $\Gamma(X, \overline{\mathcal{G}}^{(m)})$ the relation

$$\forall i = 1, \dots, r, \forall j = 1, \dots, d, \forall l = 1, \dots, m,\ \overline{f}^{p^{n_m}} (\partial_j^{[p^l]})^h \cdot \overline{x}_i = 0.$$

Fix such n_m. Since $n_m > m$, then following 1.4.4.1 the section $\overline{f}^{p^{n_m}}$ is in the center of $\Gamma(X, \mathcal{D}^{(m)}_{X/S})$. Let $P = \prod_{j=1}^d \prod_{l=1}^m (\partial_j^{[p^l]})^{h_{jl}} \in \Gamma(X, \mathcal{D}^{(m)}_{X/S})$ where $h_{jl} \in \mathbb{N}$. Since $\overline{f}^{p^{n_m}}$ is in the center of $\Gamma(X, \mathcal{D}^{(m)}_{X/S})$, if there exist j_0 and l_0 such that $h_{j_0 l_0} \geq h$, then we have in $\Gamma(X, \overline{\mathcal{G}}^{(m)})$ the relation $\overline{f}^{p^{n_m}} P \cdot \overline{x}_i = 0$, for any i.

2) Let $x_1, \dots, x_r \in \Gamma(\mathfrak{X}, \mathcal{G}^{(m_0)})$ be some sections lifting respectively $\overline{x}_1, \dots, \overline{x}_r$.

i) Let $P = \prod_{j=1}^d \prod_{l=1}^m (\partial_j^{[p^l]})^{h_{jl}} \in \Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$ where $h_{jl} \in \mathbb{N}$ are such that there exist j_0 and l_0 satisfying $h_{j_0 l_0} \geq h$. Then, we get in $\Gamma(\mathfrak{X}, \mathcal{G}^{(m)})$ the relation

$$\forall i = 1, \dots, r,\ f^{p^{n_m}} P \cdot x_i \in p\Gamma(\mathfrak{X}, \mathcal{G}^{(m)}),$$

where by abuse of notation we still denote by x_i the image of x_i via the canonical map $\Gamma(\mathfrak{X}, \mathcal{G}^{(m_0)}) \to \Gamma(\mathfrak{X}, \mathcal{G}^{(m)})$. Let $T_{n_m-1} \in \mathcal{B}^{(n_m-1)}_{\mathfrak{X}}(T)$ be the element such that $f^{p^{n_m}} T_{n_m-1} = p$. Since the $\mathcal{B}^{(n_m-1)}_{\mathfrak{X}}(T)$-module $\mathcal{G}^{(m,n_m-1)}$ is π-torsion free then it is f-torsion free. Hence, for such P, we get in $\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n_m-1)})$:

$$\forall i = 1, \dots, r,\ P \cdot x_i \in T_{n_m-1}\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n_m-1)}). \tag{11.2.1.12.1}$$

ii) Let $y_1, \dots, y_s$ be the elements of the form $\left(\prod_{j=1}^d \prod_{l=1}^m (\partial_j^{[p^l]})^{h_{jl}}\right) \cdot x_i$ where $h_{jl} \in \{0, \dots, h-1\}$ for any j and l (beware that these elements and their number depend on m but remark that $y_1, \dots, y_s \in \Gamma(\mathfrak{X}, \mathcal{E}^{(m_0)})$). Following 1.4.2.10, $\Gamma(\mathfrak{X}, \mathcal{D}^{(m)}_{\mathfrak{X}/\mathfrak{S}})$ is generated as $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$-module (for its left or right structure) by the elements of the form $\prod_{j=1}^d \prod_{l=1}^m (\partial_j^{[p^l]})^{h_{jl}}$, where $h_{jl} \in \mathbb{N}$. Since $\overline{x}_1, \dots, \overline{x}_r$ generate $\overline{\mathcal{G}}^{(m_0)}$ as $\mathcal{D}^{(m_0)}_{X/S}(T)$-module, then for any $n \geq n_m - 1$, $\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)})$ is generated as $\Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T))$-module by $p\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)})$ and by the elements of the form $\left(\prod_{j=1}^d \prod_{l=1}^m (\partial_j^{[p^l]})^{h_{jl}}\right) \cdot x_i$ where $h_{jl} \in \mathbb{N}$. Since T_{n_m-1} divides p, since $\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)})$ has no p-torsion, then by using 11.2.1.12.1 we get

$$\forall n \geq n_m - 1,\ \Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)}) = \sum_{i=1}^s \Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)) \cdot y_i + T_{n_m-1}\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)}).$$

By iteration, this yields

$$\forall n \geq n_m - 1,\ \Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)}) = \sum_{i=1}^s \Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)) \cdot y_i + T^p_{n_m-1}\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)}).$$

For any $n \geq n_m$, we have $T^p_{n_m-1} = p^{p-1} T_{n_m}$. We get,

$$\forall n \geq n_m,\ \Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)}) = \sum_{i=1}^s \Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T)) \cdot y_i + p\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)}).$$

Since $\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)})$ is p-adically separated and complete, this yields that $\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n)})$ is generated as $\Gamma(\mathfrak{X}, \mathcal{B}^{(n)}_{\mathfrak{X}}(T))$-module by $y_1, \ldots, y_s$.

III) We can suppose that the sequence $(n_m)_m$ is increasing. Set $\mathcal{E}_m := \mathcal{G}^{(m,n_m)}_{\mathbb{Q}}$. Following II.2), the $\widehat{\mathcal{D}}^{(m,n_m)}_{\mathfrak{X}/\mathfrak{S}}(T)_{\mathbb{Q}}$-module $\mathcal{E}_m$ is $\mathcal{B}^{(n_m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-coherent. Since $\mathcal{E}_{m_0}|\mathfrak{Y} \xrightarrow{\sim} \mathcal{E}_m|\mathfrak{Y}$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{Y}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$-module which is locally projective of finite type over $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$, then, with the remark 8.7.6.9, increasing m_0 is necessary, $\mathcal{E}_{m_0}$ is a projective $\mathcal{B}^{(n_{m_0})}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module of finite type.

Following 11.2.1.7, it is sufficient to check that the canonical homomorphism

$$\mathcal{B}^{(n_m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{m_0} \to \mathcal{E}_m$$

is an isomorphism for any $m \geq m_0$. Fix $m \geq m_0$ and set $B_m := \Gamma(\mathfrak{X}, \mathcal{B}^{(n_m)}_{\mathfrak{X}}(T)_{\mathbb{Q}})$, $E_m := \Gamma(\mathfrak{X}, \mathcal{E}_m)$, $E_{m_0,m} := \Gamma(\mathfrak{X}, \mathcal{B}^{(n_m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}_{m_0})$. We get the morphism $E_{m_0,m} \to E_m$ of B_m-modules of finite type. We end the proof by check this morphism $E_{m_0,m} \to E_m$ is an isomorphism:

Following the part II.2) and its notations, $\Gamma(\mathfrak{X}, \mathcal{G}^{(m,n_m)})$ is generated as $\Gamma(\mathfrak{X}, \mathcal{B}^{(n_m)}_{\mathfrak{X}}(T))$-module by $y_1, \ldots, y_s$. We remark that $y_1, \ldots, y_s \in E_{m_0}$. Hence, the morphism $E_{m_0,m} \to E_m$ is surjective. After applying $\Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}}) \otimes_{B_m} -$ to the morphism $E_{m_0,m} \to E_m$, we get an isomorphism. Since $E_{m_0,m}$ is a projective B_m-module of finite type and since $B_m \to \Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$ is injective, we get the injectivity of $E_{m_0,m} \to E_m$. We are done. □

Corollary 11.2.1.13. *Suppose the log structures are trivial. Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-module which is locally projective of finite type as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module. The following conditions are equivalent:*

(a) The structure of left $\mathcal{D}_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-module of $\mathcal{E}$ extends to a structure of coherent left $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-modules ;

(b) $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/\mathfrak{S})$.

Proof. The implication $(b) \Rightarrow (a)$ is 11.2.1.9. Conversely, suppose (a) holds. By using 11.2.1.12, since $\mathcal{E}$ is locally projective of finite type as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module, then we reduce to check $\mathcal{E}|\mathfrak{Y} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathfrak{S})$, i.e. we can suppose first to the case where the divisor is empty. In this case, this is 11.1.1.1. □

Proposition 11.2.1.14. *Suppose the log structures are trivial and $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$. Let $\mathcal{E}$ be a left $\mathcal{D}_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module.*

(a) The object $\mathcal{E}$ is a locally projective $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module of finite type.

(b) If $\mathfrak{X}$ is affine, then $\Gamma(\mathfrak{X}, \mathcal{E})$ is a projective $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$-module of finite type.

(c) We have $\mathcal{E} = 0$ if and only if there exists a dense open subset $\mathfrak{U}$ of $\mathfrak{X}$ such that $\mathcal{E}|\mathfrak{U} = 0$.

(d) The category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/\mathcal{V})$ is equal to the full category of that of coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-modules consisting of objects which are coherent as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module.

(e) Set $\mathfrak{Y} := \mathfrak{X} \setminus T$. Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-module. We have $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/\mathcal{V})$ if and only if $\mathcal{E}|\mathfrak{Y} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathcal{V})$.

Proof. a) and b) By using 10.2.2.7 and 11.2.1.3, we get (a). More precisely, this is a consequence of (b) which is checked as follows. Suppose $\mathfrak{X}$ and $\mathfrak{Y}$ affine. Since $\mathfrak{Y}_K$ is affinoid, since $\mathrm{sp}^*(\mathcal{E})$ is a locally free $\mathcal{O}_{\mathfrak{Y}_K}$-module of finite type (see 10.2.2.7), then $\Gamma(\mathfrak{Y}, \mathcal{E}) = \Gamma(\mathfrak{Y}_K, \mathrm{sp}^*(\mathcal{E}))$ is a projective $\Gamma(\mathfrak{Y}_K, \mathcal{O}_{\mathfrak{Y}_K}) = \Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$-module of finite type. Using theorem of type A concerning coherent $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules, $\Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \otimes_{\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})} \Gamma(\mathfrak{X}, \mathcal{E}) \to \Gamma(\mathfrak{Y}, \mathcal{E})$ is an isomorphism. Since $\Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) = \Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$, since $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \to \Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$ is faithfully flat (this is checked in the proof of 8.7.6.8), then this implies that $\Gamma(\mathfrak{X}, \mathcal{E})$ is a projective $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$-module of finite type.

c) Since the third part is local on $\mathfrak{X}$, we can suppose $\mathfrak{X}$ is affine and that $\mathcal{E}$ is a direct summand (in the category of coherent $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules) of a free $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module $\mathcal{L}$ of finite type. Suppose $\mathcal{E}|\mathfrak{U} = 0$. Replacing $\mathfrak{U}$ by a smaller open subset, we reduce to the case where $\mathfrak{U}$ is a principal open subset (i.e. given by a global section of $\mathfrak{X}$). Since $\Gamma(\mathfrak{X}, \mathcal{L}) \to \Gamma(\mathfrak{U}, \mathcal{L})$ is injective, we get $\Gamma(\mathfrak{X}, \mathcal{E}) = 0$. Using theorem of type A, this yields that $\mathcal{E} = 0$. The converse is obvious.

d) This is a consequence of 11.2.1.13 and of (a).

e) The last statement follows from a) and d) and from 11.2.1.12. □

11.2.2 $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$

We keep notation 11.2.1.

Notation 11.2.2.1. We denote by $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$ consisting of objects $\mathcal{E}^{(\bullet)}$ such that $\underrightarrow{l}^*_{\mathbb{Q}}\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ (see notation 11.2.1.4). Since the functor $\underrightarrow{l}^*_{\mathbb{Q}}\colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^{(\bullet)}) \to \mathrm{Coh}(\mathcal{D}^\dagger_{\mathbb{Q}})$ is an equivalence of category (e.g. see 8.4.5.9), then we get the equivalence of categories

$$\underrightarrow{l}^*_{\mathbb{Q}}\colon \mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp) \cong \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp). \qquad (11.2.2.1.1)$$

Proposition 11.2.2.2. *Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. For $\lambda \in L(\mathbb{N})$ large enough, denoting by $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, let $\mathcal{E}^{(0)}$ be a topologically nilpotent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module, coherent as $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module satisfying both conditions of 11.2.1.7.(b). We get a $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module by setting $\mathcal{E}^{(\bullet)} := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)}$.*

1. *There exists $\mathcal{F}^{(0)}$ a $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$-module, coherent over $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)$ together with an isomorphism of $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-modules of the form $\mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(0)}$.*
2. *Let $\mathcal{F}^{(m)} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}^{(0)}$, let $\mathcal{G}^{(m)} := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}^{(0)}$ and let $\mathcal{H}^{(m)}$ be the quotient of $\mathcal{F}^{(m)}$ by its p-torsion part for any $m \in \mathbb{N}$. The following conditions hold.*
   - (a) *We have the isomorphisms $\mathcal{G}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{H}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(m)}$ of topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-modules.*
   - (b) *The module $\mathcal{H}^{(m)}$ is $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$-coherent for any integer m.*
   - (c) *The canonical morphism $\mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ is an ind-isogeny of $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$. The canonical morphism $\mathcal{G}^{(\bullet)} \to \mathcal{H}^{(\bullet)}$ is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$.*
   - (d) *We have $\mathcal{G}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ and the $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism $\underrightarrow{l}^*_{\mathbb{Q}}\,\mathcal{G}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}$.*
   - (e) *The canonical morphism*
     $$\mathcal{G}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} \mathcal{G}^{(\bullet)} \qquad (11.2.2.2.1)$$
     is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$.
   - (f) *We have $\mathcal{F}^{(0)} \in D^{\mathrm{b}}_{\mathrm{perf}}((\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)))$ and the canonical morphism*
     $$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}^{(0)} \to \mathcal{G}^{(\bullet)} \qquad (11.2.2.2.2)$$
     is an isomorphism of $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$. In particular, $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$ (see notation 8.6.1.4)

Proof. 1) The existence of $\mathcal{F}^{(0)}$ follows from 7.5.2.8.(a).

2)a) Since the canonical morphisms $\mathcal{G}^{(m)}_{\mathbb{Q}} \to \mathcal{H}^{(m)}_{\mathbb{Q}} \to \mathcal{E}^{(m)}$ are isomorphisms (use 11.2.1.9.1 for the second isomorphism), since $\mathcal{E}^{(m)}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module then we get the assertion.

b) Using 7.5.2.9, the part 2.a) of the proof implies that $\mathcal{H}^{(m)}$ is $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$-coherent for any integer m.

c) Since the canonical epimorphism $\mathcal{G}^{(m)} \to \mathcal{H}^{(m)}$ of coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$-modules is an isomorphism after tensoring by $\mathbb{Q}$, then $\mathcal{G}^{(\bullet)} \to \mathcal{H}^{(\bullet)}$ is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$ (use 8.4.2.8).

Since the canonical morphism $\mathcal{F}^{(m)} \to \mathcal{H}^{(m)}$ of coherent $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$-modules is an isomorphism after tensoring by $\mathbb{Q}$ (this follows from 11.2.1.9.1), then the canonical morphism $\mathcal{F}^{(\bullet)} \to \mathcal{H}^{(\bullet)}$ is an ind-isogeny of $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$ (use 8.4.2.8). Hence so is $\mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$.

d) It follows from c) that the canonical morphisms $\mathcal{F}^{(\bullet)}_{\mathbb{Q}} \to \mathcal{G}^{(\bullet)}_{\mathbb{Q}} \to \mathcal{H}^{(\bullet)}_{\mathbb{Q}} \to \mathcal{E}^{(\bullet)}$ are isomorphisms. Hence, $\mathcal{G}^{(\bullet)}_{\mathbb{Q}}$ satisfies both conditions of 11.2.1.7.(b) and is endowed with a $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-linear isomorphism $\underrightarrow{l}^{*}_{\mathbb{Q}}\, \mathcal{G}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}$.

e) By using the part b) and 7.5.2.8.(b), we get that the canonical morphism

$$\mathcal{H}^{(\bullet)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T) \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}} \mathcal{H}^{(\bullet)} \tag{11.2.2.2.3}$$

is an isomorphism of $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)$-modules. We conclude with c).

f) It follows from 4.7.3.7 that $\mathcal{F}^{(0)} \in D^{\mathrm{b}}_{\mathrm{perf}}((\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)))$. By flatness of $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)_{\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)_{\mathbb{Q}}$, the morphism 11.2.2.2.2 of $D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$ becomes an isomorphism in $D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)_{\mathbb{Q}})$. Hence, by using 8.4.2.9 we get that the morphism 11.2.2.2.2 becomes an isomorphism in $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$. Since the left term of 11.2.2.2.2 is an object of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$, then so is $\mathcal{G}^{(\bullet)}$.

□

Corollary 11.2.2.3. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$. The following conditions are equivalent:*

(a) The object $\mathcal{E}^{(\bullet)}$ belongs to $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^{\sharp}, T/\mathfrak{S}^{\sharp})$.

(b) For $\lambda \in L(\mathbb{N})$ large enough, denoting by $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda^{*}\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$, there exist $\mathcal{F}^{(0)}$ a p-torsion free $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)$-module, coherent over $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)$ such that

(i) $\mathcal{F}^{(\bullet)} := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)} \mathcal{F}^{(0)}$ is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$ to $\mathcal{E}^{(\bullet)}$

(ii) the canonical morphism

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}^{(0)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)} \mathcal{F}^{(0)}$$

is an ind-isogeny in $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$,

(iii) $\mathcal{F}^{(m)}_{\mathbb{Q}}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)_{\mathbb{Q}}$-module for any m.

Proof. The implication $(a) \Rightarrow (b)$ follows from 11.2.2.2. Conversely, if such $\lambda \in L(\mathbb{N})$ and $\mathcal{F}^{(0)}$ exist, then using properties (ii) and (iii) we can check that $\mathcal{F}^{(\bullet)}_{\mathbb{Q}}$ satisfies both conditions of 11.2.1.7.(b). Hence, it follows from 11.2.1.7 that $\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{F}^{(\bullet)} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^{\sharp}, T/\mathfrak{S}^{\sharp})$. The property (i) implies that $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$ and $\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{F}^{(\bullet)} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^{\sharp}, T/\mathfrak{S}^{\sharp})$. Hence $\mathcal{E}^{(\bullet)}$ belongs to $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^{\sharp}, T/\mathfrak{S}^{\sharp})$.

□

11.2.2.4. Let $\lambda \in L(\mathbb{N})$, $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda^{*}\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}$, $\mathcal{F}^{(0)}$ be a p-torsion free $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)$-module, coherent over $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)$ such that the canonical morphism

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}^{(0)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)} \mathcal{F}^{(0)} = \mathcal{F}^{(\bullet)}$$

is an ind-isogeny in $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$.

It follows from 8.4.2.1 that $\mathcal{F}^{(\bullet)}$ is a $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)$-module having global finite presentation. It follows from 8.4.2.5 that $\mathcal{F}^{(\bullet)}$ is a $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)$-module having global finite presentation *up to an ind-isogeny*. In particular $\mathcal{F}^{(\bullet)}$ is an object of $\underrightarrow{M}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)) \cap \underrightarrow{M}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$

11.2.2.5. Let us denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}^{\sharp}}(T))$, the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$ of complexes whose image by the forgetful functor $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}^{\sharp}}(T))$ is in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}^{\sharp}}(T))$. By replacing "$\underrightarrow{LD}^{\mathrm{b}}$" by "$\underrightarrow{LM}$", we define similarly $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)) \cap \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}^{\sharp}}(T))$.

Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. With 8.4.3.2, 8.4.3.3 and 11.2.2.2, we get from 11.2.2.4 that $\mathcal{E}^{(\bullet)}$ is coherent up to a lim-ind-isogeny both as $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$-module and as $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$-module, i.e. we have the fully faithful functor (the identity on the objects):

$$\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp) \subset \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)) \cap \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}^\sharp}(T)). \tag{11.2.2.5.1}$$

When log structures are trivial and $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$, it follows from 11.2.1.14.(d) that the functor 11.2.2.5.1 is essentially surjective, i.e. that we have the equality:

$$\mathrm{MIC}^{(\bullet)}(\mathfrak{X}, T/K) = \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathcal{V}}(T)) \cap \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)). \tag{11.2.2.5.2}$$

11.2.3 Stability by inverse images of isocrystals

We keep notation 9.2.1 except concerning the divisors which are denoted here respectively by T and T' (instead of Z and Z'). In particular, we fix $\lambda_0 \in L(\mathbb{N})$ and we set $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda_0^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ and $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ etc.

11.2.3.1. Let $\mathcal{E}^{(\bullet)} \in M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$. With similar to 9.2.1.8.1 notation (with locally projective isocrystals, we prefer to work with $\widetilde{f}^*$ instead of $\widetilde{f}^!$), we get the functor $\widetilde{f}^{*(\bullet)}_{\mathrm{alg}} \colon M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)) \to M(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp})$ by setting $\widetilde{f}^{(\bullet)!}_{\mathrm{alg}}(\mathcal{E}^{(\bullet)}) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T', T) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}} f^{-1}\mathcal{F}^{(\bullet)}$. By left deriving the functor $\widetilde{f}^{*(\bullet)}_{\mathrm{alg}}$, this yields the functor $\mathbb{L}\widetilde{f}^{*(\bullet)}_{\mathrm{alg}} \colon D^-(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)) \to D^-(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T'))$, defined by setting $\mathbb{L}\widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T', T) \otimes^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} f^{-1}\mathcal{F}^{(\bullet)}$ for any $\mathcal{F}^{(\bullet)} \in D^-(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$. Since it preserves lim-ind-isogenies, this induces the functor $\mathbb{L}\widetilde{f}^{*(\bullet)}_{\mathrm{alg}} \colon \underrightarrow{LD}^-_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)) \to \underrightarrow{LD}^-_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T'))$.

Following notation 9.2.1.15.3, we set $\mathbb{L}\widetilde{f}^{*(\bullet)}(\mathcal{F}^{(\bullet)}) := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T', T)\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} f^{-1}\mathcal{F}^{(\bullet)}$, for any $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$. We get the morphism $\mathbb{L}\widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to \mathbb{L}\widetilde{f}^{*(\bullet)}(\mathcal{F}^{(\bullet)})$ (beware the notation is slightly misleading since $\mathbb{L}\widetilde{f}^{*(\bullet)}$ is not necessarily the left derived functor of a functor).

Lemma 11.2.3.2. *Let $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$. Then, the canonical morphism*

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T') \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} f^{-1}\mathcal{G}^{(\bullet)} \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T')\widehat{\otimes}^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} f^{-1}\mathcal{G}^{(\bullet)}$$

is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T'))$.

Proof. This is checked similarly to Lemma 9.2.1.17. □

Proposition 11.2.3.3. *We have the following assertions.*

(a) Let $\mathcal{F}$ be a $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$-module, coherent over $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$. Then the morphism

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)} f^{-1}\mathcal{F} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T', T) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} f^{-1}\mathcal{F}$$

is an isomorphism. In particular, the inverse image $\widetilde{f}^{(m)*}_{\mathrm{alg}}(\mathcal{F}) := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T', T) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} f^{-1}\mathcal{F}$ is a (coherent) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')$-module, coherent over $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')$.

(b) Let $\mathcal{F}$ be a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module, coherent over $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$. Then the morphism

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} f^{-1}\mathcal{F} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T', T)_{\mathbb{Q}} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}} f^{-1}\mathcal{F}$$

is an isomorphism. The inverse image $\widetilde{f}^{(m)*}_{\mathrm{alg}}(\mathcal{F}) := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T', T)_{\mathbb{Q}} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}} f^{-1}\mathcal{F}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')_{\mathbb{Q}}$-module, coherent over $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}$.

Proof. Let us check the second statement. It follows from 7.5.2.8.(a) that there exists a p-torsion free $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$-module $\mathring{\mathcal{F}}$, coherent over $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$ together with an $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{F}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{F}$. Then the canonical morphisms

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T') \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)} f^{-1}\mathring{\mathcal{F}} \to \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')\widehat{\otimes}_{f^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)} f^{-1}\mathring{\mathcal{F}} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T',T)\widehat{\otimes}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} f^{-1}\mathring{\mathcal{F}}$$
$$\leftarrow \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T',T) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} f^{-1}\mathring{\mathcal{F}}$$

are isomorphisms. Indeed, since $\mathring{\mathcal{F}}$ is both $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$-coherent and $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$ -coherent, the first and the last morphisms are isomorphisms. Since the modulo π^{n+1} reduction of the middle morphism is an isomorphism for any $n \in \mathbb{N}$ (see 5.1.1.6), since this is a morphism of separated complete modules for the p-adic topology, this implies that the middle morphism is an isomorphism. It follows from 4.4.2.10 that the modulo π^{n+1} reduction of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T',T)\widehat{\otimes}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} f^{-1}\mathring{\mathcal{F}}$ is nilpotent module for any n. Hence, tensoring with $\mathbb{Q}$, we get that $\widetilde{f}^{(m)*}_{\mathrm{alg}}(\mathcal{F})$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')_{\mathbb{Q}}$-module.

We proceed similarly (without taking care of topological nilpotence) for the first statement. □

Proposition 11.2.3.4. *Let $\mathcal{F}^{(0)}$ be a $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$-module, coherent over $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)$ such that the canonical morphism*

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}^{(0)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}^{(0)} =: \mathcal{F}^{(\bullet)} \tag{11.2.3.4.1}$$

is an ind-isogeny in $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$ and such that $\mathcal{F}^{(m)}_{\mathbb{Q}}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module for any m.

(a) The canonical morphism $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}}\mathcal{F}^{(0)} \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)})$ is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T'))$.

(b) The canonical morphism

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T') \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}}\mathcal{F}^{(0)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}}\mathcal{F}^{(0)} \tag{11.2.3.4.2}$$

is an ind-isogeny of $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T'))$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}}\mathcal{F}^{(0)}$ is a topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')_{\mathbb{Q}}$-module for any m. In particular, $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}}\mathcal{F}^{(0)}$ belongs to $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}'^\sharp, T'/\mathfrak{S}'^\sharp)$.

(c) The canonical morphism $\mathbb{L}\widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to \mathbb{L}\widetilde{f}^{*(\bullet)}(\mathcal{F}^{(\bullet)})$ is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T'))$.

(d) If $\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})$ is flat as $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module, then the canonical morphism $\mathbb{L}\widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)})$ is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp}(T'))$.

Proof. 1) Since the canonical morphism $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}} = \mathcal{F}^{(m)}_{\mathbb{Q}}$ is an isomorphism, then the coherent $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}}$ is canonically endowed with a structure of topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module (extending its structure of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module). This yields the isomorphisms

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}}\mathcal{F}^{(0)}_{\mathbb{Q}} \underset{11.2.3.3}{\xleftarrow{\sim}} \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \left(\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} f^{-1}\mathcal{F}^{(0)}_{\mathbb{Q}}\right)$$
$$\xrightarrow{\sim} \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} f^{-1}\left(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}}\right)$$
$$\underset{11.2.3.3}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp\to\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T',T)_{\mathbb{Q}} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}} f^{-1}\left(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}}\right)$$
$$= f^{(m)*}_{\mathrm{alg}}\left(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}}\right) \overset{11.2.3.4.1}{\xrightarrow{\sim}} f^{(m)*}_{\mathrm{alg}}(\mathcal{F}^{(m)}_{\mathbb{Q}}). \tag{11.2.3.4.3}$$

Hence, with 11.2.3.3, $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}}$ is therefore canonically endowed with a structure of topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')_{\mathbb{Q}}$-module and is also $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}$-coherent (for the induced structure of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module). This yields the isomorphisms:

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow[7.5.2.8.2]{\sim} (\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T') \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}'}} \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T))_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}}$$

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \xrightarrow[7.5.2.8.1]{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T') \otimes_{(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T') \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}'}} \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T))_{\mathbb{Q}}} \left(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \right).$$

Hence, the canonical map

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \tag{11.2.3.4.4}$$

is an isomorphism. With 11.2.3.4.3 and 11.2.3.4.5 we get that the canonical map

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \to f^{(m)*}_{\mathrm{alg}}(\mathcal{F}^{(m)}_{\mathbb{Q}}) \tag{11.2.3.4.5}$$

is an isomorphism.

2) For any $m \in \mathbb{N}$, let $\mathcal{G}^{(m)}$ be the quotient of $\mathcal{F}^{(m)}$ by its p-torsion part. i) Let us prove the part (a). Since $\mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T))$, then $\widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{F}^{(\bullet)}) \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)})$ is an isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T'))$. Hence, to prove the part (a) we reduce to check that the canonical morphism

$$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)} \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)}) \tag{11.2.3.4.6}$$

is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T'))$. It follows from 11.2.3.3 that $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}$ is therefore a coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')$-module. Using 7.5.2.8, $\mathcal{G}^{(m)}$ is a (coherent) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}(T)$-module, coherent over $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$. Hence, with 11.2.3.3 $\widetilde{f}^{(m)*}_{\mathrm{alg}} \mathcal{G}^{(m)}$ is a (coherent) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')$-module, coherent over $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')$. We get the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)} \to \widetilde{f}^{(m)*}_{\mathrm{alg}} \mathcal{G}^{(m)}$ of coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')$-modules. Hence, by using 8.4.2.8, to check that $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T') \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)} \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)})$ is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T'))$, we reduce to check that $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp}}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)}_{\mathbb{Q}})$ is an isomorphism, which is a consequence of the isomorphism 11.2.3.4.5.

ii) To check that 11.2.3.4.2 is an ind-isogeny, we reduce to check that its composition with the ind-isogeny 11.2.3.4.6

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T') \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)} \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)}) \tag{11.2.3.4.7}$$

is an ind-isogeny. Since $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T') \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}$ and $\widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)})$ are both $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}'}(T')$-coherent, by using 8.4.2.8 we reduce to prove that $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T')_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}'}(T')_{\mathbb{Q}}} \widetilde{f}^{(0)*}_{\mathrm{alg}} \mathcal{F}^{(0)}_{\mathbb{Q}} \to \widetilde{f}^{*(\bullet)}_{\mathrm{alg}}(\mathcal{G}^{(\bullet)}_{\mathbb{Q}})$ is an isomorphism, which follows from 11.2.3.4.3.

3) The part c) follows from 9.2.1.17 and the coherence of $\mathcal{F}^{(\bullet)}$.

4) It remains to check that the canonical morphism $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T') \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} f^{-1}\mathcal{F}^{(\bullet)} \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}'}(T') \otimes_{f^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} f^{-1}\mathcal{F}^{(\bullet)}$ is an isomorphism under the flatness assumption. Since this is a morphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}'}(T'))$, we reduce to check it after applying the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$, which is a consequence of the flatness as $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$-module. □

Corollary 11.2.3.5. *We have the following properties.*

(a) Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^{\sharp}, T/\mathfrak{S}^{\sharp})$. *The canonical morphism*

$$\mathcal{O}_{\mathfrak{X}'}({}^{\dagger}T')_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{O}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}} f^{-1}\mathcal{E} \to \mathcal{D}^{\dagger}_{\mathfrak{X}'^{\sharp}/\mathfrak{S}'^{\sharp} \to \mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}T', T)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}} f^{-1}\mathcal{E}$$

is an isomorphism. We have $\widetilde{f}^*(\mathcal{E}) := \mathcal{D}^\dagger_{\mathfrak{X}'^\sharp/\mathfrak{S}'^\sharp \to \mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T', T)_{\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}} f^{-1}\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}'^\sharp, T'/\mathfrak{S}'^\sharp)$, *which induces the functor* $\widetilde{f}^* \colon \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp) \to \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}'^\sharp, T'/\mathfrak{S}'^\sharp)$.

(b) Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. *We have the isomorphism*

$$\underrightarrow{l}^*_{\mathbb{Q}} \circ \mathbb{L}\widetilde{f}^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{L}\widetilde{f}^* \circ \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}).$$

(c) Suppose log structures are trivial and $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$. *The functor* $\mathbb{L}\widetilde{f}^{*(\bullet)}$ *factors through*

$$\mathbb{L}\widetilde{f}^{*(\bullet)} \colon \mathrm{MIC}^{(\bullet)}(\mathfrak{X}, T/\mathfrak{S}) \to \mathrm{MIC}^{(\bullet)}(\mathfrak{X}', T'/\mathfrak{S}). \tag{11.2.3.5.1}$$

Proof. We can suppose that $\mathcal{E}^{(\bullet)}$ satisfies the hypotheses of 11.2.2.3.(b). Hence, the part (a) and (b) are a corollary of 11.2.3.4. The part (c) is a consequence of 11.2.1.14 and 11.2.3.4. □

11.2.4 Stability by tensor product of isocrystals

We keep notation 11.2.1.

Proposition 11.2.4.1. *Let* $\mathcal{E}, \mathcal{E}' \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. *For* $\lambda \in L(\mathbb{N})$ *large enough, denoting by* $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda^*\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ *and* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, *let* $\mathcal{E}^{(0)}$, $\mathcal{E}'^{(0)}$ *be tow topologically nilpotent* $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-*module, coherent as* $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-*module satisfying both conditions of 11.2.1.7.(b) for respectively* $\mathcal{E}$ *and* $\mathcal{E}'$. *We get the* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-*module by setting* $\mathcal{E}^{(\bullet)} := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)}$, $\mathcal{E}'^{(\bullet)} := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}'^{(0)}$.

(a) $\mathcal{E} \otimes_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}' \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$

(b) $\mathcal{E}^{(\bullet)} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}'^{(\bullet)}$ *both conditions of 11.2.1.7.(b) for* $\mathcal{E} \otimes_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}'$.

and similarly for $\mathcal{F}'^{(0)}$, *is an ind-isogeny in* $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$ *and such that* $\mathcal{F}^{(m)}_{\mathbb{Q}}$ *and* $\mathcal{F}'^{(m)}_{\mathbb{Q}}$ *are topologically nilpotent* $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-*modules for any* m. *Set* $\mathcal{F}''^{(0)} := \mathcal{F}^{(0)} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}'^{(0)}$, $\mathcal{F}''^{(\bullet)} := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}''^{(0)}$.

(a) $\mathcal{F}''^{(m)}_{\mathbb{Q}}$ *are topologically nilpotent* $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-*modules for any* m.

(b) The canonical morphism

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}''^{(0)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}''^{(0)} = \mathcal{F}''^{(\bullet)} \tag{11.2.4.2.1}$$

is an ind-isogeny of $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$.

(c) $\mathcal{F}''^{(\bullet)}$ *belongs to* $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$.

(d) The canonical morphism

$$\mathcal{F}^{(\bullet)} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{F}'^{(\bullet)} \to \mathcal{F}^{(\bullet)}\widehat{\otimes}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)}\mathcal{F}'^{(\bullet)}. \tag{11.2.4.2.2}$$

is an ind-isogeny of $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$.

(e) *The canonical morphism*

$$\mathcal{F}''^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}''^{(0)} \to \mathcal{F}^{(\bullet)} \widehat{\otimes}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{F}'^{(\bullet)} \tag{11.2.4.2.3}$$

is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$*. In particular,* $\mathcal{F}^{(\bullet)} \widehat{\otimes}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{F}'^{(\bullet)}$ *belongs to* $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$.

Proof. a) We have the isomorphism

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} (\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}^{(0)}_{\mathbb{Q}}) \otimes_{\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} (\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}'^{(0)}_{\mathbb{Q}})$$

By using 7.5.2.10, this yields that $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}}$ is therefore canonically endowed with a structure of topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module and is also $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-coherent (for the induced structure of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module). Hence, we get the isomorphisms:

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}} \underset{7.5.2.8.2}{\xrightarrow{\sim}} (\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}}$$

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}} \underset{7.5.2.8.1}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))_{\mathbb{Q}}} \left(\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}}\right).$$

This implies that the canonical map

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}} \mathcal{F}''^{(0)}_{\mathbb{Q}} \tag{11.2.4.2.4}$$

is an isomorphism.

b) Set $\mathcal{E}''^{(\bullet)} := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}''^{(0)}$. For any $m \in \mathbb{N}$, let $\mathcal{G}''^{(m)}$ be the quotient of $\mathcal{F}''^{(m)}$ by its p-torsion part. Since $\mathcal{F}''^{(\bullet)} \to \mathcal{G}''^{(\bullet)}$ is an ind-isogeny, to check that $\mathcal{E}''^{(\bullet)} \to \mathcal{F}''^{(\bullet)}$ is an ind-isogeny we reduce to prove that so is the composition $\mathcal{E}''^{(\bullet)} \to \mathcal{G}''^{(\bullet)}$.

Using 7.5.2.8, the part 1) of the proof implies that $\mathcal{G}''^{(m)}$ is $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$-coherent for any integer m. Similarly, $\mathcal{F}^{(0)}$ and $\mathcal{F}'^{(0)}$ are $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)$-coherent. This yields that $\mathcal{E}''^{(m)} = \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}''^{(0)}$ is $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$-coherent. Hence, by using 8.4.2.8, to check that $\mathcal{E}''^{(\bullet)} \to \mathcal{G}''^{(\bullet)}$ is an ind-isogeny of $M(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$, we reduce to check that $\mathcal{E}''^{(\bullet)}_{\mathbb{Q}} \to \mathcal{G}''^{(\bullet)}_{\mathbb{Q}}$ is an isomorphism. Since $\mathcal{E}''^{(\bullet)}_{\mathbb{Q}} \to \mathcal{F}''^{(\bullet)}_{\mathbb{Q}}$ is an isomorphism (see 11.2.4.2.4) and $\mathcal{F}''^{(\bullet)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{G}''^{(\bullet)}_{\mathbb{Q}}$, then we are done.

c) By using 11.2.2.3, this is a consequence of (a) and (b).

d) Let $\mathcal{G}^{(m)}$ (resp. $\mathcal{G}'^{(m)}$) be the quotient of $\mathcal{F}^{(m)}$ (resp. $\mathcal{F}'^{(m)}$) by its p-torsion part for any $m \in \mathbb{N}$. Following 7.5.2.9, $\mathcal{G}^{(m)}$ (resp. $\mathcal{G}'^{(m)}$) are $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)$-coherent for any integer m. Hence, so is $\mathcal{G}^{(m)} \otimes_{\mathcal{B}^{(m)}_{\mathfrak{X}}(T)} \mathcal{G}'^{(m)}$. By applying 7.5.2.1, this yields that the canonical morphism

$$\mathcal{G}^{(\bullet)} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{G}'^{(\bullet)} \to \mathcal{G}^{(\bullet)} \widehat{\otimes}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)} \mathcal{G}'^{(\bullet)}. \tag{11.2.4.2.5}$$

is an isomorphism. Hence, 11.2.4.2.2 is an ind-isogeny.

e) It follows from 8.4.2.8 that to check that the map

$$\mathcal{F}''^{(\bullet)} = \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}''^{(0)} \to \mathcal{G}^{(\bullet)} \widehat{\otimes}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{G}'^{(\bullet)} \tag{11.2.4.2.6}$$

is an ind-isogeny, we reduce to prove $\mathcal{F}''^{(\bullet)}_{\mathbb{Q}} \to \mathcal{G}^{(\bullet)}_{\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{G}'^{(\bullet)}_{\mathbb{Q}}$ is an isomorphism. Since $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}''^{(0)} \xrightarrow{\sim} \mathcal{G}^{(\bullet)}_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{G}'^{(\bullet)}_{\mathbb{Q}}$, this follows from 11.2.4.2.1 and 11.2.4.2.5. □

Proposition 11.2.4.3. *Let* $\mathcal{F}^{(\bullet)}$ *and* $\mathcal{F}'^{(\bullet)}$ *two objects of* $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$.

(a) *The canonical morphism of* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T))$ *:*

$$\mathcal{F}^{(\bullet)} \otimes^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{F}'^{(\bullet)} \to \mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{P}}(T)} \mathcal{F}'^{(\bullet)}. \tag{11.2.4.3.1}$$

is an isomorphism. This yields $\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{P}}(T)} \mathcal{F}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathfrak{X}^\sharp}(T))$.

(b) *Set* $\mathcal{F} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{F}^{(\bullet)})$, $\mathcal{F}' := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{F}'^{(\bullet)})$. *The canonical morphism*

$$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{F}' \to \mathcal{F} \otimes^{\mathbb{L}\dagger}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{F}'. \tag{11.2.4.3.2}$$

is an isomorphism.

(c) *We have* $\mathcal{F}^{(\bullet)} \widehat{\otimes}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{F}'^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. *By abuse of notation, we can simply write this isocrystal* $\mathcal{F}^{(\bullet)} \otimes_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)} \mathcal{F}'^{(\bullet)}$.

Proof. By using 11.2.2.5.1, we get that 11.2.4.3.1 is an isomorphism. By applying $\underrightarrow{l}^*_{\mathbb{Q}}$ to 11.2.4.3.1, we get 11.2.4.3.2. The last assertion follows from 9.1.1.16, 11.2.2.3 and 11.2.4.2. □

Corollary 11.2.4.4. *Suppose* $\mathfrak{S}^\sharp = \mathrm{Spf}\,\mathcal{V}$ *and log structures are trivial. For* $i = 1, 2$, *let* $\mathfrak{X}_i$ *be a noetherian of finite Krull dimension* $\mathcal{V}$*-smooth formal scheme, For* $i = 1, 2$, *let* X_i *be a* k*-smooth closed subscheme of* P, T_i *be a divisor of* P_i *such that* $Z_i := T_i \cap X_i$ *is a divisor of* X_i. *Let* $\mathfrak{X} := \mathfrak{X}_1 \times_{\mathfrak{S}} \mathfrak{X}_2$. *For* $i = 1, 2$, *let* $p_i \colon \mathfrak{X} \to \mathfrak{X}_i$ *be the natural projection,* $T := p_1^{-1}(T_1) \cup p_2^{-1}(T_2)$, $\mathcal{E}_i^{(\bullet)}$ *be an object of* $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}_i, T_i/K)$. *Then* $\mathcal{E}_1^{(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{E}_2^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}, T/K)$.

Proof. Following Lemma 9.2.5.9 (see also 9.2.5.3), we already know $\mathcal{E}_1^{(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{E}_2^{(\bullet)} \xrightarrow{\sim} \mathcal{E}_1^{(\bullet)} \widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{E}_2^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(T))$. This follows from 11.2.4.3 and 11.2.3.5.1. □

11.2.5 Stability by $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)$-linear duality of isocrystals

Proposition 11.2.5.1. *Let* $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. *For* $\lambda \in L(\mathbb{N})$ *large enough, denoting by* $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) := \lambda^* \mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$ *and* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, *let* $\mathcal{E}^{(0)}$ *be a topologically nilpotent* $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$*-module, coherent as* $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$*-module satisfying both conditions of 11.2.1.7.(b). We get the* $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$*-module by setting* $\mathcal{E}^{(\bullet)} := \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{(0)}$.

(a) $\mathcal{E}^\vee := \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$;

(b) $\mathcal{E}^{\vee(\bullet)} := \mathcal{H}om_{\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}}}(\mathcal{E}^{(\bullet)}, \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T)_{\mathbb{Q}})$ *satisfies both conditions of 11.2.1.7.(b) for* $\mathcal{E}^\vee$.

Proof. Since $\mathcal{E}^{\vee(0)}$ is a left $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module, then so is $\mathcal{E}^{\vee(0)}$. Via the canonical isomorphism of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{\vee(0)} \xrightarrow{\sim} \mathcal{E}^{\vee(m)}$, we get the morphism of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-modules $\mathcal{E}^{\vee(m)} \to \mathcal{E}^{\vee(m+1)}$. We get the $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism

$$\varinjlim_m \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} \mathcal{E}^{\vee(0)} \xrightarrow{\sim} \mathcal{E}^\vee. \tag{11.2.5.1.1}$$

Since $\mathcal{E}^{(m)}$ (uniquely) extends to a structure of topologically nilpotent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-module then so is $\mathcal{E}^{\vee(m)}$ (see 7.5.2.10). By continuity, we get that the homomorphisms

$$\mathcal{E}^{\vee(m)} \to \mathcal{E}^{\vee(m+1)} \tag{11.2.5.1.2}$$

are $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$-linear. □

Proposition 11.2.5.2. *Let* $\mathcal{F}^{(0)}$ *be a* $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)$*-module, coherent over* $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)$ *such that the canonical morphism*

$$\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T) \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)} \mathcal{F}^{(0)} \to \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}^{(0)} =: \mathcal{F}^{(\bullet)} \tag{11.2.5.2.1}$$

is an ind-isogeny in $M(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(T))$ *and such that* $\mathcal{F}^{(m)}_{\mathbb{Q}}$ *is a topologically nilpotent* $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}}$*-module for any* m. *Set* $\mathcal{F}^{\vee(0)} := \mathcal{H}om_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)}(\mathcal{F}^{(0)}, \widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T))$, $\mathcal{F}^{\vee(\bullet)} := \widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}(T)} \mathcal{F}^{\vee(0)}$.

(a) $\mathcal{F}_{\mathbb{Q}}^{\vee(m)} \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}}}(\mathcal{F}_{\mathbb{Q}}^{(m)}, \widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}})$ *is a topologically nilpotent* $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(m)}(T)_{\mathbb{Q}}$*-modules for any* m*.*

(b) The canonical morphism

$$\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(\bullet)}(T) \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)} \mathcal{F}^{\vee(0)} \to \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(\bullet)}(T) \otimes_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(0)}(T)} \mathcal{F}^{\vee(0)} = \mathcal{F}^{\vee(\bullet)} \tag{11.2.5.2.2}$$

is an ind-isogeny of $M(\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(\bullet)}(T))$*.*

(c) $\mathcal{F}^{\vee(\bullet)}$ *belongs to* $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$*.*

Proof. a) We have the isomorphism

$$\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)} \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}}}(\mathcal{F}_{\mathbb{Q}}^{(m)}, \widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}})$$

By using 7.5.2.10, this yields that $\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)}$ is therefore canonically endowed with a structure of topologically nilpotent $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(m)}(T)_{\mathbb{Q}}$-module and is also $\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}}$-coherent. Hence, we get the isomorphisms:

$$\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)} \underset{7.5.2.8.2}{\xrightarrow{\sim}} (\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(0)}(T))_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)}$$

$$\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)} \underset{7.5.2.8.1}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(m)}(T) \otimes_{(\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(0)}(T))_{\mathbb{Q}}} \left(\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)}\right).$$

This implies that the canonical map

$$\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)} \to \widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(m)}(T)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(0)}(T)_{\mathbb{Q}}} \mathcal{F}_{\mathbb{Q}}^{\vee(0)} \tag{11.2.5.2.3}$$

is an isomorphism.

By tensoring with $\mathbb{Q}$ the ind-isogeny 11.2.5.2.1, we get an isomorphism which yields the isomorphism $\mathcal{F}_{\mathbb{Q}}^{\vee(m)} \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}}}(\mathcal{F}_{\mathbb{Q}}^{(m)}, \widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)_{\mathbb{Q}})$ of $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(m)}(T)_{\mathbb{Q}}$-modules for any m. Since $\mathcal{F}_{\mathbb{Q}}^{(m)}$ is a topologically nilpotent $\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(m)}(T)_{\mathbb{Q}}$-module then so is $\mathcal{F}^{\vee(m)}$ (see 7.5.2.10).

b) Set $\mathcal{E}^{(\bullet)} := \widetilde{\mathcal{B}}_{\mathfrak{X}}^{(\bullet)}(T) \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)} \mathcal{F}^{\vee(0)}$. For any $m \in \mathbb{N}$, let $\mathcal{G}^{(m)}$ be the quotient of $\mathcal{F}^{\vee(m)}$ by its p-torsion part. Since $\mathcal{F}^{\vee(\bullet)} \to \mathcal{G}^{(\bullet)}$ is an ind-isogeny, to check that $\mathcal{E}^{(\bullet)} \to \mathcal{F}^{\vee(\bullet)}$ is an ind-isogeny we reduce to prove that so is the composition $\mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$.

Using 7.5.2.8, the part a) of the proof implies that $\mathcal{G}^{(m)}$ is $\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)$-coherent for any integer m. Similarly, $\mathcal{F}^{\vee(0)}$ is $\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)$-coherent. This yields that $\mathcal{E}''^{(m)} = \widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T) \otimes_{\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(0)}(T)} \mathcal{F}^{\vee(0)}$ is $\widetilde{\mathcal{B}}_{\mathfrak{X}}^{(m)}(T)$-coherent. Hence, by using 8.4.2.8, to check that $\mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)}$ is an ind-isogeny of $M(\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}^{(\bullet)}(T))$, we reduce to check that $\mathcal{E}_{\mathbb{Q}}^{(\bullet)} \to \mathcal{G}_{\mathbb{Q}}^{(\bullet)}$ is an isomorphism. Since $\mathcal{E}_{\mathbb{Q}}^{(\bullet)} \to \mathcal{F}_{\mathbb{Q}}^{(\bullet)}$ is an isomorphism (see 11.2.5.2.3) and $\mathcal{F}_{\mathbb{Q}}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}_{\mathbb{Q}}^{(\bullet)}$, then we are done.

□

11.2.6 Comparison with the $\mathcal{D}$-linear duality

We keep notation 11.2.1. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ which is locally projective of finite type on $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$.

Remark 11.2.6.1. Specially when T is not empty (see 8.7.7.7 to get example when T is empty), we do not know a priori if $\mathcal{D}_{\mathfrak{X}^\sharp}^\dagger({}^\dagger T)_{\mathbb{Q}}$ has finite tor dimension. Be careful because standard isomorphisms concerning the sheaves of homomorphisms require to work with perfect complexes instead of complexes with bounded and coherent cohomology.

Proposition 11.2.6.2. *We have* $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$*,* $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}_{\mathfrak{X}^\sharp}^\dagger({}^\dagger T)_{\mathbb{Q}})$*.*

Proof. Following 4.7.3.7.1 (see also the remark 4.7.3.15), the first Spencer sequence $\mathrm{Sp}^{\bullet}_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E})$ associated to the trivial filtration is exact. As $\mathcal{E}$ is locally projective of finite type on $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$, then this sequence gives a finite resolution of $\mathcal{E}$ by of locally projective of finite type left $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules. Hence, $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$. Since the extension $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$ is flat, with 11.2.1.9.2, this yields that $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$. □

11.2.6.3. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ (see notation 11.2.1.4) which is locally projective of finite type on $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$. Following 4.6.7.1, with notation 9.2.4.22.1 we have the canonical isomorphism of the form

$$\theta^{\mathrm{alg}} \colon \mathbb{D}^{\mathrm{alg}}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)}(\mathcal{E},\, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)) \to \mathbb{D}^{\mathrm{alg}}_T(\mathcal{E}). \tag{11.2.6.3.1}$$

Following 4.6.7.1, since $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}} \in D_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}})$ and $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$ (because it is locally projective of finite type on $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)$), then the map 11.2.6.3.1 is an isomorphism.

Since $\mathcal{E}$ is locally projective of finite type on $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)$, the morphism $\mathcal{E}^\vee := \mathcal{H}om_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)}(\mathcal{E},\, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)) \to \mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)}(\mathcal{E},\, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T))$ is an isomorphism. Following 8.7.7.5.c), we have a canonical isomorphism $\mathbb{D}^{\mathrm{alg}}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$. Hence, we get the isomorphism of $D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}})$ (see 11.2.6.2):

$$\mathcal{E}^\vee \xrightarrow{\sim} \mathbb{D}^{\mathrm{alg}}_T(\mathcal{E}). \tag{11.2.6.3.2}$$

In particular, for any $i \neq 0$, $H^i(\mathbb{D}^{\mathrm{alg}}_T(\mathcal{E})) = 0$ and we can see $\mathbb{D}^{\mathrm{alg}}_T(\mathcal{E})$ as a $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is locally projective of finite type on $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)$.

Following 11.2.5.1, $\mathcal{E}^\vee \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. Hence, so is $\mathbb{D}^{\mathrm{alg}}_T(\mathcal{E})$. This yields from of 11.2.1.9.2 that the canonical morphisms $\mathcal{E} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}$ and $\mathbb{D}^{\mathrm{alg}}_T(\mathcal{E}) \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathbb{D}^{\mathrm{alg}}_T(\mathcal{E})$ is an isomorphism. With notation 9.2.4.22.2, this yields the isomorphism:

$$\rho_T \colon \mathbb{D}^{\mathrm{alg}}_T(\mathcal{E}) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathbb{D}^{\mathrm{alg}}_T(\mathcal{E}) \underset{4.6.4.7.1}{\xrightarrow{\sim}} \mathbb{D}_T(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}) \xrightarrow{\sim} \mathbb{D}_T(\mathcal{E}), \tag{11.2.6.3.3}$$

Hence, from 11.2.6.3.2 we get the $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism:

$$\mathcal{E}^\vee \xrightarrow{\sim} \mathbb{D}_T(\mathcal{E}). \tag{11.2.6.3.4}$$

In particular, for any $r \in \mathbb{Z} \setminus \{0\}$ we have $H^r(\mathbb{D}_T(\mathcal{E})) = 0$.

11.2.6.4. Beware the isomorphism 11.2.6.3.4 is not compatible with Frobenius. The key point is that the isomorphism $\mathbb{D}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ [1] is not compatible. Hence, the "twist" $\mathbb{D}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$ is essential to obtain this one. To get a compatible with Frobenius morphism, let us consider the isomorphism $\theta \colon \mathbb{D}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}^\vee \xrightarrow{\sim} \mathbb{D}_T(\mathcal{E})$ making commutative the following diagram:

$$\begin{array}{ccc} \mathbb{D}^{\mathrm{alg}}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}^\vee & \xrightarrow[\sim]{\theta^{\mathrm{alg}}} & \mathbb{D}^{\mathrm{alg}}_T(\mathcal{E}) \\ \sim \downarrow \rho\otimes\mathrm{id} & & \sim \downarrow \rho \\ \mathbb{D}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}^\vee & \overset{\theta}{\underset{\sim}{\dashrightarrow}} & \mathbb{D}_T(\mathcal{E}). \end{array} \tag{11.2.6.4.1}$$

We will check later its compatibility with Frobenius (see **??**).

Corollary 11.2.6.5. *Let $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$. The following assertions are equivalent :*

(a) For any $r \in \mathbb{Z}$, $H^r(\mathcal{F}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ and is locally projective of finite type on $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$.

(b) For any $r \in \mathbb{Z}$, $H^r(\mathbb{D}_T(\mathcal{F})) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ and is locally projective of finite type on $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ for any $r \in \mathbb{Z}$.

If $\mathcal{F}$ satisfies one of these equivalent conditions, then, for any r, $s \in \mathbb{Z}$ such that $r \neq 0$, $H^r(\mathbb{D}_T(H^s(\mathcal{F})) = 0$ and $\mathbb{D}_T(H^s(\mathcal{F})) \xrightarrow{\sim} H^s(\mathbb{D}_T(\mathcal{F}))$.

Proof. This is a consequence of 11.2.6.3.4. □

[1] See Abe's paper

11.2.7 Commutation of sp_* with inverse images, glueing isomorphisms and duality

11.2.7.1. Let $\mathfrak{S} \to \operatorname{Spf} \mathcal{V}$ be a smooth morphism. Let $\mathfrak{X}$ (resp. $\mathfrak{X}'$) be a smooth $\mathfrak{S}$-scheme, $\mathfrak{Z}$ (resp. $\mathfrak{Z}'$) be a relative strict normal crossing divisor of $\mathfrak{X}$ (resp. $\mathfrak{X}'$) over $\mathfrak{S}$, $\mathfrak{X}^\sharp := (\mathfrak{X}, M_{\mathfrak{Z}})$ (resp. $\mathfrak{X}'^\sharp := (\mathfrak{X}', M_{\mathfrak{Z}'})$) be the logarithmic $\mathcal{V}$-formal scheme induced by the logarithmic structure $M_{\mathfrak{Z}}$ (resp. $M_{\mathfrak{Z}'}$) associated with $\mathfrak{Z}$ (resp. $\mathfrak{Z}'$). Let T (resp. T') be a divisor of X_0 (resp. X_0') and $\mathfrak{Y}^\sharp$ (resp. $\mathfrak{Y}'^\sharp$) the open subset of $\mathfrak{X}^\sharp$ (resp. $\mathfrak{X}'^\sharp$) complementary to the support of T (resp. T'), let $j\colon \mathfrak{Y}^\sharp \setminus \mathfrak{X}^\sharp$ (resp. $j\colon \mathfrak{Y}'^\sharp \setminus \mathfrak{X}'^\sharp$) be the induced open immersion.

Let $u\colon \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ be a morphism of formal schemes such that $T' \supset u_0^{-1}(T)$. This yields the morphism of smooth frames $f := (b, a, u)\colon (Y', X', \mathfrak{X}') \to (Y, X, \mathfrak{X})$. According to notation 10.1.2.6.1, we have the functor

$$f_K^* := j'^\dagger u_K^*, \tag{11.2.7.1.1}$$

which induces the functor $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}_K) \to \mathrm{MIC}^\dagger(\mathfrak{X}'^\sharp_K, T'/\mathfrak{S}_K)$. If this do not cause too much confusion (the tilde symbol indicates the divisors T and T'), we will write $\widetilde{u}_K^*$ instead of f_K^*.

Following 11.2.1.5.(a), the functors sp_* and sp^* (see 11.2.1.3) induce quasi-inverse equivalences of categories between $\mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}^\sharp_K)$ and $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$. With notation 11.2.3.5, we have the functor $\widetilde{u}^*\colon \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/K) \to \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}', T'/K)$ which is compatible with $\widetilde{u}_K^*$, i.e. for any $E \in \mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}^\sharp_K)$ and $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$, there exist canonical isomorphisms of respectively $\mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{X}', T'/K)$ and $\mathrm{MIC}^\dagger(Y', X', \mathfrak{X}'/K)$ of the form

$$\mathrm{sp}_* \widetilde{u}_K^*(E) \xrightarrow{\sim} \widetilde{u}^* \mathrm{sp}_*(E), \qquad \widetilde{u}_K^* \mathrm{sp}^*(\mathcal{E}) \xrightarrow{\sim} \mathrm{sp}^* \widetilde{u}^*(\mathcal{E}). \tag{11.2.7.1.2}$$

We leave as an exercice the check that these isomorphisms are transitive with respect to the composition of morphisms.

Example 11.2.7.2. With notation 11.2.7.1, suppose $u = \mathrm{id}$. For any $E \in \mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}^\sharp_K)$, following 11.2.3.5 and 11.2.7.1.2, we have the isomorphism:

$$\mathrm{sp}_*(j'^\dagger E) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T')_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathrm{sp}_*(E) = ({}^\dagger T')(\mathrm{sp}_*(E)). \tag{11.2.7.2.1}$$

Proposition 11.2.7.3. *We keep notation 11.2.7.1 and suppose log structures are trivial. Let $u'\colon \mathfrak{X}'^\sharp \to \mathfrak{X}^\sharp$ be a morphism of formal log smooth $\mathfrak{S}$-schemes such that $u_0' = u_0$. Then, the following diagrams*

$$\begin{array}{ccc} \mathrm{sp}_* \widetilde{u}'^*_K(E) & \xrightarrow[\sim]{\mathrm{sp}_*(\epsilon_{u,\,u'})} & \mathrm{sp}_* \widetilde{u}^*_K(E) \\ \sim\downarrow 11.2.7.1.2 & & \sim\downarrow 11.2.7.1.2 \\ \widetilde{u}'^* \mathrm{sp}_*(E) & \xrightarrow[\sim]{\tau_{u,u'}} & \widetilde{u}^* \mathrm{sp}_*(E), \end{array} \qquad \begin{array}{ccc} \widetilde{u}'^*_K \mathrm{sp}^*(\mathcal{E}) & \xrightarrow[\sim]{\epsilon_{u,\,u'}} & \widetilde{u}^*_K \mathrm{sp}^*(\mathcal{E}) \\ \sim\downarrow 11.2.7.1.2 & & \sim\downarrow 11.2.7.1.2 \\ \mathrm{sp}^* \widetilde{u}'^*(\mathcal{E}) & \xrightarrow[\sim]{\mathrm{sp}^*(\tau_{u,u'})} & \widetilde{u}^* \mathrm{sp}_*(\mathcal{E}), \end{array}$$

where the glueing isomorphisms $\epsilon_{u,u'}$ and $\tau_{u,u'}$ are that of 10.2.4.1.1 and 9.2.2.3.1, are commutative.

Proof. This follows from the fact that both glueing isomorphisms $\epsilon_{u,u'}$ and $\tau_{u,u'}$ are built similarly using some factorization via the closed imbedding $(u, u')\colon \mathfrak{X}' \hookrightarrow (\mathfrak{X})^{(n)}$ where $(\mathfrak{X})^{(n)}$ is the nth infinitesimal neighborhood of the diagonal immersion $\mathfrak{X} \hookrightarrow \mathfrak{X} \times_{\mathfrak{S}} \mathfrak{X}$. □

Proposition 11.2.7.4. *Let $\mathfrak{X} \to \mathfrak{S} \to \operatorname{Spf} \mathcal{V}$ be two smooth morphisms, $\mathfrak{Z}$ be a relative strict normal crossing divisor of $\mathfrak{X}$ over $\mathfrak{S}$, $\mathfrak{X}^\sharp := (\mathfrak{X}, M_{\mathfrak{Z}})$ be the logarithmic $\mathcal{V}$-formal scheme induced by the logarithmic structure $M_{\mathfrak{Z}}$ associated with $\mathfrak{Z}$. Let T be a divisor of X_0. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ which is locally projective of finite type as $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)$-module. Let $E \in \mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}_K)$ which is locally free of finite type $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-module. We have the canonical isomorphisms (compatibility with Frobenius when log structures are trivial):*

$$\mathrm{sp}^* \mathcal{H}om_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)}(\mathcal{E}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)) \xrightarrow{\sim} \mathcal{H}om_{j^\dagger \mathcal{O}_{\mathfrak{X}_K}}(\mathrm{sp}^* \mathcal{E}, j^\dagger \mathcal{O}_{\mathfrak{X}_K}) \tag{11.2.7.4.1}$$

$$\mathcal{H}om_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)}(\mathrm{sp}_* E, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)) \xrightarrow{\sim} \mathrm{sp}_*(\mathcal{H}om_{j^\dagger \mathcal{O}_{\mathfrak{X}_K}}(E, j^\dagger \mathcal{O}_{\mathfrak{X}_K})). \tag{11.2.7.4.2}$$

Proof. Since $\mathcal{E}$ is an $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)$-module locally projective of finite type, then the canonical homomorphism

$$\mathrm{sp}^* \mathcal{H}om_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)}(\mathcal{E}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}({}^\dagger T)) \to \mathcal{H}om_{j^\dagger \mathcal{O}_{\mathfrak{X}_K}}(\mathrm{sp}^* \mathcal{E}, j^\dagger \mathcal{O}_{\mathfrak{X}_K})$$

is an isomorphism. By using the equivalence of categories 11.2.1.5, since $\mathcal{H}om_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}(^\dagger T)}(\mathcal{E}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}(^\dagger T))$ is an isocrystal which is locally projective of finite type as $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}(^\dagger T)$-module, by applying the functor sp_* to 11.2.7.4.1, we get the isomorphism 11.2.7.4.2. □

Corollary 11.2.7.5. *With notation and hypotheses of 11.2.7.4, we have the canonical isomorphism*

$$\mathrm{sp}_*(E^\vee) \xrightarrow{\sim} \mathbb{D}_T(\mathrm{sp}_* E), \tag{11.2.7.5.1}$$

where $E^\vee = \mathcal{H}om_{j^\dagger \mathcal{O}_{\mathfrak{X}_K}}(E, j^\dagger \mathcal{O}_{\mathfrak{X}_K})$.

Proof. This is a consequence of 11.2.6.3.4 and 11.2.7.4. □

Remark 11.2.7.6. The isomorphism 11.2.7.5.1 is not compatible with Frobenius. To get a compatible with Frobenius version we need to add a twist (see 11.3.5.3).

11.3 Compatibility with Frobenius of the comparison isomorphism between both dual functors of isocrystals

We suppose there exists a lifting $\sigma\colon \mathcal{V} \to \mathcal{V}$ of the power s-th of Frobenius of k. Let $\mathfrak{X}$ be a smooth $\mathcal{V}$-formal scheme, $\mathfrak{X}'$ be the $\mathcal{V}$-formal scheme induced by $\mathfrak{X}$ by the base change relative to σ, T be a divisor X and T' the divisor of X' induced by T by the base change relative to σ. We prove in this section that the isomorphism θ constructed at 11.2.6.4.1 is compatible with Frobenius (see 11.3.4.6.1).

11.3.1 Construction of $\widehat{\theta}^{(m)}$

Let m and i_0 be two nonnegative integers, X will be either $\mathfrak{X}$ or X_{i_0} (the case $X = \mathfrak{X}$ can be seen as the case where $i_0 = \infty$) and S will be either $\mathrm{Spf}\,\mathcal{V}$ or $\mathrm{Spec}\,\mathcal{V}/\mathfrak{m}\mathcal{V}^{i+1}$, with $\mathfrak{m}$ the ideal maximal of $\mathcal{V}$.

The $\mathcal{D}_X^{(m)}$-linear functor, denoted by $\mathbb{D}^{(m)}\colon D_{\mathrm{perf}}(\mathcal{D}_X^{(m)}) \to D_{\mathrm{perf}}(\mathcal{D}_X^{(m)})$, is defined by setting for any $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{D}_X^{(m)})$

$$\mathbb{D}_X^{(m)}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\mathcal{D}_X^{(m)}}(\mathcal{E}, \mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \omega_{X/S}^{-1}))[d_X]. \tag{11.3.1.0.1}$$

If there is no risk of confusion, we simply write $\mathbb{D}^{(m)}$ instead of $\mathbb{D}_X^{(m)}$.

The $\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)}$-linear functor, denoted by $\widehat{\mathbb{D}}^{(m)}\colon D_{\mathrm{perf}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)}) \to D_{\mathrm{perf}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)})$, is defined by setting for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)})$

$$\widehat{\mathbb{D}}_{\mathfrak{X}}^{(m)}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)}}(\mathcal{E}, \widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}/\mathfrak{S}}^{-1}))[d_X]. \tag{11.3.1.0.2}$$

If there is no risk of confusion, we simply write $\widehat{\mathbb{D}}^{(m)}$ instead of $\widehat{\mathbb{D}}_{\mathfrak{X}}^{(m)}$. Similarly to 8.7.7.3, we construct for any $\mathcal{E} \in D(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)})$ the canonical morphism

$$\mathcal{E} \to \widehat{\mathbb{D}}_{\mathfrak{X}}^{(m)} \circ \widehat{\mathbb{D}}_{\mathfrak{X}}^{(m)}(\mathcal{E}) \tag{11.3.1.0.3}$$

which is an isomorphism when $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)})$.

In this subsection, we construct (see 11.3.1.16.2) , for any $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}}) \cap D({}^{1}\mathcal{D}_{\mathfrak{X}}^{(m)})$, the isomorphism

$$\widehat{\theta}^{(m)}\colon \widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\vee \to \widehat{\mathbb{D}}^{(m)}(\mathcal{E}),$$

where $\mathcal{E}^\vee := \mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\mathcal{E}, \mathcal{O}_{\mathfrak{X}})$. In order to get its compatibility with Frobenius (see 11.3.2.9.1), the idea is to take the p-adic completion of the isomorphism $\theta^{(m)}\colon \mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\vee \to \mathbb{D}^{(m)}(\mathcal{E})$ constructed at 6.3.4.15. To make later the link with the construction of θ (by extension from $\theta^{(m)}$: see 11.2.6.4.1), we also check that this morphism $\widehat{\theta}^{(m)}$ is the one induced by extension from $\theta^{(m)}$ (see below 11.3.1.19).

Remark 11.3.1.1. Let us recall that $\dim \mathrm{coh}\, \mathcal{D}_{\mathfrak{X}}^{(0)} = \dim \mathrm{coh}\, \widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)} = 2d_{\mathfrak{X}} + 1$ (8.7.7.6). As the sheaves $\mathcal{D}_{\mathfrak{X}}^{(m)}$ and $\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)}$ are coherent, we obtain $D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}}^{(0)}) = D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{\mathfrak{X}}^{(0)})$, $D^{\mathrm{b}}_{\mathrm{perf}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)}) = D^{\mathrm{b}}_{\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(m)})$ and $D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}_{\mathfrak{X}}^{(m)}) = D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{\mathfrak{X}}^{(m)}) \cap D_{\mathrm{tdf}}(\mathcal{D}_{\mathfrak{X}}^{(m)})$.

Via 11.1.1.5, this yields that every object $\mathcal{E}$ of $D(\mathcal{D}^{(m)}_{\mathfrak{X}}) \cap D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}})$ is also an object of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{\mathfrak{X}})$ and of $D^{\mathrm{b}}_{\mathrm{perf}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}})$. Moreover, since the extension $\mathcal{D}^{(m)}_{\mathfrak{X}} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}}$ is flat, since $\mathcal{E} \in D_{\mathrm{tdf}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}})$ then $\mathcal{E} \in D_{\mathrm{tdf}}(\mathcal{D}^{(m)}_{\mathfrak{X}})$. Hence, $\mathcal{E}$ belongs to $D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{(m)}_{\mathfrak{X}})$.

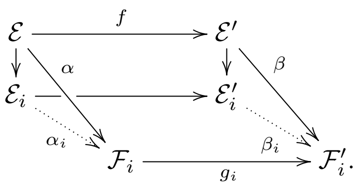
Remark 11.3.1.2. Following 4.7.3.7 and 4.7.3.14, we have the canonical isomorphisms $\mathbb{D}^{(0)}(\mathcal{O}_{\mathfrak{X}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}$, $\widehat{\mathbb{D}}^{(0)}(\mathcal{O}_{\mathfrak{X}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}$ and $\mathbb{D}^{(0)}(\mathcal{O}_{X_i}) \xrightarrow{\sim} \mathcal{O}_{X_i}$ for any nonnegative integer i. By Frobenius increasing of the level (use 6.2.7.2), since the pullback under Frobenius of the constant coefficient is the constant coefficient, then we get $\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}$ and for any positive integer i, $\mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \xrightarrow{\sim} \mathcal{O}_{X_i}$. However, we do not know if we have an isomorphism $\mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}$ nor if $\mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \in D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}})$ or $\mathcal{O}_{\mathfrak{X}} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}^{(m)}_{\mathfrak{X}})$.

Notation 11.3.1.3. Let $\mathcal{D} = \mathcal{D}^{(m)}_{X}$ or $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}}$. For any integer $i \leq i_0$ and every $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{D})$, the canonical morphism

$$\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E} \xrightarrow{\sim} \mathcal{D}^{(m)}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E} \tag{11.3.1.3.1}$$

is an isomorphism and we set $\mathcal{E}_i := \mathcal{D}^{(m)}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}$.

11.3.1.4. Let $f\colon \mathcal{E} \to \mathcal{E}'$ be a morphism of $D(\mathcal{D}^{(m)}_{X})$, $g_i\colon \mathcal{F}_i \to \mathcal{F}'_i$ be a morphism of $D(\mathcal{D}^{(m)}_{X_i})$, $\alpha\colon \mathcal{E} \to \mathcal{F}_i$ and $\beta\colon \mathcal{E}' \to \mathcal{F}'_i$ be two morphisms of $D(\mathcal{D}^{(m)}_{X})$ such that $\beta \circ f = g_i \circ \alpha$. The morphisms α and β factors through the morphisms $\alpha_i\colon \mathcal{E}_i \to \mathcal{F}_i$ and $\beta_i\colon \mathcal{E}'_i \to \mathcal{F}_i$. We get also the following commutative diagram :



11.3.1.5. The goal of this paragraph is to construct the functor 11.3.1.5.1. Let $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X})$, $\mathcal{G} \in D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$. Let $\mathcal{I} \to \mathcal{J}$ be a quasi-isomorphism of K-injective complexes of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$. Then, the morphism $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\ \mathcal{J})$ is a quasi-isomorphism of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$ because it is canonically isomorphic to $\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{E}, \mathcal{I}) \to \mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{E}, \mathcal{J})$ and because $\mathcal{I} \to \mathcal{J}$ is also (by flatness of $\mathcal{O}_{X_i} \to \mathcal{D}^{(m)}_{X_i}$) a quasi-isomorphism of K-injective complexes of $K(\mathcal{O}_{X_i})$. Hence, following [Sta22, 13.14.15], we get the functor $\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\ -)\colon D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i}) \to D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$, i.e. the right derived functor (with respect to quasi-isomophisms of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$) of $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\ -)\colon K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i}) \to D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$ exists and is computed by K-injective complexes. Moreover, the functor $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X}) \to D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$, given by $\mathcal{E} \mapsto \mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\ \mathcal{G})$ has a derived functor (with respect to quasi-isomophisms of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X})$). Indeed, following [Sta22, 13.14.15], it is sufficient to check that if $\mathcal{P} \to \mathcal{P}'$ is a quasi-isomorphism of K-flat complexes of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X})$ (and therefore a K-flat complexes of $K(\mathcal{O}_X)$), then $\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}',\ \mathcal{G}) \to \mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P},\ \mathcal{G})$ is an isomorphism. Let $\mathcal{I}$ be a K-injective complex of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$ representing $\mathcal{G}$. Then, the map $\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}',\ \mathcal{G}) \to \mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P},\ \mathcal{G})$ corresponds to the map $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}',\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P},\ \mathcal{I})$ induced by the quasi-isomorphism $\mathcal{P} \to \mathcal{P}'$. Moreover, this latter is canonically isomorphic to $\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{P}',\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{P},\ \mathcal{I})$. Since $\mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{P} \to \mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{P}'$ is a quasi-isomorphism of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$, since $\mathcal{I}$ is a K-injective complex of $K({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$ then $\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{P}',\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes_{\mathcal{O}_X} \mathcal{P},\ \mathcal{I})$ is an isomorphism. We denote by $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(-, \mathcal{G})\colon D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X})^{\mathrm{op}} \to D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i})$ the derived functor. Since this is functorial in $\mathcal{G}$, this yields the bifunctor

$${}^{2}\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(-,-)\colon D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X})^{\mathrm{op}} \times D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i}) \to D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X_i}). \tag{11.3.1.5.1}$$

We remark that $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{G})$ could have been directly defined by setting $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{G}) = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}, \mathcal{I})$ where $\mathcal{P}$ is a K-flat complex representing $\mathcal{E}$ and $\mathcal{I}$ is a K-injective complex representing $\mathcal{G}$

[2] This can still be defined by adding log structure and coefficients

and by checking its independence relatively to the choices (it is a way of defining analogous to the one of [Sta22, 20.38.7]). By using [Sta22, 13.14.16], we check that we have the 2-commutative diagram

$$\begin{array}{ccc} D({}^{1}\mathcal{D}_{X}^{(m)})^{\mathrm{op}} \times D({}^{1}\mathcal{D}_{X_i}^{(m)}) & \xrightarrow{\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(-,-)} & D({}^{1}\mathcal{D}_{X_i}^{(m)}) \\ \uparrow & & \| \\ D({}^{1}\mathcal{D}_{X}^{(m)})^{\mathrm{op}} \times D({}^{1}\mathcal{D}_{X}^{(m)}) & \xrightarrow{\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(-,-)} & D({}^{1}\mathcal{D}_{X}^{(m)}). \end{array} \quad (11.3.1.5.2)$$

Hence, this is not confusing to simply denote by $\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(-,-)\colon D({}^{1}\mathcal{D}_{X}^{(m)})^{\mathrm{op}} \times D({}^{1}\mathcal{D}_{X_i}^{(m)}) \to D({}^{1}\mathcal{D}_{X_i}^{(m)})$, instead of $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{O}_X}(-,-)$.

Lemma 11.3.1.6. *Let $\mathcal{E} \in D({}^{1}\mathcal{D}_{X}^{(m)})$, $0 \le i \le i_0$ be an integer, $\mathcal{G} \in D({}^{1}\mathcal{D}_{X_i}^{(m)})$. We have the canonical isomorphism of $D({}^{1}\mathcal{D}_{X_i}^{(m)})$:*

$$\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\ \mathcal{G}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}, \mathcal{G}) \quad (11.3.1.6.1)$$

This isomorphism is transitive, i.e. for any integer $0 \le j \le i$ and any $\mathcal{H} \in D({}^{1}\mathcal{D}_{X_j}^{(m)})$ we have the commutative diagram

$$\begin{array}{ccc} \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\ \mathcal{H}) & \xrightarrow{11.3.1.6.1} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}, \mathcal{H}) \\ \downarrow{\scriptstyle 11.3.1.6.1} & & \downarrow{\scriptstyle 11.3.1.6.1} \\ \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_j}}(\mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}, \mathcal{H}) & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_j}}(\mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}), \mathcal{H}). \end{array} \quad (11.3.1.6.2)$$

Proof. We construct the morphism 11.3.1.6.1 by choosing a K-flat complex of $K({}^{1}\mathcal{D}_{X}^{(m)})$ representing $\mathcal{E}$ and a K-injective complex of $K({}^{1}\mathcal{D}_{X_i}^{(m)})$ representing $\mathcal{G}$. The transitivity is left to the reader as an easy exercice. □

Lemma 11.3.1.7. *For any $\mathcal{E} \in D({}^{1}\mathcal{D}_{X}^{(m)})$, $\mathcal{F} \in D({}^{1}\mathcal{D}_{X}^{(m)})$, for any integer $0 \le i \le i_0$, we have the canonical morphism of $D({}^{1}\mathcal{D}_{X_i}^{(m)})$:*

$$\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i} \to \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i}). \quad (11.3.1.7.1)$$

This one is an isomorphism if $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_X)$. Moreover, this is transitive, i.e., if $j \le i \le i_0$ is a nonnegative integer, we have the following commutative diagram :

$$\begin{array}{ccc} (\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i}) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{O}_{X_j} & \underset{\sim}{\xrightarrow{11.3.1.7.1}} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i}) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{O}_{X_j} \\ \sim\downarrow & & \sim\downarrow{\scriptstyle 11.3.1.7.1} \\ \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_j} & \underset{\sim}{\xrightarrow{11.3.1.7.1}} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_j}). \end{array}$$

Proof. It follows from (the right version of) 4.6.4.1.1 (and 11.3.1.3.1) that the morphism $\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i} \to \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i})$ induces 11.3.1.7.1. The transitivity is an easy exercice. □

Proposition 11.3.1.8. *Let $\mathcal{E} \in D({}^{1}\mathcal{D}_{X}^{(m)})$ and $\mathcal{F} \in D({}^{1}\mathcal{D}_{X}^{(m)})$.*

(i) For any $i \le i_0$, with notation 11.3.1.3 we have the canonical morphisms of $D({}^{1}\mathcal{D}_{X_i}^{(m)})$:

$$\alpha\colon \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i} \to \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i, \mathcal{F}_i), \quad (11.3.1.8.1)$$

which is an isomorphism when $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_X)$.

(ii) They are transitive, i.e., if $j \leq i \leq i_0$ is a nonnegative integer, the following diagram

$$\begin{array}{ccc} \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{O}_{X_j} & \xrightarrow{\alpha \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{O}_{X_j}} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\,\mathcal{F}_i) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{O}_{X_j} \\ \downarrow & & \downarrow \alpha \\ \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_j} & \xrightarrow{\alpha} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_j}}(\mathcal{E}_j,\,\mathcal{F}_j) \end{array} \tag{11.3.1.8.2}$$

is commutative.

Proof. We construct the morphism 11.3.1.8.1 by composition as follows

$$\alpha\colon \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{O}_{X_i} \overset{11.3.1.7.1}{\longrightarrow} \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\,\mathcal{F}_i) \overset{11.3.1.6.1}{\underset{\sim}{\longrightarrow}} \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\,\mathcal{F}_i).$$

□

Proposition 11.3.1.9. *Let $i \leq i_0$ be a nonnegative integer and $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_X) \cap D(\mathcal{D}^{(m)}_X)$. There exists the canonical isomorphisms*

$$\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{D}^{(m)}(\mathcal{O}_X) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}^\vee] \xrightarrow{\sim} \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^\vee, \tag{11.3.1.9.1}$$

$$\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\vee] \xrightarrow{\sim} \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^\vee. \tag{11.3.1.9.2}$$

Moreover, they are transitive.

Proof. First recall that thanks to 11.3.1.2 some $\mathbb{L}$ can be removed in both isomorphisms of the proposition. Let us treat the isomorphism 11.3.1.9.1. Following 4.6.4.7, we have the last isomorphism $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathbb{D}^{(m)}(\mathcal{O}_X) \xrightarrow{\sim} \mathcal{D}^{(m)}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathbb{D}^{(m)}(\mathcal{O}_X) \xrightarrow{\sim} \mathbb{D}^{(m)}(\mathcal{O}_{X_i})$. Following 11.3.1.8, we have the isomorphisms $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}^\vee \xrightarrow{\sim} \mathcal{E}_i^\vee$. We get then

$$\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{D}^{(m)}(\mathcal{O}_X) \otimes_{\mathcal{O}_X} \mathcal{E}^\vee] \xrightarrow{\sim} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathbb{D}^{(m)}(\mathcal{O}_X)) \otimes_{\mathcal{O}_{X_i}} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}^\vee) \xrightarrow{\sim} \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^\vee.$$

Since the isomorphism $\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [- \otimes^{\mathbb{L}}_{\mathcal{O}_X} -] \xrightarrow{\sim} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} -) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} (\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} -)$ is also transitive, we obtain the transitivity by functoriality.

The second case is checked in a similar way □

Lemma 11.3.1.10. *Let $i \leq i_0$ be a nonnegative integer, $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_X) \cap D(\mathcal{D}^{(m)}_X)$, $\mathcal{F} \in D(\mathcal{D}^{(m)}_X)$ and $\mathcal{G} \in D(\mathcal{D}^{(m)}_X)$. The following canonical diagram of $D(\mathcal{D}^{(m)}_{X_i})$*

$$\begin{array}{ccc} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{G}] & \underset{\sim}{\longrightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{G}_i \\ \sim \downarrow 6.3.4.12 & & \sim \downarrow 6.3.4.12 \\ \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{G})] & \underset{\sim}{\longrightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{G}_i) \end{array} \tag{11.3.1.10.1}$$

is commutative.

Proof. Let us consider the diagram

$$\begin{array}{ccccc} \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{G} & \longrightarrow & \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}_i) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{G} & \underset{\sim}{\longrightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{G}_i \\ \sim \downarrow & & \sim \downarrow & & \sim \downarrow \\ \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{G}) & \longrightarrow & \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}_i \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{G}) & \underset{\sim}{\longrightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{G}_i). \end{array} \tag{11.3.1.10.2}$$

By functoriality, the left one is commutative. To check the right one, let $\mathcal{I}_i$ be a K-injective complex of $\mathcal{D}^{(m)}_{X_i}$-modules representing $\mathcal{F}_i$, $\mathcal{P}$ (resp. $\mathcal{P}'$) be a K-flat complex of $\mathcal{D}^{(m)}_{X^\sharp}$-modules representing $\mathcal{E}$ (resp.

$\mathcal{G}$) and $\mathcal{I}'_i$ be K-injective complex of $\mathcal{D}^{(m)}_{X_i}$-modules representing $\mathcal{I}_i \otimes_{\mathcal{O}_X} \mathcal{P}'$ ($\xrightarrow{\sim} \mathcal{I}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{P}'_i$). Let us recall that theses allow to compute the derived functors of the right square of the diagram of 11.3.1.10.2 (see 4.6.4.2). We compute that the canonical diagram

$$\begin{array}{ccccc} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P},\mathcal{I}_i) \otimes_{\mathcal{O}_X} \mathcal{P}' & \longrightarrow & \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P},\mathcal{I}_i \otimes_{\mathcal{O}_X} \mathcal{P}') & \longrightarrow & \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P},\mathcal{I}'_i) \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{P}_i,\mathcal{I}_i) \otimes_{\mathcal{O}_{X_i}} \mathcal{P}'_i & \longrightarrow & \mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{P}_i,\mathcal{I}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{P}'_i) & \longrightarrow & \mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{P}_i,\mathcal{I}'_i) \end{array}$$

is commutative. Hence so is the right diagram of 11.3.1.10.2. We conclude thanks to 11.3.1.4 (and 11.3.1.3.1). □

Lemma 11.3.1.11. *Let $i \leq i_0$ be a nonnegative integer, $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{D}^{(m)}_X)$ and $\mathcal{F} \in D({}^{\mathrm{l}}\mathcal{D}^{(m)}_X)$. The canonical diagram*

$$\begin{array}{ccc} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{E},\mathcal{F})] & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i) \\ \sim\downarrow 6.3.4.14 & & \sim\downarrow 6.3.4.14 \\ \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{O}_X,\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}))] & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X_i}}(\mathcal{O}_{X_i},\mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i)) \end{array} \tag{11.3.1.11.1}$$

is commutative.

Proof. By functoriality, the left square of the following diagram

$$\begin{array}{ccccc} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{E},\mathcal{F}) & \longrightarrow & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{E},\mathcal{F}_i) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i) \\ \sim\downarrow & & \sim\downarrow & & \sim\downarrow \\ \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{O}_X,\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F})) & \to & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{O}_X,\mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}_i)) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X_i}}(\mathcal{O}_{X_i},\mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{E}_i,\mathcal{F}_i)) \end{array} \tag{11.3.1.11.2}$$

is commutative. Let us now check the right one. Let $\mathcal{P}$ (resp. $\mathcal{P}'$) be a K-flat complex of $\mathcal{D}^{(m)}_{X^\sharp}$-modules representing $\mathcal{O}_X$ (resp. $\mathcal{E}$), $\mathcal{I}_i$ be a K-injective complex of $\mathcal{D}^{(m)}_{X_i}$-modules representing $\mathcal{F}_i$. We remark that $\mathcal{P} \otimes_{\mathcal{O}_X} \mathcal{P}'$ is then a K-flat complex of $\mathcal{D}^{(m)}_{X^\sharp}$-modules representing $\mathcal{E}$. Moreover, as $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}',\mathcal{I}_i) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{P}'_i,\mathcal{I}_i)$, following 4.2.4.6, $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}',\mathcal{I}_i)$ is a K-injective complex of $\mathcal{D}^{(m)}_{X_i}$-modules. Hence, they allow us to compute the terms of the right square of the diagram of 11.3.1.11.2 (for its top arrow, recall the construction of 4.6.4.2.1). Its commutativity is then a consequence of that of the square :

$$\begin{array}{ccc} \mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{P} \otimes_{\mathcal{O}_X} \mathcal{P}',\mathcal{I}_i) & \longrightarrow & \mathcal{H}om_{\mathcal{D}^{(m)}_{X_i}}(\mathcal{P}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{P}'_i,\mathcal{I}_i) \\ \downarrow & & \downarrow \\ \mathcal{H}om_{\mathcal{D}^{(m)}_{X^\sharp}}(\mathcal{P},\mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}',\mathcal{I}_i)) & \longrightarrow & \mathcal{H}om_{\mathcal{D}^{(m)}_{X_i}}(\mathcal{P}_i,\mathcal{H}om_{\mathcal{O}_{X_i}}(\mathcal{P}'_i,\mathcal{I}_i)). \end{array}$$

Finally, via 11.3.1.4 (and 11.3.1.3.1), the commutativity of 11.3.1.11.1 follows from that of 11.3.1.11.2. □

Lemma 11.3.1.12. *For any nonnegative integer $i \leq i_0$, for any $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{D}^{(m)}_X)$, we have the commutative diagram :*

$$\begin{array}{ccc} \mathcal{D}^{(m)}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} [\mathcal{D}^{(m)}_X \otimes_{\mathcal{O}_X} \mathcal{E}] & \xrightarrow[\sim]{\mathcal{D}^{(m)}_{X_i} \otimes \gamma_{\mathcal{E}}} & \mathcal{D}^{(m)}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} [\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_X] \\ \sim\downarrow & & \sim\downarrow \\ \mathcal{D}^{(m)}_{X_i} \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i & \xrightarrow[\sim]{\gamma_{\mathcal{E}_i}} & \mathcal{E}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i}, \end{array}$$

where γ is the logarithmic transposition isomorphism (see 4.2.5.1).

Proof. Let $\mathcal{P}$ be a K-flat complex of left $\mathcal{D}_X^{(m)}$-modules representing $\mathcal{E}$. Then $\mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \mathcal{P}$ is a K-flat complex of left $\mathcal{D}_X^{(m)}$-modules (for the underlying structure) representing $\mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$. It follows from the logarithmic transposition isomorphism that $\mathcal{P} \otimes_{\mathcal{O}_X} \mathcal{D}_X^{(m)}$ is a K-flat complex of left $\mathcal{D}_X^{(m)}$-modules (for the underlying structure) representing $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{D}_X^{(m)}$. Hence, we reduce to check the commutativity of the diagram where $\mathcal{E}$ is replaced by $\mathcal{P}$ and without $\mathbb{L}$. By $\mathcal{D}_{X_i}^{(m)}$-linearity, it is sufficient to check that for any both path, for any $x \in \mathcal{P}$, $1 \otimes [1 \otimes x]$ is sent on $(1 \otimes x) \otimes 1$, which is straightforward. □

Lemma 11.3.1.13. *Let $i \leq i_0$ be a nonnegative integer and $\mathcal{E} \in D({}^1\mathcal{D}_X^{(m)})$. The following diagram*

$$\begin{array}{ccc} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{D}_X^{(m)}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}] & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_{X_i}^{(m)}}(\mathcal{O}_{X_i}, \mathcal{D}_{X_i}^{(m)}) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{E}_i \\ \downarrow \sim & & \downarrow \sim \\ \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_X} [\mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E})] & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_{X_i}^{(m)}}(\mathcal{O}_{X_i}, \mathcal{D}_{X_i}^{(m)} \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i), \end{array} \quad (11.3.1.13.1)$$

where the horizontal isomorphisms follow from 4.6.4.7 and the vertical from 6.3.4.8, is commutative.

Proof. Since $\mathcal{O}_X \in D_{\mathrm{perf}}({}^1\mathcal{D}_X^{(m)})$ and $\mathcal{O}_{X_i} \in D_{\mathrm{perf}}({}^1\mathcal{D}_{X_i}^{(m)})$ (see 11.3.1.2), the vertical arrows are therefore isomorphisms. Moreover, we check by functoriality the commutativity of the left diagram below.

$$\begin{array}{ccccc} \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{D}_X^{(m)}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E} & \longrightarrow & \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{D}_{X_i}^{(m)}) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E} & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_{X_i}^{(m)}}(\mathcal{O}_{X_i}, \mathcal{D}_{X_i}^{(m)}) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{E}_i \\ \downarrow\sim & & \downarrow\sim & & \downarrow\sim \\ \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E}) & \longrightarrow & \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{D}_{X_i}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E}) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{{}^1\mathcal{D}_{X_i}^{(m)}}(\mathcal{O}_{X_i}, \mathcal{D}_{X_i}^{(m)} \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i). \end{array}$$

(11.3.1.13.2)

Let $\mathcal{I}_i$ be a K-injective complex of left $\mathcal{D}_{X_i}^{(m)} \otimes_{\mathcal{O}_{S_i}} \mathcal{D}_{X_i}^{(m)}$-modules representing $\mathcal{D}_{X_i}^{(m)}$, $\mathcal{P}$ be a K-flat complex of $\mathcal{D}_{X^\sharp}^{(m)}$-modules representing $\mathcal{E}$ and $\mathcal{I}'_i$ be a K-injective complex of $\mathcal{D}_{X_i}^{(m)} \otimes_{\mathcal{O}_{S_i}} \mathcal{D}_{X_i}^{(m)}$-modules representing $\mathcal{I}_i \otimes_{\mathcal{O}_X} \mathcal{P}$ ($\xrightarrow{\sim} \mathcal{I}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{P}_i$). The commutativity of the right diagram of 11.3.1.13.2 comes from that of

$$\begin{array}{ccccc} \mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{I}_i) \otimes_{\mathcal{O}_X} \mathcal{P} & \longrightarrow & \mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{I}_i \otimes_{\mathcal{O}_X} \mathcal{P}) & \longrightarrow & \mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{I}'_i) \\ \downarrow & & \downarrow & & \downarrow \\ \mathcal{H}om_{{}^1\mathcal{D}_{X_i}^{(m)}}(\mathcal{O}_{X_i}, \mathcal{I}_i) \otimes_{\mathcal{O}_{X_i}} \mathcal{P}_i & \longrightarrow & \mathcal{H}om_{{}^1\mathcal{D}_{X_i}^{(m)}}(\mathcal{O}_{X_i}, \mathcal{I}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{P}_i) & \longrightarrow & \mathcal{H}om_{{}^1\mathcal{D}_{X_i}^{(m)}}(\mathcal{O}_{X_i}, \mathcal{I}'_i). \end{array}$$

(11.3.1.13.3)

Moreover, if $\phi \in \mathcal{H}om_{{}^1\mathcal{D}_X^{(m)}}(\mathcal{O}_X, \mathcal{I}_i)$ and $x \in \mathcal{P}$, we compute that $\phi \otimes x$ is sent via both possible ways of the left diagram of 11.3.1.13.3, on $P_i \otimes a \mapsto P_i[\phi(a) \otimes (1 \otimes x)] = (P_i\phi(a)) \otimes (1 \otimes x)$, with $P_i \in \mathcal{D}_{X_i}^{(m)}$ and $a \in \mathcal{O}_X$. As the right diagram of 11.3.1.13.3 is commutative by functoriality, this yields that of 11.3.1.13.3.

Finally, with the remark 11.3.1.4, we deduce from the commutativity of 11.3.1.13.2 that of 11.3.1.13.1. □

Notation 11.3.1.14. For any $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_X) \cap D({}^1\mathcal{D}_X^{(m)})$, we denote by $\mathcal{E}^\vee := \mathbb{R}\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{O}_X)$ and by $\theta^{(m)} \colon \mathbb{D}^{(m)}(\mathcal{O}_X) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}^\vee \to \mathbb{D}^{(m)}(\mathcal{E})$ and $\theta_i^{(m)} \colon \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^\vee \xrightarrow{\sim} \mathbb{D}^{(m)}(\mathcal{E}_i)$ the homomorphism constructed via 6.3.4.15. Following 11.3.1.2, $\theta_i^{(m)}$ do is an isomorphism.

Proposition 11.3.1.15. *Let $i \leq i_0$ be a nonnegative integer and $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{O}_X) \cap D({}^1\mathcal{D}_X^{(m)})$. The following diagram*

$$\begin{array}{ccc} \mathcal{D}_{X_i}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{D}_X^{(m)}} [\mathbb{D}^{(m)}(\mathcal{O}_X) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}^\vee] & \xrightarrow[\sim]{} & \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^\vee \\ \downarrow 1\otimes\theta^{(m)} & & \sim \downarrow \theta_i^{(m)} \\ \mathcal{D}_{X_i}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{D}_X^{(m)}} [\mathbb{D}^{(m)}(\mathcal{E})] & \xrightarrow[\sim]{} & \mathbb{D}^{(m)}(\mathcal{E}_i), \end{array}$$

where the horizontal isomorphisms come from 4.6.4.7 (see also the example 4.6.4.5) and of 11.3.1.9, is commutative.

Proof. By construction of $\theta^{(m)}$ and $\theta_i^{(m)}$ (6.3.4.15), this is a consequence of lemmas 11.3.1.10, 11.3.1.11.1, 11.3.1.12 and 11.3.1.13.1. $\square$

11.3.1.16 (Construction of $\widehat{\theta}^{(m)}$)**.** For any nonnegative integer $i \leq i_0$, for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}}) \cap D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{\mathfrak{X}})$, let $\theta_i'^{(m)}$ be the morphism making commutative by definition the diagram

$$\begin{array}{ccc} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow[\sim]{\theta_i'^{(m)}} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{E})] \\ \sim\downarrow & & \sim\downarrow \\ \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^{\vee} & \xrightarrow[\sim]{\theta_i^{(m)}} & \mathbb{D}^{(m)}(\mathcal{E}_i), \end{array} \tag{11.3.1.16.1}$$

where the vertical isomorphisms are constructed thanks to 4.6.4.7 (see also the remark 4.6.4.5.(i)) and to 11.3.1.9. For any $j \leq i \leq i_0$, let us consider the diagram

$$\begin{array}{ccc} \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow{\theta_j'^{(m)}} & \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}\mathcal{E}] \\ \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow{\mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \theta_i'^{(m)}} & \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}\mathcal{E}] \\ \mathbb{D}^{(m)}(\mathcal{O}_{X_j}) \otimes_{\mathcal{O}_{X_j}} \mathcal{E}_j^{\vee} & \xrightarrow{\theta_j^{(m)}} & \mathbb{D}^{(m)}(\mathcal{E}_j) \\ \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} [\mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^{\vee}] & \xrightarrow{\mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} \theta_i^{(m)}} & \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_i}} [\mathbb{D}^{(m)}\mathcal{E}_i]. \end{array}$$

The squares of the front side and of the back side are commutative by construction of $\theta_i'^{(m)}$ (11.3.1.16.1). Moreover, thanks to 11.3.1.15 (resp. 4.6.4.7 and 4.6.4.5.(i), resp. 11.3.1.9.2), so is the bottom (resp. right, resp. left) one. Since the arrows are isomorphisms, then it follows that the top square is commutative. In other words, the family of isomorphisms $(\theta_i'^{(m)})_{i\in\mathbb{N}}$ induces the isomorphism of $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_{X_\bullet})$:

$$\mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] \xrightarrow{\sim} \mathcal{O}_{X_\bullet} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{E})].$$

By using 7.3.2.15 and 7.3.3.4, this yields the construction of an isomorphism

$$\widehat{\theta}^{(m)} \colon \widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee} \to \widehat{\mathbb{D}}^{(m)}(\mathcal{E})$$

inducing the following diagram

$$\begin{array}{ccccc} \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & = & \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow[\sim]{} & \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^{\vee} \\ \sim\downarrow \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\theta}^{(m)} & & \downarrow \theta_j'^{(m)} & & \sim\downarrow \theta_i^{(m)} \\ \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}\mathcal{E}] & = & \mathcal{O}_{X_j} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}\mathcal{E}] & \xrightarrow[\sim]{} & \mathbb{D}^{(m)}(\mathcal{E}_i). \end{array} \tag{11.3.1.16.2}$$

Notation 11.3.1.17. For any $\mathcal{E} \in D(\mathcal{D}^{(m)}_{\mathfrak{X}}) \cap D_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}})$, we denote by $\rho^{(m)}_{\mathcal{E}}$ or $\rho^{(m)}$ the morphism

$$\rho^{(m)}_{\mathcal{E}} \colon \mathbb{D}^{(m)}(\mathcal{E}) \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{X}}} \mathbb{D}^{(m)}(\mathcal{E}) \underset{4.6.4.7.1}{\xrightarrow{\sim}} \widehat{\mathbb{D}}^{(m)}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{X}}} \mathcal{E}) \xrightarrow{\sim} \widehat{\mathbb{D}}^{(m)}(\mathcal{E}), \tag{11.3.1.17.1}$$

the latter isomorphism coming from 11.1.1.5.

Lemma 11.3.1.18. *Let $f \colon \mathcal{E} \to \mathcal{E}'$ be a morphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{\mathfrak{X}})$, $g \colon \mathcal{F} \to \mathcal{F}'$ be a morphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}})$, $\alpha \colon \mathcal{E} \to \mathcal{F}$ and $\beta \colon \mathcal{E}' \to \mathcal{F}$ be two morphisms of $D(\mathcal{D}^{(m)}_{\mathfrak{X}})$.*

The left following diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{f} & \mathcal{E}' \\ \downarrow{\scriptstyle \alpha} & & \downarrow{\scriptstyle \beta} \\ \mathcal{F} & \xrightarrow{g} & \mathcal{F}', \end{array} \qquad \begin{array}{ccc} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} & \xrightarrow{\mathrm{id} \otimes f} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}' \\ \downarrow{\scriptstyle id \otimes \alpha} & & \downarrow{\scriptstyle \mathrm{id} \otimes \beta} \\ \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{F} & \xrightarrow{\mathrm{id} \otimes g} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{F}' \end{array} \tag{11.3.1.18.1}$$

is commutative if and only if, for any nonnegative integer i, so is the right one.

Proof. The morphisms α and β factors through $\alpha' \colon \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{X}}} \mathcal{E} \to \mathcal{F}$ and $\beta' \colon \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{X}}} \mathcal{E}' \to \mathcal{F}'$. By considering the diagram

$$\begin{array}{ccccc} \mathcal{E} & & \xrightarrow{f} & & \mathcal{E}' \\ \downarrow & \searrow{\scriptstyle \alpha} & & & \downarrow \quad \searrow{\scriptstyle \beta} \\ \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{X}}} \mathcal{E} & & \xrightarrow{1 \otimes f} & & \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{X}}} \mathcal{E}' \\ & \searrow{\scriptstyle \alpha'} & & & \searrow{\scriptstyle \beta'} \\ & \mathcal{F} & \xrightarrow{g} & & \mathcal{F}', \end{array} \tag{11.3.1.18.2}$$

we check that the left square of 11.3.1.18.1 is commutative if and only if so is the horizontal square of 11.3.1.18.2. We conclude via 7.3.2.15 and 7.3.3.4. □

Proposition 11.3.1.19. *For any $\mathcal{E} \in D(\mathcal{D}^{(m)}_{\mathfrak{X}}) \cap D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}})$, the following diagram*

$$\begin{array}{ccc} \mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee} & \xrightarrow{\theta^{(m)}} & \mathbb{D}^{(m)}(\mathcal{E}) \\ \downarrow{\scriptstyle \rho^{(m)}_{\mathcal{O}_{\mathfrak{X}}} \otimes \mathrm{id}} & & \downarrow{\scriptstyle \rho^{(m)}_{\mathcal{E}}} \\ \widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee} & \underset{\sim}{\xrightarrow{\widehat{\theta}^{(m)}}} & \widehat{\mathbb{D}}^{(m)}(\mathcal{E}) \end{array}$$

is commutative.

Proof. By using 11.3.1.18, it is sufficient to prove, for any nonnegative integer i, that the central square of the diagram

$$\begin{array}{ccccccc} \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^{\vee} & \underset{\sim}{\longleftarrow} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow{\theta^{(m)}} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\mathbb{D}^{(m)}(\mathcal{E})] & \underset{\sim}{\longrightarrow} & \mathbb{D}^{(m)}(\mathcal{E}_i) \\ \| & & \downarrow{\scriptstyle \mathrm{id} \otimes \rho^{(m)}_{\mathcal{O}_{\mathfrak{X}}} \otimes \mathrm{id}} & & \downarrow{\scriptstyle \mathrm{id} \otimes \rho^{(m)}_{\mathcal{E}}} & & \| \\ \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^{\vee} & \underset{\sim}{\longleftarrow} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \underset{\sim}{\xrightarrow{\mathrm{id} \otimes \widehat{\theta}^{(m)}}} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{E})] & \underset{\sim}{\longrightarrow} & \mathbb{D}^{(m)}(\mathcal{E}_i) \end{array} \tag{11.3.1.19.1}$$

is commutative. Following 11.3.1.15, the composition of the morphisms of the top of 11.3.1.19.1 is equal to $\theta_i^{(m)}$. By construction (11.3.1.16.2), so is that bottom. Since the thorizontal arrows at the end of the diagram 11.3.1.19.1 are isomorphisms, to get the commutativity of the square of the center, it is sufficient to prove that of the right and left squares. The right square of 11.3.1.19.1 corresponds to the outer of the following diagram

$$\begin{array}{ccccccc} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathbb{D}(\mathcal{E}) & \longrightarrow & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathcal{D}}_{\mathfrak{X}} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathbb{D}(\mathcal{E})] & \longrightarrow & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathbb{D}}(\widehat{\mathcal{D}}_{\mathfrak{X}} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{E}) & \longrightarrow & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathbb{D}}(\mathcal{E}) \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ \mathcal{D}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{D}_{\mathfrak{X}}} \mathbb{D}(\mathcal{E}) & \longrightarrow & \mathcal{D}_{X_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_{\mathfrak{X}}} [\widehat{\mathcal{D}}_{\mathfrak{X}} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathbb{D}(\mathcal{E})] & \longrightarrow & \mathcal{D}_{X_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_{\mathfrak{X}}} \widehat{\mathbb{D}}(\widehat{\mathcal{D}}_{\mathfrak{X}} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{E}) & \longrightarrow & \mathcal{D}_{X_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_{\mathfrak{X}}} \widehat{\mathbb{D}}(\mathcal{E}) \\ \downarrow & & & & \downarrow & & \downarrow \\ \mathbb{D}(\mathcal{D}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{D}_{\mathfrak{X}}} \mathcal{E}) & & \longleftarrow & & \mathbb{D}(\mathcal{D}_{X_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_{\mathfrak{X}}} \widehat{\mathcal{D}}_{\mathfrak{X}} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{E}) & \longrightarrow & \mathbb{D}(\mathcal{D}_{X_i} \otimes_{\widehat{\mathcal{D}}_{\mathfrak{X}}} \mathcal{E}) \\ \downarrow & & & & & & \downarrow \\ \mathbb{D}(\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) & & = & = & = & & \mathbb{D}(\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}), \end{array} \tag{11.3.1.19.2}$$

where we have omitted to write the indices (m). Moreover, we compute that the top right square (we choose a K-flat complex representing $\mathbb{D}^{(m)}(\mathcal{E})$) and the bottom rectangle (by forgetting $\mathbb{D}^{(m)}$, we choose a K-flat complex representing $\mathcal{E}$) are commutative. Moreover, so is the rectangle of the middle thanks to the transitivity of 4.6.4.7 (with also the remark 4.6.4.5.(i)). The commutativity of the other squares is functorial. Hence we get that of the right diagram of 11.3.1.19.1.

Finally, the commutativity of the left square of 11.3.1.19.1 is a consequence of that of the diagram below :

$$\begin{array}{ccccc}
\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow{\sim} & [\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}})] \otimes_{\mathcal{O}_{X_i}} [\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow{\sim} & \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^{\vee} \\
\downarrow{\scriptstyle \mathrm{id} \otimes \rho^{(m)} \otimes \mathrm{id}} & & \downarrow{\scriptstyle (id \otimes \rho^{(m)}) \otimes \mathrm{id}} & & \| \\
\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow{\sim} & [\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}})] \otimes_{\mathcal{O}_{X_i}} [\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee}] & \xrightarrow{\sim} & \mathbb{D}^{(m)}(\mathcal{O}_{X_i}) \otimes_{\mathcal{O}_{X_i}} \mathcal{E}_i^{\vee},
\end{array}$$

whose that of the right square can be checked by functoriality thanks to that of the right square of 11.3.1.19.1. □

11.3.2 Compatibility with Frobenius of $\widehat{\theta}^{(m)}$

For simplicity suppose [3] there exists $F\colon \mathfrak{X} \to \mathfrak{X}'$ a morphism of smooth formal $\mathfrak{S}$-schemes which is a lifting of the relative Frobenius $F^s_{X_0/S_0}\colon X_0 \to X_0^{(s)}$. We prove in this subsection that the isomorphism

$$\widehat{\theta}^{(m)}\colon \widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^{\vee} \to \widehat{\mathbb{D}}^{(m)}(\mathcal{E})$$

is compatible with Frobenius (see 11.3.2.9.1). The idea it to check it by p-adic completion.

11.3.2.1. The functor $\widehat{\mathbb{D}}^{(m)}$ commutes canonically with Frobenius. More precisely, denoting by $\widetilde{\mathbb{D}}^{(m)} = \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(-, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})[d_{X'/S}]$, which is canonically isomorphic to the composition of the functors $\widehat{\mathbb{D}}^{(m)}$ and $- \otimes_{\mathcal{O}_X} \omega_{\mathfrak{X}}$, we have for any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})$ the isomorphisms

$$F^{\flat}\widetilde{\mathbb{D}}^{(m)}(\mathcal{E}') \underset{4.6.3.6.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \underset{F^*}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \underset{8.8.1.1.1}{\xrightarrow{\sim}} \widetilde{\mathbb{D}}^{(m+s)}(F^*\mathcal{E}'). \tag{11.3.2.1.1}$$

This yields:

$$F^*\widehat{\mathbb{D}}^{(m)}(\mathcal{E}') \overset{8.8.1.3.1}{\xrightarrow{\sim}} F^{\flat}\widetilde{\mathbb{D}}^{(m)}(\mathcal{E}') \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}/\mathfrak{S}} \overset{11.3.2.1.1}{\xrightarrow{\sim}} \widetilde{\mathbb{D}}^{(m+s)}(F^*\mathcal{E}') \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} \widehat{\mathbb{D}}^{(m+s)}(F^*\mathcal{E}'). \tag{11.3.2.1.2}$$

Remark, replacing $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$ by $\mathcal{D}^{(m)}_{X'_i}$ and $\widehat{\mathcal{D}}^{(m+s)}_{X_i}$ by $\mathcal{D}^{(m+s)}_{X_i}$, we get the construction of the commutation with Frobenius of the dual functor of 6.2.7.2. The purpose of the following lemmas and facts is to check the compatibility with base change of this isomorphism 11.3.2.1.1 (i.e. the commutativity of the diagram 11.3.2.7.1).

11.3.2.2. It follows by functoriality from 8.8.1.3 that the functors F^* and $F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} -$ induce exact canonically quasi-inverse equivalences between the category of complexes of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})^{\mathrm{op}}$-modules (i.e. $(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})$-bimodules whose both induced structures of $\mathcal{V}$-algebras coincide) and that of complexes of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}})^{\mathrm{op}}$-modules (i.e. $(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}, \widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}})$-bimodules whose both induced structures of $\mathcal{V}$-algebras coincide).

Similarly, by functoriality, we can check that the functors $F^{\flat}$ and $- \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} F^*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$ induce exact canonically quasi-inverse equivalences between the category of complexes of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})^{\mathrm{op}}$-modules and that of complexes of left $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})^{\mathrm{op}}$-modules.

11.3.2.3. 1) Let $\mathcal{M}'$ be a K-flat complex of right $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules. The functor F^* induces an equivalence of categories between acyclic complexes of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules and acyclic complexes of left $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules. For any acyclic complex $\mathcal{E}'$ of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules, we get

$$F^{\flat}\mathcal{M}' \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} F^*(\mathcal{E}') \xrightarrow{\sim} \mathcal{M}' \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} F^*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} \mathcal{E}' \xrightarrow{\sim} \mathcal{M}' \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} \mathcal{E}'.$$

[3] This hypothesis is useless since we can define by glueing F^* etc.

This yields that $F^\flat \mathcal{M}'$ is a K-flat complex of right $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules.

Similarly, if $\mathcal{E}'$ is a K-flat complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules then $F^*\mathcal{E}'$ is a K-flat complex of left $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules.

1') Similarly, let $\mathcal{M}'$ be a K-flat complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})^{\mathrm{op}}$-modules. Then, $F^\flat \mathcal{M}'$ is a complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}})^{\mathrm{op}}$-modules which is both a K-flat complex of right $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules and a K-flat complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules. Indeed, the first property is checked as above. Let us check the second one. For any acyclic complex $\mathcal{E}'$ of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules, we get

$$\mathcal{E}' \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^\flat \mathcal{M}' \xrightarrow{\sim} \left(\mathcal{E}' \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} \mathcal{M}'\right) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}.$$

Since $F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$ is a flat right $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-module, then we can conclude.

Moreover, similarly, we can check that $F^*\mathcal{M}'$ is a complex of left $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})^{\mathrm{op}}$-modules which is both a K-flat complex of left $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules and a K-flat complex of right $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules.

2) Let $\mathcal{I}'$ be a K-injective complex of right $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules. The functor $F^\flat$ induces an equivalence of categories between acyclic complexes of right $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules and acyclic complexes of right $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules. This yields that $F^\flat \mathcal{I}'$ is a K-injective complex of right $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules. Indeed, for any acyclic complex $\mathcal{N}'$ of right $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules, we have the isomorphism

$$\mathrm{Hom}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{N}', \mathcal{I}') \xrightarrow{\sim} \mathrm{Hom}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^\flat \mathcal{N}', F^\flat \mathcal{I}').$$

Hence, we are done.

Similarly (use 11.3.2.2), if $\mathcal{I}'$ is a K-injective complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})^{\mathrm{op}}$-modules. then $F^\flat \mathcal{I}'$ is a K-injective complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} \otimes_{\mathcal{V}} (\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}'})^{\mathrm{op}}$-modules. In particular, it is both a K-injective complex of right $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$-modules and a K-injective complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules.

To prove 11.3.2.7, that we will use in the proof of the theorem 11.3.2.9 of commutation to Frobenius of $\widehat{\theta}^{(m)}$, we will need the three lemmas below.

Lemma 11.3.2.4. *Let i be a nonnegative integer and $\mathcal{E}' \in D_{\mathrm{perf}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})$. The following diagram of $D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}^{(m+s)}_{X_i})$*

$$\begin{array}{ccc}
\left(\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}\right) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow[\sim]{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\mathcal{D}^{(m)}_{X'_i}}(\mathcal{E}'_i, \mathcal{D}^{(m)}_{X'_i}) \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^\flat \mathcal{D}^{(m)}_{X'_i} \\
\sim\downarrow 4.6.3.6.1 & & \sim\downarrow 4.6.3.6.1 \\
\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow[\sim]{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\mathcal{D}^{(m)}_{X'_i}}(\mathcal{E}'_i, F^\flat \mathcal{D}^{(m)}_{X'_i}),
\end{array} \tag{11.3.2.4.1}$$

is commutative.

Proof. By using the remark 11.3.1.4, we reduce to check the commutativity of (the outer of) the diagram:

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} & \xrightarrow[\sim]{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \\
\downarrow & & \downarrow \\
\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{D}^{(m)}_{X'_i}) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} & \xrightarrow[\sim]{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{D}^{(m)}_{X'_i} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \\
\downarrow & & \downarrow \\
\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\mathcal{D}^{(m)}_{X'_i}}(\mathcal{E}'_i, \mathcal{D}^{(m)}_{X'_i}) \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^\flat \mathcal{D}^{(m)}_{X'_i} & \xrightarrow[\sim]{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\mathcal{D}^{(m)}_{X'_i}}(\mathcal{E}'_i, F^\flat \mathcal{D}^{(m)}_{X'_i}).
\end{array} \tag{11.3.2.4.2}$$

By functoriality, we can check the commutativity of the top square. Let $\mathcal{P}'$ be a K-flat complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules representing $\mathcal{E}'$, let $\mathcal{I}'_i$ be a K-injective complex of left $\mathcal{D}^{(m)}_{X'_i} \otimes_{\mathcal{V}} (\mathcal{D}^{(m)}_{X'_i})^{\mathrm{op}}$-modules representing $\mathcal{D}^{(m)}_{X'_i}$. We set $\mathcal{P}'_i := \mathcal{D}^{(m)}_{X'_i} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} \mathcal{P}'$. We easily compute the commutativity of the diagram:

$$\begin{array}{ccc}
\mathcal{H}om_{{}^1\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{P}', \mathcal{I}'_i) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'} & \longrightarrow & \mathcal{H}om_{{}^1\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{P}', \mathcal{I}'_i \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \\
\downarrow & & \downarrow \\
\mathcal{H}om_{{}^1\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{P}', \mathcal{I}'_i) \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^{\flat}\mathcal{D}^{(m)}_{X'_i} & \longrightarrow & \mathcal{H}om_{{}^1\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{P}', \mathcal{I}'_i \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^{\flat}\mathcal{D}^{(m)}_{X'_i}) \\
\downarrow & & \downarrow \\
\mathcal{H}om_{{}^1\mathcal{D}^{(m)}_{X'_i}}(\mathcal{P}'_i, \mathcal{J}'_i) \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^{\flat}\mathcal{D}^{(m)}_{X'_i} & \xrightarrow{\sim} & \mathcal{H}om_{{}^1\mathcal{D}^{(m)}_{X'_i}}(\mathcal{P}'_i, \mathcal{J}'_i \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^{\flat}\mathcal{D}^{(m)}_{X'_i}),
\end{array} \quad (11.3.2.4.3)$$

Since $\mathcal{J}'_i \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^{\flat}\mathcal{D}^{(m)}_{X'_i} = F^{\flat}\mathcal{J}'_i$ is a K-injective complex of left $\mathcal{D}^{(m)}_{X'_i} \otimes_{\mathcal{V}} (\mathcal{D}^{(m+s)}_{X_i})^{\mathrm{op}}$-modules representing $F^{\flat}\mathcal{D}^{(m)}_{X'_i}$ (see 11.3.2.3), this yields the commutativity of the bottom square of 11.3.2.4.2. □

Lemma 11.3.2.5. *Let i be a nonnegative integer, $\mathcal{E}' \in D({}^1\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})$ and $\mathcal{F}' \in D({}^1\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}, \widehat{\mathcal{D}}^{(m+s)\mathrm{r}}_{\mathfrak{X}})$ The following diagram*

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{F}') \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X'_i}}(\mathcal{E}'_i, \mathcal{F}'_i) \\
\sim \downarrow F^*\otimes \mathrm{id} & & \sim \downarrow F^* \\
\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*\mathcal{F}') \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m+s)}_{X_i}}(F^*\mathcal{E}'_i, F^*\mathcal{F}'_i)
\end{array}$$

is commutative.

Proof. By using the remark 11.3.1.4, it is sufficient to prove the commutativity of the diagram below

$$\begin{array}{ccccc}
\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{F}') & \longrightarrow & \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{F}'_i) & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X'_i}}(\mathcal{E}'_i, \mathcal{F}'_i) \\
\sim\downarrow F^* & & \sim\downarrow F^* & & \sim\downarrow F^* \\
\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*\mathcal{F}') & \longrightarrow & \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*\mathcal{F}'_i) & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m+s)}_{X_i}}(F^*\mathcal{E}'_i, F^*\mathcal{F}'_i).
\end{array}$$

That of the left square is proved by functoriality, whereas we can check the right one by choosing a K-injective complex of left $\mathcal{D}^{(m)}_{X'_i} \otimes_{\mathcal{O}_{S_i}} \mathcal{D}^{(m+s)}_{X_i}$-modules representing $\mathcal{F}'_i$ and a K-flat complex of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-modules representing $\mathcal{E}'$ (the functor F^*, by increasing the level, preserves the K-flatness and the K-injectivity). □

Lemma 11.3.2.6. *Let i be a nonnegative integer. The following canonical diagram*

$$\begin{array}{ccc}
\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m+s)}_{X_i}}(F^*\mathcal{E}'_i, F^*F^{\flat}\mathcal{D}^{(m)}_{X'_i}) \\
\sim\downarrow 8.8.1.1.1 & & \sim\downarrow 6.1.3.2.1 \\
\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', \widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow{4.6.4.7.1} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m+s)}_{X_i}}(F^*\mathcal{E}'_i, \mathcal{D}^{(m+s)}_{X_i})
\end{array}$$

is commutative.

Proof. Exercice. □

Proposition 11.3.2.7. *Let i be a nonnegative integer and $\mathcal{E}' \in D_{\mathrm{perf}}({}^1\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'})$. The following canonical diagram*

$$\begin{array}{ccccc}
\mathcal{D}^{(m+s)}_{X_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} [F^*\widehat{\mathbb{D}}^{(m)}(\mathcal{E}')] & \xrightarrow{\sim} & F^*[\mathcal{D}^{(m)}_{X'_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} \widehat{\mathbb{D}}^{(m)}(\mathcal{E}')] & \underset{\sim}{\xrightarrow{4.6.4.7.1}} & F^*\mathbb{D}^{(m)}(\mathcal{E}'_i) \\
\sim\downarrow 11.3.2.1.2 & & & & \sim\downarrow 11.3.2.1.2 \\
\mathcal{D}^{(m+s)}_{X_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} [\widehat{\mathbb{D}}^{(m+s)}F^*(\mathcal{E}')] & \underset{\sim}{\xrightarrow{4.6.4.7.1}} & \mathbb{D}^{(m+s)}(\mathcal{D}^{(m+s)}_{X_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} F^*(\mathcal{E}')) & \xrightarrow{\sim} & \mathbb{D}^{(m+s)}F^*(\mathcal{E}'_i),
\end{array}$$

(11.3.2.7.1)

is commutative.

Proof. To get 11.3.2.7.1, we have just to By composing the commutative diagrams 11.3.2.4 with 11.3.2.5 in the case where $\mathcal{F}' = F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$ and next with 11.3.2.6, we get the commutative diagram

$$\begin{array}{ccc} \left(\widetilde{\mathbb{D}}^{(m)}(\mathcal{E}') \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}} F^\flat \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}\right) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow[\sim]{4.6.4.7.1} & \widetilde{\mathbb{D}}^{(m)}(\mathcal{E}'_i) \otimes_{\mathcal{D}^{(m)}_{X'_i}} F^\flat \mathcal{D}^{(m)}_{X'_i} \\ \sim\downarrow 11.3.2.1.1 & & \sim\downarrow 11.3.2.1.1 \\ \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', \widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}} \mathcal{D}^{(m+s)}_{X_i} & \xrightarrow{4.6.4.7.1} & \widetilde{\mathbb{D}}^{(m+s)}(F^*\mathcal{E}'_i) \end{array} \qquad (11.3.2.7.2)$$

By applying the switching functor $- \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}/\mathfrak{S}}$ to 11.3.2.7.2, we get 11.3.2.7.1. □

Proposition 11.3.2.8. *For any nonnegative integer i, for any $\mathcal{E}', \mathcal{F}' \in D(\mathcal{D}^{(m)}_{\mathfrak{X}'})$, the diagram*

$$\begin{array}{ccc} \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} F^*\mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{F}') & \xrightarrow[\sim]{} & \mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*\mathcal{F}') \\ \downarrow & & \downarrow \\ F_i^*\mathbb{R}\mathcal{H}om_{\mathcal{O}_{X'_i}}(\mathcal{E}'_i, \mathcal{F}'_i) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(F_i^*\mathcal{E}'_i, \mathcal{F}'_i) \end{array}$$

is commutative.

Proof. By using the remark 11.3.1.3.1 and 11.3.1.3.1, it is sufficient to prove the commutativity of the diagram below

$$\begin{array}{ccc} F^*\mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{F}') & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*\mathcal{F}') \\ \downarrow & & \downarrow \\ F^*\mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{F}'_i) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*\mathcal{F}'_i) \\ \downarrow & & \downarrow \\ F^*\mathbb{R}\mathcal{H}om_{\mathcal{O}_{X'_i}}(\mathcal{E}'_i, \mathcal{F}'_i) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{O}_{X_i}}(F_i^*\mathcal{E}'_i, F_i^*\mathcal{F}'_i). \end{array} \qquad (11.3.2.8.1)$$

The commutativity of the top square follows by functoriality. Choose a K-flat complex $\mathcal{P}'$ of left $\mathcal{D}^{(m)}_{\mathfrak{X}'}$-modules representing $\mathcal{E}'$ and a K-injective complex $\mathcal{I}'_i$ of left $\mathcal{D}^{(m)}_{X'_i}$-modules representing $\mathcal{F}'_i$. Since $F^*\mathcal{P}'$ is a K-flat complex of left $\mathcal{D}^{(m+s)}_{\mathfrak{X}}$-modules representing $f^*\mathcal{E}'$, since $F^*\mathcal{P}'_i$ is a K-flat complex of left $\mathcal{D}^{(m+s)}_{X_i}$-modules representing $F^*\mathcal{E}'_i$ since $F^*\mathcal{I}'_i$ is a K-injective complex of left $\mathcal{D}^{(m+s)}_{X_i}$-modules representing $F^*\mathcal{F}'_i$, to check the commutativity of the bottom square by replacing $\mathcal{E}'$ by $\mathcal{P}'$ and $\mathcal{F}'$ by $\mathcal{I}'$, we can remove $\mathbb{R}$. Hence, the check of the commutativity is elementary. □

Theorem 11.3.2.9. *For any $\mathcal{E}' \in D(\mathcal{D}^{(m)}_{\mathfrak{X}'}) \cap D_{\mathrm{perf}}(\mathcal{O}_{\mathfrak{X}'})$, the diagram below*

$$\begin{array}{ccc} F^*(\mathcal{E}'^\vee \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}} \widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'})) & \xrightarrow[\sim]{F^*\widehat{\theta}^{(m)}} & F^*\widehat{\mathbb{D}}^{(m)}(\mathcal{E}') \\ \sim\downarrow & & \sim\downarrow \\ (F^*\mathcal{E}')^\vee \otimes_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathbb{D}}^{(m+s)}(\mathcal{O}_{\mathfrak{X}}) & \xrightarrow[\sim]{\widehat{\theta}^{(m+s)}} & \widehat{\mathbb{D}}^{(m+s)}(F^*\mathcal{E}') \end{array} \qquad (11.3.2.9.1)$$

is commutative.

Proof. Following 7.3.2.15 and 7.3.3.4, it is sufficient to prove that for any nonnegative integer i, the square of the front side of the cube

$$\begin{array}{ccccc}
 & F^*(\mathcal{E}_i'^{\vee}\otimes_{\mathcal{O}_{X_i'}}\mathbb{D}^{(m)}\mathcal{O}_{X_i'}) & \xrightarrow{F^*\theta_i^{(m)}} & F^*\mathbb{D}^{(m)}(\mathcal{E}_i') & \\
\mathcal{O}_{X_i}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}[F^*(\mathcal{E}'^{\vee}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'}))] & \xrightarrow{\mathrm{id}\otimes F^*\widehat{\theta}^{(m)}} & \mathcal{O}_{X_i}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}[F^*\widehat{\mathbb{D}}^{(m)}(\mathcal{E}')] & & \\
 & (F^*\mathcal{E}_i')^{\vee}\otimes_{\mathcal{O}_{X_i}}\mathbb{D}^{(m+s)}\mathcal{O}_{X_i} & \xrightarrow{\theta_i^{(m+s)}} & \mathbb{D}^{(m+s)}(F^*\mathcal{E}_i') & \\
\mathcal{O}_{X_i}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}[(F^*\mathcal{E}')^{\vee}\otimes_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathbb{D}}^{(m+s)}(\mathcal{O}_{\mathfrak{X}})] & \xrightarrow{\mathrm{id}\otimes\widehat{\theta}^{(m+s)}} & \mathcal{O}_{X_i}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}\widehat{\mathbb{D}}^{(m+s)}(F^*\mathcal{E}') & &
\end{array} \tag{11.3.2.9.2}$$

is commutative. Following 11.3.2.7, this is the case for the right square. Moreover, by using 11.3.2.7 and of 11.3.2.8 so is the left one. For the bottom square, this is a consequence (modulo the isomorphism $F^*\mathcal{E}_i'\xrightarrow{\sim}\mathcal{O}_{X_i}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}}F^*\mathcal{E}'$) of the definitions (11.3.1.16.2). The square of the top corresponds to the outer of

$$\begin{array}{ccccc}
\mathcal{O}_{X_i}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}}[F^*(\mathcal{E}'^{\vee}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'}))] & \xrightarrow[\sim]{} & F^*[\mathcal{O}_{X_i'}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}(\mathcal{E}'^{\vee}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'}))] & \xrightarrow[\sim]{} & F^*(\mathcal{E}_i'^{\vee}\otimes_{\mathcal{O}_{X_i'}}\mathbb{D}^{(m)}\mathcal{O}_{X_i'}) \\
\sim\downarrow \mathrm{id}\otimes F^*(\widehat{\theta}^{(m)}) & & \sim\downarrow F^*(id\otimes\widehat{\theta}^{(m)}) & & \sim\downarrow F^*\theta_i^{(m)} \\
\mathcal{O}_{X_i}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}}[F^*\widehat{\mathbb{D}}^{(m)}(\mathcal{E}')] & \xrightarrow[\sim]{} & F^*[\mathcal{O}_{X_i'}\otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}'}}\widehat{\mathbb{D}}^{(m)}(\mathcal{E}')] & \xrightarrow[\sim]{} & F^*\mathbb{D}^{(m)}(\mathcal{E}_i').
\end{array} \tag{11.3.2.9.3}$$

The commutativity of the left square of 11.3.2.9.3 is functorial and that of the right square follows from 11.3.1.16.2. Finally, that of the back square of 11.3.2.9.2 is due to the fact that $\theta_i^{(m)}$ is compatible with Frobenius (6.3.4.15.(ii)). The arrows of 11.3.2.9.2 being isomorphisms, since we check that five of its faces are commutative, then so is the front side one. □

11.3.3 Construction of $\theta_{\mathbb{Q}}^{(m)}$ and its compatibility with Frobenius

11.3.3.1. Let $\mathcal{E}'$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}$-coherent (i.e., it corresponds to a convergent isocrystal on X') and, for any nonnegative integer m, $\mathring{\mathcal{E}}'^{(m)}$ be a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$-module which is $\mathcal{O}_{\mathfrak{X}'}$-coherent and such that there exists a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}'^{(m)}_{\mathbb{Q}}\xrightarrow{\sim}\mathcal{E}'$.

We denote by $\mathbb{D}^{\mathrm{alg}}_{\mathfrak{X}}$ or $\mathbb{D}^{\mathrm{alg}}$, the $\mathcal{D}_{\mathfrak{X},\mathbb{Q}}$-linear dual functor, and by $\mathbb{D}^{(m)}_{\mathfrak{X},\mathbb{Q}}$ or $\mathbb{D}^{(m)}_{\mathbb{Q}}$, the $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}$-linear dual. We remark that it follows from 8.7.7.5 that for any nonnegative integer m we have the isomorphisms $\mathbb{D}^{\mathrm{alg}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}})\xrightarrow{\sim}\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ and $\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}})\xrightarrow{\sim}\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$, this latter is probably not compatible with Frobenius.

We construct the isomorphism $\theta^{(m)}_{\mathbb{Q}}$, via the commutative diagram :

$$\begin{array}{ccc}
\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X}',\mathbb{Q}})\otimes_{\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}}\mathcal{E}'^{\vee} & \overset{\theta^{(m)}_{\mathbb{Q}}}{\underset{\sim}{\dashrightarrow}} & \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \\
\uparrow\sim & & \uparrow\sim \\
(\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'})\otimes_{\mathcal{O}_{\mathfrak{X}'}}\mathring{\mathcal{E}}'^{(m)\vee})\otimes_{\mathbb{Z}}\mathbb{Q} & \xrightarrow[\sim]{\widehat{\theta}^{(m)}\otimes\mathbb{Q}} & (\widehat{\mathbb{D}}^{(m)}(\mathring{\mathcal{E}}'^{(m)}))\otimes_{\mathbb{Z}}\mathbb{Q}.
\end{array} \tag{11.3.3.1.1}$$

We notice that thanks to 11.3.3.3, this one is independent of the choice of $\mathring{\mathcal{E}}'^{(m)}$.

11.3.3.2. For any coherent $\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-coherent $\mathcal{E}$ (similarly by replacing $\mathfrak{X}$ by another smooth $\mathcal{V}$-formal scheme, like by example $\mathfrak{X}'$), we denote by $\rho^{(m)}_{\mathbb{Q}}$, the composite isomorphism :

$$\rho^{(m)}_{\mathbb{Q}}\colon\mathbb{D}^{\mathrm{alg}}(\mathcal{E})\xrightarrow{\sim}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}\otimes_{\mathcal{D}_{\mathfrak{X},\mathbb{Q}}}\mathbb{D}^{\mathrm{alg}}(\mathcal{E})\underset{4.6.4.7.1}{\xrightarrow{\sim}}\mathbb{D}^{(m)}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}\otimes_{\mathcal{D}_{\mathfrak{X},\mathbb{Q}}}\mathcal{E})\xrightarrow{\sim}\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}). \tag{11.3.3.2.1}$$

According to 11.2.6.3.1, we denote by θ^{alg}, the isomorphism $\mathbb{D}^{\mathrm{alg}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}})\otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}}\mathcal{E}^{\vee}\xrightarrow{\sim}\mathbb{D}^{\mathrm{alg}}(\mathcal{E})$ constructed via 6.3.4.15.

Theorem 11.3.3.3. *With the notations of 11.3.3.1, the following diagram*

$$\begin{array}{ccc}
\mathbb{D}^{\mathrm{alg}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}'^{\vee} & \xrightarrow[\sim]{\theta^{\mathrm{alg}}} & \mathbb{D}^{\mathrm{alg}}(\mathcal{E}') \\
\sim \downarrow {\scriptstyle \rho^{(m)}_{\mathbb{Q}} \otimes \mathrm{id}} & & \sim \downarrow {\scriptstyle \rho^{(m)}_{\mathbb{Q}}} \\
\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}'^{\vee} & \xrightarrow[\sim]{\theta^{(m)}_{\mathbb{Q}}} & \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}')
\end{array} \tag{11.3.3.3.1}$$

is commutative

Proof. Let us consider the cube

$$\begin{array}{ccccc}
 & (\mathbb{D}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathring{\mathcal{E}}'^{(m)\vee}) \otimes \mathbb{Q} & \xrightarrow{\theta^{(m)} \otimes \mathbb{Q}} & & \mathbb{D}^{(m)}(\mathring{\mathcal{E}}'^{(m)}) \otimes \mathbb{Q} \\
\swarrow {\scriptstyle 4.6.4.7} & \downarrow {\scriptstyle \rho^{(m)} \otimes id \otimes \mathbb{Q}} & & \swarrow {\scriptstyle 4.6.4.7} & \downarrow {\scriptstyle \rho^{(m)} \otimes \mathbb{Q}} \\
\mathbb{D}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}'^{\vee} & & \xrightarrow{\theta^{\mathrm{alg}}} & \mathbb{D}(\mathcal{E}') & \\
\downarrow {\scriptstyle \rho^{(m)}_{\mathbb{Q}} \otimes \mathrm{id}} & (\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathring{\mathcal{E}}'^{(m)\vee}) \otimes \mathbb{Q} & \xrightarrow{\widehat{\theta}^{(m)} \otimes \mathbb{Q}} & \downarrow {\scriptstyle \rho^{(m)}_{\mathbb{Q}}} & (\widehat{\mathbb{D}}^{(m)}(\mathring{\mathcal{E}}'^{(m)})) \otimes \mathbb{Q} \\
\swarrow {\scriptstyle 4.6.4.7} & & & \swarrow {\scriptstyle 4.6.4.7} & \\
\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}'^{\vee} & & \xrightarrow{\theta^{(m)}_{\mathbb{Q}}} & \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}'), &
\end{array} \tag{11.3.3.3.2}$$

where the four horizontal isomorphisms from the back square towards the front one can be constructed via 4.6.4.7 and the remark 4.6.4.5(ii) (in the category of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}$-modules, the functor $-\otimes_{\mathbb{Z}} \mathbb{Q}$ is canonically isomorphic to $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}}} -$ and similarly by replacing $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}}$ by $\mathcal{D}^{(m)}_{\mathfrak{X}}$). The bottom square is commutative by definition (11.3.3.1.1). Moreover, the right one corresponds to the diagram below

$$\begin{array}{ccccccc}
\mathbb{D}^{(m)}(\mathring{\mathcal{E}}'^{(m)})_{\mathbb{Q}} & \longrightarrow & \widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}} \widehat{\mathcal{D}} \otimes_{\mathcal{D}} \mathbb{D}^{(m)}(\mathring{\mathcal{E}}'^{(m)}) & \xrightarrow{4.6.4.7} & \widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}} \widehat{\mathbb{D}}^{(m)}(\widehat{\mathcal{D}} \otimes_{\mathcal{D}} \mathring{\mathcal{E}}'^{(m)}) & \longrightarrow & \widehat{\mathbb{D}}^{(m)}(\mathring{\mathcal{E}}'^{(m)})_{\mathbb{Q}} \\
\downarrow & & \downarrow & & \downarrow {\scriptstyle 4.6.4.7} \quad \searrow & & \downarrow \\
\mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{D}^{(m)}(\mathring{\mathcal{E}}'^{(m)}) & \longrightarrow & \widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathbb{Q}}} \mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{D}^{(m)}(\mathring{\mathcal{E}}'^{(m)}) & & \mathbb{D}^{(m)}_{\mathbb{Q}}(\widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}} \widehat{\mathcal{D}} \otimes_{\mathcal{D}} \mathring{\mathcal{E}}'^{(m)}) & & \widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}} \widehat{\mathbb{D}}^{(m)}(\mathring{\mathcal{E}}'^{(m)}) \\
\downarrow & & \downarrow {\scriptstyle 4.6.4.7} & & \downarrow \quad \searrow & & \downarrow \\
\mathbb{D}(\mathcal{E}') & \longrightarrow & \widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathbb{Q}}} \mathbb{D}(\mathcal{E}') & \xrightarrow{4.6.4.7} & \mathbb{D}^{(m)}_{\mathbb{Q}}(\widehat{\mathcal{D}}_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathbb{Q}}} \mathcal{E}') & \longrightarrow & \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}'),
\end{array} \tag{11.3.3.3.3}$$

where the ring $\mathcal{D}$ is $\mathcal{D}^{(m)}_{\mathfrak{X}}$. By transitivity of 4.6.4.7, we check that the rectangle of the middle is commutative. This yields that 11.3.3.3.3 is commutative. Then so is the right diagram of 11.3.3.3.2. Moreover, the commutativity of the right square of 11.3.3.3.2 implies that of the left square. For the back side one, this is a consequence of 11.3.1.19. Moreover, similarly to 11.3.1.15 (i.e., we check that the four morphisms that we use in the construction of $\theta^{(m)}$ and θ^{alg} commute with the functors $-\otimes_{\mathbb{Z}} \mathbb{Q}$), we prove that the top square is commutative. As the arrows of 11.3.3.3.2 are isomorphisms, we get the commutativity of the front side. □

11.3.3.4. The functor $\mathbb{D}^{(m)}_{\mathbb{Q}}$ commutes canonically with Frobenius. More precisely, denoting by $\widetilde{\mathbb{D}}^{(m)}_{\mathbb{Q}} = \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}}(-, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}})$, which is canonically isomorphic to the composition of the functors $\widehat{\mathbb{D}}^{(m)}_{\mathbb{Q}}$ and $-\otimes_{\mathcal{O}_X} \omega_{\mathfrak{X}}$, we have for any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}})$ the isomorphisms

$$F^{\flat} \widetilde{\mathbb{D}}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \underset{4.6.3.6.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}}(\mathcal{E}', F^{\flat} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}) \underset{F^*}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}}(F^*\mathcal{E}', F^* F^{\flat} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}) \xrightarrow{\sim} \widetilde{\mathbb{D}}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}'). \tag{11.3.3.4.1}$$

This yields:

$$F^* \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \overset{8.8.1.3.1}{\xrightarrow{\sim}} F^{\flat} \widetilde{\mathbb{D}}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}/\mathfrak{S}} \overset{11.3.3.4.1}{\xrightarrow{\sim}} \widetilde{\mathbb{D}}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}/\mathfrak{S}} \xrightarrow{\sim} \mathbb{D}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}'). \tag{11.3.3.4.2}$$

Theorem 11.3.3.5. *With the notations of 11.3.3.1, the following canonical diagram*

$$\begin{array}{ccc} \mathbb{D}^{(m+s)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} (F^*\mathcal{E}')^\vee & \xrightarrow[\sim]{\theta^{(m+s)}_{\mathbb{Q}}} & \mathbb{D}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \\ {\scriptstyle 11.3.3.4.2}\uparrow\wr & & {\scriptstyle 11.3.3.4.2}\uparrow\wr \\ F^*[\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X}',\mathbb{Q}})\otimes_{\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}}(\mathcal{E}')^\vee] & \xrightarrow[\sim]{F^*\theta^{(m)}_{\mathbb{Q}}} & F^*[\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}')] \end{array} \qquad (11.3.3.5.1)$$

is commutative.

Proof. Let us consider the following cube :

$$\begin{array}{ccccc} & & (\widehat{\mathbb{D}}^{(m+s)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} (F^*\mathring{\mathcal{E}}'^{(m)})^\vee)_{\mathbb{Q}} & \xrightarrow{\widehat{\theta}^{(m+s)}\otimes\mathbb{Q}} & \widehat{\mathbb{D}}^{(m+s)}(F^*\mathring{\mathcal{E}}'^{(m)})_{\mathbb{Q}} \\ & \nearrow & \downarrow & \nearrow & \downarrow \\ F^*[(\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'}) \otimes_{\mathcal{O}_{\mathfrak{X}'}} (\mathring{\mathcal{E}}'^{(m)})^\vee)_{\mathbb{Q}}] & \xrightarrow{F^*(\widehat{\theta}^{(m)}\otimes\mathbb{Q})} & & F^*[\widehat{\mathbb{D}}^{(m)}(\mathring{\mathcal{E}}'^{(m)})_{\mathbb{Q}}] & \\ \downarrow & & \mathbb{D}^{(m+s)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} (F^*\mathcal{E}')^\vee & \xrightarrow{\theta^{(m+s)}_{\mathbb{Q}}} & \mathbb{D}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \\ & \nearrow & & \downarrow\ \nearrow & \\ F^*[\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}} (\mathcal{E}')^\vee] & \xrightarrow{F^*\theta^{(m)}_{\mathbb{Q}}} & & F^*[\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}')]. & \end{array}$$

(11.3.3.5.2)

The commutativity of the squares of the front face and of the back face follows from the construction of $\theta^{(m)}_{\mathbb{Q}}$ (and $\theta^{(m+s)}_{\mathbb{Q}}$) given at 11.3.3.1.1. We denote by $\mathcal{D}' := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}'}$ and $\mathcal{D} := \widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}$. We will put a tilde above $\mathcal{D}$ or $\mathcal{D}'$ to mean that we apply to them the functors $\otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}}$ or $\otimes_{\mathcal{O}_{\mathfrak{X}'}} \omega^{-1}_{\mathfrak{X}'}$. The commutativity of the right square of 11.3.3.5.2 can be translated by the commutativity of the diagram below

$$\begin{array}{ccc} \boxed{F^*\mathcal{D}'_{\mathbb{Q}} \otimes_{\mathcal{D}'_{\mathbb{Q}}} \mathcal{D}'_{\mathbb{Q}} \otimes_{\mathcal{D}'} \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}}')} & \xrightarrow[\sim]{} & \mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} F^*\mathcal{D}' \otimes_{\mathcal{D}'} \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}}') \\ \sim\downarrow & & \sim\downarrow \\ F^*\mathcal{D}'_{\mathbb{Q}} \otimes_{\mathcal{D}'_{\mathbb{Q}}} \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}}'_{\mathbb{Q}}) & & \mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, F^*_{\mathrm{r}}\widetilde{\mathcal{D}}') \\ \sim\downarrow & \swarrow\sim & \sim\downarrow \\ \boxed{F^*\mathcal{D}'_{\mathbb{Q}} \otimes_{\mathcal{D}'_{\mathbb{Q}}} \mathbb{R}\mathcal{H}om_{\mathcal{D}'_{\mathbb{Q}}}(\mathcal{E}', \widetilde{\mathcal{D}}'_{\mathbb{Q}})} & & \mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{R}\mathcal{H}om_{\mathcal{D}}(F^*\mathring{\mathcal{E}}'^{(m)}, F^*_{\mathrm{l}}F^*_{\mathrm{r}}\widetilde{\mathcal{D}}') \\ \sim\downarrow & & \sim\downarrow \\ \mathbb{R}\mathcal{H}om_{\mathcal{D}'_{\mathbb{Q}}}(\mathcal{E}', F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) & & \boxed{\mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{R}\mathcal{H}om_{\mathcal{D}}(F^*\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}})} \\ \sim\downarrow & \swarrow\sim & \sim\downarrow \\ \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathbb{Q}}}(F^*\mathcal{E}', F^*_{\mathrm{l}}F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) & & \mathbb{R}\mathcal{H}om_{\mathcal{D}}(F^*\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}}_{\mathbb{Q}}) \\ \sim\downarrow & & \sim\downarrow \\ \boxed{\mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathbb{Q}}}(F^*\mathcal{E}', \widetilde{\mathcal{D}}_{\mathbb{Q}})} & \xleftarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathbb{Q}}}((F^*\mathring{\mathcal{E}}'^{(m)})_{\mathbb{Q}}, \widetilde{\mathcal{D}}_{\mathbb{Q}}). \end{array} \qquad (11.3.3.5.3)$$

We remark that the commutativity of the trapeze (at the top) of 11.3.3.5.3 is a consequence of that of the diagram

$$\begin{array}{ccc} F^*\mathcal{D}'_{\mathbb{Q}} \otimes_{\mathcal{D}'_{\mathbb{Q}}} \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}}'_{\mathbb{Q}}) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) \\ \sim\downarrow & & \sim\downarrow \\ F^*\mathcal{D}'_{\mathbb{Q}} \otimes_{\mathcal{D}'_{\mathbb{Q}}} \mathbb{R}\mathcal{H}om_{\mathcal{D}'_{\mathbb{Q}}}(\mathcal{E}', \widetilde{\mathcal{D}}'_{\mathbb{Q}}) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}'_{\mathbb{Q}}}(\mathcal{E}', F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) \end{array} \qquad (11.3.3.5.4)$$

and of the transitivity 6.3.4.1. To check that of 11.3.3.5.4, we choose a K-flat complex of left $\mathcal{D}'$-modules representing $\mathring{\mathcal{E}}'^{(m)}$, a K-injective complex of left $\mathcal{D}'_{\mathbb{Q}} \otimes_{\mathcal{V}} \mathcal{D}'_{\mathbb{Q}}$-modules representing $\widetilde{\mathcal{D}}'_{\mathbb{Q}}$.

The losange of 11.3.3.5.3 corresponds to the outer of

$$\begin{array}{ccccc} \mathbb{R}\mathcal{H}om_{\mathcal{D}'_{\mathbb{Q}}}(\mathcal{E}', F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) & \xleftarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) & \xleftarrow[\sim]{} & \mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{R}\mathcal{H}om_{\mathcal{D}'}(\mathring{\mathcal{E}}'^{(m)}, F^*_{\mathrm{r}}\widetilde{\mathcal{D}}') \\ \sim\downarrow F^* & & \sim\downarrow F^* & & \sim\downarrow \mathrm{id}\otimes F^* \\ \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathbb{Q}}}(F^*\mathcal{E}', F^*_{\mathrm{l}}F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) & \xleftarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}}(F^*\mathring{\mathcal{E}}'^{(m)}, F^*_{\mathrm{l}}F^*_{\mathrm{r}}\widetilde{\mathcal{D}}'_{\mathbb{Q}}) & \xleftarrow[\sim]{} & \mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{R}\mathcal{H}om_{\mathcal{D}}(F^*\mathring{\mathcal{E}}'^{(m)}, F^*_{\mathrm{l}}F^*_{\mathrm{r}}\widetilde{\mathcal{D}}') \\ \sim\downarrow & & \sim\downarrow & & \downarrow \\ \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathbb{Q}}}(F^*\mathcal{E}', \widetilde{\mathcal{D}}_{\mathbb{Q}}) & \xleftarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\mathcal{D}}(F^*\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}}'_{\mathbb{Q}}) & \xleftarrow[\sim]{} & \mathcal{D}_{\mathbb{Q}} \otimes_{\mathcal{D}} \mathbb{R}\mathcal{H}om_{\mathcal{D}}(F^*\mathring{\mathcal{E}}'^{(m)}, \widetilde{\mathcal{D}}), \end{array}$$

(11.3.3.5.5)

whose commutativity is straightforward. Finally, as the (bottom) triangle of 11.3.3.5.3 is also commutative, we conclude that the right square of 11.3.3.5.2 is commutative.

We proceed similarly to prove that of the left square of 11.3.3.5.2.

Finally, the top square of 11.3.3.5.2 corresponds to the following outer:

$$\begin{array}{ccccc} F^*[(\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'}) \otimes_{\mathcal{O}_{\mathfrak{X}'}} (\mathring{\mathcal{E}}'^{(m)})^\vee)_{\mathbb{Q}}] & \xrightarrow{\sim} & [F^*(\widehat{\mathbb{D}}^{(m)}(\mathcal{O}_{\mathfrak{X}'}) \otimes_{\mathcal{O}_{\mathfrak{X}'}} (\mathring{\mathcal{E}}'^{(m)})^\vee)]_{\mathbb{Q}} & \xrightarrow{\sim} & (\widehat{\mathbb{D}}^{(m+s)}(\mathcal{O}_{\mathfrak{X}}) \otimes_{\mathcal{O}_{\mathfrak{X}}} (F^*\mathring{\mathcal{E}}'^{(m)})^\vee)_{\mathbb{Q}} \\ \sim\downarrow F^*(\widehat{\theta}^{(m)}\otimes\mathbb{Q}) & & \sim\downarrow (F^*\widehat{\theta}^{(m)})\otimes\mathbb{Q} & & \sim\downarrow \widehat{\theta}_{\mathbb{Q}}^{(m+s)}\otimes\mathbb{Q} \\ F^*[\widehat{\mathbb{D}}^{(m)}(\mathring{\mathcal{E}}'^{(m)})_{\mathbb{Q}}] & \xrightarrow{\sim} & [F^*\widehat{\mathbb{D}}^{(m)}(\mathring{\mathcal{E}}'^{(m)})]_{\mathbb{Q}} & \xrightarrow{\sim} & \widehat{\mathbb{D}}^{(m+s)}(F^*\mathring{\mathcal{E}}'^{(m)})_{\mathbb{Q}}. \end{array} \tag{11.3.3.5.6}$$

The left square of 11.3.3.5.6 is commutative by functoriality. It follows from 11.3.2.9.1 that the right square of 11.3.3.5.6 is commutative. Hence, we have checked that five of the squares of 11.3.3.5.2 are commutative. Then so is the bottom one. □

11.3.4 Compatibility with Frobenius of θ

11.3.4.1. For any coherent $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-module $\mathcal{E}$ which is $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-coherent, let us denote by $\sigma^{(m)}_{\mathbb{Q}}$ the isomorphism

$$\sigma^{(m)}_{\mathbb{Q}} \colon \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}} \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}) \underset{4.6.4.7.1}{\xrightarrow{\sim}} \mathbb{D}(\mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}) \xrightarrow{\sim} \mathbb{D}(\mathcal{E}). \tag{11.3.4.1.1}$$

Proposition 11.3.4.2. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-coherent. The square*

$$\begin{array}{ccc} \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}^\vee & \xrightarrow[\sim]{\theta^{(m)}_{\mathbb{Q}}} & \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}) \\ \sim\downarrow \sigma^{(m)}_{\mathbb{Q}}\otimes\mathrm{id} & & \sim\downarrow \sigma^{(m)}_{\mathbb{Q}} \\ \mathbb{D}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}^\vee & \xrightarrow[\sim]{\theta} & \mathbb{D}(\mathcal{E}), \end{array}$$

where θ was defined in 11.2.6.4.1, is commutative.

Proof. Thanks to the commutative diagrams 11.2.6.4.1 and 11.3.3.3.1, it is about proving the equality $\sigma^{(m)}_{\mathbb{Q}} \circ \rho^{(m)}_{\mathbb{Q}} = \rho$, where ρ was constructed at 11.2.6.3.3. It amounts to saying that the outer of the diagram

$$\begin{array}{ccccccc} \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}) & \longrightarrow & \mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}} \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}) & \longrightarrow & \mathbb{D}(\mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}) & \longrightarrow & \mathbb{D}(\mathcal{E}) \\ \uparrow & & \uparrow & & \uparrow & \nearrow & \\ \mathbb{D}^{(m)}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}) & \longrightarrow & \mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}}} \mathbb{D}^{(m)}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}) & \longrightarrow & \mathbb{D}(\mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}) & & \\ \uparrow & & \uparrow & \nearrow & & & \\ \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X},\mathbb{Q}}} \mathbb{D}(\mathcal{E}) & \longrightarrow & \mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X},\mathbb{Q}}} \mathbb{D}(\mathcal{E}) & & & & \\ \uparrow & \nearrow & & & & & \\ \mathbb{D}(\mathcal{E}) & & & & & & \end{array} \tag{11.3.4.2.1}$$

is commutative. Moreover, that of squares is checked by functoriality and that of the top and bottom triangles are straightforward. Finally, that of the triangle of the middle follows from the transitivity of 4.6.4.7 (see also the remark 4.6.4.5.(ii)). □

11.3.4.3. With the notations of 11.3.3.1, we have a morphism $\mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} F^*\mathcal{E}' \to F^*(\mathcal{D}^\dagger_{\mathfrak{X}'\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathcal{E}')$ making commutative the following diagram

$$F^*\mathcal{E}' \longrightarrow \mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} F^*\mathcal{E}' \dashrightarrow F^*(\mathcal{D}^\dagger_{\mathfrak{X}'\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathcal{E}'). \tag{11.3.4.3.1}$$

By completion, tensorizing by $\mathbb{Q}$ and taking the limit, it follows from 6.2.3.2.1 that this morphism is an isomorphism.

We will need the following lemma to prove the proposition below.

Lemma 11.3.4.4. *For any $\mathcal{E}' \in D_{\mathrm{perf}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}})$, the following diagram*

$$\begin{array}{ccccc}
F^*\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}') & \underset{11.3.4.3.1}{\overset{\sim}{\longleftarrow}} & \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} F^*\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}') & \underset{\sim}{\overset{11.3.3.4.2}{\longrightarrow}} & \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} \mathbb{D}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \\
\sim\downarrow & & & & \downarrow\sim \\
F^*\mathbb{D}(\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathcal{E}') \xrightarrow[\sim]{9.5.2.4.2} & & \mathbb{D}F^*(\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathcal{E}') & \xrightarrow[\sim]{11.3.4.3} & \mathbb{D}(\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} F^*\mathcal{E}'),
\end{array}$$

is commutative.

Proof. A tilde above $\mathbb{D}$ means that the functor is tensorized by $- \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}}$ (or $- \otimes_{\mathcal{O}_{\mathfrak{X}'}} \omega_{\mathfrak{X}'}$).

We denote by τ, the composite isomorphism:

$$\tau\colon F^{\flat}\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \underset{8.8.1.1.2}{\overset{\sim}{\longleftarrow}} F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} F^*F^{\flat}\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \overset{\mathrm{id}\otimes\alpha}{\longrightarrow} F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}},$$

and where α is the inverse of the canonical isomorphism $\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}} \overset{\sim}{\longrightarrow} F^*F^{\flat}\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$ (see 8.8.2.2.1). The structure of $(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}, \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}})$-bimodule of $F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}$ extends then to a structure of $(\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}, \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}})$-bimodule. The morphism τ is the inverse of the morphism of $(\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}, \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}})$-bimodules that we deduce by extension from $F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}} \to F^{\flat}\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$. Hence, we reduce to prove the commutativity of the diagram:

$$\begin{array}{ccccc}
\widetilde{\mathbb{D}}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} F^{\flat}\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} & \underset{\sim}{\overset{\mathrm{id}\otimes\tau}{\longrightarrow}} & \widetilde{\mathbb{D}}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} F^{\flat}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}} & \underset{\sim}{\overset{11.3.3.4.2}{\longrightarrow}} & \widetilde{\mathbb{D}}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}} \\
\sim\downarrow & & & & \downarrow\sim \\
F^{\flat}\widetilde{\mathbb{D}}(\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathcal{E}') & \underset{\sim}{\overset{9.5.2.4.1}{\longrightarrow}} & \widetilde{\mathbb{D}}(F^*\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathcal{E}') & \underset{\sim}{\overset{11.3.4.3}{\longrightarrow}} & \widetilde{\mathbb{D}}(\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} F^*\mathcal{E}').
\end{array} \tag{11.3.4.4.1}$$

We will write $\mathcal{D}^{\dagger}$ (resp. $\mathcal{D}_{\mathfrak{X}'}$, resp. $\mathcal{D}_{\mathfrak{X}}$) instead of $\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$ or $\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}$ (resp. $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}$, resp. $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}$). We set $\mathcal{E}'^{\dagger} := \mathcal{D}^{\dagger} \otimes_{\mathcal{D}_{\mathfrak{X}'}} \mathcal{E}'$ and $(F^*\mathcal{E}')^{\dagger} = \mathcal{D}^{\dagger} \otimes_{\mathcal{D}_{\mathfrak{X}}} F^*\mathcal{E}'$. Let us consider the diagram

$$\begin{array}{ccccc}
\boxed{\widetilde{\mathbb{D}}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \otimes_{\mathcal{D}_{\mathfrak{X}'}} F^{\flat}\mathcal{D}^{\dagger}} & \overset{\mathrm{id}\otimes\tau}{\longrightarrow} & \widetilde{\mathbb{D}}^{(m)}_{\mathbb{Q}}(\mathcal{E}') \otimes_{\mathcal{D}_{\mathfrak{X}'}} F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger} & \longrightarrow & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}'}}(\mathcal{E}', F^{\flat}\mathcal{D}_{\mathfrak{X}'}) \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger} \\
\downarrow & & & & \downarrow \\
\mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}'}}(\mathcal{E}', \mathcal{D}^{\dagger}) \otimes_{\mathcal{D}^{\dagger}} F^{\flat}\mathcal{D}^{\dagger} & \longrightarrow & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}'}}(\mathcal{E}', F^{\flat}\mathcal{D}^{\dagger}) & \overset{\tau}{\longrightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}'}}(\mathcal{E}', F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) \\
\downarrow & & \downarrow & & \downarrow \\
\widetilde{\mathbb{D}}(\mathcal{E}'^{\dagger}) \otimes_{\mathcal{D}^{\dagger}} F^{\flat}\mathcal{D}^{\dagger} & \longrightarrow & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(\mathcal{E}'^{\dagger}, F^{\flat}\mathcal{D}^{\dagger}) & \overset{\tau}{\longrightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(\mathcal{E}'^{\dagger}, F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) \\
\Vert & & \downarrow F^* & & \downarrow F^* \\
\Vert & & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(F^*\mathcal{E}'^{\dagger}, F^*F^{\flat}\mathcal{D}^{\dagger}) & \overset{\tau}{\longrightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(F^*\mathcal{E}'^{\dagger}, F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) \\
\Vert & & \downarrow & & \downarrow \\
\boxed{\widetilde{\mathbb{D}}(\mathcal{E}'^{\dagger}) \otimes_{\mathcal{D}^{\dagger}} F^{\flat}\mathcal{D}^{\dagger}} & \dashrightarrow & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}((F^*\mathcal{E}')^{\dagger}, F^*F^{\flat}\mathcal{D}^{\dagger}) & \overset{\tau}{\rightarrow} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}((F^*\mathcal{E}')^{\dagger}, F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}),
\end{array} \tag{11.3.4.4.2}$$

where the left bottom arrow is defined in order to make commutative the left bottom rectangle. By composing 11.3.4.4.2 with the following diagram

$$\begin{array}{ccccc}
\mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}'}}(\mathcal{E}', F^{\flat}\mathcal{D}_{\mathfrak{X}'}) \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger} & \xrightarrow{F^*} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'}) \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger} & \xrightarrow{\alpha^{(m)}} & \boxed{\widetilde{\mathbb{D}}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}} \\
\downarrow & & \downarrow & & \downarrow \\
\mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}'}}(\mathcal{E}', F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & \xrightarrow{F^*} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & \xrightarrow{\alpha^{(m)}} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{\mathfrak{X}}}(F^*\mathcal{E}', \mathcal{D}^{\dagger}) \\
\downarrow & & \downarrow & & \downarrow \\
\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(\mathcal{E}'^{\dagger}, F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & & & & \\
\downarrow F^* & & & & \\
\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(F^*\mathcal{E}'^{\dagger}, F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & & & & \\
\downarrow & & \downarrow & & \downarrow \\
\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}((F^*\mathcal{E}')^{\dagger}, F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & = & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}((F^*\mathcal{E}')^{\dagger}, F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & \xrightarrow{\alpha^{(m)}} & \boxed{\widetilde{\mathbb{D}}((F^*\mathcal{E}')^{\dagger})},
\end{array} \tag{11.3.4.4.3}$$

where $\alpha^{(m)}$ is the inverse of the canonical isomorphism $\mathcal{D}_{\mathfrak{X}} \xrightarrow{\sim} F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'}$ of 8.8.1.1.1, we get the square 11.3.4.4.1. Indeed, concerning the top, right and left arrows, this is straightforward. To establish that so is the bottom one, we have to check that the composition arrow of the top of the commutative diagram below

$$\begin{array}{ccccc}
\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(F^*\mathcal{E}'^{\dagger}, F^*F^{\flat}\mathcal{D}^{\dagger}) & \xrightarrow{\tau} & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}(F^*\mathcal{E}'^{\dagger}, F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & \xrightarrow{\alpha^{(m)}} & \widetilde{\mathbb{D}}(F^*\mathcal{E}'^{\dagger}) \\
 & & \downarrow & & \downarrow \\
 & & \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}}((F^*\mathcal{E}')^{\dagger}, F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}) & \xrightarrow{\alpha^{(m)}} & \widetilde{\mathbb{D}}((F^*\mathcal{E}')^{\dagger}).
\end{array} \tag{11.3.4.4.4}$$

is the canonical morphism induced by α. This latter fact is a consequence of the commutativity of

$$\begin{array}{ccccc}
F^*F^{\flat}\mathcal{D}^{\dagger} & \longrightarrow & F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} F^*F^{\flat}\mathcal{D}^{\dagger}) & \xrightarrow{\alpha^{(m)}\otimes \mathrm{id}} & \mathcal{D}_{\mathfrak{X}} \otimes_{\mathcal{D}_{\mathfrak{X}}} F^*F^{\flat}\mathcal{D}^{\dagger} \\
 & \searrow^{F^*\tau} & \downarrow \mathrm{id}\otimes\alpha & & \downarrow \mathrm{id}\otimes\alpha \\
 & & F^*F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger} & \xrightarrow{\alpha^{(m)}\otimes \mathrm{id}} & \mathcal{D}_{\mathfrak{X}} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}.
\end{array} \tag{11.3.4.4.5}$$

By using the commutativity of the rectangle of the top of 6.2.3.3.1 (we complete, we tensorize by $\mathbb{Q}$ and we apply it with $\mathcal{E}' = F^{\flat}\mathcal{D}_{\mathfrak{X}'}$), we get that of the top diagram of 11.3.4.4.5. The one of the square of 11.3.4.4.5 is functorial and that of the triangle is tautological.

It remains now to prove that the diagrams 11.3.4.4.2 and 11.3.4.4.3 are commutative. The one of the top rectangle of 11.3.4.4.2 follows, via the remark 4.6.4.5.(ii), from the transitivity of 4.6.4.7. We can check that of the left square of the second row of 11.3.4.4.2 by proceeding similarly to 11.3.3.5.4. To check the commutativity of the rectangle at the bottom left of 11.3.4.4.3, it is sufficient to choose a K-injective complex of $\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}} \otimes_{\mathcal{V}} \mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}}$-modules representing $F^{\flat}\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{D}_{\mathfrak{X}}} \mathcal{D}^{\dagger}$ and a K-flat complex of left $\mathcal{D}_{\mathfrak{X}'}$-modules representing $\mathcal{E}'$. That of the top right square of 11.3.4.4.3 can be computed by choosing a K-flat complex of left $\mathcal{D}_{\mathfrak{X}'}$-modules representing $\mathcal{E}'$ and a K-injective complex of left $\mathcal{D}_{\mathfrak{X}'} \otimes_{\mathcal{V}} \mathcal{D}_{\mathfrak{X}}$-modules representing $F^{\flat}\mathcal{D}_{\mathfrak{X}'}$. The commutativity of the other squares or of the rectangle is checked by functoriality. □

Proposition 11.3.4.5. *Let $\mathcal{E}'$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}$-coherent. The diagram*

$$\begin{array}{ccc}
F^*[\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}')] & \longrightarrow & \mathbb{D}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \\
\downarrow \sigma^{(m)}_{\mathbb{Q}} & & \downarrow \sigma^{(m+s)}_{\mathbb{Q}} \\
F^*[\mathbb{D}(\mathcal{E}')] & \longrightarrow & \mathbb{D}(F^*\mathcal{E}')
\end{array}$$

is commutative.

Proof. By construction of the isomorphism $\mathcal{D}^{\dagger}_{\mathfrak{X}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X},\mathbb{Q}}} F^*\mathcal{E} \xrightarrow{\sim} F^*(\mathcal{D}^{\dagger}_{\mathfrak{X}'\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}',\mathbb{Q}}} \mathcal{E})$ (see 11.3.4.3), the first and the latter isomorphism of 11.3.4.1.1 are compatible with Frobenius. For the middle one, this corresponds to 11.3.4.4. □

Theorem 11.3.4.6. *Let $\mathcal{E}'$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}$-module, $\mathcal{O}_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}$-coherent. The diagram*

$$\begin{array}{ccc} F^*[\mathbb{D}_{T'}(\mathcal{O}_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}} \mathcal{E}'^{\vee}] & \xrightarrow{F^*\theta} & F^*\mathbb{D}_{T'}(\mathcal{E}') \\ \downarrow & & \downarrow \\ \mathbb{D}_T(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} (F^*\mathcal{E}')^{\vee} & \xrightarrow{\theta} & \mathbb{D}_T(F^*\mathcal{E}'). \end{array} \tag{11.3.4.6.1}$$

is commutative.

Proof. As the edges of 11.3.4.6.1 are morphisms of coherent $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules, thanks to 8.7.6.11, it is sufficient to prove the commutativity of 11.3.4.6.1 when T is empty. Let us consider the following cube

$$\begin{array}{ccccccc} & & (\mathbb{D}^{(m+s)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} (F^*\mathcal{E}')^{\vee}) & & \xrightarrow{\theta^{(m+s)}_{\mathbb{Q}}} & & \mathbb{D}^{(m+s)}_{\mathbb{Q}}(F^*\mathcal{E}') \\ & \nearrow & & & & \nearrow & \\ F^*[(\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}} (\mathcal{E}')^{\vee})] & & \downarrow & \xrightarrow{F^*(\theta^{(m)}_{\mathbb{Q}})} & F^*[\mathbb{D}^{(m)}_{\mathbb{Q}}(\mathcal{E}')] & & \downarrow \\ & & \mathbb{D}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} (F^*\mathcal{E}')^{\vee} & & \xrightarrow{\theta^{\dagger}} & & \mathbb{D}(F^*\mathcal{E}') \\ \downarrow & \nearrow & & & \downarrow & \nearrow & \\ F^*[\mathbb{D}(\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}} (\mathcal{E}')^{\vee}] & & & \xrightarrow{F^*\theta^{\dagger}} & F^*[\mathbb{D}(\mathcal{E}')], & & \end{array} \tag{11.3.4.6.2}$$

where the vertical arrows are induced by the morphisms of the form $\sigma^{(m)}_{\mathbb{Q}}$. Following 11.3.3.5, the top square is commutative. Moreover, thanks to 11.3.4.2, so are the front and back squares. Via 11.3.4.5, the right and left squares are commutative. As the morphisms are isomorphisms, it follows the commutativity of the bottom square. □

Theorem 11.3.4.7. *Let E' be an isocrystal on $X' \setminus T'$ overconvergent along X'. The isomorphism*

$$\mathbb{D}_{T'}(\mathcal{O}_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}) \otimes_{\mathcal{O}_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}} \mathrm{sp}_*(E'^{\vee}) \xrightarrow{\sim} \mathbb{D}_{T'}(\mathrm{sp}_*(E'))$$

is compatible with Frobenius.

Proof. Following 11.2.7.4, we have the isomorphism $\mathrm{sp}_*(E'^{\vee}) \xrightarrow{\sim} (\mathrm{sp}_*(E'))^{\vee}$ which is compatible with Frobenius. By using 11.3.4.6, we are done. □

11.3.5 Commutation of the duality with pullbacks via a smooth morphism, adjunction

We collect here some results concerning the compatibility with Frobenius and its corollaries. Following [Abe14a, 3.10], we have the following theorem.

Theorem 11.3.5.1 (Abe)**.** *Let $f\colon \mathfrak{X} \to \mathfrak{Y}$ be a smooth morphism of smooth $\mathcal{V}$-formal schemes of relative dimension d_f. Let us denote by d the relative dimension of X_0 over Y_0. For any divisors T of X and W of Y such that $f(X \setminus T) \subset Y \setminus W$, for any integers $0 \leq m \leq n_m$, for any $\mathcal{E}^{(m)} \in F$-$D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{B}^{(n_m)}_{\mathfrak{Y}}(W)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}})$, denoting by $\mathcal{E} := \mathcal{D}^\dagger_{\mathfrak{Y}}({}^\dagger W)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_m)}_{\mathfrak{Y}}(W)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}}} \mathcal{E}^{(m)}$, and using notation 8.8.3.3 we have the canonical isomorphism*

$$f^!_{T,W} \circ \mathbb{D}_{\mathfrak{Y},W}(\mathcal{E}) \xrightarrow{\sim} \mathbb{D}_{\mathfrak{X},T} \circ f^!_{T,W}(\mathcal{E})(d_f)[2d_f]. \tag{11.3.5.1.1}$$

In the case where $\mathfrak{Y} = \mathrm{Spf}\,\mathcal{V}$, this yields:

Corollary 11.3.5.2. *We have the isomorphism of F-$\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules:*

$$\mathbb{D}_{\mathfrak{X},Z}(\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}(-d). \tag{11.3.5.2.1}$$

Corollary 11.3.5.3. *We have the compatible to Frobenius isomorphism*

$$\mathrm{sp}_*(E'^{\vee})(-d) \xrightarrow{\sim} \mathbb{D}_{T'}(\mathrm{sp}_*(E')).$$

Proof. This follows from 11.3.4.7 and 11.3.5.2.1. □

11.3.5.4. With notation 11.3.5.1, set $f^{+}_{T,W} := \mathbb{D}_{\mathfrak{X},T} \circ f^{!}_{T,W} \circ \mathbb{D}_{\mathfrak{Y},W}$. We get the isomorphisms:

$$f^{!}_{T,W}(\mathcal{E}) \xrightarrow{\sim} f^{!}_{T,W} \circ \mathbb{D}_{\mathfrak{X},T}(\mathbb{D}_{\mathfrak{X},T}(\mathcal{E})) \underset{11.3.5.1.1}{\xrightarrow{\sim}} \mathbb{D}_{\mathfrak{X},T} \circ f^{!}_{T,W}(\mathbb{D}_{\mathfrak{X},T}(\mathcal{E}))(d_f)[2d_f] = f^{+}_{T,W}(\mathcal{E})(d_f)[2d_f]. \tag{11.3.5.4.1}$$

The twisted version of 11.3.5.1 is:

$$f^{!}_{T,W}(\omega_{\mathfrak{Y}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \mathbb{D}_{\mathfrak{Y},W}(\mathcal{E})) \underset{9.2.1.23.1}{\xrightarrow{\sim}} \omega_{\mathfrak{X}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{X}}} f^{!}_{T,W} \circ \mathbb{D}_{\mathfrak{Y},W}(\mathcal{E}) \underset{11.3.5.1.1}{\xrightarrow{\sim}} \omega_{\mathfrak{X}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathbb{D}_{\mathfrak{X},T} \circ f^{!}_{T,W}(\mathcal{E})(d_f)[2d_f]. \tag{11.3.5.4.2}$$

Corollary 11.3.5.5. *Let $f\colon \mathfrak{X} \to \mathfrak{Y}$ be a smooth morphism of smooth $\mathcal{V}$-formal schemes of relative dimension d_f. Let us denote by d the relative dimension of X_0 over Y_0. For any divisors T of X and W of Y such that $f(X \setminus T) \subset Y \setminus W$, for any integers $0 \le m \le n_m$, for any $\mathcal{E}^{(m)} \in F\text{-}D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{B}^{(n_m)}_{\mathfrak{Y}}(W) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}})$, denoting by $\mathcal{E} := \mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}} \otimes_{\mathcal{B}^{(n_m)}_{\mathfrak{Y}}(W) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Y}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}}} \mathcal{E}^{(m)}$, for any $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$. we have the canonical isomorphism*

$$\mathbb{R}f_* \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}}(f^{+}_{T,W}(\mathcal{E}), \mathcal{F}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}}(\mathcal{E}, f_{T,W,+}(\mathcal{F})), \tag{11.3.5.5.1}$$

$$\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}}(f^{+}_{T,W}(\mathcal{E}), \mathcal{F}) \xrightarrow{\sim} \mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}}(\mathcal{E}, f_{T,W,+}(\mathcal{F})). \tag{11.3.5.5.2}$$

Proof. From the twisted version 11.3.5.4.2, we get:

$$\begin{aligned} f^{-1}(\omega_{\mathfrak{Y}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \mathbb{D}_{\mathfrak{Y},W}(\mathcal{E})) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{Y}\leftarrow\mathfrak{X}}({}^{\dagger}W)_{\mathbb{Q}}[d_f] &\xrightarrow{\sim} f^{!}_{T,W}(\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}))[d_Y] \\ &\underset{11.3.5.4.2}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}}(f^{!}_{T,W}(\mathcal{E}), \mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}))[d_X](d_f)[2d_f] \\ &\underset{11.3.5.4.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}}(f^{+}_{T,W}(\mathcal{E}), \mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}))[d_X]. \end{aligned} \tag{11.3.5.5.3}$$

Since $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}})$ (resp. $f^{+}_{T,W}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$), then we get the last (resp. first) isomorphism:

$$\begin{aligned} \mathbb{R}f_*\left(\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}}(f^{+}_{T,W}(\mathcal{E}), \mathcal{F})\right) &\xrightarrow{\sim} \mathbb{R}f_*\left(\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}}(f^{+}_{T,W}(\mathcal{E}), \mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}} \mathcal{F}\right) \\ &\underset{11.3.5.5.3}{\xrightarrow{\sim}} \mathbb{R}f_*\left(f^{-1}(\omega_{\mathfrak{Y}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \mathbb{D}_{\mathfrak{Y},W}(\mathcal{E})[-d_Y]) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}} \mathcal{D}^{\dagger}_{\mathfrak{Y}\leftarrow\mathfrak{X}}({}^{\dagger}W)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}} \mathcal{F}\right) \\ &\xrightarrow{\sim} \omega_{\mathfrak{Y}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{Y}}} \mathbb{D}_{\mathfrak{Y},W}(\mathcal{E})[-d_Y] \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}} \mathbb{R}f_*\left(\mathcal{D}^{\dagger}_{\mathfrak{Y}\leftarrow\mathfrak{X}}({}^{\dagger}W)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}} \mathcal{F}\right) \\ &\xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}} f_{T,W,+}(\mathcal{F}) \\ &\xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{Y}}({}^{\dagger}W)_{\mathbb{Q}}}(\mathcal{E}, f_{T,W,+}(\mathcal{F})). \end{aligned}$$

Hence, we get 11.3.5.5.1. Applying $\mathbb{R}\Gamma(\mathfrak{Y}, -)$, this yields 11.3.5.5.2.

□

Chapter 12

Differential coherence of the constant coefficient

Put $\mathfrak{S} = \operatorname{Spf} \mathcal{V}$.

12.1 Local cohomology with support in a smooth closed subscheme

12.1.1 Arithmetic $\mathcal{D}$-modules associated with overconvergent isocrystals in the lifted case via the functor $\mathbb{R}\mathrm{sp}_*$

Contrary to the situation of chapter 11, the locus of overconvergent singularities is not the support of a divisor. In that case, the functor sp_* is not exact. The purpose of this section is to compute $\mathbb{R}\mathrm{sp}_*$ in the category of $\mathcal{D}^\dagger$-modules.

12.1.1.1. Let $\mathfrak{X}$ be an affine smooth $\mathcal{V}$-formal scheme. Let Z be a divisor of X, $\mathfrak{Y}$ be the open of $\mathfrak{X}$ complementary to the support of Z and $j\colon \mathfrak{Y} \to \mathfrak{X}$ be the canonical morphism. For any $m \in \mathbb{N}$, we set $\lambda_m := p^{-1/p^{m+1}}$, $V_m := \mathfrak{X}_K \backslash]Z[_{\mathfrak{X}\lambda_m}$ and $j_m\colon V_m \to \mathfrak{X}_K$ be the canonical immersion. Following 10.1.1.7, the family V_m forms a basis of strict neighborhoods of $\mathfrak{Y}_K$ in $\mathfrak{X}_K$.

Let E be a $j^\dagger\mathcal{O}_{\mathfrak{X}_K}$-module of finite presentation. Then, for m_0 large enough, there exists $\mathcal{E}_0$ an $\mathcal{O}_{V_{m_0}}$-module of finite presentation together with an isomorphism $E \xrightarrow{\sim} j^\dagger\mathcal{E}_0 = j^\dagger\mathcal{O}_{V_{m_0}} \otimes_{\mathcal{O}_{V_{m_0}}} \mathcal{E}_0$. With 10.1.2.2.1, this yields the isomorphism

$$E \xrightarrow{\sim} \varinjlim_{m \geq m_0} j_{m*}(\mathcal{E}_0|V_m).$$

Let $r \geq 1$, $m \geq m_0$ be two integers, U be an affinoid subset of $\mathfrak{X}_K$. Set $\mathcal{E}_m := \mathcal{E}_0|V_m$. Since V_m is an affinoid subset of $\mathfrak{X}_K$, then $j_m^{-1}(U) = U \cap Y_m$ is also an affinoid subset of $\mathfrak{X}_K$ and then is an affinoid subset of V_m. Hence, by using theorem B of Kiehl's (see [Kie67]), we get $H^r(j_m^{-1}(U), \mathcal{E}_m) = 0$. This yields that $R^r j_{m*}(\mathcal{E}_m) = 0$ (see [Gro61, 0.12.2.1]). This means that the canonical morphism

$$j_{m*}(\mathcal{E}_m) \to \mathbb{R}j_{m*}(\mathcal{E}_m) \qquad (12.1.1.1.1)$$

is an isomorphism.

The following Lemma will be useful to check the resolution 12.1.1.4.1.

Lemma 12.1.1.2. *Let $\mathfrak{X} = \operatorname{Spf} A$ be an affine smooth formal $\mathfrak{S}$-scheme. Let $g \in A$, $\mathfrak{Y} := D(g) \overset{j}{\hookrightarrow} \mathfrak{X}$ be the corresponding open immersion. Let $u\colon \mathfrak{X} \hookrightarrow \mathfrak{X}'$ be an open immersion of separated smooth formal $\mathfrak{S}$-schemes. Let $u_K\colon \mathfrak{X}_K \hookrightarrow \mathfrak{X}'_K$ be the induced morphism of rigid spaces.*

(a) Let E be a $j^\dagger\mathcal{O}_{\mathfrak{X}_K}$-module of finite presentation.

(i) The module E is acyclic for the functor u_{K*}, i.e. the canonical morphism

$$u_{K*}(E) \to \mathbb{R}u_{K*}(E) \qquad (12.1.1.2.1)$$

is an isomorphism.

(ii) The module $u_{K*}(E)$ is acyclic for sp_*, i.e., the canonical morphism

$$\mathrm{sp}_* u_{K*}(E) \to \mathbb{R}\mathrm{sp}_* u_{K*}(E) \qquad (12.1.1.2.2)$$

is an isomorphism.

(b) Let E be a coherent $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$-module which is equipped with an integrable connection overconvergent along $X \setminus Y$.

(i) The sheaf $\mathrm{sp}_* u_{K*} E$ is equipped with a canonical structure of $\mathcal{D}^\dagger_{\mathfrak{X}',\mathbb{Q}}$-module functorial in E.

(ii) If $\mathfrak{X}_1$ is an affine open subscheme of $\mathfrak{X}$ and if $f_1 \in \Gamma(\mathfrak{X}_1, \mathcal{O}_{\mathfrak{X}_1})$ is so that the induced open immersion $\mathfrak{Y}_1 = D(f_1) \stackrel{j_1}{\hookrightarrow} \mathfrak{X}_1$ factors through $\mathfrak{Y}_1 \subset \mathfrak{Y}$, then the canonical homomorphism

$$\mathrm{sp}_*(u_{K*}E) \to \mathrm{sp}_*(u_{1K*} j_1^\dagger (E|\mathfrak{X}_{1K})),$$

where $u_1 \colon \mathfrak{X}_1 \hookrightarrow \mathfrak{X}'$ is the open immersion, is $\mathcal{D}^\dagger_{\mathfrak{X}',\mathbb{Q}}$-linear.

Proof. 0) This yields, since $\mathfrak{X}'$ is separated, that we can suppose both $\mathfrak{X}$ and $\mathfrak{X}'$ are affine (and $\mathfrak{Y}$ is still a standard open formal subscheme of $\mathfrak{X}$) and we use notations of 12.1.1.1.

a)i) Let us check 12.1.1.2.1. This is local on $\mathfrak{X}'_K$. Let $r \geq 1$ be an integer, U' be an affinoid subset of $\mathfrak{X}'_K$. Since $\mathfrak{X}_K$ and Y_m are affinoid spaces, then $U := (u_K)^{-1}(U')$ is an affinoid subset of $\mathfrak{X}_K$, and $j_m^{-1}(U)$ is an affinoid subset of Y_m. By using theorem B of Kiehl's (see [Kie67]), this implies $H^r((u_K \circ j_m)^{-1}(U'), \mathcal{E}_m) = 0$. This yields that the canonical morphism $u_{K*} \circ j_{m*}(\mathcal{E}_m) \to \mathbb{R}(u_{K*} \circ j_{m*})(\mathcal{E}_m)$ is an isomorphism. From the isomorphism 12.1.1.1.1, we get $\mathbb{R}(u_{K*} \circ j_{m*})(\mathcal{E}_m) \xrightarrow{\sim} \mathbb{R}u_{K*}(j_{m*}(\mathcal{E}_m))$. Hence the canonical morphism $u_{K*}(j_{m*}\mathcal{E}_m) \to \mathbb{R}u_{K*}(j_{m*}\mathcal{E}_m)$ is an isomorphism, i.e. $R^r u_{K*}(j_{m*}\mathcal{E}_m) = 0$ for any $r \geq 1$. Since u_K is a coherent morphism of coherent topological spaces, then inductive limits commutes with $R^r u_{K*}$ (see [SGA4.2, VI.5.1], or also [FK18, 0.3.1.9]). Hence, taking the inductive limit, this yields $R^r u_{K*}(j_Y^\dagger \mathcal{O}_{\mathfrak{X}_K}) = 0$ for any $r \geq 1$, i.e. that the canonical morphism 12.1.1.2.2 is an isomorphism.

ii) Using the same arguments than in the first part (i.e. theorem B of Kiehl's and next taking the inductive limits), we check the canonical morphism

$$(\mathrm{sp}_* \circ u_{K*})(j_Y^\dagger \mathcal{O}_{\mathfrak{X}_K}) \to \mathbb{R}(\mathrm{sp}_* \circ u_{K*})(j_Y^\dagger \mathcal{O}_{\mathfrak{X}_K}) \qquad (12.1.1.2.3)$$

is an isomorphism. Using 12.1.1.2.1 and 12.1.1.2.3, we get 12.1.1.2.2.

b) This follows from 11.2.1.5. □

Notation 12.1.1.3. Let $\mathfrak{X}$ be a smooth $\mathcal{V}$-formal scheme. Let $\mathrm{sp} \colon \mathfrak{X}_K \to \mathfrak{X}$ be the specialization morphism. Let Z be a closed subscheme of X and let $Y := X \setminus Z$ and $j \colon Y \subset X$ be the open immersion. Let $\mathscr{X} := (\mathfrak{X}_i)_{i \in I}$ be a finite affine open covering of $\mathfrak{X}$. For any $i \in I$, let $\mathscr{Y}_i := (Y_{i\,j_i})_{j_i \in J_i}$ be a finite open covering of $Y_i := Y \cap \mathfrak{X}_i$ such that there exists $f_{i\,j_i} \in \Gamma(\mathfrak{X}_i, \mathcal{O}_{\mathfrak{X}})$ satisfying $Y_{i\,j_i} = D(f_{i\,j_i}) \cap X_i$. We get the divisor $T_{i\,j_i} := V(f_{i\,j_i})$ of X_i such that $Y_{i\,j_i} = X_i \setminus T_{i\,j_i}$. Let E be an abelian sheaf on $\mathfrak{X}_K$.

Fix $h, l \in \mathbb{N}$. Let $\underline{i} = (i_0, \ldots, i_h) \in I^{1+h}$. We set $\mathfrak{X}_{\underline{i}} := \mathfrak{X}_{i_0} \cap \cdots \cap \mathfrak{X}_{i_h}$, $Y_{\underline{i}} := Y \cap \mathfrak{X}_{\underline{i}}$, $u_{\underline{i}} \colon \mathfrak{X}_{\underline{i}} \to \mathfrak{X}$, $u_{\underline{i}K} \colon \mathfrak{X}_{\underline{i}K} \to \mathfrak{X}_K$, and $J_{\underline{i}} := J_{i_0} \times \cdots \times J_{i_h}$. For any $\underline{j} = (j_{i_0}, \ldots, j_{i_h}) \in J_{\underline{i}}$, we set $Y_{\underline{i}\,\underline{j}} := Y_{i_0\,j_{i_0}} \cap \cdots \cap Y_{i_h\,j_{i_h}}$, $f_{\underline{i}\,\underline{j}} := f_{i_0\,j_{i_0}}|_{\mathfrak{X}_{\underline{i}}} \cdots f_{i_h\,j_{i_h}}|_{\mathfrak{X}_{\underline{i}}}$. Denoting by $T_{\underline{i}\,\underline{j}} := V(f_{\underline{i}\,\underline{j}})$ the divisor of $X_{\underline{i}}$, we have $Y_{\underline{i}\,\underline{j}} = X_{\underline{i}} \setminus T_{\underline{i}\,\underline{j}}$.

We get the covering $\mathscr{Y}_{\underline{i}} := (Y_{\underline{i}\,\underline{j}})_{\underline{j} \in J_{\underline{i}}}$ of $Y_{\underline{i}}$. For any $\underline{\underline{j}} = (\underline{j}_0, \ldots, \underline{j}_l) \in (J_{\underline{i}})^{1+l}$, we set $Y_{\underline{i},\underline{\underline{j}}} := Y_{\underline{i}\,\underline{j}_0} \cap \cdots \cap Y_{\underline{i}\,\underline{j}_l}$, $f_{\underline{i},\underline{\underline{j}}} := f_{\underline{i}\,\underline{j}_0} \cdots f_{\underline{i}\,\underline{j}_l}$. We denote the corresponding open immersions by

$$j \colon Y \hookrightarrow \mathfrak{X}, \qquad j_{\underline{i}} \colon Y_{\underline{i}} \hookrightarrow \mathfrak{X}_{\underline{i}}, \qquad j_{\underline{i}\underline{\underline{j}}} \colon Y_{\underline{i}\underline{\underline{j}}} \hookrightarrow \mathfrak{X}_{\underline{i}}.$$

Denoting by $T_{\underline{i}\underline{\underline{j}}} := V(f_{\underline{i}\underline{\underline{j}}})$ the divisor of $X_{\underline{i}}$, we have $Y_{\underline{i}\underline{\underline{j}}} = X_{\underline{i}} \setminus T_{\underline{i}\underline{\underline{j}}}$. We set

$$\check{C}^{\dagger hl}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E) := \prod_{\underline{i}\in I^{1+h}} u_{\underline{i}K*} \check{C}^{\dagger l}(\mathfrak{X}_{\underline{i}}, \mathscr{Y}_{\underline{i}}, u^*_{\underline{i}K}(E)) = \prod_{\underline{i}\in I^{1+h}} u_{\underline{i}K*}\left(\prod_{\underline{\underline{j}}\in J_{\underline{i}}^{1+l}} j^\dagger_{\underline{i},\underline{\underline{j}}} u^*_{\underline{i}K}(E)\right),$$

where $\check{C}^{\dagger l}(\mathfrak{X}_{\underline{i}}, \mathscr{Y}_{\underline{i}}, u^*_{\underline{i}K}(E))$ is defined in 10.1.3.5.1. We get the Cech bicomplexes $\check{C}^{\dagger\bullet\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$ associated with the coverings $\mathscr{X}, \mathscr{Y}_{\underline{i}}$ of E (see 10.1.4). We denote by $\check{C}^{\dagger\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$ the total complex of $\check{C}^{\dagger\bullet\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$.

Proposition 12.1.1.4. *Let E be a coherent $j^\dagger\mathcal{O}_{\mathfrak{X}_K}$-module which is equipped with an integrable connection overconvergent along $X \setminus Y$. We keep notation 12.1.1.3*

(a) The complex $\check{C}^{\dagger\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$ gives a resolution of E.

(b) For any h, l, the module $\check{C}^{\dagger hl}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$ is acyclic for the functor sp_*.

(c) $\mathrm{sp}_*\check{C}^{\dagger\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E)$ *is a complex of left $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-modules.*

(d) We have in $D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$ the canonical isomorphism

$$\mathbb{R}\mathrm{sp}_*(E) \xrightarrow{\sim} \mathrm{sp}_*\check{C}^{\dagger\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E). \qquad (12.1.1.4.1)$$

(e) Let T be a closed subscheme of X and $j'\colon Y \setminus T \hookrightarrow X$ be the open immersion. We have the exact triangle in $D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$:

$$\mathbb{R}\mathrm{sp}_*(\underline{\Gamma}^\dagger_{]T[}(E)) \to \mathbb{R}\mathrm{sp}_*(E) \to \mathbb{R}\mathrm{sp}_*(j'^\dagger E) \to +1. \qquad (12.1.1.4.2)$$

Proof. Since, $j^\dagger E = E$, the first statement is a consequence of 10.1.4.2. Since $Y_{\underline{i},\underline{\underline{j}}} = D(f_{\underline{i},\underline{\underline{j}}})$, following 12.1.1.2.2, $u_{\underline{i}K*}\left(j^\dagger_{\underline{i},\underline{\underline{j}}} u^*_{\underline{i}K}(E)\right)$ is acyclic for the functor sp_*. Hence,

$$\check{C}^{\dagger hl}(\mathscr{X}, (\mathscr{Y}_i)_{i\in I}, E) = \prod_{\underline{i}\in I^{1+h}} u_{\underline{i}K*}\left(\prod_{\underline{\underline{j}}\in J_{\underline{i}}^{1+l}} \left(j^\dagger_{\underline{i},\underline{\underline{j}}} u^*_{\underline{i}K}(E)\right)\right)$$

is acyclic for the functor sp_*. This yields the isomorphism 12.1.1.4.1. It follows from 12.1.1.2.2 that by applying the functor $\mathbb{R}\mathrm{sp}_*$ to the map $E \to j'^\dagger E$ we get a morphism in $D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$. Hence, by applying the functor $\mathbb{R}\mathrm{sp}_*$ to the exact sequence

$$0 \longrightarrow \underline{\Gamma}^\dagger_{]T[_{\mathcal{P}}}(E) \longrightarrow E \to j'^\dagger E \longrightarrow 0. \qquad (12.1.1.4.3)$$

we get the exact triangle 12.1.1.4.2 of $D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$. □

12.1.2 Differential coherence of $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ when Z is a strict normal crossing divisor

Lemma 12.1.2.1. *Let $\mathfrak{X} = \mathrm{Spf}\, A$ be a reduced affine $\mathcal{V}$-formal scheme of finite type. Suppose $\|\cdot\|$ is a Banach norm on $A \otimes K$, $f \in A$ and $\{a_n\}_{n\geq 0}$ is a sequence of elements of $A \otimes K$ satisfying the following conditions:*

(i) There exist real constants c, η with $\eta < 1$ such that $\|a_n\| \leq c\eta^n$ for all n.

(ii) $\sum_{n\geq 0} a_n f^{-n} = 0$ in $B := A_{\{f\}} \otimes K$ where $A_{\{f\}}$ denotes the p-adic separated completion of A_f.

Then for all $j \geq 0$ there exist c' and $\eta' < 1$ such that

$$\| \sum_{n=0}^{j} a_n f^{j-n} \| \leq c' {\eta'}^j.$$

Proof. If the lemma holds for one norm on $A \otimes K$ then it holds also for any equivalent norm. As $A \otimes K$ is reduced, the spectral semi-norm on $\mathrm{Spm}(A \otimes K)$ is a Banach norm and is equivalent to any other Banach norm ([BGR84] §6.2.4, th. 1). Thus we shall take $\| \cdot \|$ to be the spectral norm. Let η' be a real number a power of which is in the value group of K such that $\eta < \eta' < 1$. Consider now a covering of $\mathfrak{X}_K$ by open affinoids

$$V_1 := \{x \in \mathfrak{X}_K : |f(x)| \leq \eta'\}, \qquad V_2 := \{x \in \mathfrak{X}_K : |f(x)| \geq \eta'\}.$$

It suffices to bound $b_j := \sum_{n=0}^{j} a_n f^{j-n}$ on V_1 and on V_2. For $x \in V_1$ we have

$$|b_j(x)| \leq \sup_{n \leq j} \|a_n\| {\eta'}^{j-n} \leq c{\eta'}^j.$$

Next we consider V_2. $A \otimes K$ is reduced implies $C := \Gamma(V_2, \mathcal{O}_{\mathfrak{X}_K})$ is reduced ([BGR84] §7.3.2, cor. 10). Thus the spectral norm is a Banach norm on C. In C we have $|a_n(x) f(x)^{-n}| \leq c(\eta/\eta')^n$. The series $\sum_n a_n f^{-n}$ converges to say b in C. As b is 0 in B by assumption, we get $|f(x)| < 1$ at all points in the support of b, and then the maximal modulus principle ([BGR84] §3.8.1 p. 171, §6.2.1. prop 4) implies that, increasing η' if necessary, we can suppose that $\sum_n a_n f^{-n} = 0$ in C. Then on V_2 we have

$$|b_j(X)| = | - \sum_{n \rangle j} a_n(x) f(x)^{j-n}| \leq \sup_{n \rangle j} \|a_n\| {\eta'}^{j-n} \leq c{\eta'}^j.$$

□

Proposition 12.1.2.2. *Let $\mathfrak{X}$ be a smooth separated $\mathcal{V}$-formal scheme with reduction X on k, Z a smooth divisor in X and $j : Y = X \setminus Z \to X$ the open immersion. Then:*

(a) The $\mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ is coherent.

(b) If $\mathfrak{U}$ is an open formal subscheme of $\mathfrak{X}$ such that there exist local coordinates $t_1, \ldots, t_d$ satisfying $Z = V(t_1)$ modulo $\mathfrak{m}$, and $\partial_1, \ldots, \partial_d$ are the corresponding derivations. Then we have the exact sequence

$$(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})^d \xrightarrow{\psi} \mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}} \xrightarrow{\phi} \mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \to 0, \qquad (12.1.2.2.1)$$

where $\phi(P) = P \cdot (1/t_1)$, and ψ is defined by

$$\psi(P_1, \ldots, P_d) = P_1 \partial_1 t_1 + \sum_{i=2}^{d} P_i \partial_i. \qquad (12.1.2.2.2)$$

Proof. Part (a) follows from (b) as $\mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}}$ is coherent. It suffices to check (b) for an affine open subscheme $\mathfrak{U}$. Put $A = \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}})$, $D^\dagger = \Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}})$. We claim that the map $\phi : D^\dagger \to \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}) = A[1/t_1]^\dagger \otimes_{\mathcal{V}} K$ is surjective. Indeed, an element f of $A[1/t_1]^\dagger$ can be written as $f = \sum_{n \geq 0} a_n t_1^{-n-1}$ with $a_n \in A$ and $\|a_n\| < c\eta^n$ for some $\eta < 1$. Take $P = \sum_{n \geq 0} (-1)^n a_n \partial^{[n]} \in D^\dagger$, then $P \cdot (1/t_1) = f$.

Next we consider $\mathrm{Ker}\, \phi$. Take $P = \sum_{\underline{n}} a_{\underline{n}} \partial^{[\underline{n}]} \in D^\dagger$ such that $P \cdot (1/t_1) = 0$. Break P into two sums $\sum'$ and $\sum''$ - in $\sum'$ we include those terms with $\underline{n}$ such that $n_i = 0$ for $i > 1$; and in $\sum''$ we include those terms with $\underline{n}$ such that there is an $i > 1$ for which $n_i \neq 0$. According to 8.7.1.10, the operator $\sum''_{\underline{n}} a_{\underline{n}} \partial^{[\underline{n}]}$ lies in the ideal generated by $\partial_2, \ldots, \partial_d$ and thus it is in the image of ψ. We can thus suppose that P is of the form $P = \sum_{n \geq 0} a_n \partial_1^{[n]}$. Since $P \in \mathrm{Ker}\, \phi$, we get in $A[1/t_1]^\dagger$ the relation

$$\sum_{n \geq 0} (-1)^n a_n t_1^{-n-1} = 0. \qquad (12.1.2.2.3)$$

For $j \geq 0$ put

$$b_j := (-1)^{j+1} \sum_{n=0}^{j-1} (-1)^n a_n t_1^{j-n-1}.$$

As $P \in D^\dagger$, there exist c and $\eta < 1$ such that $\|a_n\| < c\eta^n$ for some $\eta < 1$. By lemma 12.1.2.1, there exist c' and $\eta' < 1$ such that $\|b_j\| < c'\eta'^j$. Now put $Q := \sum_{j\geq 0} b_j \partial_1^{[j]}$. We claim: $Qt_1 = P$. It suffices to check in $\Gamma(\mathfrak{U} \cap Y, \mathcal{D}^\dagger_{\mathfrak{X}\mathbb{Q}}) \supset D^\dagger$. Using (12.1.2.2.3) we have $b_j = (-1)^j \sum_{n \geq j} (-1)^n a_n t_1^{j-n-1}$. From this we get

$$\begin{aligned} Qt_1 &= \sum_{j\geq 0} (\sum_{n\geq j} (-1)^{n-j} a_n t_1^{j-n-1}) \partial_1^{[j]} t_1 = \sum_{n \geq 0} a_n (\sum_{j=0}^{n} (-1)^{n-j} t_1^{j-n-1} \partial_1^{[j]}) t_1 \\ &= \sum_{n\geq 0} a_n (\partial_1^{[n]} t_1^{-1}) t_1 = P. \end{aligned}$$

Moreover as $b_0 = 0$, by 8.7.1.10, we can write $Q = Q_1 \partial_1$ for some $Q_1 \in D^\dagger$. □

Proposition 12.1.2.3. *Let $\mathfrak{X}$ be a smooth separated $\mathcal{V}$-formal scheme with reduction X on k, Z be a strict normal crossing divisor in X. Then:*

(a) The $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ is coherent.

(b) If $\mathfrak{U}$ is an affine open formal subscheme of $\mathfrak{X}$ such that there exist local coordinates $t_1, \ldots, t_d$ satisfying $t_1, \ldots, t_r \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{U}})$ with $r \leq d$, and $Z \cap U = V(\bar{t}_1 \cdots \bar{t}_r)$ where $\bar{t}_1, \ldots, \bar{t}_r$ is image of $t_1, \ldots, t_r$ in $\Gamma(U, \mathcal{O}_U)$. We have the exact sequence

$$(\mathcal{D}^\dagger_{\mathfrak{U}/\mathfrak{S},\mathbb{Q}})^d \xrightarrow{\psi} \mathcal{D}^\dagger_{\mathfrak{U}/\mathfrak{S},\mathbb{Q}} \xrightarrow{\phi} \mathcal{O}_{\mathfrak{U}}({}^\dagger Z \cap U)_{\mathbb{Q}} \to 0, \tag{12.1.2.3.1}$$

where $\phi(P) = P \cdot (1/t_1 \cdots t_r)$, and ψ is defined by

$$\psi(P_1, \ldots, P_d) = \sum_{i=1}^{r} P_i \partial_i t_i + \sum_{i=r+1}^{d} P_i \partial_i. \tag{12.1.2.3.2}$$

Proof. See [Ber90, 4.3.2]. □

12.1.3 Differential coherence of the local cohomology with support in a smooth closed subscheme of the constant coefficient

Notation 12.1.3.1. Let $\mathfrak{X}$ be a smooth formal scheme over $\mathfrak{S}$. Let Z be a closed subscheme of X and $j_Z \colon X \setminus Z \to X$ be the open immersion. We set

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} := \mathbb{R}\mathrm{sp}_* j_Z^\dagger(\mathcal{O}_{\mathfrak{X}_K}), \qquad \mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} := \mathbb{R}\mathrm{sp}_* \underline{\Gamma}^\dagger_Z(\mathcal{O}_{\mathfrak{X}_K}).$$

By definition, $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ is the local cohomology with support in Z of the constant coefficient $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$. Remark that when Z is moreover a divisor of X, then we retrieve the definition 8.7.3.5.2. The exact sequence $0 \to \underline{\Gamma}^\dagger_Z(\mathcal{O}_{\mathfrak{X}_K}) \to \mathcal{O}_{\mathfrak{X}_K} \to j_Z^\dagger(\mathcal{O}_{\mathfrak{X}_K}) \to 0$ induces the exact triangle

$$\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to \mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \to \mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}[1]. \tag{12.1.3.1.1}$$

For any integer $i \in \mathbb{Z}$, we set $\mathcal{H}^{\dagger i}_Z(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) := H^i \mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$.

Notation 12.1.3.2 (Cech complexes with divisors for the constant coefficient)**.** Let $\mathfrak{X}$ be a smooth formal scheme. Let $\mathscr{T} := (T_i)_{i\in I}$ be a finite set of divisors of X and $Z = \cap_{i\in I} T_i$.

For each $h \in I$, for any $(i_0, \ldots, i_h) \in I$, put $T_{i_0,\ldots,i_h} := T_{i_0} \cup \cdots \cup T_{i_h}$. For each $h \in I$, set

$$\check{C}^{\dagger h}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}) := \prod_{(i_0,i_1,\ldots,i_h)\in I^{1+h}} \mathcal{O}_{\mathfrak{X}}({}^\dagger T_{i_0\ldots i_h})_{\mathbb{Q}}. \tag{12.1.3.2.1}$$

Let $\alpha \in \check{C}^{\dagger h}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}})$. For any $h \in I$, for any $(i_0, \dots, i_h) \in I$, we denote by $\alpha_{i_0,\dots,i_h}$ the coefficient of α in $\mathcal{O}_{\mathfrak{X}}({}^\dagger T_{i_0 \dots i_h})_{\mathbb{Q}}$.

We define the coboundary map $d\colon \check{C}^{\dagger h}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \to \check{C}^{\dagger h+1}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}})$ by setting

$$(d\alpha)_{i_0,\dots,i_{h+1}} := \sum_{j=0}^{h+1} (-1)^j \alpha_{i_0,\dots,\widehat{i_j},\dots,i_{h+1}}.$$

This yields the complex

$$\cdots 0 \to \check{C}^{\dagger 0}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \to \check{C}^{\dagger 1}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \to \cdots \to \check{C}^{\dagger h}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \to 0 \cdots$$

that we will denote by $\check{C}^{\dagger \bullet}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}})$.

Let $Y_i := X \setminus T_i$ the open subscheme of X and $Y := \cup_{i \in I} Y_i$. We get the finite open covering $\mathscr{Y} := (Y_i)_{i=1,\dots,r}$ of Y (i.e. $Y = X \setminus Z$). Since $\mathrm{sp}_*(j^\dagger_{Y_i} \mathcal{O}_{\mathfrak{X}_K}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}({}^\dagger T_i)_{\mathbb{Q}}$, then

$$\mathrm{sp}_* \check{C}^{\dagger \bullet}(\mathfrak{X}, \mathscr{Y}, \mathcal{O}_{\mathfrak{X}_K}) \xrightarrow{\sim} \check{C}^{\dagger \bullet}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}), \tag{12.1.3.2.2}$$

where $\check{C}^{\dagger \bullet}(\mathfrak{X}, \mathscr{Y}, \mathcal{O}_{\mathfrak{X}_K})$ is defined in 10.1.3.5.

Notation 12.1.3.3. We keep notation 12.1.1.3 and for any $i \in I$ we denote by $\mathscr{T}_i := (T_{i\, j_i})_{j_i \in J_i}$ the finite set of divisors of X_i. For any $h, l \in \mathbb{N}$, for any $\underline{i} = (i_0, \dots, i_h) \in I^{1+h}$, we denote by $\mathscr{T}_{\underline{i}} := (T_{\underline{i}\, \underline{\underline{j}}})_{\underline{\underline{j}} \in (J_{\underline{i}})^{1+l}}$ the finite set of divisors of $X_{\underline{i}}$. For any $h, l \in \mathbb{N}$, we get the left $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-module

$$\check{C}^{\dagger hl}(\mathscr{X}, (\mathscr{T}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}}) := \prod_{\underline{i} \in I^{1+h}} u_{\underline{i}*} \check{C}^{\dagger l}(\mathfrak{X}_{\underline{i}}, \mathscr{T}_{\underline{i}}, \mathcal{O}_{\mathfrak{X}_{\underline{i}},\mathbb{Q}}) \overset{12.1.3.2.1}{=} \prod_{\underline{i} \in I^{1+h}} u_{\underline{i}K*} \left(\prod_{\underline{\underline{j}} \in J^{1+l}_{\underline{i}}} \mathcal{O}_{\mathfrak{X}_{\underline{i}}}({}^\dagger T_{\underline{i}\,\underline{\underline{j}}})_{\mathbb{Q}} \right).$$

Similarly to 10.1.4, we get the bicomplex $\check{C}^{\dagger \bullet\bullet}(\mathscr{X}, (\mathscr{T}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}})$. We denote by $\check{C}^{\dagger \bullet}(\mathscr{X}, (\mathscr{T}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}})$ its total complex.

Proposition 12.1.3.4. *With notation 12.1.3.3, we have the isomorphism:*

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} = \mathbb{R}\mathrm{sp}_*(j^\dagger \mathcal{O}_{\mathfrak{X}_K}) \xrightarrow{\sim} \check{C}^{\dagger \bullet}(\mathscr{X}, (\mathscr{T}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}}).$$

Proof. Since $\mathrm{sp}_* u_{\underline{i}K*} \xrightarrow{\sim} u_{\underline{i}*} \mathrm{sp}_*$, then we get

$$\begin{aligned} \mathrm{sp}_* \check{C}^{\dagger hl}(\mathscr{X}, (\mathscr{Y}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}_K}) &\xrightarrow{\sim} \prod_{\underline{i} \in I^{1+h}} \mathrm{sp}_* u_{\underline{i}K*} \check{C}^{\dagger l}(\mathfrak{X}_{\underline{i}}, \mathscr{Y}_{\underline{i}}, \mathcal{O}_{\mathfrak{X}_{\underline{i}K}}) \xrightarrow{\sim} \prod_{\underline{i} \in I^{1+h}} u_{\underline{i}*} \mathrm{sp}_* \check{C}^{\dagger l}(\mathfrak{X}_{\underline{i}}, \mathscr{Y}_{\underline{i}}, \mathcal{O}_{\mathfrak{X}_{\underline{i}K}}) \\ &\underset{12.1.3.2.2}{\xrightarrow{\sim}} \prod_{\underline{i} \in I^{1+h}} u_{\underline{i}*} \check{C}^{\dagger l}(\mathfrak{X}_{\underline{i}}, \mathscr{T}_{\underline{i}}, \mathcal{O}_{\mathfrak{X}_{\underline{i}},\mathbb{Q}}) = \check{C}^{\dagger hl}(\mathscr{X}, (\mathscr{T}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}}). \end{aligned} \tag{12.1.3.4.1}$$

Since these isomorphisms commute with the transition maps, this yields the last isomorphism

$$\mathbb{R}\mathrm{sp}_*(j^\dagger \mathcal{O}_{\mathfrak{X}_K}) \overset{10.1.4.2}{\xrightarrow{\sim}} \mathrm{sp}_* \check{C}^{\dagger \bullet\bullet}(\mathscr{X}, (\mathscr{Y}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}_K}) \xrightarrow{\sim} \check{C}^{\dagger \bullet\bullet}(\mathscr{X}, (\mathscr{T}_i)_{i \in I}, \mathcal{O}_{\mathfrak{X}}).$$

□

Example 12.1.3.5. Within notation 12.1.1.3 suppose I has only one element and remove i in the notation, i.e. suppose $\mathfrak{X}$ is an affine smooth $\mathcal{V}$-formal scheme, $\mathscr{T} := (T_j)_{j \in J}$ is a finite set of divisors of X such that there exists $f_j \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ satisfying $T_j = V(f_j)$. By setting $Z = \cap_{j \in J} T_j$, we get

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \xrightarrow{\sim} \check{C}^{\dagger \bullet}(\mathfrak{X}, \mathscr{T}, \mathcal{O}_{\mathfrak{X},\mathbb{Q}}).$$

Proposition 12.1.3.6. *Let $\mathfrak{X}$ be a smooth formal scheme over $\mathfrak{S}$. Let $u\colon Z \to X$ be a closed immersion of k-smooth schemes purely of codimension r.*

(a) We have $\mathcal{H}^{\dagger i}_Z(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) = 0$ for any $i \neq r$.

(b) *Let $x \in X$. Choose an affine open formal subscheme $\mathfrak{U}$ of $\mathfrak{X}$ containing x such that there exist coordinates $t_1, \dots, t_d \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{U}})$ such that $Z \cap U = V(\bar{t}_1, \dots, \bar{t}_r)$ where $r \leq d$ and $\bar{t}_1, \dots, \bar{t}_r$ are the image of $t_1, \dots, t_r$ in $\Gamma(U, \mathcal{O}_U)$. We have the exact sequence*

$$(\mathcal{D}^\dagger_{\mathfrak{U}/\mathfrak{S},\mathbb{Q}})^d \xrightarrow{\vartheta} \mathcal{D}^\dagger_{\mathfrak{U}/\mathfrak{S},\mathbb{Q}} \xrightarrow{\phi} \mathcal{H}^{\dagger r}_{Z\cap U}(\mathcal{O}_{\mathfrak{U},\mathbb{Q}}) \to 0, \tag{12.1.3.6.1}$$

where $\phi(P) = P \cdot (1/t_1 \cdots t_r)$, and ϑ is defined by

$$\vartheta(P_1, \dots, P_d) = \sum_{i=1}^{r} P_i t_i + \sum_{i=r+1}^{d} P_i \partial_i. \tag{12.1.3.6.2}$$

(c) *The complexes $\mathcal{O}_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}, \mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ are in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$.*

Proof. See [Ber90, 4.3.4]. □

Remark 12.1.3.7. With the notation 12.1.3.6, suppose, $\mathfrak{U} = \mathfrak{X}$. For $i = 1, \dots, r$, put $Z_i := V(\bar{t}_i)$, and $Z_{i_0,\dots,i_k} := Z_{i_0} \cup \dots \cup Z_{i_k}$ (i.e. $V(\bar{t}_{i_0} \cdots \bar{t}_{i_k}) = Z_{i_0,\dots,i_k}$). Then it follows from 12.1.3.5 that $\mathcal{O}_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$ is represented by the (ordered version) Cech complex

$$\prod_{i=1}^{d} \mathcal{O}_{\mathfrak{X}}(^\dagger Z_i)_{\mathbb{Q}} \to \prod_{i_0<i_1} \mathcal{O}_{\mathfrak{X}}(^\dagger Z_{i_0 i_1})_{\mathbb{Q}} \to \dots \to \mathcal{O}_{\mathfrak{X}}(^\dagger Z_{1\dots r})_{\mathbb{Q}} \to 0, \tag{12.1.3.7.1}$$

whose first term is at degree 0. This yields that $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ is represented by the complex

$$\mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to \prod_{i=1}^{d} \mathcal{O}_{\mathfrak{X}}(^\dagger Z_i)_{\mathbb{Q}} \to \prod_{i_0<i_1} \mathcal{O}_{\mathfrak{X}}(^\dagger Z_{i_0 i_1})_{\mathbb{Q}} \to \dots \to \mathcal{O}_{\mathfrak{X}}(^\dagger Z_{1\dots r})_{\mathbb{Q}} \to 0, \tag{12.1.3.7.2}$$

whose first term is at degree 0. Using 12.1.2.3, this is how Berthelot checked in [Ber90, 4.3.4] that $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$.

Corollary 12.1.3.8. *Let $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ be a closed immersion of smooth formal schemes over $\mathfrak{S}$.*

(a) *We have $u^!(\mathcal{O}_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}) = 0$, i.e. by applying the functor $u^!$ to the canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$, we get an isomorphism.*

(b) *We have the isomorphisms $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \xrightarrow{\sim} u_+ u^!(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \xrightarrow{\sim} u_+(\mathcal{O}_{\mathfrak{Z},\mathbb{Q}})[d_u]$.*

Proof. 0) Since this is local in $\mathfrak{X}$ and $\mathfrak{Z}$, we can suppose u ispurely of codimension r. Let $\mathfrak{Y}$ be the open formal subscheme of $\mathfrak{X}$ complementary to Z. First we check that $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}|\mathfrak{Y} = 0$. Since this is local, we can suppose with the notation of Proposition 12.1.3.6 that $\mathfrak{U} = \mathfrak{X}$. In that case, we compute that the restriction to $\mathfrak{Y}$ of the map ϑ of the exact sequence 12.1.3.6.1 is surjective. Hence, $\mathcal{H}^{\dagger r}_Z(\mathcal{O}_{\mathfrak{X},\mathbb{Q}})|\mathfrak{Y} = 0$ (or we can also compute the rth cohomological space of the complex 12.1.3.7.2).

a) Now, let us check that $u^!(\mathcal{O}_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}) = 0$. Since this local, we can suppose with the notation of Proposition 12.1.3.6 that $\mathfrak{U} = \mathfrak{X}$, and we use notation 12.1.3.7. Using the resolution 12.1.3.7.1 of $\mathcal{O}_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}}$, we reduce to check $\mathbb{L}u^*(\mathcal{O}_{\mathfrak{X}}(^\dagger Z_{i_0\dots i_k})_{\mathbb{Q}}) = 0$. Let $u_i\colon \mathfrak{Z}_i \hookrightarrow \mathfrak{X}$ be the closed immersion of formal schemes whose corresponding ideal is generated by t_i. If we choose $i \in \{i_0, \dots, i_k\}$, then the multiplication by $t_i\colon \mathcal{O}_{\mathfrak{X}}(^\dagger Z_{i_0\dots i_k})_{\mathbb{Q}} \xrightarrow{t_i} \mathcal{O}_{\mathfrak{X}}(^\dagger Z_{i_0\dots i_k})_{\mathbb{Q}}$ is an isomorphism. Hence, $\mathbb{L}u_i^*(\mathcal{O}_{\mathfrak{X}}(^\dagger Z_{i_0\dots i_k})_{\mathbb{Q}}) = 0$. This yields $\mathbb{L}u^*(\mathcal{O}_{\mathfrak{X}}(^\dagger Z_{i_0\dots i_k})_{\mathbb{Q}}) = 0$.

b) Hence, by applying the functor $u^!$ to the exact triangle 12.1.3.1.1, using part b) of the proof, we get the isomorphism $u^! \mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \xrightarrow{\sim} u^! \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$. Hence, $u_+ u^! \mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \xrightarrow{\sim} u_+ u^! \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$. Since $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ has his support in Z, we get from Theorem 9.3.5.9 the isomorphism $\mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \xrightarrow{\sim} u_+ u^! \mathbb{R}\underline{\Gamma}^\dagger_Z \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$. Hence, we are done by composition. □

12.1.4 Local cohomology with support in a smooth closed subscheme for (quasi-)coherent complexes of $\mathcal{D}$-modules

Notation 12.1.4.1. Let $\mathfrak{X}$ be a smooth formal scheme over $\mathfrak{S}$. Let Z be a k-smooth closed subscheme of X. Let $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{O}^{(\bullet)}_{\mathfrak{X}}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ such that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{O}^{(\bullet)}_{\mathfrak{X}}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Z}\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$, where this latter complex is defined at 12.1.3.1 (and is coherent thanks to 12.1.3.6). Then we can define the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ by setting for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}^{(\bullet)}) := \mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{O}^{(\bullet)}_{\mathfrak{X}})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)}. \tag{12.1.4.1.1}$$

Let T be a divisor of X. Following 8.4.1.15, we have the equivalence of categories: $\underrightarrow{l}^{*}_{X,\mathbb{Q}} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(T) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$. Then we get the functor

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z} \colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}}) \tag{12.1.4.1.2}$$

so that for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(T))$ we get by definition the isomorphism:

$$\underrightarrow{l}^{*}_{X,\mathbb{Q}}(\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\underrightarrow{l}^{*}_{X,\mathbb{Q}}(\mathcal{E}^{(\bullet)})).$$

By using the map $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}\mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$ (see 12.1.3.1.1), we get the arrow $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{O}^{(\bullet)}_{\mathfrak{X}}) \to \mathcal{O}^{(\bullet)}_{\mathfrak{X}}$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$. This yields for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$ the morphism of $D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}) \to \mathcal{E}. \tag{12.1.4.1.3}$$

Remark 12.1.4.2. Beware that in our work first we do need to use the functor 12.1.4.1.2 and the arrow 12.1.4.1.3 in order to prove the $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-coherence of $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$ when Z is a divisor (more precisely, see the proof of 12.2.7.1). This coherence result is fundamental in order to be able to define local cohomology with support in any closed subscheme in the context of quasi-coherent complexes of the next chapter. We will see via 13.1.3.10 that both local cohomologies coincide, which justifies adopting the notation 12.1.3.1 and 12.1.4.1.

Lemma 12.1.4.3. *Let $u \colon \mathfrak{Z} \to \mathfrak{X}$ be a closed immersion of smooth formal $\mathfrak{S}$-schemes. For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$, we have the isomorphism*

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{+} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}), \tag{12.1.4.3.1}$$

where by abuse of notation we denote $u(Z)$ by Z.

Proof. Using 9.4.3.2.1 and 12.1.4.1.1, we reduce to the case where $\mathcal{E}^{(\bullet)} = \mathcal{O}^{(\bullet)}_{\mathfrak{X}}$. Then the Lemma follows from 12.1.3.8. □

12.2 Arithmetic $\mathcal{D}$-modules associated with overconvergent isocrystals on completely smooth d-frames

12.2.1 The categories of isocrystals $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$, $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$ on completely smooth d-frames and their stability

Definition 12.2.1.1. We define the category of d-frames as follows:

(a) A "d-frame over $\mathcal{V}$" is the data of a separated and smooth $\mathcal{V}$-formal scheme $\mathfrak{P}$, of a closed subscheme X of P, of a divisor T of P such that $Y = X \setminus T$. Such a d-frame over $\mathcal{V}$ is denoted by $(Y, X, \mathfrak{P}, T)/\mathcal{V}$. We say that $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ is d-frame over $\mathcal{V}$ enclosing (Y, X). A d-frame $(Y, X, \mathfrak{P}, T)$ is "completely smooth" (resp. "smooth") if X (resp. Y) is k-smooth and if $T \cap X$ is a divisor of X (resp. and $T \cap Y$ is a divisor of Y).

(b) A morphism $\theta\colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ of (resp. completely smooth, resp. smooth) d-frames (over $\mathcal{V}$) is the data of a morphism $f\colon \mathfrak{P}' \to \mathfrak{P}$ of $\mathfrak{S}$-formal schemes such that such that $X' \subset f^{-1}X$ and $T' \supset f^{-1}(T)$. When $T' = f^{-1}(T)$, we say that the morphism is *strict*. If $a\colon X' \to X$, $b\colon Y' \to Y$ are the morphisms induced by f, the morphism θ is also denoted by (b, a, f).

Notation 12.2.1.2. Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ be a d-frame over $\mathcal{V}$. Then, we can simply write it $(X, \mathfrak{P}, T)/\mathcal{V}$ and even $(X, \mathfrak{P}, T)$ if $\mathcal{V}$ is understood.

Remark 12.2.1.3. We will introduce later the notion of frames (see 16.2.1.8) which extends that of d-frames of 12.2.1.1.

Notation 12.2.1.4. Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ be a completely smooth d-frame. We denote by $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ the full subcategory of $\mathrm{Coh}(X, \mathfrak{P}, T/\mathcal{V})$ (see notation 9.3.7.4) whose objects $\mathcal{E}$ satisfy the following condition: for any affine open formal subscheme $\mathfrak{P}'$ of $\mathfrak{P}$, for any morphism of formal schemes $v\colon \mathfrak{X}' \hookrightarrow \mathfrak{P}'$ whose reduction modulo π is the closed imbedding $X \cap P' \hookrightarrow P'$, the sheaf $v^!(\mathcal{E}|\mathfrak{P}')$ is $\mathcal{O}_{\mathfrak{X}'}({}^\dagger T \cap X')_{\mathbb{Q}}$-coherent. When T is empty, we remove it in the notation. When T is empty, we remove it in the notation. When $X = P$, we get $\mathrm{MIC}^{\dagger\dagger}(P, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$ (see notation 11.2.1.4).

Proposition 12.2.1.5. *Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ be a completely smooth d-frame. Let $\mathcal{E} \in \mathrm{Coh}(X, \mathfrak{P}, T/\mathcal{V})$. The following properties are equivalent:*

(a) $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$;

(b) $\mathcal{E}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$.

Proof. This follows from 11.2.1.14.(e). □

Notation 12.2.1.6. Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ be a completely smooth d-frame. We denote by $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$ the full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ consisting of objects $\mathcal{E}^{(\bullet)}$ with support in X and such that $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ where $\underrightarrow{l}^*_{\mathbb{Q}}$ is the equivalence of categories of 8.4.5.6, and where $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ is defined in 12.2.1.4. By definition, we get the equivalence of categories

$$\underrightarrow{l}^*_{\mathbb{Q}}\colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \cong \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}). \tag{12.2.1.6.1}$$

When T is empty, we remove it in the notation. When $X = P$, we get $\mathrm{MIC}^{(\bullet)}(P, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{(\bullet)}(\mathfrak{P}, T/\mathcal{V})$ (see notation 11.2.2.1).

12.2.1.7 (Berthelot-Kashiwara isocrystal variation)**.** Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ be a completely smooth d-frame such that $X \hookrightarrow \mathfrak{P}$ lifts to a morphism $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ of smooth $\mathcal{V}$-formal schemes. It follows from 9.3.5.9 (resp. 9.3.5.13) that the functors u_+ and $u^!$ (resp. $u_+^{(\bullet)}$ and $u^{(\bullet)!}$) induce quasi-inverse equivalences of categories between $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ and $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T \cap X/\mathcal{V})$ (resp. $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$ and $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}, T \cap X/\mathcal{V})$).

Since $\mathrm{MIC}^{(\bullet)}(\mathfrak{X}, T \cap X/\mathcal{V}) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(T \cap X))$ (see 11.2.2.2) then it follows from 9.4.2.6 that

$$\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T)). \tag{12.2.1.7.1}$$

Proposition 12.2.1.8. *For $i = 1, 2$, let $(Y_i, X_i, \mathfrak{P}_i, T_i)/\mathcal{V}$ be a completely smooth d-frame, let $\mathcal{E}_i^{(\bullet)}$ be an object of $\mathrm{MIC}^{(\bullet)}(X_i, \mathfrak{P}_i, T_i/\mathcal{V})$. Let $\mathfrak{P} := \mathfrak{P}_1 \times_{\mathfrak{S}} \mathfrak{P}_2$, $p_i\colon \mathfrak{P} \to \mathfrak{P}_i$ be the natural projection for $i = 1, 2$, $X := X_1 \times_k X_2$, $T := p_1^{-1}(T_1) \cup p_2^{-1}(T_2)$. Then $\mathcal{E}_1^{(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{E}_2^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$.*

Proof. Following Lemma 9.2.5.9 (see also 9.2.5.3), we already know $\mathcal{E}_1^{(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{E}_2^{(\bullet)} \xrightarrow{\sim} \mathcal{E}_1^{(\bullet)} \widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}}} \mathcal{E}_2^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. Since the proposition is local, by using 12.2.1.7 and 9.4.4.1, we reduce to the case where $X = P$ and $Y = Q$. Hence, this follows from 11.2.4.4. □

Proposition 12.2.1.9. Let $\theta := (b,\, a,\, f)\colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ be a morphism of completely smooth d-frames (see 12.2.1.1) such that f is smooth.

(i) For any $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$, we have $\theta^{(\bullet)*} := \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{(\bullet)!}_{T',T} \mathcal{E}^{(\bullet)}[-d_{X'/X}] \in \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V})$. We get the functor:

$$\theta^{(\bullet)*} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}', T'/\mathcal{V}) \qquad (12.2.1.9.1)$$

(ii) If a and b are the identities, then the functor $\theta^{(\bullet)*}$ of 12.2.1.9.1 is an equivalence of categories.

Proof. (i) The fact that $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{(\bullet)!}\mathcal{E}^{(\bullet)}[-d_{X'/X}] \in \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V})$ is local on $\mathfrak{P}'$. Hence, we can suppose there exists a closed immersion of smooth formal $\mathfrak{S}$-schemes of the form $u \colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ (resp. $u' \colon \mathfrak{X}' \hookrightarrow \mathfrak{P}'$, resp. $a \colon \mathfrak{X}' \to \mathfrak{X}$) which reduces modulo π to the given morphism $X \hookrightarrow P$ (resp. $X' \hookrightarrow P'$, resp. a). Hence, it follows from 9.2.2.1 that we have the glueing isomorphism

$$\tau \colon u'^{(\bullet)!} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} a^{(\bullet)!} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}). \qquad (12.2.1.9.2)$$

This yields

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \underset{12.1.4.3.1}{\xrightarrow{\sim}} u'^{(\bullet)}_{+} \circ u'^{(\bullet)!} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \underset{12.2.1.9.2}{\xrightarrow{\sim}} u'^{(\bullet)}_{+} \circ a^{(\bullet)!} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}). \qquad (12.2.1.9.3)$$

Since $u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}, T \cap X/\mathcal{V})$ (see 12.2.1.7), then $\mathbb{L}a^{*(\bullet)} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}', T' \cap X'/\mathcal{V})$ (see 11.2.3.5.1)). Since $\mathbb{L}a^{*(\bullet)} = a^{(\bullet)!}[-d_{X'/X}]$, we get the first statement (again, use 12.2.1.7).

(ii) The fact that this is an equivalence of categories is local in $\mathfrak{P}$. Hence, we can suppose that $\mathfrak{P}$ is affine, in which case there exists $u \colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ (resp. $u' \colon \mathfrak{X} \hookrightarrow \mathfrak{P}'$) which reduces modulo π to the given morphism $X \hookrightarrow P$ (resp. $X \hookrightarrow P'$). Following 12.2.1.9.3, we get

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u'^{(\bullet)}_{+} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}).$$

We conclude by using Berthelot-Kashiwara theorem of the form 12.2.1.7. □

12.2.1.10 (Independance of the d-frame enclosing (Y, X))**.** Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ be a completely smooth d-frame over $\mathcal{V}$. Then the category $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$ do not depend on the completely smooth d-frame over $\mathcal{V}$ enclosing (Y, X). Indeed let $(Y, X, \mathfrak{P}', T')/\mathcal{V}$ be a second choice of completely smooth d-frame enclosing (Y, X). Let $\mathfrak{P}'' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{P}'$, $p_0 \colon \mathfrak{P}'' \to \mathfrak{P}$ and $p_1 \colon \mathfrak{P}'' \to \mathfrak{P}'$ be the projections and $T'' := p_0^{-1}(T) \cup p_1^{-1}(T')$. We get the morphisms of d-frames $\theta_0 := (\mathrm{id}, \mathrm{id}, p_0) \colon (Y, X, \mathfrak{P}'', T'')/\mathcal{V} \to (Y, X, \mathfrak{P}, T)/\mathcal{V}$ and $\theta_1 := (\mathrm{id}, \mathrm{id}, p_1) \colon (Y, X, \mathfrak{P}'', T'')/\mathcal{V} \to (Y, X, \mathfrak{P}', T')/\mathcal{V}$. Since $\theta_0^{(\bullet)*}$ and $\theta_1^{(\bullet)*}$ are equivalence of categories, then we are done.

Corollary 12.2.1.11. *Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ and $(Y', X', \mathfrak{P}', T')/\mathcal{V}$ be two completely smooth d-frames. Suppose we have the following commutative diagram:*

$$\begin{array}{ccccccc} Y' & \xrightarrow{j'} & X' & \xrightarrow{i'} & P' & \longrightarrow & \mathfrak{P}' \\ \downarrow h & & \downarrow g & & \downarrow f_0 & & \\ Y & \xrightarrow{j} & X & \xrightarrow{i} & P & \longrightarrow & \mathfrak{P}, \end{array} \qquad (12.2.1.11.1)$$

where j and j' are the underlying open embeddings, i and i' are the underlying closed embeddings. Set $\theta := (h,\, g,\, f_0)$.

(a) We get a natural functor

$$\theta^{(\bullet)*} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V}) \qquad (12.2.1.11.2)$$

satisfying the condition (b):

(b) Suppose f_0 has a lifting $f \colon \mathfrak{P}' \to \mathfrak{P}$. The functor 12.2.1.11.2 is equal (up to equivalence of categories) to the functor $(h,\, g,\, f)^{(\bullet)*}$ of 12.2.1.9.1. In particular, the functor $(h,\, g,\, f)^{(\bullet)*}$ does not depend (up to equivalence of categories) on the lifting f of f_0.

Proof. Let $\mathfrak{P}'' := \mathfrak{P}' \times_{\mathfrak{S}} \mathfrak{P}$, $p_0 \colon \mathfrak{P}'' \to \mathfrak{P}'$ and $p_1 \colon \mathfrak{P}'' \to \mathfrak{P}$ be the projections and $T'' := p_0^{-1}(T) \cup p_1^{-1}(T)$. Since $\mathcal{P}$ is separated then the morphism $i'' := (i', i \circ g) \colon X' \to \mathcal{P}''$ is a closed immersion. We get the morphisms of d-frames $\theta_0 := (\mathrm{id}, \mathrm{id}, p_0) \colon (Y', X', \mathfrak{P}'', T'')/\mathcal{V} \to (Y', X', \mathfrak{P}', T')/\mathcal{V}$ and $\theta_1 :=$

$(h,g,p_1)\colon (Y',X',\mathfrak{P}'',T'') \to (Y,X,\mathfrak{P},T)/\mathcal{V}$. Since $\theta_0^{(\bullet)*}$ is an equivalence of categories, then we get the unique (up to equivalence of categories) functor $\theta^{(\bullet)*}$ so that

$$\theta_0^{(\bullet)*} \circ \theta^{(\bullet)*} \cong \theta_1^{(\bullet)*}.$$

□

Remark 12.2.1.12. With notation 12.2.1.11, Berthelot constructed in the same way (see [Ber96b, 2.3.2.(iv)]) the inverse image functor:

$$(h,\, g,\, f_0)^*\colon \mathrm{MIC}^\dagger(Y,X,\mathfrak{P}/\mathcal{V}) \to \mathrm{MIC}^\dagger(Y',X',\mathfrak{P}'/\mathcal{V}). \qquad (12.2.1.12.1)$$

In [Car09a, 2.3.1], we have constructed a functor of the form 12.2.1.12.1 in another way by glueing local data (which allows us to reduce to the case where f_0 has a lifting). We checked that both functors coincide.

Proposition 12.2.1.13. Let $(Y,X,\mathfrak{P},T)/\mathcal{V}$ be a completely smooth d-frame over $\mathcal{V}$. Let $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ be two objects of $\mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V})$.

(a) We have $\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}[d_{X/P}] \in \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V})$, i.e. for any $j \neq d_{X/P}$, $\mathcal{H}^j(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) = 0$ and $\mathcal{H}^{d_{X/P}}(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V})$.

(b) The functor $\mathbb{D}^{(\bullet)}_T$ of 9.2.4.20 induces the involution:

$$\mathbb{D}^{(\bullet)}_T\colon \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V}). \qquad (12.2.1.13.1)$$

Proof. a) Let $\mathfrak{R} := \mathfrak{P}\times_{\mathfrak{S}}\mathfrak{P}$, $p_0,p_1\colon \mathfrak{Q} \to \mathfrak{P}$ be respectively the natural left and right projection, $Q := X\times_k X$, $D := p_0^{-1}(T)\cup p_1^{-1}(T)$. Following 12.2.1.8, $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{F}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(Q,\mathfrak{R},D/\mathcal{V})$. By using 12.2.1.9 in the case of the diagonal morphism $(X,\mathfrak{P},T/\mathcal{V}) \to (Q,\mathfrak{R},D/\mathcal{V})$, we get (a) from 9.2.5.15.1.

b) Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V})$. Following 12.2.1.7.1, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ and then $\mathbb{D}^{(\bullet)}_T(\mathcal{E}^{(\bullet)})$ is well defined. We reduce to check that $\underrightarrow{l}^*_{\mathbb{Q}}\mathbb{D}^{(\bullet)}_T(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V})$, where $\underrightarrow{l}^*_{\mathbb{Q}}$ is the equivalence of categories of 8.4.5.6. Since this is local, we reduce to the case where there exists a morphism of smooth $\mathfrak{S}$-formal schemes $\mathfrak{X} \to \mathfrak{P}$ which is a lifting of $X \to \mathfrak{P}$. This is then the consequence of 11.2.6.3.4 and of the relative duality isomorphism 9.4.5.2.1. □

12.2.1.14. Via the equivalence of categories 12.2.1.6.1, the results of 12.2.1.8, 12.2.1.11 and 12.2.1.13 are still valid by replacing $\mathrm{MIC}^{(\bullet)}$ with $\mathrm{MIC}^{\dagger\dagger}$. More precisely, with notation 12.2.1.11, we get the functors

$$\theta^*\colon \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(X',\mathfrak{P}',T'/\mathcal{V}), \qquad (12.2.1.14.1)$$

$$-\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}} - [d_{X/P}]\colon \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V}) \times \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V}), \qquad (12.2.1.14.2)$$

$$\mathbb{D}_{\mathfrak{P},T}\colon \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V}). \qquad (12.2.1.14.3)$$

Moreover, with notation 12.2.1.8, we get the functor

$$-\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},T_1,T_2} -\colon \mathrm{MIC}^{\dagger\dagger}(X_1,\mathfrak{P}_1,T_1/\mathcal{V}) \times \mathrm{MIC}^{\dagger\dagger}(X_2,\mathfrak{P}_2,T_2/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V}). \qquad (12.2.1.14.4)$$

12.2.1.15. With notation 12.2.1.11, we can check that the inverse image functor 12.2.1.11.2 is equal to that of 9.2.2.4.3. In particular, when f_0 is the relative Frobenius, then this is equal to the functor 9.5.1.2.2. Since our objects are coherent then 9.5.1.1.3 via the isomorphisms 9.5.1.2.5 and 9.5.1.2.4, we get the functor $(F^s_{X_0/S_0})^*$ constructed at 8.8.2.4.1 is equal to the functor $(F^s_{Y_0/S_0}, F^s_{X_0/S_0}, F^s_{P_0/S_0})^*$ of 12.2.1.14.1.

12.2.2 Equivalence of categories via the functor sp_+

Let $\mathfrak{P}$ be a separated smooth formal scheme over $\mathfrak{S}$. Let $u_0 : X \to P$ be a closed immersion of smooth k-schemes. Let T be a divisor of P such that $Z := T \cap X$ is a divisor of X. We set $Y := X \setminus Z$. Choose $(\mathfrak{P}_\alpha)_{\alpha\in\Lambda}$ an affine open covering of $\mathfrak{P}$ and let us use the corresponding notation and lifting choices of 9.3.7 (which are compatible with that of 10.2.4.2).

Notation 12.2.2.1. We denote by $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$ the full subcategory of $\mathrm{Coh}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$ (see the notation of 9.3.7.2) whose objects $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ for all $\alpha \in \Lambda$, $\mathcal{E}_\alpha$ is $\mathcal{O}_{\mathfrak{X}_\alpha}({}^\dagger Z_\alpha)_{\mathbb{Q}}$-coherent.

Lemma 12.2.2.2. *With notation 10.2.4.3 and 12.2.2.1, we have the canonical functor*

$$\mathrm{sp}_* : \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K) \to \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}).$$

Proof. Let us sketch the construction (see the proof of [Car09a, 2.5.9.i)] for the details). Let us pick the object $((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$. Let $\theta_{\alpha\beta}$ be the isomorphism making commutative the diagram

$$\begin{array}{ccc} \mathrm{sp}_* p_{1K}^{\alpha\beta !}(E_\alpha) & \xrightarrow[\sim]{11.2.7.1.2} & p_1^{\alpha\beta !}\mathrm{sp}_*(E_\alpha) \\ {\scriptstyle \mathrm{sp}_*\eta_{\alpha\beta}}\uparrow\wr & & \uparrow{\scriptstyle \theta_{\alpha\beta}} \\ \mathrm{sp}_* p_{2K}^{\alpha\beta !}(E_\beta) & \xrightarrow[\sim]{11.2.7.1.2} & p_2^{\alpha\beta !}\mathrm{sp}_*(E_\beta). \end{array} \qquad (12.2.2.2.1)$$

Using 11.2.7.3, we can check that $\mathrm{sp}_*((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) := ((\mathrm{sp}_* E_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ is functorially an object of $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$. □

Lemma 12.2.2.3. *We have the canonical functor* $\mathrm{sp}^* : \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}) \to \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$.

Proof. The construction is similar to that of 12.2.2.2 (see the proof of [Car09a, 2.5.9.i)] for the details). □

Proposition 12.2.2.4. *The functors* sp_* *and* sp^* *are quasi-inverse equivalences of categories between the categories* $\mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$ *and* $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$.

Proof. Let us sketch the proof (see the proof of [Car09a, 2.5.9)] for the details). For any object $((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ of $\mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$, we check that the adjunction isomorphisms $\mathrm{sp}^*\mathrm{sp}_*(E_\alpha) \xrightarrow{\sim} E_\alpha$ commute with glueing data. Similarly, for any object $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ of $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$ the adjunction isomorphisms $\mathcal{E}_\alpha \xrightarrow{\sim} \mathrm{sp}_*\mathrm{sp}^*(\mathcal{E}_\alpha)$ commute with glueing data. □

12.2.2.5. The functors $u_0^!$ and u_{0+} constructed in respectively 9.3.7.5 and 9.3.7.6 induce quasi-inverse equivalences of categories between $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ and $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$, i.e., we have the commutative diagram

$$\begin{array}{ccc} \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}) & \hookrightarrow & \mathrm{Coh}(X, \mathfrak{P}, T/\mathcal{V}) \\ \cong \uparrow u_{0+} \quad u_0^! \downarrow \cong & & \cong \uparrow u_{0+} \quad u_0^! \downarrow \cong \\ \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}) & \hookrightarrow & \mathrm{Coh}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}). \end{array} \qquad (12.2.2.5.1)$$

Notation 12.2.2.6. We get the canonical equivalence of categories

$$\mathrm{sp}_{X\hookrightarrow\mathfrak{P}, T+} : \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) \cong \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}) \qquad (12.2.2.6.1)$$

by composition of the equivalences

$$\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) \underset{u_{0K}^*}{\overset{10.2.4.4.1}{\xrightarrow{\sim}}} \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K) \underset{\mathrm{sp}_*}{\xrightarrow{\sim}} \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}) \underset{u_{0+}}{\xrightarrow{\sim}} \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}).$$

When there is no doubt on $(X, \mathfrak{P}, T/\mathcal{V})$, we simply write sp_+.

12.2.3 sp_+ of the constant coefficient

12.2.3.1. Let $\mathfrak{P}$ be a separated smooth formal scheme over $\mathfrak{S}$. Let $u_0\colon X \hookrightarrow P$ be a closed immersion of k-smooth schemes purely of codimension r. Let T be a divisor of P such that $Z := T \cap X$ is a divisor of X. We set $\mathfrak{U} := \mathfrak{P} \setminus T$, $Y := X \setminus Z$, $v_0\colon Y \to U$ be the morphism induced by u_0. Choose $(\mathfrak{P}_\alpha)_{\alpha\in\Lambda}$ an affine open covering of $\mathfrak{P}$ and let us use the corresponding notation and lifting choices of 9.3.7 (which are compatible with that of 10.2.4.2).

(a) Denoting by $f := (v_0, u_0, id)\colon (Y, X, \mathfrak{P}) \to (U, P, \mathfrak{P})$ the morphism of frames, we get the inverse image $f_K^* = |_{]X[_\mathfrak{P}}\colon \mathrm{MIC}^\dagger(U, P, \mathfrak{P}/K) \to \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$ (see notation 10.2.2.8.1). Hence, we get the functor $u_{0K}^* \circ |_{]X[_\mathfrak{P}}\colon \mathrm{MIC}^\dagger(U, P, \mathfrak{P}/K) \to \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$ (where u_{0K}^* is the functor 10.2.4.4.1).

(b) Similarly to the construction of $u_0^!\colon \mathrm{Coh}(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{Coh}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$ of 9.3.7.5, we define the functor
$$u_0^*\colon \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$$
as follows. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$, i.e. a coherent $\mathcal{D}^\dagger_\mathfrak{P}({}^\dagger T)_\mathbb{Q}$ which is also $\mathcal{O}_\mathfrak{P}({}^\dagger T)_\mathbb{Q}$-coherent. We set $\mathcal{E}_\alpha := u_\alpha^*(\mathcal{E}|\mathfrak{P}_\alpha) := H^r u_\alpha^!(\mathcal{E}|\mathfrak{P}_\alpha) \xrightarrow{\sim} u_\alpha^!(\mathcal{E}|\mathfrak{P}_\alpha)[r]$. Then it follows from 11.2.1.7 (and 11.2.1.14) that $\mathcal{E}_\alpha$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}_\alpha}({}^\dagger Z_\alpha)_\mathbb{Q}$-module, which is also $\mathcal{O}_{\mathfrak{X}_\alpha}({}^\dagger Z_\alpha)_\mathbb{Q}$-coherent. Via the isomorphisms of the form τ (9.2.2.3.1), we obtain the glueing $\mathcal{D}^\dagger_{\mathfrak{X}_{\alpha\beta}}({}^\dagger Z_{\alpha\beta})_\mathbb{Q}$-linear isomorphism $\theta_{\alpha\beta}\, p_2^{\alpha\beta !}(\mathcal{E}_\beta) \xrightarrow{\sim} p_1^{\alpha\beta !}(\mathcal{E}_\alpha)$, satisfying the cocycle condition: $\theta_{13}^{\alpha\beta\gamma} = \theta_{12}^{\alpha\beta\gamma} \circ \theta_{23}^{\alpha\beta\gamma}$.

Beware we have three different functors u_0^*, $u_0^!$ and u_{0K}^* (defined at 10.2.4.4.1) whose notation are very similar.

Proposition 12.2.3.2. *With the notation 12.2.3.1, we have the canonical isomorphism*
$$\mathrm{sp}_* \circ u_{0K}^* \circ |_{]X[_\mathfrak{P}} \xrightarrow{\sim} u_0^* \circ \mathrm{sp}_*$$
of functors $\mathrm{MIC}^\dagger(U, P, \mathfrak{P}/K) \to \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$.

Proof. Using 11.2.7.3, we check that glueing data are compatible. □

Corollary 12.2.3.3. *Let $\mathfrak{P}$ be a separated smooth formal scheme over $\mathfrak{S}$. Let X be a closed smooth k-subvariety of P purely of codimension r. We have the isomorphism of* $\mathrm{Coh}(X, \mathfrak{P}/K)$ *of the form*
$$\mathrm{sp}_+(\mathcal{O}_{]X[_\mathfrak{P}}) \xrightarrow{\sim} \mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}}.$$

Proof. 0) Choose $(\mathfrak{P}_\alpha)_{\alpha\in\Lambda}$ an affine open covering of $\mathfrak{P}$ and let us use the corresponding notation and lifting choices of 9.3.7 (which are compatible with that of 10.2.4.2). Choosing a finer covering if necessarily, we can suppose furthermore that there exist local coordinates $t_{\alpha 1}, \ldots, t_{\alpha d} \in \Gamma(\mathfrak{P}_\alpha, \mathcal{O}_\mathfrak{P})$ such that $\mathfrak{X}_\alpha = V(t_{\alpha 1}, \ldots, t_{\alpha r})$.

1) Following 12.1.3.6, $\mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}} \in \mathrm{Coh}(X, \mathfrak{P}/K)$ and $\mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}}[r]$. By functoriality, we have the commutative diagram
$$\begin{array}{ccc}
p_2^{\alpha\beta !} u_\beta^!(\mathbb{R}\underline{\Gamma}^\dagger_{X_\beta} \mathcal{O}_{\mathfrak{P}_\beta,\mathbb{Q}})[-r] & \longrightarrow & p_2^{\alpha\beta !} u_\beta^!(\mathcal{O}_{\mathfrak{P}_\beta,\mathbb{Q}}[-r]) \\
\tau \downarrow \wr & & \tau \downarrow \wr \\
p_1^{\alpha\beta !} u_\alpha^!(\mathbb{R}\underline{\Gamma}^\dagger_{X_\alpha} \mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}}[-r]) & \longrightarrow & p_1^{\alpha\beta !} u_\alpha^!(\mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}}[-r]),
\end{array}$$
where the horizontal morphisms are induced by $\mathbb{R}\underline{\Gamma}^\dagger_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}} \to \mathcal{O}_{\mathfrak{P},\mathbb{Q}}$ and where the vertical isomorphisms are the canonical glueing ones (i.e. of the form 9.2.2.3.1). By applying $\mathcal{H}^0$, since the glueing isomorphisms induced by $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$ are the identity, we get the commutative diagram
$$\begin{array}{ccc}
p_2^{\alpha\beta !} u_\beta^!(\mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}}|\mathfrak{P}_\beta) & \longrightarrow & \mathcal{O}_{\mathfrak{X}_{\alpha\beta},\mathbb{Q}} \\
\tau \downarrow \wr & & \| \\
p_1^{\alpha\beta !} u_\alpha^!(\mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}}|\mathfrak{P}_\alpha) & \longrightarrow & \mathcal{O}_{\mathfrak{X}_{\alpha\beta},\mathbb{Q}},
\end{array} \tag{12.2.3.3.1}$$

where we omit indicating $\mathcal{H}^0$ to simplify notation. Set $\mathcal{E} := \mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}} \in \mathrm{Coh}(X,\mathfrak{P}/K)$, and $\mathcal{E}_\alpha := H^0 u^!_\alpha(\mathcal{E}|\mathfrak{P}_\alpha)$. We denote by $\theta_{\alpha\beta}$ $p_2^{\alpha\beta !}(\mathcal{E}_\beta) \xrightarrow{\sim} p_1^{\alpha\beta !}(\mathcal{E}_\alpha)$, the glueing $\mathcal{D}^\dagger_{\mathfrak{X}_{\alpha\beta}}({}^\dagger Z_{\alpha\beta})_{\mathbb{Q}}$-linear isomorphism (which is equal to the left arrow of 12.2.3.3.1).

2) For $i = 1,\dots,r$, put $X_{\alpha i} := V(\bar{t}_{\alpha i})$, and $X_{\alpha i_0,\dots,i_k} := X_{\alpha i_0} \cup \dots \cup X_{\alpha i_k}$. Consider the diagram

$$\begin{array}{ccccccccccc}
\mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}} & \longrightarrow & \prod_{i=1}^d \mathcal{O}_{\mathfrak{P}_\alpha}({}^\dagger X_i)_{\mathbb{Q}} & \longrightarrow & \prod_{i_0<i_1} \mathcal{O}_{\mathfrak{P}_\alpha}({}^\dagger X_{i_0 i_1})_{\mathbb{Q}} & \longrightarrow & \cdots & \longrightarrow & \mathcal{O}_{\mathfrak{P}_\alpha}({}^\dagger X_{1\dots r})_{\mathbb{Q}} & \longrightarrow & 0 \\
\downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
\mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}} & \longrightarrow & 0 & \longrightarrow & 0 & \longrightarrow & \cdots & \longrightarrow & 0 & \longrightarrow & 0.
\end{array} \tag{12.2.3.3.2}$$

We denote by $\mathcal{F}^\bullet_\alpha$ the complex of the top of 12.2.3.3.2 such that $\mathcal{F}^0_\alpha = \mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}}$. Then, $\mathcal{F}^\bullet_\alpha[r]$ is a left resolution of $\mathcal{E}|\mathfrak{P}_\alpha$ by coherent $\mathcal{D}^\dagger_{\mathfrak{P}_\alpha}({}^\dagger T_\alpha)_{\mathbb{Q}}$-modules which are $\mathcal{O}_{\mathfrak{P}_\alpha}({}^\dagger T_\alpha)_{\mathbb{Q}}$-flat, and the canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_{X_\alpha} \mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}} \to \mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}}$ is represented by $\mathcal{E}|\mathfrak{P}_\alpha[-r] \xleftarrow{\sim} \mathcal{F}^\bullet_\alpha \to \mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}}$, where the first arrow is a quasi-isomorphism and the second one corresponds to the vertical morphism of complexes of 12.2.3.3.2. Hence, since $H^0 u^!_\alpha(\mathcal{E}|\mathfrak{P}_\alpha) = H^r \mathbb{L} u^*_\alpha(\mathcal{E}|\mathfrak{P}_\alpha)$ (see 9.2.2.5), then we get the isomorphism $\mathcal{E}'_\alpha \xrightarrow{\sim} \mathcal{E}_\alpha$, where $\mathcal{E}'_\alpha := H^0 \mathbb{L} u^*_\alpha(\mathcal{F}^\bullet_\alpha)$. Then, we denote by $\theta'_{\alpha\beta}$ $p_2^{\alpha\beta !}(\mathcal{E}'_\beta) \xrightarrow{\sim} p_1^{\alpha\beta !}(\mathcal{E}'_\alpha)$, the glueing $\mathcal{D}^\dagger_{\mathfrak{X}_{\alpha\beta}}({}^\dagger Z_{\alpha\beta})_{\mathbb{Q}}$-linear isomorphism making commutative the diagram

$$\begin{array}{ccc}
p_2^{\alpha\beta !}(\mathcal{E}'_\beta) & \xrightarrow{\sim} & p_2^{\alpha\beta !}(\mathcal{E}_\beta) \\
{\scriptstyle \theta'_{\alpha\beta}} \downarrow \wr & & {\scriptstyle \theta_{\alpha\beta}} \downarrow \wr \\
p_1^{\alpha\beta !}(\mathcal{E}'_\alpha) & \xrightarrow{\sim} & p_1^{\alpha\beta !}(\mathcal{E}_\alpha).
\end{array} \tag{12.2.3.3.3}$$

Since $\theta_{\alpha\beta}$ satisfy the cocycle condition, then so are $\theta'_{\alpha\beta}$ (this is just a matter of writing some commutative cubes). Hence, $u^!_0(\mathcal{E})$ is isomorphic to $((\mathcal{E}'_\alpha)_{\alpha\in\Lambda}, (\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda})$.

3) For any $s \neq 0$, we have $u^*_\alpha(\mathcal{F}^s_\alpha) = 0$. Moreover, $\mathcal{E}'_\alpha = u^*_\alpha(\mathcal{F}^0_\alpha) = \mathcal{O}_{\mathfrak{X}_{\alpha\beta},\mathbb{Q}}$. Hence, by applying the functor $\mathbb{L}u^*_\alpha$ to $\mathcal{F}^\bullet_\alpha \to \mathcal{O}_{\mathfrak{P}_\alpha,\mathbb{Q}}$ we get the identity $\mathcal{O}_{\mathfrak{X}_\alpha,\mathbb{Q}} \to \mathcal{O}_{\mathfrak{X}_\alpha,\mathbb{Q}}$. This yields that composing 12.2.3.3.1 with 12.2.3.3.3, we get a square whose morphisms are the identity of $\mathcal{O}_{\mathfrak{X}_{\alpha\beta},\mathbb{Q}}$. In particular $\theta'_{\alpha\beta}$ is the identity of $\mathcal{O}_{\mathfrak{X}_{\alpha\beta},\mathbb{Q}}$. By construction of the functor u^*_0 (see 12.2.3.1) this means that $((\mathcal{E}'_\alpha)_{\alpha\in\Lambda}, (\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda}) = u^*_0(\mathcal{O}_{\mathfrak{P},\mathbb{Q}})$.

4) Using 2) and 3), we get the canonical isomorphism

$$u^*_0(\mathcal{O}_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} u^!_0(\mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$$

of $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$. Using 12.2.3.2 and its notation, since $\mathrm{sp}_*(\mathcal{O}_{\mathfrak{P}_K}) = \mathcal{O}_{\mathfrak{P},\mathbb{Q}}$, then we get $\mathrm{sp}_+(\mathcal{O}_{]X[_\mathfrak{P}}) = u_{0+}\mathrm{sp}_* u^*_{0K}(\mathcal{O}_{]X[_\mathfrak{P}}) \underset{12.2.3.2}{\xrightarrow{\sim}} u_{0+}u^*_0 \mathrm{sp}_*(\mathcal{O}_{\mathfrak{P}_K}) = u_{0+}u^*_0(\mathcal{O}_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} u_{0+}u^!_0(\mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}}) \underset{9.3.7.7}{\xrightarrow{\sim}} \mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}}$. $\square$

12.2.4 Commutation of sp_+ with pullbacks, compatibility with Frobenius

Proposition 12.2.4.1. *Let $(Y,X,\mathfrak{P},T)/\mathcal{V}$ and $(Y',X',\mathfrak{P}',T')/\mathcal{V}$ be two completely smooth d-frames. Suppose we have the following commutative diagram:*

$$\begin{array}{ccccccc}
Y' & \xrightarrow{j'} & X' & \xrightarrow{i'} & P' & \longrightarrow & \mathfrak{P}' \\
\downarrow h & & \downarrow g & & \downarrow f_0 & & \\
Y & \xrightarrow{j} & X & \xrightarrow{i} & P & \longrightarrow & \mathfrak{P},
\end{array} \tag{12.2.4.1.1}$$

where j and j' are the underlying open embeddings, i and i' are the underlying closed embeddings. Set $\theta := (h, g, f_0)$. Let $E \in \mathrm{MIC}^\dagger(Y,X,\mathfrak{P}/K)$ (see notation 10.2.2.7). We have the isomorphism in $\mathrm{MIC}^{\dagger\dagger}(X',\mathfrak{P}',T'/\mathcal{V})$ (see notation 12.2.1.4):

$$\mathrm{sp}_+(\theta^*(E)) \xrightarrow{\sim} \theta^* \mathrm{sp}_+(E), \tag{12.2.4.1.2}$$

where θ^* are the inverse functors constructed respectively at 12.2.1.14.1 and 12.2.1.12.1.

Proof. 0) By construction of both of the functors of the form θ^*, we reduce to the case where there exists a *smooth* morphism $f\colon \mathfrak{P}' \to \mathfrak{P}$ of smooth $\mathcal{V}$-formal schemes whose reduction modulo π is f_0.

1) First suppose the squares of the diagram 12.2.4.1.1 are cartesian. Let $(\mathfrak{P}_\alpha)_{\alpha\in\Lambda}$ be an affine open covering of $\mathfrak{P}$. We fix some liftings of $X \cap P_\alpha$ etc. and we use notation 9.3.7. Moreover, we denote by $\mathfrak{P}'_\alpha := f^{-1}(\mathfrak{P}_\alpha)$, $\mathfrak{X}'_\alpha := \mathfrak{P}'_\alpha \times_{\mathfrak{P}_\alpha} \mathfrak{X}_\alpha$, $a_\alpha\colon \mathfrak{X}'_\alpha \to \mathfrak{X}_\alpha$ the projection, and similarly for other notations. If $((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ is an object of $\mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$, we get canonically an object of $\mathrm{MIC}^\dagger(Y', (\mathfrak{X}'_\alpha)_{\alpha\in\Lambda}/K)$ of the form $((a^*_{\alpha K}E_\alpha)_{\alpha\in\Lambda}, (\eta'_{\alpha\beta})_{\alpha,\beta\in\Lambda})$. This yields the functor $\mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K) \to \mathrm{MIC}^\dagger(Y', (\mathfrak{X}'_\alpha)_{\alpha\in\Lambda}/K)$ that we will denote by a^*_K. Similarly, we construct the functor $a^*\colon \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}'_\alpha)_{\alpha\in\Lambda}, Z'/\mathcal{V})$. Consider the following diagram.

$$\begin{array}{ccc}
\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) & \xrightarrow{f^*_K} & \mathrm{MIC}^\dagger(Y', X', \mathfrak{P}'/K) \\
u^*_{0K}\big\downarrow 10.2.4.4 & & u'^*_{0K}\big\downarrow 10.2.4.4 \\
\mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K) & \xrightarrow{a^*_K} & \mathrm{MIC}^\dagger(Y', (\mathfrak{X}'_\alpha)_{\alpha\in\Lambda}/K) \\
12.2.2.3\ \big\uparrow \mathrm{sp}^* \quad \mathrm{sp}_* \big\downarrow\ 12.2.2.2 & & 12.2.2.3\ \big\uparrow \mathrm{sp}^* \quad \mathrm{sp}_* \big\downarrow\ 12.2.2.2 \\
\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}) & \xrightarrow{a^*} & \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}'_\alpha)_{\alpha\in\Lambda}, Z'/\mathcal{V}) \\
12.2.2.5.1\ \big\uparrow u^!_0 \quad u_{0+} \big\downarrow\ 12.2.2.5.1 & & 12.2.2.5.1\ \big\uparrow u'^!_0 \quad u'_{0+} \big\downarrow\ 12.2.2.5.1 \\
\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}) & \xrightarrow{f^*} & \mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}', T'/\mathcal{V}).
\end{array} \qquad (12.2.4.1.3)$$

By transitivity of the inverse image with respect to the composition, the top square is commutative up to canonical isomorphism. For the same reason, the middle square involving sp^* is commutative up to canonical isomorphism. Since sp_* and sp^* are canonically quasi-inverse equivalences of categories, this yields the middle square involving sp_* is commutative up to canonical isomorphism. Using similar arguments, we check the commutativity up to canonical isomorphism of the bottom square.

2) Now suppose $f = \mathrm{id}$ and a is a closed immersion and the left square of the diagram 12.2.4.1.1 is cartesian. Let $(\mathfrak{P}_\alpha)_{\alpha\in\Lambda}$ be an open covering of $\mathfrak{P}$ by affine subschemes. Then, we fix some liftings (separately) for both u and u' (for the later case, add some primes in notation) and we use notation 9.3.7. Then choose some lifting morphisms $a_\alpha\colon \mathfrak{X}'_\alpha \to \mathfrak{X}_\alpha$, and similarly for other notations. Consider the following diagram.

$$\begin{array}{ccc}
\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) & \xrightarrow{|_{]X'[_{\mathfrak{P}}}} & \mathrm{MIC}^\dagger(Y', X', \mathfrak{P}/K) \\
u^*_{0K}\big\downarrow 10.2.4.4 & & u'^*_{0K}\big\downarrow 10.2.4.4 \\
\mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K) & \xrightarrow{a^*_K} & \mathrm{MIC}^\dagger(Y', (\mathfrak{X}'_\alpha)_{\alpha\in\Lambda}/K) \\
12.2.2.2\ \big\uparrow \mathrm{sp}^* \quad \mathrm{sp}_* \big\downarrow\ 12.2.2.2 & & 12.2.2.2\ \big\uparrow \mathrm{sp}^* \quad \mathrm{sp}_* \big\downarrow\ 12.2.2.2 \\
\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}) & \xrightarrow{a^*} & \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}'_\alpha)_{\alpha\in\Lambda}, Z'/\mathcal{V}) \\
12.2.2.5.1\ \big\uparrow u^!_0 \quad u_{0+} \big\downarrow\ 12.2.2.5.1 & & 12.2.2.5.1\ \big\uparrow u'^!_0 \quad u'_{0+} \big\downarrow\ 12.2.2.5.1 \\
\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}) & \xrightarrow{\mathbb{R}\underline{\Gamma}^\dagger_{X'}[-d_{X'/X}]} & \mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}, T/\mathcal{V}).
\end{array} \qquad (12.2.4.1.4)$$

The commutativity up to canonical isomorphism of the top and middle squares of 12.2.4.1.4 is checked as for 12.2.4.1.3. It remains to look at the bottom square. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$. The canonical morphism

$$u'^!_\alpha\left(\mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E})|\mathfrak{P}_\alpha\right)[-d_{X'/X}] \to u'^!_\alpha(\mathcal{E}|\mathfrak{P}_\alpha)[-d_{X'/X}]$$

is an isomorphism. Moreover, $u'^!_\alpha(\mathcal{E}|\mathfrak{P}_\alpha)[-d_{X'/X}] \xrightarrow{\sim} a^!_\alpha u^!_\alpha(\mathcal{E}|\mathfrak{P}_\alpha)[-d_{X'/X}] \xrightarrow{\sim} a^*_\alpha\left(u^!_\alpha(\mathcal{E}|\mathfrak{P}_\alpha)\right)$. These isomorphisms glue, hence we get the commutativity up to canonical isomorphism of the bottom square.

3) The case where $f = \mathrm{id}$ and $a = \mathrm{id}$ is checked similarly (in the diagram 12.2.4.1.4, we replace $|_{]X'[_{\mathfrak{P}}}$ by $j'^\dagger$ and $\mathbb{R}\underline{\Gamma}^\dagger_{X'}[-d_{X'/X}]$ by $({}^\dagger T')$). This yields the general case by splitting the diagram 12.2.4.1.1. $\square$

Remark 12.2.4.2. The isomorphism $\mathrm{sp}_+(\mathcal{O}_{]X[_{\mathfrak{P}}}) \xrightarrow{\sim} \mathcal{H}^{\dagger,r}_X \mathcal{O}_{\mathfrak{P},\mathbb{Q}}$ of 12.2.3.3 can be viewed as a particular case of 12.2.4.1 (in the case $\theta\colon (X, X, \mathfrak{P}/\mathcal{V}) \to (P, \mathfrak{P}, /\mathcal{V})$ and for the constant coefficient). Notice that in order to give a meaning of the isomorphism 12.2.4.1.2, first we had to construct the local cohomological functor with support over a k-smooth closed subscheme In order to define our local cohomological functor in its general context (see 13.1), we do need the coherent theorem 12.2.7.1. But, the check of this latter theorem only uses the case where the closed subscheme is k-smooth, which explains why we have given a preliminary different construction of the local cohomological functor in this k-smooth context.

Notation 12.2.4.3. Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. Suppose there exists an automorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining. We keep notation 8.8.3.1. Let $\mathfrak{P}$ be a separated smooth formal scheme over $\mathfrak{S}$. Let $u_0\colon X \hookrightarrow P$ be a closed immersion of k-smooth schemes. Let T be a divisor of P such that $Z := T \cap X$ is a divisor of X.

(a) We denote by $F\text{-Coh}(X, \mathfrak{P}, T/\mathcal{V})$ the category of coherent $F\text{-}\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}}$-modules $(\mathcal{E}, \Phi)$ such that $\mathcal{E}$ has its support in X (see notation 8.8.3.2).

(b) We denote by $F\text{-MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ the full subcategory of $F\text{-Coh}(X, \mathfrak{P}, T/\mathcal{V})$ consisting of objects $(\mathcal{E}, \Phi)$ such that $\mathcal{E}$ is an object of $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$.

(c) When T is the empty divisor (or when $X = \mathcal{P}$), e.g. we simply write $F\text{-Coh}(X, \mathfrak{P}/\mathcal{V})$ or $F\text{-MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$.

Corollary 12.2.4.4. *We keep notation 12.2.4.3 and set* $Y := X \setminus T$.

(a) For any $E \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$*, we have the functorial in* E *isomorphism:*

$$\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\,T\,+}(F^*E) \xrightarrow{\sim} F^*\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\,T\,+}(E).$$

(b) The functor $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\,T\,+}$ *induces the equivalence of categories:*

$$\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\,T\,+}\colon F\text{-MIC}^\dagger(Y,\, X/K) \cong F\text{-MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}).$$

Proof. This follows from 12.2.4.1 and 12.2.1.15. □

12.2.5 Commutation of sp_+ with duality

We keep notation 12.2.2.

12.2.5.1. With notation 10.2.4.3, let $((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$. The $j^\dagger\mathcal{O}_{\mathfrak{X}_{\alpha K}}$-linear dual of E_α is denoted by $E_\alpha^\vee := \mathcal{H}om_{j^\dagger\mathcal{O}_{\mathfrak{X}_{\alpha K}}}(E, j^\dagger\mathcal{O}_{\mathfrak{X}_{\alpha K}})$. Since the $j^\dagger\mathcal{O}$-linear dual commutes with pullbacks, the inverse of the isomorphism $(\eta_{\alpha\beta})^\vee$ is canonically isomorphic to an isomorphism of the form $p_{2K}^{\alpha\beta*}((E_\beta)^\vee) \xrightarrow{\sim} p_{1K}^{\alpha\beta*}((E_\alpha)^\vee)$ that we denote by $\eta^*_{\alpha\beta}$. These isomorphisms satisfy the cocycle condition (for more details, see [Car09a, 4.3.1]). Hence, we get the dual functor $(-)^\vee\colon \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K) \to \mathrm{MIC}^\dagger(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$ defined by setting

$$((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda})^\vee := (((E_\alpha)^\vee)_{\alpha\in\Lambda}, (\eta^*_{\alpha\beta})_{\alpha,\beta\in\Lambda}).$$

Let $E \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$, and $E^\vee$ be its dual. We check the isomorphism

$$u^*_{0K}(E^\vee) \xrightarrow{\sim} (u^*_{0K}(E))^\vee,$$

i.e. that the isomorphisms coming from the commutation of the dual with the pullbacks are compatible with glueing data, which is easy.

12.2.5.2. Let $f\colon \mathfrak{X}' \to \mathfrak{X}$ be an open immersion of smooth formal schemes over $\mathfrak{S}$. Let Z be a divisor of X and $Z' := f^{-1}(Z)$. According to notation 9.2.1.21, the functor $f^!_Z\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}})$ is equal to $\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}} f^{-1}(-)$. Hence, for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}})$, we get the isomorphism:

$$\begin{aligned} \xi\ \ f^!_Z\mathbb{D}_Z(\mathcal{E}) &\xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}}(f^!_Z(\mathcal{E}), f^!_{Z\mathrm{r}}(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X},\mathbb{Q}}))[d_X] \\ &\xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}}(f^!_Z(\mathcal{E}), (\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \omega^{-1}_{\mathfrak{X}'/\mathfrak{S}})_{\mathrm{t}})[d_X] \underset{\beta}{\xrightarrow{\sim}} \mathbb{D}_{Z'} f^!_Z(\mathcal{E}), \end{aligned} \qquad (12.2.5.2.1)$$

where β is the transposition isomorphism exchanging both structures of left $\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}}$-modules of $\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger Z')_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}'}} \omega^{-1}_{\mathfrak{X}'/\mathfrak{S}}$.

12.2.5.3. With notation 9.3.7, let $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$. Via the isomorphisms 12.2.5.2.1, the inverse of the isomorphism $\mathbb{D}_{Z_{\alpha\beta}}(\theta_{\alpha\beta})$ is canonically isomorphic to an isomorphism of the form $p_2^{\alpha\beta!}(\mathbb{D}_{Z_\beta}(\mathcal{E}_\beta)) \xrightarrow{\sim} p_1^{\alpha\beta!}(\mathbb{D}_{Z_\alpha}(\mathcal{E}_\alpha))$ and denoted by $\theta^*_{\alpha\beta}$. These isomorphisms satisfy the cocycle condition (for more details, see [Car09a, 4.3.1]). Hence, we get the dual functor

$$\mathbb{D}_Z\colon \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$$

defined by $\mathbb{D}_Z((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) := ((\mathbb{D}_{Z_\alpha}(\mathcal{E}_\alpha))_{\alpha\in\Lambda}, (\theta^*_{\alpha\beta})_{\alpha,\beta\in\Lambda})$.

12.2.5.4. With notation 9.3.7, let $((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^{\dagger}(Y, (\mathfrak{X}_\alpha)_{\alpha\in\Lambda}/K)$. Following 11.2.7.5, we have the canonical isomorphism $\mathrm{sp}_*(E_\alpha^\vee) \xrightarrow{\sim} \mathbb{D}(\mathrm{sp}_*(E_\alpha))$ of $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$. These isomorphisms satisfy the cocycle condition (for more details, see [Car09a, 4.3.1]). Hence, we get the isomorphism

$$\mathrm{sp}_*(((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda})^\vee) \xrightarrow{\sim} \mathbb{D}\circ \mathrm{sp}_*((E_\alpha)_{\alpha\in\Lambda}, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda}).$$

12.2.5.5. With notation 9.3.7, let $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, Z/\mathcal{V})$. From the relative duality isomorphism (see 9.4.5.2), we have the isomorphism $u_{\alpha+}\circ \mathbb{D}_{Z_\alpha}(\mathcal{E}_\alpha) \xrightarrow{\sim} \mathbb{D}_{T_\alpha}\circ u_{\alpha+}(\mathcal{E}_\alpha)$ These isomorphisms satisfy the cocycle condition (for more details, see [Car09a, 4.3.1]), i.e. we get the commutation isomorphism:

$$u_{0+}\circ \mathbb{D}_Z((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \xrightarrow{\sim} \mathbb{D}_T\circ u_{0+}((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})).$$

Proposition 12.2.5.6. *We keep notation 12.2.2. Let $E\in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$, and $E^\vee$ be its dual. We have the functorial canonical isomorphism in E: $\mathrm{sp}_+(E^\vee) \xrightarrow{\sim} \mathbb{D}_T\circ \mathrm{sp}_+(E)$.*

Proof. Since $\mathrm{sp}_+ = u_{0+}\circ\mathrm{sp}_*\circ u^*_{0K}$, the proposition is a consequence of 12.2.5.1, 12.2.5.4, and 12.2.5.5. □

Proposition 12.2.5.7. *Let $\theta\colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ be a morphism of completely smooth d-frames over $\mathcal{V}$. We have the isomorphism of $\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V})$ of the form*

$$\mathbb{D}^{(\bullet)}_{T'}\left(\mathbb{R}\underline{\Gamma}^\dagger_{X'} f^{(\bullet)!}\mathcal{E}^{(\bullet)}[-d_{X'/X}]\right) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{X'} f^{(\bullet)!}(\mathbb{D}^{(\bullet)}_T\mathcal{E}^{(\bullet)})[-d_{X'/X}]. \tag{12.2.5.7.1}$$

Proof. Following 12.2.1.9 and 12.2.1.13, the objects appearing in 12.2.5.7.1 belong to $\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V})$. Hence, it is sufficient to check the isomorphism 12.2.5.7.1 in $\mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}', T'/\mathcal{V})$ (i.e.after applying the equivalence functor $\underrightarrow{l}^*_{\mathbb{Q}}$ of 12.2.1.6.1). This follows from 12.2.5.6 and 12.2.4.1.2 and from the isomorphism $\theta^*(E^\vee) \xrightarrow{\sim} \theta^*(E)^\vee$. □

12.2.6 Commutation of the exterior or internal tensor product with sp_+

We keep notation 12.2.2.

Proposition 12.2.6.1. *With the notations of 12.2.2.1, we define the bifunctor tensor product*

$$-\otimes-\quad \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/\mathcal{V}) \times \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/\mathcal{V}), \tag{12.2.6.1.1}$$

by setting, for any $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda})$, $((\mathcal{E}'_\alpha)_{\alpha\in\Lambda}, (\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/\mathcal{V})$,

$$((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \otimes ((\mathcal{E}'_\alpha)_{\alpha\in\Lambda}, (\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda}) := ((\mathcal{E}_\alpha \otimes_{\mathcal{O}_{\mathfrak{X}_\alpha}({}^\dagger Z_\alpha)_{\mathbb{Q}}} \mathcal{E}'_\alpha)_{\alpha\in\Lambda}, (\theta''_{\alpha\beta})_{\alpha,\beta\in\Lambda}),$$

where $\theta''_{\alpha\beta}$ is the unique morphism inducing the commutative diagram :

$$\begin{array}{ccc} p_2^{\alpha\beta!}(\mathcal{E}_\beta \otimes_{\mathcal{O}_{\mathfrak{X}_\beta}({}^\dagger Z_\beta)_{\mathbb{Q}}} \mathcal{E}'_\beta) & \xrightarrow[\sim]{} & p_2^{\alpha\beta!}(\mathcal{E}_\beta) \otimes_{\mathcal{O}_{\mathfrak{X}_{\alpha\beta}}({}^\dagger Z_{\alpha\beta})_{\mathbb{Q}}} p_2^{\alpha\beta!}(\mathcal{E}'_\beta) \\ \sim\downarrow \theta''_{\alpha\beta} & & \sim\downarrow \theta_{\alpha\beta}\otimes\theta'_{\alpha\beta} \\ p_1^{\alpha\beta!}(\mathcal{E}_\alpha \otimes_{\mathcal{O}_{\mathfrak{X}_\alpha}({}^\dagger Z_\alpha)_{\mathbb{Q}}} \mathcal{E}'_\alpha) & \xrightarrow[\sim]{} & p_1^{\alpha\beta!}(\mathcal{E}_\alpha) \otimes_{\mathcal{O}_{\mathfrak{X}_{\alpha\beta}}({}^\dagger Z_{\alpha\beta})_{\mathbb{Q}}} p_1^{\alpha\beta!}(\mathcal{E}'_\alpha), \end{array} \tag{12.2.6.1.2}$$

whose horizontal isomorphisms are constructed by using the equivalence of categories 12.2.1.6.1 from the commutation of tensor products with extraordinary inverse images (see 9.2.1.27.1) and from the isomorphisms 11.2.4.3.1.

Proof. To check that this tensor product bifunctor is well defined, we have to establish that the isomorphisms $\theta''_{\alpha\beta}$ satisfy to the cocycle condition (see 9.3.7.1). Let us consider the commutative diagram:

$$\begin{array}{ccccccc}
p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta\otimes\mathcal{E}'_\beta) & \underset{\sim}{\xrightarrow{\tau}} & p_{12}^{\alpha\beta!}p_2^{\alpha\beta!}(\mathcal{E}_\beta\otimes\mathcal{E}'_\beta) & \underset{\sim}{\longrightarrow} & p_{12}^{\alpha\beta!}p_2^{\alpha\beta!}(\mathcal{E}_\beta)\otimes p_{12}^{\alpha\beta!}p_2^{\alpha\beta!}(\mathcal{E}'_\beta) & \underset{\tau\otimes\tau}{\xleftarrow{\sim}} & p_2^{\alpha\beta\gamma!}(\mathcal{E}_\beta)\otimes p_2^{\alpha\beta\gamma!}(\mathcal{E}'_\beta) \\
\sim\downarrow\theta''^{\alpha\beta\gamma}_{12} & & \sim\downarrow p_{12}^{\alpha\beta!}(\theta''_{\alpha\beta}) & & \sim\downarrow p_{12}^{\alpha\beta!}(\theta_{\alpha\beta})\otimes p_{12}^{\alpha\beta!}(\theta'_{\alpha\beta}) & & \sim\downarrow\theta_{12}^{\alpha\beta\gamma}\otimes\theta'^{\alpha\beta\gamma}_{12} \\
p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha\otimes\mathcal{E}'_\alpha) & \underset{\sim}{\xrightarrow{\tau}} & p_{12}^{\alpha\beta!}p_1^{\alpha\beta!}(\mathcal{E}_\alpha\otimes\mathcal{E}'_\alpha) & \underset{\sim}{\longrightarrow} & p_{12}^{\alpha\beta!}p_1^{\alpha\beta!}(\mathcal{E}_\alpha)\otimes p_{12}^{\alpha\beta!}p_1^{\alpha\beta!}(\mathcal{E}'_\alpha) & \underset{\tau\otimes\tau}{\xleftarrow{\sim}} & p_1^{\alpha\beta\gamma!}(\mathcal{E}_\alpha)\otimes p_1^{\alpha\beta\gamma}(\mathcal{E}'_\alpha),
\end{array} \tag{12.2.6.1.3}$$

where, following 9.3.7.1.1 and with its notations, the right and left squares are commutative by definition. By applying the functor $p_{12}^{\alpha\beta!}$ to 12.2.6.1.2 and next by functoriality of the commutation of the tensor product with extraordinary inverse images, we get the square of the middle, which is then commutative. Moreover, It follows from 9.2.2.2.1 that the composition of the horizontal isomorphisms of 12.2.6.1.3 are the canonical isomorphisms of commutation of extraordinary inverse images with tensor products. With the two other diagrams similar to 12.2.6.1.3, as the family of isomorphisms $\theta_{\alpha\beta}$ and $\theta'_{\alpha\beta}$ satisfy to the cocycle conditions, so is $\theta''_{\alpha\beta}$. □

Lemma 12.2.6.2. *Let $\mathcal{E}$, $\mathcal{E}'\in \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V})$. We have the canonical isomorphism of $\mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},Z/\mathcal{V})$ which commutes with Frobenius:*

$$u_0^!(\mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}\mathcal{E}'[d_{Y/P}]) \xrightarrow{\sim} u_0^!(\mathcal{E})\otimes u_0^!(\mathcal{E}'), \tag{12.2.6.2.1}$$

where $u_0^!\colon \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V})\cong \mathrm{MIC}^{\dagger\dagger}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},Z/\mathcal{V})$ is the functor defined at 12.2.2.5.

Proof. 0) Following 12.2.1.14.2, $\mathcal{E}'':=\mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}\mathcal{E}'[d_{Y/P}]\in \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V})$.

1) For any $\alpha\in\Lambda$, let us construct the isomorphism

$$u_\alpha^!(\mathcal{E}''|_{\mathfrak{P}_\alpha}) \xrightarrow{\sim} u_\alpha^!(\mathcal{E}|_{\mathfrak{P}_\alpha})\otimes_{\mathcal{O}_{\mathfrak{X}_\alpha}({}^\dagger Z_\alpha)_{\mathbb{Q}}} u_\alpha^!(\mathcal{E}'|_{\mathfrak{P}_\alpha}). \tag{12.2.6.2.2}$$

Choose $\mathcal{E}^{(\bullet)}$, $\mathcal{E}'^{(\bullet)}\in \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V})$ such that $\mathcal{E}\xrightarrow{\sim}\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{E}^{(\bullet)}$ and $\mathcal{E}'\xrightarrow{\sim}\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{E}'^{(\bullet)}$. Let us denote by $\mathcal{E}''^{(\bullet)}:=\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{P}}(T)}\mathcal{E}'^{(\bullet)}[d_{Y/P}]$. Hence, $\mathcal{E}''\xrightarrow{\sim}\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{E}''^{(\bullet)}$. We have isomorphisms:

$$\begin{aligned} u_\alpha^{(\bullet)!}(\mathcal{E}''^{(\bullet)}|_{\mathfrak{P}_\alpha}) &\underset{9.2.1.27.1}{\xrightarrow{\sim}} u_\alpha^{(\bullet)!}(\mathcal{E}^{(\bullet)}|_{\mathfrak{P}_\alpha})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}_\alpha}(Z_\alpha)}u_\alpha^{(\bullet)!}(\mathcal{E}'^{(\bullet)}|_{\mathfrak{P}_\alpha}) \\ &\underset{11.2.4.3.1}{\xrightarrow{\sim}} u_\alpha^{(\bullet)!}(\mathcal{E}^{(\bullet)}|_{\mathfrak{P}_\alpha})\otimes_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}_\alpha}(Z_\alpha)} u_\alpha^{(\bullet)!}(\mathcal{E}'^{(\bullet)}|_{\mathfrak{P}_\alpha}). \end{aligned} \tag{12.2.6.2.3}$$

By applying the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ to 12.2.6.2.3, we obtain the desired isomorphism 12.2.6.2.2.

2) It remains now to check that the isomorphisms 12.2.6.2.2 commute with glueing isomorphisms. Let us consider the following diagram

$$\begin{array}{ccc}
p_2^{\alpha\beta(\bullet)!}u_\beta^{(\bullet)!}(\mathcal{E}''^{(\bullet)}|_{\mathfrak{P}_\beta}) & \underset{\sim}{\xrightarrow{\tau}} & p_1^{\alpha\beta(\bullet)!}u_\alpha^{(\bullet)!}(\mathcal{E}''^{(\bullet)}|_{\mathfrak{P}_\alpha}) \\
\sim\downarrow 9.2.1.27.1 & & \sim\downarrow 9.2.1.27.1 \\
p_2^{\alpha\beta(\bullet)!}(u_\beta^{(\bullet)!}(\mathcal{E}^{(\bullet)}|_{\mathfrak{P}_\beta})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}_\beta}(Z_\beta)}(\mathcal{E}'^{(\bullet)}|_{\mathfrak{P}_\beta})) & & p_1^{\alpha\beta(\bullet)!}(u_\alpha^{(\bullet)!}(\mathcal{E}^{(\bullet)}|_{\mathfrak{P}_\alpha})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}_\alpha}(Z_\alpha)}(\mathcal{E}'^{(\bullet)}|_{\mathfrak{P}_\alpha})) \\
\sim\downarrow 9.2.1.27.1 & & \sim\downarrow 9.2.1.27.1 \\
p_2^{\alpha\beta(\bullet)!}(u_\beta^{(\bullet)!}(\mathcal{E}^{(\bullet)}|_{\mathfrak{P}_\beta}))\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}_{\alpha\beta}}(Z_{\alpha\beta})}p_2^{\alpha\beta(\bullet)!}(u_\beta^{(\bullet)!}(\mathcal{E}'^{(\bullet)}|_{\mathfrak{P}_\beta})) & \underset{\sim}{\xrightarrow{\tau\otimes\tau}} & p_1^{\alpha\beta(\bullet)!}(u_\alpha^{(\bullet)!}(\mathcal{E}^{(\bullet)}|_{\mathfrak{P}_\alpha}))\widehat{\otimes}^{\mathbb{L}}_{\mathcal{B}^{(\bullet)}_{\mathfrak{X}_{\alpha\beta}}(Z_{\alpha\beta})}p_1^{\alpha\beta(\bullet)!}(u_\alpha^{(\bullet)!}(\mathcal{E}'^{(\bullet)}|_{\mathfrak{P}_\alpha}))
\end{array} \tag{12.2.6.2.4}$$

Modulo the identifications $p_2^{\alpha\beta(\bullet)!}\circ u_\beta^{(\bullet)!}\xrightarrow{\sim}(u_\beta\circ p_2^{\alpha\beta})^{(\bullet)!}$ and $p_1^{\alpha\beta(\bullet)!}\circ u_\alpha^{(\bullet)!}\xrightarrow{\sim}(u_\alpha\circ p_1^{\alpha\beta})^{(\bullet)!}$ and by transitivity of isomorphisms 9.2.1.27.1 (see 9.2.1.27.2), the rectangle 12.2.6.2.4 is of the form 9.2.2.2.1. Hence it is commutative. By applying the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ to the rectangle 12.2.6.2.4, modulo the canonical isomorphisms of the form 11.2.4.3.2, we get the outer of the diagram

$$\begin{array}{ccc} p_2^{\alpha\beta !} u_\beta^!(\mathcal{E}''|_{\mathfrak{P}_\beta}) & \xrightarrow[\sim]{\tau} & p_1^{\alpha\beta !} u_\alpha^!(\mathcal{E}''|_{\mathfrak{P}_\alpha}) \\ \sim \downarrow 12.2.6.2.2 & & \sim \downarrow 12.2.6.2.2 \\ p_2^{\alpha\beta !}(u_\beta^!(\mathcal{E}|_{\mathfrak{P}_\beta}) \otimes_{\mathcal{O}_{\mathfrak{X}_\beta}(^\dagger Z_\beta)_\mathbb{Q}} u_\beta^!(\mathcal{E}'|_{\mathfrak{P}_\beta})) & \xrightarrow[\sim]{} & p_1^{\alpha\beta !}(u_\alpha^!(\mathcal{E}|_{\mathfrak{P}_\alpha}) \otimes_{\mathcal{O}_{\mathfrak{X}_\alpha}(^\dagger Z_\alpha)_\mathbb{Q}} u_\alpha^!(\mathcal{E}'|_{\mathfrak{P}_\alpha})) \\ \sim \downarrow & & \sim \downarrow \\ p_2^{\alpha\beta !} u_\beta^!(\mathcal{E}|_{\mathfrak{P}_\beta}) \otimes_{\mathcal{O}_{\mathfrak{X}_{\alpha\beta}}(^\dagger Z_{\alpha\beta})_\mathbb{Q}} p_2^{\alpha\beta !} u_\beta^!(\mathcal{E}|_{\mathfrak{P}_\beta}) & \xrightarrow[\sim]{\tau\otimes\tau} & p_1^{\alpha\beta !} u_\alpha^!(\mathcal{E}|_{\mathfrak{P}_\alpha}) \otimes_{\mathcal{O}_{\mathfrak{X}_{\alpha\beta}}(^\dagger Z_{\alpha\beta})_\mathbb{Q}} p_1^{\alpha\beta !} u_\alpha^!(\mathcal{E}|_{\mathfrak{P}_\alpha}) \end{array} \tag{12.2.6.2.5}$$

whose middle horizontal isomorphism is defined such that the bottom square is commutative. By definition, this isomorphism is the canonical glueing data structure of the family $\left(u_\alpha^!(\mathcal{E}|_{\mathfrak{P}_\alpha}) \otimes_{\mathcal{O}_{\mathfrak{X}_\alpha}(Z_\alpha)_\mathbb{Q}} u_\alpha^!(\mathcal{E}'|_{\mathfrak{P}_\alpha})\right)_\alpha$ (see 12.2.6.1.2). Hence we have to check that the top square of the diagram 12.2.6.2.5 is commutative, which follows from that of its outer and of the bottom square. □

12.2.6.3. With the notations of 10.2.4.3, in a similar way to 12.2.6.1.1, we define the bifunctor tensor product

$$-\otimes - \quad \mathrm{MIC}^\dagger((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/K) \times \mathrm{MIC}^\dagger((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/K) \to \mathrm{MIC}^\dagger((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/K).$$

Similarly to 12.2.6.2, we then construct, for any $E, E' \in \mathrm{MIC}^\dagger(X, \mathfrak{P}, T/K)$, the canonical isomorphism commuting to Frobenius:

$$u_{0K}^*(E \otimes_{j^\dagger \mathcal{O}_{]X[_\mathfrak{P}}} E') \xrightarrow{\sim} u_{0K}^*(E) \otimes u_{0K}^*(E'). \tag{12.2.6.3.1}$$

Lemma 12.2.6.4. *Let* $((E_\alpha)_{\alpha\in\Lambda},\, (\eta_{\alpha\beta})_{\alpha,\beta\in\Lambda}), ((E'_\alpha)_{\alpha\in\Lambda},\, (\eta'_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^\dagger((\mathfrak{X}_\alpha)_{\alpha\in\Lambda},\, Z/K)$. *With the notations of 10.2.4.3 and 12.2.6.3, we have the canonical isomorphism which commutes with Frobenius:*

$$\mathrm{sp}_*((E_\alpha,\, \eta_{\alpha\beta}) \otimes (E'_\alpha,\, \eta'_{\alpha\beta})) \xrightarrow{\sim} \mathrm{sp}_*(E_\alpha,\, \eta_{\alpha\beta}) \otimes \mathrm{sp}_*(E'_\alpha,\, \eta'_{\alpha\beta}).$$

Proof. Following [Car09a, 2.5.9], denoting by $(\mathcal{E}_\alpha,\, \theta_{\alpha\beta}) := \mathrm{sp}_*(E_\alpha,\, \eta_{\alpha\beta})$ and similarly with some primes, it comes back to the same to establish the isomorphism

$$\mathrm{sp}^*((\mathcal{E}_\alpha,\, \theta_{\alpha\beta}) \otimes (\mathcal{E}'_\alpha,\, \theta'_{\alpha\beta})) \xrightarrow{\sim} \mathrm{sp}^*(\mathcal{E}_\alpha,\, \theta_{\alpha\beta}) \otimes \mathrm{sp}^*(\mathcal{E}'_\alpha,\, \theta'_{\alpha\beta}).$$

For this purpose, we check that the canonical isomorphisms $\mathrm{sp}^*(\mathcal{E}_\alpha \otimes \mathcal{E}'_\alpha) \xrightarrow{\sim} \mathrm{sp}^*(\mathcal{E}_\alpha) \otimes \mathrm{sp}^*(\mathcal{E}'_\alpha)$ commute with the respective glueing isomorphisms. □

Proposition 12.2.6.5. *For any* $E, E' \in \mathrm{MIC}^\dagger(X, \mathfrak{P}, T/K)$, *we have the canonical isomorphism in* $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$*:*

$$\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}(E \otimes_{j^\dagger \mathcal{O}_{]X[_\mathfrak{P}}} E') \xrightarrow{\sim} \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}(E) \overset{\mathbb{L}}{\otimes}{}^\dagger_{\mathcal{O}_\mathfrak{P}(^\dagger T)_\mathbb{Q}} \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}(E')[d_{Y/P}] \tag{12.2.6.5.1}$$

which commutes with Frobenius.

Proof. By using 12.2.1.14.2, we get that the right term of 12.2.6.5.1 do is a element of $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$. The construction of 12.2.6.5.1 is equivalent to that of an isomorphism of the form

$$u_0^! \circ \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}(E \otimes_{j^\dagger \mathcal{O}_{]X[_\mathfrak{P}}} E') \xrightarrow{\sim} u_0^!(\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}(E) \overset{\mathbb{L}}{\otimes}{}^\dagger_{\mathcal{O}_\mathfrak{P}(^\dagger T)_\mathbb{Q}} \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}(E')[d_{Y/P}]). \tag{12.2.6.5.2}$$

Moreover, we have the canonical isomorphism $u_0^! \circ \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+} \xrightarrow{\sim} \mathrm{sp}_* \circ u_{0K}^*$ (see the construction of $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}$ of 12.2.2.6 and use the equivalences of 12.2.2.5), this one commuting to actions of Frobenius. Following 12.2.6.2.2, 12.2.6.3.1 and 12.2.6.4, then we get the isomorphism 12.2.6.5.2.

□

Notation 12.2.6.6. Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ and $(Y', X', \mathfrak{P}', T')/\mathcal{V}$ be two completely smooth d-frames over $\mathcal{V}$. We set $\mathfrak{P}'' := \mathfrak{P} \times \mathfrak{P}'$, $X'' := X \times X'$, $Y'' := Y \times Y'$, $j \colon Y \subset X$, $j' \colon Y' \subset X'$ and $j'' \colon Y'' \subset X''$ the canonical inclusions. We denote by $\theta = (a, b, p) \colon (Y'', X'', \mathfrak{P}'', T'') \to (Y, X, \mathfrak{P}, T)$ and $\theta' = (a', b', p') \colon (Y'', X'', \mathfrak{P}'', T'') \to (Y', X', \mathfrak{P}', T')$ the morphisms of d-frames induced by the canonical projections, where $T'' = p^{-1}(T) \cup p'^{-1}(T')$. Let $E \in \mathrm{MIC}^{\dagger}(X, \mathfrak{P}, T/K)$ and $E' \in \mathrm{MIC}^{\dagger}(X', \mathfrak{P}', T'/K)$. With the notations of 12.2.1.12.1, we define the bifunctor $- \boxtimes - \colon \mathrm{MIC}^{\dagger}(X, \mathfrak{P}, T/K) \times \mathrm{MIC}^{\dagger}(X', \mathfrak{P}', T'/K) \to \mathrm{MIC}^{\dagger}(X'', \mathfrak{P}'', T''/K)$ by setting

$$E \boxtimes E' := \theta^*(E) \otimes_{j''^{\dagger}\mathcal{O}_{]X''[_{\mathfrak{P}''}}} \theta'^*(E').$$

Proposition 12.2.6.7. *With the notations 12.2.6.6, we have the canonical isomorphism commuting to Frobenius in* $\mathrm{MIC}^{\dagger\dagger}(X'', \mathfrak{P}'', T''/\mathcal{V})$*:*

$$\mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'', +}(E \boxtimes E') \xrightarrow{\sim} \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E) \overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}}, T, T'} \mathrm{sp}_{X' \hookrightarrow \mathfrak{P}', T', +}(E'). \tag{12.2.6.7.1}$$

Proof. Following 12.2.1.14.4, the right term do belong to $\mathrm{MIC}^{\dagger\dagger}(X'', \mathfrak{P}'', T''/\mathcal{V})$. Let us denote by $\mathcal{E} := \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E)$ and $\mathcal{E}' := \mathrm{sp}_{X' \hookrightarrow \mathfrak{P}', T', +}(E')$. Following 12.2.4.1.2, we have

$$\mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'', +}(\theta^*(E)) \xrightarrow{\sim} \theta^*(\mathcal{E}) := \mathbb{R}\underline{\Gamma}^{\dagger}_{X''} p^{!}_{T'', T}(\mathcal{E}[-d_{Y'}]),$$
$$\mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'', +}(\theta'^*(E')) \xrightarrow{\sim} \theta'^*(\mathcal{E}') := \mathbb{R}\underline{\Gamma}^{\dagger}_{X''} p'^{!}_{T'', T'}(\mathcal{E}'[-d_{Y}]).$$

By using 12.2.6.5, this yields the isomorphism in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}''}({}^{\dagger}T'')_{\mathbb{Q}})$

$$\mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'', +}(E \boxtimes E') \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X''} p^{!}_{T'', T}(\mathcal{E}) \overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}''}({}^{\dagger}T'')_{\mathbb{Q}}} \mathbb{R}\underline{\Gamma}^{\dagger}_{X''} p'^{!}_{T'', T'}(\mathcal{E}')[-d_P - d_{P'}]. \tag{12.2.6.7.2}$$

Moreover, following 9.2.5.16.1, we have the canonical isomorphism

$$\mathcal{E} \overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}}, T, T'} \mathcal{E}' \xrightarrow{\sim} p^{!}_{T'', T}(\mathcal{E}) \overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}''}({}^{\dagger}T'')_{\mathbb{Q}}} p'^{!}_{T'', T'}(\mathcal{E})[-d_P - d_{P'}]. \tag{12.2.6.7.3}$$

As the right term of 12.2.6.7.3 has its support in X'', then it is isomorphic to the right term of 12.2.6.7.2. Hence we are done. ☐

12.2.7 Differential coherence of $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$ when Z is a divisor

Theorem 12.2.7.1. *Let $\mathfrak{X}$ be a smooth formal scheme over $\mathfrak{S}$. Let Z be a divisor of X. Then $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}, \mathbb{Q}}$-module.*

Proof. We can adapt the proof of Berthelot of [Ber96a] as follows. 0) Using [Gro66, 8.8.2, 8.10.5] and [Gro67, 17.7.8], it follows from Theorem [dJ96, 4.1] (this is also explained in [dJ96, 4.5]), that there exists a finite extension l of k satisfying the following property: for any irreducible component $\widetilde{X}$ of $X \times_k l$, setting $\widetilde{Z} := \widetilde{X} \cap (Z \times_k l)$, there exist a smooth integral l-variety X', a projective morphism of l-varieties $\phi \colon X' \to \widetilde{X}$ which is generically finite and étale such that X' is quasi-projective and $Z' := \phi^{-1}(\widetilde{Z})$ is a strict normal crossing divisor of X'.

1) Using Lemma 9.2.7.4, we can suppose $k = l$ and X integral.

2) i) There exists a closed immersion of the form $u_0 \colon X' \hookrightarrow \mathbb{P}^n_X$ whose composition with the projection $\mathbb{P}^n_X \to X$ is ϕ. Let $\mathfrak{P} := \widehat{\mathbb{P}}^n_{\mathfrak{X}}$, $f \colon \mathfrak{P} \to \mathfrak{X}$ be the projection. Since f is proper and smooth, we have the adjoint morphism $f_+ \circ f^!(\mathcal{O}_{\mathfrak{X}, \mathbb{Q}}) \to \mathcal{O}_{\mathfrak{X}, \mathbb{Q}}$ in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}, \mathbb{Q}})$ (see 9.4.5.5). Following 12.1.3.1.1 and 12.1.3.6, we have in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S}, \mathbb{Q}})$ the morphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathcal{O}_{\mathfrak{P}, \mathbb{Q}}) \to \mathcal{O}_{\mathfrak{P}, \mathbb{Q}}$. Since $f^!(\mathcal{O}_{\mathfrak{X}, \mathbb{Q}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{P}, \mathbb{Q}}[n]$, then we get the morphism in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}, \mathbb{Q}})$

$$f_+(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \mathcal{O}_{\mathfrak{P}, \mathbb{Q}}[n]) \to \mathcal{O}_{\mathfrak{X}, \mathbb{Q}}. \tag{12.2.7.1.1}$$

ii) In this step, we construct the morphism $\mathcal{O}_{\mathfrak{X}, \mathbb{Q}} \to f_+(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \mathcal{O}_{\mathfrak{P}, \mathbb{Q}}[n])$ as follows: we have

$$\mathbb{D}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \mathcal{O}_{\mathfrak{P}, \mathbb{Q}}[n]) \underset{12.2.3.3}{\xrightarrow{\sim}} \mathbb{D}(\mathrm{sp}_+(\mathcal{O}_{]X'[_{\mathfrak{P}}})) \underset{12.2.5.6}{\xrightarrow{\sim}} \mathrm{sp}_+((\mathcal{O}_{]X'[_{\mathfrak{P}}})^{\vee}) \xrightarrow{\sim} \mathrm{sp}_+(\mathcal{O}_{]X'[_{\mathfrak{P}}}) \underset{12.2.3.3}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \mathcal{O}_{\mathfrak{P}, \mathbb{Q}}[n]. \tag{12.2.7.1.2}$$

This yields

$$\mathcal{O}_{\mathfrak{X},\mathbb{Q}} \underset{11.2.6.3.4}{\xrightarrow{\sim}} \mathbb{D}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}) \underset{12.2.7.1.1}{\longrightarrow} \mathbb{D}f_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n]) \underset{9.4.5.2}{\xrightarrow{\sim}} f_{+}\mathbb{D}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n]) \underset{12.2.7.1.2}{\xrightarrow{\sim}} f_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n]).$$

iii) The composite morphism $\mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to f_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n]) \to \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X},\mathbb{Q}})$ is an isomorphism. Indeed, using the third part of Proposition 11.2.1.14.c, since this composition is a morphism of the abelian category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}/\mathcal{V})$, we reduce to check that its restriction to a dense open subset is an isomorphism. Hence, we can suppose that $\phi\colon X' \to X$ is finite and étale, which is easy.

3) Following the step 2), $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ is a direct summand of $f_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n])$ in the category $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}})$. This yields that $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}}$ is a direct summand of $({}^{\dagger}Z)f_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n])$ in the category $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}})$. Using 9.4.3.3, we get in $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S}}({}^{\dagger}Z)_{\mathbb{Q}})$ morphism

$$({}^{\dagger}Z)f_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n]) \xrightarrow{\sim} f_{Z,+}\circ({}^{\dagger}f^{-1}(Z))(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n]).$$

Hence, it is sufficient to check that this latter object is $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-coherent. Since f is proper and since $({}^{\dagger}f^{-1}(Z))(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n])$ is already known to be $\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S}}({}^{\dagger}f^{-1}(Z))_{\mathbb{Q}}$-coherent, using the remark of 9.2.4.19.(b), we reduce to check that $({}^{\dagger}f^{-1}(Z))(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n])$ is $\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}$-coherent. Since this is local on $\mathfrak{P}$, we can suppose $\mathfrak{P}$ affine. Hence, there exists a morphism $u\colon \mathfrak{X}' \to \mathfrak{P}$ of smooth formal schemes over $\mathfrak{S}$ which is $u_0\colon X' \to P$ modulo π. We get

$$({}^{\dagger}f^{-1}(Z))(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}[n]) \underset{12.1.3.8}{\xrightarrow{\sim}} ({}^{\dagger}f^{-1}(Z))(u_{+}(\mathcal{O}_{\mathfrak{X}',\mathbb{Q}})) \underset{9.4.3.3}{\xrightarrow{\sim}} u_{f^{-1}(Z),+}(\mathcal{O}_{\mathfrak{X}'}({}^{\dagger}\phi^{-1}(Z))_{\mathbb{Q}}).$$

Since $\phi^{-1}(Z)$ is a strict normal crossing divisor of X', then following 12.1.2.3 $\mathcal{O}_{\mathfrak{X}'}({}^{\dagger}\phi^{-1}(Z))_{\mathbb{Q}})$ is $\mathcal{D}^{\dagger}_{\mathfrak{X}'/\mathfrak{S},\mathbb{Q}}$-coherent. Hence, using the remark 9.2.4.19, $u_{f^{-1}(Z),+}(\mathcal{O}_{\mathfrak{X}'}({}^{\dagger}\phi^{-1}(Z))_{\mathbb{Q}}) \xrightarrow{\sim} u_{+}(\mathcal{O}_{\mathfrak{X}'}({}^{\dagger}\phi^{-1}(Z))_{\mathbb{Q}})$ is $\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}$-coherent.

□

Corollary 12.2.7.2. *We have* $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}) \cap \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$.

Proof. We already know that $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$. Following 12.2.7.1, $\mathcal{O}_{\mathfrak{X}}({}^{\dagger}Z)_{\mathbb{Q}} = \underrightarrow{l}^{*}_{\mathbb{Q}}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}}(Z)$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}/\mathfrak{S},\mathbb{Q}}$-module. Using 9.1.6.3, we can conclude. □

We will need later the following proposition.

Proposition 12.2.7.3. *With notation 9.2.7.4, let* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$. *Let* $\mathcal{E}'^{(\bullet)} := \mathcal{V}' \otimes_{\mathcal{V}} \mathcal{E}^{(\bullet)}$. *If* $({}^{\dagger}Z')(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}'})$, *then* $({}^{\dagger}Z)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$.

Proof. Using 9.1.6.3, this is a consequence of Lemma 9.2.7.4. □

Chapter 13

Local cohomological operations and applications

13.1 Local cohomological functors

Let $\mathfrak{P}$ a separated, smooth and quasi-compact $\mathcal{V}$-formal scheme, $\mathfrak{D}$ a relative to $\mathfrak{P}/\mathfrak{S}$ strict normal crossing divisor and $\mathfrak{P}^\sharp := (\mathfrak{P}, M(\mathfrak{D}))$ the $\mathfrak{S}$-log smooth log formal scheme whose log-structure is given by $\mathfrak{D}$ (see 4.5.2.14). If $\mathfrak{U}$ is an open of $\mathfrak{P}$, we will write $\mathfrak{U}^\sharp := (\mathfrak{U}, M(\mathfrak{D} \cap \mathfrak{U}))$.

We fix $\lambda_0 \colon \mathbb{N} \to \mathbb{N}$ an increasing map such that $\lambda_0(m) \geq m$. For any divisor T of P, we then set $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{P}}(T) := \widehat{\mathcal{B}}^{(\lambda_0(m))}_{\mathfrak{P}}(T)$ and $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp}(T) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{P}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{P}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp}$. We will also see a posteriori (see 9.1.1.16.(c), that the hypothesis $\lambda_0 = \mathrm{id}$ does not harm generality. Finally, if $f \colon \mathfrak{X} \to \mathfrak{P}$ (resp. $f^\sharp \colon \mathfrak{X}^\sharp \to \mathfrak{P}^\sharp$) is a morphism of smooth formal $\mathfrak{S}$-schemes (resp. $\mathfrak{S}$-log-smooth log formal schemes), for any integer $i \in \mathbb{N}$, we denote by $f_i \colon X_i \to P_i$ (resp. $f^\sharp_i \colon X^\sharp_i \to P^\sharp_i$) the induced morphism modulo π^{i+1}. We finally set $\mathcal{D}^{(m)}_{P^\sharp_i}(T) := \mathcal{V}/\pi^{i+1} \otimes_{\mathcal{V}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp}(T) = \mathcal{B}^{(m)}_{P_i}(T) \otimes_{\mathcal{O}_{P_i}} \mathcal{D}^{(m)}_{P^\sharp_i}$ and $\widetilde{\mathcal{D}}^{(m)}_{P^\sharp_i}(T) := \widetilde{\mathcal{B}}^{(m)}_{P_i}(T) \otimes_{\mathcal{O}_{P_i}} \mathcal{D}^{(m)}_{P^\sharp_i}$.

13.1.1 Local cohomological functor with strict support over a divisor

Let T be a divisor of P. We have already defined in 9.1.1.5.3 the localisation functor $({}^\dagger T)$ outside T. In this subsection, we define and study the local cohomological functor with support in T, which we denote by $\mathbb{R}\underline{\Gamma}^\dagger_T$.

Lemme 13.1.1.1. Consider a distinguished triangle in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ of the form

$$\mathcal{F}^{(\bullet)} \to \mathcal{E}^{(\bullet)} \to ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \to \mathcal{F}^{(\bullet)}[1], \tag{13.1.1.1.1}$$

where the second morphism is the canonical morphism. For any divisor $T \subset T'$, we then have the isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ of the form $({}^\dagger T')(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} 0$.

Proof. As according to 9.1.3.2 the canonical morphism $({}^\dagger T')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger T')(({}^\dagger T)(\mathcal{E}^{(\bullet)}))$ is an isomorphism, then by applying the functor $({}^\dagger T')$ to the distinguished triangle 13.1.1.1.1, one of the axioms on triangulated categories allows us to conclude. □

Lemme 13.1.1.2. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ and $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$. We further assume that we have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ of the isomorphism $({}^\dagger T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$. Then $\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})}(\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}) = 0$.

Proof. Let $\phi \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$. As the canonical morphism $\mathcal{F}^{(\bullet)} \to ({}^\dagger T)(\mathcal{F}^{(\bullet)})$ is an isomorphism, then the morphism ϕ is canonically factorized by $({}^\dagger T)(\phi)$. Now, as $({}^\dagger T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$, then $({}^\dagger T)(\phi) = 0$. We deduce that $\phi = 0$. Hence the result. □

13.1.1.3. Following 8.3.4.4, we have the bifunctor (which is the standard construction bifunctor of homomorphims of the abelian category $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$):

$$\mathrm{Hom}^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))}(-,-)\colon K(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))^{\circ}\times K(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))\to K(\mathbb{Z}).$$

Following 8.3.4.8, the bifunctor $\mathrm{Hom}^{\bullet}_{\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))}(-,-)$ is right localizable. We get the bifunctor

$$\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))}(-,-)\colon D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))^{\circ}\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))\to D(\mathbb{Z}).$$

Let $\mathfrak{Ab}$ be the category of abelian groups. Following 8.3.4.8.3, we have the isomorphism of bifunctors $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))^{\circ}\times D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))\to\mathfrak{Ab}$ of the form:

$$H^0(\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))}(-,-))\xrightarrow{\sim}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))}(-,-). \qquad (13.1.1.3.1)$$

13.1.1.4. Let $T\subset T'$ be a second divisor. Suppose we have the commutative diagram in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ of the form

$$\begin{array}{ccccccc}
\mathcal{F}^{(\bullet)} & \to & \mathcal{E}^{(\bullet)} & \to & ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) & \to & \mathcal{F}^{(\bullet)}[1] \\
 & & \downarrow{\scriptstyle\phi} & & \downarrow{\scriptstyle({}^{\dagger}T)(\phi)} & & \\
\mathcal{F}'^{(\bullet)} & \to & \mathcal{E}'^{(\bullet)} & \to & ({}^{\dagger}T)(\mathcal{E}'^{(\bullet)}) & \to & \mathcal{F}'^{(\bullet)}[1]
\end{array} \qquad (13.1.1.4.1)$$

where middle horizontal morphisms are the canonical ones and where both horizontal triangles are distinguished. Modulo the equivalence of categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))\cong D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))$ (see 8.1.5.14.1) which allows us to see 13.1.1.4.1 as a diagram of $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))$, we have

$$H^{-1}(\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))}(\mathcal{F}^{(\bullet)},({}^{\dagger}T)(\mathcal{E}'^{(\bullet)})))\underset{13.1.1.3.1}{\xrightarrow{\sim}}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)))}(\mathcal{F}^{(\bullet)},({}^{\dagger}T)(\mathcal{E}'^{(\bullet)})[-1])\underset{13.1.1.2}{=}0.$$

Following [BBD82, 1.1.9], this implies there exists a unique morphism $\mathcal{F}^{(\bullet)}\to\mathcal{F}'^{(\bullet)}$ making commutative in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ the diagram:

$$\begin{array}{ccccccc}
\mathcal{F}^{(\bullet)} & \to & \mathcal{E}^{(\bullet)} & \to & ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) & \to & \mathcal{F}^{(\bullet)}[1] \\
\downarrow{\scriptstyle\exists!} & & \downarrow{\scriptstyle\phi} & & \downarrow{\scriptstyle({}^{\dagger}T)(\phi)} & & \downarrow{\scriptstyle\exists!} \\
\mathcal{F}'^{(\bullet)} & \to & \mathcal{E}'^{(\bullet)} & \to & ({}^{\dagger}T)(\mathcal{E}'^{(\bullet)}) & \to & \mathcal{F}'^{(\bullet)}[1].
\end{array} \qquad (13.1.1.4.2)$$

Similarly to [BBD82, 1.1.10], this implies that the cone of $\mathcal{E}^{(\bullet)}\to({}^{\dagger}T)(\mathcal{E}^{(\bullet)})$ is unique up to canonical isomorphism. Hence, such a complex $\mathcal{F}^{(\bullet)}$ is unique up to canonical isomorphism. We denote it by $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)})$. Moreover,the complex $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)})$ is functorial in $\mathcal{E}^{(\bullet)}$.

Definition 13.1.1.5. With notation 13.1.1.4, the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}\colon\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})\to\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ is the "local cohomological functor with strict support over the divisor T". For $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$, we denote by $\Delta_T(\mathcal{E}^{(\bullet)})$ the canonical exact triangle

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)})\to\mathcal{E}^{(\bullet)}\to({}^{\dagger}T)(\mathcal{E}^{(\bullet)})\to\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)})[1]. \qquad (13.1.1.5.1)$$

Lemma 13.1.1.6. *Let $T\subset T'$ be a second divisor, and $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. There exists a unique morphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)})\to\mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E}^{(\bullet)})$ making commutative the following diagram*

$$\begin{array}{ccccccc}
\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)} & \to & ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)})[1] \\
\downarrow{\scriptstyle\exists!} & & \| & & \downarrow & & \downarrow{\scriptstyle\exists!} \\
\mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)} & \to & ({}^{\dagger}T')(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E}^{(\bullet)})[1].
\end{array} \qquad (13.1.1.6.1)$$

In other words, $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}^{(\bullet)})$ is functorial in T.

Proof. This follows from 13.1.1.4. □

13.1.1.7. Let $T \subset T'$ be a second divisor. Let's denote by $\mathrm{forg}_\sharp$ the canonical forgetful functors of the form $\mathrm{forg}_\sharp\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$ or of the form $\mathrm{forg}_\sharp\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{P_\bullet}(T)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{P^\sharp_\bullet/\mathfrak{S}}(T))$ We deduce from 9.1.1.5.2 that the location functors $({}^\dagger T', T)$ of 9.1.1.5.3 or of 9.1.1.12.1 do not depend on the log- structure, i.e., we have the canonical isomorphism

$$({}^\dagger T', T) \circ \mathrm{forg}_\sharp \xrightarrow{\sim} \mathrm{forg}_\sharp \circ ({}^\dagger T', T) \tag{13.1.1.7.1}$$

of functors of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T'))$ or of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{P_\bullet}(T)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{P^\sharp_\bullet}(T))$.

13.1.1.8. We deduce from 13.1.1.7 that the functor $\mathbb{R}\underline{\Gamma}^\dagger_T$ does not depend on the log-structure, i.e., we have the canonical isomorphism

$$\mathbb{R}\underline{\Gamma}^\dagger_T \circ \mathrm{forg}_\sharp \xrightarrow{\sim} \mathrm{forg}_\sharp \circ \mathbb{R}\underline{\Gamma}^\dagger_T$$

of functors of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$.

Example 13.1.1.9. Let $T \subset T'$ be a second divisor, $\mathfrak{U}'$ be the complementary to T' open of $\mathfrak{X}$ and $j'\colon \mathfrak{U}' \to \mathfrak{X}$ be the open immersion. Let $E \in \mathrm{MIC}^\dagger(\mathfrak{X}^\sharp_K, T/\mathfrak{S}^\sharp_K)$. By applying the functor $\mathbb{R}\mathrm{sp}_*$ to an exact sequence of the form 10.1.3.2.1, we get the exact triangle (and with 10.1.2.3.2):

$$\mathbb{R}\mathrm{sp}_* \circ \underline{\Gamma}^\dagger_{]T'[_{\mathfrak{X}}}(E) \longrightarrow \mathrm{sp}_*(E) \longrightarrow \mathrm{sp}_*(j'^\dagger(E)) \longrightarrow \mathbb{R}\mathrm{sp}_* \circ \underline{\Gamma}^\dagger_{]T'[_{\mathfrak{X}}}(E)[1].$$

Since $\mathrm{sp}_*(E) \to \mathrm{sp}_*(j'^\dagger(E))$ is canonically isomorphic to $\mathcal{E} \to \mathcal{E}({}^\dagger T')$ (see 11.2.7.2.1), it follows from the exact triangle of localization of $\mathrm{sp}_*(E)$ with respect to T' (see 13.1.5.6.3), then using [BBD82, 1.1.9–10] we get the canonical isomorphism:

$$\mathbb{R}\underline{\Gamma}^\dagger_{T'}(\mathrm{sp}_*(E)) \xrightarrow{\sim} \mathbb{R}\mathrm{sp}_* \circ \underline{\Gamma}^\dagger_{]T'[_{\mathfrak{X}}}(E). \tag{13.1.1.9.1}$$

13.1.2 Commutation between localisations and local functors in the case of a divisor

13.1.2.1 (Commutation of location and local functors to the tensor product)**.** Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. By commutativity and associativity of tensor products, we have the canonical isomorphisms

$$({}^\dagger T)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} \xrightarrow{\sim} ({}^\dagger T)(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T)(\mathcal{F}^{(\bullet)}).$$

Hence, there exists a unique isomorphism of the form $\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}$ (resp. $\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{F}^{(\bullet)})$) and making commutative the following diagram

$$\begin{array}{ccccccc}
\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & \mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}[1] \\
\uparrow{\exists!} & & \| & & \uparrow{\sim} & & \uparrow{\exists!} \\
\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T)(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)})[1] \\
\downarrow{\exists!} & & \| & & \downarrow{\sim} & & \downarrow{\exists!} \\
\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T)(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{F}^{(\bullet)})[1].
\end{array} \tag{13.1.2.1.1}$$

These isomorphisms are functorial in $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$, T (for the meaning of the functoriality in T, we can look at 13.1.1.6.1). To check the functoriality in $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$, T, it is a question of writing the corresponding diagrams in three dimensions, which is left to the reader.

13.1.2.2 (Commutation between local cohomological functors and localization functors)**.** Let T_1, T_2 be two divisors of P, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$.

(a) By commutativity of the tensor product, we have the functorial in T_1, T_2 and $\mathcal{E}^{(\bullet)}$ canonical isomorphism
$$({}^\dagger T_2)\circ({}^\dagger T_1)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger T_1)\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)}). \tag{13.1.2.2.1}$$

(b) There then exists a unique isomorphism $({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})$ inducing the canonical morphism of distinguished triangles $({}^\dagger T_2)(\Delta_{T_1}(\mathcal{E}^{(\bullet)}))\to\Delta_{T_1}(({}^\dagger T_2)(\mathcal{E}^{(\bullet)}))$, i.e. of the form:
$$\begin{array}{ccccccc}
({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) & \to & ({}^\dagger T_2)(\mathcal{E}^{(\bullet)}) & \to & ({}^\dagger T_2)\circ({}^\dagger T_1)(\mathcal{E}^{(\bullet)}) & \to & ({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})[1] \\
\downarrow\exists! & & \| & & \downarrow\sim & & \downarrow\exists! \\
\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)}) & \to & ({}^\dagger T_2)(\mathcal{E}^{(\bullet)}) & \to & ({}^\dagger T_1)\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})[1],
\end{array} \tag{13.1.2.2.2}$$
whose middle square is indeed commutative by functoriality in T_1 of the isomorphism 13.1.2.2.1. By writing the diagrams in three dimensions (i.e., we write the parallelepiped whose face in front is 13.1.2.2.2, the back face is 13.1.2.2.2 with T_1' replacing T_1, the morphisms from front to back are the functoriality morphisms induced by $T_1\subset T_1'$; ditto to validate the functoriality in T_2 or $\mathcal{E}^{(\bullet)}$), we check that the isomorphism $({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})$ is functorial in T_1, T_2, $\mathcal{E}^{(\bullet)}$.

(c) Likewise, there then exists a unique isomorphism $\mathbb{R}\underline{\Gamma}^\dagger_{T_2}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_2}(\mathcal{E}^{(\bullet)})$ functorial in T_1, T_2, $\mathcal{E}^{(\bullet)}$ inducing the canonical morphism of distinguished triangles $\Delta_{T_2}(\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}))\to\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\Delta_{T_2}(\mathcal{E}^{(\bullet)}))$, i.e. of the form:
$$\begin{array}{ccccccc}
\mathbb{R}\underline{\Gamma}^\dagger_{T_2}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) & \to & ({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_{T_2}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})[1] \\
\downarrow\exists! & & \| & & \downarrow\sim & & \downarrow\exists! \\
\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_2}(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_2}(\mathcal{E}^{(\bullet)})[1],
\end{array} \tag{13.1.2.2.3}$$
whose middle square is indeed commutative by functoriality in T_2 of the isomorphism $({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})$.

13.1.2.3 (Compatibility of commutation isomorphisms with the tensor product)**.** The three isomorphisms of 13.1.2.2 are compatible with that of 13.1.2.1. More precisely, let T, T_1, T_2 be divisors of P, $\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. By composing the vertical isomorphisms of the diagram 13.1.2.1.1, we obtain the canonical isomorphisms $({}^\dagger T)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T)(\mathcal{F}^{(\bullet)})$ and $\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{F}^{(\bullet)})$ functorials in T, $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$. We verify in this paragraph that these isomorphisms are compatible with the three isomorphisms of commutation of local functors and localization of 13.1.2.2.

(a) Compatibility with isomorphisms 13.1.2.2.1 means that the diagram
$$\begin{array}{ccccc}
({}^\dagger T_2)\circ({}^\dagger T_1)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \xrightarrow{\sim} & ({}^\dagger T_1)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_1)\circ({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) \\
{\scriptstyle 13.1.2.2.1}\downarrow\sim & & & & \sim\uparrow{\scriptstyle 13.1.2.2.1} \\
({}^\dagger T_1)\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \xrightarrow{\sim} & ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_1)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)\circ({}^\dagger T_1)(\mathcal{F}^{(\bullet)}),
\end{array} \tag{13.1.2.3.1}$$
is commutative, which is easy.

(b) Now let's check that the diagram
$$\begin{array}{ccccc}
({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \xrightarrow{\sim} & \mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) \\
\downarrow\sim & & & & \sim\uparrow \\
\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \xrightarrow{\sim} & ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{F}^{(\bullet)}),
\end{array} \tag{13.1.2.3.2}$$

is commutative. To do this, consider the diagram:

$$\begin{array}{ccccccc}
({}^\dagger T_2)\circ \mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T_2)\circ({}^\dagger T_1)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & +1\\
\downarrow & & \downarrow & & \downarrow\wr & & \\
\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_1)\circ({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \to & +1,
\end{array} \tag{13.1.2.3.3}$$

whose right (resp. left) vertical arrow is the top composite of 13.1.2.3.1 (resp. 13.1.2.3.2). As these morphisms are functorial in T_1, the left (resp right) square of the diagram 13.1.2.3.3 is commutative. This diagram 13.1.2.3.3 therefore corresponds to a morphism of distinguished triangles of the form $({}^\dagger T_2)(\Delta_{T_1}(\mathcal{E}^{(\bullet)}))\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} \to \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\Delta_{T_1}(({}^\dagger T_2)(\mathcal{E}^{(\bullet)}))$. In the same way, we check the commutativity of the middle squares of the diagram

$$\begin{array}{ccccccc}
({}^\dagger T_2)\circ \mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T_2)\circ({}^\dagger T_1)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & +1\\
\downarrow & & \| & & \downarrow\wr & & \\
\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & ({}^\dagger T_1)\circ({}^\dagger T_2)(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \to & +1\\
\downarrow & & \downarrow & & \downarrow & & \\
\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)\circ({}^\dagger T_1)(\mathcal{F}^{(\bullet)}) & \to & +1\\
\downarrow & & \| & & \downarrow & & \\
\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}({}^\dagger T_1)\circ({}^\dagger T_2)(\mathcal{F}^{(\bullet)}) & \to & +1,
\end{array} \tag{13.1.2.3.4}$$

whose top (resp. bottom) triangle morphism is the image by the functor $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}$ (resp. $\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}-$) of the morphism of distinguished triangles 13.1.2.2.2. The commutativity of the diagram 13.1.2.3.1 means that the right (resp. middle) vertical composite arrow of the 13.1.2.3.4 diagram is the right (resp. middle) vertical arrow of 13.1.2.3.3. For uniqueness (thanks to [BBD82, 1.1.9]), the same applies to the left vertical arrows. Hence the result.

(c) By tracing the proof of the commutativity of 13.1.2.3.2 from 13.1.2.3.1, we verify from the commutativity of 13.1.2.3.2 that of the diagram below:

$$\begin{array}{ccccc}
\mathbb{R}\underline{\Gamma}^\dagger_{T_2}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \xrightarrow{\sim} & \mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_2}(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_2}(\mathcal{F}^{(\bullet)})\\
\downarrow\wr & & & & \wr\uparrow\\
\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_2}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} & \xrightarrow{\sim} & \mathbb{R}\underline{\Gamma}^\dagger_{T_2}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_2}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{F}^{(\bullet)}).
\end{array} \tag{13.1.2.3.5}$$

13.1.2.4. Let $T_1,\ldots,T_r$ and $T'_1,\ldots,T'_s$ be divisors of P, $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. Using s-times the morphisms of the form 13.1.2.3.5, we can check that we have the canonical functorial isomorphisms in $T_1,\ldots,T_r$, $T'_1,\ldots,T'_s$, $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$ of the form

$$\begin{aligned}
\mathbb{R}\underline{\Gamma}^\dagger_{T'_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T'_s}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) &\xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{T'_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T'_s}(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{F}^{(\bullet)}))\\
&\xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{T'_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T'_s}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{F}^{(\bullet)}),
\end{aligned} \tag{13.1.2.4.1}$$

these do not depend, up to canonical isomorphism, on the order of $T_1,\ldots,T_r$ or $T'_1,\ldots,T'_s$. In particular, by taking $\mathcal{F}^{(\bullet)} = \mathcal{O}^{(\bullet)}_{\mathfrak{P}}$ and the empty $T'_1,\ldots,T'_s$, we obtain the canonical functorial isomorphism in $T_1,\ldots,T_r$, $\mathcal{E}^{(\bullet)}$ of the form:

$$\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \tag{13.1.2.4.2}$$

and which does not depend, up to canonical isomorphism, on the order of $T_1,\ldots,T_r$.

13.1.3 Local cohomological functor with strict support in a closed subscheme

We will need the following Lemmas (e.g. see the construction of 13.1.3.8 or Proposition 13.1.4.8) in the next section.

Lemma 13.1.3.1. *Let Z, T be two divisors of P, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$, $\mathfrak{U}$ the open of $\mathfrak{P}$ complementary to the support of Z. The following assertions are equivalent:*

(a) We have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}^\sharp}(T\cap U))$ the isomorphism $\mathcal{E}^{(\bullet)}|\mathfrak{U} \xrightarrow{\sim} 0$.

(b) The canonical morphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$.

(c) We have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}(T))$ the isomorphism $({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$.

Proof. The equivalence between (b) and (c) is tautological (i.e., we have the distinguished triangle 13.1.1.5.1). The assertion $(c) \to (a)$ is trivial. Conversely, let's prove $(a) \to (c)$. Since $({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z)\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger T\cup Z)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(Z\cup T))$, as the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ is fully faithful on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}(Z\cup T))$, it is then equivalent to prove that $\underrightarrow{l}^*_{\mathbb{Q}}({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$. Since the cohomological spaces of $\underrightarrow{l}^*_{\mathbb{Q}}({}^\dagger Z)(\mathcal{E}^{(\bullet)})$ are coherent $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp}({}^\dagger T\cup Z)_{\mathbb{Q}}$-modules with support in Z (see the remark 9.3.5.15) and therefore in $T\cup Z$, the latter is indeed zero thanks to 8.7.6.11. □

Lemma 13.1.3.2. *Let $T_1,\ldots,T_r,T$ be divisors of P. Then $\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$.*

Proof. As according to 9.1.3.2 we have the canonical isomorphism $({}^\dagger T_1)(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T_1\cup T)$, then we obtain the distinguished triangle:

$$\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T) \to \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T_1\cup T) \to \mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T))[1]. \tag{13.1.3.2.1}$$

According to 12.2.7.2, it follows that the distinguished triangle 13.1.3.2.1 is a triangle in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. We deduce by induction on r (we apply the functor $\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_2}$ to the distinguished triangle 13.1.3.2.1) the result. □

Corollary 13.1.3.3. *For $r\in\mathbb{N}$, let $T_1,\ldots,T_r$ be some divisors of P (by convention, $r=0$ means there is no divisors). Let T be a divisor of P. Then there exists a canonical isomorphism*

$$\mathbb{R}\mathrm{sp}_*\left(\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K})\right) \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T))$$

which is functorial in T_i and T, i.e. making commutative the diagram of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S},\mathbb{Q}})$

$$\begin{array}{ccc}
\mathbb{R}\mathrm{sp}_*\left(\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(\mathcal{O}_{\mathfrak{P}_K})\right) & \xrightarrow{\sim} & \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \\
\downarrow & & \downarrow \\
\mathbb{R}\mathrm{sp}_*\left(\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K})\right) & \xrightarrow{\sim} & \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \\
\downarrow & & \downarrow \\
\mathbb{R}\mathrm{sp}_*\left(\underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K})\right) & \xrightarrow{\sim} & \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)),
\end{array}$$

where the vertical arrows are the canonical ones induced by $\mathcal{O}_{\mathfrak{P}_K}\to j^\dagger_T\mathcal{O}_{\mathfrak{P}_K}$, $\mathcal{O}^{(\bullet)}_{\mathfrak{P}}\to\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)$, $\underline{\Gamma}^\dagger_{T_r}\to\mathrm{id}$, $\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\to\mathrm{id}$, and where $\underrightarrow{l}^*_{\mathbb{Q}}$ is the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q}}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S},\mathbb{Q}})$ (see 8.4.5.6).

Proof. This is checked by induction on $r\in\mathbb{N}$. When $r=0$, this corresponds to the functorial in T isomorphism $\mathbb{R}\mathrm{sp}_*(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}} \xrightarrow{\sim} \underrightarrow{l}^*_{\mathbb{Q}}\,\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)$. Since $j^\dagger_{T_r}j^\dagger_T\mathcal{O}_{\mathfrak{P}_K} = j^\dagger_{T_r\cup T}\mathcal{O}_{\mathfrak{P}_K}$, we get the exact sequence

$$0\to\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K}) \to \underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K}) \to \underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_{T_r\cup T}\mathcal{O}_{\mathfrak{P}_K}) \to 0. \tag{13.1.3.3.1}$$

Hence, by induction hypothesis, we get a unique (using again [BBD82, 1.1.9]) isomorphism making commutative the diagram of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S},\mathbb{Q}})$:

$$\begin{array}{ccc}
\mathbb{R}\mathrm{sp}_*\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K}) & \overset{\sim}{\dashrightarrow} & \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \\
\downarrow & & \downarrow \\
\mathbb{R}\mathrm{sp}_*\underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K}) & \xrightarrow{\sim} & \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \\
\downarrow & & \downarrow \\
\mathbb{R}\mathrm{sp}_*\underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_{T_r\cup T}\mathcal{O}_{\mathfrak{P}_K}) & \xrightarrow{\sim} & \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_{r-1}}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T_r\cup T)) \\
\downarrow & & \downarrow \\
\mathbb{R}\mathrm{sp}_*\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\underline{\Gamma}^\dagger_{T_1}(j^\dagger_T\mathcal{O}_{\mathfrak{P}_K})[1] & \overset{\sim}{\dashrightarrow} & \underrightarrow{l}^*_{\mathbb{Q}}\,\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T))[1]
\end{array} \qquad (13.1.3.3.2)$$

where the triangle given by the right vertical arrows is distinguished since we have $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T_r\cup T)\xrightarrow{\sim}({}^\dagger T_r)(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T))$ (use 9.1.3.2).

□

Lemma 13.1.3.4. *Let X be a closed subscheme of P, $T_1,\dots,T_r$ (resp. $T'_1,\dots,T'_s$) be some divisors of P such that $X=\cap_{l=1,\dots,r}T_l$ (resp. $X=\cap_{l=1,\dots,s}T'_l$) and $\mathcal{E}^{(\bullet)}\in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$. There then exists an canonical isomorphism (compatible with Frobenius when $\mathfrak{D}$ is empty)*

$$\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathbb{R}\underline{\Gamma}^\dagger_{T'_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T'_s}\mathcal{E}^{(\bullet)}.$$

Proof. Since $\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ thanks to 13.1.3.1, the morphism canonical $\mathbb{R}\underline{\Gamma}^\dagger_{T'_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T'_s}\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})\to\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})$ is an isomorphism (compatible with Frobenius when $\mathfrak{D}$ is empty). By symmetry and noting that the proposition 13.1.2.1 implies that the functors $\mathbb{R}\underline{\Gamma}^\dagger_{T_i}$ and $\mathbb{R}\underline{\Gamma}^\dagger_{T'_j}$ commute canonically, we deduce an isomorphism $\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})\xrightarrow{\sim}\mathbb{R}\underline{\Gamma}^\dagger_{T'_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T'_s}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})$.

Now, it follows, by induction on r, from 13.1.2.1 that we have a canonical isomorphism $\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{E}^{(\bullet)}\xrightarrow{\sim}\mathbb{R}\underline{\Gamma}^\dagger_{T_1}\circ\cdots\circ\mathbb{R}\underline{\Gamma}^\dagger_{T_r}(\mathcal{E}^{(\bullet)})$. Likewise, replacing T with T' and r with s. Hence the result. □

13.1.3.5. Let U be an open subset of P. The maps $D\mapsto\overline{D}$ and $T\mapsto T\cap U$ are reciprocal bijections between the set of irreducible divisors of U and that of the irreducible divisors of P meeting U. The maps $D\mapsto\overline{D}$ and $T\mapsto T\cap U$ are reciprocal bijections between the set of divisors of U and that of the divisors of P whose irreducible components meet U. These bijections preserve the number of irreducible components.

Lemma 13.1.3.6. *Suppose P integral. Let X be a reduced closed subscheme of P. Then, X is a finite intersection of divisors of P.*

Proof. When $X=P$, we can see X as the intersection of 0 divisors of P. Suppose $X\neq P$. By using the formula commuting the intersection and union of the form $\cup_{i=1}^r\cap_{j=1}^s D_{i,j}=\cap_{1\le j_1,\dots,j_r\le s}\cup_{i=1}^r D_{i,j_i}$ for a family of subsets $D_{i,j}$ (divisors or P) of P, since the union of divisors is a divisor, then we reduce to the case where X is irreducible. Let $(P_i)_{i\in I}$ be a family of affine and dense open sets in P, such that the family $(X\cap P_i)_{i\in I}$ covers X and $X\cap P_i$ is non-empty for all $i\in I$. Now, there exists a finite number of divisors $(T_{i,j_i})_{j_i\in J_i}$ of P_i such that $X\cap P_i=\cap_{j_i}T_{i,j_i}$. As $X\cap P_i$ is dense in X, we then notice that $X=\cap_{i,j_i}\overline{T_{i,j_i}}$, where $\overline{T_{i,j_i}}$ is the closure of T_{i,j_i} in X. □

Remark 13.1.3.7. Beware that if P has at least two connected components, if X is one on its connected components then X is not a finite intersection of divisors of P.

Definition 13.1.3.8. Let X be a reduced closed subscheme of P. We define the local cohomological functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}$ with strict support in X as follows. Since P is the sum of its irreducible components, it suffices to define it in the case where P is integral.

1. If $X = P$, then the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}$ is by definition the identity.

2. Now suppose $X \neq P$. According to 13.1.3.6, there exists $T_1, \dots, T_r$ some divisors of P such that $X = \cap_{i=1}^{r} T_i$, then, for all $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$, the complex $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) := \mathbb{R}\underline{\Gamma}^{\dagger}_{T_r} \circ \dots \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{T_1}(\mathcal{E}^{(\bullet)})$ does not canonically depend on the choice of such divisors $T_1, \dots, T_r$ satisfying $X = \cap_{i=1}^{r} T_i$ (see 13.1.3.4).

13.1.3.9. Let X be a closed subscheme of P. We deduce from 13.1.1.8 that the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}$ does not depend on the log-structure, i.e., we have the canonical isomorphism

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X} \circ \mathrm{forg}_{\sharp} \xrightarrow{\sim} \mathrm{forg}_{\sharp} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X} \tag{13.1.3.9.1}$$

of functors of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$.

Proposition 13.1.3.10. *Let X be a smooth closed subscheme of P. The complex $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}\mathcal{O}_{\mathfrak{P},\mathbb{Q}} := \mathbb{R}\mathrm{sp}_{*}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}_{\mathfrak{P}_K})$ defined at 12.1.3.1 is canonically isomorphic to $\underrightarrow{l}^{*}_{\mathbb{Q}}\, \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$, which confirms the compatibility of our notation.*

Proof. By the construction explained in 13.1.3.8, this is a consequence of 13.1.3.3. □

Proposition 13.1.3.11. *Let X, X' be two closed subschemes of P, $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$.*

(a) We have the canonical isomorphism functorial in $\mathcal{E}^{(\bullet)}$, X, and X':

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X\cap X'}(\mathcal{E}^{(\bullet)}). \tag{13.1.3.11.1}$$

(b) We have the canonical isomorphism functorial in $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$, X, and X':

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X\cap X'}(\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathcal{F}^{(\bullet)}). \tag{13.1.3.11.2}$$

Proof. The first statement is obvious by construction of the local cohomological functor with strict support. The last one results from the canonical isomorphisms 13.1.2.4.1. □

Example 13.1.3.12. Taking $X' = P$ (and $\mathcal{E}^{(\bullet)} = \mathcal{O}^{(\bullet)}_{\mathfrak{P}}$) in 13.1.3.11.2, we get

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)}, \qquad \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)}. \tag{13.1.3.12.1}$$

13.1.4 Localisation outside a closed subscheme functor

Lemma 13.1.4.1. *Let $X \subset X'$ be two closed subschemes of P, $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$. We further assume that we have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$ the isomorphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} 0$. Then*

$$\mathrm{Hom}_{\underrightarrow{LD}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}), \mathcal{F}^{(\bullet)}) = 0.$$

Proof. Let $\phi\colon \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \to \mathcal{F}^{(\bullet)}$ be a morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$. Since the canonical morphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)})) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)})$ is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$(see 13.1.3.11.1), then the morphism ϕ is canonically factorized by $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\phi)$. Now, since $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{F}^{(\bullet)}) \xleftarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} 0$, then $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\phi) \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$. This implies $\phi = 0$. Hence the result. □

Lemma 13.1.4.2. *Let X be a closed subscheme of P and a distinguished triangle in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ of the form*

$$\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)} \to \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)})[1], \tag{13.1.4.2.1}$$

where the first morphism is the canonical morphism. We then have the isomorphism $\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$.

Proof. Since the canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_X(\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)})) \to \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)})$ is an isomorphism (see 13.1.3.11.1), by applying the functor $\mathbb{R}\underline{\Gamma}^\dagger_X$ to the distinguished triangle 13.1.4.2.1, one of the axioms on triangulated categories allows us to conclude. □

13.1.4.3. Let $X \subset X'$ be two closed subschemes of P. Suppose given the commutative diagram in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ of the form

$$\begin{array}{ccccccc} \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) & \longrightarrow & \mathcal{E}^{(\bullet)} & \longrightarrow & \mathcal{F}^{(\bullet)} & \longrightarrow & \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)})[1] \\ \downarrow{\scriptstyle \mathbb{R}\underline{\Gamma}^\dagger_X(\phi)} & & \downarrow{\scriptstyle \phi} & & & & \downarrow{\scriptstyle \mathbb{R}\underline{\Gamma}^\dagger_X(\phi)} \\ \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}'^{(\bullet)}) & \longrightarrow & \mathcal{E}'^{(\bullet)} & \longrightarrow & \mathcal{F}'^{(\bullet)} & \longrightarrow & \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}'^{(\bullet)})[1] \end{array} \tag{13.1.4.3.1}$$

whose left horizontal arrows are the canonical morphisms and whose two horizontal triangles are distinguished. According to lemmas 13.1.4.1 and 13.1.4.2, we then obtain

$$H^{-1}(\mathbb{R}\mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}))}(\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}), \mathcal{F}'^{(\bullet)})) = \mathrm{Hom}_{D(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}))}(\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}), \mathcal{F}'^{(\bullet)}[-1]) = 0.$$

We deduce, thanks to [BBD82, 1.1.9], that there therefore exists a unique morphism $\mathcal{F}^{(\bullet)} \to \mathcal{F}'^{(\bullet)}$ inducing in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ the commutative diagram:

$$\begin{array}{ccccccc} \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) & \longrightarrow & \mathcal{E}^{(\bullet)} & \longrightarrow & \mathcal{F}^{(\bullet)} & \longrightarrow & \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)})[1] \\ \downarrow{\scriptstyle \mathbb{R}\underline{\Gamma}^\dagger_X(\phi)} & & \downarrow{\scriptstyle \phi} & & \downarrow{\scriptstyle \exists !} & & \downarrow{\scriptstyle \mathbb{R}\underline{\Gamma}^\dagger_X(\phi)} \\ \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}'^{(\bullet)}) & \longrightarrow & \mathcal{E}'^{(\bullet)} & \longrightarrow & \mathcal{F}'^{(\bullet)} & \longrightarrow & \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}'^{(\bullet)})[1]. \end{array} \tag{13.1.4.3.2}$$

As for [BBD82, 1.1.10], this implies that the cone of $\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ is unique up to canonical isomorphism. We will denote it $({}^\dagger X)(\mathcal{E}^{(\bullet)})$. We check that $({}^\dagger X)(\mathcal{E}^{(\bullet)})$ is functorial in X, and $\mathcal{E}^{(\bullet)}$, e.g. we get the morphism of the form $\mathcal{E}^{(\bullet)} \to ({}^\dagger X)(\mathcal{E}^{(\bullet)})$. We have by construction the distinguished triangle

$$\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)} \to ({}^\dagger X)(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)})[1]. \tag{13.1.4.3.3}$$

We deduce from 13.1.5.2 that the functor $({}^\dagger X)$ does not depend on the log-structure, i.e., we have the canonical isomorphism $({}^\dagger X) \circ \mathrm{forg}_\sharp \xrightarrow{\sim} \mathrm{forg}_\sharp \circ ({}^\dagger X)$ of functors $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$.

Definition 13.1.4.4. With notation 13.1.4.3, the functor $({}^\dagger X)\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ is called the localisation outside X functor.

13.1.4.5. For any closed subscheme X of P, for all $\mathcal{E}^{(\bullet)},\ \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$, there exists a unique isomorphism of the form

$$({}^\dagger X)(\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} ({}^\dagger X)(\mathcal{F}^{(\bullet)}) \tag{13.1.4.5.1}$$

fitting into the commutative diagram

$$\begin{array}{ccccccc} \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)} & \to & ({}^\dagger X)(\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)})[1] \\ {\scriptstyle 13.1.3.12.1}\downarrow\wr & & \| & & \downarrow{\scriptstyle \exists !} & & {\scriptstyle 13.1.3.12.1}\downarrow\wr \\ \mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathcal{F}^{(\bullet)} & \to & \mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} ({}^\dagger X)(\mathcal{F}^{(\bullet)}) & \to & \mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{F}^{(\bullet)})[1]. \end{array}$$

As usual (by writing parallelepipeds), we check that it is functorial by X, $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$.

Theorem 13.1.4.6. *Let X, X' be two closed subschemes of P. We have $({}^\dagger X')\circ\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$.*

Proof. By devissage (use 13.1.4.3.3), this is a straightforward consequence of lemma 13.1.3.2. □

13.1.4.7. Let X, X' be to closed subschemes of P, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. There then exists a unique isomorphism

$$({}^\dagger X') \circ \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_X \circ ({}^\dagger X')(\mathcal{E}^{(\bullet)}) \tag{13.1.4.7.1}$$

functorial in X, X', $\mathcal{E}^{(\bullet)}$ fitting into the commutative diagram of the form

$$\begin{array}{ccccccc}
\mathbb{R}\underline{\Gamma}^\dagger_{X'} \circ \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) & \to & ({}^\dagger X') \circ \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_{X'} \circ \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)})[1] \\
\downarrow\sim & & \| & & \downarrow\exists! & & \downarrow\sim \\
\mathbb{R}\underline{\Gamma}^\dagger_X \circ \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_X \circ ({}^\dagger X')(\mathcal{E}^{(\bullet)}) & \to & \mathbb{R}\underline{\Gamma}^\dagger_X \circ \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}^{(\bullet)})[1].
\end{array}$$

Let us now generalize 13.1.3.1.

Proposition 13.1.4.8. *Let Z be a divisor of P and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(Z))$. Let X be a closed subscheme of P, $\mathfrak{U}$ be the open subset of $\mathfrak{P}$ complementary to X. The following assertions are equivalent:*

(a) We have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}^\sharp/\mathfrak{S}}(Z\cap U))$ the isomorphism $\mathcal{E}^{(\bullet)}|\mathfrak{U} \xrightarrow{\sim} 0$.

(b) The canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ is an isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(Z))$.

(c) We have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(Z))$ the isomorphism $({}^\dagger X)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$.

Proof. We can suppose P is integral. Let's prove $(a) \to (b)$. If T is a divisor containing X, by 13.1.3.1, the canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ is an isomorphism. As X is a finite intersection of divisor of P containing it we conclude $(a) \to (b)$. The converse $(b) \to (a)$ is obvious while the localization triangle at X leads to the equivalence between the assertions (b) and (c). □

Corollary 13.1.4.9. *Let T be a divisor of P, X a closed subscheme of P, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$ Then $({}^\dagger X)(\mathcal{E}^{(\bullet)}) = 0$ if and only if for any integer r, $({}^\dagger X)(\mathcal{H}^r(\mathcal{E}^{(\bullet)})) = 0$.*

Remark 13.1.4.10. Let X be a closed subscheme of P and $\mathcal{E}^{(\bullet)}$ be a complex of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$ such that $\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) = 0$. In general, it is false that its cohomology spaces satisfies $\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{H}^r(\mathcal{E}^{(\bullet)})) = 0$.

For example, if X is a smooth closed subscheme of P of pure codimension 2, 13.1.4.11 gives $\mathbb{R}\underline{\Gamma}^\dagger_X(({}^\dagger X)(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})) = 0$. Now, using the location triangle at X of $\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}$, we obtain $\mathcal{H}^1(({}^\dagger X)(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})) \xrightarrow{\sim} \mathcal{H}^{\dagger,2}_X(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})$. Finally, since $\mathcal{H}^{\dagger,2}_X(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})$ is an object of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ with support in X, then $\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{H}^1(({}^\dagger X)(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}))) \xrightarrow{\sim} \mathcal{H}^{\dagger,2}_X(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \neq 0$.

Proposition 13.1.4.11. Let $X \subset X'$ be two closed subschemes of X and $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. We then have $\mathbb{R}\underline{\Gamma}^\dagger_X \circ ({}^\dagger X')(\mathcal{E}^{(\bullet)})$ =0.

Proof. By applying the local cohomological functor $\mathbb{R}\underline{\Gamma}^\dagger_X$ to the distinguished triangle $\mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}^{(\bullet)}) \to \mathcal{E} \to ({}^\dagger X')(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}^{(\bullet)})[1]$, the theorem 13.1.3.11.1 allows us to conclude. □

Lemme 13.1.4.12. Let X and X' be two closed subschemes of P. We have: $({}^\dagger X)\circ({}^\dagger X')\circ\mathbb{R}\underline{\Gamma}^\dagger_{X\cup X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) = 0$.

Proof. Let us denote by $\mathcal{E}^{(\bullet)} = ({}^\dagger X) \circ ({}^\dagger X') \circ \mathbb{R}\underline{\Gamma}^\dagger_{X\cup X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})$, $\mathfrak{U} = \mathfrak{P} \setminus X$ and $|_{\mathfrak{U}}$ the restriction functor to $\mathfrak{U}$. We have $|_{\mathfrak{U}} \circ ({}^\dagger X) \xrightarrow{\sim} |_{\mathfrak{U}}$, $|_{\mathfrak{U}} \circ ({}^\dagger X') \xrightarrow{\sim} ({}^\dagger X' \cap U) \circ |_{\mathfrak{U}}$ and $|_{\mathfrak{U}} \circ \mathbb{R}\underline{\Gamma}^\dagger_{X\cup X'} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{X'\cap U} \circ |_{\mathfrak{U}}$. This implies that $\mathcal{E}^{(\bullet)}|_{\mathfrak{U}} = 0$. It follows by devissage from 13.1.4.6, 13.1.4.7.1 and 13.1.3.11.1 that $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$.

It then follows from 13.1.4.8 that $({}^\dagger X)(\mathcal{E}^{(\bullet)}) = 0$. However, thanks to 13.1.4.11, $({}^\dagger X) \to ({}^\dagger X) \circ ({}^\dagger X)$ is an isomorphism of functors and therefore that $\mathcal{E}^{(\bullet)} \to ({}^\dagger X)(\mathcal{E}^{(\bullet)})$ is an isomorphism. □

Theorem 13.1.4.13. *Let X, X' be two closed subschemes of P, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. We have the canonical isomorphism*

$$({}^\dagger X) \circ ({}^\dagger X')(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger X \cup X')(\mathcal{E}^{(\bullet)}), \tag{13.1.4.13.1}$$

functorial in X, X', $\mathcal{E}^{(\bullet)}$.

Proof. On one hand, it follows from 13.1.4.11 that the morphism $({}^\dagger X \cup X')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger X) \circ ({}^\dagger X')({}^\dagger X \cup X')(\mathcal{E}^{(\bullet)})$ is an isomorphism. On the other hand, we deduce from 13.1.4.12 that the morphism $({}^\dagger X) \circ ({}^\dagger X')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger X) \circ ({}^\dagger X') \circ ({}^\dagger X \cup X')(\mathcal{E}^{(\bullet)})$ is an isomorphism. □

In order to prove the following theorem, we will need the following lemma.

Lemma 13.1.4.14. *Let $\mathcal{E}'^{(\bullet)} \to \mathcal{E}^{(\bullet)} \to \mathcal{E}''^{(\bullet)} \to \mathcal{E}'^{(\bullet)}[1]$ be a triangle in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ and X a closed subscheme of P. This is distinguished if and only if the triangles obtained after applying the functors $\mathbb{R}\underline{\Gamma}^\dagger_X$ and $({}^\dagger X)$ are distinguished.*

Theorem 13.1.4.15. *Let X, X' be two closed subschemes of P. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$. We have the Mayer-Vietoris distinguished triangles:*

$$\mathbb{R}\underline{\Gamma}^\dagger_{X\cap X'}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X}(\mathcal{E}^{(\bullet)}) \oplus \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X\cup X'}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X\cap X'}(\mathcal{E}^{(\bullet)})[1], \tag{13.1.4.15.1}$$

$$({}^\dagger X \cap X')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger X)(\mathcal{E}^{(\bullet)}) \oplus ({}^\dagger X')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger X \cup X')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger X \cap X')(\mathcal{E}^{(\bullet)})[1]. \tag{13.1.4.15.2}$$

Proof. Let us just demonstrate that the triangle 13.1.4.15.1 is distinguished, the second proving itself in the same way. By using 13.1.3.12.1 and 13.1.4.5.1, it is enough to prove it for $\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}$. Now, the functors $\mathbb{R}\underline{\Gamma}^\dagger_X$ and $({}^\dagger X)$ applied to the exact triangle 13.1.4.15.1 for $\mathcal{E}^{(\bullet)} = \mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}$ give respectively

$$\mathbb{R}\underline{\Gamma}^\dagger_{X\cap X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \oplus \mathbb{R}\underline{\Gamma}^\dagger_{X\cap X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X\cap X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})[1]$$
$$0 \to 0 \oplus ({}^\dagger X)\mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \to ({}^\dagger X)\mathbb{R}\underline{\Gamma}^\dagger_{X\cup X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \to 0.$$

It is immediate that the first triangle is distinguished while the last is if and only if the morphism $({}^\dagger X)\mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}}) \to ({}^\dagger X)\mathbb{R}\underline{\Gamma}^\dagger_{X\cup X'}(\mathcal{O}^{(\bullet)}_{\mathfrak{P},\mathbb{Q}})$ is an isomorphism. Now, it follows from 13.1.4.8 that it suffices to verify it above $P \setminus X$, which is immediate. Thanks to 13.1.4.14, we conclude that 13.1.4.15.1 is distinguished. □

Example 13.1.4.16. Let $X_1, \ldots, X_r$ be r closed subschemes of P which are two by two disjoint. Let $X := X_1 \cup \cdots \cup X_r$. By induction in r, it follows from the Mayer-Vietoris exact sequence that the canonical morphism

$$\oplus_{j=1}^r \mathbb{R}\underline{\Gamma}^\dagger_{X_j}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{X}(\mathcal{E}^{(\bullet)}). \tag{13.1.4.16.1}$$

is an isomorphism.

13.1.4.17 (Support)**.** Let T be a divisor of P, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$. The support of $\mathcal{E}^{(\bullet)}$ is by definition the biggest closed subscheme X of P such that $({}^\dagger X)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ (one of the equivalent conditions of 13.1.4.8). We denote it by $\mathrm{Supp}\, \mathcal{E}^{(\bullet)}$.

Remark if $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$, then this is equal to the support (for the usual definition) of the coherent $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-module $\underrightarrow{l}^*_{\mathbb{Q}}\, \mathcal{E}^{(\bullet)}$, which justifies the terminology. We will extend later the proposition 13.1.4.8 (see 15.3.8.2) and the notion of support (15.3.8.1) in the case where T is not a divisor but we will need the notion of partially overcoherent complexes.

13.1.4.18 (t-structure for coherent complexes)**.** For a definition of t-structure, see [HTT08, 8.1.1]. Let T be a divisor of P. Following 8.7.5.4.1, for any $* \in \{\mathrm{r}, \mathrm{l}\}$, the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ induces the equivalence of categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)) \cong D^{\mathrm{b}}_{\mathrm{coh}}({}^*\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}})$. Since the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ preserves distinguished triangles, then we get the canonical t-structure on $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}})$ induces a t-structure on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$. For any $n \in \mathbb{N}$, the functor $H^n\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T)) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$ of 8.4.5.4 and the usual functor $H^n\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}}) \to \mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$ commutes with the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$. In other words, the functor H^n constructed at 8.4.5.4 is the one induced by the t-structure of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$ via the equivalence of categories $\underrightarrow{l}^{*}_{\mathbb{Q}}$.

Let $n \in \mathbb{Z}$. Let us denote by $\underrightarrow{LD}^{\leq n}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}(T))$ (resp. $\underrightarrow{LD}^{\geq n}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}(T))$) the strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}(T))$ consisting of complexes $\mathcal{E}^{(\bullet)}$ such that, for any $j \geq n+1$ (resp. for any $j \leq n-1$), we have $H^j(\mathcal{E}^{(\bullet)}) = 0$. We denote by $\tau^{\star}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}(T)) \to \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}(T))$ the canonical truncation functors, where $\star$ means either $\leq n$ or $\geq n$.

Remark 13.1.4.19. Since $\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$ is an abelian category, then we have a canonical t-structure on $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}))$ given by the standard truncation functors. By using the equivalence of categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}) \cong D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}}))$, of 8.1.5.14.1, this yields a canonical t-structure on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$.

Since the truncation functors do not a priori preserve quasi-coherence, beware that there is no clear that $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$ can be endowed with a t-structure induced by that of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$.

13.1.4.20. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. With notation 13.1.4.18 and 13.1.4.17, we have the equality

$$\mathrm{Supp}\,\mathcal{E}^{(\bullet)} = \cup_{j\in\mathbb{Z}}\,\mathrm{Supp}\,H^j(\mathcal{E}^{(\bullet)}). \tag{13.1.4.20.1}$$

13.1.5 Local cohomological functor with strict support over a subvariety

13.1.5.1. Let X, X', T, T' be closed subschemes of P such that $X \setminus T = X' \setminus T'$. For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$, we have the canonical isomorphism:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X}({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}({}^{\dagger}T')(\mathcal{E}^{(\bullet)}). \tag{13.1.5.1.1}$$

Indeed, $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X}({}^{\dagger}T)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{E}^{(\bullet)}$, and similarly with some primes. Hence, we reduce to the case $\mathcal{E}^{(\bullet)} = \mathcal{O}^{(\bullet)}_{\mathfrak{P}}$. Using 13.1.4.6, 13.1.3.11.1, 13.1.4.13.1, 13.1.4.8, we get the isomorphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}({}^{\dagger}T)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X\cap X'}({}^{\dagger}T\cup T')(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$. We conclude by symmetry.

Setting $Y := X \setminus T$, we denote by $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)})$ one of both complexes of 13.1.5.1.1.

13.1.5.2. Let Y be a subscheme of P. We deduce from 13.1.5.2 that the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}$ does not depend on the log-structure, i.e., we have the canonical isomorphism

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Y} \circ \mathrm{forg}_{\sharp} \xrightarrow{\sim} \mathrm{forg}_{\sharp} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Y} \tag{13.1.5.2.1}$$

of functors of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}/\mathfrak{S}})$.

Notation 13.1.5.3. Let Y be a subvariety of P and T be a divisor of P. Using notation 9.1.6.6, we get the functor

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Y} := \mathrm{Coh}_{T}(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y})\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}).$$

If we want to distinguish both functors $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}$, then we will denote in this case by $\mathbb{R}\underline{\Gamma}^{(\bullet)}_{Y}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^{\sharp}})$. Finally, for any $n \in \mathbb{N}$, we denote by $\mathcal{H}^{\dagger n}_{Y} := \mathcal{H}^n \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}) \to M(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})$, where $M(\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})$ is the category of left $\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules.

Lemma 13.1.5.4. *Let X be a closed subscheme of P, T be a divisor of P, $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-module.*

(a) For any $j \leq -1$, we have $H^j(\mathcal{E}({}^{\dagger}X)) = 0$.

(b) The canonical morphism $\mathcal{H}^{\dagger 0}_{X}(\mathcal{E}) \to \mathcal{E}$ is injective.

Proof. a) We can suppose P is integral. When X is a divisor of P, this is a consequence of the exactness of the functor $({}^\dagger Z)$ on the category of coherent $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules. This yields the general case via the distinguished triangle of Mayer-Vietoris (see 13.1.4.15), by proceeding by induction on the minimal number of divisors whose intersection is Y (recall 13.1.3.6).

b) Considering the long exact sequence induced by the triangle of localisation of $\mathcal{E}$ with respect to X, the fact that $H^{-1}(\mathcal{E}({}^\dagger Y)) = 0$ implies the desired injectivity. □

Proposition 13.1.5.5. *We have* $\mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$.

Proof. This is a translation of 13.1.4.6. □

13.1.5.6. Let Y and Y' be two subschemes of P. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$.

(a) Using 13.1.3.11.1, 13.1.4.13.1, we get the canonical isomorphism functorial in $\mathcal{E}^{(\bullet)}$, Y, and Y':

$$\mathbb{R}\underline{\Gamma}^\dagger_Y \circ \mathbb{R}\underline{\Gamma}^\dagger_{Y'}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Y\cap Y'}(\mathcal{E}^{(\bullet)}). \tag{13.1.5.6.1}$$

(b) Using 13.1.3.11.2 and 13.1.4.5.1 we get the canonical isomorphism functorial in $\mathcal{E}^{(\bullet)}$, $\mathcal{F}^{(\bullet)}$, Y, and Y':

$$\mathbb{R}\underline{\Gamma}^\dagger_{Y\cap Y'}(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathbb{R}\underline{\Gamma}^\dagger_{Y'}(\mathcal{F}^{(\bullet)}). \tag{13.1.5.6.2}$$

(c) If Y' is an open (resp. a closed) subscheme of Y, we have the canonical homomorphism $\mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{Y'}(\mathcal{E}^{(\bullet)})$ (resp. $\mathbb{R}\underline{\Gamma}^\dagger_{Y'}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}^{(\bullet)})$). If Y' is a closed subscheme of Y, we have the localization distinguished triangle

$$\mathbb{R}\underline{\Gamma}^\dagger_{Y'}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{Y\setminus Y'}(\mathcal{E}^{(\bullet)}) \to +1. \tag{13.1.5.6.3}$$

Proposition 13.1.5.7 (Commutation with base change)**.** *Let $\mathcal{V} \to \mathcal{V}'$ be a morphism of rings of complete discrete valuation of unequal characteristics $(0,p)$, $\mathfrak{S}' := \operatorname{Spf}\mathcal{V}'$. Let $\mathfrak{P}' := \mathfrak{P} \times_{\operatorname{Spf}(\mathcal{V})} \operatorname{Spf}(\mathcal{V}')$ be the separated, smooth and quasi-compact $\mathcal{V}$-formal scheme induced by base change, $\varpi\colon \mathfrak{X}' \to \mathfrak{X}$ the canonical projection, $\mathfrak{D}' := \varpi^{-1}(\mathfrak{D})$ the relative strict normal crossing divisor on $\mathfrak{P}'/\mathfrak{S}'$ induced by base change, $\mathfrak{P}'^\sharp := (\mathfrak{P}', \mathfrak{D}')$ the $\mathfrak{S}'$-smooth logarithmic formal scheme whose log-structure is given by $\mathfrak{D}'$ and $\varpi^\sharp\colon \mathfrak{P}'^\sharp \to \mathfrak{P}^\sharp$ the canonical projection. Let Y be a subvariety of P. Let $Y' := \varpi^{-1}(Y)$. For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{-}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}(Z_1))$, we have the isomorphism*

$$\mathbb{R}\underline{\Gamma}^\dagger_{Y'} \circ \varpi^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \varpi^{\sharp(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}^{(\bullet)}) \tag{13.1.5.7.1}$$

Proof. This follows by devissage and by Mayer-Vietoris exact triangles from 9.2.6.8. □

13.2 Fundamental properties

13.2.1 Commutation with local cohomological functors

Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of smooth $\mathcal{V}$-formal schemes, T and T' of the respective divisors of P and P' such that $f(P' \setminus T') \subset P \setminus T$, $\mathfrak{D}$ and $\mathfrak{D}'$ be relative to respectively $\mathfrak{P}/\mathfrak{S}$ and $\mathfrak{P}'/\mathfrak{S}$ strict normal crossing divisors such that $f^{-1}(\mathfrak{D}) \subset \mathfrak{D}'$. We set $\mathfrak{P}^\sharp := (\mathfrak{P}, M(\mathfrak{D}))$, $\mathfrak{P}'^\sharp := (\mathfrak{P}', M(\mathfrak{D}'))$ and $f^\sharp\colon \mathfrak{P}'^\sharp \to \mathfrak{P}^\sharp$ the morphism of $\mathfrak{S}$-log smooth formal logarithmic schemes induced by f. If $\mathfrak{U}$ is an open of $\mathfrak{P}$, we will write $\mathfrak{U}^\sharp := (\mathfrak{U}, M(\mathfrak{D} \cap \mathfrak{U}))$.

13.2.1.1. With the notations of 13.1.1.7, for all $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ and for all $\mathcal{E}^{(\bullet)}_\bullet \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{P_\bullet}(T))$ we verify that the canonical morphisms

$$f^{\sharp(\bullet)!}_{T',T} \circ \mathrm{forg}_\sharp(\mathcal{E}^{(\bullet)}) \to \mathrm{forg}_\sharp \circ f^{(\bullet)!}_{T',T}(\mathcal{E}^{(\bullet)}), \tag{13.2.1.1.1}$$

$$f^{\sharp(\bullet)!}_{\bullet T',T} \circ \mathrm{forg}_\sharp(\mathcal{E}^{(\bullet)}_\bullet) \to \mathrm{forg}_\sharp \circ f^{(\bullet)!}_{\bullet T',T}(\mathcal{E}^{(\bullet)}_\bullet) \tag{13.2.1.1.2}$$

are isomorphisms. Indeed, the fact that 13.2.1.1.2 is an isomorphism follows from 9.2.1.9.1. The yields so is 13.2.1.1.1.

13.2.1.2. In this paragraph, assume that $f^{-1}(\mathfrak{D}) = \mathfrak{D}'$ and $f^\sharp$ is exact. For all $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'))$, the canonical morphism

$$f^{(\bullet)}_{T,T',+} \circ \mathrm{forg}_\sharp(\mathcal{E}'^{(\bullet)}) \to \mathrm{forg}_\sharp \circ f^{\sharp(\bullet)}_{T,T',+}(\mathcal{E}'^{(\bullet)}) \tag{13.2.1.2.1}$$

is then an isomorphism. Indeed, since $f^\sharp$ is the composition of its graph with the canonical projection $\mathfrak{P}'^\sharp \times \mathfrak{P}^\sharp \to \mathfrak{P}^\sharp$, we reduce to the case where $f^\sharp$ is an exact closed immersion or a smooth (i.e. exact and log smooth) morphism. In the case where $f^\sharp$ is an exact closed immersion, this follows from an easy calculation in local coordinates (e.g. 9.3.3.6.1) and that where $f^\sharp$ is a smooth morphism, this is a consequence of 9.4.1.6 (and the fact that $\Omega^\bullet_{\mathfrak{P}'/\mathfrak{P}} = \Omega^\bullet_{\mathfrak{P}'^\sharp/\mathfrak{P}^\sharp}$).

Without the hypothesis that $f^\sharp$ is exact, we will take care of the fact that the morphism 13.2.1.2.1 is no longer an isomorphism (just consider the case $f = \mathrm{id}$).

Lemma 13.2.1.3. *Let $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ be a closed immersion of smooth formal $\mathfrak{S}$-scheme. Let T be a divisor of P such that $u(X) \subset T$. We have the canonical isomorphism: $u^{(\bullet)!}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$.*

Proof. 0) Following the proposition 8.3.3.5, the Lemma is local en $\mathfrak{P}$. So, we can suppose $\mathfrak{P}$ affine and endowed with coordinates $t_1, \ldots, t_d$ such that $\mathfrak{X} = V(t_1, \ldots, t_r)$ and there exists an element f of $O_{\mathfrak{P}}$ satisfying $T = V(\overline{f})$, where $\overline{f}$ is the reduction of f modulo $\pi O_{\mathfrak{P}}$. Let us check by induction on $r \geq 1$ the lemma.

1) Let us first deal with the case $r = 1$. Thanks to 9.2.1.17, we reduce to prove the isomorphism $u^{(\bullet)!}_{\mathrm{alg}}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. As $\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)$ is a sheaf of integral rings, using the exact sequence $0 \to u^{-1}\mathcal{O}_{\mathfrak{P}} \xrightarrow{t_1} u^{-1}\mathcal{O}_{\mathfrak{P}} \to \mathcal{O}_{\mathfrak{X}} \to 0$ which solves $\mathcal{O}_{\mathfrak{X}}$ by flat $u^{-1}\mathcal{O}_{\mathfrak{P}}$-modules, we verify that the canonical morphism of the form $\mathcal{O}_{\mathfrak{X}} \otimes^{\mathbb{L}}_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T) \to \mathcal{O}_{\mathfrak{X}} \otimes_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)$ is then an isomorphism in $D(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. Thus, we have the canonical isomorphism $u^{(\bullet)!}_{\mathrm{alg}}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}} \otimes_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)[d_{X/P}]$ in $D(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ and therefore in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. Let $\chi\colon \mathbb{N} \to \mathbb{N}$ be the element of M (see the definition in paragraph 8.1.5.1) defined by $\chi(m) = 1$. It is then sufficient to verify that the canonical morphism of $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}$-modules

$$\mathcal{O}_{\mathfrak{X}} \otimes_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T) \to \chi^*(\mathcal{O}_{\mathfrak{X}} \otimes_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T))$$

is the null morphism (in other words, $\mathcal{O}_{\mathfrak{X}} \otimes_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)$ is canceled by multiplication by p). As $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{P}}(T)$ does not depend, up to canonical isomorphism, from the choice of the lifting f of a local equation of T (see 8.7.3.4), we can suppose that t divides f, i.e. the image of f on $\mathcal{O}_{\mathfrak{X}}$ is zero. In this case, we calculate that $\mathcal{O}_{\mathfrak{X}} \otimes_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{P}}(T) = \mathcal{O}_{\mathfrak{X}} \otimes_{u^{-1}\mathcal{O}_{\mathfrak{P}}} u^{-1}\mathcal{O}_{\mathfrak{P}}\{X\}/(f^{p^{m+1}}X - p) = \mathcal{O}_{\mathfrak{X}}\{X\}/(p) = \mathcal{O}_X[X]$, which is canceled by p. Hence the result.

2) Now assume the property is true for $r-1$ and prove it for r. Let us denote $\mathfrak{X}_1 := V(t_1)$, and by $u_1\colon \mathfrak{X}_1 \hookrightarrow \mathfrak{P}$ and $v_1\colon \mathfrak{X} \hookrightarrow \mathfrak{X}_1$ the closed immersions. We can suppose X_1 is integral.

i) If $T \cap X_1$ is a divisor of X, following lemma 9.2.1.26, $u_1^{(\bullet)!}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} \widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}_1}(T \cap X_1))[-1]$. By using the induction hypothesis, we get the last isomorphism $u^{(\bullet)!}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} v_1^{(\bullet)!}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{X}_1}(T \cap X_1))[-1]) \xrightarrow{\sim} 0$, hence we are done.

ii) If $T \supset X_1$, then from the case $r = 1$, we get $u_1^{(\bullet)!}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} 0$, and then $u^{(\bullet)!}(\widetilde{\mathcal{B}}^{(\bullet)}_{\mathfrak{P}}(T)) \xrightarrow{\sim} 0$. □

Theorem 13.2.1.4. *Let Y be a subscheme of P, $Y' := f^{-1}(Y)$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ and $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'^\sharp/\mathfrak{S}})$. We have the functorial in Y isomorphisms:*

$$f^{\sharp(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Y'} \circ f^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}), \tag{13.2.1.4.1}$$

$$\mathbb{R}\underline{\Gamma}^\dagger_Y \circ f^{\sharp(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f^{\sharp(\bullet)}_+ \circ \mathbb{R}\underline{\Gamma}^\dagger_{Y'}(\mathcal{E}'^{(\bullet)}). \tag{13.2.1.4.2}$$

Proof. 1) Let us check 13.2.1.4.1. With 13.1.5.2.1 and 13.2.1.1, we can suppose logarithmic structures are trivial, i.e. $\mathfrak{D}$ and $\mathfrak{D}'$ are empty. Using 9.2.1.27.1 and 13.1.5.6.2, we reduce to the case where Y is the complement of a divisor T and $\mathcal{E}^{(\bullet)} = \mathcal{O}^{(\bullet)}_{\mathfrak{P}}$. The morphism f is the composition of its graph $\gamma_f\colon \mathfrak{P}' \hookrightarrow \mathfrak{P}' \times \mathfrak{P}$ with the projection $\mathfrak{P}' \times \mathfrak{P} \to \mathfrak{P}$. Since the case where f is a flat morphism follows from 9.2.1.26, we reduce to the case where f is a closed immersion. We can suppose P' is integral. Either

$T \cap P'$ is a divisor and we can conclude by using 9.2.1.26, or $T \cap P' = P'$ and then the isomorphism 13.2.1.4.1 is $0 \xrightarrow{\sim} 0$ following proposition 13.2.1.3.

2) Let us check that 13.2.1.4.2 is a consequence of 13.2.1.4.1.

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Y} \circ f^{\sharp(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \underset{13.1.5.6.2}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} f^{\sharp(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \underset{9.4.3.1}{\xrightarrow{\sim}} f^{\sharp(\bullet)}_{+}(f^{\sharp(\bullet)!}(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}))\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}'}}\mathcal{E}'^{(\bullet)}))[-d_{P'/P}] \tag{13.2.1.4.3}$$

Using 13.2.1.4.1, we get $f^{\sharp(\bullet)!}(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}))[-d_{P'/P}] \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Y'}\mathcal{O}^{(\bullet)}_{\mathfrak{P}'}$. Hence we are done. □

The following corollary means that the definitions 12.1.4.1.1 and 13.1.3.8 coincide.

Corollary 13.2.1.5. *Suppose $f^\sharp$ is an exact closed immersion. Let denote $f^\sharp$ (resp. $\mathfrak{P}'$) by $u^\sharp$ (resp. by $\mathfrak{X}$). For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$, with notation 13.1.3.8, we have the isomorphism*

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{\sharp(\bullet)}_{+} \circ u^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}). \tag{13.2.1.5.1}$$

Proof. As the immersion $u^\sharp$ is exact, by 13.1.5.2.1, 13.2.1.1 and 13.2.1.2.1, we can suppose the logarithmic structures are trivial. Using 9.4.3.2.1 and 13.1.3.11.2, we reduce to the case where $\mathcal{E}^{(\bullet)} = \mathcal{O}^{(\bullet)}_{\mathfrak{P}}$. From Berthelot-Kashiwara's theorem 9.3.5.13, since $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$ is coherent with support in X (see 13.1.4.6), we get

$$u^{(\bullet)}_{+}u^{(\bullet)!}\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}).$$

On the other hand,

$$u^{(\bullet)!}\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \underset{13.2.1.4.1}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^{\dagger}_{X}u^{(\bullet)!}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \xrightarrow{\sim} u^{(\bullet)!}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}).$$

Hence $u^{(\bullet)}_{+}u^{(\bullet)!}\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \xrightarrow{\sim} u^{(\bullet)}_{+}u^{(\bullet)!}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$, and we are done. □

Corollary 13.2.1.6. *Suppose $f^\sharp$ is an exact closed immersion. Let denote $f^\sharp$ (resp. $\mathfrak{P}'$) by $u^\sharp$ (resp. by $\mathfrak{X}$). Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}^\sharp/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$ with support in X. With notation 13.1.5.3, the natural morphism*

$$\mathcal{H}^{\dagger 0}_{Z}(\mathcal{E}) \to \mathcal{E} \tag{13.2.1.6.1}$$

is an isomorphism.

Proof. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}})$ such that $\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}$. Then this follows from Berthelot-Kashiwara theorem 9.3.5.13 and from 13.2.1.5. □

Proposition 13.2.1.7 (Compatibility with Frobenius)**.** *Suppose k is perfect. Let $u\colon \mathfrak{X} \to \mathfrak{P}$ be a closed immersion of smooth $\mathcal{V}$-formal schemes. Let T be a divisor of X such that $Z := T \cap X$ is a divisor of X. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ such $u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(Z))$ (e.g. if $\mathcal{E}^{(\bullet)}$ has its support in X). Then we have a compatible with Frobenius isomorphism of the form*

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{+} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}). \tag{13.2.1.7.1}$$

Proof. Consider the following commutative diagram

$$\begin{array}{ccc} u^{(\bullet)}_{+} \circ u^{(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) & \xrightarrow{\mathrm{adj}_{\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)})}} & \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \\ \downarrow & & \downarrow \\ u^{(\bullet)}_{+} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) & \xrightarrow{\mathrm{adj}_{\mathcal{E}^{(\bullet)}}} & \mathcal{E}^{(\bullet)}, \end{array} \tag{13.2.1.7.2}$$

where the horizontal arrows are the adjunction morphism of 9.5.4.5 and vertical arrows follows by functoriality in X of the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}$.

1) Following 9.5.4.5, the adjunction morphism $\mathrm{adj}_{\mathcal{E}^{(\bullet)}}$ and $\mathrm{adj}_{\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)})}$ are compatible with Frobenius.

2) It follows from 13.2.1.5.1 that $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ and has its support in X. Hence, by using Berthelot-Kashiwara theorem of the form 9.3.5.13, we can check that the adjunction morphism $\mathrm{adj}_{\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)})}$ is an isomorphism.

3) Since $\mathbb{R}\underline{\Gamma}^{\dagger}_{X} = \mathrm{id}$ on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$, it follows from 13.2.1.4.1 that the canonical morphism $u^{(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \to u^{(\bullet)!}(\mathcal{E}^{(\bullet)})$ is an isomorphism. Hence, the left morphism of the square 13.2.1.7.2 is a isomorphism. We get the compatible with Frobenius isomorphism 13.2.1.7.1 fitting into the commutative diagram

$$\begin{array}{ccc} u^{(\bullet)}_{+} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) & \xrightarrow{\mathrm{adj}_{\mathcal{E}^{(\bullet)}}} & \mathcal{E}^{(\bullet)} \\ \sim\downarrow & & \| \\ \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) & \longrightarrow & \mathcal{E}^{(\bullet)}. \end{array} \tag{13.2.1.7.3}$$

□

13.2.2 Coherence of the localisation of convergent isocrystals

Theorem 13.2.2.1. *Let $\mathfrak{P}$ be a smooth formal scheme over $\mathfrak{S}$. Let X be a smooth closed subscheme of P, and T be a divisor of X. Let $\mathcal{E}^{(\bullet)}$ be an object of $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}/\mathcal{V})$ (as defined in 12.2.1.6). Then $({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$.*

Proof. 1) Using the inductive system version of Berthelot-Kashiwara's theorem (see 9.3.5.13), we reduce to the case where $X = P$. In this case, we write $\mathfrak{X}$ (resp. Z) instead of $\mathfrak{P}$ (resp. T) and we will use the notation of the proof of 12.2.7.1. Now, following the part 0),1) and 2) of the proof of 12.2.7.1, modulo the equivalence of categories 8.4.5.6 and the compatibility of 13.1.3.10, the object $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$ is a direct summand of $f^{(\bullet)}_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}^{(\bullet)}_{\mathfrak{P}}[n])$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$. This yields that $({}^{\dagger}Z)(\mathcal{E}^{(\bullet)})$ is a direct summand of

$$\begin{aligned} &({}^{\dagger}Z)\left(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} f^{(\bullet)}_{+}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}^{(\bullet)}_{\mathfrak{P}}[n])\right) \underset{9.4.3.1.1}{\xrightarrow{\sim}} ({}^{\dagger}Z) f^{(\bullet)}_{+}\left(f^{(\bullet)!}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\mathcal{O}^{(\bullet)}_{\mathfrak{P}}\right) \\ &\underset{13.1.5.6.2}{\xrightarrow{\sim}} ({}^{\dagger}Z) f^{(\bullet)}_{+} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)})\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \underset{13.2.1.4.2}{\xrightarrow{\sim}} f^{(\bullet)}_{+}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'\setminus Z'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}). \end{aligned} \tag{13.2.2.1.1}$$

Hence, we reduce to check that $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'\setminus Z'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$ is an object of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$. Since this is local on $\mathfrak{P}$, we can suppose there exists a closed immersion of smooth $\mathcal{V}$-formal schemes $u\colon \mathfrak{X}' \hookrightarrow \mathfrak{P}$ which reduces modulo π to $X' \hookrightarrow P$. Following 13.2.1.5.1, $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{+} \circ u^{(\bullet)!} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$. Hence, $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'\setminus Z'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{+} \circ ({}^{\dagger}Z') \circ u^{(\bullet)!} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$. Following 11.1.3.6, we get $\mathcal{E}'^{(\bullet)} := u^{(\bullet)!} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}'/\mathcal{V})$. Since u is proper, then $u^{(\bullet)}_{+}$ preserves the coherence. Hence, we reduce to check that $({}^{\dagger}Z')(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}})$.

2) Since this is local, we can suppose $\mathfrak{X}'$ is integral and affine. We proceed by induction on the number of irreducible component of Z'. Let Z'_1 be one irreducible component of Z' and Z'' be the union of the other irreducible components. Let $u_1\colon \mathfrak{Z}'_1 \hookrightarrow \mathfrak{X}'$ be a lifting of $Z'_1 \hookrightarrow X'$, and $Z'_2 := Z'_1 \cap Z''$.

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'_1}(({}^{\dagger}Z'')\mathcal{E}'^{(\bullet)}) \to ({}^{\dagger}Z'')(\mathcal{E}'^{(\bullet)}) \to ({}^{\dagger}Z')(\mathcal{E}'^{(\bullet)}) \to +1 \tag{13.2.2.1.2}$$

Following 11.1.3.6, we get $\mathbb{L}u^{*(\bullet)}_1(\mathcal{E}'^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(\mathfrak{Z}'_1/\mathcal{V})$. Since $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'_1}(({}^{\dagger}Z'')\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{1+} \circ u^{(\bullet)!}_1(({}^{\dagger}Z'')\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{1+} \circ ({}^{\dagger}Z'_2)(u^{(\bullet)!}_1\mathcal{E}'^{(\bullet)})$, by induction hypothesis and preservation of the coherence under $u^{(\bullet)}_{1+}$, this yields $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'_1}(({}^{\dagger}Z'')\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}})$. By induction hypothesis $({}^{\dagger}Z'')(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'/\mathfrak{S}})$. We conclude using the exact triangle 13.2.2.1.2.

□

13.2.3 Base change isomorphism for coherent complexes and realizable morphisms

Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of separated $\mathcal{V}$-smooth formal schemes. Let $\mathfrak{D}$ (resp. $\mathfrak{D}'$) be a relative strict normal crossing divisors of $\mathfrak{P}/\mathfrak{S}$ (resp. $\mathfrak{P}'/\mathfrak{S}$) such that $f^{-1}(\mathfrak{D}) \subset \mathfrak{D}'$. We set $\mathfrak{P}^{\sharp} = (\mathfrak{P}, \mathfrak{D})$, $\mathfrak{P}'^{\sharp} := (\mathfrak{P}', \mathfrak{D}')$ the induced $\mathfrak{S}$-log smooth log formal schemes and $f^{\sharp}\colon \mathfrak{P}'^{\sharp} \to \mathfrak{P}^{\sharp}$ the induced morphisms of $\mathfrak{S}$-log smooth log formal schemes. Let T be a divisor of P such that $T' := f^{-1}(T)$ is a divisor of P'.

Definition 13.2.3.1. We say that $f^\sharp$ is *realizable with respect to* T if there exist a proper morphism $\pi\colon \mathfrak{P}'' \to \mathfrak{P}$ of smooth $\mathcal{V}$-formal schemes $\pi^{-1}(T)$ is a divisor of P'', a relative strict normal crossing divisors $\mathfrak{D}''$ of $\mathfrak{P}''/\mathfrak{S}$ such that $\pi^{-1}(\mathfrak{D}) \subset \mathfrak{D}''$, an exact immersion $u^\sharp\colon \mathfrak{P}'^\sharp \hookrightarrow \mathfrak{P}''^\sharp$ of log formal schemes such that $f^\sharp = \pi^\sharp \circ u^\sharp$, where $\mathfrak{P}''^\sharp := (\mathfrak{P}'', \mathfrak{D}'')$ and $\pi^\sharp\colon \mathfrak{P}''^\sharp \to \mathfrak{P}^\sharp$ is the morphism induced by π.

When T is empty, we simply say that $f^\sharp$ is a realizable morphism. When $\mathfrak{P}^\sharp = \operatorname{Spf} \mathcal{V}$ and T is empty, we say that $\mathfrak{P}'^\sharp$ is a realizable $\mathfrak{S}$-log smooth log formal scheme.

Example 13.2.3.2. If f is proper, then $f^\sharp$ is a realizable morphism with respect to T. If $f^\sharp$ is an exact immersion, then $f^\sharp$ is a realizable morphism with respect to T.

When log structures are trivial, if $\mathfrak{P}'$ is realizable, then any f is a realizable morphism with respect to T.

Remark 13.2.3.3. We have the following properties.

(a) The morphism f is realizable with respect to T (in the sense of 13.2.3.1 when $\mathfrak{D}$ and $\mathfrak{D}'$ are empty) if and only if there exist a proper morphism $\pi\colon \mathfrak{P}'' \to \mathfrak{P}$ of smooth $\mathcal{V}$-formal schemes, $\pi^{-1}(T)$ is a divisor of P'', an immersion $u\colon \mathfrak{P}' \hookrightarrow \mathfrak{P}''$ of formal schemes such that $f = \pi \circ u$.

(b) If $f^\sharp$ is realizable with respect to T then so is f. The converse is not clear.

Proposition 13.2.3.4. *Suppose $f^\sharp$ is realizable with respect to T in the sense of 13.2.3.1. For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'^\sharp/\mathfrak{S}}(T'))$ with proper support over P (i.e., if X' is the support of $\mathcal{E}'^{(\bullet)}$ in the sense 13.1.4.17 then the composite $X' \hookrightarrow P' \xrightarrow{f} P$ is proper), the object $f^{\sharp(\bullet)}_{+}(\mathcal{E}'^{(\bullet)})$ belongs to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$.*

Proof. Let X' be the support of $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'^\sharp/\mathfrak{S}}(T'))$. By assumption, X' is proper over P via f. Let $\pi\colon \mathfrak{P}'' \to \mathfrak{P}$ be a proper morphism of smooth $\mathcal{V}$-formal schemes, $\mathfrak{D}''$ be a relative strict normal crossing divisors of $\mathfrak{P}''/\mathfrak{S}$ such that $\pi^{-1}(\mathfrak{D}) \subset \mathfrak{D}''$ and $T'' := \pi^{-1}(T)$ is a divisor of P'', let $u^\sharp\colon \mathfrak{P}'^\sharp \hookrightarrow \mathfrak{P}''^\sharp$ be an exact immersion of log formal schemes such that $f^\sharp = \pi^\sharp \circ u^\sharp$, where $\mathfrak{P}''^\sharp := (\mathfrak{P}'', M_{\mathfrak{D}''})$ and $\pi^\sharp\colon \mathfrak{P}''^\sharp \to \mathfrak{P}^\sharp$ is the morphism induced by π.

Let $v^\sharp\colon \mathfrak{P}'^\sharp \hookrightarrow \mathfrak{U}''^\sharp$ be an exact closed immersion, and $j^\sharp\colon \mathfrak{U}''^\sharp \hookrightarrow \mathfrak{P}''^\sharp$ be an open immersion such that $u^\sharp = j^\sharp \circ v^\sharp$. Since X' is proper over P via f and since π is proper, then X' is proper over P'' via u. Since v is proper, then it follows from 9.4.2.6 that we get $\mathcal{E}''^{(\bullet)} := v^{\sharp(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U''))$ with proper support over P'' via j.

a) We check in this step that $\mathbb{R}j_*\mathcal{E}''^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''^\sharp/\mathfrak{S}}(T''))$ (with support in X'). Following 8.4.5.6.2, we have the equivalence of triangulated categories

$$\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U'')) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U''))).$$

Hence, we reduce by devissage to the case where $\mathcal{E}''^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U''))$. Following 8.4.5.10, there exists $m_0 \in \mathbb{N}$ large enough such that $\mathcal{E}''^{(\bullet)}$ is isomorphic in $\underrightarrow{LM}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U''))$ to a locally finitely presented $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U'')$-module $\mathcal{G}^{(\bullet)}$. Since $\mathcal{E}''^{(\bullet)}$ is null on the open complementary to X', then, taking larger m_0 is necessary, we can suppose $\mathcal{G}^{(0)}$ is a coherent $\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U'')$-module with support in X' (i.e. $\mathcal{G}^{(0)}$ is zero on the open complementary to X'). This yields that $\mathcal{G}^{(m)}$ is a coherent $\widetilde{\mathcal{D}}^{(m+m_0)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U'')$-module with support in X'. Since X' is closed in P'', a coherent $\widetilde{\mathcal{D}}^{(m+m_0)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U'')$-module with support in X' is acyclic for the functor j_*. Moreover, the functors j_* and j^* induce quasi-inverse equivalences of categories between the category of coherent $\widetilde{\mathcal{D}}^{(m+m_0)}_{\mathfrak{U}''^\sharp/\mathfrak{S}}(T'' \cap U'')$-modules with support in X' and that of coherent $\widetilde{\mathcal{D}}^{(m+m_0)}_{\mathfrak{P}''^\sharp/\mathfrak{S}}(T'')$-modules with support in X'. This yields that the canonical morphism $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{P}''^\sharp/\mathfrak{S}}(T'') \otimes_{\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{P}''^\sharp/\mathfrak{S}}(T'')} j_*\mathcal{G}^{(0)} \to j_*\mathcal{G}^{(\bullet)}$ is an isomorphim and that $j_*\mathcal{G}^{(\bullet)}$ is a locally finitely presented $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{P}''^\sharp/\mathfrak{S}}(T'')$-module with support in X'. Moreover, since the functor j_* is exact over the category of sheaves with support in X' (because X' is closed in P'' and in U''), then the canonical morphism $j_*\mathcal{G}^{(\bullet)} \to \mathbb{R}j_*\mathcal{G}^{(\bullet)}$ is an isomorphism. Hence, $j^{\sharp(\bullet)}_{+}\mathcal{E}''^{(\bullet)} = \mathbb{R}j_*\mathcal{E}''^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''^\sharp/\mathfrak{S}}(T''))$.

b) Since π is proper, by using 9.4.2.4 and the part a) we get $\pi^{\sharp(\bullet)}_{+} j^{\sharp(\bullet)}_{+}(\mathcal{E}''^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$. By transitivity of the push forwards, we get the isomorphism $f^{\sharp(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \pi^{\sharp(\bullet)}_{+} j^{\sharp(\bullet)}_{+}(\mathcal{E}''^{(\bullet)})$. Hence, we are done. □

Remark 13.2.3.5. In the overcoherent case, we can remove the hypothesis that f realizable (see 13.2.3.4).

Corollary 13.2.3.6. *Suppose $f\colon \mathfrak{P}' \to \mathfrak{P}$ is an open immersion of smooth $\mathcal{V}$-formal schemes and $f^\sharp$ is exact. Let X' be a closed subscheme of P' such that the composite $X' \hookrightarrow P' \xrightarrow{f} P$ is proper. Then the functors $f_+^{\sharp(\bullet)}$ and $f^{\sharp(\bullet)!}$ induce quasi-inverse equivalences of categories between the subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'^\sharp/\mathfrak{S}}(T'))$ consisting of objects with support in X' and the subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$ consisting of objects with support in X'.*

Proof. Denote by $\mathfrak{C}$ (resp. $\mathfrak{C}'$) the subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}}(T))$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'^\sharp/\mathfrak{S}}(T'))$) consisting of objects with support in X'. From 13.2.3.4, the functor $f_+^{\sharp(\bullet)} = \mathbb{R}f_*$ is well defined. This is also obvious for $f^{\sharp(\bullet)!} = f^*$. We easily check that the canonical morphism $f^*\mathbb{R}f_* \to \mathrm{id}$ of functors $\mathfrak{C}' \to \mathfrak{C}'$ is an isomorphism and that the functor $f^*\colon \mathfrak{C} \to \mathfrak{C}'$ is faithful. Hence, the morphism $\mathrm{id} \to \mathbb{R}f_* f^*$ of functors $\mathfrak{C} \to \mathfrak{C}$ is an isomorphism. □

Theorem 13.2.3.7. *Suppose $f^\sharp$ is realizable with respect to T in the sense of 13.2.3.1. Let $g\colon \mathfrak{Q} \to \mathfrak{P}$ be a smooth morphism of $\mathfrak{S}$-smooth formal schemes. We denote by $\mathfrak{Q}' := \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{Q}$, by $f'\colon \mathfrak{Q}' \to \mathfrak{Q}$ and $g'\colon \mathfrak{Q}' \to \mathfrak{P}'$ the two canonical projections. We set $\mathfrak{Z} := g^{-1}(\mathfrak{D})$, $\mathfrak{Z}' := g'^{-1}(\mathfrak{D}')$, $U := g^{-1}(T)$, $U' := g'^{-1}(T')$, $\mathfrak{Q}^\sharp := (\mathfrak{Q}, M(\mathfrak{Z}))$, $\mathfrak{Q}'^\sharp := (\mathfrak{Q}', M(\mathfrak{Z}'))$) the induced $\mathfrak{S}$-log smooth log formal schemes and $g^\sharp\colon \mathfrak{Q}^\sharp \to \mathfrak{P}^\sharp$, $f'^\sharp\colon \mathfrak{Q}'^\sharp \to \mathfrak{Q}^\sharp$ and $g'^\sharp\colon \mathfrak{Q}'^\sharp \to \mathfrak{P}'^\sharp$ the induced morphisms of $\mathfrak{S}$-log smooth log formal schemes. Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'^\sharp/\mathfrak{S}}(T'))$ with proper support over P. There then exists a canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}^\sharp/\mathfrak{S}}(U))$:*

$$g^{\sharp(\bullet)!} \circ f_+^{\sharp(\bullet)}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f'^{\sharp(\bullet)}_+ \circ g'^{\sharp(\bullet)!}(\mathcal{E}'^{(\bullet)}). \tag{13.2.3.7.1}$$

Proof. With the hypotheses on f and g, it follows from 13.2.3.4 and 9.4.1.7 that the complexes of 13.2.3.7.1 are indeed coherent. The morphism g decomposes into its graph γ followed by the canonical projection $\pi\colon \mathfrak{P} \times \mathfrak{Q} \to \mathfrak{P}$. By base change via f, this yields that the morphism g' decomposes into a closed immersion $\gamma'\colon \mathfrak{Q}' \hookrightarrow \mathfrak{P}' \times \mathfrak{Q}$ followed by the canonical projection $\pi'\colon \mathfrak{P}' \times \mathfrak{Q} \to \mathfrak{P}'$. Set $\mathfrak{U} := \mathfrak{P} \times \mathfrak{Q}$, $\mathfrak{U}' := \mathfrak{P}' \times \mathfrak{Q}$. We denote by $\pi^\sharp\colon \mathfrak{U}^\sharp \to \mathfrak{P}^\sharp$ and $\gamma^\sharp\colon \mathfrak{Q}^\sharp \to \mathfrak{U}^\sharp$ the strict morphisms of formal log-schemes whose underlying formal scheme morphisms are π and γ; the same with primes. We denote by $f''^\sharp = f^\sharp \times \mathrm{id}_{\mathfrak{Q}}\colon \mathfrak{U}'^\sharp \to \mathfrak{U}^\sharp$ the morphism canonically induced. Thanks to the theorem 9.3.5.13, we come down to checking that we have of a canonical isomorphism of the form

$$\gamma_+^{\sharp(\bullet)} \circ g^{\sharp(\bullet)!} \circ f_+^{\sharp(\bullet)}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \gamma_+^{\sharp(\bullet)} \circ f'^{\sharp(\bullet)}_+ \circ g'^{\sharp(\bullet)!}(\mathcal{E}'^{(\bullet)}).$$

Concerning the left term, by transitivity of extraordinary inverse images, we obtain the canonical isomorphism $\gamma_+^{\sharp(\bullet)} \circ g^{\sharp(\bullet)!} \circ f_+^{\sharp(\bullet)}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \gamma_+^{\sharp(\bullet)} \circ \gamma^{\sharp(\bullet)!} \circ \pi^{\sharp(\bullet)!} \circ f_+^{\sharp(\bullet)}(\mathcal{E}'^{(\bullet)})$. For the one on the right, by transitivity of direct images or extraordinary inverse images and using 13.2.1.4.2 and 13.2.1.5.1 we obtain the canonical isomorphisms $\gamma_+^{\sharp(\bullet)} \circ f'^{\sharp(\bullet)}_+ \circ g'^{\sharp(\bullet)!}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f''^{\sharp(\bullet)}_+ \circ \gamma'^{\sharp(\bullet)}_+ \circ \gamma'^{\sharp(\bullet)!} \circ \pi'^{\sharp(\bullet)!}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \gamma_+^{\sharp(\bullet)} \circ \gamma^{\sharp(\bullet)!} \circ f''^{\sharp(\bullet)}_+ \circ \pi'^{\sharp(\bullet)!}(\mathcal{E}'^{(\bullet)})$. It is thus sufficient to check the isomorphism $\pi^{\sharp(\bullet)!} \circ f_+^{\sharp(\bullet)}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f''^{\sharp(\bullet)}_+ \circ \pi'^{\sharp(\bullet)!}(\mathcal{E}'^{(\bullet)})$, which is already known following Theorem 9.4.4.3. □

Remark 13.2.3.8. In the theorem 13.2.3.7, we can remove the hypothesis of realizability of the morphism g when we work with overcoherent complexes and when the residue field k is perfect (see later 16.3.3.2).

Remark 13.2.3.9. When logarithmic structures are trivial, f is proper and the residue field k is perfect, T. Abe has checked that the isomorphism of base change 13.2.3.7.1 is compatible with Frobenius (see [Abe14a, 5.7]).

13.2.4 Relative duality isomorphism and adjunction for realisable morphisms

Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a realizable with respect to T (see 13.2.3.3) morphism of separated $\mathcal{V}$-smooth formal schemes. Let T be a divisor of P such that $T' := f^{-1}(T)$ is a divisor of P'.

Theorem 13.2.4.1 (Relative duality isomorphism)**.** *For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T'))$ with proper support over P, we have the isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ of the form*

$$f_+^{(\bullet)} \circ \mathbb{D}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \mathbb{D} \circ f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)}).$$

Proof. Let X' be the support of $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T'))$. By assumption, X' is proper over P via f. Let $\pi\colon \mathfrak{P}'' \to \mathfrak{P}$ be a proper morphism of smooth $\mathcal{V}$-formal schemes, let $u\colon \mathfrak{P}' \hookrightarrow \mathfrak{P}''$ be an immersion of formal schemes such that $f = \pi \circ u$. Let $v\colon \mathfrak{P}' \hookrightarrow \mathfrak{U}''$ be a closed immersion, and $j\colon \mathfrak{U}'' \hookrightarrow \mathfrak{P}''$ be an open immersion such that $u = j \circ v$. Since X' is proper over P via f and since π is proper, then X' is proper over P'' via u. Since v is proper, then it follows from 9.4.2.6 that we get $\mathcal{E}''^{(\bullet)} := v^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}''/\mathfrak{S}}(T'' \cap U''))$ with proper support over P'' via j.

From the relative duality isomorphism in the case of a closed immersion (see 9.3.2.8), we have $\mathbb{D}v^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} v^{(\bullet)}_{+}\mathbb{D}(\mathcal{E}'^{(\bullet)})$. Set $\mathcal{E}''^{(\bullet)} := v^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)})$. Using 13.2.3.4, we get $j^{(\bullet)}_{+}\mathcal{E}''^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''/\mathfrak{S}}(T''))$ and it has his support in X'. Hence, $\mathbb{D}j^{(\bullet)}_{+}\mathcal{E}''^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''/\mathfrak{S}}(T''))$ and has its support in X'. Hence, $\mathbb{D}j^{(\bullet)}_{+}\mathcal{E}''^{(\bullet)} \xrightarrow{\sim} j^{(\bullet)}_{+}j^{(\bullet)!}\mathbb{D}j^{(\bullet)}_{+}\mathcal{E}''^{(\bullet)}$ (use 13.2.3.6). Moreover, this is obvious that $j^{(\bullet)!}\mathbb{D}j^{(\bullet)}_{+}\mathcal{E}''^{(\bullet)} \xrightarrow{\sim} \mathbb{D}j^{(\bullet)!}j^{(\bullet)}_{+}\mathcal{E}''^{(\bullet)} \xrightarrow{\sim} \mathbb{D}\mathcal{E}''^{(\bullet)}$. Hence, $\mathbb{D}j^{(\bullet)}_{+}\mathcal{E}''^{(\bullet)} \xrightarrow{\sim} j^{(\bullet)}_{+}\mathbb{D}\mathcal{E}''^{(\bullet)}$. By composition we get $\mathbb{D}u^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{+}\mathbb{D}(\mathcal{E}'^{(\bullet)})$. Since π is proper, from the relative duality isomorphism in the proper case (see 9.4.5.2), we obtain the first isomorphism $\mathbb{D}\pi^{(\bullet)}_{+}u^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \pi^{(\bullet)}_{+}\mathbb{D}u^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \pi^{(\bullet)}_{+}u^{(\bullet)}_{+}\mathbb{D}(\mathcal{E}'^{(\bullet)})$. Hence, we are done.

□

Corollary 13.2.4.2. *Let $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}}({}^{\dagger}T')_{\mathbb{Q}})$ with proper support over P, and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$. We have the isomorphisms*

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}}}(f_{T,+}(\mathcal{E}'), \mathcal{E}) \xrightarrow{\sim} \mathbb{R}f_{*}\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}}({}^{\dagger}T')_{\mathbb{Q}}}(\mathcal{E}', f^{!}_{T}(\mathcal{E})). \tag{13.2.4.2.1}$$

$$\mathbb{R}\,\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}}}(f_{T,+}(\mathcal{E}'), \mathcal{E}) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}}({}^{\dagger}T')_{\mathbb{Q}}}(\mathcal{E}', f^{!}_{T}(\mathcal{E})). \tag{13.2.4.2.2}$$

Proof. Using 13.2.4.1, we can copy word by word the proof of 9.4.5.4. □

Corollary 13.2.4.3. *We have the following properties.*

(a) Let $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}}({}^{\dagger}T')_{\mathbb{Q}})$ with proper support over P. We have the adjunction morphism $\mathcal{E}' \to f^{!}_{T}f_{T+}(\mathcal{E}')$.

(b) Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ such that $f^{!}_{T}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$. We have the adjunction morphism $f_{T+}f^{!}_{T}(\mathcal{E}) \to \mathcal{E}$.

(c) Suppose f is proper and smooth. Then $f_{T+}\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ is a right adjoint functor of $f^{!}_{T}\colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$.

Chapter 14

On the preservation of the coherence by extraordinary inverse image of a closed immersion

In the first section of this chapter, we give some preliminaries topological concerning locally convex K-vector spaces. We recall notably the definition of spaces of type LB and we consider some points on the completed tensor products of locally convex module in the context which we will be useful in the sequence of this work. In the second section, we naturally endow the overconvergent isocrystals and the sheaf of differential operators of finite level with overconvergent singularities with a canonical structure of space of type LB. After some topological properties on pushforwards and extraordinary pullbacks by a closed immersion, we establish in the next section the main result described in the beginning of introduction of this paper. We end with some applications of the main theorem with overconvergent log-isocrystals satisfying some non-Liouville type properties.

14.1 Topological preliminaries

Let us denote by $\mathfrak{C}$ the category of locally convex topological K-vector spaces. Let us denote by $\mathfrak{D}$ the full subcategory of $\mathfrak{C}$ consisting of separated and complete K-vector spaces.

14.1.1 LB-spaces

We aggregate everything we will need on K-vector spaces of LB-type, above all of the lemma 14.1.1.7 but also of its proof (see the step 2 of the proof of 14.3.3.8). Recall that since $\mathfrak{C}$ has filtrant inductive limits and projective limits, then a strict morphism of $\mathfrak{C}$ is a morphism such that $\mathrm{Coim}(f) \to \mathrm{Im}(f)$ is an isomorphism (see Definition [KS06, 5.1.4]).

14.1.1.1. Let $(V_i)_{i\in I}$ be a filtrant inductive system of $\mathfrak{C}$. Let us denote by $V := \varinjlim_i V_i$ the inductive limit computed in $\mathfrak{C}$. As K-vector space, V is the inductive limit of $(V_i)_{i\in I}$ computed in the category of K-vector spaces. The locally convex topology on V is the finest one making continuous every canonical morphisms $V_i \to V$.

Lemma 14.1.1.2. *Let $(V_i)_{i\in I}$ and $(W_i)_{i\in I}$ be two filtrant inductive systems of $\mathfrak{C}$, $f_i\colon V_i \to W_i$ be a compatible family of morphisms of $\mathfrak{C}$ and $f\colon \varinjlim_i V_i \to \varinjlim_i W_i$ the morphism of $\mathfrak{C}$ induced by passage to the inductive limit. If for any i the image of f_i is dense in W_i then the image of f is dense.*

Proof. Let F be a closed subset of $\varinjlim_i W_i$ containing the image of f. Then the inverse image of F on W_i is a closed subset containing the image of f_i which is dense in W_i. Hence, the canonical arrow $W_i \to \varinjlim_i W_i$ factorizes always via $W_i \to F$. Hence $F = \varinjlim_i W_i$. □

Lemma 14.1.1.3. *Let $(V_i)_{i\in I}$ and $(W_i)_{i\in I}$ be two filtrant inductive systems of $\mathfrak{C}$, $f_i\colon V_i \to W_i$ be a compatible family of surjective, strict morphisms of $\mathfrak{C}$ and $f\colon \varinjlim_i V_i \to \varinjlim_i W_i$ be the morphism of $\mathfrak{C}$ induced by passage to the inductive limit. Then f is a surjective strict morphism.*

Proof. The surjectivity and the continuity of f is already known. Let us denote by $W := \varinjlim_i W_i$. Let W' be an object of $\mathfrak{C}$ and $g\colon W \to W'$ be a K-linear morphism such that $g \circ f$ is continuous. Let us denote by $g_i\colon W_i \to W'$ the composition of the canonical morphism $W_i \to W$ with g. As f_i is surjective and strict, as $g_i \circ f_i\colon V_i \to W'$ is continuous, then the morphisms g_i are continuous. Following the universal property of the inductive limit, this yields g is also continuous. □

Lemma 14.1.1.4. *Let $(V_i)_{i\in I}$ be a filtrant inductive system of $\mathfrak{C}$ and J be a cofinal subpart of I. We have the canonical homeomorphism $\varinjlim_{j\in J} V_j \xrightarrow{\sim} \varinjlim_{i\in I} V_i$ whose underlying bijection is the canonical bijection.*

Proof. Straightforward. □

Definition 14.1.1.5. A "K-vector space of type LB" is a separated locally convex K-vector space V such that there exist, for any integer $m \in \mathbb{N}$, some continuous morphisms of Banach K-vector spaces $V_m \to V_{m+1}$ and a homeomorphism of the form $\varinjlim_m V_m \xrightarrow{\sim} V$. When the field K is clearly determined we simply say LB-space.

Remark 14.1.1.6. In the definition of K-vector space of type LB of 14.1.1.5 and with its notations, it is not restrictive to suppose that the morphisms $V_m \to V_{m+1}$ are injective. Indeed, denote by $j_m\colon V_m \to V$, $W_m := V_m/\ker j_m$ endowed with the quotient topology, then W_m. Since V is separated then so is W_m. Since W_m is also a quotient of a Banach K-vector space, then W_m is a Banach K-vector space. Moreover, we check by using the universal property that the canonical K-linear morphisms (which are mutually inverse to each other) $\varinjlim_m V_m \to \varinjlim_m W_m$ and $\varinjlim_m W_m \to \varinjlim_m V_m$ are continuous.

Lemma 14.1.1.7. *A separated quotient of a LB-space is an LB-space.*

Proof. For any integer $m \in \mathbb{N}$, let $V_m \to V_{m+1}$ be a continuous monomorphism of Banach K-vector spaces. We denote by $V := \varinjlim_m V_m$ and $i_m\colon V_m \hookrightarrow V$ the canonical continuous monomorphisms. Let W be a sub-K-space of V. Let $G := V/W$ be the quotient of V by W which is separated for the quotient topology. Let us denote by $G^{(m)} := V_m/i_m^{-1}(W)$ endowed with the quotient topology, i.e. such that the canonical surjection $\pi_m\colon V_m \twoheadrightarrow G^{(m)}$ is strict. Let $j_m\colon G^{(m)} \to G$ be the canonical injection. As $j_m \circ \pi_m$ is continuous, as π_m is strict, then j_m is continuous. Since G is separated and j_m is an injective continuous morphism, then $G^{(m)}$ is separated. Hence $G^{(m)}$ is a Banach K-vector space. It follows from 14.1.1.3 that the left morphism of the canonical diagram

$$\begin{array}{ccc} \varinjlim_m G^{(m)} & \xrightarrow{\sim} & G \\ \uparrow\!\!\uparrow & & \uparrow\!\!\uparrow \\ \varinjlim_m V_m & \xrightarrow{\sim} & V, \end{array} \tag{14.1.1.7.1}$$

is a strict epimorphism. Since the right morphism is a strict epimorphism, since the bottom morphism is a homeomorphism, then the top isomorphism is a homeomorphism. □

14.1.2 Projective topology of a tensor product on a K-algebra

Let D be a K-algebra (non-necessarily commutative and without topology) such that K is in the center of D. Let us denote by $\mathfrak{C}_{D,l}$ (resp. $\mathfrak{C}_{D,r}$) the full subcategory of $\mathfrak{C}$ of objects of $\mathfrak{C}$ such that the underlying structure of K-vector space extends to a structure of left (resp. right) D-module.

14.1.2.1. (Continuous D-balanced map and completion). Let V be an object of $\mathfrak{C}_{D,r}$, W be an object of $\mathfrak{C}_{D,l}$ and U be an object of $\mathfrak{C}$. We endow $V \times W$ with the product topology, i.e. $V \times W$ is the product computated in $\mathfrak{C}$. Let $\beta\colon V \times W \to U$ be a D-balanced map, i.e. a K-bilinear map such that for any $v \in V$, $w \in W$ and $d \in D$ we have $\beta(vd, w) = \beta(v, dw)$. Moreover, following [Sch02, 17.1], as β is K-bilinear, the map β is continuous if and only if it is continuous at zero, i.e., for any open $\mathcal{V}$-submodule of L of U, there exist some open $\mathcal{V}$-submodules M of V and N of W such that $\beta(M \times N) \subset L$.

Let us suppose β continuous. Hence we have the K-bilinear morphism

$$\varprojlim_{M,N} V \times W/M \times N \to \varprojlim_{L} U/L,$$

where L (resp. M, resp. N) goes through the open lattices of U (resp. V, resp. W). We denote this application by $\widehat{\beta}\colon \widehat{V} \times \widehat{W} \to \widehat{U}$. As the open lattices of $\widehat{U}$ are of the form $\varprojlim_{L} L_0/L$ where L_0 is an open lattice of U and L goes through the open lattices of U included in L_0 (and similarly for $\widehat{V} \times \widehat{W}$), then we check that $\widehat{\beta}$ is continuous. As the image of $V \times W$ in $\widehat{V} \times \widehat{W}$ is dense, we check that $\widehat{\beta}$ is the unique continuous K-bilinear map inducing the commutative square :

$$\begin{array}{ccc} \widehat{V} \times \widehat{W} & \overset{\widehat{\beta}}{\dashrightarrow} & \widehat{U} \\ \uparrow & & \uparrow \\ V \times W & \xrightarrow{\beta} & U. \end{array} \tag{14.1.2.1.1}$$

But, to get the property that $\widehat{\beta}$ is D-balanced, we need further topological hypotheses on D (see 14.1.3.4).

Definition 14.1.2.2. Let V be an object of $\mathfrak{C}_{D,r}$ and W be an object of $\mathfrak{C}_{D,l}$.

(a) By endowing $V \times W$ with the product topology, the projective topology on the tensor product $V \otimes_D W$ is by definition a locally convex K-vector space topology which is the finest one such that the canonical K-bilinear morphism $\rho_{V,W}\colon V \times W \to V \otimes_D W$ is continuous. So, a lattice $L \subset V \otimes_D W$ is open if and only if $\rho_{V,W}^{-1}(L)$ is open. As we will only consider projective topologies on tensor products, it might happen that we omit indicating " projective".

(b) The object $V \otimes_D W$ satisfies the following universal property: for any D-balanced and continuous map of the form $\phi\colon V \times W \to U$, there exists a unique morphism in $\mathfrak{C}$ of the form $\theta\colon V \otimes_D W \to U$ such that $\theta \circ \rho_{V,W} = \phi$. This yields that we get in fact the canonical bifunctor

$$- \otimes_D -\colon \mathfrak{C}_{D,r} \times \mathfrak{C}_{D,l} \to \mathfrak{C}.$$

Lemma 14.1.2.3. *Let V be an object of $\mathfrak{C}_{D,r}$ and W be an object of $\mathfrak{C}_{D,l}$. We suppose that there exist a $\mathcal{V}$-submodule V_0 of V (resp. W_0 of W) such that a basis of open neighborhoods at zero of V (resp. W) is given by the family $(p^n V_0)_{n\in\mathbb{N}}$ (resp. $(p^n W_0)_{n\in\mathbb{N}}$). Let us denote by $U_0 := <\rho_{V,W}(V_0 \times W_0)>$, where $<?>$ means the "$\mathcal{V}$-submodule of $V \otimes_D W$ generated by ?". Then a basis of open neighborhoods on $V \otimes_D W$ endowed with its projective topology (see 14.1.2.2) is given by $(p^n U_0)_{n\in\mathbb{N}}$.*

Proof. Since V_0 and W_0 are respectively lattices of V and W, then U_0 is a lattice of U. For any integer $n \in \mathbb{N}$, since $\rho_{V,W}^{-1}(p^n U_0) \supset p^n(V_0 \times W_0)$, then the $p^n U_0$ are open subsets of $V \otimes_D W$. Conversely, let L be an open $\mathcal{V}$-submodule of $V \otimes_D W$. Since $\rho_{V,W}^{-1}(L)$ is open, then there exists a large enough integer n such that $\rho_{V,W}^{-1}(L) \supset p^n(V_0 \times W_0)$. Then we have $L \supset \rho_{V,W}(p^n(V_0 \times W_0)) = p^{2n}\rho_{V,W}(V_0 \times W_0)$. Since L is a $\mathcal{V}$-submodule of $V \otimes_D W$, this yields $L \supset p^{2n} U_0$. □

14.1.2.4. Let $D' \to D$ be a homomorphism of K-algebras such that K is also in the center of D'. Let V be an object of $\mathfrak{C}_{D,r}$ and W be an object of $\mathfrak{C}_{D,l}$. Since the composition morphism $V \times W \to V \otimes_{D'} W \to V \otimes_D W$ is the canonical morphism, using the definition of the topologies defined on $V \otimes_{D'} W$ and $V \otimes_D W$ (see 14.1.2.2.a), then we can check the strictness of the epimorphism $V \otimes_{D'} W \to V \otimes_D W$.

Lemma 14.1.2.5. *Let $V \to V''$ (resp. $W \to W''$) be a strict epimorphism of $\mathfrak{C}_{D,r}$ (resp. of $\mathfrak{C}_{D,l}$). Then the epimorphisms $V \otimes_D W \to V \otimes_D W''$ and $V \otimes_D W \to V'' \otimes_D W$ are strict.*

Proof. By symmetry, let us check it only for the first epimorphism. Let L be a lattice of $V \otimes_D W''$. Since $V \times W \to V \times W''$ is a strict morphism of $\mathfrak{C}$, by using the definition of the topology on $V \otimes_D W''$, we can check that L is open if and only if its inverse image on $V \times W$ is open. By using the definition of the topology on $V \otimes_D W$, this latter property is equivalent to the fact that its inverse image on $V \otimes_D W$ is an open lattice. Hence we are done.

□

14.1.3 Tensor products on locally convex K-algebras, completions

14.1.3.1. With the notations of 14.1.2, let V be an object of $\mathfrak{C}_{D,r}$ and W be an object of $\mathfrak{C}_{D,l}$. We denote by $V\widehat{\otimes}_D W$ the separated completion of $V\otimes_D W$ and $i_{V,W}\colon V\otimes_D W\to V\widehat{\otimes}_D W$ the canonical morphism. Using the universal property of the tensor product and that of the separated completion we get the following universal property : for any continuous and D-balanced map of the form $\phi\colon V\times W\to U$ with $U\in\mathfrak{D}$, there exists a unique morphism in $\mathfrak{D}$ of the form $\theta\colon V\widehat{\otimes}_D W\to U$ such that $\theta\circ i_{V,W}\circ\rho_{V,W}=\phi$.

Hence, we get the canonical bifunctor

$$-\widehat{\otimes}_D-\colon \mathfrak{C}_{D,r}\times\mathfrak{C}_{D,l}\to\mathfrak{D}.$$

Definition 14.1.3.2. Let D be a K-algebra such that K is in the center of D.

(i) We say that D is a "locally convex K-algebra", if D is endowed with a locally convex K-vector space topology such that the multiplication is a continuous K-bilinear map. A "morphism of locally convex K-algebras" is a morphism of K-algebras which is continuous for the respective topologies. We say that D is a Banach K-algebra if D is a locally convex K-algebra whose underlying topology makes D a Banach K-vector space.

When D is moreover of type LB, we say that D is a "locally convex K-algebra of type LB".

(ii) Let D be a locally convex K-algebra.

(a) A "locally convex left D-module" is a left D-module M endowed with a locally convex K-vector space topology such that the structural exterior law $D\times M\to M$ is a continuous K-bilinear map. We have a similar notion of "locally convex right D-module".

(b) A "Banach left D-module" is a locally convex left D-module which is also a Banach K-vector space (with respect to its underlying topology).

(c) A " LB left D-module" is a locally convex left D-module which is also a K-vector LB-space (with respect to its underlying topology). Even if we do not clarify K is this terminology, beware it might depend we it.

(d) A "morphism of locally convex left D-modules" (resp. "morphism of Banach left D-modules", resp "morphism of LB left D-modules") is a morphism of left D-modules which is also a morphism of locally convex K-vector spaces (resp. Banach K-vector spaces, resp. LB-spaces).

(e) We get similar definitions by replacing left by right.

(iii) Let (D,D') be two locally convex K-algebra. A "locally convex (D,D')-bimodule" is a (D,D')-bimodule M endowed with a locally convex K-vector space topology such that M is a locally convex left D-module and a locally convex right D'-module.

Lemma 14.1.3.3. *Let D be a locally convex K-algebra, $\phi\colon M\to N$ be a morphism of locally convex left (resp. right) D-modules.*

(a) The structure of separated complete locally convex K-vector space on $\widehat{D}$ extends to a canonical structure of locally convex K-algebra. Moreover, the canonical morphism $D\to\widehat{D}$ is a morphism of locally convex K-algebras.

(b) The induced morphism by separated completion $\widehat{\phi}\colon\widehat{M}\to\widehat{N}$ is a morphism of locally convex $\widehat{D}$-modules. Moreover, the canonical morphism $M\to\widehat{M}$ is a morphism of locally convex D-modules.

Proof. Let's just prove the non-respective case. Following 14.1.2.1.1, the structural continuous K-bilinear map $\mu_D\colon D\times D\to D$ induces the continuous K-bilinear map $\mu_{\widehat{D}}:=\widehat{\mu_D}\colon\widehat{D}\times\widehat{D}\to\widehat{D}$ (uniquely) fitting into the commutative diagram:

$$\begin{array}{ccc}\widehat{D}\times\widehat{D} & \xrightarrow{\mu_{\widehat{D}}} & \widehat{D}\\ \uparrow & & \uparrow\\ D\times D & \xrightarrow{\mu_D} & D.\end{array}\qquad(14.1.3.3.1)$$

As the two maps $\mu_{\widehat{D}}\circ(\mu_{\widehat{D}}\times id)$, $\mu_{\widehat{D}}\circ(id\times\mu_{\widehat{D}})\colon\widehat{D}\times\widehat{D}\times\widehat{D}\to\widehat{D}$ coincide after composition with the canonical morphism $D\times D\times D\to\widehat{D}\times\widehat{D}\times\widehat{D}$ whose image is dense, we get $\mu_{\widehat{D}}\circ(\mu_{\widehat{D}}\times id)=\mu_{\widehat{D}}\circ(id\times\mu_{\widehat{D}})$, i.e. the multiplication is associative. We check similarly the other properties making $\widehat{D}$ a locally convex K-algebra. It is clear that the continuous canonical morphism $D \to \widehat{D}$ is then a morphism of locally convex K-algebras.

Following 14.1.2.1, the structural continuous K-bilinear maps $\mu_M : D \times M \to M$ and $\mu_N : D \times N \to N$ induce the continuous K-bilinear maps $\mu_{\widehat{M}} := \widehat{\mu_M} : \widehat{D} \times \widehat{M} \to \widehat{M}$ and $\mu_{\widehat{N}} := \widehat{\mu_N} : \widehat{D} \times \widehat{N} \to \widehat{N}$. In the same way, we check that $\mu_{\widehat{M}}$ and $\mu_{\widehat{N}}$ induce respectively a canonical structure of $\widehat{D}$-module locally convex on $\widehat{M}$ and $\widehat{N}$. As the diagram

$$\begin{array}{ccc} \widehat{D} \times \widehat{M} & \xrightarrow{\mu_{\widehat{M}}} & \widehat{M} \\ \downarrow{\scriptstyle \mathrm{id} \times \widehat{\phi}} & & \downarrow{\scriptstyle \widehat{\phi}} \\ \widehat{D} \times \widehat{N} & \xrightarrow{\mu_{\widehat{N}}} & \widehat{N} \end{array}$$

is commutative after composition with $D \times M \to \widehat{D} \times \widehat{M}$ whose image is dense, this one is commutative. Hence we are done. □

Lemma 14.1.3.4. *Let D be a locally convex K-algebra, M be a locally convex right D-module, N be a locally convex left D-module and U be a locally convex K-vector space. Let $\beta : M \times N \to U$ be a D-balanced and continuous map. The application $\widehat{\beta} : \widehat{M} \times \widehat{N} \to \widehat{U}$ (see 14.1.2.1) is then a $\widehat{D}$-balanced and continuous map.*

Proof. We already know that the map $\widehat{\beta}$ is continuous. Let us consider the square :

$$\begin{array}{ccc} \widehat{M} \times \widehat{D} \times \widehat{N} & \xrightarrow{\mu_{\widehat{M}} \times id} & \widehat{M} \times \widehat{N} \\ \downarrow{\scriptstyle \mathrm{id} \times \mu_{\widehat{N}}} & & \downarrow{\scriptstyle \widehat{\beta}} \\ \widehat{M} \times \widehat{N} & \xrightarrow{\widehat{\beta}} & \widehat{U}, \end{array} \qquad (14.1.3.4.1)$$

where $\mu_{\widehat{M}} : \widehat{M} \times \widehat{D} \to \widehat{M}$ and $\mu_{\widehat{N}} : \widehat{D} \times \widehat{N} \to \widehat{N}$ are the canonical structural continuous K-bilinear maps. As the image of $M \times D \times N$ in $\widehat{M} \times \widehat{D} \times \widehat{N}$ is dense, the square 14.1.3.4.1 is then commutative because so is without the hats. □

Proposition 14.1.3.5. *Let D be a locally convex K-algebra, M be a locally convex right D-module and N be a locally convex left D-module. Hence we have the canonical isomorphism in $\mathfrak{D}$ of the form:*

$$M \widehat{\otimes}_D N \xrightarrow{\sim} \widehat{M} \widehat{\otimes}_{\widehat{D}} \widehat{N}.$$

Proof. By functoriality of the separated completion functor, we have the morphism in $\mathfrak{D}$ of the form: $M \widehat{\otimes}_D N \to \widehat{M} \widehat{\otimes}_{\widehat{D}} \widehat{N}$. To construct the inverse morphism, by using the universal property of the tensor product, it is about defining canonically a continuous map of the form $\widehat{M} \times \widehat{N} \to M \widehat{\otimes}_D N$ which is $\widehat{D}$-balanced. This can be done by using lemma 14.1.3.4 applied in the case where β is equal to the canonical map $M \times N \to M \otimes_D N$. □

14.2 LB-spaces in the theory of D-modules arithmetic

We set $\mathfrak{S} := \mathrm{Spf}\, \mathcal{V}$. Unless otherwise stated, we will use the following notations and hypotheses : let $\mathfrak{X}$ be an affine, smooth $\mathcal{V}$-formal scheme endowed with local coordinates $t_1, \dots, t_d$ and let $\partial_1, \dots, \partial_d$ be the corresponding derivations. Let $0 \le r \le s \le d$ be some integers. We denote by $\mathfrak{Z} := \cap_{i=s+1}^d V(t_i)$ and $u : \mathfrak{Z} \hookrightarrow \mathfrak{X}$ the induced closed immersion. We denote by $\mathfrak{D} = V(t_1 \cdots t_r)$ the relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor (the case $r = 0$ means $\mathfrak{D}$ is empty). This yields the relative to $\mathfrak{Z}/\mathfrak{S}$ strict normal crossing divisor $u^{-1}(\mathfrak{D})$. We set $\mathfrak{X}^\sharp := (\mathfrak{X}, M(\mathfrak{D}))$, $\mathfrak{Z}^\sharp := (\mathfrak{Z}, M(u^{-1}\mathfrak{D}))$ and $u^\sharp : \mathfrak{Z}^\sharp \hookrightarrow \mathfrak{X}^\sharp$ the exact closed immersion of $\mathfrak{S}$-log-smooth log formal schemes. Let $f \in O_{\mathfrak{X}}$, $f_0 \in O_X$ be its reduction modulo π, $T := V(f_0)$ the corresponding divisor of X. We suppose that $T \cap Z$ is a divisor of Z. Let $\lambda_0 \in L(\mathbb{N})$. To lighten the notations, we put then $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}}(T)$, $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{Z}}(T \cap Z)$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}$. We set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}}} \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z)$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}$, $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp} := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}$ and finally $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} := \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}$. We denote by the corresponding straight letter, the global section of a sheaf on $\mathfrak{X}$ or $\mathfrak{Z}$, e.g. $D^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}} := \Gamma(\mathfrak{X}, \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}})$. We use in this section the notation 4.5.1.1.1 : for any $m \in \mathbb{N} \cup \{\infty\}$, for any $(l_1, \ldots, l_{r+s}) = \underline{l} \in \mathbb{N}^{r+s}$ and $(k_1, \ldots, k_d) = \underline{k} \in \mathbb{N}^d$, we get an element of respectively $\mathcal{D}^{(m)}_{\mathfrak{Z}^{\sharp}}$ and $\mathcal{D}^{(m)}_{\mathfrak{X}^{\sharp}}$ by setting

$$\underline{\partial}^{\langle \underline{l} \rangle_{(m)}}_{(r)} := \underline{\partial}^{\langle (l_1,\ldots,l_r,0,\ldots,0) \rangle_{(m)}}_{\sharp} \underline{\partial}^{\langle (0,\ldots,0,l_{r+1},\ldots,l_{r+s}) \rangle_{(m)}},$$
$$\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{(r)} := \underline{\partial}^{\langle (k_1,\ldots,k_r,0,\ldots,0) \rangle_{(m)}}_{\sharp} \underline{\partial}^{\langle (0,\ldots,0,k_{r+1},\ldots,k_d) \rangle_{(m)}}. \tag{14.2.0.0.1}$$

When $m = \infty$, we better write $\underline{\partial}^{[\underline{k}]}_{(r)}$.

14.2.1 Canonical topology of the global section of a log-overconvergent isocrystal

14.2.1.1. We have the canonical isomorphisms $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}} \xrightarrow{\sim} O_{\mathfrak{X}}[\frac{1}{f}]^{\dagger}_{K}$ and $\widetilde{B}^{(m)}_{\mathfrak{X}}(T) \xrightarrow{\sim} A\{T\}/(f^{p^{m+1}}T - p) = O_{\mathfrak{X}}\{\frac{p}{f^{p^{m+1}}}\}$ (see 8.7.3.11). This yields the morphism of $\mathcal{V}$-algebras $\widetilde{B}^{(m)}_{\mathfrak{X}}(T) \hookrightarrow O_{\mathfrak{X}}[\frac{1}{f}]^{\dagger}$ (for the injectivity, see 8.7.4.1.(b)). We have also the canonical inclusion $\widetilde{D}^{(m)}_{\mathfrak{X}^{\sharp},\mathbb{Q}} \hookrightarrow D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$.

Definition 14.2.1.2. (Canonical locally convex K-vector space topology of $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$). We define the following topologies.

(a) For any integer m, the *canonical Banach K-algebra topology* on $\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$ is the one such that a basis of open neighborhoods at zero is given by $(p^n \widetilde{B}^{(m)}_{\mathfrak{X}}(T))_{n \in \mathbb{N}}$.

(b) We endow $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$ with a *canonical locally convex K-vector space* topology which makes the canonical isomorphism $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}} \xrightarrow{\sim} \varinjlim_{m} \widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$ a homeomorphism. We remark that following 14.1.1.4, this does not depend on the map $\lambda_0 \in L(\mathbb{N})$.

Notation 14.2.1.3. Let V be a K-vector and $(V_m)_{m \in \mathbb{N}}$ be a sequence of K-vector subspaces of V. We set $\sum_{m=0}^{\infty} V_m := \cup_{m \in \mathbb{N}} \sum_{m=0}^{n} V_m$.

Proposition 14.2.1.4. *The canonical locally convex K-vector space $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$ defined at 14.2.1.2 is a locally convex K-algebra (see definition 14.1.3.2). More precisely the following properties hold.*

(a) A basis of open neighborhoods of zero of the canonical locally convex K-vector space topology of $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$ is given by the family

$$L_{\underline{n}} := \sum_{m=0}^{\infty} p^{n_m} \widetilde{B}^{(m)}_{\mathfrak{X}^{\sharp}}(T).$$

where $\underline{n} := (n_m)_{m \in \mathbb{N}}$ goes through sequences of nonnegative integer.

(b) Moreover $L_{\underline{n}}$ is a sub K-algebra of $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$ for any sequence $\underline{n}$.

Proof. Let us check the part (a). Since tensor product commutes with filtrant inductive limits then $L_{\underline{n}} \otimes_{\mathbb{Z}} \mathbb{Q} \xrightarrow{\sim} O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$ and then $L_{\underline{n}}$ is a lattice. The openness of $L_{\underline{n}}$ is straightforward, so is the fact that any open lattice of $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$ contains $L_{\underline{n}}$ for some large enough sequence $\underline{n}$.

Let us check the part (b). Let $P = \sum_{m \geq 0} p^{n_m} b_m$ and $Q = \sum_{m \geq 0} p^{n_m} c_m$ be two elements of $L_{\underline{n}}$, with $b_m, c_m \in \widetilde{B}^{(m)}_{\mathfrak{X}^{\sharp}}(T)$ null except for a finite number of terms. Then $PQ = \sum_{m_1, m_2 \geq 0} p^{n_{m_1} + n_{m_2}} b_{m_1} c_{m_2}$. Set

$$[PQ]_m := \sum_{\substack{0 \leq m_1, m_2 \\ \max\{m_1, m_2\} = m}} p^{n_{m_1} + n_{m_2}} b_{m_1} c_{m_2} \in p^{n_m} \widetilde{B}^{(m)}_{\mathfrak{X}^{\sharp}}(T).$$

Hence $PQ = \sum_{m \geq 0} Q_m \in L_{\underline{n}}$. □

Remark 14.2.1.5. (Canonical normed $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-algebra topology of $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$). Since $\cap_{n\in\mathbb{N}} p^n \mathcal{O}_{\mathfrak{X}}[\frac{1}{f}]^\dagger = \{0\}$, since we have the canonical isomorphism $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}[\frac{1}{f}]^\dagger_K$ (see 8.7.3.11). then $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$ can be endowed with a *canonical normed K-algebra topology structure* whose a basis of open neighborhoods at zero is given by $(p^n \mathcal{O}_{\mathfrak{X}}[\frac{1}{f}]^\dagger)_{n\in\mathbb{N}}$. Endowed with this topology, $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$ is normed but not of Banach: its separated completion is $\mathcal{O}_{\mathfrak{X}}\{\frac{1}{f}\}_K$. Let us recall finally that since $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}[\frac{1}{f}]^\dagger_K$, then $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$ is noetherian (see 17.1.1.9).

14.2.1.6. Beware that the topology on $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$ of 14.2.1.5 is different from that of 14.2.1.2. We will see that $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$ is an LB-space for the canonical locally convex topology K-algebra of 14.2.1.2 (see lemma 14.2.2.1). Since it is more convenient to work with LB-spaces, then we can forget the topology defined in 14.2.1.5 and when we refer to the canonical locally convex K-algebra topology on $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$, we mean the topology defined in 14.2.1.2.

14.2.1.7. (Canonical topology of a finite type $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module). Let E be an $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module of finite type. Following 8.4.1.11, there exist, for m_0 large enough, a $\widetilde{B}^{(m_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module of finite type $E^{(m_0)}$ and an $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-linear isomorphism of the form $\epsilon\colon \mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}} \otimes_{\widetilde{B}^{(m_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} E^{(m_0)} \xrightarrow{\sim} E$. For any integer $m \geq m_0$, we set $E^{(m)} := \widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{B}^{(m_0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} E^{(m_0)}$. We endow $E^{(m)}$ with its canonical topology of Banach $\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module of finite type (equal to the quotient topology via an epimorphism of the form $(\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}})^r \to E^{(m)}$). Since, for any m, the canonical morphisms of the form $(\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}})^r \to (\widetilde{B}^{(m+1)}_{\mathfrak{X}}(T)_{\mathbb{Q}})^r$ are continuous, this yields that the canonical morphism $E^{(m)} \to E^{(m+1)}$ is continuous. By decreeing that $\epsilon\colon \varinjlim_m E^{(m)} \xrightarrow{\sim} E$ is a homeomorphism, we define a structure of locally convex $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module on E. Similarly to 14.2.1.9, we can check that this does not depend on the choice of $(m_0, E^{(m_0)}, \epsilon)$.

14.2.1.8. (Sheaves of differential operators).

(a) For any integer $m \geq 0$, $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$ is canonically endowed with a Banach $\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module topology as follows: the family $(p^n \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp})_{n\in\mathbb{N}}$ forms a basis of open neighborhoods at zero. We have similarly a canonical Banach $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T\cap Z)_{\mathbb{Q}}$-module structures on respectively $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$, $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}}$ and $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}$ whose basis of open neighborhoods of zero is given by respectively $(p^n \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp})_{n\in\mathbb{N}}$, $(p^n \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})_{n\in\mathbb{N}}$ and $(p^n \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp})_{n\in\mathbb{N}}$.

(b) The canonical locally convex K-algebra topology on $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ is defined as follows. First, we make $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ a locally convex K-vector space by decreeing that the canonical isomorphism of K-algebras $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}} \xrightarrow{\sim} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$ is an homeomorphism, where the right side is endowed with the inductive limit topology in $\mathfrak{C}$ and where $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$ is endowed with the topology defined above in (a). Similarly to 14.2.1.4, we can check that a basis of open neighborhoods of zero of $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ is given by the family $L_{\underline{n}} := \sum_{m=0}^{\infty} p^{n_m} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp}$, where $\underline{n} := (n_m)_{m\in\mathbb{N}}$ goes through the sequences of nonnegative integers and that $L_{\underline{n}}$ is a ring for any sequence $\underline{n}$, which implies that $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ is in fact a locally convex K-algebra.

Since $\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$ is continuous, then by taking the inductive limits on the level the morphism $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}} \to D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ is continuous. Hence, $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ has two structures (the left and the right one) of locally convex $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-modules.

(c) In the same way, we define on $D^\dagger_{\mathfrak{Z}^\sharp}(^\dagger T\cap Z)_{\mathbb{Q}} = \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$, on $\widetilde{D}^\dagger_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}} = \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}}$ and $\widetilde{D}^\dagger_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}} = \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}$ a canonical locally convex K-vector space topology. We remark that following the lemma 14.1.1.4 we can replace the index $\mathbb{N}$ by a cofinal subset without changing the topology. Moreover, $\widetilde{D}^\dagger_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}}$ is a locally convex $(D^\dagger_{\mathfrak{Z}^\sharp}(^\dagger T\cap Z)_{\mathbb{Q}}, D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}})$-bimodule and $\widetilde{D}^\dagger_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}$ is a locally convex $(D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}, D^\dagger_{\mathfrak{Z}^\sharp}(^\dagger T\cap Z)_{\mathbb{Q}})$-bimodule.

14.2.1.9. (Canonical topology of a coherent left $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module). Let E be a coherent left $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module.

We endow E with a canonical locally convex $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module topology as follows. Following 8.4.1.11, there exist for any large enough m_0 a $\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-module of finite type $E^{(m_0)}$ and a $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism of the form $\epsilon\colon D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}}} E^{(m_0)} \xrightarrow{\sim} E$. For any integer $m \geq m_0$, we set $E^{(m)} := \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}}} E^{(m_0)}$. Following 7.5.1.8, we endow $E^{(m)}$ with its Banach $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-module of finite type topology (equal to the quotient topology via an epimorphism of the form $(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to E^{(m)}$). As for any m the canonical morphisms of the form $(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to (\widetilde{D}^{(m+1)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r$ are continuous, this yields that the canonical morphism $E^{(m)} \to E^{(m+1)}$ is continuous. By decreeing that the isomorphism $\epsilon\colon \varinjlim_m E^{(m)} \xrightarrow{\sim} E$ is a homeomorphism, we get a structure of locally convex left $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module on E.

This does not depend on the choice of $(m_0, E^{(m_0)}, \epsilon)$. Indeed, for m_0' large enough let $E'^{(m_0')}$ be a $\widetilde{D}^{(m_0')}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-module of finite type and a $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear isomorphism of the form $\epsilon'\colon D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}}} E'^{(m_0')} \xrightarrow{\sim} E$. For $m \geq m_0'$, we set $E'^{(m)} := \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0')}_{\mathfrak{X}^\sharp,\mathbb{Q}}} E'^{(m_0')}$. Following 8.4.1.11, for m_0'' large enough, there exist for any $m \geq m_0''$ some $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-linear isomorphisms $\epsilon_m\colon E'^{(m)} \xrightarrow{\sim} E^{(m)}$ such that $\epsilon \circ \epsilon^\dagger = \epsilon'$, with $\epsilon^\dagger := \varinjlim_m \epsilon_m$. Moreover, following [BGR84, 3.7.3] (indeed, we remark that the commutativity of rings is useless), the maps ϵ_m are homeomorphisms. Taking the inductive limit, this yields that $\epsilon^\dagger$ is a homeomorphism. Using 14.1.1.4, this implies the canonicity of the topology on E.

Proposition 14.2.1.10. *(Canonical topology of the global section of a log-overconvergent isocrystal). Let E be a coherent $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is also a finitely generated projective $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module for the induced structure. The topology on E as coherent $D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module is the same as that as finite type $O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module. Hence, we will call it the canonical topology on the (locally free) overconvergent isocrystal E.*

Proof. Let $\mathcal{E} := \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} E \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ (see notation 11.2.1.4) be the log isocrystal on $\mathfrak{X}^\sharp$ with overconvergent singularities along T associated with E. Following 11.2.1.9, increasing $\lambda_0 \in L(\mathbb{N})$ if necessary, there exists $\mathcal{E}^{(0)}$ a topologically nilpotent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-module, coherent as $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module satisfying both conditions of 11.2.1.7.(b). By taking global section functor and using theorem A, it follows from 11.2.1.9.1 that the canonical morphism

$$\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{B}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} E^{(0)} \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}} \otimes_{\widetilde{D}^{(0)}_{\mathfrak{X}^\sharp,\mathbb{Q}}} E^{(0)}$$

is an isomorphism. Following 7.5.2.6, the canonical topology of $\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \otimes_{\widetilde{B}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}} E^{(0)}$ as finite type $\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module is the same as that as finite type $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-module. Hence we are done. □

14.2.2 Examples of LB-spaces

Lemma 14.2.2.1. *(a) The canonical locally convex K-algebra topology on $O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ (see 14.2.1.2.b) is finer than its normed K-algebra topology (see 14.2.1.5).*

(b) The canonical locally convex K-algebra $O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ is of type LB.

Proof. a) Since we have the monomorphism of $\mathcal{V}$-algebras $\widetilde{B}^{(m)}_{\mathfrak{X}}(T) \hookrightarrow O_{\mathfrak{X}}[\frac{1}{f}]^\dagger$, then the canonical morphism of K-algebras $\widetilde{B}^{(m)}_{\mathfrak{X}}(T)_{\mathbb{Q}} \hookrightarrow O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ is continuous, when $O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ is endowed with its topology of normed K-algebra. By taking the inductive limit, this yields the result.

b) The first part implies that the canonical locally convex K-algebra topology on $O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ is separated. Hence, this is an LB-space. □

Lemma 14.2.2.2. *Let $N \subset (O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})^r$ be a monomorphism of $O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules. Then N is closed in $(O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})^r$ for the topology induced by the canonical topology of $(O_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})^r$.*

Proof. Let us denote by $M := (O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}})^r/N$ and by M_0 the image of the composite morphism $(O_{\mathfrak{X}}[\frac{1}{f}]^\dagger)^r \subset (O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}})^r \twoheadrightarrow M$. We endow M with the quotient topology (for the canonical topology of $(O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}})^r$). Hence we have to check that M is separated for this topology. As for any integer n the $\mathcal{V}$-module $p^n(O_{\mathfrak{X}}[\frac{1}{f}]^\dagger)^r$ is open in $(O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}})^r$ (see 14.2.2.1), the $\mathcal{V}$-module $p^n M_0$ is then open in M. Moreover, as $O_{\mathfrak{X}}[\frac{1}{f}]^\dagger$ is noetherian and as $O_{\mathfrak{X}}[\frac{1}{f}]^\dagger \to O_{\mathfrak{X}}\{\frac{1}{f}\}$ is faithfully flat, as M_0 is a finite type $O_{\mathfrak{X}}[\frac{1}{f}]^\dagger$-module, then M_0 is separated for the p-adic topology (see [Mat89, Theorems 8.10 and 8.12]), i.e. $\cap_{n\in\mathbb{N}} p^n M_0 = \{0\}$. This yields that M is separated. □

Proposition 14.2.2.3. *Finitely generated $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-modules are $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-modules of type LB (for the canonical topology). Moreover, any $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-submodule of a finitely generated $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module M is closed in M for the canonical topology of M.*

Proof. Let M be a finite type $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module endowed with its canonical topology. There exists an epimorphism of $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-modules of the form $(O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}})^r \twoheadrightarrow M$. Following 14.2.3.2, this morphism is strict with respect to their canonical topologies. Using 14.2.2.2 this yields that M is separated and then M is an $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module of type LB. If M' is an $O_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-submodule of M, then the module M/M' is separated for the induced quotient topology by M. Thanks to 14.2.3.2 this yields that M' is closed in M. □

Remark 14.2.2.4. Let $I \subset (D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}})^r$ be a coherent left $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$-submodule. This is not clear that these inclusions are strict for the respective canonical topologies nor that I is closed in $(D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}})^r$. However, following a communication of Tomoyuki Abe, the coherent $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$-modules are also spaces of type LB.

Proposition 14.2.2.5. *Let $(n_m)_{m\in\mathbb{N}}$ be a strictly increasing sequence of nonnegative integers. The locally convex K-vector space $\varinjlim_m \widetilde{D}^{(n_m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$ (endowed with the inductive limit topology in the category of locally convex K-vector spaces) is an LB-space.*

Proof. Following 14.1.1.4, it is sufficient to treat the case where $n_m = m$. As the K-vector spaces $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$ are Banach spaces, it only remains to check the separateness of $\varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$. With notation 14.2.0.0.1, let us denote by L the $\mathcal{V}$-submodule of $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ of elements which can be written of the form $\sum_{\underline{k}\in\mathbb{N}^d} a_{\underline{k}} \underline{\partial}^{[k]}_{(r)}$ with $a_{\underline{k}} \in \mathcal{O}_{\mathfrak{X}}[\frac{1}{f}]^\dagger$ (and the sum has to converge in $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$). Moreover, as $p^n L \supset p^n D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T) \supset \sum_{m=0}^\infty p^n \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp}$ (see notation 14.2.1.3), then $p^n L$ is an open subset of $D^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$ for any integer n. By uniqueness of the writing of the form $\sum_{\underline{k}\in\mathbb{N}^d} a_{\underline{k}} \underline{\partial}^{[k]}_{(r)}$ of elements of L, we check that $\cap_{n\in\mathbb{N}} p^n L = \{0\}$. Hence, we get the required separateness. □

Proposition 14.2.2.6. *The canonical topologies are that defined in 14.2.1.8.*

(a) For any integer $m \in \mathbb{N}$, let $V^{(m)}$ be a locally convex left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-module and $V^{(m)} \to V^{(m+1)}$ be a continuous morphism. Let $(N_m)_{m\in\mathbb{N}}$, $(N'_m)_{m\in\mathbb{N}}$ and $(N''_m)_{m\in\mathbb{N}}$ be three strictly increasing sequences of nonnegative integers such that $N''_m \leq \max\{N_m, N'_m\}$ for any $m \in \mathbb{N}$. With the notations of 14.1.3.1, the canonical isomorphism

$$\varinjlim_m \widetilde{D}^{(N'_m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(N''_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V^{(N_m)} \xrightarrow{\sim} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V^{(m)}. \tag{14.2.2.6.1}$$

is then a homeomorphism.

(b) The locally convex K-vector spaces

$$\varinjlim_m \widetilde{D}^{(N_m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}}, \qquad \varinjlim_m \widetilde{D}^{(N_m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}} \quad \text{and} \quad \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}}$$

are LB-spaces.

Proof. We can check the first assertion similarly to 14.1.1.4. For the second assertion, we proceed similarly to 14.2.2.5. □

14.2.3 Continuity, strictness

Lemma 14.2.3.1. *Let $\phi\colon E \to E'$ be a morphism of coherent $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules (resp. of finite type $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$-modules). Endowing E and E' with their canonical topologies (see respectively 14.2.1.9 and 14.2.1.7), the morphism ϕ is continuous.*

Proof. Following 8.4.1.11, there exist for a large enough nonnegative integer m_0 a morphism of $\widetilde{D}^{(m_0)}_{\mathfrak{X}^{\sharp},\mathbb{Q}}$-modules of finite type $\phi^{(m_0)}\colon E^{(m_0)} \to E'^{(m_0)}$ such that $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^{\sharp},\mathbb{Q}}} \phi^{(m_0)}$ is isomorphic to ϕ. As $\phi^{(m_0)}$ is continuous for the canonical topologies (see [BGR84, 3.7.3]), this yields that ϕ is continuous. The respective case is treated in a similar way. □

Lemma 14.2.3.2. *Let $\phi\colon E \twoheadrightarrow E'$ be an epimorphism of coherent $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules (resp. of finite type $O_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$-modules). Then the morphism ϕ is strict.*

Proof. Following 8.4.1.11 there exists for a large enough nonnegative integer m_0 a morphism of finite type $\widetilde{D}^{(m_0)}_{\mathfrak{X}^{\sharp},\mathbb{Q}}$-modules $\phi^{(m_0)}\colon E^{(m_0)} \to E'^{(m_0)}$ such that $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^{\sharp},\mathbb{Q}}} \phi^{(m_0)}$ is isomorphic to ϕ. As we have $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^{\sharp},\mathbb{Q}}} \mathrm{Coker}(\phi^{(m_0)}) = \{0\}$, increasing m_0 if necessary, we can suppose that $\phi^{(m_0)}$ is surjective. Then so is $\widetilde{D}^{(m)}_{\mathfrak{X}^{\sharp},\mathbb{Q}} \otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^{\sharp},\mathbb{Q}}} \phi^{(m_0)}$, for any integer $m \geq m_0$. Moreover, these latter epimorphisms are also strict and continuous for the respective Banach topologies (see [BGR84, 3.7.3, corollary 5]). Taking the inductive limit, this yields that ϕ is strict (use 14.1.1.3). The respective case is treated in a similar way. □

Proposition 14.2.3.3. *For some integers $r, s \geq 0$, let ϕ be a left $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-linear morphism of the form $\phi\colon (D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^r \to (D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^s$. Let ψ be a right $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-linear morphism of the form $\psi\colon (D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^r \to (D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^s$. With notation 9.3.4.6, the morphisms ϕ, $u^*_{\mathrm{l}}(\phi)$, $u^*_{\mathrm{r}}(\psi)$ are continuous for the respective canonical topologies (see the definitions of 14.2.1.8).*

Proof. 1) The continuity of ϕ is a consequence of the lemma 14.2.3.1.

2) Let us check now that $u^*_{\mathrm{l}}(\phi)$ is continuous. For any nonnegative integer n, let us denote by ϖ^n the surjective right $D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-linear morphims of the form $\varpi^n\colon (D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^n \twoheadrightarrow (\widetilde{D}^{\dagger}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp},\mathbb{Q}})^n$. As $u^*_{\mathrm{l}}(\phi) \circ \varpi^r = \varpi^s \circ \phi$ is continuous, it is sufficient to establish that ϖ^r is a continuous and strict morphism. As the canonical surjection $\widetilde{D}^{(m)}_{\mathfrak{X}^{\sharp},\mathbb{Q}} \to \widetilde{D}^{(m)}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp},\mathbb{Q}}$ sends $\widetilde{D}^{(m)}_{\mathfrak{X}^{\sharp}}$ into $\widetilde{D}^{(m)}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp}}$, this one is then continuous. Following Banach open mapping theorem, this surjective and continuous morphism of Banach K-vector spaces is then strict. Using the lemma 14.1.1.3, this yields that so is ϖ^r by taking the inductive limit on the level.

3) To validate the continuity of $u^*_{\mathrm{r}}(\psi)$, we proceed in the same way as the step 2). □

14.3 Preservation of the coherence by local cohomological functor

Let $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ be a closed immersion of separated, quasi-compact and smooth $\mathcal{V}$-formal schemes, T be a divisor of X such that $T \cap Z$ is a divisor of Z. Let $\mathfrak{D}$ be a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor such that $u^{-1}(\mathfrak{D})$ is a relative to $\mathfrak{Z}/\mathfrak{S}$ strict normal crossing divisor. We set $\mathfrak{X}^{\sharp} := (\mathfrak{X}, M(\mathfrak{D}))$, $\mathfrak{Z}^{\sharp} := (\mathfrak{Z}, M(u^{-1}\mathfrak{D}))$ and we denote by $u^{\sharp}\colon \mathfrak{Z}^{\sharp} \hookrightarrow \mathfrak{X}^{\sharp}$ the exact closed immersion of smooth logarithmic formal schemes on $\mathcal{V}$. Let $\lambda_0\colon \mathbb{N} \to \mathbb{N}$ be an increasing map such that $\lambda_0(m) \geq m$, for any $m \in \mathbb{N}$. To lighten the notations, we put then $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}}(T)$, $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{Z}}(T \cap Z)$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}}$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}}$. In the same way, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}}} \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z)$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp}} := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp}}$, $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp},\mathbb{Q}} = \varinjlim_{m} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}\to\mathfrak{X}^{\sharp},\mathbb{Q}}$ and $\widetilde{\mathcal{D}}^{\dagger}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp},\mathbb{Q}} = \varinjlim_{m} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}\leftarrow\mathfrak{Z}^{\sharp},\mathbb{Q}}$.

14.3.1 Pushforward of level m by u in local coordinates context: exactness

We suppose that $\mathfrak{X}$ is affine, $\mathfrak{X}/\mathfrak{S}$ is endowed with coordinates $t_1, \ldots, t_d$ such that for some integers $0 \le r \le s \le d$ we have $\mathfrak{D} = V(t_1 \cdots t_r)$, $\mathfrak{Z} := \cap_{s+1}^{i=d} V(t_i)$ and $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ is equal to the induced exact closed immersion. Remark, that locally such hypotheses are valid.

Notation 14.3.1.1. For any integer $m \geq 0$, we put $D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z) := \widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z) \otimes_{\mathcal{O}_{\mathfrak{Z}}} D^{(m)}_{\mathfrak{Z}^\sharp}$, $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z) := D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{Z}}} \widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)$. We endow $D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}$ (resp. $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}$) with a structure of normed $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-algebra whose basis of open neighborhoods at zero is given by the family $(p^n D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z))_{n \in \mathbb{N}}$ (resp. $(p^n D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z))_{n \in \mathbb{N}}$). In other words, they are the topologies coming from the induced norms via the inclusions $D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \hookrightarrow \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}$ and $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \hookrightarrow \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}}$. Moreover, we remark that the separated completion of $D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}$ (resp. $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}$) is $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}$ (resp. $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}}$).

Lemma 14.3.1.2. *Let $V' \underset{\phi}{\longrightarrow} V \underset{\psi}{\longrightarrow} V''$ be an exact sequence of Banach $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}$-modules (see the definition 14.1.3.2 and the canonical topology of 14.2.1.8). We suppose moreover that ϕ and ψ are strict morphisms. Then the sequences*

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V' \underset{\mathrm{id} \otimes \phi}{\longrightarrow} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V \underset{\mathrm{id} \otimes \psi}{\longrightarrow} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V'', \tag{14.3.1.2.1}$$

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V' \underset{\mathrm{id} \widehat{\otimes} \phi}{\longrightarrow} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V \underset{\mathrm{id} \widehat{\otimes} \psi}{\longrightarrow} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V'' \tag{14.3.1.2.2}$$

are exact and their morphisms are strict.

Proof. 0) By breaking down the exact sequence into short exact sequences, we can suppose we have in fact the exact sequence $0 \to V' \underset{\phi}{\longrightarrow} V \underset{\psi}{\longrightarrow} V'' \to 0$.

1) First, let us check the exactness and strictness of 14.3.1.2.2. For any $\underline{k} \in \mathbb{N}^{d-s}$, let us denote by $\xi_{\underline{k},(m)}$ the image of $\underline{\partial}^{\langle (\underline{0}, \underline{k}) \rangle_{(m)}}_{(r)}$ via the canonical surjection $D^{(m)}_{\mathfrak{X}^\sharp}(T)_{\mathbb{Q}} \twoheadrightarrow D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}$. The elements of the K-vector space $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V$ can be written uniquely of the form $\sum_{\underline{k} \in \mathbb{N}^{d-s}} \xi_{\underline{k},(m)} \otimes x_{\underline{k}}$, the sum being finite and $x_{\underline{k}} \in V$. Following 14.1.2.3, if we denote by V_0 the $\mathcal{V}$-submodule of V consisting of elements of norm less or equal to 1 and by U_0 the $\mathcal{V}$-submodule of $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V$ generated by the canonical image of the arrow $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z) \times V_0 \to D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V$, then a basis of open neighborhoods of $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V$ at zero is given by the family $(p^n U_0)_{n \in \mathbb{N}}$. This yields that the canonical topology on $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V$ is induced by the norm $\| \sum_{\underline{k} \in \mathbb{N}^{d-s}} \xi_{\underline{k},(m)} \otimes x_{\underline{k}} \| = \max_{\underline{k}} \| x_{\underline{k}} \|$. We have the same description for V' or V'' instead of V. We get then the short exact sequence of normed K-vector spaces

$$0 \to D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V' \to D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V \to D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \otimes_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V'' \to 0, \tag{14.3.1.2.3}$$

whose morphisms are strict (the strictness of the injection is straightforward from the description of their norm ; the strictness of the surjection can be checked by using for instance 14.1.2.5 or by an easy computation). Moreover, following the proposition 14.1.3.5, as V is a Banach $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}$-module, the canonical morphism $D^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}} \widehat{\otimes}_{D^{(m)}_{\mathfrak{Z}^\sharp}(T \cap Z)_{\mathbb{Q}}} V \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V$ is an isomorphism. As the separated completion functor transforms short exact sequences in which the applications are strict morphisms of normed K-vector spaces in short exact sequences in which the applications are strict morphisms, we obtain the exact sequence

$$0 \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V' \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} V'' \to 0 \tag{14.3.1.2.4}$$

whose morphisms are strict.

2)Let us now check the exactness and strictness of 14.3.1.2.1. As $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}$ is a flat left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-module, we have the same exact sequence than 14.3.1.2.4 where we replace $\widehat{\otimes}$ by $\otimes$. The surjective morphism of this last exact sequence is strict thanks to 14.1.2.5. Finally, the strictness of the injective morphism is a consequence of the fact that by composing it with the strict monomorphism $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V\to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V$, we still get a strict monomorphism. □

Lemma 14.3.1.3. *Let $m'\geq m$ be two integers, V be a Banach $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-module and V' be a Banach $\widetilde{D}^{(m')}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-module (see the definition 14.1.3.2). Let $\phi\colon V\hookrightarrow V'$ be a $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-linear continuous injective morphism. The continuous morphism $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V\to \widetilde{D}^{(m')}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m')}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V'$ canonically induced by ϕ is then injective.*

Proof. For any $\underline{k}\in\mathbb{N}^{d-s}$, let $\xi_{\underline{k},(m')}$ be the image of $\underline{\partial}_{(r)}^{\langle(\underline{0},\underline{k})\rangle_{(m')}}$ via the canonical surjection $D^{(m')}_{\mathfrak{X}^\sharp}(T\cap Z)_{\mathbb{Q}}\twoheadrightarrow D^{(m')}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}(T\cap Z)_{\mathbb{Q}}$. Since the Banach K-vector space $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m')}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}V'$ is isomorphic to $D^{(m')}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}(T\cap Z)_{\mathbb{Q}}\widehat{\otimes}_{D^{(m')}_{\mathfrak{Z}^\sharp}(T\cap Z)_{\mathbb{Q}}}V'$ (see the proof of 14.3.1.2), then $\widetilde{D}^{(m')}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m')}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}V'$ is the K-space consisting of elements which can be written uniquely of the form $\sum_{\underline{k}\in\mathbb{N}^{d-s}}\xi_{\underline{k},(m')}\otimes x'_{\underline{k}}$, the sum being infinite but the sequence of elements $x'_{\underline{k}}\in V'$ converging to zero when $|\underline{k}|$ converges to the infinity. As $\xi_{\underline{k},(m)}=\lambda_{\underline{k},(m,m')}\xi_{\underline{k},(m')}$, for some $\lambda_{\underline{k},(m,m')}\in\mathcal{V}\setminus\{0\}$, then the canonical morphism $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}(T\cap Z)_{\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V\to \widetilde{D}^{(m')}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}(T\cap Z)_{\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m')}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}V'$ sends the sum $\sum_{\underline{k}\in\mathbb{N}^{d-s}}\xi_{\underline{k},(m)}\otimes x_{\underline{k}}$ on $\sum_{\underline{k}\in\mathbb{N}^{d-s}}\xi_{\underline{k},(m')}\otimes\lambda_{\underline{k},(m,m')}\phi(x_{\underline{k}})$. Hence we are done. □

Proposition 14.3.1.4. *Let $0\to V'\underset{\phi}{\longrightarrow} V\underset{\psi}{\longrightarrow} V''$ be an exact sequence of Banach $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-modules (see the definition 14.1.3.2). We suppose moreover that ϕ is a strict morphism. The sequence*

$$0\to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V'\underset{\mathrm{id}\widehat{\otimes}\phi}{\longrightarrow}\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V\underset{\mathrm{id}\widehat{\otimes}\psi}{\longrightarrow}\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} V'' \qquad (14.3.1.4.1)$$

is then exact and $id\widehat{\otimes}\phi$ is strict.

Proof. By endowing $W:=V/V'$ with the quotient topology, we obtain the $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-linear, injective and continuous morphism $W\hookrightarrow V''$. This yields that W is a Banach $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-module, because it is a separated quotient of V. We conclude by applying respectively the lemmas 14.3.1.2 and 14.3.1.3 to the exact sequence $0\to V'\to V\to W\to 0$ and to the monomorphism $W\to V''$. □

Lemma 14.3.1.5. *The module $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}$ is separated for the p-adic topology.*

Proof. If E is a finite type left $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}$-submodule of $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}$, since $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}$ is the separated p-adic completion of a free right $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}$-module, then $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}}E$ is separated and complete for the p-adic topology (see 7.2.1.4). By using 14.3.1.3, this yields that the canonical morphism $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}}E\to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}$ is also a monomorphism. By taking the inductive limit on E, this yields that the canonical morphism $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}\to\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}$ is injective. □

14.3.1.6. We define some normed K-vector spaces as follows.

(a) We endow $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}}$ with the tensor product topology defined in 14.1.2.2, i.e. following the lemma 14.1.2.3, this is the topology whose basis of open neighborhoods at zero is given by the family $p^n\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}$ where n is going through $\mathbb{N}$.

(b) We endow naturally $(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})_{\mathbb{Q}}$ with the topology whose basis of open neighborhoods at zero is given by the family $p^n \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}$ with n going through $\mathbb{N}$, which is in fact a Banach K-vector space.

(c) Since we have the equality

$$\left(p^n \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}\right) \cap \left(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp, \mathbb{Q}}\right) = p^n \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}$$

(this is a consequence of the uniqueness of the writing as described in the proof of 14.3.1.3), then we get the strict monomorphism of normed K-vector spaces

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp, \mathbb{Q}} \hookrightarrow (\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})_{\mathbb{Q}}. \tag{14.3.1.6.1}$$

Lemma 14.3.1.7. *The morphism 14.3.1.6.1 factors through the canonical (independent of local coordinates) isomorphism of Banach K-vector spaces:*

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp, \mathbb{Q}} \xrightarrow{\sim} (\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})_{\mathbb{Q}}. \tag{14.3.1.7.1}$$

Proof. By using the universal property of separated completions of locally convex K-vector spaces (see [Sch02, 7.5]), the morphism 14.3.1.6.1 canonically factors through a morphism of the form 14.3.1.7.1. Since 14.3.1.6.1 is a strict monomorphism of normed K-vector spaces, since $(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})_{\mathbb{Q}}$ is a Banach spaces, then this amount to saying that the image of the map 14.3.1.6.1 is dense. By construction of separated completions of locally convex K-vector spaces (e.g. see the proof of [Sch02, 7.5]), since $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}$ is a dense open lattice of $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp, \mathbb{Q}}$, then $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}$ is a dense open lattice of $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp, \mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp, \mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp, \mathbb{Q}}$. Since $\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp}$ is a dense open lattice of $(\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})_{\mathbb{Q}}$, we are done. □

14.3.2 Stability of the coherence by local cohomological functor in degree zero

Proposition 14.3.2.1. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module. The sheaf $\mathcal{H}^{\dagger 0}_Z(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module if and only if $H^0 u^{\sharp !}(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module. When these two equivalent conditions are satisfied, we have the isomorphism $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}) \xrightarrow{\sim} \mathcal{H}^{\dagger 0}_Z(\mathcal{E})$ (see notation 13.1.5.3).*

Proof. 1) a) Let us suppose that $H^0 u^{\sharp !}(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module. Following 9.3.2.3, we have the canonical adjoint morphism of (coherent) $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules of the form $\phi\colon u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}) \to \mathcal{E}$. Let us check that ϕ is injective.

It follows from Berthelot-Kashiwara theorem (see 9.3.5.9), that the canonical adjoint morphism $H^0 u^{\sharp !}(\mathcal{E}) \to u^{\sharp !} \circ u^\sharp_+ (H^0 u^{\sharp !}(\mathcal{E}))$ is an isomorphism and $u^\sharp_+ (H^0 u^{\sharp !}(\mathcal{E})) \xrightarrow{\sim} H^0 u^\sharp_+ (H^0 u^{\sharp !}(\mathcal{E}))$. Since the composition $H^0 u^{\sharp !}(\mathcal{E}) \to H^0 u^{\sharp !} \circ u^\sharp_+ \circ H^0 u^{\sharp !}(\mathcal{E})) \to H^0 u^{\sharp !}(\mathcal{E})$ is the identity (see 9.3.2.3), this yields that $H^0 u^{\sharp !}(\phi)$ is an isomorphism. Let $\mathcal{K} := \operatorname{Ker} \phi$. Since $H^0 u^{\sharp !}$ is left exact (on the category of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules), since $\operatorname{Ker} H^0 u^{\sharp !}(\phi) = 0$, then $H^0 u^{\sharp !}(\mathcal{K}) = 0$. Since $\mathcal{K}$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module with support in Z, then it comes from Berthelot-Kashiwara theorem (see 9.3.5.9) that $\mathcal{K} = 0$, i.e. that ϕ is injective.

b) Since $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module with support in Z, then the canonical morphism $\mathcal{H}^{\dagger 0}_Z(u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})) \to u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})$ is an isomorphism (see 13.2.1.6.1). This yields the injection $\phi\colon u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}) \hookrightarrow \mathcal{E}$ factors through the inclusions $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}) \hookrightarrow \mathcal{H}^{\dagger 0}_Z(\mathcal{E}) \hookrightarrow \mathcal{E}$ (the second arrow do is injective thanks to 13.1.5.4).

c) Let us now check that the inclusion $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}) \hookrightarrow \mathcal{H}^{\dagger 0}_Z(\mathcal{E})$ is an isomorphism. By the absurd, suppose that this latter inclusion is not an isomorphism. In that case, there exists an affine open

$\mathfrak{U}$ of $\mathfrak{X}$, such that $\Gamma(\mathfrak{U}, u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})) \neq \Gamma(\mathfrak{U}, \mathcal{H}^{\dagger 0}_Z(\mathcal{E}))$. Let $s \in \Gamma(\mathfrak{U}, \mathcal{H}^{\dagger 0}_Z(\mathcal{E})) \setminus \Gamma(\mathfrak{U}, u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}))$. Let G be the $D^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-submodule of $\Gamma(\mathfrak{U}, \mathcal{H}^{\dagger 0}_Z(\mathcal{E}))$ generated by $\Gamma(\mathfrak{U}, u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}))$ and by the section s. Since $\mathfrak{U}$ is affine, then $\Gamma(\mathfrak{U}, \mathcal{E})$ is a coherent $D^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-module. Since the composition $G \to \Gamma(\mathfrak{U}, \mathcal{H}^{\dagger 0}_Z(\mathcal{E})) \to \Gamma(\mathfrak{U}, \mathcal{E})$ is injective, then G is a coherent $D^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-module because it is a finite type submodule of a coherent $D^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-module. We get the coherent $\mathcal{D}^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-module by setting $\mathcal{G} := \mathcal{D}^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q} \otimes_{D^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}} G$. From the inclusion $G \subset \Gamma(\mathfrak{U}, \mathcal{H}^{\dagger 0}_Z(\mathcal{E}))$ we get the morphism $\mathcal{G} \to \mathcal{H}^{\dagger 0}_Z(\mathcal{E})|\mathfrak{U}$. Since $\mathcal{G}$ and $\mathcal{E}|\mathfrak{U}$ are coherent $\mathcal{D}^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-modules, then using theorem of type A the composition $\mathcal{G} \to \mathcal{H}^{\dagger 0}_Z(\mathcal{E})|\mathfrak{U} \to \mathcal{E}|\mathfrak{U}$ is injective. Hence, so is $\mathcal{G} \to \mathcal{H}^{\dagger 0}_Z(\mathcal{E})|\mathfrak{U}$. Moreover, since $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})|\mathfrak{U}$ and $\mathcal{G}$ are coherent $\mathcal{D}^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-modules, similarly we get the canonical inclusion $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})|\mathfrak{U} \hookrightarrow \mathcal{G}$. Let $v^{\sharp !}\colon \mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp \hookrightarrow \mathfrak{U}^\sharp$ be the morphism induced by $u^\sharp$ by restriction. By applying the left exact functor $H^0 v^{\sharp !}$ to the inclusions $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})|\mathfrak{U} \hookrightarrow \mathcal{G} \hookrightarrow \mathcal{E}|\mathfrak{U}$, we get the monomorphisms $H^0 u^{\sharp !} u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})|\mathfrak{U} \hookrightarrow H^0 v^{\sharp !}\mathcal{G} \hookrightarrow H^0 u^{\sharp !}\mathcal{E}|\mathfrak{U}$ whose composition is an isomorphism (equal to $H^0 u^{\sharp !}(\phi)|\mathfrak{U}$). Hence, we get the isomorphism $H^0 u^{\sharp !} u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})|\mathfrak{U} \xrightarrow{\sim} H^0 v^{\sharp !}\mathcal{G}$. Since $\mathcal{G}$ and $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})|\mathfrak{U}$ are coherent $\mathcal{D}^\dagger_{\mathfrak{U}^\sharp}({}^\dagger T\cap U)_\mathbb{Q}$-modules with support in $U \cap Z$, then by using Berthelot-Kashiwara theorem this implies that the morphism $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E})|\mathfrak{U} \to \mathcal{G}$ is an isomorphism, which is a contradiction.

2) Let us suppose that $\mathcal{H}^{\dagger 0}_Z(\mathcal{E})$ is $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}$-coherent.

a) Let us check that for any closed subscheme Z' of X containing Z we have

$$\mathcal{H}om_{\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}}(\mathcal{O}_\mathfrak{Z}({}^\dagger T\cap Z)_\mathbb{Q}, \omega_{\mathfrak{X}^\sharp/\mathfrak{S}} \otimes_{\mathcal{O}_\mathfrak{X}} H^0(\mathcal{E}({}^\dagger Z'))) \otimes_{\mathcal{O}_\mathfrak{Z}} \omega^{-1}_{\mathfrak{Z}^\sharp/\mathfrak{S}} = 0.$$

Since this is local, then we can suppose $\mathfrak{X}$ is integral and we are in the situation of 14.2. Let us denote by $n_{Z'}$ the minimal number of divisor $T_1, \ldots, T_r$ such that $Z' = T_1 \cap \cdots \cap T_r$. We check the assertion by induction on $n_{Z'}$. The case where $n_{Z'} = 0$ (i.e. is the case where $Z' = X$) is obvious and the case $n_{Z'} = 1$ (i.e. the case where Z' is a divisor containing Z) is an easy computation. Suppose now $r \geq 2$ and the proposition holds for any Z' such that $n_{Z'} < r$. Let $T_1, \ldots, T_r$ be some divisors such that $Z' = T_1 \cap \cdots \cap T_r$. Set $Z'' = T_2 \cap \cdots \cap T_r$. It follows from 13.1.5.4.(a) that the long exact sequence induced by the Mayer-Vietoris exact triangles (see 13.1.4.15.2) yields the exact sequence:

$$0 \to H^0\mathcal{E}({}^\dagger Z') \to H^0({}^\dagger T_1)(\mathcal{E}) \oplus H^0({}^\dagger Z'')(\mathcal{E}) \to H^0({}^\dagger T_1 \cup Z'')(\mathcal{E}({}^\dagger Z')) \tag{14.3.2.1.1}$$

Since the functor $\mathcal{H}om_{\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}}(\mathcal{O}_\mathfrak{Z}({}^\dagger T\cap Z)_\mathbb{Q}, \omega_{\mathfrak{X}^\sharp/\mathfrak{S}} \otimes_{\mathcal{O}_\mathfrak{X}} -) \otimes_{\mathcal{O}_\mathfrak{Z}} \omega^{-1}_{\mathfrak{Z}^\sharp/\mathfrak{S}}$ is left exact, then we can conclude the induction.

b) With notation 9.3.4.5, we get from 9.3.1.17.1 the isomorphisms

$$u^{\sharp !}(H^0\mathcal{E}({}^\dagger Z)) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}}(\mathcal{O}_\mathfrak{Z}({}^\dagger T\cap Z)_\mathbb{Q}, \omega_{\mathfrak{X}^\sharp/\mathfrak{S}} \otimes_{\mathcal{O}_\mathfrak{X}} H^0\mathcal{E}({}^\dagger Z)) \otimes_{\mathcal{O}_\mathfrak{Z}} \omega^{-1}_{\mathfrak{Z}^\sharp/\mathfrak{S}}.$$

By using the vanishing of the part (a) in the case where $Z' = Z$, this yields $H^0 u^{\sharp !} H^0(\mathcal{E}({}^\dagger Z)) = 0$. By applying the functor $H^0 u^{\sharp !}$ to the exact sequence $0 \to \mathcal{H}^{\dagger 0}_Z(\mathcal{E}) \to \mathcal{E} \to H^0(\mathcal{E}({}^\dagger Z))$, this implies that the canonical morphism $H^0 u^{\sharp !}\mathcal{H}^{\dagger 0}_Z(\mathcal{E}) \to H^0 u^{\sharp !}(\mathcal{E})$ is an isomorphism. It follows from 9.3.5.9 that $H^0 u^{\sharp !}\mathcal{H}^{\dagger 0}_Z(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T\cap Z)_\mathbb{Q}$-module. Hence, we are done.

3) If one of these two conditions is satisfied then the isomorphism $u^\sharp_+ H^0 u^{\sharp !}(\mathcal{E}) \xrightarrow{\sim} \mathcal{H}^{\dagger 0}_Z(\mathcal{E})$ has been checked at the step 1.c). □

14.3.3 Stability of the coherence by local cohomological functor in maximal degree

The purpose of this subsection is to check the corollary 14.3.3.9. This corollary completes the theorem 14.3.3.1 just below which is straightforward from 9.1.6.3 and 13.2.1.5.1.

Theorem 14.3.3.1. *We suppose that $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ is of pure codimension 1. Let $\mathcal{E}^{(\bullet)}$ be an object of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$ and $\mathcal{E} := \varinjlim (\mathcal{E}^{(\bullet)})$ the corresponding object of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q})$. The following assertions are equivalent:*

(a) $u^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp})$.

(b) $\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$.

(c) $({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$.

(d) $({}^\dagger Z)(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$.

(e) $\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$.

When these assertions are fulfilled, we have therefore $u^{\sharp !}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T\cap Z)_{\mathbb{Q}})$ *and the isomorphism*

$$u^\sharp_+(u^{\sharp !}(\mathcal{E})) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E}).$$

Proof. The equivalences $(b) \Leftrightarrow (c)$ and $(d) \Leftrightarrow (e)$ are a consequence of the distinguished triangle of localisation $\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)} \to ({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \to +1$. The equivalence $(c) \Leftrightarrow (d)$ is exactly the corollary 9.1.6.3. The equivalence $(a) \Leftrightarrow (b)$ follows from the canonical isomorphism $u^{\sharp(\bullet)}_+ \circ u^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E}^{(\bullet)})$ (see 13.2.1.5.1), from the canonical isomorphism $u^{\sharp(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)})$, as well as from the theorem of Berthelot-Kashiwara still valid in the context of the categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$ (see 9.3.5.13). When these assertions are fulfilled, by applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ which preserves the coherence and the isomorphisms, we get the desired consequences. □

14.3.3.2. Let $\mathfrak{B}$ be the basis of open neighborhoods of $\mathfrak{X}$ consisting of affine opens which are endowed with local coordinates satisfying the conditions of 14.2. For any $\mathfrak{U} \in \mathfrak{B}$, we denote by $\mathfrak{U}^\sharp := (\mathfrak{U}, \mathfrak{U}\cap\mathfrak{D})$. Let us describe the section on $\mathfrak{U} \in \mathfrak{B}$ of the sheaf $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})_{\mathbb{Q}}$.

Let $\mathfrak{U} \in \mathfrak{B}$. For any nonnegative integer i, we denote by X_i, $X_i^\sharp$, Z_i, $Z_i^\sharp$, U_i, $U_i^\sharp$ the reductions modulo π^{i+1} of respectively $\mathfrak{X}$, $\mathfrak{X}^\sharp$, $\mathfrak{Z}$, $\mathfrak{Z}^\sharp$, $\mathfrak{U}$, $\mathfrak{U}^\sharp$. We have the quasi-coherent $\mathcal{B}^{(m)}_{Z_i\cap U_i}(T\cap U_i)$-modules $\widetilde{\mathcal{D}}^{(m)}_{U_i^\sharp\leftarrow Z_i^\sharp\cap U_i^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{U}^\sharp\leftarrow\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}\otimes_{\mathcal{V}}\mathcal{V}/\pi^{i+1}$, $\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp\cap U_i^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}\otimes_{\mathcal{V}}\mathcal{V}/\pi^{i+1}$, and finally $\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp\cap U_i^\sharp\to U_i^\sharp} := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp\to\mathfrak{U}^\sharp}\otimes_{\mathcal{V}}\mathcal{V}/\pi^{i+1}$. It follows from 7.2.3.13.1 (and 7.2.3.13.(i)) that $\widetilde{D}^{(m)}_{\mathfrak{U}^\sharp\leftarrow\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}$ is separated and complete for the p-adic completion and that we have the canonical isomorphism: $\widetilde{D}^{(m)}_{U_i^\sharp\leftarrow Z_i^\sharp\cap U_i^\sharp} \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp\leftarrow\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}\otimes_{\mathcal{V}}\mathcal{V}/\pi^{i+1}$; similarly for $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp\to\mathfrak{U}^\sharp}$. Since the global sections functor commutes with projective limits and by quasi-coherence of our sheaves on X_i, we obtain the canonical isomorphisms

$$\begin{aligned}\Gamma(\mathfrak{U}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}) &= \Gamma(\mathfrak{U}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{U}^\sharp\leftarrow\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp\to\mathfrak{U}^\sharp})\\ \xrightarrow{\sim} \varprojlim_i \Gamma(U_i, \widetilde{\mathcal{D}}^{(m)}_{U_i^\sharp\leftarrow Z_i^\sharp\cap U_i^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp\cap U_i^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{Z_i^\sharp\cap U_i^\sharp\to U_i^\sharp}) &\xrightarrow{\sim} \varprojlim_i \widetilde{D}^{(m)}_{U_i^\sharp\leftarrow Z_i^\sharp\cap U_i^\sharp}\otimes_{\widetilde{D}^{(m)}_{Z_i^\sharp\cap U_i^\sharp}}\widetilde{D}^{(m)}_{Z_i^\sharp\cap U_i^\sharp\to U_i^\sharp}\\ &\xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp\leftarrow\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp\to\mathfrak{U}^\sharp}. \qquad (14.3.3.2.1)\end{aligned}$$

Moreover, for any $\mathfrak{U} \in \mathfrak{B}$, the functor $\Gamma(\mathfrak{U}, -)$ commutes with the tensor product by $\mathbb{Q}$. This yields

$$\Gamma(\mathfrak{U}, (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})_{\mathbb{Q}}) \xrightarrow{\sim} (\widetilde{D}^{(m)}_{\mathfrak{U}^\sharp\leftarrow\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp\to\mathfrak{U}^\sharp})_{\mathbb{Q}}.$$

By tensorizing by $\mathbb{Q}$ the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp}$, we get the morphism

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}} \to (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})_{\mathbb{Q}}. \qquad (14.3.3.2.2)$$

Notation 14.3.3.3. We keep notation 14.3.3.2.

(a) We denote by $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp,\mathbb{Q}}$ the sheaf (of K-algebras) on $\mathfrak{X}$ associated to the presheaf (in fact this is a sheaf following 14.3.3.4) on $\mathfrak{B}$ defined as follows: $\mathfrak{U} \in \mathfrak{B} \mapsto \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp\leftarrow\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}}}\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp\to\mathfrak{U}^\sharp,\mathbb{Q}}$, the restriction morphisms being the canonical morphisms (the separated completion is a functor).

(b) Since the canonical morphisms

$$\widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp \to \mathfrak{U}^\sharp,\mathbb{Q}} \to \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp \to \mathfrak{U}^\sharp,\mathbb{Q}}$$

are functorial in $\mathfrak{U} \in \mathfrak{B}$, we get then the canonical morphism of sheaves:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}}. \qquad (14.3.3.3.1)$$

(c) Let $\alpha^{(m)} \colon (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ be a left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-linear morphism. With the notation 9.3.4.1, by using the functoriality in $\mathfrak{U} \in \mathfrak{B}$ of the morphisms

$$id\widehat{\otimes}\Gamma(\mathfrak{U}\cap\mathfrak{Z}, u^*(\alpha^{(m)}))\colon \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}}} (\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp \to \mathfrak{U}^\sharp,\mathbb{Q}})^r \to \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}}} (\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp \to \mathfrak{U}^\sharp,\mathbb{Q}})^s,$$

we get the morphism of sheaves:

$$id\widehat{\otimes}u^*(\alpha^{(m)})\colon \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}})^r \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}})^s. \qquad (14.3.3.3.2)$$

Lemma 14.3.3.4. *We keep the notations of 14.3.3.3.*

(a) We have the canonical commutative diagram in the category of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-bimodules:

$$\begin{array}{ccc} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}} & \overset{\sim}{\dashrightarrow} & (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})_{\mathbb{Q}} \\ {\scriptstyle 14.3.3.3.1}\nwarrow & & \nearrow{\scriptstyle 14.3.3.2.2} \\ & \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}} & \end{array} \qquad (14.3.3.4.1)$$

whose top arrow is an isomorphism. For any $\mathfrak{U} \in \mathfrak{B}$, we have moreover

$$\Gamma(\mathfrak{U}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}}) \xrightarrow{\sim} \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp,\mathbb{Q}}} \widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp\cap\mathfrak{U}^\sharp \to \mathfrak{U}^\sharp,\mathbb{Q}}.$$

(b) Let $\epsilon^{(m)} \colon (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})^r \to (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})^s$ be a left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-linear morphism and $\alpha^{(m)} \colon (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ be the morphism induced by tensorizing by $\mathbb{Q}$. We have the commutative square

$$\begin{array}{ccc} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})^r)_{\mathbb{Q}} & \xrightarrow{(id\widehat{\otimes}u^*\epsilon^{(m)})_{\mathbb{Q}}} & (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp})^s)_{\mathbb{Q}} \\ \sim\uparrow & & \sim\uparrow \\ \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r & \xrightarrow{id\widehat{\otimes}u^*\alpha^{(m)}} & \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s, \end{array} \qquad (14.3.3.4.2)$$

whose vertical isomorphisms are induced by the factorisation of 14.3.3.4.1.

Proof. The first statement is a consequence of the canonical isomorphisms of 14.3.1.7.1. The second assertion can easily be checked. □

Remark 14.3.3.5. With the notations of 14.3.3.3, the sheaf $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp \to \mathfrak{X}^\sharp,\mathbb{Q}}$ of K-vector spaces on $\mathfrak{B}$ is also a sheaf of topological K-vector spaces on $\mathfrak{B}$ (indeed we can check that the restriction morphisms are injective and strict).

Lemma 14.3.3.6. *We suppose that $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ is of pure codimension e. Let α be a morphism of left $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules which is of the form $\alpha\colon (\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^r \to (\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$. Let m_0 be a large enough integer such that there exists a left $\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}}$-linear morphism of the form $\alpha^{(m_0)}\colon (\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to (\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ inducing α by extension via $\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp,\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$. For $m \geq m_0$, we denote by $\alpha^{(m)}\colon (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$, the morphism induced by extension of $\alpha^{(m_0)}$.*

Hence we have the commutative diagram

$$\begin{array}{ccc}
\mathcal{H}^{\dagger e}_Z((\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^r) & \xrightarrow{\mathcal{H}^{\dagger e}_Z(\alpha)} & \mathcal{H}^{\dagger e}_Z((\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s) \\
\sim\uparrow & & \sim\uparrow \\
u_*\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r & \xrightarrow{\varinjlim_m (\mathrm{id}\,\widehat{\otimes} u^*\alpha^{(m)})} & u_*\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s
\end{array} \tag{14.3.3.6.1}$$

whose vertical arrows are isomorphisms.

Proof. 1) Multiplying $\alpha^{(m_0)}$ by a large enough power of p, we can suppose that $\alpha^{(m_0)}$ comes by extension from a left $\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp}$-linear morphism of the form $\epsilon^{(m_0)}\colon (\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp})^r \to (\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^\sharp})^s$. For $m \geq m_0$, let us denote by $\epsilon^{(m)}\colon (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})^r \to (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})^s$ the morphisms induced by extension. So we get the morphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$ of the form

$$\epsilon^{(\bullet+m_0)}\colon (\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp})^r \to (\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp})^s.$$

2) Let $N \in \mathbb{N}$. Since $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})^N$ is a p-torsion free quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp/\mathfrak{S}}$-module (see the definition 7.2.3.5 and 7.3.1.7) for any $m \in \mathbb{N}$, then it follows from 9.3.3.1.2

$$u^{\sharp(\bullet)}_+((\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})^N) \xrightarrow{\sim} u_*\left(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}} (\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})^N\right). \tag{14.3.3.6.2}$$

Since $u^{\sharp(\bullet)!}((\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp})^N)[e] \xrightarrow{\sim} (\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})^N$, this yields the third (from the top) vertical isomorphisms

$$\begin{array}{ccc}
\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})[e] & \xrightarrow{\mathbb{R}\underline{\Gamma}^\dagger_Z(\alpha)[e]} & \mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^N)[e] \\
\sim\downarrow & & \sim\downarrow \\
\underrightarrow{l}^*_{\mathbb{Q}}\mathbb{R}\underline{\Gamma}^\dagger_Z((\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp})^N)[e] & \xrightarrow{\underrightarrow{l}^*_{\mathbb{Q}}\mathbb{R}\underline{\Gamma}^\dagger_Z\epsilon^{(\bullet+m_0)}} & \underrightarrow{l}^*_{\mathbb{Q}}\mathbb{R}\underline{\Gamma}^\dagger_Z((\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp})^N)[e] \\
\sim\downarrow 13.2.1.5.1 & & \sim\downarrow 13.2.1.5.1 \\
\underrightarrow{l}^*_{\mathbb{Q}}u^{\sharp(\bullet)}_+\circ u^{\sharp(\bullet)!}((\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp})^N)[e] & \xrightarrow{\underrightarrow{l}^*_{\mathbb{Q}}u^{\sharp(\bullet)}_+u^{\sharp(\bullet)!}\epsilon^{(\bullet+m_0)}} & \underrightarrow{l}^*_{\mathbb{Q}}u^{\sharp(\bullet)}_+\circ u^{\sharp(\bullet)!}((\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp})^N)[e] \\
\sim\downarrow 14.3.3.6.2 & & \sim\downarrow 14.3.3.6.2 \\
\underrightarrow{l}^*_{\mathbb{Q}}u_*\left(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}}(\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})^N\right) & \xrightarrow{\underrightarrow{l}^*_{\mathbb{Q}}u_*(\mathrm{id}\,\widehat{\otimes}u^*\epsilon^{(\bullet+m_0)})} & \underrightarrow{l}^*_{\mathbb{Q}}u_*\left(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp/\mathfrak{S}^\sharp}}(\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{Z}^\sharp\to\mathfrak{X}^\sharp})^N\right) \\
\downarrow\sim & & \downarrow\sim \\
u_*\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}(u^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^N & \xrightarrow{\varinjlim_m(\mathrm{id}\,\widehat{\otimes}u^*\alpha^{(m)})} & u_*\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}(u^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^N.
\end{array} \tag{14.3.3.6.3}$$

This yields $\mathbb{R}\underline{\Gamma}^\dagger_Z(\alpha)[e] \xrightarrow{\sim} \mathcal{H}^{\dagger e}_Z(\alpha)$ and the commutative diagram 14.3.3.6.1 is equal to 14.3.3.6.3. □

Remark 14.3.3.7. With the notations of 14.3.3.6, let us suppose $\mathfrak{X}$ affine. Let $E^{(m_0)}$ be a coherent $\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp}$-module without p-torsion, $\mathcal{E}^{(\bullet)} := \widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}\otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp}} E^{(m_0)}$ the induced $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}$-module of finite presentation, $\mathcal{E} := \varinjlim(\mathcal{E}^\bullet)$ the associated coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module. By taking a resolution of $E^{(m_0)}$ by free finite type $\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp}$-module which induces, after applying the functor $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}\otimes_{\widetilde{D}^{(m_0)}_{\mathfrak{X}^\sharp}} -$, a resolution of $\mathcal{E}^{(\bullet)}$ by finite type free $\widetilde{\mathcal{D}}^{(\bullet+m_0)}_{\mathfrak{X}^\sharp}$-modules, we can check that the complex $\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E})$ is isomorphic to a complex whose terms are of the form $\mathcal{H}^{\dagger e}_Z((\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^N)$ for some integers N.

We are now ready to prove the following theorem.

Theorem 14.3.3.8. *We suppose that* $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ *is of pure codimension* e*. Let* $\mathcal{E}$ *be a coherent* $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$*-module satisfying the two following properties :*

(a) for any $i = 0, \ldots, e-1$*, locally in* $\mathfrak{Z}$*, the* $\mathcal{D}^{\dagger}_{\mathfrak{Z}^{\sharp}}({}^{\dagger}T \cap Z)_{\mathbb{Q}}$*-modules* $\mathcal{H}^i u^{\sharp !}(\mathcal{E})$ *are* $\Gamma(\mathfrak{Z}, -)$*-acyclic ;*

(b) the module $u^*(\mathcal{E})$ *is a coherent* $\mathcal{D}^{\dagger}_{\mathfrak{Z}^{\sharp}}({}^{\dagger}T \cap Z)_{\mathbb{Q}}$*-module which is also a finitely generated locally projective* $\mathcal{O}_{\mathfrak{Z}}({}^{\dagger}T \cap Z)_{\mathbb{Q}}$*-module for the induced structure.*

The $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$*-module* $\mathcal{H}^{\dagger e}_{Z}(\mathcal{E})$ *is then coherent and is isomorphic to* $u^{\sharp}_{+} u^*(\mathcal{E})$*.*

Proof. 0) a) *Taking global sections.*

We use hypotheses 14.3.3.8.(a) as follows: Since the $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-coherence of $\mathcal{H}^{\dagger e}_{Z}(\mathcal{E})$ is local, we can suppose we are in the local situation of the subsection 14.2, and we keep its notations. In that case, we set $E := \Gamma(\mathfrak{X}, \mathcal{E})$ as usual. With the notations of 9.3.4.1, the hypotheses of 14.3.3.8.(a) yields the isomorphism $\Gamma(\mathfrak{Z}, u^*\mathcal{E}) \xrightarrow{\sim} H^0(\mathbb{R}\Gamma(\mathfrak{Z}, \mathbb{L}u^*\mathcal{E}))$ (we use the unbounded version of spectral sequence of hypercohomology of 4.6.1.6.1 for the functor of $\Gamma(\mathfrak{Z}, -)$). Then by using lemma 9.3.4.8 we get the isomorphism $\Gamma(\mathfrak{Z}, u^*\mathcal{E}) \xrightarrow{\sim} H^0(\mathbb{L}u^*(E)) = u^*(E)$.

b) *The morphisms* α*,* β*,* ϕ*,* ψ*.*

Since $\mathfrak{X}$ is affine, then via the theorem of type A of Berthelot of 8.7.5.5 which is valid for coherent $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules, we have the exact sequence of left $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules $(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^r \underset{\alpha}{\longrightarrow} (\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^s \underset{\beta}{\longrightarrow} \mathcal{E} \to 0$. Using theorems of type A and B, we get the exact sequence $(D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^r \underset{a}{\longrightarrow} (D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^s \underset{b}{\longrightarrow} E \to 0$, where $a = \Gamma(\mathfrak{X}, \alpha)$ and $b = \Gamma(\mathfrak{X}, \beta)$. By setting $\phi := u^*(a)$ and $\psi := u^*(b)$, we get the commutative diagram.

$$\begin{array}{ccccccc}
\Gamma(\mathfrak{Z}, (u^*\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^r) & \xrightarrow{\Gamma(\mathfrak{Z}, u^*(\alpha))} & \Gamma(\mathfrak{Z}, (u^*\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^s) & \xrightarrow{\Gamma(\mathfrak{Z}, u^*(\beta))} & \Gamma(\mathfrak{Z}, u^*(\mathcal{E})) & \longrightarrow & 0 \\
{\scriptstyle 9.3.4.3.1}\uparrow\wr & & {\scriptstyle 9.3.4.3.1}\uparrow\wr & & \uparrow & & \\
(u^* D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^r & \xrightarrow{\phi} & (u^* D^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^s & \xrightarrow{\psi} & u^*(E) & \xrightarrow{\sim} & 0
\end{array} \tag{14.3.3.8.1}$$

By right exactness of the functor of the form u^* (see the definition of 9.3.4.1), we obtain the exactness of the bottom sequence. Since the canonical morphism $u^*(E) \to \Gamma(\mathfrak{Z}, u^*\mathcal{E})$ is an isomorphism, using 9.3.4.3.1, then every vertical arrows of 14.3.3.8.1 are isomorphisms. Hence, its top sequence is exact.

c) *Increasing* $\lambda_0 \in L(\mathbb{N})$ *if necessary, we define in this step* $\mathcal{M}$ *and* $\mathcal{M}^{(m)}$ *as follows.* We set $\mathcal{M} := u^*(\mathcal{E})$, $M := \Gamma(\mathfrak{Z}, \mathcal{M})$. Since $\mathcal{M} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Z}^{\sharp}, T \cap Z/\mathfrak{S})$ and is finitely generated projective $\mathcal{O}_{\mathfrak{Z}}({}^{\dagger}T \cap Z)_{\mathbb{Q}}$-module, then it follows from 11.2.1.9 (and from the remark 8.7.6.9 for the projectivity of $\mathcal{M}^{(0)}$) that, increasing $\lambda_0 \in L(\mathbb{N})$ if necessary, there exists $\mathcal{M}^{(0)}$ a topologically nilpotent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{Z}^{\sharp}, \mathbb{Q}}$-module, projective of finite type as $\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{X}}(T)_{\mathbb{Q}}$-module satisfying both conditions of 11.2.1.7.(b). For any $m \geq 0$, we set then $\mathcal{M}^{(m)} := \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}, \mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{Z}^{\sharp}, \mathbb{Q}}} \mathcal{M}^{(0)}$. Following 11.2.1.9.1, the canonical morphism

$$\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}} \otimes_{\widetilde{\mathcal{B}}^{(0)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}} \mathcal{M}^{(0)} \to \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^{\sharp}, \mathbb{Q}} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{Z}^{\sharp}, \mathbb{Q}}} \mathcal{M}^{(0)} = \mathcal{M}^{(m)}$$

is an isomorphism. Hence, $\mathcal{M}^{(m)}$ is a projective of finite type $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-module and the canonical morphisms $\mathcal{M}^{(0)} \to \mathcal{M}^{(m)}$ are injective. Moreover, we get the equality $M = \cup_{m \in \mathbb{N}} M^{(m)}$, where as usual we set $M^{(m)} := \Gamma(\mathfrak{Z}, \mathcal{M}^{(m)})$.

d) *Levels* $m \geq m_0$*, the morphisms* $\alpha^{(m)}$*,* $\beta^{(m)}$*,* $\phi^{(m)}$*,* $\psi^{(m)}$*.*

Let $m_0 \geq 0$ be a large enough integer such that there exists a left $\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}}$-linear morphism of the form $\alpha^{(m_0)}\colon (\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}})^r \to (\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}})^s$ and inducing α by extension via $\widetilde{\mathcal{D}}^{(m_0)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}} \to \mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$. For any $m \geq m_0$, let us denote by $\alpha^{(m)}\colon (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}})^r \to (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}})^s$ the map induced by $\alpha^{(m_0)}$ by extension. For any $m \geq 0$, let us denote by $\beta^{(m)}\colon (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}})^s \to \mathcal{E}$ the composition of the morphism β with the canonical inclusion $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}, \mathbb{Q}})^s \hookrightarrow (\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})^s$. Let us denote by $\phi^{(m)} := u^*\Gamma(\mathfrak{Z}, \alpha^{(m)})$ and $\psi^{(m)} := u^*\Gamma(\mathfrak{Z}, \beta^{(m)})$. With the definitions and notations of 9.3.4.1, so we obtain the commutative diagram

$$\begin{array}{ccccccc}
\Gamma(\mathfrak{Z}, (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r) & \xrightarrow{\Gamma(\mathfrak{Z},u^*(\alpha^{(m)}))} & \Gamma(\mathfrak{Z}, (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s) & \xrightarrow{\Gamma(\mathfrak{Z},u^*(\beta^{(m)}))} & M & \longrightarrow & 0 \\
{\scriptstyle 9.3.4.3.1}\uparrow \wr & & {\scriptstyle 9.3.4.3.1}\uparrow \wr & & \wr\uparrow & & \\
(u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r & \xrightarrow{\phi^{(m)}} & (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s & \xrightarrow{\psi^{(m)}} & u^*(E) & \longrightarrow & 0
\end{array} \qquad (14.3.3.8.2)$$

We remark that both horizontal sequences become exact only after taking the inductive limit on m. We can identify M and u^*E.

1) *Topology of type LB on M, levels $m \geq m_1$, continuous sections θ, $\theta^{(m)}$.*

Since $\mathfrak{Z}$ is affine, then it follows from the hypotheses 14.3.3.8.(b) that the $O_{\mathfrak{Z}}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module M is projective and of finite type. We endow M with its canonical topology as overconvergent isocrystal (see 14.2.1.10). With this topology, M is in fact an $O_{\mathfrak{Z}}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module of type LB (see 14.2.2.3). Since M is a projective $O_{\mathfrak{Z}}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module, there exist therefore an $O_{\mathfrak{Z}}({}^\dagger T \cap Z)_{\mathbb{Q}}$-linear morphism $\theta\colon M \to (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$ such that $\psi \circ \theta = \mathrm{id}$. Since $M^{(0)}$ is a finite type $\widetilde{B}^{(0)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-module, then there exist $m_1 \geq m_0$ such that for any $m \geq m_1$, we have $\theta(M^{(0)}) \subset (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$. So, this section θ induces (uniquely) a $\widetilde{B}^{(0)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-linear morphism of the form $M^{(0)} \to (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$. For any $m \geq m_1$, we denote by $\theta^{(m)}\colon M^{(m)} \to (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ the induced $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-linear morphism. Let $\mathring{M}^{(m)}$ be a finite type $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)$-module equipped with a $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-linear isomorphism $\mathring{M}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} M^{(m)}$. A basis of open neighborhoods at zero on $(u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ (resp. $M^{(m)}$) is given by the family of $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)$-modules $\{p^n(u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp})^s\}_{n\in\mathbb{N}}$ (resp. $\{p^n(\mathring{M}^{(m)}\}_{n\in\mathbb{N}}$). For n large enough, we have the inclusion $\theta^{(m)}(p^n\mathring{M}^{(m)}) \subset (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp})^s$. This yields that the morphism $\theta^{(m)}$ is continous. By composition of continuous morphisms, then so is $M^{(m)} \to (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$. Taking the inductive limit on the level $m \geq m_1$, the section $\theta\colon M \to (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$ is then continuous. From now in the proof, $m \geq m_1$ will be an integer.

2) *The K-vector space G of type LB, the Banach K-vector spaces $G^{(m)}$, the continuous morphism ι.*

With the respective canonical topologies (see the definitions of 14.2.1.8), following the proposition 14.2.3.3, the application ϕ is a continuous morphism of K-vector spaces of LB-type (see 14.2.2.6). Let us denote by $G := (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^r/\ker(\phi)$ the locally convex K-vector space whose topology is that which makes the canonical projection

$$\pi\colon (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^r \twoheadrightarrow G$$

is a strict morphism. Let us denote by $\iota\colon G \hookrightarrow (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$ the monomorphism such that $\iota \circ \pi = \phi$. Hence, since ϕ is continuous, then ι is continuous. Since $(u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$ is separated (see 14.2.2.6), then so is G. So G is a separated quotient of a LB-space. Following 14.1.1.7, this yields that G is also an LB-space. More precisely, following its proof, denoting by $G^{(m)} := (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r/(\ker(\phi) \cap (u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r)$ endowed with the quotient topology, $G^{(m)}$ is a Banach K-vector space and the canonical isomorphism $\varinjlim_m G^{(m)} \xrightarrow{\sim} G$ is a homeomorphism. Since by definition the morphism $(u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to G^{(m)}$ is strict, it follows from 14.3.1.2, that we have the strict epimorphism

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}(u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \twoheadrightarrow \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} G^{(m)}. \qquad (14.3.3.8.3)$$

Using 14.1.1.3, this yields that we have the strict epimorphism:

$$\varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}}(u^*\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \twoheadrightarrow \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp\leftarrow\mathfrak{Z}^\sharp,\mathbb{Q}}\widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} G^{(m)}. \qquad (14.3.3.8.4)$$

3) *The maps ι, ϕ and ψ are strict morphisms.*

We have the $O_{\mathfrak{Z},\mathbb{Q}}$-linear map $(\iota, \theta)\colon G \oplus M \to (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$ which is also a continuous bijective map between two K-vector spaces of LB-type. Since Banach open mapping theorem holds for K-vector spaces of LB-type (see [Sch02, 8.8] and use the remark 14.1.1.6), then the morphism (ι, θ) is a homeomorphism. Since ι is the composition morphism

$$\iota\colon G \subset G \oplus M \underset{(\iota,\theta)}{\xrightarrow{\sim}} (u^*D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s, \qquad (14.3.3.8.5)$$

the morphism ι is then strict. Hence, ϕ is a strict morphism. We remark that as M is a separated K-space, then G is a closed subset of $G \oplus M$ (because homeomorphic to the closed subset $G \oplus \{0\}$). Finally, we obtain the canonical commutative square

$$\begin{array}{ccc} G \oplus M & \xrightarrow[\sim]{(\iota,\theta)} & (u^* D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s \\ \downarrow{\scriptstyle (0,id)} & & \downarrow{\scriptstyle \psi} \\ M & = & M, \end{array} \tag{14.3.3.8.6}$$

in which we already know that all the arrows except ψ are continuous and that the top arrow is a homeomorphism. This yields the continuity of ψ. Since ψ is a continuous and surjective morphism between two LB-spaces, this yields that ψ is a strict morphism (see [Sch02, 8.8] and use the remark 14.1.1.6).

4) *Constructions and properties of $H^{(m)}$ and $N^{(m)}$.*

Let us denote by $H^{(m)} := \iota^{-1}((u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s)$ and $\iota^{(m)} \colon H^{(m)} \hookrightarrow (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ the $\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}$-linear morphism induced by ι. We endow $H^{(m)}$ with the unique topology such that $\iota^{(m)}$ is a strict morphism (with $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ endowed with its canonical topology of Banach K-vector space). We have seen at the step 3) that $\iota(G)$ is closed. Since $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \hookrightarrow (u^* D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s$ is continuous, this yields that $\iota^{(m)}(H^{(m)})$ is a closed subset of $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$. Since $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ is a Banach $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-module, this implies that $H^{(m)}$ is also a Banach $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-module. Let us then denote by $N^{(m)} := \operatorname{Im}(\psi^{(m)})$ and $\psi'^{(m)} \colon (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \twoheadrightarrow N^{(m)}$ the canonical epimorphism which factors $\psi^{(m)}$. We get on $N^{(m)}$ a structure of locally convex $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-module by decreeing the $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-linear epimorphism $\psi'^{(m)} \colon (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \twoheadrightarrow N^{(m)}$ strict map. So we get the commutative diagram

$$\begin{array}{ccccccccc} 0 & \longrightarrow & G & \xrightarrow{\iota} & (u^* D^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})^s & \xrightarrow{\psi} & M & \longrightarrow & 0 \\ & & \uparrow & \square & \uparrow & \nearrow{\scriptstyle \psi^{(m)}} & \uparrow & & \\ 0 & \longrightarrow & H^{(m)} & \xrightarrow{\iota^{(m)}} & (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s & \xrightarrow{\psi'^{(m)}} & N^{(m)} & \longrightarrow & 0 \end{array} \tag{14.3.3.8.7}$$

whose horizontal morphisms are strict and form two short exact sequences (moreover the top one splits via θ). Since the composition of $H^{(m)} \subset G$ with ι is continuous, as ι is a strict monomorphism, we remark that the inclusion $H^{(m)} \subset G$ is then continuous. Finally, as $\psi^{(m)}$ is continuous, then so is the inclusion $N^{(m)} \subset M$. Since M is separated, this yields that $N^{(m)}$ is a Banach $\widetilde{B}^{(m)}_{\mathfrak{Z}}(T \cap Z)_{\mathbb{Q}}$-module

By using 14.3.1.2, the bottom short exact sequence of 14.3.3.8.7 induces the exact sequence with strict morphisms:

$$0 \to \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} H^{(m)} \underset{\mathrm{id}\,\widehat{\otimes}\iota^{(m)}}{\to} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \underset{\mathrm{id}\,\widehat{\otimes}\psi'^{(m)}}{\to} \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} N^{(m)} \to 0. \tag{14.3.3.8.8}$$

By taking the inductive limit on m, this yields the exact sequence with continuous morphisms:

$$0 \to \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} H^{(m)} \to \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \to \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} N^{(m)} \to 0. \tag{14.3.3.8.9}$$

5) *Taking the inductive limit on m for $G^{(m)}$ and $H^{(m)}$: comparaison.*

Let $j_m \colon G^{(m)} \to G$ be the canonical continuous monomorphism. For any $m \geq m_1$, since the morphism ϕ induces the continuous morphism $\phi^{(m)} \colon (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \to (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$, then we get the inclusion $\iota \circ j_m(G^{(m)}) \subset (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ and then $j_m(G^{(m)}) \subset H^{(m)}$. Hence, the continuous monomorphism j_m can be factored factorizes through a continuous monomorphism of the form $G^{(m)} \to H^{(m)}$.

Conversely, since $H^{(m)}$ is a Banach K-vector space, since we have the equality $G = \cup_{m \in \mathbb{N}} j_m(G^{(m)})$ with j_m continuous, K-linear and $G^{(m)}$ are Banach K-vector spaces, then it follows from [Sch02, 8.9] that then there exist a large enough integer $n_m \geq m$ such that the continuous homomorphism $H^{(m)} \subset G$ is the composition of a (unique) continuous morphism of the form $H^{(m)} \to G^{(n_m)}$ with j_{n_m}. It is harmless to suppose that the sequence $(n_m)_{m \geq m_1}$ is strictly increasing. With 14.3.1.3, this yields the following continuous monomorphisms:

$$\widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} H^{(m)} \hookrightarrow \widetilde{D}^{(n_m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} G^{(n_m)} \hookrightarrow \widetilde{D}^{(n_m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} H^{(n_m)}. \tag{14.3.3.8.10}$$

By taking the inductive limit on m of the sequence 14.3.3.8.10, we get the diagram of K-vector spaces of LB-type of the form:

$$\begin{array}{ccc} \varinjlim_m \widetilde{D}^{(n_m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} G^{(n_m)} & \longrightarrow & \varinjlim_m \widetilde{D}^{(n_m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} H^{(n_m)} \\ \sim\uparrow & \nwarrow & \sim\uparrow \\ \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} G^{(m)} & \longrightarrow & \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} H^{(m)}. \end{array} \tag{14.3.3.8.11}$$

Since vertical morphisms are homeomorphisms (see 14.2.2.6.1), then so are the three other ones.

6) *Taking the limit on m for $M^{(m)}$ and $N^{(m)}$, strict homeomorphism $\beta^\dagger_Z$.*

Since $\psi^{(m)} \colon (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \to M$ is continuous, since $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s$ is a Banach K-vector space, since we have the equality $M = \cup_{m\in\mathbb{N}} M^{(m)}$ where $M^{(m)}$ are Banach K-vector spaces, then following [Sch02, 8.9], there exists $n_m \geq m$ large enough such that $\psi^{(m)}$ is the composition of a (unique) continuous morphism of the form $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \to M^{(n_m)}$ with the monomorphism $M^{(n_m)} \hookrightarrow M$. Since $N^{(m)} = \mathrm{Im}(\psi^{(m)}) = \mathrm{Im}(\psi'^{(m)})$, since $N^{(m)}$ is endowed with the quotient topology, then this continuous morphism $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \to M^{(n_m)}$ uniquely decompose into continuous morphisms as follows $(u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \underset{\psi'^{(m)}}{\twoheadrightarrow} N^{(m)} \hookrightarrow M^{(n_m)}$. On the other hand, we have the continuous injective morphism $\psi'^{(m)} \circ \theta^{(m)} \colon M^{(m)} \to N^{(m)}$ whose composition with $N^{(m)} \subset M$ gives $M^{(m)} \hookrightarrow M$. This yields the diagram of K-vector spaces of LB-type of the form:

$$\begin{array}{ccc} \varinjlim_m \widetilde{D}^{(n_m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} M^{(n_m)} & \longrightarrow & \varinjlim_m \widetilde{D}^{(n_m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} N^{(n_m)} \\ \sim\uparrow & \nwarrow & \sim\uparrow \\ \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} M^{(m)} & \longrightarrow & \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} N^{(m)}. \end{array} \tag{14.3.3.8.12}$$

Since vertical morphisms are homeomorphisms (see 14.2.2.6.1), then so are the three other ones.

Let us denote by $\beta^\dagger_{\mathfrak{X}}$ the following composite morphism:

$$\beta^\dagger_{\mathfrak{X}} \colon \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \underset{\varinjlim_m id \widehat{\otimes} \psi'^{(m)}}{\twoheadrightarrow} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} N^{(m)}$$

$$\xrightarrow{\sim} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} M^{(n_m)} \xleftarrow{\sim} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(n_m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} M^{(m)}. \tag{14.3.3.8.13}$$

Since the first morphism is a strict epimorphism and the other ones are homeomorphisms, then $\beta^\dagger_{\mathfrak{X}}$ is a strict epimorphism.

7) *First conclusion.*

By composing the strict epimorphism 14.3.3.8.4 with the bottom isomorphism of 14.3.3.8.11, we obtain the strict epimorphism of the sequence by composition :

$$\varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \twoheadrightarrow \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} H^{(m)} \hookrightarrow \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s, \tag{14.3.3.8.14}$$

the second arrow being the monomorphism of 14.3.3.8.9. The composition of morphisms of 14.3.3.8.14 will be denoted by $\alpha^\dagger_{\mathfrak{X}}$. We have the equality $\alpha^\dagger_{\mathfrak{X}} = \varinjlim_m id \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} \phi^{(m)}$.

By using the exact sequence 14.3.3.8.9 and the fact that the right arrow of 14.3.3.8.13 is a homeomorphism, this yields the exact sequence:

$$\varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \underset{\alpha^\dagger_{\mathfrak{X}}}{\longrightarrow} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \underset{\beta^\dagger_{\mathfrak{X}}}{\longrightarrow} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} M^{(m)} \to 0. \tag{14.3.3.8.15}$$

8) *Sheafification.*

i) Let $\mathfrak{B}$ be the basis of open neighborhoods of $\mathfrak{X}$ given by the affine opens endowed with local coordinates satisfying the hypotheses of the chapter 14.2 (same notation as 14.3.3.2). The presheaf on $\mathfrak{B}$ defined by

$$\mathfrak{U} \in \mathfrak{B} \mapsto \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}}} \Gamma(\mathfrak{U} \cap \mathfrak{Z}, \mathcal{M}^{(m)})$$

is in fact, by definition of $\mathcal{M}^{(m)}$, a sheaf whose associated sheaf on $\mathfrak{X}$ is $u^\sharp_+(\mathcal{M})$ (e.g. notice that $\widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}}} \Gamma(\mathfrak{U} \cap \mathfrak{Z}, \mathcal{M}^{(m)}) = \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}} \otimes_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}}} \Gamma(\mathfrak{U} \cap \mathfrak{Z}, \mathcal{M}^{(m)})$).

ii) With the notations of 14.3.3.3, as the functor "sheaf (of sets) associated to a presheaf (of sets)" commutes with filtrant inductive limits, then the sheaf associated to the presheaf

$$\mathfrak{U} \in \mathfrak{B} \mapsto \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{U}^\sharp \leftarrow \mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}}} \Gamma(\mathfrak{U} \cap \mathfrak{Z}, u^*((\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r))$$

is $\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r$, similarly for another integer than r.

iii) For any $\mathfrak{U} \in \mathfrak{B}$, let us denote by $u^\sharp_{\mathfrak{U}} \colon \mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp \hookrightarrow \mathfrak{U}^\sharp$ the exact closed immersion induced by $u^\sharp$. For any $m \geq m_1$, we have the (a priori non-exact) sequence: $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{U}^\sharp,\mathbb{Q}})^r \underset{\alpha^{(m)}|\mathfrak{U}}{\longrightarrow} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{U}^\sharp,\mathbb{Q}})^s \underset{\beta^{(m)}|\mathfrak{U}}{\longrightarrow} \mathcal{E}|\mathfrak{U} \to 0$. Similarly to 14.3.3.8.15, (it is sufficient to replace $u^\sharp$ by $u^\sharp|\mathfrak{U}$), we get the exact sequence

$$\varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{U} \leftarrow \mathfrak{Z} \cap \mathfrak{U},\mathbb{Q}} \widehat{\otimes} u^*_{\mathfrak{U}} (\widetilde{D}^{(m)}_{\mathfrak{U}^\sharp,\mathbb{Q}})^r \underset{\alpha^\dagger_{\mathfrak{U}}}{\longrightarrow} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{U} \leftarrow \mathfrak{Z} \cap \mathfrak{U},\mathbb{Q}} \widehat{\otimes} u^*_{\mathfrak{U}} (\widetilde{D}^{(m)}_{\mathfrak{U}^\sharp,\mathbb{Q}})^s \underset{\beta^\dagger_{\mathfrak{U}}}{\longrightarrow} \varinjlim_m \widetilde{D}^{(m)}_{\mathfrak{U} \leftarrow \mathfrak{Z} \cap \mathfrak{U},\mathbb{Q}} \widehat{\otimes} \Gamma(\mathfrak{U} \cap \mathfrak{Z}, \mathcal{M}^{(m)}) \to 0.$$

where $\widehat{\otimes} := \widehat{\otimes}_{\widetilde{D}^{(m)}_{\mathfrak{Z}^\sharp \cap \mathfrak{U}^\sharp,\mathbb{Q}}}$, $\alpha^\dagger_{\mathfrak{U}}$ and $\beta^\dagger_{\mathfrak{U}}$ are defined similarly to 14.3.3.8.13. Since these exact sequences are functorial in $\mathfrak{U}$, since the sheaf associated to a presheaf functor is exact, we get then the exact sequence:

$$\varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^r \underset{\varinjlim_m id \widehat{\otimes} u^* \alpha^{(m)}}{\longrightarrow} \varinjlim_m \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp \leftarrow \mathfrak{Z}^\sharp,\mathbb{Q}} \widehat{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp,\mathbb{Q}}} (u^* \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp,\mathbb{Q}})^s \to u^\sharp_+(\mathcal{M}) \to 0. \qquad (14.3.3.8.16)$$

9) *End of the proof.* Since the functor $\mathcal{H}^{\dagger e}_Z$ is right exact (in the category of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules), then the cokernel of $\mathcal{H}^{\dagger e}_Z(\alpha)$ is isomorphic to $\mathcal{H}^{\dagger e}_Z(\mathcal{E})$. Moreover, it follows from the lemma 14.3.3.6 and the exact sequence 14.3.3.8.16, that the cokernel of $\mathcal{H}^{\dagger e}_Z(\alpha)$ is isomorphic to $u^\sharp_+\mathcal{M}$. Since $u^*(\mathcal{E}) = \mathcal{M}$, so we have checked $\mathcal{H}^{\dagger e}_Z(\mathcal{E}) \xrightarrow{\sim} u^\sharp_+ u^*(\mathcal{E})$. Finally, as u is proper and $u^*(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module, then $u^\sharp_+ u^*(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module. □

Corollary 14.3.3.9. *We suppose that $u \colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ is of pure codimension 1. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module such that $H^0 u^{\sharp!}(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module and that $\mathcal{H}^1 u^{\sharp!}(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module which is also a locally projective of finite type $\mathcal{O}_{\mathfrak{Z}}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module for the induced structure. Then the complex $\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E})$ is $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-coherent.*

Proof. Via the distinguished triangle $\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E}) \to \mathcal{E} \to ({}^\dagger Z)(\mathcal{E}) \to +1$, since $({}^\dagger Z)(\mathcal{E})$ is a module, this yields that $\mathcal{H}^{\dagger i}_Z(\mathcal{E}) = 0$ for any $i \notin \{0, 1\}$. The $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-coherence of the complex $\mathbb{R}\underline{\Gamma}^\dagger_Z(\mathcal{E})$ is then a consequence of 14.3.2.1 and of 14.3.3.8. □

Corollary 14.3.3.10. *We suppose that $u \colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ is of pure codimension 1. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module such that $H^0 u^{\sharp!}(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module and that $\mathcal{H}^1 u^{\sharp!}(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Z}^\sharp}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module which is also an $\mathcal{O}_{\mathfrak{Z}}({}^\dagger T \cap Z)_{\mathbb{Q}}$-module locally projective of finite type for the induced structure. Let $\mathcal{E}^{(\bullet)}$ be an object of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$ such that $\mathcal{E} \xrightarrow{\sim} \varinjlim (\mathcal{E}^{(\bullet)})$. Then $u^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\sharp})$.*

Proof. This is a consequence of 14.3.3.9 and 14.3.3.1. □

Remark 14.3.3.11. We keep the notations and hypotheses of theorem 14.3.3.1.

(a) If one of the equivalent conditions of the theorem 14.3.3.1 is satisfied then we have the isomorphism $u^{\sharp}_{+} \circ u^{\sharp !}(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E})$ (in the left term, the functors $u^{\sharp}_{+}$ and $u^{\sharp !}$ are computed in the respective categories of coherent $\mathcal{D}^{\dagger}$-modules).

(b) On the other hands, if we only suppose that $u^{\sharp !}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Z}^{\sharp}}({}^{\dagger}T \cap Z)_{\mathbb{Q}})$, then it is not clear that $u^{\sharp}_{+} \circ u^{\sharp !}(\mathcal{E})$ (the functors $u^{\sharp}_{+}$ and $u^{\sharp !}$ are computed in the categories of coherent $\mathcal{D}^{\dagger}$-modules) is isomorphic to $\varinjlim \circ u^{\sharp(\bullet)}_{+} \circ u^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}) = \mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E})$. Indeed, then it is not clear that the coherence of $u^{\sharp !}(\mathcal{E})$ implies $u^{\sharp(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^{\sharp}})$. A priori, to ensure with such implication, we need additional conditions (e.g. 14.3.3.10).

Chapter 15

Holonomicity, overcoherence

Suppose the residue field k of $\mathcal{V}$ is perfect.

15.1 Characteristic varieties

15.1.1 Cotangent space

Let X be a smooth k-variety. For any quasi-coherent $\mathcal{O}_X$-module $\mathcal{E}$, we denote by $\mathrm{Sym}(\mathcal{E})$ the symetric algebra of $\mathcal{E}$ and by $\mathbb{V}(\mathcal{E}) := \mathrm{Spec}(\mathrm{Sym}(\mathcal{E}))$ endowed with its canonical projection $\mathbb{V}(\mathcal{E}) \to \mathrm{Spec}\,\mathrm{Sym}(\mathcal{O}_X) = X$. We denote by Ω^1_X the sheaf of differential form of $X/\mathrm{Spec}(k)$ (we skip k in the notation), and $\mathcal{T}_X$ the tangent space of $X/\mathrm{Spec}(k)$, i.e. the $\mathcal{O}_X$-dual of Ω^1_X. We denote by $T^*X := \mathbb{V}(\mathcal{T}_X)$ the cotangent space of X and $\pi_X \colon T^*X \to X$ the canonical projection. Recall that from [Gro61, 1.7.9], there is a canonical bijection between sections of π_X and $\Gamma(X, \Omega^1_X)$. We denote by $T^*_X X$ the section corresponding to the zero section of $\Gamma(X, \Omega^1_X)$. If $t_1, \dots, t_d$ are local coordinates of X, we get local coordinates $t_1, \dots, t_d, \xi_1, \dots, \xi_d$ of T^*X, where ξ_i is the element associated with ∂_i, the derivation with respect to t_i. Is this case, $T^*_X X = V(\xi_1, \dots, \xi_d)$ is the closed subvariety of T^*X defined by $\xi_1 = 0, \dots, \xi_d = 0$.

Let $f \colon X \to Y$ be a morphism of smooth k-varieties. Using the equality [Gro61, 1.7.11.(iv)] we get the last one $X \times_Y T^*Y = X \times_Y \mathbb{V}(\mathcal{T}_Y) = \mathbb{V}(f^*\mathcal{T}_Y)$. The morphism $f^*\Omega^1_Y \to \Omega^1_X$ induced by f yields by duality $\mathcal{T}_X \to f^*\mathcal{T}_Y$ and then by functoriality $\mathbb{V}(f^*\mathcal{T}_Y) \to \mathbb{V}(\mathcal{T}_X) = T^*X$. By composition, we get the morphism denoted by $\rho_f \colon X \times_Y T^*Y \to T^*X$. We will write by $\varpi_f \colon X \times_Y T^*Y \to T^*Y$ the base change of f under π_Y.

We denote by $\mathscr{T}_f$ the function from the set of subvarieties of T^*X to the set of subvarieties of T^*Y defined by setting, for any subvariety V of T^*X, $\mathscr{T}_f(V) := \varpi_f(\rho_f^{-1}(V))$. If f is an open immersion, then ρ_f is an isomorphism. In that case, $\mathscr{T}_f := \varpi_f \circ \rho_f^{-1} \colon T^*X \to T^*Y$ is an open immersion and this is compatible with the above definition of $\mathscr{T}_f$. The application $\mathscr{T} : f \mapsto \mathscr{T}_f$ is transitive (with respect to the composition), i.e. we have the equality $\mathscr{T}_g \circ \mathscr{T}_f = \mathscr{T}_{g \circ f}$ for any $g \colon Y \to Z$ (e.g. look at the bottom of the diagram **??** where f and u are replaced respectively by g and f).

We define the k-variety $T^*_X Y$ (recall a k-variety is a separated reduced scheme of finite type over k from our convention) by setting $T^*_X Y := \rho_f^{-1}(T^*_X X)$. When f is an immersion, $T^*_X Y$ is viewed as a subvariety of T^*Y via $T^*_X Y \subset X \times_Y T^*Y \overset{\varpi_f}{\hookrightarrow} T^*Y$, i.e. we will simply denote $\varpi_f(T^*_X Y)$ by $T^*_X Y$.

15.1.2 Cotangent space of level m

Set $S := \mathrm{Spec}\,k$, $m \in \mathbb{N}$.

Notation 15.1.2.1. We denote by $F_X \colon X \to X$ be the absolute Frobenius morphism. We denote by $X^{(m)}$ the base change of X by F^m_S the mth power of Frobenius of S, and by $F^m_{X/S} \colon X \to X^{(m)}$ the relative Frobenius morphism. We get the equality $F^m_X = \mathrm{id} \times F^m_S \circ F^m_{X/S}$

15.1.2.2 (Universal homeomorphism)**.** Let $f \colon X \to Y$ be a morphism of schemes.

1. Following Definitions [Gro60, 3.5.4] (and Remark [Gro60, 3.5.11]) or [Gro65, 2.4.2], f is by definition a universal homeomorphism (resp. is universally injective) if for any morphism of schemes $g\colon Y' \to Y$, the morphism $f_{Y'}\colon X \times_Y Y' \to Y'$ is a homeomorphism (resp. is injective).

2. Some authors use the name of "purely inseparable" (e.g. [Liu02, 5.3.13]) or "radicial" (e.g. [Gro60, 3.5.4]) instead of "universally injective". From Definition [Gro60, 3.5.4], Proposition [Gro60, 3.5.8] and Remark [Gro60, 3.5.11], the following conditions are equivalent:

   (a) f is universally injective ;

   (b) for any field K, the map $X(K) \to Y(K)$ is injective ;

   (c) f is injective and for any point x of X the monomorphism of the residue fields $k(f(x)) \to k(x)$ induced by f is purely inseparable (some authors say "radicial" instead of "purely inseparable").

3. Suppose now that $f\colon X \to Y$ is a morphism of k-varieties. Using Proposition [Gro65, 2.4.5], we check that f is a universal homeomorphism if and only if f is finite, surjectif and radicial.

Lemma 15.1.2.3. *Let X be a S-variety. Then the relative Frobenius $F^m_{X/S}\colon X \to X^{(m)}$, the morphism $F^m_S\colon X^{(m)} \to X$ (induced from F^m_S by base change) and the absolute Frobenius morphism $F^m_{X/S}\colon X \to X$ (equal to $F^m_X = F^m_S \circ F^m_{X/S}$) are universal homeomorphisms.*

Proof. From the characterization 15.1.2.2.3, $F^m_S\colon S \to S$ is a universal homeomorphism. Hence, by stability of this property by base change we get that $F^m_S\colon X^{(m)} \to X$ is a universal homeomorphism. From Lemma [Liu02, 3.2.25], we check that $F^m_{X/S}$ is finite. Hence, so is by composition F^m_X. Since F^m_X induces the identity on the underlying topological space, F^m_X is bijective. Moreover, the monomorphism of the residue fields $k(x) \to k(x)$ induced by F^m_X is the sth power of the Frobenius, hence it is radicial. From 15.1.2.2.2.(c), this yields that F^m_X is radicial. From 15.1.2.2.2.(b), this implies that $F^m_{X/S}$ is also radicial. With the characterization 15.1.2.2.3, we get that $F^m_{X/S}$ and F^m_X are universal homeomorphisms. □

Notation 15.1.2.4. Let X be a smooth S-scheme The sheaf $\mathcal{D}^{(m)}_{X/S}$ is equipped with the order filtration of differential operators. Its associated graded ring $\operatorname{gr}\mathcal{D}^{(m)}_{X/S}$ is a quasi-coherent, commutative $\mathcal{O}_X$-algebra. We will denote by $T^{(m)*}X$, and we will call *the cotangent space of level m of X*, the reduced scheme

$$T^{(m)*}X := (\operatorname{Spec}(\operatorname{gr}\mathcal{D}^{(m)}_{X/S}))_{\mathrm{red}}.$$

Example 15.1.2.5. With notation 15.1.2.4, when $m = 0$, following 2.3.3.2, we have the canonical isomorphism $\mathbb{S}(\mathcal{T}_{X/S}) \xrightarrow{\sim} \operatorname{gr}\mathcal{D}^{(0)}_{X/S}$, so that $T^{(0)*}X$ is the usual cotangent fiber $T * X$.

15.1.2.6 (Local description and notation)**.** Let X be affine S-scheme such that X/S is endowed with coordinates $t_1, \dots, t_d$. Let $i \in \{1, \dots, d\}$. Let $j < m$ be an integer. It follows from the formula 1.4.2.7.(c) that we have the equality $(\partial_i^{<p^j>_{(m)}})^p = \left(\prod_{l=2}^p \left\langle {lp^j \atop (l-1)p^j} \right\rangle_{(m)}\right) \partial_i^{<p^{j+1}>_{(m)}}$. Using the formula 1.2.1.4.1, we compute $v_p\left(\left\langle {lp^j \atop (l-1)p^j} \right\rangle_{(m)}\right) = 1$. Hence, $(\partial_i^{<p^j>_{(m)}})^p = 0$ in $\mathcal{D}^{(m)}_{X/S}$. From 1.2.1.5.(b) and 1.4.2.7.(c), for any $l \in \mathbb{N}$, we compute that there exists $u \in \mathbb{Z}_p^*$ such that $(\partial_i^{<p^m>_{(m)}})^l = u\partial_i^{<p^m l>_{(m)}}$. Let $\xi_i^{(m)}$ be the class of $\partial_i^{<p^m>_{(m)}} = \partial_i^{[p^m]}$ in $(\operatorname{gr}\mathcal{D}^{(m)}_{X/S})_{\mathrm{red}}$. Hence, with the formula 1.4.2.8.3 (the factors of this latter formula commute two by two), we get the canonical isomorphism of $\mathcal{O}_X$-algebras

$$\mathcal{O}_X[x_1, \dots, x_d] \xrightarrow{\sim} (\operatorname{gr}\mathcal{D}^{(m)}_{X/S})_{\mathrm{red}} \qquad (15.1.2.6.1)$$

given by $x_i \mapsto \xi_i^{(m)}$.

Lemma 15.1.2.7. *Let X be a smooth S-scheme. There exists a canonical isomorphism*

$$X \times_{X^{(m)}} T^*X^{(m)} \xrightarrow{\sim} T^{(m)*}X. \qquad (15.1.2.7.1)$$

Proof. We reduce to check that the canonical morphism morphism $(\operatorname{gr}\mathcal{D}^{(m)}_{X/S})_{\mathrm{red}} \to F^{m*}_{X/S}\operatorname{gr}\mathcal{D}^{(0)}_{X^{(m)}/S}$ induced by the morphism $\mathcal{D}^{(m)}_{X/S} \to F^{m*}_{X/S}\mathcal{D}^{(0)}_{X^{(m)}/S}$ of left $\mathcal{D}^{(m)}_{X/S}$-modules is an isomorphism. Since this is local, we can suppose we are in the local situation of 15.1.2.6. Following 6.1.1.8.3, the image of $\partial_i^{<k>_{(m)}}$ via $\mathcal{D}^{(m)}_{X/S} \to F^{m*}_{X/S}\mathcal{D}^{(0)}_{X^{(m)}/S}$ is $1 \otimes \partial_i^{k/p^m}$ if p^m divides k and otherwise is 0. Hence, $\xi_i^{(m)}$ is sent to $1 \otimes \xi_i$, where ξ_i is the class of ∂_i in $\operatorname{gr}\mathcal{D}^{(0)}_{X^{(m)}/S}$, i.e. we get the commutative diagram

$$\begin{array}{ccc}
\mathcal{O}_X[x_1,\dots,x_d] & \xrightarrow[\text{15.1.2.6.1}]{\sim} & (\operatorname{gr}\mathcal{D}^{(m)}_{X/S})_{\mathrm{red}} \\
\downarrow{\scriptstyle\sim} & & \downarrow \\
\mathcal{O}_X \otimes_{\mathcal{O}_{X^{(m)}}} \mathcal{O}_{X^{(m)}}[x_1,\dots,x_d] & \xrightarrow[\text{15.1.2.6.1}]{\sim} & \mathcal{O}_X \otimes_{\mathcal{O}_{X^{(m)}}} (\operatorname{gr}\mathcal{D}^{(0)}_{X^{(m)}/S}).
\end{array}$$

□

15.1.2.8. Since $(F^m_S)^*\Omega^1_{X/S} \xrightarrow{\sim} \Omega^1_{X^{(m)}/S}$ then $(F^m_S)^*\mathcal{T}_{X/S} \xrightarrow{\sim} \mathcal{T}_{X^{(m)}/S}$ and therefore

$$: X^{(m)} \times_X T^*X \xrightarrow{\sim} S \times_{F^m_S, S} T^*X \xrightarrow{\sim} T^*X^{(m)}. \qquad (15.1.2.8.1)$$

Hence, it follows from 15.1.2.7.1 and 15.1.2.3 that we have the canonical universal homeomorphism $\iota^{(m)}_{X/S} \colon T^{(m)*}X \to T^*X^{(m)}$ and $\iota^{(m)}_S \colon T^*X^{(m)} \to T^*X$. Setting $\iota^{(m)}_X := \iota^{(m)}_S \circ \iota^{(m)}_{X/S} \colon T^*X \to T^{(m)*}X$ we get the following cartesian diagram

$$\begin{array}{ccccc}
T^{(m)*}X & \xrightarrow{\iota^{(m)}_{X/S}} & T^*X^{(m)} & \xrightarrow{\iota^{(m)}_S} & T^*X, \\
\downarrow & \square & \downarrow & \square & \downarrow \\
X & \xrightarrow{F^m_{X/S}} & X^{(m)} & \xrightarrow{F^m_S} & X
\end{array} \qquad (15.1.2.8.2)$$

where the vertical arrows are the canonical ones. In particular, we get the homeomorphism

$$\iota^{(m)}_X \colon |T^{(m)*}X| \xrightarrow{\sim} |T^*X|, \qquad (15.1.2.8.3)$$

which may allow us to identify the closed parts of $|T^{(m)*}X|$ and $|T^*X|$.

15.1.3 The characteristic variety of a coherent $\mathcal{D}^{(m)}_{X/S}$-module

Let $i, m \in \mathbb{N}$. Let X_i be a smooth variety over $S_i = \operatorname{Spec}\mathcal{V}/\pi^{i+1}\mathcal{V}$. Let X be the reduction of X_i modulo π.

15.1.3.1. Let $\mathcal{K}$ be the kernel of the epimorphism $\operatorname{gr}\mathcal{D}^{(m)}_{X_i/S_i} \twoheadrightarrow \operatorname{gr}\mathcal{D}^{(m)}_{X/S}$. Since $\mathcal{K}^{i+1} = 0$, then

$$T^{(m)*}X = (\operatorname{Spec}(\operatorname{gr}\mathcal{D}^{(m)}_{X_i/S_i}))_{\mathrm{red}}. \qquad (15.1.3.1.1)$$

Hence, $|\operatorname{Spec}(\operatorname{gr}\mathcal{D}^{(m)}_{X_i/S_i})| = |T^{(m)*}X| \xrightarrow{\sim} |T^*X|$.

Definition 15.1.3.2. Let $\mathcal{E}$ be a coherent left or right $\mathcal{D}^{(m)}_{X_i/S_i}$-module.

(a) Choose a good filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ (see the definition 4.1.3.8 or 4.1.3.27 for the right version), i.e. a filtration such that $\operatorname{gr}\mathcal{E}$ is a coherent $\operatorname{gr}\mathcal{D}^{(m)}_{X_i/S_i}$-module (see Theorem 4.1.3.25 which is still valid for the right version). The characteristic variety of level m of $\mathcal{E}$, denoted by $\operatorname{Car}^{(m)}(\mathcal{E})$ is by definition the image by the homeomorphism $\iota^{(m)}$ (see 15.1.2.8.3) of the support of $\operatorname{gr}\mathcal{E}$ in $T^{(m)*}X$ (see 15.1.3.1.1). By using the inclusions 4.1.3.10.1, we can copy the standard proof (e.g. see [HTT08, D.3.1]) of the fact that $\operatorname{Car}^{(m)}(\mathcal{E})$ does not depend on the choice of a good filtration.

(b) Suppose $\mathcal{E}$ is a left $\mathcal{D}^{(m)}_{X_i/S_i}$-module. If $(\mathcal{E}_n)_{n\in\mathbb{N}}$ is a good filtration of $\mathcal{E}$ then $(\omega_{X_i/S_i}\otimes_{\mathcal{O}_{X_i}}\mathcal{E}_r)_{r\in\mathbb{N}}$ is a good filtration of $\omega_{X_i/S_i}\otimes_{\mathcal{O}_{X_i}}\mathcal{E}$. Hence, we get

$$\mathrm{Car}^{(m)}(\mathcal{E})=\mathrm{Car}^{(m)}(\omega_{X_i/S_i}\otimes_{\mathcal{O}_{X_i}}\mathcal{E}).$$

To simplify the statements, we will focus later on left modules case but the right versions will obviously be valid.

(c) The "dimension of level m of $\mathcal{E}$" is defined by setting $\dim^{(m)}(\mathcal{E}):=\dim\mathrm{Car}^{(m)}(\mathcal{E})$. The "codimension of level m of $\mathcal{E}$" is defined by setting $\mathrm{codim}^{(m)}(\mathcal{E}):=2\dim X-\dim^{(m)}(\mathcal{E})$.

(d) Let $\mathcal{F}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{X_i/S_i})$ By definition, we define the characteristic variety of this complex by setting $\mathrm{Car}^{(m)}(\mathcal{F}):=\cup_r\mathrm{Car}^{(m)}(H^r(\mathcal{F}))$.

Example 15.1.3.3. Let $\mathcal{E}$ be a coherent $\mathcal{D}^{(m)}_{X_i/S_i}$-module. We have $\mathcal{E}=0$ if and only if $\mathrm{Car}^{(m)}(\mathcal{E})$ is empty.

15.1.3.4 (Conicity)**.** Let $\mathcal{E}$ be a coherent left $\mathcal{D}^{(0)}_{X_0/S_0}$-module. The characteristic variety $\mathrm{Car}^{(0)}(\mathcal{E})$ is conic, i.e. the following properties hold. Let $s\in\mathrm{Car}^{(0)}(\mathcal{E})$ and $x:=\pi_X(s)$. Then $\pi_X^{-1}(x)\cap\mathrm{Car}^{(0)}(\mathcal{E})$ is a closed subscheme of $\pi_X^{-1}(x)$ defined by an homogeneous ideal. More precisely, if X_0/S_0 is endowed with coordinates $t_1,\dots,t_d$, then the ideal defining $\pi_X^{-1}(x)\cap\mathrm{Car}^{(0)}(\mathcal{E})$ is an homegenous ideal of $k(x)[\xi_1,\dots,\xi_d]$. In particular, we get the inequality (that we will need to check 15.1.5.5):

$$\text{For any } s\in\mathrm{Car}^{(0)}(\mathcal{E})\setminus T^*_XX,\text{ we have }\dim\left(\pi_X^{-1}(\pi_X(s))\cap\mathrm{Car}^{(0)}(\mathcal{E})\right)\geq 1 \qquad (15.1.3.4.1)$$

Lemma 15.1.3.5. *Let $0\to\mathcal{E}'\to\mathcal{E}\to\mathcal{E}''\to 0$ be an exact sequence of coherent left $\mathcal{D}^{(m)}_{X_i/S_i}$-modules. We have the equality*

$$\mathrm{Car}^{(m)}(\mathcal{E})=\mathrm{Car}^{(m)}(\mathcal{E}')\cup\mathrm{Car}^{(m)}(\mathcal{E}''). \qquad (15.1.3.5.1)$$

In particular, we have the formula $\mathrm{codim}^{(m)}(\mathcal{E})=\min\{\mathrm{codim}^{(m)}(\mathcal{E}'),\mathrm{codim}^{(m)}(\mathcal{E}'')\}$.

Proof. Choose a good filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ of $\mathcal{E}$. Denote by $\epsilon\colon\mathcal{E}\to\mathcal{E}''$ the surjection. Following 4.1.3.26, the filtrations of $\mathcal{E}'$, $\mathcal{E}''$ defined by: $\mathcal{E}'_n:=\mathcal{E}_n\cap\mathcal{E}'$, $\mathcal{E}''_n=\epsilon(\mathcal{E}_n)$ are good. With theses filtrations, we get the exact sequence $0\to\mathrm{gr}\,\mathcal{E}'\to\mathrm{gr}\,\mathcal{E}\to\mathrm{gr}\,\mathcal{E}''\to 0$. Hence, we are done. □

Lemma 15.1.3.6. *Let $\mathcal{E}$ be coherent left $\mathcal{D}^{(m)}_{X_i/S_i}$-module. For any integer $0\leq i'\leq i$, we have the equality*

$$\mathrm{Car}^{(m)}(\mathcal{E})=\mathrm{Car}^{(m)}(\mathcal{E}/\pi^{i'+1}\mathcal{E}). \qquad (15.1.3.6.1)$$

Proof. Let $i\in\mathbb{N}$. We proceed by induction on i. When $i=0$, this is obvious. Suppose $i\geq 1$ and the Lemma holds for $i-1$. Let $0\leq i'\leq i$.

a) The multiplication by π^i induces the surjective $\mathcal{D}^{(m)}_{X_i/S_i}$-linear map $\mathcal{E}/\pi^i\mathcal{E}\to\pi^i\mathcal{E}$. From 15.1.3.5.1, this yields $\mathrm{Car}^{(m)}(\pi^i\mathcal{E})\subset\mathrm{Car}^{(m)}(\mathcal{E}/\pi^i\mathcal{E})$. By using the exact sequence $0\to\pi^i\mathcal{E}\to\mathcal{E}\to\mathcal{E}/\pi^i\mathcal{E}\to 0$, we get $\mathrm{Car}^{(m)}(\mathcal{E})=\mathrm{Car}^{(m)}(\pi^i\mathcal{E})\cup\mathrm{Car}^{(m)}(\mathcal{E}/\pi^i\mathcal{E})$. Hence, $\mathrm{Car}^{(m)}(\mathcal{E})=\mathrm{Car}^{(m)}(\mathcal{E}/\pi^i\mathcal{E})$, i.e. 15.1.3.6.1 holds when $i'=i$.

b) When $i'<i$, since $\mathcal{E}/\pi^{i'+1}\mathcal{E}\xrightarrow{\sim}(\mathcal{E}/\pi^i\mathcal{E})/\pi^{i'+1}(\mathcal{E}/\pi^i\mathcal{E})$, then from the induction hypothesis, we have $\mathrm{Car}^{(m)}(\mathcal{E}/\pi^i\mathcal{E})=\mathrm{Car}^{(m)}(\mathcal{E}/\pi^{i'+1}\mathcal{E})$. Hence, we are done. □

Lemma 15.1.3.7. *Let $F\colon X_i\to X'_i$ be a lifting of $F^s_{X/S}\colon X\to X^{(s)}$, the sth relative Frobenius of X/S. Let $\mathcal{E}'$ be a coherent left $\mathcal{D}^{(m)}_{X'_i/S_i}$-module. Then we have in $|T^*X|$ the equality:*

$$\iota^{(s)}_S(\mathrm{Car}^{(m)}(\mathcal{E}'))=\mathrm{Car}^{(m+s)}(F^*\mathcal{E}'), \qquad (15.1.3.7.1)$$

where $\iota^{(s)}_S\colon T^*X^{(s)}\to T^*X$ is the canonical universal homeomorphism induced by base change via F^s_S (see 15.1.2.8.2).

Proof. With 15.1.3.6, we can suppose $i = 0$.

1) We reduce to the case where $m = 0$ as follows. Let $F_S^s := (F_S^s \times \mathrm{id}, F_S^s)\colon X^{(s)}/S \to X/S$ be the canonical isomorphism induced by the sth power of Frobenius of S. Let $\mathcal{E}$ be a coherent left $\mathcal{D}^{(m)}_{X/S}$-module such that $\mathcal{E}' \xrightarrow{\sim} (F_S^s)^*\mathcal{E}$. Since $\iota_S^{(s)}(\mathrm{Car}^{(m)}(\mathcal{E}')) = \mathrm{Car}^{(m)}(\mathcal{E})$, then the formula 15.1.3.7.1 holds if and only if $\mathrm{Car}^{(m)}(\mathcal{E}) = \mathrm{Car}^{(m+s)}((F_X^s)^*\mathcal{E})$. Since the functor $\mathcal{E} \mapsto (F_X^s)^*\mathcal{E}$ is an equivalence of categories between the coherent left $\mathcal{D}^{(m)}_{X/S}$-modules and the coherent left $\mathcal{D}^{(m+s)}_{X/S}$-module (this follows from the Frobenius descent 6.1.1.9 and $F_S^s \circ F_{X/S}^s = F_X^s$), then by transitivity , we can suppose $m = 0$ (and s may vary).

2) We check the equality 15.1.3.7.1 in the case where $i = 0$ and $m = 0$. We set $X' := X^{(s)}$ and $F = F^s_{X/S}$. Since $\mathcal{E}'$ is a quasi-coherent $\mathcal{O}_{X'}$-module, then it is the inductive limit of its coherent $\mathcal{O}_{X'}$-submodules (see [Gro60, 9.4.9]). Hence, there exists a coherent $\mathcal{O}_{X'}$-submodule $\mathcal{G}'$ of $\mathcal{E}'$ such that the canonical $\mathcal{D}^{(m)}_{X'/S}$-linear map $\varpi\colon \mathcal{D}^{(0)}_{X'/S} \otimes_{\mathcal{O}_{X'}} \mathcal{G}' \twoheadrightarrow \mathcal{E}'$ is surjective. This yields the good filtration $(\mathcal{E}'_l)_{l\in\mathbb{N}}$ by setting $\mathcal{E}'_l = \varpi(\mathcal{D}^{(0)}_{X'/S,l} \otimes_{\mathcal{O}_{X'}} \mathcal{G}')$. Since $\mathcal{D}^{(s)}_{X/S} \to F^*\mathcal{D}^{(0)}_{X'/S}$ is $(\mathcal{D}^{(s)}_{X/S}, F^{-1}\mathcal{O}_{X'})$-bilinear (see 4.4.2.8), we get the surjective $\mathcal{D}^{(s)}_{X/S}$-linear maps $\varpi^{(s)}\colon \mathcal{D}^{(s)}_{X/S} \otimes_{\mathcal{O}_X} F^*\mathcal{G}' \xrightarrow{\sim} \mathcal{D}^{(s)}_{X/S} \otimes_{F^{-1}\mathcal{O}_{X'}} F^{-1}\mathcal{G}' \twoheadrightarrow F^*\mathcal{D}^{(0)}_{X/S} \otimes_{F^{-1}\mathcal{O}_{X'}} F^{-1}\mathcal{G}' \overset{F^*(\varpi)}{\twoheadrightarrow} F^*\mathcal{E}'$. Via the formula 6.1.1.8.3, we compute the induced good filtration of $F^*\mathcal{E}'$ is

$$\mathrm{Fil}_n F^*\mathcal{E}' := \varpi^{(s)}(\mathcal{D}^{(s)}_{X/S,n} \otimes_{\mathcal{O}_X} F^*\mathcal{G}') = F^*\mathcal{E}'_{q_n^{(s)}},$$

where $q_n^{(s)}$ is the quotient of the Euclidian division of n by p^s. We compute $\mathrm{gr}_{p^s n} F^*\mathcal{E}' \xrightarrow{\sim} F^* \mathrm{gr}_n \mathcal{E}'$, and $\mathrm{gr}_N F^*\mathcal{E}' = 0$ if p^s does not divides N. Recall the canonical map $\mathcal{D}^{(s)}_{X/S} \to F^*\mathcal{D}^{(0)}_{X'/S}$ induces the isomorphism $(\mathrm{gr}\,\mathcal{D}^{(s)}_{X/S})_{\mathrm{red}} \xrightarrow{\sim} F^*\,\mathrm{gr}\,\mathcal{D}^{(0)}_{X^{(s)}/S}$ (see the proof of 15.1.2.7), which is translated by the isomorphism $X \times_{X^{(s)}} T^*X^{(s)} \xrightarrow{\sim} T^{(s)*}X$ of 15.1.2.7.1. Via the above computation, the corresponding coherent $F^*\,\mathrm{gr}\,\mathcal{D}^{(0)}_{X'/S}$-module associated with the coherent $(\mathrm{gr}\,\mathcal{D}^{(s)}_{X/S})_{\mathrm{red}}$-module $\mathrm{gr}\,F^*\mathcal{E}'$ is therefore $F^*\,\mathrm{gr}\,\mathcal{D}^{(0)}_{X'/S} \otimes_{\mathrm{gr}\,\mathcal{D}^{(0)}_{X'/S}} \mathrm{gr}\,\mathcal{E}'$. Hence $\mathrm{gr}\,F^*\mathcal{E}' \xrightarrow{\sim} \iota^{(s)}_{S*}\iota^{(s)*}_S\,\mathrm{gr}\,\mathcal{E}'$. On one hand $\mathrm{Car}^{(s)}(F^*\mathcal{E}') = \iota^{(s)}_*\,\mathrm{Supp}\,\mathrm{gr}\,F^*\mathcal{E}'$. On the other hand, since $\iota^{(s)}_S$ is a flat universal homeomorphism, then $\mathrm{Supp}\,\iota^{(s)}_{S*}\iota^{(s)*}_S\,\mathrm{gr}\,\mathcal{E}' = \mathrm{Supp}\,\mathrm{gr}\,\mathcal{E}'$. □

15.1.4 The characteristic variety of a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module

Let $\mathfrak{P}$ be a smooth $\mathcal{V}$-formal scheme, P_i be the reduction of $\mathfrak{P}$ modulo π^{i+1}, P be the reduction of $\mathfrak{P}$ modulo π. Let $m \in \mathbb{N}$ be an integer.

Definition 15.1.4.1. Let $\mathcal{E}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module.

(a) The "characteristic variety $\mathrm{Car}^{(m)}(\mathcal{E})$ of level m" of $\mathcal{E}$ is by definition the characteristic variety of level m of $\mathcal{E}/\pi\mathcal{E}$ as coherent $\mathcal{D}^{(m)}_P$-module, i.e. $\mathrm{Car}^{(m)}(\mathcal{E}) := \mathrm{Car}^{(m)}(\mathcal{E}/\pi\mathcal{E})$.

(b) The "dimension of level m of $\mathcal{E}$" is defined by setting $\dim^{(m)}(\mathcal{E}) := \dim \mathrm{Car}^{(m)}(\mathcal{E})$. The "codimension of level m of $\mathcal{E}$" is defined by setting $\mathrm{codim}^{(m)}(\mathcal{E}) := 2\dim P - \dim^{(m)}(\mathcal{E})$.

   We have the inequalities $0 \le \dim(\mathcal{E}) \le 2\dim P$ and $0 \le \mathrm{codim}(\mathcal{E}) \le 2\dim P$.

(c) We obtain the analogous constructions and definitions for right modules. Moreover, we get

$$\mathrm{Car}^{(m)}(\mathcal{E}) = \mathrm{Car}^{(m)}(\omega_{\mathfrak{P}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{P}}} \mathcal{E}).$$

Proposition 15.1.4.2. *Let $\mathcal{E}$, $\mathcal{F}$ be two p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-modules, such that there exists an isogeny $\phi\colon \mathcal{E} \to \mathcal{F}$. Then $\mathrm{Car}^{(m)}(\mathcal{E}) = \mathrm{Car}^{(m)}(\mathcal{F})$.*

Proof. Since $\mathcal{E}$ is p-torsion free, then ϕ is a monomorphism and there exists $n \in \mathbb{N}$ such that $p^{n+1}(\mathcal{F}/\phi(\mathcal{E})) = 0$. Hence $\mathrm{Tor}_1^{\mathcal{O}_{\mathfrak{P}}}(\mathcal{O}_{\mathfrak{P}}/p^{n+1}\mathcal{O}_{\mathfrak{P}}, \mathcal{F}/\phi(\mathcal{E})) \xrightarrow{\sim} \mathcal{F}/\phi(\mathcal{E})$. Since $\mathcal{F}$ is p-torsion free, then $\mathrm{Tor}_1^{\mathcal{O}_{\mathfrak{P}}}(\mathcal{O}_{\mathfrak{P}}/p^{n+1}\mathcal{O}_{\mathfrak{P}}, \mathcal{F}) =$

0. Hence, by applying the functor $\mathcal{O}_{P_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{P}}} -$ to the exact sequence $0 \to \mathcal{E} \xrightarrow{\phi} \mathcal{F} \to \mathcal{F}/\phi(\mathcal{E}) \to 0$ we get an exact triangle which induces the long exact sequence of coherent left $\mathcal{D}^{(m)}_{P_n/S_n}$-modules:

$$0 \to \mathcal{F}/\phi(\mathcal{E}) \to \mathcal{E}/p^{n+1}\mathcal{E} \to \mathcal{F}/p^{n+1}\mathcal{F} \to \mathcal{F}/\phi(\mathcal{E}) \to 0.$$

Hence, it follows from 15.1.3.5.1 that $\mathrm{Car}^{(m)}(\mathcal{E}/p^{n+1}\mathcal{E}) = \mathrm{Car}^{(m)}(\mathcal{F}/p^{n+1}\mathcal{F})$. We conclude thanks to 15.1.3.6.1. □

Definition 15.1.4.3. Let $\mathcal{E}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module.

(a) Choose a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module $\mathring{\mathcal{E}}$ such that there exists an isomorphism of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-modules of the form $\mathring{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ (see 7.5.2.8). The characteristic variety of level m of $\mathcal{E}$ denoted by $\mathrm{Car}^{(m)}(\mathcal{E})$ is by definition that of $\mathring{\mathcal{E}}$ as coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module, i.e., $\mathrm{Car}^{(m)}(\mathcal{E}) := \mathrm{Car}^{(m)}(\mathring{\mathcal{E}}/\pi\mathring{\mathcal{E}})$. It follows from 15.1.4.2 that this is well defined.

(b) The "dimension of level m of $\mathcal{E}$" is defined by setting $\dim^{(m)}(\mathcal{E}) := \dim \mathrm{Car}^{(m)}(\mathcal{E})$. The "codimension of level m of $\mathcal{E}$" is defined by setting $\mathrm{codim}^{(m)}(\mathcal{E}) := 2\dim P - \dim^{(m)}(\mathcal{E})$.

   We have the inequalities $0 \leq \dim(\mathcal{E}) \leq 2\dim P$ and $0 \leq \mathrm{codim}(\mathcal{E}) \leq 2\dim P$.

(c) We obtain the analogous constructions and definitions for right modules. Moreover, we get

$$\mathrm{Car}^{(m)}(\mathcal{E}) = \mathrm{Car}^{(m)}(\omega_{\mathfrak{P}/\mathfrak{S}} \otimes_{\mathcal{O}_{\mathfrak{P}}} \mathcal{E}).$$

Example 15.1.4.4. Let $\mathcal{E}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. The variety $\mathrm{Car}^{(m)}(\mathcal{E})$ is empty if and only if $\dim^{(m)} \mathcal{E} = 0$ if and only if $\mathcal{E} = 0$ (because, since $\mathring{\mathcal{E}}$ has no p-torsion, $\mathring{\mathcal{E}}/\pi\mathring{\mathcal{E}} = 0$ is equivalent to $\mathring{\mathcal{E}}_{\mathbb{Q}} = 0$).

Lemma 15.1.4.5. *Let $0 \to \mathcal{E}' \to \mathcal{E} \to \mathcal{E}'' \to 0$ be an exact sequence of coherent left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-modules. We have the equality*

$$\mathrm{Car}^{(m)}(\mathcal{E}) = \mathrm{Car}^{(m)}(\mathcal{E}') \cup \mathrm{Car}^{(m)}(\mathcal{E}''). \tag{15.1.4.5.1}$$

In particular, we have the formula $\mathrm{codim}^{(m)}(\mathcal{E}) = \min\{\mathrm{codim}^{(m)}(\mathcal{E}'), \mathrm{codim}^{(m)}(\mathcal{E}'')\}$.

Proof. Choose a morphism of p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-modules $g\colon \mathcal{F} \to \mathcal{F}''$ such that the induced morphism $\mathcal{F}_{\mathbb{Q}} \to \mathcal{F}''_{\mathbb{Q}}$ is isomorphic to $\mathcal{E} \to \mathcal{E}''$. Replacing $\mathcal{F}''$ by the image of g if necessary we can suppose g is surjective. Let $\mathcal{F}' := \ker g$. Then $\mathcal{F}'$ is a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module and is endowed with an isomorphism of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-modules of the form $\mathcal{F}'_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}'$. Setting $\overline{\mathcal{F}}' := \mathcal{D}^{(0)}_P \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}} \mathcal{F}'$, $\overline{\mathcal{F}} := \mathcal{D}^{(0)}_P \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}} \mathcal{F}$ and $\overline{\mathcal{F}}'' := \mathcal{D}^{(0)}_P \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}} \mathcal{F}''$ we get the exact sequence of $\mathcal{D}^{(0)}_P$-modules $0 \to \overline{\mathcal{F}}' \to \overline{\mathcal{F}} \to \overline{\mathcal{F}}'' \to 0$. Hence, this is a consequence of 15.1.3.5. □

Lemma 15.1.4.6. *Let $F\colon \mathfrak{P} \to \mathfrak{P}'$ be a morphism of smooth $\mathfrak{S}$-formal schemes which is a lifting of $F^s_{P/S}$. Let $\mathcal{E}'$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}}$-module. Then we have in $|T^*P|$ the equality:*

$$\iota^{(s)}_S(\mathrm{Car}^{(m)}(\mathcal{E}')) = \mathrm{Car}^{(m+s)}(F^*\mathcal{E}'),$$

where $\iota^{(s)}_S\colon T^*X^{(s)} \to T^*X$ is the canonical universal homeomorphism induced by base change via F^s_S (see 15.1.2.8.2).

Proof. Choose a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'/\mathfrak{S}}$-module $\mathring{\mathcal{E}}'$ such that there exists an isomorphism of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}}$-modules of the form $\mathring{\mathcal{E}}'_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}'$. By definition, $\mathrm{Car}^{(m)}(\mathcal{E}') = \mathrm{Car}^{(m)}(\mathring{\mathcal{E}}') = \mathrm{Car}^{(m)}(\mathring{\mathcal{E}}'/\pi\mathring{\mathcal{E}}')$. On the other hand, since $F^*\mathring{\mathcal{E}}'$ is a p-torsion free coherent $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{P}/\mathfrak{S}}$-module, since we have an isomorphism of $\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}$-modules of the form $(F^*\mathring{\mathcal{E}}')_{\mathbb{Q}} \xrightarrow{\sim} F^*\mathcal{E}'$, then $\mathrm{Car}^{(m+s)}(F^*\mathcal{E}') = \mathrm{Car}^{(m+s)}(F^*\mathring{\mathcal{E}}') = \mathrm{Car}^{(m+s)}(F^*(\mathring{\mathcal{E}}'/\pi\mathring{\mathcal{E}}'))$. We conclude by using Lemma 15.1.3.7. □

15.1.5 The characteristic variety of a coherent F-$\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module

Definition 15.1.5.1. Suppose there exists an isomorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ lifting the s-power of the Frobenius of k. Let $(\mathcal{N}, \phi)$ be a coherent F-$\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module, i.e. a coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{N}$ and an isomorphism of $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules ϕ of the form $\phi\colon F^*\mathcal{N} \xrightarrow{\sim} \mathcal{N}$, where $F\colon \mathfrak{P} \to \mathfrak{P}'$ is (locally) a lifσ-linear lifting of F_P. Then there exists a (unique up to isomorphism) coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{N}^{(0)}$ and an isomorphism $\phi^{(0)}\colon \widehat{\mathcal{D}}^{(1)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{N}^{(0)} \xrightarrow{\sim} F^*\mathcal{N}^{(0)}$ which induces canonically ϕ. Then, the characteristic variety of $\mathcal{N}$ denoted by $\mathrm{Car}(\mathcal{N})$ is by definition the characteristic variety of level 0 of $\mathcal{N}^{(0)}$, i.e., $\mathrm{Car}(\mathcal{N}) := \mathrm{Car}^{(0)}(\mathcal{N}^{(0)})$.

Example 15.1.5.2. The variety $\mathrm{Car}(\mathcal{N})$ is empty if and only if $\mathcal{N} = 0$.

Proposition 15.1.5.3. *We have the following properties.*

1. *Let $\mathcal{G}$ be a coherent $\mathcal{D}^{(0)}_P$-module. Choose a good filtration $(\mathcal{G}_n)_{n\in\mathbb{N}}$ of $\mathcal{G}$. Then the following assertions are equivalent*
   (a) $\mathrm{Car}^{(0)}(\mathcal{G}) \subset T^*_P P$.
   (b) $\mathrm{gr}\,\mathcal{G}$ *is $\mathcal{O}_P$-coherent (for the $\mathcal{O}_P$-module structure induced by $\mathcal{O}_P \hookrightarrow \mathrm{gr}\,\mathcal{D}^{(0)}_P$).*
   (c) $\mathcal{G}$ *is $\mathcal{O}_P$-coherent (for the $\mathcal{O}_P$-module structure induced by $\mathcal{O}_P \hookrightarrow \mathcal{D}^{(0)}_P$).*

2. *Let $\mathcal{G}$ be a coherent $\mathcal{D}^{(m)}_P$-module (resp. a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module, resp. a topologically nilpotent coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module). Then the following assertions are equivalent*
   (a) $\mathrm{Car}^{(m)}(\mathcal{G}) \subset T^*_P P$.
   (b) $\mathcal{G}$ *is $\mathcal{O}_P$-coherent (resp. $\mathcal{O}_{\mathfrak{P}}$-coherent, resp. $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent).*

Proof. 1) Let us treat the first part. Let us prove that (a) implies (b). Since this is local, we can suppose that P affine and P/S has coordinates $t_1, \ldots, t_d$. Let ξ_i be the global section of $\mathrm{gr}\,\mathcal{D}^{(0)}_P$ which is the element associated with ∂_i, the derivation with respect to t_i. Since the ideal defining the closed immersion $\mathrm{Car}^{(0)}(\mathcal{G}) \hookrightarrow T^*P$ is the radical of the annihilator of $\mathrm{gr}\,\mathcal{G}$, the inclusion $\mathrm{Car}^{(0)}(\mathcal{G}) \subset T^*_P P$ implies that $\xi_1^N, \ldots, \xi_d^N$ annihilate $\mathrm{gr}\,\mathcal{G}$ for some integer N large enough. Hence, $\mathrm{gr}\,\mathcal{G}$ is a coherent $\mathrm{gr}\,\mathcal{D}^{(0)}_P/(\xi_1, \ldots, \xi_d)^{Nd}$-module. Since $\mathrm{gr}\,\mathcal{D}^{(0)}_P/(\xi_1, \ldots, \xi_d)^{Nd}$ is a finite $\mathcal{O}_P$-algebra we conclude that $\mathrm{gr}\,\mathcal{G}$ is $\mathcal{O}_P$-coherent.

Now, suppose (b) is satisfied and let us check (c) holds. By definition of a good filtration, we get $\mathcal{G}_n = \mathcal{G}$ for n large enough. Hence, $\mathcal{G}$ is coherent $\mathcal{O}_P$-module. Finally, suppose (c). Then, the constant filtration $(\mathcal{G}_n = \mathcal{G})_{n\in\mathbb{N}}$ is a good filtration (it might be more convenient to complete the filtration by $\mathcal{G}_n = 0$ if $n < 0$). Then the action of ξ_i on $\mathrm{gr}\,\mathcal{G} = \mathcal{G}_0/\mathcal{G}_{-1} = \mathcal{G}$ is zero (because the action of ξ_i is induced by maps of the form $\mathcal{G}_n/\mathcal{G}_{n-1} \to \mathcal{G}_{n+1}/\mathcal{G}_n$, which are zero). Hence, $\mathrm{Car}^{(0)}(\mathcal{G}) \subset T^*_P P$ (recall that the construction of $\mathrm{Car}^{(0)}(\mathcal{G})$ does not depend on the choice of the good filtration).

2) i) Suppose $\mathcal{G}$ is a coherent $\mathcal{D}^{(m)}_{P/S}$-module. Let $\mathcal{G}'^{(0)}$ be a coherent $\mathcal{D}^{(0)}_{P^{(s)}/S}$-module such that $F^{m*}_{P/S}\mathcal{G}'^{(0)} \xrightarrow{\sim} \mathcal{G}$, where $F^m_{P/S}$ is the mth relative Frobenius of P/S. Since $F^m_{P/S}$ is faithfully flat, then $\mathcal{G}'^{(0)}$ is coherent over $\mathcal{O}_{P^{(s)}}$ if and only if $\mathcal{G}$ is coherent over $\mathcal{O}_P$. By using 15.1.3.7, we reduce therefore to the case where $m = 0$ which has been checked above.

ii) Suppose $\mathcal{G}$ is a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module. Since $\mathcal{G}$ is coherent over $\mathcal{O}_{\mathfrak{P}}$ if and only if $\mathcal{G}/\pi\mathcal{G}$ is coherent over $\mathcal{O}_P$ (use 7.2.1.2 and theorem of type A for coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-modules), since $\mathrm{Car}^{(0)}(\mathcal{G}) = \mathrm{Car}^{(0)}(\mathcal{G}/\pi\mathcal{G})$ (see definition 15.1.4.1), then we conclude from the case i).

iii) Suppose $\mathcal{G}$ is a topologically nilpotent coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. Choose a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module $\overset{\circ}{\mathcal{G}}$ together with the isomorphism of the form $\overset{\circ}{\mathcal{G}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{G}$. By definition, $\mathrm{Car}^{(m)}(\mathcal{G}) = \mathrm{Car}^{(m)}(\overset{\circ}{\mathcal{G}})$. Since $\mathcal{G}$ is *topologically nilpotent*, then if follows from 7.5.2.9 that $\mathcal{G}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent if and only if $\overset{\circ}{\mathcal{G}}$ is $\mathcal{O}_{\mathfrak{P}}$-coherent. □

Corollary 15.1.5.4. *Suppose there exists an isomorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ lifting the s-power of the Frobenius of k. Let $(\mathcal{E}, \phi)$ be a coherent $F\text{-}\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. The following assertions are equivalent.*

(a) $\operatorname{Car}(\mathcal{E}) \subset T^*_P P$.

(b) $\mathcal{E}$ *is* $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$*-coherent.*

Proof. i) Suppose $\operatorname{Car}(\mathcal{E}) \subset T^*_P P$. Let $m_0 \geq 0$ be an integer such that there exist a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}^{(m_0)}$ together with a $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism of the form $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)} \xrightarrow{\sim} \mathcal{E}$ (8.4.1.11). Let $\mathring{\mathcal{E}}^{(m_0)}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P}}$-module together with a $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}^{(m_0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(m_0)}$ (see 7.4.5.2). Since $\operatorname{Car}(\mathcal{E}) = \operatorname{Car}^{(m_0)}(\mathring{\mathcal{E}}^{(m_0)})$, then it follows from the part 2) that $\mathring{\mathcal{E}}^{(m_0)}$ is $\mathcal{O}_{\mathfrak{P}}$-coherent. Hence $\mathcal{E}^{(m_0)}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent and $\mathcal{E}$ is therefore $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent (see 15.3.1.22).

ii) Conversely if $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent then following 11.1.1.6 there exists a p-torsion free $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}/\mathfrak{S}}$-module $\mathring{\mathcal{E}}$, coherent over $\mathcal{O}_{\mathfrak{P}}$ together with a $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$. Since $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E} \xrightarrow{\sim} \mathcal{E}$ (use 11.1.1.6.(b and c)), this yields $\operatorname{Car}(\mathcal{E}) = \operatorname{Car}^{(0)}(\mathring{\mathcal{E}})$. Following the part 2) of 15.1.5.3, $\operatorname{Car}^{(0)}(\mathring{\mathcal{E}}) \subset T^*_P P$ and we are done. □

Proposition 15.1.5.5. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{(m)}_{P/S}$-module (resp. a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module, resp. a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module).*

If $\dim \operatorname{Car}^{(m)}(\mathcal{E}) \leq \dim P$, then there exists a dense open subset $\mathfrak{U} \subset \mathfrak{P}$ such that $\mathcal{E}|U$ is coherent over $\mathcal{O}_U$ (resp. $\mathcal{O}_{\mathfrak{U}}$, resp. $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$).

Proof. 1) i) Suppose $\mathcal{E}$ be a coherent $\mathcal{D}^{(0)}_{P/S}$-module. Set $S := \operatorname{Car}^{(0)}(\mathcal{E}) \setminus T^*_P P$. If $S = \emptyset$, then $\mathcal{E}$ is coherent over $\mathcal{O}_P$ by Proposition 15.1.5.3. Assume that $S \neq \emptyset$. Since S is conic (see 15.1.3.4.1), then $\dim \left(\pi_P^{-1}(\pi_P(s)) \cap \operatorname{Car}^{(0)}(\mathcal{E})\right) \geq 1$ for any $s \in S$. Hence $\dim \pi_P(S) < \dim S \leq \dim P$. Therefore, there exists a non-empty open subset $U \subset P$ such that $P \setminus \pi_P(S) \supset U$. In this case we have $\operatorname{Car}^{(0)}(\mathcal{E}|U) = \operatorname{Car}^{(0)}(\mathcal{E}) \cap T^*U \subset T^*_U U$ and hence $\mathcal{E}|U$ is coherent over $\mathcal{O}_U$ by 15.1.5.3.

ii) Suppose $\mathcal{E}$ be a coherent $\mathcal{D}^{(m)}_{P/S}$-module. Let $\mathcal{E}'^{(0)}$ be a coherent $\mathcal{D}^{(0)}_{P^{(s)}}$-module such that $F^{m*}_{P/S}\mathcal{E}'^{(0)} \xrightarrow{\sim} \mathcal{E}$. For any open U of P, since $F^m_{P/S}$ is faithfully flat, then $\mathcal{E}'^{(0)}|U^{(s)}$ is coherent over $\mathcal{O}_{U^{(s)}}$ if and only if so is $\mathcal{E}|U$. By using 15.1.3.7, we reduce therefore to the case where $m = 0$ already treated.

2) Suppose $\mathcal{E}$ a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module. Since $\mathcal{E}$ is coherent over $\mathcal{O}_{\mathfrak{P}}$ if and only if $\mathcal{E}/\pi\mathcal{E}$ is coherent over $\mathcal{O}_P$, since $\operatorname{Car}^{(m)}(\mathcal{E}) = \operatorname{Car}^{(m)}(\mathcal{E}/\pi\mathcal{E})$ (see definition 15.1.4.1), then we conclude by using the part 1).

3) Suppose $\mathcal{E}$ is a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. Let $\mathring{\mathcal{E}}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module together with a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ (see 7.4.5.2). From the part 2), there exists a dense open subset $\mathfrak{U} \subset \mathfrak{P}$ such that $\mathring{\mathcal{E}}|\mathfrak{U}$ is coherent over $\mathcal{O}_{\mathfrak{U}}$. Hence $\mathcal{E}|\mathfrak{U}$ is coherent over $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$. □

Corollary 15.1.5.6. *We suppose there exists an isomorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ lifting the s-power of the Frobenius of k. Let $\mathcal{E}$ be a coherent $F\text{-}\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module If $\dim \operatorname{Car}(\mathcal{E}) \leq \dim P$, then there exists a dense open subset $\mathfrak{U} \subset \mathfrak{P}$ such that $\mathcal{E}|\mathfrak{U}$ is coherent over $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$.*

Proof. This follows from 15.1.5.5 and 15.3.1.22 (which is checked independently of 15.1.5.6). □

15.1.6 Purity for the level 0: preliminaries on filtered modules

We use here the terminology of Laumon in [Lau85, A.1]:

(i) A filtered ring (D, D_i) is a ring D, unitary, non-necessary commutative, with an increasing filtration by additive subgroups $(D_i)_{i\in\mathbb{Z}}$ indexed by $\mathbb{Z}$ such that $1 \in D_0$ and $D_i \cdot D_j \subset D_{i+j}$ for any $i, j \in \mathbb{Z}$.

(ii) Let (D, D_i) be a filtered ring. We get a category of filtered (D, D_i)-modules as follows. A filtered (D, D_i)-module (M, M_i) is a D-module M endowed with a filtration $(M_i)_{i\in\mathbb{Z}}$ such that $A_i \cdot M_j \subset M_{i+j}$ for any $i, j \in \mathbb{Z}$. A morphism of $(M, M_i) \to (M', M'_i)$ of filtered (D, D_i)-modules is a morphism of D-modules $f\colon M \to M'$ such that $f(M_i) \subset M'_i$ for any $i \in \mathbb{Z}$. If (M, M_i) is a filtered

(D, D_i)-module and $n \in \mathbb{Z}$, we denote by $(M(n), M(n)_i)$ the filtered (D, D_i)-module defined as follows: $M(n) = M$ and $M(n)_i := M_{i+n}$. Following [Gro61, 2.1.2], a filtered free (D, D_i)-module (resp. filtered free (D, D_i)-module of finite type) is a direct sum (resp. a finite direct sum) in the category of filtered (D, D_i)-modules of the form $(D(n), D(n)_i)$, for some integer n. Let (M, M_i) be a filtered (D, D_i)-module. We say that the filtration M_i is good or that (M, M_i) is a good filtered (D, D_i)-module if there exists an epimorphism in the category of filtered (D, D_i)-modules of the form $\phi\colon (L, L_i) \twoheadrightarrow (M, M_i)$ such that $\phi(L_i) = M_i$ (compare with 4.1.3.8). We remark that any D-module of finite type can be endowed with a good filtration. Conversely, for any good filtered (D, D_i)-module (M, M_i), M is a D-module of finite type.

(iii) Let (D, D_i) be a filtered ring and (M, M_i) be a filtered (D, D_i)-module. The *ind-pro-complete separation* of (M, M_i), denoted by $(\widehat{M}, \widehat{M}_i)$ is a filtered (D, D_i)-module defined as follows: $\widehat{M}_i := \varprojlim_n M_i/M_{i-n}$ is the complete separation of M_i with respect to the filtration $(M_{i-n})_{n\in\mathbb{N}}$ and $\widehat{M} := \cup_{i\in\mathbb{Z}} \widehat{M}_i$, where the inclusion $\widehat{M}_i \subset \widehat{M}_{i+1}$ are that induced by complete separation from the inclusion $M_i \subset M_{i+1}$. Using the universal property of projective limits we check that $(\widehat{D}, \widehat{D}_i)$ is also a filtered ring and that $(\widehat{M}, \widehat{M}_i)$ is a filtered $(\widehat{D}, \widehat{D}_i)$-module.

We say that (M, M_i) is *ind-pro-complete separated* if the canonical morphism $(M, M_i) \to (\widehat{M}, \widehat{M}_i)$ is an isomorphism. For instance, we remark that the filtration of an ind-pro-complete separated filtered ring is exhaustive. Like Laumon, to simplify the terminology (we hope there will not be confusion with the usual notion of completion), we will simply say "complete" for "ind-pro-complete separated" and "completion" for "ind-pro-complete separation".

(iv) In this section, with our abuse of terminology, (D, D_i) will be a complete filtered ring such that $\mathrm{gr}(D, D_i)$ is a left and right noetherian ring. Hence, from Proposition [Lau85, A.1.1], a good filtered (D, D_i)-module is complete.

The following Lemmas 15.1.6.1, 15.1.6.3, 15.1.6.5, 15.1.6.7, 15.1.6.8 correspond to Laumon's Lemmas [Lau83, 3.3.2, 3.3.3, 3.3.5,3.3.8] formulated in our context.

Lemma 15.1.6.1. *Let* $0 \to (M', M'_i) \xrightarrow{f} (M, M_i) \xrightarrow{g} (M'', M''_i) \to 0$ *be a sequence of morphisms of good filtered* (D, D_i)*-modules.*

1) The following conditions are equivalent:

(a) we have $M'_i = M' \cap M_i$ *and* $M''_i = g(M'_i)$ *for any* $i \in \mathbb{Z}$*;*

(b) the sequences of abelian groups $0 \to M'_i \xrightarrow{f} M_i \xrightarrow{g} M''_i \to 0$ *are exact for any* $i \in \mathbb{Z}$*;*

(c) $g \circ f = 0$ *and the sequence of* $\mathrm{gr}\, D$*-modules* $0 \to \mathrm{gr}\, M' \to \mathrm{gr}\, M \to \mathrm{gr}\, M'' \to 0$ *is exact.*

2) When these equivalent conditions of 1) are satisfied, the sequence of D*-modules* $0 \to M' \to M \to M'' \to 0$ *is exact.*

Proof. The equivalence between (a) and (b) is obvious. Suppose the condition (b) is satisfied. The fact good filtrations are exhaustive implies that $g \circ f = 0$. We get the last condition (c) by using the nine Lemma (see the exercice [Wei94, 1.3.2]). Suppose now the condition (c) is satisfied. Using the nine Lemma (more precisely, the part 3 of the exercice [Wei94, 1.3.2]), for any $i \in \mathbb{Z}$, we check by induction on $n \geq 1$ that the sequence of abelian groups $0 \to M'_i/M'_{i-n} \to M_i/M_{i-n} \to M''_i/M''_{i-n} \to 0$ are exact. Taking the projective limits, since M'_i, M_i and M''_i are complete separated by hypothesis, since Mittag Leffler condition is satisfied, this yields that the sequence $0 \to M'_i \xrightarrow{f} M_i \xrightarrow{g} M''_i \to 0$ is exact. The part 2) of the Lemma follows from the remark that filtrations are exhaustive. □

Definition 15.1.6.2. Let $0 \to (M', M'_i) \xrightarrow{f} (M, M_i) \xrightarrow{g} (M'', M''_i) \to 0$ be a sequence of morphisms of good filtered (D, D_i)-modules satisfying the equivalent conditions of 15.1.6.1.1). We say that this sequence is an "exact" sequence of morphisms of good filtered (D, D_i)-modules.

Lemma 15.1.6.3. *Let* $u\colon (M, M_i) \to (N, N_i)$ *be a morphism of good filtered* (D, D_i)*-modules. We have the exact sequences of good filtered* (D, D_i)*-modules:*

$$0 \to \ker u \to (M, M_i) \to \mathrm{Coim} u \to 0,$$
$$0 \to \mathrm{Im} u \to (N, N_i) \to \mathrm{Coker}\, u \to 0. \qquad (15.1.6.3.1)$$

Proof. Let $\ker u$ be the kernel of u in the category of filtered (D, D_i)-modules, i.e. $\ker u = (\ker u, \ker u \cap M_i)$. Let $\operatorname{Coker} u$ be the cokernel of u in the category of filtered (D, D_i)-modules, i.e. $\operatorname{Coker} u = (\operatorname{Coker} u, N_i/N_i \cap u(M))$. From [Lau85, A.1.1.2], the filtered (D, D_i)-modules $\ker u$ and $\operatorname{Coker} u$ are good. Hence, $\ker u, \operatorname{Coker} u, \operatorname{Im} u, \operatorname{Coim} u$ exist in the category of good filtered (D, D_i)-modules (and are equal to that computed in the category of filtered (D, D_i)-modules). Hence, both sequences 15.1.6.3.1 are well defined in the category of good filtered (D, D_i)-modules. Since $\operatorname{Coim} u = (u(M), u(M_i))$ and $\operatorname{Im} u = (u(M), u(M) \cap N_i)$, then these sequence satisfy the condition (a) of Lemma 15.1.6.1 and hence they are exact.

□

Definition 15.1.6.4 (Strictness)**.** A morphism $u: (M, M_i) \to (N, N_i)$ of good filtered (D, D_i)-modules is strict if the canonical morphism $\operatorname{Coim} u \to \operatorname{Im} u$ is an isomorphism of (good) filtered (D, D_i)-modules. If $u: M \to N$ is a monomorphism (resp. epimorphism) and if $u: (M, M_i) \to (N, N_i)$ is strict, we say that u is a strict monomorphism (resp. strict epimorphism).

Lemma 15.1.6.5. *Let $u: (M, M_i) \to (N, N_i)$ be a morphism of good filtered (D, D_i)-modules.*

1. *Then u is strict if and only if $u(M_i) = u(M) \cap N_i$ for any $i \in \mathbb{Z}$.*
2. *The following conditions are equivalent*
   (a) *u is a strict monomorphism ;*
   (b) *the morphism $(M, M_i) \to \operatorname{Im} u$ is an isomorphism ;*
   (c) *the sequence of good filtered (D, D_i)-modules $0 \to (M, M_i) \to (N, N_i) \to \operatorname{Coker} u \to 0$ is exact ;*
   (d) *$\operatorname{gr} u$ is a monomorphism.*
3. *The following conditions are equivalent*
   (a) *u is a strict epimorphism ;*
   (b) *the morphism $\operatorname{Coim} u \to (N, N_i)$ is an isomorphism ;*
   (c) *the sequence of good filtered (D, D_i)-modules $0 \to \ker u \to (M, M_i) \to (N, N_i) \to 0$ is exact ;*
   (d) *$\operatorname{gr} u$ is an epimorphism.*
4. *u is an isomorphism if and only if $\operatorname{gr} u$ is an isomorphism.*

Proof. The first statement is straighforward from the description of $\operatorname{Im} u$ and $\operatorname{Coim} u$. The implication $(a) \Rightarrow (b)$ is clear from the description of $\operatorname{Im} u$ and from 1. The implication $(b) \Rightarrow (c)$ (resp. $(c) \Rightarrow (d)$) is a consequence of 15.1.6.3.1. (resp. 15.1.6.1). Finally, suppose (d) is satisfied. Let $x \in \ker u$. Suppose $x \neq 0$. There exists $i \in \mathbb{Z}$ such that $x \notin M_i$ (recall the filtration is separated). This is a contradiction with the fact that $M_{i+1}/M_i \to N_{i+1}/N_i$ is injective (because $\operatorname{gr} u$ is injective by hypothesis). Hence u is a monomorphism. The fact that $\operatorname{gr} u$ is injective implies that $M_{i+1} \cap N_i = M_i$, for any $i \in \mathbb{Z}$. By induction on $n \in \mathbb{N}$ we get that for any $i \in \mathbb{Z}$, $M_{i+n} \cap N_i = M_i$. Since the filtration is exhaustive, this yields that $M \cap N_i = M_i$. From part 1) of the Lemma, this means that u is strict. Let us check part 3). We check similarly $(a) \to (b) \to (c) \to (d)$. Now suppose that $\operatorname{gr} u$ is an epimorphism. Let $i \in \mathbb{Z}$. From part 1), it is sufficient to check $u(M_i) = N_i$ (indeed filtrations are exhausted and then u will be surjective). Let $y \in N_i$. Put $y_{-1} := y$. By induction on $n \geq 0$, we construct $y_n \in N_{i-1-n}$ and $x_n \in M_{i-n}$ such that $u(x_n) = y_{n-1} - y_n$. This is consequence of the equality $u(M_{i-n}) + N_{i-n-1} = N_{i-n}$ (because $\operatorname{gr} u$ is an epimorphism). Since N_i and M_i are separated complete for the filtrations $(N_{i-n})_{n \in \mathbb{N}}$ and $(M_{i-n})_{n \in \mathbb{N}}$, the sum $\sum_{n \geq -1}(y_n - y_{n+1})$ converges to y and $\sum_{n \in \mathbb{N}} x_n$ converges in M_i to an element, denoted by x. Hence, $u(x) = y$ and then $N_i \subset u(M_i)$. Finally, 4 is a consequence of the equivalence $(a) \Leftrightarrow (d)$ of 2 and 3. □

Remark 15.1.6.6. Let (M, M_i) be a filtered (D, D_i)-module. From 15.1.6.5.1, we remark that (M, M_i) is a good filtered (D, D_i)-module if and only if there exists a strict epimorphism of the form $u: (L, L_i) \twoheadrightarrow (M, M_i)$, where (L, L_i) is a free filtered (D, D_i)-module of finite type.

Lemma 15.1.6.7. *Let $u: (M, M_i) \to (N, N_i)$ be a morphism of good filtered (D, D_i)-modules.*

1. *The following assertions are equivalent:*

   (a) *The morphism* u *is strict ;*

   (b) *The sequence* $0 \to \operatorname{gr}\ker u \to \operatorname{gr}(M, M_i) \to \operatorname{gr}(N, N_i) \to \operatorname{gr}\operatorname{Coker} u \to 0$ *is exact.*

   (c) $\ker \operatorname{gr}(u) = \operatorname{gr}\ker(u)$ *and* $\operatorname{Coker}\operatorname{gr}(u) = \operatorname{gr}\operatorname{Coker}(u)$.

2. *If* u *is strict then we have also* $\operatorname{im}\operatorname{gr}(u) = \operatorname{gr}\operatorname{im}(u)$.

Proof. By applying the functor gr to the exact sequences 15.1.6.3.1, we get that $(a) \to (b)$. Conversely, suppose (b) satisfied. First, remark the following fact available in an abelian category $\mathfrak{A}$: let $\alpha\colon M_1 \twoheadrightarrow M_2$ (resp. $\beta\colon M_2 \to M_3$, resp. $\gamma\colon M_3 \hookrightarrow M_4$) be a epimorphism (resp. a morphism, resp. a monomorphism) of $\mathfrak{A}$. Then if $\ker\alpha = \ker \gamma\circ\beta\circ\alpha$ then β is a monomorphism. Moreover, if $\operatorname{Im}\gamma = \operatorname{Im}\gamma\circ\beta\circ\alpha$, then β is surjective. By applying the functor gr to the exact sequences 15.1.6.3.1, with this remark, the condition (b) implies that the morphism $\operatorname{gr}\operatorname{Coim}(u) \to \operatorname{gr}\operatorname{Im}(u)$ is an isomorphism of the abelian category of $\operatorname{gr} D$-modules. With Lemma 15.1.6.5.4, this implies that $\operatorname{Coim}(u) \to \operatorname{Im}(u)$ is an isomorphism.

The equivalence $(b) \Leftrightarrow (c)$ is straightforward. We check the statement 2) by applying gr to the exact sequences 15.1.6.3.1. □

Lemma 15.1.6.8. *Let* $u\colon (M, M_i) \to (N, N_i)$ *and* $v\colon (N, N_i) \to (O, O_i)$ *be two morphisms of good filtered* (D, D_i)*-modules.*

1. *If* v *is a strict monomorphism and* u *is strict then* $v \circ u$ *is strict.*

2. *If* u *is a strict epimorphism and* v *is strict then* $v \circ u$ *is strict.*

3. *If* $v \circ u$ *is strict epimorphism then* v *is a strict epimorphism.*

4. *If* $v \circ u$ *is strict monomorphism then* u *is a strict monomorphism.*

Proof. This can be checked elementarily from the characterization 15.1.6.5.1 For instance, let us check 1. Suppose v is a strict monomorphism and u is strict. We have $v(u(M)) \cap O_i \subset v(N) \cap O_i = v(N_i)$ (because v is strict). Hence, we get $v(u(M)) \cap O_i \subset v(u(M)) \cap v(N_i) = v(u(M) \cap N_i) = v(u(M_i))$ (to check the equalities, use respectively that v is a monomorphism and u is strict). This implies $v(u(M_i)) = v(u(M)) \cap O_i$. Let us check 4. If $v\circ u$ is strict monomorphism then u is a monomorphism and we have $M_i \subset M \cap u^{-1}(N_i) \subset M \cap (v\circ u)^{-1}(O_i) = M_i$. Hence, $M_i = M \cap u^{-1}(N_i)$, i.e. $u(M_i) = u(M) \cap N_i$. We leave the other statements to the reader. □

Remark 15.1.6.9. With the notation 15.1.6.8, this is not true in general that if u and v are strict then $v \circ u$ is also strict. However, using 15.1.6.8 and 15.1.6.3, we remark that a morphism of good filtered (D, D_i)-modules is strict if and only if it is the composition (in the category of good filtered (D, D_i)-modules) of a strict epimorphism with a strict monomorphism. This last characterization of strictness was Laumon's definition of strictness given in [Lau83, 1.0.1].

Proposition 15.1.6.10. With the definition 15.1.6.4 of strictness, the category of good filtered (D, D_i)-modules is exact (see the definition in [Lau83, 1.0.2]).

Proof. This is straighforward from previous Lemmas. For instance, the condition [Lau83, 1.0.2.(vi)] are the last two statements of 15.1.6.8. □

Notation 15.1.6.11 (Localisation)**.** Let f be a homogeneous element of $\operatorname{gr} D$. We denote by $(D_{[f]}, D_{[f],i})$ the complete filtered ring of (D, D_i) relatively to $S_1(f) := \{f^n\ ,\ n \in \mathbb{N}\} \subset \operatorname{gr} D$ (see the definition after [Lau85, Corollaire A.2.3.4]).

Let (M, M_i) be a good filtered (D, D_i)-module. We put

$$(M_{[f]}, M_{[f],i}) := (D_{[f]}, D_{[f],i}) \otimes_{(D,D_i)} (M, M_i), \tag{15.1.6.11.1}$$

the localized filtered module of (M, M_i) with respect to $S_1(f)$. We remind that $(M_{[f]}, M_{[f],i})$ is also a good filtered $(D_{[f]}, D_{[f],i})$-module (see [Lau85, A.2.3.6]) and $\operatorname{gr} M_{[f]} \xrightarrow{\sim} \operatorname{gr} D_{[f]} \otimes_{\operatorname{gr} D} \operatorname{gr} M$ (see [Lau85, A.1.1.3]).

The results and proofs of Malgrange in [Mal76, IV.4.2.3] (we can also find the proof in the book [HTT08, D.2.2]) can be extended without further problem in the context of complete filtered rings:

Lemma 15.1.6.12. *Let (M, M_i) be a good filtered (D, D_i)-module. Then there exists some free filtered (D, D_i)-modules of finite type $(L_n, L_{n,i})$ with $n \in \mathbb{N}$ and strict morphisms of good filtered (D, D_i)-modules $(L_{n+1}, L_{n+1,i}) \to (L_n, L_{n,i})$ and $(L_0, L_{0,i}) \to (M, M_i)$ such that $L_\bullet \to M$ is a resolution of M (in the category of D-modules).*

We call such a resolution $(L_\bullet, L_{\bullet,i})$ a "good resolution" of (M, M_i).

Proof. This is almost the same as [Mal76, IV.4.2.3.2]. For the reader, we remind the construction: with the remark 15.1.6.6, there exists a strict epimorphism of good filtered (D, D_i)-modules of the form $\phi_0 \colon (L_0, L_{0,i}) \to (M, M_i)$, with $(L_0, L_{0,i})$ a free filtered (D, D_i)-module of finite type. Let $(M_1, M_{1,i})$ be the kernel of ϕ_0 (in the category of good filtered (D, D_i)-modules: see 15.1.6.10). Since $(M_1, M_{1,i})$ is good, there exists a strict epimorphism of the form $\phi_1 \colon (L_1, L_{1,i}) \to (M_1, M_{1,i})$, with $(L_1, L_{1,i})$ a free filtered (D, D_i)-module of finite type. Hence, the morphism $(L_1, L_{1,i}) \to (L_0, L_{0,i})$ is strict. We go on similarly.

□

Remark 15.1.6.13. Let $(L_\bullet, L_{\bullet,i})$ be a good resolution of (M, M_i). Then $\mathrm{gr}(L_\bullet, L_{\bullet,i})$ is a resolution of $\mathrm{gr}(M, M_i)$ by free $\mathrm{gr}(D, D_i)$-modules of finite type (use the equivalence between 15.1.6.7.1.(a) and 15.1.6.7.1.(c)).

Lemma 15.1.6.14. *Let $K^\bullet$ be a complex of abelian groups. Let $(F_i K^\bullet)_{i \in \mathbb{Z}}$ be an increasing filtration of $K^\bullet$. We put*

$$F_i H^r(K^\bullet) := \mathrm{Im}(H^r(F_i K^\bullet) \to H^r(K^\bullet)). \tag{15.1.6.14.1}$$

Then $\mathrm{gr}_i^F(H^r(K^\bullet))$ is a subquotient of $H^r(\mathrm{gr}_i^F K^\bullet)$.

Proof. For instance, we can follow the last seven lines of the proof of [HTT08, D.2.4] (or also at Malgrange's description of the corresponding spectral sequence in [Mal76, IV.4.2.3.2]): denote by $d^r \colon K^r \to K^{r+1}$ the morphism in $K^\bullet$, $d_i^r \colon F_i K^r \to F_i K^{r+1}$ the morphism in $F_i K^\bullet$, $\overline{d}_i^r \colon \mathrm{gr}_i^F K^r = F_i K^r / F_{i-1} K^r \to F_i K^{r+1} / F_{i-1} K^{r+1} = \mathrm{gr}_i^F K^{r+1}$. Since $\ker d_i^r = \ker d^r \cap F_i K^r$, we get $F_i H^r(K^\bullet) = \ker d^r \cap F_i K^r + \mathrm{Im}\, d^{r-1} / \mathrm{Im}\, d^{r-1}$. By definition we obtain:

$$\mathrm{gr}_i^F(H^r(K^\bullet)) := F_i H^r(K^\bullet)/F_{i-1} H^r(K^\bullet) = \ker d^r \cap F_i K^r + \mathrm{Im}\, d^{r-1} / \ker d^r \cap F_{i-1} K^r + \mathrm{Im}\, d^{r-1}. \tag{15.1.6.14.2}$$

We have $\ker \overline{d}_i^r = \ker(F_i K^r \to \mathrm{gr}_i^F K^{r+1})/F_{i-1} K^r$ and $\mathrm{Im}\, \overline{d}_{i-1}^r = d_i^{r-1}(F_i K^{r-1}) + F_{i-1} K^r / F_{i-1} K^r$. Hence

$$H^r(\mathrm{gr}_i^F K^\bullet) := \ker \overline{d}_i^r / \mathrm{Im}\, \overline{d}_{i-1}^r = \ker(F_i K^r \to \mathrm{gr}_i^F K^{r+1})/d_i^{r-1}(F_i K^{r-1}) + F_{i-1} K^r. \tag{15.1.6.14.3}$$

Set $L = \ker d^r \cap F_i K^r / d_i^{r-1}(F_i K^{r-1}) + \ker d^r \cap F_{i-1} K^r$. The inclusion $\ker d^r \cap F_i K^r \subset \ker(F_i K^r \to \mathrm{gr}_i^F K^{r+1})$ induces the map $\phi \colon \ker d^r \cap F_i K^r \to \ker(F_i K^r \to \mathrm{gr}_i^F K^{r+1})/d_i^{r-1}(F_i K^{r-1}) + F_{i-1} K^r$. Let $x \in \ker d^r \cap F_i K^r$ be an element in the kernel of ϕ. Then there exist $y \in F_i K^{r-1}$ and $z \in F_{i-1} K^r$ such that $x = d_i^{r-1}(y) + z$. Since $d_i^{r-1}(y) \in \ker d^r$, we get $z \in \ker d^r$ and then $z \in \ker d^r \cap F_{i-1} K^r$. Hence $\ker \phi \subset d_i^{r-1}(F_i K^{r-1}) + \ker d^r \cap F_{i-1} K^r$. Since the converse is obvious, we get $\ker \phi = d_i^{r-1}(F_i K^{r-1}) + \ker d^r \cap F_{i-1} K^r$. From 15.1.6.14.3, this yields that L is a subobject of $H^r(\mathrm{gr}_i^F K^\bullet)$. Moreover, we have the epimorphism $\ker d^r \cap F_i K^r \to \ker d^r \cap F_i K^r + \mathrm{Im}\, d^{r-1} / \ker d^r \cap F_{i-1} K^r + \mathrm{Im}\, d^{r-1}$. Since $d_i^{r-1}(F_i K^{r-1}) + \ker d^r \cap F_{i-1} K^r$ is in the kernel of this map, we get the factorisation $L \to \ker d^r \cap F_i K^r + \mathrm{Im}\, d^{r-1} / \ker d^r \cap F_{i-1} K^r + \mathrm{Im}\, d^{r-1}$, which is still an epimorphism. From 15.1.6.14.2, this implies that L is a quotient of $\mathrm{gr}_i^F(H^r(K^\bullet))$. Hence, $\mathrm{gr}_i^F(H^r(K^\bullet))$ is a quotient of a submodule of $H^r(\mathrm{gr}_i^F K^\bullet)$.
□

15.1.6.15. Let (M, M_i) and (N, N_i) be two filtered (D, D_i)-modules. For any integer $i \in \mathbb{Z}$, let $F_i \mathrm{Hom}_D(M, N)$ be the subgroup of $Hom_D(M, N)$ of the elements ϕ such that, for any integer $j \in \mathbb{Z}$, $\phi(M_j) \subset N_{i+j}$. For any integer $j \in \mathbb{Z}$, for any $\phi \in F_i \mathrm{Hom}_D(M, N)$, we get a morphism $\mathrm{gr}_i M \to \mathrm{gr}_{i+j} N$ defined by sending the class of a element $x \in M_i$ to the class of $\phi(x)$. Hence ϕ induces a map $\mathrm{gr}\, M \to \mathrm{gr}\, N$, which is in fact gr_D-linear. Hence we get the canonical morphism $F_i \mathrm{Hom}_D(M, N) \to \mathrm{Hom}_{\mathrm{gr}\, D}(\mathrm{gr}\, M, \mathrm{gr}\, N)$ and then

$$\mathrm{gr}^F \mathrm{Hom}_D(M, N) \to \mathrm{Hom}_{\mathrm{gr}\, D}(\mathrm{gr}\, M, \mathrm{gr}\, N). \tag{15.1.6.15.1}$$

Lemma 15.1.6.16. *Let (L, L_i) be a free filtered (D, D_i)-module of finite type. Let (N, N_i) be filtered (D, D_i)-module. The canonical morphism*

$$\operatorname{gr}\operatorname{Hom}_D(L, N) \to \operatorname{Hom}_{\operatorname{gr} D}(\operatorname{gr} L, \operatorname{gr} N)$$

of 15.1.6.15.1 is an isomorphism of abelian groups.

Proof. Let (M, M_i), (M', M'_i) be two filtered (D, D_i)-modules and $(M'', M''_i) := (M, M_i) \oplus (M', M'_i)$. Then the morphism of 15.1.6.15.1 $\operatorname{gr}^F \operatorname{Hom}_D(M'', N) \to \operatorname{Hom}_{\operatorname{gr} D}(\operatorname{gr} M'', \operatorname{gr} N)$ is an isomorphism if and only if so are $\operatorname{gr}^F \operatorname{Hom}_D(M, N) \to \operatorname{Hom}_{\operatorname{gr} D}(\operatorname{gr} M, \operatorname{gr} N)$ and $\operatorname{gr}^F \operatorname{Hom}_D(M', N) \to \operatorname{Hom}_{\operatorname{gr} D}(\operatorname{gr} M', \operatorname{gr} N)$. Hence, we can suppose that $(L, L_i) = (D(n), D(n)_i)$, for some integer n. Twisting the filtrations, we can suppose $n = 0$. Finally, we compute that the morphism of 15.1.6.15.1 $\operatorname{gr}\operatorname{Hom}_D(D, N) \to \operatorname{Hom}_{\operatorname{gr} D}(\operatorname{gr} D, \operatorname{gr} N)$ is, modulo the identifications $N = \operatorname{Hom}_D(D, N)$ and $\operatorname{Hom}_{\operatorname{gr} D}(\operatorname{gr} D, \operatorname{gr} N) = \operatorname{gr} N$, the identity, which is an isomorphism. □

Proposition 15.1.6.17. Let (M, M_i) be a good filtered (D, D_i)-module. Let (N, N_i) be a filtered (D, D_i)-module. For any integer r, there exists a filtration F of $\operatorname{Ext}^r_D(M, N)$ satisfying the following properties

1. $\operatorname{Ext}^r_D(M, N) = \cup_{i \in \mathbb{Z}} F_i \operatorname{Ext}^r_D(M, N)$,
2. $\operatorname{gr}^F \operatorname{Ext}^r_D(M, N)$ is a subquotient of $\operatorname{Ext}^r_{\operatorname{gr} D}(\operatorname{gr} M, \operatorname{gr} N)$.
3. Suppose $(N, N_i) = (D, D_i)$. The filtration $(F_i \operatorname{Ext}^r_D(M, D))_{i \in \mathbb{Z}}$ of the right D-module $\operatorname{Ext}^r_D(M, D)$ is a good filtration. In particular, $0 = \cap_{i \in \mathbb{Z}} F_i \operatorname{Ext}^r_D(M, D)$. Moreover, we have the implication

$$\operatorname{Ext}^r_{\operatorname{gr} D}(\operatorname{gr} M, \operatorname{gr} D) = 0 \Rightarrow \operatorname{Ext}^r_D(M, D) = 0.$$

Proof. From 15.1.6.12 and with its definition, there exists a good resolution $(L_\bullet, L_{\bullet,i})$ of (M, M_i). We put $K^\bullet := \operatorname{Hom}_D(L_\bullet, N)$. Since $L_\bullet$ is a resolution of M by projective D-modules, we get $H^r(K^\bullet) = \operatorname{Ext}^r_D(M, N)$.

Let $F_i K^n$ be the subset of the elements ϕ of $Hom_D(L_n, N)$ such that, for any integer $j \in \mathbb{Z}$, $\phi(L_{n,j}) \subset N_{i+j}$. Since L_n is a D-module of finite type, we get $\cup_{i \in \mathbb{Z}} F_i K^n = K^n$. With the induced filtration on $H^r(K^\bullet) = \operatorname{Ext}^r_D(M, N)$ (see 15.1.6.14), this yields the first property. Since L_n is a free filtered (D, D_i)-modules of finite type, from Lemma 15.1.6.16, the canonical morphism $\operatorname{gr} K^n \to \operatorname{Hom}_{\operatorname{gr} D}(\operatorname{gr} L_n, \operatorname{gr} N)$ is an isomorphism. Since $\operatorname{gr} L_\bullet$ is a resolution of $\operatorname{gr} M$ by projective $\operatorname{gr} D$-modules, we get $H^r(\operatorname{gr} K^\bullet) = \operatorname{Ext}^r_{\operatorname{gr} D}(\operatorname{gr} M, \operatorname{gr} N)$. This implies the second point by using Lemma 15.1.6.14.

When $(N, N_i) = (D, D_i)$, the filtration $F_i K^n$ of the right D-module K^n is a good filtration. We denote by $d_n \colon K^n \to K^{n+1}$ the canonical morphisms. From [Lau85, A.1.1.2], the induced filtrations on $\ker d_n$ and next on $\ker d_n / Imd_{n-1}$ (induced from the surjection $\ker d_n \to \ker d_n / Imd_{n-1}$) are good. We notice that this filtration on $\ker d_n / \operatorname{Im} d_{n-1} = H^n(K^\bullet)$ is the same as that defined at 15.1.6.14.1, which is the first assertion of the third point. With the second point, this yields the rest of the third point. □

15.1.7 A criterium on the purity of the characteristic variety of a coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}$-module

In the subsection, we prove that when $\mathcal{E}$ is holonomic, its characteristic variety $\operatorname{Car}(\mathcal{E})$ is of pure dimension $\dim X$. One main ingredient of the proof is to use the homological characterization of the holonomicity (see 15.2.4.8) and another one is to use the sheaf of microdifferential operators (for instance, see [Abe14b]). Both ideas comes from the original proof of Kashiwara of the analogous property in the theory of analytic $\mathcal{D}$-modules (see [Kas77]).

Let $\mathcal{V}$ be a complete discrete valued ring of mixed characteristic $(0, p)$, π be a uniformizer, K its field of fractions, k its residue field which is supposed to be perfect. A k-variety is a separated reduced scheme of finite type over k.

Lemme 15.1.7.1. Let X be an affine smooth variety over k, $\overline{D} := \Gamma(X, \mathcal{D}^{(0)}_{X/k})$, $(\overline{D}_i)_{i \in \mathbb{N}}$ be its order filtration of the operators, $\overline{f}$ be an homogeneous element of $\operatorname{gr} \overline{D}$. Let $(\overline{M}, \overline{M}_i)$ and $(\overline{N}, \overline{N}_i)$ be two good filtered $(\overline{D}_{[\overline{f}]}, \overline{D}_{[\overline{f}],i})$-modules and r be an integer.

1. We have $\operatorname{codim} \operatorname{Ext}^r_{\operatorname{gr} \overline{D}_{[\overline{f}]}}(\operatorname{gr} \overline{M}, \operatorname{gr} \overline{N}) \geq r$.

2. If $r < \operatorname{codim} \operatorname{gr} \overline{M}$ then $\operatorname{Ext}^r_{\operatorname{gr} \overline{D}_{[\overline{f}]}}(\operatorname{gr} \overline{N}, \operatorname{gr} \overline{D}_{[\overline{f}]}) = 0$.

Proof. By construction (see [Lau85, A.2]), we get $\operatorname{gr} \overline{D}_{[\overline{f}]} \xrightarrow{\sim} (\operatorname{gr} \overline{D})_{\overline{f}}$. Then, this is well known (e.g. see [HTT08, D.4.4]). □

15.1.7.2 (Localisation and π-adic completion)**.** Let $\mathfrak{P}$ be an affine smooth $\mathcal{V}$-formal scheme, X_n be the reduction of $\mathfrak{P}$ modulo π^{n+1}. We put $D := \Gamma(X, \mathcal{D}^{(0)}_{\mathfrak{P}/\mathfrak{S}})$ and $D_n := \Gamma(X, \mathcal{D}^{(0)}_{X_n/S_n})$. These rings are canonically filtered by the order of the differential operators ; we denote by (D, D_i) and $(D_n, D_{n,i})$ the (ind-pro) complete filtered rings. Let f be an homogeneous element of $\operatorname{gr} D$ and f_n be its image in $\operatorname{gr} D_n$. With the notation of 15.1.6.11, by using the same arguments as in the proof of [Abe14b, 2.3], we get the canonical isomorphism of (ind-pro) complete filtered ring

$$(D_{[f]}, D_{[f],i}) \otimes_{\mathcal{V}} \mathcal{V}/\pi^{n+1} \xrightarrow{\sim} (D_{n[f_n]}, D_{n[f_n],i}). \tag{15.1.7.2.1}$$

We put $\widehat{D}_{[f]}$ (be careful that this notation is slightly different from that of 15.1.6.11) as the π-adic completion of $D_{[f]}$, i.e. $\widehat{D}_{[f]} := \varprojlim_n D_{[f]}/\pi^{n+1} D_{[f]} \xrightarrow{\sim} \varprojlim_n D_{n,[f_n]}$. Using Corollary [Lau85, A.1.1.1] and 7.2.1.2.(c), we get from the isomorphism 15.1.7.2.1 the noetherianity of $\widehat{D}_{[f]}$.

Finally, when there is no confusion with the notation 15.1.6.11, for any coherent $\widehat{D}$-module (resp. coherent $\widehat{D}_{\mathbb{Q}}$-module) M (resp. N), we set (by default in this new context) $M_{[f]} := \widehat{D}_{[f]} \otimes_{\widehat{D}} M$ (resp. $N_{[f]} := \widehat{D}_{[f]} \otimes_{\widehat{D}} N$).

Lemme 15.1.7.3. With the notation of 15.1.7.2, the homomorphism $\widehat{D} \to \widehat{D}_{[f]}$ is flat.

Proof. This is a consequence of 7.2.1.3.(g), [Lau85, A.2.3.4.(ii)] and 15.1.7.2.1. □

Remark 15.1.7.4. With the notation of 15.1.7.2, let M be a coherent $\widehat{D}$-module. We put $M_n := M/\pi^{n+1}M$. From 4.1.3.17, there exists a good filtration $(M_{n,i})_{i \in \mathbb{N}}$ of M_n indexed by $\mathbb{N}$. We recall (see notation 15.1.6.11.1) that we get a good filtered $(D_{n,[f_n]}, D_{n,[f_n],i})$-module by putting $(M_{n,[f_n]}, M_{n,[f_n],i}) := (D_{n,[f_n]}, D_{n,[f_n],i}) \otimes_{(D_n, D_{n,i})} (M_n, M_{n,i})$. Moreover, since $\widehat{D}_{[f]}/\pi^{n+1}\widehat{D}_{[f]} \xrightarrow{\sim} D_{n,[f_n]}$ (use 15.1.7.2.1), then

$$M_{[f]}/\pi^{n+1} M_{[f]} \xrightarrow{\sim} M_{n,[f_n]}. \tag{15.1.7.4.1}$$

From 7.2.1.4, since $M_{[f]}$ is a $\widehat{D}_{[f]}$-module of finite type, then $M_{[f]}$ is complete for the π-adic topology. Hence, using 15.1.7.4.1 we get the canonical isomorphism of $\widehat{D}_{[f]}$-modules$M_{[f]} \xrightarrow{\sim} \varprojlim_n M_{n,[f_n]}$.

Lemme 15.1.7.5. We keep notation 15.1.7.2. Let $\mathcal{N}$ be a coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}$-module, $\operatorname{Car}^{(0)}(\mathcal{N})$ its characteristic variety of level 0 (see the definition in 15.1.4.3). We put $N := \Gamma(X, \mathcal{N})$. The following assertions are equivalent

1. $D(f_0) \cap \operatorname{Car}^{(0)}(\mathcal{N}) = \emptyset$.

2. $N_{[f]} = 0$.

Proof. From 7.4.5.1 and 7.4.5.2, there exits a p-torsion free coherent $\widehat{D}$-module M such that $M_{\mathbb{Q}} \xrightarrow{\sim} N$. Since the extension $\widehat{D} \to \widehat{D}_{[f]}$ is flat (see 15.1.7.3), we get that $M_{[f]}$ is also p-torsion free (p is in the center of $\widehat{D}$ and $\widehat{D}_{[f]}$). This yields that $N_{[f]} = 0$ if and only if $M_{[f]} = 0$. Let $\overline{M} := M/\pi M$. From 15.1.7.4.1, we have $M_{[f]}/\pi M_{[f]} \xrightarrow{\sim} \overline{M}_{[f_0]}$. Hence, $M_{[f]} = 0$ if and only if $\overline{M}_{[f_0]} = 0$ (7.2.1.2.(c)). Following 4.1.3.17, there exists a good filtration $(\overline{M}_i)_{i \in \mathbb{N}}$ of $\overline{M}$ indexed by $\mathbb{N}$. From the remark 15.1.7.4, this induces canonically the (ind-pro) complete $(\overline{D}_{[f_0]}, \overline{D}_{[f_0],i})$-module $(\overline{M}_{[f_0]}, \overline{M}_{[f_0],i})$. Since $\overline{M}_{[f_0]}$ is (ind-pro) complete, then the equalities $\overline{M}_{[f_0]} = 0$ and $\operatorname{gr}(\overline{M}_{[f_0]}, \overline{M}_{[f_0],i})) = 0$ are equivalent. Also, $(\operatorname{gr} \overline{M})_{f_0} = 0$ if and only if $D(f_0) \cap \operatorname{Supp}(\operatorname{gr} \overline{M}) = \emptyset$. Since $(\operatorname{gr} \overline{M})_{f_0} \xrightarrow{\sim} \operatorname{gr}(\overline{M}_{[f_0]})$ (see [Lau85, A.1.1.3]) and since by definition $\operatorname{Car}^{(0)}(\mathcal{N}) = \operatorname{Supp}(\operatorname{gr}(\overline{M}, \overline{M}_i))$, we conclude the proof. □

Remark 15.1.7.6. Let $A = \oplus_{i\in\mathbb{N}} A_i$ be a graded ring. Let I be a graded ideal. Let $a_1, \ldots, a_r$ be some homogeneous generators of I. We notice that $|\operatorname{Spec} A| \setminus V(I) = \cup_{i=1}^r D(a_i)$.

The following proposition is the analogue of [Kas77, 2.11]:

Proposition 15.1.7.7. Let $\mathfrak{P}$ be a smooth $\mathcal{V}$-formal scheme. Let $\mathcal{N}$ be a coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}$-module and V be an irreducible component of codimension r of $\operatorname{Car}^{(0)}(\mathcal{N})$, the characteristic variety of level 0 of $\mathcal{N}$ (see 15.1.4.3). Then, $\operatorname{Car}^{(0)}(\mathcal{E}xt^r_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}))$ contains V.

Proof. We follow the proof of [Kas77, 2.11]: first, we can suppose $\mathfrak{P}$ affine with local coordinates. We set $D := \Gamma(\mathfrak{P}, \mathcal{D}^{(0)}_{\mathfrak{P}/\mathfrak{S}})$, $N := \Gamma(X, \mathcal{N})$, $\overline{D} := \Gamma(X, \mathcal{D}^{(0)}_{X/S})$. Let M be a p-torsion free coherent $\widehat{D}$-module such that $M_{\mathbb{Q}} \xrightarrow{\sim} N$. Let $\overline{M} := M/\pi M$. Following 4.1.3.17, there exists a good filtration $(\overline{M}_i)_{i\in\mathbb{N}}$ of $\overline{M}$ indexed by $\mathbb{N}$. By definition, we have $\operatorname{Car}^{(0)}(\mathcal{N}) = \operatorname{Supp}(\operatorname{gr}(\overline{M}, \overline{M}_i))$ (we recall that this is independent on the choice of the good filtration). Let η be the generic point of V. From [Mat80, 7.D and 10.B.i)], the irreducible components of $\operatorname{Supp}(\operatorname{gr} \overline{M})$ are of the form $V(J)$ with J a homogeneous ideal. Let Z be the union of the irreducible components of $\operatorname{Supp}(\operatorname{gr} \overline{M})$ which do not contain η. Then, we get from the remark 15.1.7.6 that there exists a homegeneous element $f \in \operatorname{gr} D$ such that $\eta \in D(f_0)$ and $D(f_0) \cap Z = \emptyset$ (in other words, $D(f_0) \cap \operatorname{Car}^{(0)}(\mathcal{N}) = D(f_0) \cap V \neq \emptyset$).

Now, suppose absurdly that $\eta \notin \operatorname{Car}^{(0)}(\mathcal{E}xt^r_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}))$. Using the same arguments as above, there exists a homogeneous element $g \in \operatorname{gr} D$ such that $\eta \in D(g_0)$ and $D(g_0) \cap \operatorname{Car}^{(0)}(\mathcal{E}xt^r_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}})) = \emptyset$. We put $h = fg$. Hence, we have $\eta \in D(h_0)$ and $D(h_0) \cap \operatorname{Car}^{(0)}(\mathcal{N}) = D(h_0) \cap V$ and $D(h_0) \cap \operatorname{Car}^{(0)}(\mathcal{E}xt^r_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}})) = \emptyset$.

1) Since $\mathcal{E}xt^r_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}})$ is a coherent (right) $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}$-module, from Theorem A and B of 7.2.3.16, we get the equality $\Gamma(\mathfrak{P}, \mathcal{E}xt^r_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}})) = \operatorname{Ext}^r_{\widehat{D}_{\mathbb{Q}}}(N, \widehat{D}_{\mathbb{Q}})$. From 15.1.7.5, this implies $\operatorname{Ext}^r_{\widehat{D}_{\mathbb{Q}}}(N, \widehat{D}_{\mathbb{Q}}) \otimes_{\widehat{D}_{\mathbb{Q}}} \widehat{D}_{[h],\mathbb{Q}} = 0$. Since the extension $\widehat{D}_{\mathbb{Q}} \to \widehat{D}_{[h],\mathbb{Q}}$ is flat (see 15.1.7.3), we get $\operatorname{Ext}^r_{\widehat{D}_{[h],\mathbb{Q}}}(N_{[h]}, \widehat{D}_{[h],\mathbb{Q}}) \xrightarrow{\sim} \operatorname{Ext}^r_{\widehat{D}_{\mathbb{Q}}}(N, \widehat{D}_{\mathbb{Q}}) \otimes_{\widehat{D}_{\mathbb{Q}}} \widehat{D}_{[h],\mathbb{Q}} = 0$.

2) a) Since $\operatorname{Car}^{(0)}(\mathcal{N}) = \operatorname{Supp}(\operatorname{gr} \overline{M})$, then $D(h_0) \cap \operatorname{Car}^{(0)}(\mathcal{N}) = \operatorname{Supp}(\operatorname{gr} \overline{M})_{h_0})$. Since we have also $D(h_0) \cap \operatorname{Car}^{(0)}(\mathcal{N}) = D(h_0) \cap V$, then in particular we get $\operatorname{Codim}(\operatorname{gr} \overline{M})_{h_0} = r$. Since $(\operatorname{gr} \overline{M})_{h_0} = \operatorname{gr}(\overline{M}_{[h_0]})$, then from 15.1.7.1 for any $i < r$ we obtain $\operatorname{Ext}^i_{\operatorname{gr} \overline{D}_{[h_0]}}(\operatorname{gr}(\overline{M}_{[h_0]}), \operatorname{gr} \overline{D}_{[h_0]}) = 0$. From 15.1.6.17.3, this yields that for $i < r$, $\operatorname{Ext}^i_{\overline{D}_{[h_0]}}(\overline{M}_{[h_0]}, \overline{D}_{[h_0]}) = 0$. On the other hand, from 15.1.7.1 we get for any $i > r$ the inequality $\operatorname{Codim}(\operatorname{Ext}^i_{\operatorname{gr} \overline{D}_{[h_0]}}(\operatorname{gr}(\overline{M}_{[h_0]}), \operatorname{gr} \overline{D}_{[h_0]})) > r$. Hence, by reducing $D(h_0)$ if necessary (use again the remark 15.1.7.6), for any $i > r$ we get $\operatorname{Ext}^i_{\operatorname{gr} \overline{D}_{[h_0]}}(\operatorname{gr}(\overline{M}_{[h_0]}), \operatorname{gr} \overline{D}_{[h_0]}) = 0$ and then $\operatorname{Ext}^i_{\overline{D}_{[h_0]}}(\overline{M}_{[h_0]}, \overline{D}_{[h_0]}) = 0$. To sum up, we have found an homogeneous element $h \in \operatorname{gr} D$ such that $\eta \in D(h_0)$ and for $i \neq r$, $\operatorname{Ext}^i_{\overline{D}_{[h_0]}}(\overline{M}_{[h_0]}, \overline{D}_{[h_0]}) = 0$.

2) b) Now, since $M_{[h]}$ is p-torsion free, $\mathbb{R}\operatorname{Hom}_{\widehat{D}_{[h]}}(M_{[h]}, \widehat{D}_{[h]}) \otimes^{\mathbb{L}}_{\widehat{D}_{[h]}} \overline{D}_{[h_0]} \xrightarrow{\sim} \mathbb{R}\operatorname{Hom}_{\overline{D}_{[h_0]}}(\overline{M}_{[h_0]}, \overline{D}_{[h_0]})$. From the exact sequence of universal coefficients (e.g. see the proof of 15.2.1.1), we get the inclusion $\operatorname{Ext}^i_{\widehat{D}_{[h]}}(M_{[h]}, \widehat{D}_{[h]}) \otimes_{\widehat{D}_{[h]}} \overline{D}_{[h_0]} \hookrightarrow \operatorname{Ext}^i_{\overline{D}_{[h_0]}}(\overline{M}_{[h_0]}, \overline{D}_{[h_0]})$. Hence, for any $i \neq r$, from the step 2) a) of the proof, we obtain the vanishing $\operatorname{Ext}^i_{\widehat{D}_{[h]}}(M_{[h]}, \widehat{D}_{[h]}) \otimes_{\widehat{D}_{[h]}} \overline{D}_{[h_0]} = 0$. By using 7.2.1.2.(b), since $\operatorname{Ext}^i_{\widehat{D}_{[h]}}(M_{[h]}, \widehat{D}_{[h]})$ is a coherent $\widehat{D}_{[h]}$-module, for $i \neq r$ we get $\operatorname{Ext}^i_{\widehat{D}_{[h]}}(M_{[h]}, \widehat{D}_{[h]}) = 0$ and then $\operatorname{Ext}^i_{\widehat{D}_{[h],\mathbb{Q}}}(N_{[h]}, \widehat{D}_{[h],\mathbb{Q}}) = 0$ (because $\widehat{D}_{[h]} \to \widehat{D}_{[h],\mathbb{Q}}$ is flat).

3) From steps 1) and 2), we have checked that $\mathbb{R}\operatorname{Hom}_{\widehat{D}_{[h],\mathbb{Q}}}(N_{[h]}, \widehat{D}_{[h],\mathbb{Q}}) = 0$. By using the biduality isomorphism (see 4.6.4.6 and notice that $N_{[h]}$ is a perfect complex because so is N and because the extension $\widehat{D}_{\mathbb{Q}} \to \widehat{D}_{[h],\mathbb{Q}}$ is flat), we get $N_{[h]} = 0$, which is absurd following Lemma 15.1.7.5 because $\eta \in D(h_0)$. □

Theorem 15.1.7.8. Let $\mathfrak{P}$ be a smooth $\mathcal{V}$-formal scheme. Let r be an integer, $\mathcal{N}$ be a coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}$-module such that $\mathcal{E}xt^s_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}) = 0$ for any $s \neq r$. Then, the characteristic variety $\mathrm{Car}^{(0)}(\mathcal{N})$ of $\mathcal{N}$ is purely of codimension r.

Proof. If V is an irreducible component of $\mathrm{Car}^{(0)}(\mathcal{N})$ of codimension s, then from 15.1.7.7 we get $\mathcal{E}xt^s_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{N}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}) \neq 0$ since it contains V. Hence $s = r$. □

15.1.7.9. When $\mathcal{E}$ is a log extendable overconvergent F-isocrystal, we establish the inclusion of $\mathrm{Car}(\mathcal{E})$ into a explicit lagrangian subvariety of the cotangent space of X. With the above purity theorem, this inclusion implies the Lagrangianity of $\mathrm{Car}(\mathcal{E})$. Moreover, one another application of this inclusion in a further work will be to get some "relative generic $\mathcal{O}$-coherence" (see precisely the proof of Theorem [Car19a, 1.4.3]). This implies some Betti number estimates (see [Car19a]). In the theory of arithmetic $\mathcal{D}$-modules, we recall that to check some property we are often able to reduce to the case of log extendable overconvergent F-isocrystals (e.g. in the proof of Theorem [Car19a, 1.4.3]). Indeed, overholonomic F-complexes of arithmetic $\mathcal{D}$-modules are devissable in overconvergent F-isocrystals (see later 18.3.2.3) and thanks to Kedlaya's semistable reduction theorem any overconvergent F-isocrystal becomes log-extendable after the pullback by some generically etale alteration (see [Ked11]).

15.2 Holonomic $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module

Let $\mathfrak{P}$ be a smooth $\mathfrak{S}$-formal scheme.

15.2.1 Dimension of level m and vanishing of $\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(-,-)$

Lemma 15.2.1.1 (Universal coefficient exact sequence)**.** *Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}})$ and $\mathcal{E}_0 := \mathcal{D}^{(m)}_P \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} \mathcal{E}$. For any $n \in \mathbb{N}$, we have the exact sequence:*

$$0 \to \mathcal{E}xt^n_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} \mathcal{D}^{(m)}_P \to \mathcal{E}xt^n_{\mathcal{D}^{(m)}_P}(\mathcal{E}_0, \mathcal{D}^{(m)}_P) \to \mathcal{T}or^1_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}}(\mathcal{E}xt^{n+1}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}), \mathcal{D}^{(m)}_P) \to 0. \tag{15.2.1.1.1}$$

Proof. The second spectral sequence of the functor $-\otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} \mathcal{D}^{(m)}_P$ applied to the complex $\mathcal{F} := \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}})$ is:

$$E_2^{r,s} = \mathcal{T}or^{-r}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}}(H^s\mathcal{F}, \mathcal{D}^{(m)}_P) \Rightarrow H^{r+s}(\mathcal{F} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} \mathcal{D}^{(m)}_P).$$

Since dual functors commute with extensions (see 4.6.4.7.1), then we get the isomorphism $\mathcal{F} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} \mathcal{D}^{(m)}_P \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_P}(\mathcal{E}_0, \mathcal{D}^{(m)}_P)$. This yields the spectral sequence:

$$E_2^{r,s} = \mathcal{T}or^{-r}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}}(\mathcal{E}xt^s_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}), \mathcal{D}^{(m)}_P) \Rightarrow \mathcal{E}xt^n_{\mathcal{D}^{(m)}_P}(\mathcal{E}_0, \mathcal{D}^{(m)}_P).$$

Since $E_2^{r,s} = 0$ except for $r = 0$ and $r = -1$, then we are done.

□

Lemma 15.2.1.2. *Suppose $\mathfrak{P}$ affine. Let $\mathcal{E}$ be a coherent left $\mathcal{D}^{(0)}_{P/S}$-module. We endow the left $\mathcal{D}^{(0)}_{P/S}$-module $\mathcal{D}^{(0)}_{P/S}$ with its canonical order filtration which is a good filtration. Let $(\mathcal{E}_n)_{n\in\mathbb{N}}$ be a good filtration of $\mathcal{E}$. Let $i \in \mathbb{N}$. There is a good filtration of $\mathcal{E}xt^i_{\mathcal{D}^{(0)}_{P/S}}(\mathcal{E}, \mathcal{D}^{(0)}_{P/S})$, such that $\mathrm{gr}\,\mathcal{E}xt^i_{\mathcal{D}^{(0)}_{P/S}}(\mathcal{E}, \mathcal{D}^{(0)}_{P/S})$ is a $\mathrm{gr}\,\mathcal{D}^{(0)}_{P/S}$-subquotient of $\mathcal{E}xt^i_{\mathrm{gr}\,\mathcal{D}^{(0)}_{P/S}}(\mathrm{gr}\,\mathcal{E}, \mathrm{gr}\,\mathcal{D}^{(0)}_{P/S})$.*

Proof. By using the theorem of type A for quasi-coherent $\mathcal{D}^{(0)}_{P/S}$-modules, this is a consequence of 15.1.6.17. □

Lemma 15.2.1.3. *Let $\mathcal{E}, \mathcal{F}$ be two coherent left $\mathcal{D}^{(0)}_{P/S}$-modules. Let $(\mathcal{E}_n)_{n\in\mathbb{N}}$ (resp. $(\mathcal{F}_n)_{n\in\mathbb{N}}$ be a good filtration of $\mathcal{E}$ (resp. $\mathcal{F}$). Hence:*

(a) $\operatorname{codim}(\mathcal{E}xt^i_{\operatorname{gr}\mathcal{D}^{(0)}_{P/S}}(\operatorname{gr}\mathcal{E}, \operatorname{gr}\mathcal{D}^{(0)}_{P/S})) \geq i$*, for any* $i \geq 0$*.*

(b) $\mathcal{E}xt^i_{\operatorname{gr}\mathcal{D}^{(0)}_{P/S}}(\operatorname{gr}\mathcal{E}, \operatorname{gr}\mathcal{D}^{(0)}_{P/S}) = 0$*, for any* $i < \operatorname{codim}^{(0)}(\mathcal{E})$*.*

Proof. Since this is local in $\mathfrak{P}$, we can suppose $\mathfrak{P}$ is affine. Via the theorem of type A for quasi-coherent $\mathcal{D}^{(0)}_{P/S}$-modules, this is a consequence of 15.1.7.1. □

Corollary 15.2.1.4. *Let $\mathcal{E}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}$-module. Hence:*

(a) $\operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}})) \geq i$*, for any* $i \geq 0$*.*

(b) $\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}) = 0$*, for any* $i < \operatorname{codim}^{(0)}(\mathcal{E})$*.*

Proof. Let $i \in \mathbb{N}$. Since $\mathcal{E}$ is p-torsion free, we have

$$\mathcal{E}_0 := \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}} \mathcal{E} \xrightarrow{\sim} \mathcal{D}^{(0)}_{P} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}} \mathcal{E}.$$

By definition (see 15.1.4.1),

$$\operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}})) = \operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}) \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}} \mathcal{D}^{(0)}_{P}).$$

By using the injective morphism of the exact sequence 15.2.1.1.1 and the formula 15.1.3.5, this yields

$$\operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}})) \geq \operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\mathcal{D}^{(0)}_{P}}(\mathcal{E}_0, \mathcal{D}^{(0)}_{P})).$$

It follows from 15.2.1.2 (resp. 15.2.1.3.(a)) the first (resp. second) inequality:

$$\operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\mathcal{D}^{(0)}_{P}}(\mathcal{E}_0, \mathcal{D}^{(0)}_{P})) \geq \operatorname{codim}(\mathcal{E}xt^i_{\operatorname{gr}\mathcal{D}^{(0)}_{P/S}}(\operatorname{gr}\mathcal{E}_0, \operatorname{gr}\mathcal{D}^{(0)}_{P/S})) \geq i,$$

which yields (a).

Suppose $i < \operatorname{codim}^{(0)}(\mathcal{E})$. Following 15.2.1.2 and 15.2.1.3.(b), we have: $\mathcal{E}xt^i_{\mathcal{D}^{(0)}_{P}}(\mathcal{E}_0, \mathcal{D}^{(0)}_{P}) = 0$. By using the injective morphism of 15.2.1.1.1, this yields $\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}})) = 0$. □

Corollary 15.2.1.5. *Let $\mathcal{E}^{(m)}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. Hence:*

(a) $\operatorname{codim}^{(m)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})) \geq i$*, for any* $i \geq 0$*.*

(b) $\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) = 0$*, for any* $i < \operatorname{codim}^{(m)}(\mathcal{E}^{(m)})$*.*

Proof. 1) Suppose $m = 0$. Choose a p-torsion free coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}$-module $\mathcal{F}$ such that there exists an isomorphism of $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}$-modules of the form $\mathcal{F}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(0)}$ (see 7.5.2.8). Let $\mathcal{N}$ be the quotient of $\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{F}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}})$ by its p-torsion part. Since $\mathcal{N}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(0)}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}})$ then we get the first equality by definition (see 15.1.4.3):

$$\operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(0)}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}})) = \operatorname{codim}^{(0)}(\mathcal{N}).$$

Since $\mathcal{N}$ is a quotient of $\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{F}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}})$, since the functor $\mathcal{F} \mapsto \mathcal{F}/\pi\mathcal{F}$ is right exact then we get from 15.1.3.5:

$$\operatorname{codim}^{(0)}(\mathcal{N}) \geq \operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}^{(0)}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}})),$$

Hence, $\operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(0)}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P},\mathbb{Q}})) \geq \operatorname{codim}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}}(\mathcal{E}^{(0)}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}}))$. By using the example 15.1.4.4 and 15.2.1.4, we are done.

2) Let us go back to the general case. Since this is local in $\mathfrak{P}$, we can suppose there exists $F\colon \mathfrak{P} \to \mathfrak{P}'$ a morphism of smooth $\mathfrak{S}$-schemes lifting $F^m_{P_0/S_0}$. Let $\mathcal{E}'^{(0)} := F^\flat \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)}$ be the corresponding left $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}}$-module. Following 8.8.1.3, we have the isomorphism: $F^*\mathcal{E}'^{(0)} \xrightarrow{\sim} \mathcal{E}^{(m)}$. Hence, it follows from 11.3.2.1.1 that we have the canonical isomorphism

$$F^\flat \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}}}(\mathcal{E}'^{(0)}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}). \qquad (15.2.1.5.1)$$

Following (the right version of) 15.1.4.6, we get the first (second) equality:

$$\iota^{(m)}_S(\operatorname{Car}^{(0)}(\mathcal{E}'^{(0)}) = \operatorname{Car}^{(m)}(\mathcal{E}^{(m)}),$$
$$\operatorname{Car}^{(0)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}}}(\mathcal{E}'^{(0)}, \widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}})) = \operatorname{Car}^{(m)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}}(\mathcal{E}'^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'/\mathfrak{S},\mathbb{Q}})).$$

Hence, we can reduce to the case $m = 0$ of the first part and we are done. □

15.2.2 The filtration by the codimension of a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module

Let $\mathcal{E}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module.

Notation 15.2.2.1. Since we have the biduality isomorphism $\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}), \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{E}$ (see 4.6.4.6), then we get the converging biregular spectral sequence (see [Sta22, 0BDU])

$$E_2^{r,s} = \mathcal{E}xt^r_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}xt^{-s}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}), \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \Rightarrow H^n(\mathcal{E}) = E^n. \qquad (15.2.2.1.1)$$

Denote by $(F^i_{(m)}(\mathcal{E}))_{i\geq 0}$ the decreasing filtration of $\mathcal{E}$ induced by the spectral sequence 15.2.2.1.1 for $n = 0$. One gets the explicit construction at [Sta22, 012P] in the case where the filtered complex is given by the total complex associated to the bicomplex $\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{H}om_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{I}^\bullet), \mathcal{I}^\bullet)$ where $\mathcal{I}^\bullet$ is an injective resolution of the bimodule $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$, this total complex being filtrated by the first filtration F_I according to notation [Sta22, 012Z].

One important property, is the functoriality of this filtration: for any morphism $\alpha\colon \mathcal{E}' \to \mathcal{E}$ of coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-modules, α is in fact a morphism of filtered coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-modules, i.e. $\alpha(F^i_{(m)}(\mathcal{E}')) \subset F^i_{(m)}(\mathcal{E})$.

15.2.2.2. Set $k := \operatorname{codim}^{(m)}(\mathcal{E})$. We have $E_2^{i,j} = 0$ (and therefore $E_\infty^{i,j} = 0$) in the following case:

(a) for any $i < 0$ or $-j < 0$ (obvious),

(b) for any $i > 2d$ or $-j > 2d$ (use 8.7.7.6),

(c) for any $-j < k$ (use 15.2.1.5(b)),

(d) for any $i < -j$ (use both properties of 15.2.1.5).

Proposition 15.2.2.3. *With the notations of 15.2.2.1, for any $0 \leq i \leq 2d$, $F^i_{(m)}(\mathcal{E})$ is the greatest coherent sub-$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module of codimension greater or equal to i of $\mathcal{E}$.*

Proof. Let $0 \leq i \leq 2d$. Since the spectral sequence 15.2.2.1.1 is converging, then we have by definition of the convergence $F^j_{(m)}(\mathcal{E})/F^{j+1}_{(m)}(\mathcal{E}) = E_\infty^{j,-j}$ for any $j \in \mathbb{N}$.

1) Suppose $0 \leq i \leq k$. Since for any $0 \leq j < i$, we have $E_\infty^{j,-j} = 0$ (see 15.2.2.2.(c)), then we get the equality $F^i_{(m)}(\mathcal{E}) = \mathcal{E}$.

2) Following 15.2.1.5, for any $i \leq j \leq 2d$, $\operatorname{codim}^{(m)}(E_2^{j,-j}) \geq j \geq i$. With the lemma 15.1.4.5, this yields we get $\operatorname{codim}^{(m)}(E_\infty^{j,-j}) \geq i$, for any $i \leq j \leq 2d$. Since $F^j_{(m)}(\mathcal{E})/F^{j+1}_{(m)}(\mathcal{E}) = E_\infty^{j,-j}$, this yields that $F^i_{(m)}(\mathcal{E})$ has codimension greater or equal to i.

3) Let $\mathcal{E}'$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-submodule of $\mathcal{E}$ of codimension greater or equal to i. By functoriality of the filtration (see 15.2.2.1.1), we get the commutative diagram:

$$\begin{array}{ccc} F^i_{(m)}(\mathcal{E}')[r]^- & \hookrightarrow & \mathcal{E}' \\ \downarrow & & \downarrow \\ F^i_{(m)}(\mathcal{E}) & \hookrightarrow & \mathcal{E}. \end{array}$$

Since $\mathcal{E}'$ has codimension greater or equal to i, then the top arrow is an equality following the step 1) (applied to $\mathcal{E}'$). This implies the inclusion $\mathcal{E}' \hookrightarrow F^i_{(m)}(\mathcal{E})$ factoring this commutative diagram. Hence we are done. □

Proposition 15.2.2.4. *Let $\mathcal{E}^{(m)}$ be a nonzero coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. We have the equality:*

$$\operatorname{codim}^{(m)}(\mathcal{E}^{(m)}) = \min \left\{ i | \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \neq 0 \right\}. \tag{15.2.2.4.1}$$

Proof. Set $k := \operatorname{codim}^{(m)}(\mathcal{E}^{(m)})$ and $l := \min \left\{ i | \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \neq 0 \right\}$. It follows from 15.2.1.5.(b) that $l \geq k$. Hence, it remains to check that $\mathcal{E}xt^k_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \neq 0$. With notation 15.2.2.1.1, it is therefore sufficient to prove that $E_2^{k,-k} \neq 0$. By the absurd, let us suppose $E_2^{k,-k} = 0$. Following 15.2.1.5.(b), $E_2^{i,-i} = 0$ for $i < k$. Moreover, via 15.2.1.5.(a), $\operatorname{codim}(E_2^{i,-i}) \geq k+1$ for any $i \geq k+1$. By using 15.1.4.5, this yields $\operatorname{codim}(E_\infty^{i,-i}) \geq k+1$ for any $i \geq 0$ (in fact $E_\infty^{i,-i} = 0$ for any $i \leq k$). As the filtration of $\mathcal{E}^{(m)}$ induced by the spectral sequence is finite (use 8.7.7.6), then it follows from 15.1.4.5 that we obtain: $\operatorname{codim}(\mathcal{E}^{(m)}) \geq k+1$, which is absurd. □

Let us finish by results concerning the variation of the level.

Proposition 15.2.2.5. *Let $m' \geq m \geq$ be two integers, $\mathcal{E}^{(m)}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. We denote by $\mathcal{E}^{(m')} := \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)}$, $(F^i_{(m)}(\mathcal{E}^{(m)}))_{i\geq 0}$ and $(F^i_{(m')}(\mathcal{E}^{(m')}))_{i\geq 0}$ the decreasing filtrations of 15.2.2.1. We have the canonical isomorphism*

$$\widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} F^i_{(m)}(\mathcal{E}^{(m)}) \xrightarrow{\sim} F^i_{(m')}(\mathcal{E}^{(m')}).$$

Proof. It comes from the fact that the extension $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \to \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}$ is flat (see 7.5.3.1) and that the dual functor commutes with extensions (see 4.6.4.4.1). □

Corollary 15.2.2.6. *Let $\mathcal{E}^{(m)}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. For $m' \geq m$, we set $\mathcal{E}^{(m')} := \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)}$. We have the inequality* $\operatorname{codim}^{(m')}(\mathcal{E}^{(m')}) \geq \operatorname{codim}^{(m)}(\mathcal{E}^{(m)})$.

Proof. If $\mathcal{E}^{(m')} = 0$ then the assertion is straightforward. Let us suppose then $\mathcal{E}^{(m')} \neq 0$. As the extension $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \to \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}$ is flat, for any $i < \operatorname{codim}^{(m)}(\mathcal{E}^{(m)})$, we obtain:

$$0 = \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m')}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$$

Hence we are done via 15.2.2.4. □

Remark 15.2.2.7. With the notations of 15.2.2.6, following a counterexample of Berthelot and of Abe, there is no inclusion between the varieties characteristics of respectively $\mathcal{E}^{(m)}$ and $\mathcal{E}^{(m')}$.

15.2.3 The (co)dimension of a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module

Let T be a divisor of P and $\mathfrak{U} := \mathfrak{P} \setminus T$. In this subsection, we define the notion of the (co)dimension of a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. We also check here that the (co)dimension of the level m properties of the subsections 15.2.1 and 15.2.2 still hold for coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules.

Definition 15.2.3.1. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. Let m_0 be the smaller integer $m \geq 0$ such that there exists a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U},\mathbb{Q}}$-module $\mathcal{E}^{(m)}$ together with a $\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}}$-linear isomorphism of the form $\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U},\mathbb{Q}}} \mathcal{E}^{(m)} \xrightarrow{\sim} \mathcal{E}|\mathfrak{U}$. Following 8.4.1.11, this integer is well defined. Let us choose $\mathcal{E}^{(m_0)}$ such a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{U},\mathbb{Q}}$-module. For any integer $m \geq m_0$, we denote by then $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{U}\mathbb{Q}}} \mathcal{E}^{(m_0)}$. Following 15.2.2.6, for any $m' \geq m \geq m_0$, we have $\dim^{(m)}(\mathcal{E}^{(m)}) \geq \dim^{(m')}(\mathcal{E}^{(m')})$.

The *dimension of* $\mathcal{E}$, denoted by $\dim(\mathcal{E})$, is by definition the minimum of $\{\dim^{(m)}(\mathcal{E}^{(m)}), m \geq m_0\}$, i.e., the limit of the stationary sequence sequence $(\dim^{(m)}(\mathcal{E}^{(m)}))_{m \geq m_0}$. The *codimension of* $\mathcal{E}$, denoted by $\operatorname{codim}(\mathcal{E})$, is the integer $\operatorname{codim}(\mathcal{E}) := 2\dim P - \dim(\mathcal{E})$. Remark that following 8.4.1.11 the integers $\dim(\mathcal{E})$ and $\operatorname{codim}(\mathcal{E})$ do not depend on the choice of $\mathcal{E}^{(m_0)}$.

Lemma 15.2.3.2. *Let* $0 \to \mathcal{E}' \to \mathcal{E} \to \mathcal{E}'' \to 0$ *be an exact sequence of coherent left* $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$*-modules. We have the formula* $\operatorname{codim}(\mathcal{E}) = \min\{\operatorname{codim}(\mathcal{E}'), \operatorname{codim}(\mathcal{E}'')\}$.

Proof. By definition of the codimension, we can suppose the divisor T is empty. This is therefore a consequence of 15.1.4.5 and 8.4.1.11. □

Let us extend via the following two propositions the results of the preceding section:

Proposition 15.2.3.3. *Let* $\mathcal{E}$ *be a coherent* $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$*-module.*

(a) $\operatorname{codim}(\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})) \geq i$*, for any* $i \geq 0$.

(b) $\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) = 0$*, for any* $i < \operatorname{codim}(\mathcal{E})$.

Proof. By definition of the codimension or by using 8.7.6.11, we reduce to case where the divisor T is empty. With the notations of 15.2.3.1, for any $m \geq m_0$, as the extension $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$ is flat (see 7.5.3.1), as dual functors commute with extensions (see 4.6.4.4.1), then we obtain the second isomorphism:

$$\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}. \tag{15.2.3.3.1}$$

For m large enough, $\operatorname{codim}^{(m)}(\mathcal{E}^{(m)}) = \operatorname{codim}(\mathcal{E})$. Following 15.2.1.5, this yields that $\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}) = 0$ for any $i < \operatorname{codim}(\mathcal{E})$, i.e. we have checked the part (b) of the proposition. By definition of the codimension of $\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$, the isomorphism 15.2.3.3.1 can be translated for m large enough by

$$\operatorname{codim}(\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})) = \operatorname{codim}^{(m)}(\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})).$$

From 15.2.1.5.(a), this yields therefore (a). □

Notation 15.2.3.4. Since we have the biduality isomorphism

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}(\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}), \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) \xrightarrow{\sim} \mathcal{E}$$

(see 4.6.4.6), then similarly to 15.2.2.1 we get the converging biregular spectral sequence

$$E_2^{r,s} = \mathcal{E}xt^r_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E}xt^{-s}_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}), \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) \Rightarrow H^n(\mathcal{E}) = E^n. \tag{15.2.3.4.1}$$

Denote by $(F^i(\mathcal{E}))_{i \geq 0}$ the decreasing filtration of $\mathcal{E}$ induced by the spectral sequence 15.2.3.4.1 for $n = 0$. This filtration is functorial: for any morphism $\alpha \colon \mathcal{E}' \to \mathcal{E}$ of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules, α is in fact a morphism of filtered coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules, i.e. $\alpha(F^i(\mathcal{E}')) \subset F^i(\mathcal{E})$.

15.2.3.5. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. Set $k := \operatorname{codim}(\mathcal{E}) \leq d$. With the notation 15.2.3.4.1, we have $E_2^{i,j} = 0$ (and therefore $E_\infty^{i,j} = 0$) in the following case:

(i) for any $i < 0$ or $-j < 0$ (obvious),

(ii) for any $i > 2d + 2$ or $-j > 2d + 2$ (use 8.7.7.9),

(iii) for any $-j < k$ (use 15.2.3.3(b)),

(iv) for any $i < -j$ (use both properties of 15.2.3.3).

Proposition 15.2.3.6. *With the notations of 15.2.3.4, for any $0 \leq i \leq 2d$, $F^i(\mathcal{E})$ is the greatest coherent sub-$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module of codimension greater or equal to i of $\mathcal{E}$.*

Proof. Copy the check of 15.2.2.3. ☐

Proposition 15.2.3.7. *Let $\mathcal{E}^{(m)}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. We denote by $\mathcal{E} := \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)}$, $(F^i_{(m)}(\mathcal{E}^{(m)}))_{i\geq 0}$ and $(F^i(\mathcal{E})_{i\geq 0}$ the decreasing filtrations of 15.2.2.1 and 15.2.3.4. We have the canonical isomorphism*

$$\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} F^i_{(m)}(\mathcal{E}^{(m)}) \xrightarrow{\sim} F^i(\mathcal{E}). \tag{15.2.3.7.1}$$

Proof. The isomorphism 15.2.3.7.1 comes from the fact that the extension $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$ is flat (this follows from 7.5.3.1) and that the dual functor commutes with extensions (see 4.6.4.4.1). ☐

Proposition 15.2.3.8. *Let $\mathcal{E}$ be a nonzero coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. Hence:*

$$\operatorname{codim}(\mathcal{E}) = \min \left\{ i | \mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) \neq 0 \right\}. \tag{15.2.3.8.1}$$

Proof. By definition of the codimension and by using 8.7.6.11, we reduce to case where the divisor T is empty. Set $k := \operatorname{codim}(\mathcal{E})$ and $l := \min \left\{ i | \mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}) \neq 0 \right\}$. It follows from 15.2.3.3 that $k \leq l$. It remains to check $\mathcal{E}xt^k_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}) \neq 0$. With notation 15.2.3.1, for m large enough, $\mathcal{E}^{(m)} \neq 0$ and $k = \operatorname{codim}(\mathcal{E}^{(m)})$. We get from 15.2.2.4 that $\mathcal{E}xt^k_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \neq 0$ for any m large enough. For any $m' \geq m$ large enough, as the extension $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \to \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}$ is flat (see 7.5.3.1), as dual functors commute with extensions (see 4.6.4.4.1), we obtain the second isomorphism:

$$\mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m')}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}}(\widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{E}xt^i_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}^{(m)}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}) \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}}.$$

Via the isomorphisms 15.2.3.3.1, this yields $\mathcal{E}xt^k_{\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}) \neq 0$. ☐

15.2.4 Inequality of Bernstein, holonomicity, homological criterion, Berthelot-Kashiwara theorem

Let T be a divisor of P. Unless otherwise stated, we suppose P integral.

Theorem 15.2.4.1 (Inequality of Bernstein)**.** *For any nonzero coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module $\mathcal{E}$, we have*

$$\dim(\mathcal{E}) \geq \dim P. \tag{15.2.4.1.1}$$

Proof. By definition of the dimension, we reduce to case where the divisor T is empty. We proceed by induction on the dimension of P.

1) Let us suppose that the support of $\mathcal{E}$ is P. With notation 15.2.3.1, let $m \geq m_0$ and $\mathring{\mathcal{E}}^{(m)}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module such that $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} \mathring{\mathcal{E}}^{(m)} \xrightarrow{\sim} \mathcal{E}^{(m)}$. Since the support of $\mathcal{E}^{(m)}$ is P, then the support of $\operatorname{gr}(\mathring{\mathcal{E}}^{(m)}/\pi\mathring{\mathcal{E}}^{(m)})$ in T^*P contains $T^*_P P$ and the inequality holds.

2) Suppose the support Z of $\mathcal{E}$ is a closed subset of dimension smaller than that of P. Replacing if necessary P by an affine open U such that $Z \cap U$ is smooth and dense in an irreducible component of Z of maximal dimension, we can suppose Z smooth and that $Z \subset P$ lifts to a closed immersion $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{P}$ of smooth $\mathfrak{S}$-formal schemes. As $\mathcal{E}^{(m)}$ has its support in Z, following 9.3.5.8, increasing m if necessary, there exists a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z},\mathbb{Q}}$-module $\mathcal{F}^{(m)}$ such that $u^{(m)}_{+}(\mathcal{F}^{(m)}) \xrightarrow{\sim} \mathcal{E}^{(m)}$ and $\dim(\mathcal{E}) = \dim^{(m)}(\mathcal{E}^{(m)})$. Since this is local, we can suppose $\mathfrak{P}$ is affine and there exists a morphism of smooth $\mathfrak{S}$-formal schemes $F\colon \mathfrak{P} \to \mathfrak{P}'$ (resp. $F\colon \mathfrak{Z} \to \mathfrak{Z}'$) which is a lifting of the relative Frobenius $F^{m}_{P/S}\colon P \to P^{(m)}$ (resp. $F^{m}_{Z/S}\colon Z \to Z^{(m)}$). Let $u'\colon \mathfrak{Z}' \hookrightarrow \mathfrak{X}'$ be a lifting of the closed immersion $u'_0 := u^{(m)}_0$. We set $\mathcal{E}'^{(0)} := F^{\flat}\widehat{\mathcal{D}}^{(0)}_{\mathfrak{P}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)}$ and $\mathcal{F}'^{(0)} := F^{\flat}\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Z}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z},\mathbb{Q}}} \mathcal{F}^{(m)}$. Following 8.8.1.3, $F^{*}\mathcal{E}'^{(0)} \xrightarrow{\sim} \mathcal{E}^{(m)}$ and $F^{*}\mathcal{F}'^{(0)} \xrightarrow{\sim} \mathcal{F}^{(m)}$. Hence, by using 15.1.4.6, we reduce to check $\mathrm{Car}^{(0)}(\mathcal{E}'^{(0)}) \geq \dim P$.

Let $\mathring{\mathcal{F}}'^{0)}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Z}'}$-module such that $\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Z}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Z}'}} \mathring{\mathcal{F}}'^{0)} \xrightarrow{\sim} \mathcal{F}'^{(0)}$. We set $\overline{\mathcal{F}}'^{(0)} := \mathcal{D}^{(0)}_{Z^{(m)}} \otimes_{\widehat{\mathcal{D}}^{(0)}_{\mathfrak{Z}'}} \mathring{\mathcal{F}}'^{0)}$. By definition, $\mathrm{Car}^{(0)}(\overline{\mathcal{F}}'^{(0)}) = \mathrm{Car}^{(0)}(\mathring{\mathcal{F}}'^{0)}) = \mathrm{Car}^{(0)}(\mathcal{F}'^{(0)})$. Since $\mathcal{F}'^{(0)}$ is not null, then by induction hypothesis (and by 15.2.2.6) we get $\dim \mathrm{Car}^{(0)}(\overline{\mathcal{F}}'^{(0)}) \geq \dim Z$.

Via an easy computation in local coordinates, we can check the formula

$$\mathrm{Car}^{(0)}(u'^{(0)}_{0+}(\overline{\mathcal{F}}'^{(0)})) = \varpi_{u'_0}(\rho^{-1}_{u'_0}\mathrm{Car}^{(0)}(\overline{\mathcal{F}}'^{(0)})),$$

where $T^*Z \xleftarrow{\rho_{u'_0}} Z\times_P T^*P \xrightarrow{\varpi_{u'_0}} T^*P$ are the canonical maps (see 15.1.1). With notation 15.1.1, since $\rho_{u'_0}$ is flat of relative dimension $\dim P - \dim Z$ and $\varpi_{u'_0}$ is a closed immersion, then $\dim \varpi_{u'_0}(\rho^{-1}_{u'_0}\mathrm{Car}^{(0)}(\overline{\mathcal{F}}'^{(0)})) = \dim \mathrm{Car}^{(0)}(\overline{\mathcal{F}}'^{(0)}) + \dim P - \dim Z \geq \dim P$. Hence, $\dim \mathrm{Car}^{(0)}(u'^{(0)}_{0+}(\overline{\mathcal{F}}'^{(0)})) \geq \dim P$. As $u'^{(0)}_{0+}(\mathring{\mathcal{F}}'^{0)})$ gives a p-torsion free model of $\mathcal{E}'^{(0)}$, then $\mathrm{Car}^{(0)}(\mathcal{E}'^{(0)}) = \mathrm{Car}^{(0)}(u^{(0)}_{0+}(\overline{\mathcal{F}}'^{(0)})) \geq \dim P$ and we are done.

□

Remark 15.2.4.2. Let $\mathcal{E}^{(m)}$ be a nonzero coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module. We have $\dim^{(m)}(\mathcal{E}^{(m)}) \geq \dim(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)})$. However, we cannot deduce $\dim^{(m)}(\mathcal{E}^{(m)}) \geq \dim P$ from 15.2.4.1.1 because it might happen that $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)} = 0$.

The Bernstein inequality 15.2.4.1.1 is false when P is not connected. For instance is the connected composantes of $\mathfrak{P}$ are $\widehat{\mathbb{A}}^1_{\mathfrak{S}}$ and $\mathfrak{S}$, take $\mathcal{E}$ be a nonzero coherent module with support in $\mathfrak{S}$.

Theorem 15.2.4.3. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module. For any $i > \dim P$, we have*

$$\mathcal{E}xt^{i}_{\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) = 0.$$

Proof. By the absurd, let us suppose that there exist $i > \dim P$ such that $\mathcal{E}xt^{i}_{\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \neq 0$. The inequality of Bernstein can be translated by $\mathrm{codim}(\mathcal{E}xt^{i}_{\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})) \leq \dim P$, which is in contradiction with 15.2.3.3.a. □

The following corollary improves 8.7.7.6 in our specific context.

Corollary 15.2.4.4. *We have the following properties.*

(a) For any $i > \dim P$, for any coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module $\mathcal{E}$ and any $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module$\mathcal{F}$,

$$\mathcal{E}xt^{i}_{\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{F}) = 0.$$

(b) For any affine open subset $\mathfrak{U}$ of $\mathfrak{P}$, we have the equality $\mathrm{tor.dim}\,\Gamma(\mathfrak{U}, \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) = \dim U$ *and the inequalities* $\dim U \leq \mathrm{gl.dim}\,\Gamma(\mathfrak{U}, \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \leq \dim U + 1$.

Proof. a) Since $\mathcal{E}$ is a perfect complex, then it follows from 4.6.3.6.1 the isomorphism

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}} \mathcal{F} \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{F}),$$

and we conclude by using 15.2.4.3.

b) We can suppose $\mathfrak{P}$ affine. Since the functor $\Gamma(\mathfrak{P}, -)$ is exact on the category of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-modules, then we get for any $r \in \mathbb{N}$:

$$\Gamma(\mathfrak{P}, -) \circ \mathcal{E}xt^r_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) \xrightarrow{\sim} \mathrm{Ext}^r_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}).$$

With 15.2.4.3 and 1.4.3.30.(g), this yields $\mathrm{tor}\,.\dim \Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) \leq \dim U$. Since the converse inequality is already knows (see 8.7.7.4), then we get $\mathrm{tor}\,.\dim \Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) = \dim U$. The last inequalities follows from 2.3.4.3. □

Definition 15.2.4.5 (Holonomicity)**.** We do not suppose $\mathfrak{P}$ is integral. As $\mathfrak{P}$ is smooth, $\mathfrak{P}$ is the sum of its connected components denoted by $(\mathfrak{P}_r)_r$.

(a) Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-module. We say that $\mathcal{E}$ is "$\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-holonomic" or "holonomic as $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-module" if, for any r, we have $\dim(\mathcal{E}|\mathfrak{P}_r) \leq \dim P_r$.

(b) Moreover, a complex $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ is by definition *holonomic* if so are its cohomogical sheaves. It will be denoted by $D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ the full subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ consisting in holonomic $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-complexes.

(c) An F-complex $(\mathcal{E}, \Phi) \in F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ is by definition *holonomic* is $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$. We denote by $F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ the full subcategory of $F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ consisting in holonomic F-$\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-complexes.

15.2.4.6. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$. Let $\mathfrak{U} := \mathfrak{P} \setminus T$. It is straightforward from the definition of the holonomicity and of the dimension that $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ if and only if $\mathcal{E}|\mathfrak{U} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}})$.

Lemma 15.2.4.7. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-module. Hence $\mathcal{E}^* := H^0(\mathbb{D}_T(\mathcal{E}))$ is $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-holonomic.*

Proof. This follows from the proposition 15.2.3.3. □

Proposition 15.2.4.8 (Homological criterion of holonomicity)**.** *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-module. Hence $\mathcal{E}$ is holonomic if and only if, for any $i \neq \dim P$, $\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) = 0$.*

Proof. Since the case $\mathcal{E} = 0$ is obvious, then we can suppose $\mathcal{E} \neq 0$.

1) If $\mathcal{E}$ is holonomic that by definition $\dim(\mathcal{E}) = \mathrm{codim}(\mathcal{E}) = \dim P$. By using 15.2.3.3, we get $\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) = 0$ for any $i < \dim P$ and via 15.2.4.3 we obtain $\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) = 0$ for any $i > \dim P$.

2) Conversely, suppose $\mathcal{E}xt^i_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) = 0$ for any $i \neq \dim P$. Set $k = \mathrm{codim}(\mathcal{E})$. By using the proposition 15.2.3.8, we get $\mathcal{E}xt^k_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}) \neq 0$. Hence, $k = \mathrm{codim}(\mathcal{E})$. □

Example 15.2.4.9. We have the following properties.

(a) The coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-modules which are $\mathcal{O}_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-coherent are $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-holonomic. Indeed, this is a consequence of the isomorphism $\mathbb{D}_T(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}^\vee = \mathcal{H}om_{\mathcal{O}_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}}(\mathcal{E}, \mathcal{O}_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}})$ (see 11.2.6.3.4).

(b) We will give more example at 18.2.3.13.

Corollary 15.2.4.10. *Let $\mathfrak{U} := \mathfrak{P} \setminus T$. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-module. Hence $\mathcal{E}$ is $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T)_{\mathbb{Q}}$-holonomic if and only if $\mathcal{E}|\mathfrak{U}$ is $\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}}$-holonomic.*

Proof. This is a consequence of 15.2.4.8 and 8.7.6.11. ☐

Remark 15.2.4.11. The $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomicity does not imply the $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-holonomicity. Indeed, there exist some coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules $\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-coherent which are not $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-coherent (nor a fortiori $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-holonomic): when $\mathfrak{P}$ is proper, the de Rham cohomology of a coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module is of finite type on K. Now, if $\mathcal{E} = \mathrm{sp}_* E$, the de Rham cohomology of $\mathcal{E}$ is identified with the rigid cohomology of E. If we take $\mathcal{V} = \mathbb{Z}_{(p)}$, $\mathfrak{P} = \widehat{\mathbb{P}}^1_{\mathcal{V}}$, $Y = \mathbb{G}_{m,k}$, and if E is the overconvergent isocrystal on Y defined by $j^\dagger \mathcal{O}_{\mathfrak{P}_K}$, equipped with the connection ∇ such that $\nabla(1) = (\alpha/t)dt$, where $\alpha \in \mathbb{Z}_{(p)}$ is a Liouville number, the rigid cohomology of E is given by the action of ∇ on the space of analytical functions on annulus of the form $1-\epsilon < |t| < 1+\epsilon$, with $\epsilon > 0$ variable, and it is classic that its H^1 is of infinite dimension. But, when the module are endowed with Frobenius structures, Berthelot conjecture in [Ber02, 5.3.6] that this is the case:

15.2.4.12. The properties of coherence and of holonomicity are stable by base change. More precisely, let $\mathcal{V} \to \mathcal{V}'$ be a morphism of complete discrete valuation rings of unequal characteristic $(0,p)$ and perfect residue fields denoting by $\mathfrak{S} := \mathrm{Spf}(\mathcal{V})$, $\mathfrak{S}' := \mathrm{Spf}(\mathcal{V}')$, let $f\colon \mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}' \to \mathfrak{P}$ be the canonical morphism, $T' := f^{-1}(T)$. If $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}})$, then $f^*(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}'/\mathfrak{S}'}({}^\dagger T')_{\mathbb{Q}})$. Moreover, if $\mathcal{E}$ is a holonomic $\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-module (see 15.2.4.5) then $f^*(\mathcal{E})$ is a holonomic $\mathcal{D}^\dagger_{\mathfrak{P}'/\mathfrak{S}'}({}^\dagger T')_{\mathbb{Q}}$-module. Indeed, this is a consequence of the fact that the extension $f^{-1}\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T')_{\mathbb{Q}}$ is flat (see 9.2.7.1), of the fact that the dual functor commutes with extensions (see 4.6.4.4.1) and of the homological criterion of holonomicity] (see 15.2.4.8).

Conjecture 15.2.4.13 (Berthelot)**.** We suppose there exists an isomorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ lifting the s-power of the Frobenius of k. Let $\mathcal{E}$ be a coherent F-$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. If $\mathcal{E}$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic then $\mathcal{E}$ is $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-holonomic.

Proposition 15.2.4.14. *We do not suppose $\mathfrak{P}$ is integral. Let $0 \to \mathcal{E}' \to \mathcal{E} \to \mathcal{E}'' \to 0$ be an exact sequence of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules. Hence $\mathcal{E}$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic if and only if $\mathcal{E}'$ and $\mathcal{E}''$ are $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic.*

Proof. We can suppose $\mathfrak{P}$ is integral. Suppose $\mathcal{E}'$ and $\mathcal{E}''$ are $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic. By considering the long exact sequence induced by the exact triangle $\mathbb{D}_T(\mathcal{E}'') \to \mathbb{D}_T(\mathcal{E}) \to \mathbb{D}_T(\mathcal{E}') \to +1$, we get the $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomicity of $\mathcal{E}$. Conversely, suppose $\mathcal{E}$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic. By using 15.2.4.10, we reduce to the case where the divisor T is empty. The inequality of Bernstein (see 15.2.4.1.1) can be translated by $\mathrm{codim}(\mathcal{E}') \le \dim P$ and $\mathrm{codim}(\mathcal{E}'') \le \dim P$. Since we have $\mathrm{codim}(\mathcal{E}) = \min\{\mathrm{codim}(\mathcal{E}'), \mathrm{codim}(\mathcal{E}'')\}$ (see 15.2.3.2), since $\mathrm{codim}(\mathcal{E}) = \dim P$ then $\mathrm{codim}(\mathcal{E}') = \dim P$ and $\mathrm{codim}(\mathcal{E}'') = \dim P$ and we are done. ☐

Proposition 15.2.4.15. *The functor $\mathbb{D}_T$ induces an exact auto-equivalence of the categories of holonomic $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules (resp. $D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$).*

Proof. This is a consequence of the isomorphism of biduality (see 5.1.4.4) and of Proposition 15.2.4.8. ☐

Notation 15.2.4.16. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module.

(a) Thanks to 15.2.4.3, we can improve the vanishing properties of the biduality spectral sequence of 15.2.3.5.(ii) by replacing $2d$ by d. In particular, with its notation we get we have $E_2^{i,j} = 0$ in the following case:

  (i) for any $i \notin [0,d]$ or $j \notin [-d,0]$ (use 15.2.4.3),

  (ii) for any $i < -j$ (use both properties of 15.2.3.3).

  This implies the equalities

$$F^d(\mathcal{E}) = E_\infty^{d,-d} = E_2^{d,-d} = (\mathcal{E}^*)^*. \tag{15.2.4.16.1}$$

(b) We set $\mathcal{E}^{\mathrm{hol}} := (\mathcal{E}^*)^*$. Following 15.2.3.6 and 15.2.4.16.1, $\mathcal{E}^{\mathrm{hol}}$ is the greatest holonomic submodule of $\mathcal{E}$. We get the functor $(-)^{\mathrm{hol}}\colon \mathrm{Coh}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) \to \mathrm{Hol}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ defined by $\mathcal{E} \mapsto \mathcal{E}^{\mathrm{hol}}$.

  We remark moreover that the forgetful functor $\mathrm{Hol}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) \to \mathrm{Coh}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ is left adjoint of the functor $(-)^{\mathrm{hol}}$. In particular, the functor $(-)^{\mathrm{hol}}$ is left exact and commutes with projective limits.

Lemma 15.2.4.17. *Let $\mathcal{E}' \subset \mathcal{E}$ be a monomorphism of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules. The morphism $\mathcal{E}'^{\mathrm{hol}} \to \mathcal{E}^{\mathrm{hol}}$ induced by the functor $(-)^{\mathrm{hol}}$ (see 15.2.4.16) is then a monomorphism. Moreover, $\mathcal{E}'^{\mathrm{hol}} = \mathcal{E}' \cap \mathcal{E}^{\mathrm{hol}}$.*

Proof. The first assertion results from the left exactness of the functor $(-)^{\mathrm{hol}}$ (see 15.2.4.16). Since $\mathcal{E}' \cap \mathcal{E}^{\mathrm{hol}}$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module which is included into the holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module $\mathcal{E}'$, then it follows from 15.2.4.14 that it is holonomic. Since $\mathcal{E}'^{\mathrm{hol}}$ is the greatest holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-submodule of $\mathcal{E}'$, this yields the equality $\mathcal{E}'^{\mathrm{hol}} = \mathcal{E}' \cap \mathcal{E}^{\mathrm{hol}}$. □

Lemma 15.2.4.18. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module. The canonical morphism $\mathcal{E}^{*} \to (\mathcal{E}^{\mathrm{hol}})^{*}$ is an isomorphism, i.e., $(\mathcal{E}/\mathcal{E}^{\mathrm{hol}})^{*} = 0$. In particular, $(\mathcal{E}/\mathcal{E}^{\mathrm{hol}})^{\mathrm{hol}} = 0$.*

Proof. Set $\mathcal{E}_{\text{n-hol}} := \mathcal{E}/\mathcal{E}^{\mathrm{hol}}$. Since $\mathcal{E}^{\mathrm{hol}}$ is holonomic, then by using 15.2.4.8 we get $H^{-1}\mathbb{D}_T(\mathcal{E}^{\mathrm{hol}}) = 0$. By applying the functor $H^0\mathbb{D}_T$ to the exact sequence $0 \to \mathcal{E}^{\mathrm{hol}} \underset{\mathrm{adj}}{\longrightarrow} \mathcal{E} \longrightarrow \mathcal{E}_{\text{n-hol}} \to 0$, this yields the exact sequence $0 \to \mathcal{E}^{*}_{\text{n-hol}} \to \mathcal{E}^{*} \to (\mathcal{E}^{\mathrm{hol}})^{*} \to 0$. Since this a morphism of holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules, by using the biduality isomorphism it follows that it is sufficient to check that by applying the functor $H^0\mathbb{D}_T$ to the morphism $\mathcal{E}^{*} \to (\mathcal{E}^{\mathrm{hol}})^{*}$, we get an isomorphism. However, this latter is the morphism $(-)^{\mathrm{hol}}(\mathrm{adj})\colon (\mathcal{E}^{\mathrm{hol}})^{\mathrm{hol}} \to \mathcal{E}^{\mathrm{hol}}$. Since the adjunction morphism of the form $\mathrm{adj}\colon \mathcal{F}^{\mathrm{hol}} \subset \mathcal{F}$ is functorial in $\mathcal{F}$, we have the commutative diagram

$$\begin{array}{ccc} \mathcal{E}^{\mathrm{hol}} & \xhookrightarrow{\ \mathrm{adj}\ } & \mathcal{E} \\ {\scriptstyle \mathrm{adj}}\uparrow & & \uparrow{\scriptstyle \mathrm{adj}} \\ (\mathcal{E}^{\mathrm{hol}})^{\mathrm{hol}} & \xhookrightarrow{\ (-)^{\mathrm{hol}}(\mathrm{adj})\ } & \mathcal{E}^{\mathrm{hol}}. \end{array}$$

Since $\mathcal{E}^{\mathrm{hol}}$ is holonomic, the left arrow is bijective. Moreover, since the right and top arrows are identical then this implies that the bottom arrow is an isomorphism.

□

Theorem 15.2.4.19 (Holonomic version of Berthelot-Kashiwara Theorem)**.** *Let $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ be a closed immersion of smooth $\mathfrak{S}$-formal schemes. Let T be a divisor of X such that $D := X \cap T$ is a divisor of X.*

(a) For any holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module $\mathcal{E}$ supported in X, for any holonomic $\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}D)_{\mathbb{Q}}$-module $\mathcal{F}$, we have $H^r u_{+}(\mathcal{F}) = 0$ and $H^r u^{!}(\mathcal{E}) = 0$ for any $r \neq 0$.

(b) The functors u_{+} and $u^{!}$ are exact quasi-inverse equivalences between the category of holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules supported in X and that of holonomic $\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}D)_{\mathbb{Q}}$-modules.

Proof. This follows from Berthelot-Kashiwara theorem 9.3.5.9, from the criterion of holonomicity (see 15.2.4.8) and from the relative duality isomorphism (see 13.2.4.1). □

Corollary 15.2.4.20. *Let $(Y, X, \mathfrak{P}, T)/\mathcal{V}$ be a completely smooth d-frame. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ (see definition 12.2.1.4). Then $\mathcal{E}$ is a holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module.*

Proof. Since this is local, we can suppose there exists a closed immersion $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ of smooth $\mathfrak{S}$-formal schemes which lifts $X \hookrightarrow \mathfrak{P}$. This yields $u^{!}(\mathcal{E}) \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{X}, T \cap X/\mathcal{V})$ (see 12.2.1.9). Following 15.2.4.9.(a), $u^{!}\mathcal{E}$ is a holonomic $\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T \cap X)_{\mathbb{Q}}$-module. Following the coherent version of Berthelot-Kashiwara theorem (see 9.3.5.9), we have $u_{+}u^{!}(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}$. We conclude thanks to 15.2.4.19. □

15.2.5 Purity of the characteristic variety of a holonomic F-$\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module

Corollaire 15.2.5.1. We suppose there exists an isomorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ lifting the s-power of the Frobenius of k. Let $\mathfrak{P}$ be a smooth integral $\mathcal{V}$-formal scheme of dimension d. Let $\mathcal{N} \neq 0$ be a holonomic F-$\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. Then, the characteristic variety $\mathrm{Car}(\mathcal{N})$ of $\mathcal{N}$ is purely of codimension d.

Proof. The is a consequence of holonomicity characterization (see 15.2.4.8) and of Theorem 15.1.7.8. □

15.3 Overcoherence

Let $\mathfrak{P}$ be a smooth $\mathfrak{S}$-formal scheme and T a divisor of its special fiber P.

15.3.1 Generical $\mathcal{O}$-coherence of a coherent $\mathcal{D}$-module with finite fibers or an holonomic $\mathcal{D}$-module

We check in this subsection that a coherent module whose extraordinary fibers are finite becomes $\mathcal{O}$-coherent on a dense open subset of its support (more precisely, see the theorem 15.3.1.19). This corresponds to a well known property of the holonomicity in characteristic zero. This will be a fundamental ingredient of the proof of the overconvergent holonomicity criterion (see 15.3.2.8).

Notation 15.3.1.1. For any closed point x of P, we will denote by $i_x\colon \operatorname{Spf}\mathcal{V}_x \hookrightarrow \mathfrak{P}$ a morphism of smooth $\mathfrak{S}$-formal schemes which is a lifting of the canonical closed immersion induced by x. Since k is perfect then $\mathfrak{S}_x \to \mathfrak{S}$ is finite and etale. Hence, $\mathcal{D}^\dagger_{\mathfrak{S}_x/\mathfrak{S}} = \mathcal{O}_{\mathfrak{S}_x} = \mathcal{V}_x$ and $\mathcal{D}^\dagger_{\mathfrak{S}_x/\mathfrak{S},\mathbb{Q}} = \mathcal{O}_{\mathfrak{S}_x,\mathbb{Q}} = K_x$. We remark that $\mathcal{V}_x$ is a complete discrete valuation ring of unequal characteristics $(0,p)$. Its field of fractions will be designated by K_x. We set $\mathfrak{S}_x := \operatorname{Spf}\mathcal{V}_x$. According to notation 9.2.1.21, we have the functor $\mathbb{L}i_x^* := i_x^![d_{i_x}]\colon D^-(\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_\mathbb{Q} \to D^-(\mathcal{O}_{\mathfrak{S}_x,\mathbb{Q}})$. We set $i_x^* := H^0\mathbb{L}i_x^*$.

Lemma 15.3.1.2. *Let $f\colon \mathfrak{P}' \hookrightarrow \mathfrak{P}$ be a closed immersion of $\mathcal{V}$-smooth formal schemes, $\mathcal{I} \subset \mathcal{O}_\mathfrak{P}$ the ideal defining f. Let $\mathcal{E}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_\mathfrak{P}$-module (resp. a coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module) which is flat as $\mathcal{O}_\mathfrak{P}$-module (resp. $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-module). With notation 7.5.5.6 (resp. 9.2.1.21), we have therefore the natural isomorphism: $\mathbb{L}f^{(m)*}(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}/\mathcal{I}\mathcal{E}$ (resp. $\mathbb{L}f^*(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}/\mathcal{I}\mathcal{E}$).*

Proof. Since the respective case is treated similarly, then let us treat the non-respective one. Since $\widehat{\mathcal{D}}^{(m)}_\mathfrak{P}$ is $\mathcal{O}_\mathfrak{P}$-flat, this therefore implies the isomorphism of $\mathcal{O}_\mathfrak{P}$-modules:

$$\mathcal{E}/\mathcal{I}\mathcal{E} \xrightarrow{\sim} \mathcal{O}_\mathfrak{P}/\mathcal{I}\mathcal{O}_\mathfrak{P} \otimes^\mathbb{L}_{\mathcal{O}_\mathfrak{P}} \mathcal{E} \overset{9.3.1.8.2}{\xrightarrow{\sim}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'\hookrightarrow\mathfrak{P}/\mathfrak{S}} \otimes^\mathbb{L}_{\widehat{\mathcal{D}}^{(m)}_\mathfrak{P}} \mathcal{E} = f^{(m)*}(\mathcal{E})$$

□

Lemma 15.3.1.3. *Let A be a p-adically separated complete $\mathcal{V}$-algebra, M be a π-torsion free separate complete A-module. We assume that $M/\pi M$ is a free $A/\pi A$-module. There then exists a free A-module M' and an A-linear isomorphism $\widehat{M'} \xrightarrow{\sim} M$.*

Proof. By hypothesis, there exists an isomorphism of the form $\overline{\phi}\colon (A/\pi A)^{(J)} \xrightarrow{\sim} M/\pi M$. Choose a lifting $\phi\colon A^{(J)} \to M$ of $\overline{\phi}$. Since this is an isomorphism modulo π, lemma 3.3.2.5 allows us to conclude. □

Remark 15.3.1.4. It follows from 7.2.1.4 that if $\mathcal{E}$ is an $\mathcal{O}_\mathfrak{P}$-module of the form $(\mathcal{O}_\mathfrak{P}^{(J)})^\wedge$, i.e., is isomorphic to the p-adic completion of a free $\mathcal{O}_\mathfrak{P}$-module, then $\mathcal{E}$ is $\mathcal{O}_\mathfrak{P}$-flat.

Proposition 15.3.1.5. Assume that $\mathfrak{P}$ is affine and fix a closed point x of $\mathfrak{P}$. Let $\mathcal{I} \subset \mathcal{O}_\mathfrak{P}$ be the ideal defining i_x. Set $A := \Gamma(\mathfrak{P}, \mathcal{O}_\mathfrak{P})$ and $I := \Gamma(\mathfrak{P}, \mathcal{I})$. Let $\mathcal{E}$ be any coherent $\widehat{\mathcal{D}}^{(m)}_\mathfrak{P}$-module (resp. coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module, resp. coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module). Put $E := \Gamma(\mathfrak{P}, \mathcal{E})$.

(a) The canonical morphism $E/IE \to \mathcal{E}/\mathcal{I}\mathcal{E}$ is an isomorphism.

(b) In the non-respective case, if $\mathcal{E}$ is $\mathcal{O}_\mathfrak{P}$-flat, then E/IE is p-torsion free, p-adically separated and complete. Moreover, the subset IE is closed in E, when E is endowed with its p-adic topology. Furthermore, if $\mathcal{E}$ is of the form $(\mathcal{O}_\mathfrak{P}^{(J)})^\wedge$ for some set J, then E/IE is isomorphic to $(\mathcal{V}_x^{(J)})^\wedge$.

Proof. a) Let's start by proving the first assertion. The other cases being similar, we reduce to deal with the non-respected case. Let $\mathcal{E}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_\mathfrak{P}$-module. Setting $\widehat{D}^{(m)}_\mathfrak{P} := \Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_\mathfrak{P})$, the morphism $\widehat{\mathcal{D}}^{(m)}_\mathfrak{P} \otimes_{\widehat{D}^{(m)}_\mathfrak{P}} E \to \mathcal{E}$ is an isomorphism (see 7.2.3.16.(ib)) and therefore we get the last isomorphism:

$$\mathcal{E}/\mathcal{I}\mathcal{E} \xrightarrow{\sim} \mathcal{O}_\mathfrak{P}/\mathcal{I}\mathcal{O}_\mathfrak{P} \otimes_{\mathcal{O}_\mathfrak{P}} \mathcal{E} \xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_\mathfrak{P}/\mathcal{I}\widehat{\mathcal{D}}^{(m)}_\mathfrak{P} \otimes_{\widehat{\mathcal{D}}^{(m)}_\mathfrak{P}} \mathcal{E} \xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_\mathfrak{P}/\mathcal{I}\widehat{\mathcal{D}}^{(m)}_\mathfrak{P} \otimes_{\widehat{D}^{(m)}_\mathfrak{P}} E$$

As $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}/\mathcal{I}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$ has its support in $\{x\}$, then we get the first isomorphism:

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}/\mathcal{I}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}} \otimes_{\widehat{D}^{(m)}_{\mathfrak{P}}} E \xrightarrow{\sim} \Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}/\mathcal{I}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}) \otimes_{\widehat{D}^{(m)}_{\mathfrak{P}}} E$$
$$\overset{9.3.1.3.5}{\xrightarrow{\sim}} \widehat{D}^{(m)}_{\mathfrak{P}}/I\widehat{D}^{(m)}_{\mathfrak{P}} \otimes_{\widehat{D}^{(m)}_{\mathfrak{P}}} E \xrightarrow{\sim} E/IE$$

By composition the above isomorphisms, we get the assertion (a) of the Lemma.

By applying the lemmas 15.3.1.2, 7.5.5.12.(b) in the case of the closed immersion $i_x\colon \operatorname{Spf}\mathcal{V}_x \hookrightarrow \mathfrak{P}$, it follows from the part a) that E/IE is separated and complete for the p-adic topology. Hence, subset IE is closed in E (e.g. see [Mat89, 23.B]). □

Remark 15.3.1.6. With notation 15.3.1.5, if M is a flat separated complete $\mathcal{V}_x$-module, then M is the p-adic separated completion of a free $\mathcal{V}_x$-module. (Indeed, this follows from 15.3.1.3 and the fact that "p-torsion free" is equivalent to "$\mathcal{V}$-flat".) Hence, in the part (b), if $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{P}}$-flat then E/IE is always isomorphic to $(\mathcal{V}_x^{(J)})^\wedge$ for some set J.

In order to prove Proposition 15.3.1.8, we need the following lemma.

Lemma 15.3.1.7. *We assume that $\mathfrak{P}$ is affine and $\mathfrak{P}/\mathfrak{S}$ is endowed with coordinates. Let $m \geq m_0 \geq 0$ be two integers, $\mathcal{E}^{(m_0)}$ be a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module. We set $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$ and $E^{(m)} := \Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$.*

The image of $E^{(m_0)}$ in $E^{(m)}$ is dense in $E^{(m)}$, where $E^{(m)}$ is equipped with the topology induced by its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module of finite type (see 7.5.1.8).

Proof. Let $P \in \Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$. We can (uniquely) write $P = \sum_{\underline{k}} a_{\underline{k}} \underline{\partial}^{<\underline{k}>_{(m)}}$, where the $a_{\underline{k}}$ form a sequence of $\Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P}})$ converging to 0 when $|\underline{k}|$ tends to infinity. For any integer $N \geq 0$, we set $P_N := \sum_{|\underline{k}| \leq N} a_{\underline{k}} \underline{\partial}^{<\underline{k}>_{(m)}}$. The sequence $(P_N)_{N\in\mathbb{N}}$ converges to P, for the topology of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$ defined in 7.5.1.8. Let $x \in E^{(m_0)}$ and $1 \otimes x$ be the image of x in $E^{(m)}$. The action of P (resp. P_N) on $1 \otimes x$ is equal to $P \otimes x$ (resp. $P_N \otimes x$). Since the action of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$ on $E^{(m)}$ is continuous, then we get the second equality:

$$P \otimes x = (\lim_{N\to\infty} P_N) \otimes x = \lim_{N\to\infty} (P_N \otimes x) = \lim_{N\to\infty} (1 \otimes P_N \cdot x),$$

the last equality resulting from the remark that $P_N \in \Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}})$. Hence the result. □

Proposition 15.3.1.8. We keep the notations and hypotheses of 15.3.1.7. If the image of the canonical morphism $E^{(m_0)} \to E^{(m)}/IE^{(m)}$ is a K_x-vector space of finite dimension then this map is surjective. In particular, $E^{(m)}/IE^{(m)}$ has finite dimension on K.

Proof. We endow $E^{(m)}/IE^{(m)}$ with the quotient topology induced by the topology of $E^{(m)}$ given by its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module of finite type (see 7.5.1.8). Let us denote by $G^{(m)}$, the image of $E^{(m_0)} \to E^{(m)}/IE^{(m)}$. As $G^{(m)}$ is of finite dimension on K, then it is a K-Banach space. Hence, $G^{(m)}$ is closed in $E^{(m)}/IE^{(m)}$. Following 15.3.1.7, $G^{(m)}$ is dense in $E^{(m)}/IE^{(m)}$. Hence $G^{(m)} = E^{(m)}/IE^{(m)}$ and we are done. □

Lemma 15.3.1.9. *Let $(M^{(m)})_{m\in\mathbb{N}}$ be a inductive system of Banach spaces such that $M := \varinjlim_m M^{(m)}$ is a K-vector space of finite dimension. Then, for any integer m_0, there exists $m_1 \geq m_0$ such that, for any $m \geq m_1$, the canonical arrow $\operatorname{Im}(M^{(m_0)} \to M^{(m)}) \to M$ is injective.*

Proof. Let $m_0 \in \mathbb{N}$. First, suppose $M = 0$. Let K_m be the kernel of the arrow $M^{(m_0)} \to M^{(m)}$. Since $M^{(m)}$ is separated, then K_m is closed. 1) Since $M = 0$, then we have $\cup_{m\geq m_0} K_m = M^{(m_0)}$. Since $M^{(m_0)}$ is a Banach K-space, it satisfies the Baire property. This implies that for m_1 large enough $K_{m_1} = M^{(m_0)}$, which allows us to conclude.

2) Let us now consider the general case. Increasing if necessary m_0, we can suppose that $M^{(m_0)} \to M$ is surjective. Let $V^{(m_0)}$ be a K-vector subspace of $M^{(m_0)}$ of finite dimension such that $V^{(m_0)} \to M$ is bijective. Denoting by $V^{(m)}$ the image of $V^{(m_0)}$ in $M^{(m)}$, it is sufficient to prove that $\operatorname{Im}(M^{(m_0)} \to M^{(m)}) \subset V^{(m)}$ for m large enough. This results from the first case used for $(M^{(m)}/V^{(m)})_{m\geq m_0}$. □

Proposition 15.3.1.10. *Suppose $\mathfrak{P}$ affine and $\mathfrak{P}/\mathfrak{S}$ is endowed with coordinates. Fix a closed point x of $\mathfrak{P}$. Furthermore, let $\mathcal{I} \subset \mathcal{O}_{\mathfrak{P}}$ be the ideal defining i_x (see notation 15.3.1.1) and $I := \Gamma(\mathfrak{P}, \mathcal{I})$.*

Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. Let $m_0 \geq 0$ be an integer such that there exist a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}^{(m_0)}$ and a $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism of the form $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)} \xrightarrow{\sim} \mathcal{E}$ (see 8.4.1.11). For any integer $m \geq m_0$, we set $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$, $E^{(m)} := \Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ and $E := \Gamma(\mathfrak{P}, \mathcal{E})$.

Suppose the following assertions are satisfied:

(i) For any $m \geq m_0$, we can choose a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module $\overset{\circ}{\mathcal{E}}{}^{(m)}$ together with a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism $\overset{\circ}{\mathcal{E}}{}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(m_0)}$ such that the $\mathcal{V}_x$-module $\overset{\circ}{\mathcal{E}}{}^{(m)}/\mathcal{I}\overset{\circ}{\mathcal{E}}{}^{(m)}$ is p-torsion free.

(ii) E/IE is a K_x-vector space of finite dimension.

Then there exists an integer $m \geq m_0$ such that $E^{(m)}/IE^{(m)}$ is a K_x-vector space of finite dimension.

Proof. Following 15.3.1.5, $\overset{\circ}{E}{}^{(m)}/I\overset{\circ}{E}{}^{(m)}$ is p-torsion free, p-adically separated and complete. and the subset $I\overset{\circ}{E}{}^{(m)}$ is closed in $\overset{\circ}{E}{}^{(m)}$. Hence the subset $IE^{(m)}$ is closed in $E^{(m)}$, for the linear topology given by the p-adic topology of $\overset{\circ}{E}{}^{(m)}$. This topology is equal to topology induced by its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module of finite type (see 7.5.1.8). Hence, $E^{(m)}/IE^{(m)}$ is a Banach K-vector space for the quotient topology. Since the inductive system $(E^{(m)})_{m \in \mathbb{N}}$ can be considered as an inductive system in the category of A-modules whose inductive limit is isomorphic to E, then by applying the functor $A/I \otimes_A -$, which commutes to inductive limits, to this isomorphism we get the following one $E/IE \xrightarrow{\sim} \varinjlim_m E^{(m)}/IE^{(m)}$. By using Lemma 15.3.1.9 for the sequence $(E^{(m)}/IE^{(m)})_{m \geq m_0}$, since E/IE has finite dimension, then so is the image of $E^{(m_0)}/IE^{(m_0)} \to E^{(m)}/IE^{(m)}$ for m large enough. Hence, using 15.3.1.8, we get that $E^{(m)}/IE^{(m)}$ has finite dimension for m large enough.

□

Lemma 15.3.1.11. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module, $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent. Then there exists a dense open $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{E}|\mathfrak{U}$ is a free $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-module of finite type.*

Proof. We can suppose $\mathfrak{P}$ affine and endowed with local coordinates. Let $m \in \mathbb{N}$. Following 11.1.1.6.(a), there exists a p-torsion free $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module $\overset{\circ}{\mathcal{E}}$, coherent over $\mathcal{O}_{\mathfrak{P}}$ together with a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism $\overset{\circ}{\mathcal{E}}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$. We get the coherent $\mathcal{D}^{(m}_{P}$-module $\mathcal{F} := \mathcal{O}_P \otimes_{\mathcal{O}_{\mathfrak{P}}} \overset{\circ}{\mathcal{E}}$, which is also $\mathcal{O}_P$-coherent. It follows from 4.1.3.28, that there exist $\mathfrak{U} \subset \mathfrak{P}$ an affine dense open such that $\mathcal{F}|U$ is a free $\mathcal{O}_U$-module of finite type. With 15.3.1.3, since $\overset{\circ}{\mathcal{E}}$ is p-torsion free, this yields that $\overset{\circ}{\mathcal{E}}|\mathfrak{U}$ is a free $\mathcal{O}_{\mathfrak{U}}$-module of finite type and we are done. □

Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module such that for any closed point x of P, the K-vector space $i_x^*(\mathcal{E})$ is of finite dimension. A technical additional problem is that when the level m increases, the open subset above which the coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module associated to $\mathcal{E}$ becomes $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent a priori narrows. The phenomenon of contagiosity of the lemma 15.3.1.12 below allow us to solve this obstacle.

Lemma 15.3.1.12. *We suppose $\mathfrak{P}$ affine and endowed with local coordinates. Let $m' \geq m$ be two integers, $\mathfrak{U}$ be an affine dense open subset of $\mathfrak{P}$, $\mathcal{E}$ be a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-module such that $\mathcal{E}$ is a projective $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-module of finite type.*

We suppose that $\Gamma(\mathfrak{U}, \mathcal{E})$ is endowed with a structure of $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$-module extending its structure of $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module. Then $\Gamma(\mathfrak{P}, \mathcal{E})$ is endowed with a unique of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$-module extending its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module.

Proof. The uniqueness comes from the fact that $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$ is dense in $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$ (e.g. see 15.3.1.7). Let us check the existence. Let $e \in \Gamma(\mathfrak{P}, \mathcal{E})$ and $1 \otimes e$ the induced element of $\Gamma(\mathfrak{U}, \mathcal{E})$. As the elements $\underline{\partial}^{\langle \underline{k} \rangle_{(m')}}$ are of norm 1 in $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$ (for the Gauss norm), the family $\underline{\partial}^{\langle \underline{k} \rangle_{(m')}} \cdot (1 \otimes e)$ with $\underline{k}$ going through $\mathbb{N}^d$ is bounded for the topology of $\Gamma(\mathfrak{U}, \mathcal{E})$ given by its structure of $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$-module of finite type.

Let us check now that the family $\{\underline{\partial}^{\langle \underline{k}\rangle_{(m')}} \cdot e | \underline{k} \in \mathbb{N}^d\}$ is a bounded subset of $\Gamma(\mathfrak{P}, \mathcal{E})$. Following 7.5.2.6, the topology of $\Gamma(\mathfrak{P}, \mathcal{E})$ (resp. $\Gamma(\mathfrak{U}, \mathcal{E})$) given by its structure of $\Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$-module of finite type or $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module of finite type (resp. $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$-module of finite type or $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$-module of finite type) coincide. Let N be an integer and $\mathcal{F}$ be a coherent $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-module such that $\mathcal{E} \oplus \mathcal{F} \xrightarrow{\sim} \mathcal{O}^N_{\mathfrak{P},\mathbb{Q}}$. We get the commutative diagram:

$$\begin{array}{ccccc} \Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})^N & \xrightarrow{\sim} & \Gamma(\mathfrak{P}, \mathcal{E}) \oplus \Gamma(\mathfrak{P}, \mathcal{F}) & \twoheadrightarrow & \Gamma(\mathfrak{P}, \mathcal{E}) \\ \downarrow & & & & \downarrow \\ \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})^N & \xrightarrow{\sim} & \Gamma(\mathfrak{U}, \mathcal{E}) \oplus \Gamma(\mathfrak{U}, \mathcal{F}) & \twoheadrightarrow & \Gamma(\mathfrak{U}, \mathcal{E}) \end{array}$$

whose right injective arrow sends $\underline{\partial}^{\langle \underline{k}\rangle_{(m')}}.e$ on $\underline{\partial}^{\langle \underline{k}\rangle_{(m')}}.(1 \otimes e)$ (that does make sense because $\underline{\partial}^{\langle \underline{k}\rangle_{(m')}} \in \Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$). Via the top (resp. bottom) morphisms, the topology of $\Gamma(\mathfrak{P}, \mathcal{E})$ (resp. $\Gamma(\mathfrak{U}, \mathcal{E})$) is the quotient topology induced by that of $\Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})^N$ (resp. $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})^N$). As $\mathfrak{P}/\mathfrak{S}$ is smooth and U is dense in P, then the morphism $\Gamma(P, \mathcal{O}_P) \to \Gamma(U, \mathcal{O}_P)$ is injective. Since $\mathfrak{P}$ is p-torsion free, this yields $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P}}) \cap \Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}}) = \Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P}})$. Hence the family $\{\underline{\partial}^{\langle \underline{k}\rangle_{(m')}} \cdot e | \underline{k} \in \mathbb{N}^d\}$ is a bounded subset of $\Gamma(\mathfrak{P}, \mathcal{E})$.

Let $P = \sum_{\underline{k} \in \mathbb{N}^d} a_{\underline{k}} \underline{\partial}^{\langle \underline{k}\rangle_{(m')}}$ be an element of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$. This yields the convergence in $\Gamma(\mathfrak{P}, \mathcal{E})$ of the sum $\sum_{\underline{k} \in \mathbb{N}^d} a_{\underline{k}}(\underline{\partial}^{\langle \underline{k}\rangle_{(m')}}.e)$. We set then $P.e := \sum_{\underline{k} \in \mathbb{N}^d} a_{\underline{k}}(\underline{\partial}^{\langle \underline{k}\rangle_{(m')}}.e)$. It remains to check that this endows $\Gamma(\mathfrak{P}, \mathcal{E})$ with a structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$-module. By multiplying by $a_{\underline{k}}$ the equalities $\underline{\partial}^{\langle \underline{k}\rangle_{(m')}}.e = \underline{\partial}^{\langle \underline{k}\rangle_{(m')}}.(1 \otimes e)$, and next by summing it, we obtain $P.e = P.(1 \otimes e)$. So, $\Gamma(\mathfrak{P}, \mathcal{E})$ is a $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$-submodule of $\Gamma(\mathfrak{U}, \mathcal{E})$. □

Lemma 15.3.1.13. *Let $m_0 \geq 0$ be an integer, $\mathcal{E}^{(m_0)}$ be a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module. Let $m \geq m_0$ be an integer, $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$.*

(a) If $\mathcal{E}^{(m_0)}$ and $\mathcal{E}^{(m)}$ are $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent, then the canonical morphism $\mathcal{E}^{(m_0)} \to \mathcal{E}^{(m)}$ is surjective.

(b) Let $r \in \mathbb{N}$ and $\mathfrak{U}$ be a dense open of $\mathfrak{P}$. We suppose that $\mathcal{E}^{(m_0)}$ is a free $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-module of rank r and $\mathcal{E}^{(m)}|\mathfrak{U}$ is a free $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-module of rank r. Then the canonical morphism $\mathcal{E}^{(m_0)} \to \mathcal{E}^{(m)}$ is an isomorphism.

Proof. Since the lemma is local, we can assume that $\mathfrak{P}$ and $\mathfrak{U}$ are affine and $\mathfrak{P}/\mathfrak{S}$ is endowed with coordinates.

a) Let us prove the first statement. Following [BGR84, 3.7.3.1], by endowing $\Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)})$ and $\Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ with the topology given by their structure of $\Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$-module of finite type, the image of $\Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)})$ in $\Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ is closed. Moreover, following 15.3.1.7, the image of $\Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)})$ in $\Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ is dense, when $\Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ is endowed with the topology given by its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module of finite type. But, thanks to 7.5.2.6, both topologies on $\Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ coincide. This yields that the canonical morphism $\Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)}) \to \Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ is surjective. Hence, using the theorem of type A for coherent $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-modules, we get the canonical morphism $\mathcal{E}^{(m_0)} \to \mathcal{E}^{(m)}$ is an isomorphism.

b) i) Let us check the canonical morphism $\mathcal{E}^{(m_0)}|\mathfrak{U} \to \mathcal{E}^{(m)}|\mathfrak{U}$ is an isomorphism. Following the part a), this morphism is surjective. Let $K(\mathfrak{U})$ be the field of fraction of the integral ring $B(\mathfrak{U}) := \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$. By applying the functor $K(\mathfrak{U}) \otimes_{B(\mathfrak{U})} -$ to the surjective morphism $\Gamma(\mathfrak{U}, \mathcal{E}^{(m_0)}) \to \Gamma(\mathfrak{U}, \mathcal{E}^{(m)})$ of free $B(\mathfrak{U})$-module of rank r, we get a surjective morphism of $K(\mathfrak{U})$-vector spaces of dimension r which is therefore injective. Hence, the morphism $\Gamma(\mathfrak{U}, \mathcal{E}^{(m_0)}) \to \Gamma(\mathfrak{U}, \mathcal{E}^{(m)})$ is injective and therefore bijective. Via theorem of type A for of coherent $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-modules, this yields the canonical morphism $\mathcal{E}^{(m_0)}|\mathfrak{U} \to \mathcal{E}^{(m)}|\mathfrak{U}$ is an isomorphism.

b)ii) We end the proof. It follows from i) that $\Gamma(\mathfrak{U}, \mathcal{E}^{(m_0)})$ is endowed with a structure of $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module extending its structure of $\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}})$-module. With 15.3.1.12, this yields that $\Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)})$ is endowed with a (unique) structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module extending its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}})$. This implies that the canonical morphism $\rho_m \colon \Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)}) \to \Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ admits a canonical retraction. The morphism ρ_m is therefore injective. Let us check now the surjectivity ρ_m. The canonical morphism $\Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)}) \to \Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$, where for $m' = m$ or $m' = m_0$ $\Gamma(\mathfrak{P}, \mathcal{E}^{(m')})$ is endowed with the topology given by its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m')}_{\mathfrak{P},\mathbb{Q}})$-module of finite type, is continuous. Moreover, it follows from 7.5.2.6

that the topology of $\Gamma(\mathfrak{P}, \mathcal{E}^{(m_0)})$ induced by its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}})$-module of finite type and the one induced by its structure of $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-module of finite type are identical. As $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}})$ is dense in $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$, since ρ_m is continuous and $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}})$-linear, this yields that ρ_m is $\Gamma(\mathfrak{P}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}})$-linear. Hence, its image is therefore closed (see the last paragraph of 7.5.1.8). As it is also dense (see 15.3.1.7), the morphism ρ_m is therefore surjective. Hence, ρ_m is a bijection. Similarly, for any affine open $\mathfrak{P}'$ of $\mathfrak{P}$ the canonical homomorphism $\rho_m \colon \Gamma(\mathfrak{P}', \mathcal{E}^{(m_0)}) \to \Gamma(\mathfrak{P}', \mathcal{E}^{(m)})$ is an isomorphism. Hence, we get the canonical morphism $\mathcal{E}^{(m_0)} \to \mathcal{E}^{(m)}$ is an isomorphism. □

Lemma 15.3.1.14. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. Let $m_0 \geq 0$ be an integer such that there exists a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}^{(m_0)}$ inducing $\mathcal{E}$ by extension (8.4.1.11). For any integer $m \geq m_0$, set $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$. Suppose there exist a strictly increasing sequence $(m_n)_{n\in\mathbb{N}}$ and a sequence of dense opens $(\mathfrak{U}_n)_{n\in\mathbb{N}}$ of $\mathfrak{P}$ such that $\mathcal{E}^{(m_n)}|\mathfrak{U}_n$ is a free $\mathcal{O}_{\mathfrak{U}_n,\mathbb{Q}}$-module of finite rank. Then, there exists $n_0 \in \mathbb{N}$ such that $\mathcal{E}|\mathfrak{U}_{n_0}$ is $\mathcal{O}_{\mathfrak{U}_{n_0},\mathbb{Q}}$-coherent.*

Proof. We can suppose the sequence $(\mathfrak{U}_n)_{n\in\mathbb{N}}$ is decreasing. It follows from Lemma 15.3.1.13.(a) that the sequence $(\operatorname{rank} \mathcal{E}^{(m_n)}|\mathfrak{U}_n)_{n\in\mathbb{N}}$ is decreasing. Let r be the minimal rank. Hence, there exists n_0 such that for any $n \geq n_0$ the $\mathcal{O}_{\mathfrak{U}_n,\mathbb{Q}}$-module $\mathcal{E}^{(m_n)}|\mathfrak{U}_n$ is free of rank r. Using Lemma 15.3.1.13.(b), this yields that for any $n \geq n_0$, the canonical morphism $\mathcal{E}^{(m_{n_0})}|\mathfrak{U}_{n_0} \to \mathcal{E}^{(m_n)}|\mathfrak{U}_{n_0}$ is an isomorphism. By taking the inductive limit on n, this yields that $\mathcal{E}^{(m_{n_0})}|\mathfrak{U}_{n_0} \to \mathcal{E}|\mathfrak{U}_{n_0}$ is an isomorphism (of free $\mathcal{O}_{\mathfrak{U}_{n_0},\mathbb{Q}}$-module of rank r). □

Proposition 15.3.1.15. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. Let $m_0 \geq 0$ be an integer such that there exists a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}^{(m_0)}$ inducing $\mathcal{E}$ by extension (8.4.1.11). For any integer $m \geq m_0$, let us denote by $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$. The following conditions are equivalent.*

(a) The sheaf $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent.

(b) There exists $m_1 \geq m_0$ such that for any $m \geq m_1$ the sheaf $\mathcal{E}^{(m)}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent and the canonical homomorphism $\mathcal{E}^{(m)} \to \mathcal{E}$ is an isomorphism.

(c) There exists a strictly increasing sequence $(m_n)_{n\in\mathbb{N}}$ such that $\mathcal{E}^{(m_n)}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent.

Proof. The assertion is local and we can suppose that $\mathfrak{P}$ is affine. If $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent then $\mathcal{E}$ is associated to a convergent isocrystal on $\mathfrak{P}/\mathfrak{S}$ (11.1.1.3). Hence, it follows from 11.1.1.10 that we get the implication $(a) \Rightarrow (b)$. Since $(b) \to (c)$ is obvious, let us check $(c) \to (a)$. Let us suppose that there exists a strictly increasing sequence $(m_n)_{n\in\mathbb{N}}$ such that $\mathcal{E}^{(m_n)}$ is $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-coherent. Then, it follows from Lemma 15.3.1.13.(a) that the canonical morphism $\Gamma(\mathfrak{X}, \mathcal{E}^{(m_n)}) \to \Gamma(\mathfrak{X}, \mathcal{E}^{(m_{n+1})})$ is surjective. By taking the limit on n, this yields the surjectivity of $\Gamma(\mathfrak{X}, \mathcal{E}^{(m_n)}) \to \Gamma(\mathfrak{X}, \mathcal{E})$. Following 11.1.1.8, $\mathcal{E}$ is then $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-coherent. □

Lemma 15.3.1.16. *Let $\mathcal{F}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module. Then there exists an affine dense open $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{F}|\mathfrak{U}$ is isomorphic to the p-adic completion of a free $\mathcal{O}_{\mathfrak{U}}$-module.*

Proof. Since the sheaf $\mathcal{O}_P \otimes_{\mathcal{O}_{\mathfrak{P}}} \mathcal{F}$ is a coherent $\mathcal{D}^{(m)}_P$-module, then it follows from 4.1.3.28 that there exists an affine dense open $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{O}_P \otimes_{\mathcal{O}_{\mathfrak{P}}} \mathcal{F}|U$ is a free $\mathcal{O}_U$-module. Using 15.3.1.3, this yields that $\Gamma(\mathfrak{U}, \mathcal{F})$ is isomorphic to the p-adic completion of a free $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{U}})$-module. Moreover, taking the projective limit of 4.3.4.6.1, we obtain the canonical isomorphism

$$\mathcal{O}_{\mathfrak{U}} \widehat{\otimes}_{\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P}})} \Gamma(\mathfrak{U}, \mathcal{F}) \xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}} \widehat{\otimes}_{\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}})} \Gamma(\mathfrak{U}, \mathcal{F}).$$

As $\mathcal{F}|\mathfrak{U}$ is a coherent (and therefore pseudo quasi-coherent) $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}}$-module, via the theorem of type A of 7.2.3.16.(i) and 7.2.3.13.(i), we get therefore the isomorphisms:

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}} \widehat{\otimes}_{\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}})} \Gamma(\mathfrak{U}, \mathcal{F}) \xleftarrow{\sim} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}} \otimes_{\Gamma(\mathfrak{U}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}})} \Gamma(\mathfrak{U}, \mathcal{F}) \xrightarrow{\sim} \mathcal{F}|\mathfrak{U}.$$

This yields the isomorphism $\mathcal{O}_{\mathfrak{U}} \widehat{\otimes}_{\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P}})} \Gamma(\mathfrak{U}, \mathcal{F}) \xrightarrow{\sim} \mathcal{F}|\mathfrak{U}$ and we are done. □

Before considering the general case (see 15.3.1.19), let us first check the case where the residue field k is uncountable.

Lemma 15.3.1.17. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module such that for any closed point x of P, the K-vector space $i_x^*(\mathcal{E})$ is of finite dimension (see notation 15.3.1.1). Suppose k is uncountable. Then there exists an affine dense open $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{E}|\mathfrak{U}$ is a free $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-module of finite rank.*

Proof. 1) Since the theorem is local, let us suppose $\mathfrak{P}$ affine, integral and $\mathfrak{P}/\mathfrak{S}$ is endowed with coordinates. Let $m_0 \geq 0$ be an integer such that there exist a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}^{(m_0)}$ and a $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism of the form $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)} \xrightarrow{\sim} \mathcal{E}$ (see 8.4.1.11). For any integer $m \geq m_0$, we set $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$, $E^{(m)} := \Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ and $E := \Gamma(\mathfrak{P}, \mathcal{E})$. Let $\mathring{\mathcal{E}}^{(m_0)}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P}}$-module together with a $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}^{(m_0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(m_0)}$ (see 7.4.5.2). We denote by $\mathring{\mathcal{E}}^{(m)}$ the quotient of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P}}} \mathring{\mathcal{E}}^{(m_0)}$ by its π-torsion part. Following 7.4.5.1, $\mathring{\mathcal{E}}^{(m)}$ is a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module. We set $\mathring{E}^{(m)} := \Gamma(\mathfrak{P}, \mathring{\mathcal{E}}^{(m)})$. It follows from 15.3.1.16 that for any integer $m \geq m_0$, there exists an affine dense open $\mathfrak{U}_m$ of $\mathfrak{P}$ such that $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m$ is isomorphic to the p-adic completion of a free $\mathcal{O}_{\mathfrak{U}_m}$-module. As k is uncountable, then $\cap_{m \geq m0} \mathfrak{U}_m$ is not empty. Let x be a closed point of $\cap_{m \geq m0} \mathfrak{U}_m$. Shrinking the sequence $(\mathfrak{U}_m)_{m \geq m_0}$ if necessary, we can suppose $\mathfrak{U}_m \supset \mathfrak{U}_{m+1}$. Let us denote by $\mathcal{I} \subset \mathcal{O}_{\mathfrak{P}}$ the ideal induced by i_x, $I := \Gamma(\mathfrak{P}, \mathcal{I})$ and $A := \Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P}})$.

2) Let's prove that there exists $m_1 \geq m_0$ such that for any $m \geq m_1$, the sheaf $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m$ is a free $\mathcal{O}_{\mathfrak{U}_m}$-module of finite type.

From the propositions 15.3.1.2 and 15.3.1.5.(a), we get $E/IE \xrightarrow{\sim} i_x^*(\mathcal{E})$, $E^{(m)}/IE^{(m)} \xrightarrow{\sim} i_x^*(\mathcal{E}^{(m)})$ and $\mathring{E}^{(m)}/I\mathring{E}^{(m)} \xrightarrow{\sim} i_x^*(\mathring{\mathcal{E}}^{(m)})$. Hence E/IE is K_x-vector spaces of finite dimension. Let us denote by $i_x^{(m)}$ the closed immersion $\mathrm{Spf}\, \mathcal{V}_x \hookrightarrow \mathfrak{U}_m$ induced by i_x. As $i_x^*(\mathring{\mathcal{E}}^{(m)}) \xrightarrow{\sim} i_x^{(m)*}(\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m)$, since following the step 1) the $\mathcal{O}_{\mathfrak{U}_m}$-module $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m$ is flat, then $\mathring{E}^{(m)}/I\mathring{E}^{(m)}$ is p-torsion free. Hence, using 15.3.1.10, there exists an integer $m_1 \geq m_0$ such that for any $m \geq m_1$ the K_x-vector space $E^{(m)}/IE^{(m)}$ is of finite dimension. Let $m \geq m_1$ and J_m be a set such that $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m$ is of the form $(\mathcal{O}_{\mathfrak{P}}^{(J_m)})^{\wedge}$. Then $\mathring{E}^{(m)}/I\mathring{E}^{(m)}$ is isomorphic to $(\mathcal{V}_x^{(J_m)})^{\wedge}$ (see 15.3.1.5.(b)). Since $(\mathring{E}^{(m)}/I\mathring{E}^{(m)})_{\mathbb{Q}} \xrightarrow{\sim} E^{(m)}/IE^{(m)}$, since $E^{(m)}/IE^{(m)}$ is a K_x-vector space of finite dimension, then J_m much be finite and we are done.

3) It follows from the step 2) that $\mathcal{E}^{(m)}|\mathfrak{U}_m$ is a free $\mathcal{O}_{\mathfrak{U}_m,\mathbb{Q}}$-module of finite rank for any $m \geq m_1$. Hence, using 15.3.1.14 we are done. □

In order to extend to Lemma 15.3.1.17 to the general case, we proceed by descent via the Lemma:

Lemma 15.3.1.18. *Let $\mathcal{V} \to \mathcal{V}'$ be a morphism of $\mathrm{DVR}(\mathcal{V})$ (see notation 9.2.6.12), $\mathfrak{S}' := \mathrm{Spf}(\mathcal{V}')$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f\colon \mathfrak{P}' \to \mathfrak{P}$ the canonical projection. Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}$-module and $\mathcal{E}' := f^!(\mathcal{E}) := \mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}',\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}} f^{-1}\mathcal{E}$, i.e. $\mathcal{E}'$ is the base change of $\mathcal{E}$ via $\mathcal{V} \to \mathcal{V}'$ (see 9.2.7.1). The following assertions are then equivalent:*

(a) There exists a dense open $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{E}|\mathfrak{U}$ is a free $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-module of finite type.

(b) There exists a dense open $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{E}|\mathfrak{U}$ is $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-coherent.

(c) There exists a dense open $\mathfrak{U}'$ of $\mathfrak{P}'$ such that $\mathcal{E}'|\mathfrak{U}'$ is a free $\mathcal{O}_{\mathfrak{U}',\mathbb{Q}}$-module of finite type.

(d) There exists a dense open $\mathfrak{U}'$ of $\mathfrak{P}'$ such that $\mathcal{E}'|\mathfrak{U}'$ is $\mathcal{O}_{\mathfrak{U}',\mathbb{Q}}$-coherent.

Proof. The equivalence between (a) and (b) (resp. between (c) and (d)) follows from 15.3.1.11. The implication $(a) \Rightarrow (c)$ is straightforward. Conversely, let us suppose that there exist a dense open $\mathfrak{U}'$ of $\mathfrak{P}'$ such that $\mathcal{E}'|\mathfrak{U}'$ is a free $\mathcal{O}_{\mathfrak{U}',\mathbb{Q}}$-module of finite rank r. Since the property (a) is local on $\mathfrak{P}$, then we can suppose $\mathfrak{P}$ affine, integral and $\mathfrak{P}/\mathfrak{S}$ is endowed with coordinates. For any integer $m \geq m_0$, we set $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$, $E^{(m)} := \Gamma(\mathfrak{P}, \mathcal{E}^{(m)})$ and $E := \Gamma(\mathfrak{P}, \mathcal{E})$. Let $\mathring{\mathcal{E}}^{(m_0)}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P}}$-module together with a $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}^{(m_0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(m_0)}$ (see 7.4.5.2). We denote by $\mathring{\mathcal{E}}^{(m)}$ the quotient of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P}}} \mathring{\mathcal{E}}^{(m_0)}$ by its π-torsion part. Following 7.4.5.1, $\mathring{\mathcal{E}}^{(m)}$ is a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module. Hence, following 15.3.1.16, for any $m \geq m_0$, there exist an affine dense open $\mathfrak{U}_m$

of $\mathfrak{P}$, a set A_m and an $\mathcal{O}_{\mathfrak{U}_m}$-linear isomorphism of the form $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m \xrightarrow{\sim} (\mathcal{O}_{\mathfrak{U}_m}^{(A_m)})^{\wedge}$. Shrinking $\mathfrak{U}_m$ if necessary, we can suppose $\mathfrak{U}_m \supset \mathfrak{U}_{m+1}$. The rank (an integer if it is finite, if not we define it equal to $+\infty$) of $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m$ as $\mathcal{O}_{\mathfrak{U}_m}$-module is then the same one than that of $\mathcal{E}^{(m)}|\mathfrak{U}_m$ as $\mathcal{O}_{\mathfrak{U}_m,\mathbb{Q}}$-module.

Let $g\colon \mathfrak{U}' \to \mathfrak{P}$ be the morphism induce by f. Set $g^{(m)!}(\mathcal{E}^{(m)}) := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'/\mathfrak{S}',\mathbb{Q}} \otimes_{g^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}/\mathfrak{S},\mathbb{Q}}} g^{-1}\mathcal{E}^{(m)}$, which is a coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'/\mathfrak{S}',\mathbb{Q}}$-module. We deduce from 9.2.6.5.2 the isomorphism of coherent $\mathcal{D}^{\dagger}_{\mathfrak{U}',\mathbb{Q}}$-modules: $\mathcal{D}^{\dagger}_{\mathfrak{U}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}',\mathbb{Q}}} (g^{(m)!}(\mathcal{E}^{(m)})) \xrightarrow{\sim} \mathcal{E}'|\mathfrak{U}'$ (use also 9.2.7.1 and the fact that $g^{(m)!}$ is the composition of the base change $f^{(m)!}$ by $\mathcal{V} \to \mathcal{V}'$ with the restriction $|\mathfrak{U}'$). By 15.3.1.15, as $\mathcal{E}'|\mathfrak{U}'$ is moreover $\mathcal{O}_{\mathfrak{U}',\mathbb{Q}}$-coherent, this yields there exists m_0 such that for any $m \geq m_0$ we have the canonical isomorphism $g^{(m)!}(\mathcal{E}^{(m)}) \xrightarrow{\sim} \mathcal{E}'|\mathfrak{U}'$.

Let $m \geq m_0$, $\mathfrak{U}'_m := g^{-1}(\mathfrak{U}_m)$ and $g_m\colon \mathfrak{U}'_m \to \mathfrak{U}_m$ be the morphism induced by g. We get the isomorphism:

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'_m/\mathfrak{S}'} \otimes_{g_m^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}_m/\mathfrak{S}}} g_m^{-1}(\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m) \xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'_m/\mathfrak{S}'} \widehat{\otimes}^{\mathbb{L}}_{g_m^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}_m/\mathfrak{S}}} g_m^{-1}(\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m)$$

$$\xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'_m/\mathfrak{S}'} \widehat{\otimes}^{\mathbb{L}}_{g_m^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}_m/\mathfrak{S}}} g_m^{-1}((\mathcal{O}^{(A_m)}_{\mathfrak{U}_m})^{\wedge}) \overset{7.5.5.12.(c)}{\xrightarrow{\sim}} (\mathcal{O}^{(A_m)}_{\mathfrak{U}'_m})^{\wedge} \qquad (15.3.1.18.1)$$

the last one follows from the coherence of $\mathring{\mathcal{E}}^{(m)}$ and the flatness of $g^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}/\mathfrak{S},\mathbb{Q}} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'/\mathfrak{S}'}$. By tensoring with $\mathbb{Q}$ the composition of 15.3.1.18.1, we get the last $\mathcal{O}_{\mathfrak{U}'_m,\mathbb{Q}}$-linear isomorphism:

$$\mathcal{E}'|\mathfrak{U}'_m \xrightarrow{\sim} g^{(m)!}(\mathcal{E}^{(m)})|\mathfrak{U}'_m \xrightarrow{\sim} ((\mathcal{O}^{(A_m)}_{\mathfrak{U}'_m})^{\wedge})_{\mathbb{Q}}.$$

This yields that for any $m \geq m_0$, the set A_m has r elements and then $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}_m$ is $\mathcal{O}_{\mathfrak{U}_m}$-free of rank r. Hence $\mathcal{E}^{(m)}|\mathfrak{U}_m$ is a free $\mathcal{O}_{\mathfrak{U}_m,\mathbb{Q}}$-module of rank r. We conclude thanks to 15.3.1.14. □

Theorem 15.3.1.19. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module such that for any closed point x of P, $i_x^*(\mathcal{E})$ is a K-vector space of finite dimension. Then there exists a divisor $T' \supset T$ of P such that $({}^{\dagger}T')(\mathcal{E})$ is an isocrystal on $\mathfrak{P}/\mathfrak{S}$ overconvergent along T'.*

Proof. Let $\mathcal{V} \to \mathcal{V}'$ be a morphism of DVR($\mathcal{V}$) (see notation 9.2.6.12), $\mathfrak{S}' := \mathrm{Spf}(\mathcal{V}')$, such that the residue field of $\mathcal{V}'$ is uncountable. Let $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f\colon \mathfrak{P}' \to \mathfrak{P}$ be the canonical projection and $\mathcal{E}' := f^*(\mathcal{E})$ be the coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}',\mathbb{Q}}$-module induced by base change. Then for any closed point x' of P', $i^*_{x'}(\mathcal{E})$ is a K'-space vector of finite dimension. Hence, following 15.3.1.17, there exists a dense open $\mathfrak{U}'$ of $\mathfrak{P}'$ such that $\mathcal{E}'|\mathfrak{U}'$ is a free $\mathcal{O}_{\mathfrak{U}',\mathbb{Q}}$-module of finite type. We deduce from 15.3.1.18 that there exists a dense open $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{E}|\mathfrak{U}$ is a free $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-module of finite type. Shrinking $\mathfrak{U}$if necessary, we can suppose $\mathfrak{U}$ is the open complementary to the support of a divisor. We end the proof thanks to theorem 11.2.1.14.(e). □

Theorem 15.3.1.20. *Let $\mathcal{E}$ be a holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module. There exits a divisor T' containing T such that $({}^{\dagger}T')(\mathcal{E})$ is $\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T')_{\mathbb{Q}}$-coherent.*

Proof. We can suppose $\mathfrak{P}$ integral. Moreover, it follows from 11.2.1.14.(e) that we reduce to check there exists a dense open subset $\mathfrak{U}$ of $\mathfrak{P} \setminus T$ such that $\mathcal{E}|\mathfrak{U}$ is coherent over $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$. In particular, we can suppose $T = \emptyset$. By definition of the holonomicity, we have $\dim(\mathcal{E}) \leq \dim P$. Let $m_0 \geq 0$ be an integer such that there exist a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}^{(m_0)}$ together with a $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism of the form $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)} \xrightarrow{\sim} \mathcal{E}$ (8.4.1.11). For any integer $m \geq m_0$, let us denote by $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$. Increasing $m_0$if necessary, we have $\dim(\mathcal{E}) = \dim^{(m)}(\mathcal{E}^{(m)})$ for any $m \geq m_0$. Following 15.1.5.5, there exists a dense open subset $\mathfrak{U}_m$ of $\mathfrak{P}$ such that $\mathcal{E}^{(m)}|\mathfrak{U}_m$ is coherent over $\mathcal{O}_{\mathfrak{U}_m,\mathbb{Q}}$ for any $m \geq m_0$. We conclude thanks to 15.3.1.14. □

15.3.1.21. With the notations of the theorem 15.3.1.15, the fact that $\mathcal{E}^{(m_0)}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent does not a priori imply that $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent. However, with a Frobenius structure this is the case:

Proposition 15.3.1.22. *Let $\mathcal{E}$ be a coherent F-$\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module, $m_0 \geq 0$ an integer and $\mathcal{E}^{(m_0)}$, the coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module associated with $\mathcal{E}$ (8.4.1.13). Then $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent if and only if $\mathcal{E}^{(m_0)}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent.*

Proof. Since $F^*\mathcal{E}^{(m_0)}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent is and only if $\mathcal{E}^{(m_0)}$ is $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent, then this follows from 15.3.1.15. □

15.3.2 Finite extraordinary fibers and a holonomicity criterion

Definition 15.3.2.1. A coherent $\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-module $\mathcal{E}$ (resp. a complex $\mathcal{E}$ of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}})$) is said to have "finite extraordinary fibers" if, for any closed point x of P, with notation 15.3.1.1 we have $i^!_x(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{S}_x/\mathfrak{S},\mathbb{Q}})$. The property "having finite extraordinary fibers" is closed under devissage, i.e. the complexes having finite extraordinary fibers is a triangulated subcategories of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}})$.

Example 15.3.2.2. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$. If $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ then $\mathcal{E}$ has finite extraordinary fibers.

Definition 15.3.2.3. A complex $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ is said to have "finite extraordinary fibers" if, for any closed point x of P, we have $i^{(\bullet)!}_x(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{O}^{(\bullet)}_{\mathfrak{S}_x})$ (see notation 15.3.1.1). The property "having finite extraordinary fibers" is closed under devissage.

15.3.2.4. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ and $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$. If $\mathcal{E}^{(\bullet)}$ has finite extraordinary fibers then so is $\mathcal{E}$. Beware that the converse is not clear (but at least with the extra hypotheses of 14.3.3.10 for modules such converse property can be checked). In the case of curves, such an equivalence will be established below (thanks to 14.3.3.10).

We get by devissage the complex analogue of Theorem 15.3.1.19:

Theorem 15.3.2.5. *Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$. If $\mathcal{E}$ has finite extraordinary fibers then there exists a divisor $T' \supset T$ of P such that $({}^\dagger T')(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$.*

Proof. We can suppose P integral of dimension d. Thanks to theorem 11.2.1.14.(e), we reduce to check there exists a dense open $\mathfrak{U}'$ of $\mathfrak{P} \setminus T$ such that $\mathcal{E}|\mathfrak{U}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{U}',\mathbb{Q}})$. Consider the set $A := \{n \in \mathbb{Z}$ such that $H^n(\mathcal{E}) \neq 0\}$. Let N be the maximum of A. Let x be a closed point of P. By using the spectral sequence $H^r i^!_x H^s(\mathcal{E}) \to H^n i^!_x(\mathcal{E})$, since $\mathcal{E}$ has finite extraordinary fibers then we get $i^*_x(H^N(\mathcal{E})) \xrightarrow{\sim} H^{N+d} i^!_x(\mathcal{E})$ is a K-vector space of finite dimension. Hence, following 15.3.1.19 there exists a dense open $\mathfrak{U}''$ of $\mathfrak{P} \setminus T$ such that $H^N(\mathcal{E})|\mathfrak{U}'$ is $\mathcal{O}_{\mathfrak{U}',\mathbb{Q}}$-coherent. In particular, $H^N(\mathcal{E})|\mathfrak{U}'$ has finite extraordinary fibers (see 15.3.2.2). Proceeding by induction on the cardinal of A, we conclude therefore the proof by devissage. □

We will need the following result Lemmas ot check Theorem 15.3.2.8:

Lemma 15.3.2.6. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module having finite extraordinary fibers. Let Z be the support of $\mathcal{E}$. There exists an open set $\mathfrak{U}$ of $\mathfrak{P}$ such that $Y := Z \cap U$ is affine, smooth and dense in Z and such that $\mathcal{E}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$ (see notation 12.2.1.4) In particular, $\mathcal{E}|\mathfrak{U}$ is holonomic and nonzero.*

Proof. Let $\mathfrak{U}'$ be an open set of $\mathfrak{P}$ such that $Y' := Z \cap U'$ is affine, smooth and dense in Z. We can lift Y' to an affine and smooth $\mathfrak{S}$-formal scheme $\mathfrak{Y}'$. Since $\mathfrak{U}'$ is smooth and $\mathfrak{Y}'$ is affine, then there exists a morphism of smooth $\mathfrak{S}$-formal schemes of the form $v \colon \mathfrak{Y}' \hookrightarrow \mathfrak{U}'$ lifting $Y' \hookrightarrow \mathfrak{U}'$. Since $\mathcal{E}|\mathfrak{U}'$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{U}',\mathbb{Q}}$-module with support in Y' and having finite extraordinary fibers, it comes from the theorem of Berthelot-Kashiwara (see 9.3.5.9)) that $v^!(\mathcal{E}|\mathfrak{U}')$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Y}',\mathbb{Q}}$-module and having finite extraordinary fibers. Following 15.3.1.19, then there exists an open set $\mathfrak{U}$ of $\mathfrak{U}'$ such that $\mathfrak{Y} := \mathfrak{Y}' \cap \mathfrak{U}$ is affine and dense in $\mathfrak{Y}'$ and such that $v^!(\mathcal{E}|\mathfrak{U}')|\mathfrak{Y}$ is moreover $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent. Denote by $u \colon \mathfrak{Y} \hookrightarrow \mathfrak{U}$ the closed immersion induced by v. Then $u^!(\mathcal{E}|\mathfrak{U})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}}$-module which is $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent. Since $\mathcal{E}|\mathfrak{U}$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}}$-module supported in Y, then this yields $\mathcal{E}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$. The fact that $\mathcal{E}|\mathfrak{U}$ is holonomic follows from 15.2.4.20. □

Lemma 15.3.2.7. *Let $\mathcal{E}_1, \ldots, \mathcal{E}_n$ be some coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules having finite extraordinary fibers. If $\mathcal{E}_1, \ldots, \mathcal{E}_n$ are not all zero, then there exists an open set $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{E}_1|\mathfrak{U}, \ldots, \mathcal{E}_n|\mathfrak{U}$ are holonomic and not all zero.*

Proof. We proceed by induction on the number N of element $i \in \{1,\dots,n\}$ such that $\mathcal{E}_i \neq 0$. When $N=1$, this comes from 15.3.2.6. Suppose now $N \geq 2$. Reindexing if necessary, we can suppose $\mathcal{E}_1 \neq 0$. Following 15.3.2.6, there exists an open set $\mathfrak{U}'$ of $\mathfrak{P}$ such that $\mathcal{E}_1|\mathfrak{U}'$ is holonomic and nonzero. The case where, for any $i \geq 2$, $\mathcal{E}_i|\mathfrak{U}' = 0$ is straightforward. Otherwise, suppose that the $\mathcal{E}_2|\mathfrak{U}',\dots,\mathcal{E}_n|\mathfrak{U}'$ are not all zero. By induction hypothesis, there exists an open set $\mathfrak{U}$ of $\mathfrak{U}'$ such that $\mathcal{E}_2|\mathfrak{U},\dots,\mathcal{E}_n|\mathfrak{U}$ are holonomic and not all zero. The fact that $\mathcal{E}_1|\mathfrak{U}$ is also holonomic allows us to conclude. □

Theorem 15.3.2.8 (Holonomicity criterion)**.** *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. If the cohomological spaces of $\mathbb{D}_T(\mathcal{E})$ have finite extraordinary fibers, then $\mathcal{E}$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic.*

Proof. By definition of the $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic, we can suppose T is empty. Let d the dimension of P. We can suppose P integral. For any integer $d \geq i \geq 0$, set $\mathcal{F}_i := H^{-i}\mathbb{D}(\mathcal{E})$. For $d \geq i \geq 1$, let Z_i be the support of $\mathcal{F}_i$ and $Z := \cup_{i=1,\dots,d} Z_i$ their union. Following the homological criterion of holonomicity of 15.2.4.8, $\mathcal{E}$ is holonomic if and only if $\mathcal{F}_1,\dots,\mathcal{F}_d$ are all zero. By the absurd, suppose that $\mathcal{F}_1,\dots,\mathcal{F}_d$ are not all zero. It comes from 15.3.2.7 that there exists an open set $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathcal{F}_1|\mathfrak{U},\dots,\mathcal{F}_{\mathrm{r}}|\mathfrak{U}$ are holonomic and not all zero. By 15.2.4.7, $\mathcal{F}_0$ is holonomic too. So, the cohomological spaces of $\mathbb{D}(\mathcal{E}|\mathfrak{U})$ are all holonomic, i.e., the complex $\mathbb{D}(\mathcal{E}|\mathfrak{U})$ is holonomic. Hence, thanks to theorem of biduality (see 8.7.7.3) and to the preservation of the holonomicity by the functor $\mathbb{D}$ (see 15.2.4.15), $\mathcal{E}|\mathfrak{U}$ is holonomic. However, following the homological criterion of holonomicity this implies that $\mathcal{F}_1|\mathfrak{U},\dots,\mathcal{F}_d|\mathfrak{U}$ are all zero. Hence we get a contradiction. □

15.3.3 The case of curves

We suppose in this subsection that P has dimension 1.

Proposition 15.3.3.1. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. The following assertions are equivalent:*

(a) The sheaf $\mathcal{E}$ is a holonomic $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module.

(b) There exits a dense open $\mathfrak{U}$ of $\mathfrak{P} \setminus T$ such that $\mathcal{E}|\mathfrak{U}$ is $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-coherent.

(c) There exits a divisor T' containing T such that $({}^\dagger T')(\mathcal{E})$ is $\mathcal{O}_{\mathfrak{P}}({}^\dagger T')_{\mathbb{Q}}$-coherent.

Proof. Following 11.2.1.14.(e), we get the equivalence between (b) and (c). The implication $(a) \Rightarrow (c)$ is always true (see 15.3.1.20). Let's prove now the implication $(b) \Rightarrow (a)$. By definition of the holonomicity, we can suppose $\mathfrak{P}$ integral and T empty. Let $m_0 \geq 0$ be an integer such that there exist a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}^{(m_0)}$ together with a $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism of the form $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m)} \xrightarrow{\sim} \mathcal{E}$ (8.4.1.11). For any integer $m \geq m_0$, let us denote by $\mathcal{E}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{P},\mathbb{Q}}} \mathcal{E}^{(m_0)}$. Let $\mathring{\mathcal{E}}^{(m)}$ be a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}$-module together with a $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{E}}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}^{(m)}$ (see 7.4.5.2). Since by hypothesis $\mathcal{E}|\mathfrak{U}$ is $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-coherent, then following 15.3.1.15 there exists $m_1 \geq m_0$ such that for any $m \geq m_1$ the sheaf $\mathcal{E}^{(m)}|\mathfrak{U}$ is $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-coherent and the canonical homomorphism $\mathcal{E}^{(m)}|\mathfrak{U} \to \mathcal{E}|\mathfrak{U}$ is an isomorphism. Hence, it follows from 11.1.1.11 that for any $m \geq m_1$ the sheaf $\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}$ is $\mathcal{O}_{\mathfrak{U}}$-coherent. It follows from 15.1.5.3 that $\mathrm{Car}^{(m)}(\mathring{\mathcal{E}}^{(m)}|\mathfrak{U}) \subset T^*_U U$. Since U is dense, this implies that $\dim \mathrm{Car}^{(m)}(\mathring{\mathcal{E}}^{(m)}) \leq 1$. Hence, for any $m \geq m_1$, we have $\dim \mathrm{Car}^{(m)}(\mathcal{E}^{(m)}) \leq 1$. We conclude by passing to the limit. □

Remark 15.3.3.2. When $\mathfrak{X}$ is not a formal curve, the implication $(b) \Rightarrow (a)$ of 15.3.3.1 is false in general. For example, let $\mathfrak{Z}$ (resp. $\mathfrak{P}$) be the p-adic completion of $\mathbb{A}^1_{\mathcal{V}}$ (resp. $\mathbb{A}^2_{\mathcal{V}}$) and $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{P}$ be the closed immersion given by $t_2 = 0$ if t_1, t_2 are coordinates of $\mathfrak{X}/\mathfrak{S}$. Then $\mathcal{E} := u_+(\mathcal{D}^\dagger_{\mathfrak{Z},\mathbb{Q}})$ satisfies (b) but it is not holonomic since it has dimension 3.

Lemma 15.3.3.3. *Let k be a perfect field and Z be a reduced k-scheme of finite type and dimension* 0*. So Z is a finite and etale k-scheme.*

Proof. As Z is a Noetherian scheme of dimension 0, according to [Gro65, 0.14.1.9] and [Gro60, 2.8.2], Z is an Artinian scheme. If A is the ring corresponding to Z, A is therefore equal to the (finite) product of local (Artinian) rings of Z. As we further assume that Z is reduced, and as a reduced local Artinian ring is a field, then the local rings of A are all fields. Now, as k is perfect, the fields of Z are separable extensions of k. Thus, A is isomorphic to a finite product of finite extensions separable from k. Hence the result. □

Proposition 15.3.3.4. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ and $\mathcal{E} := \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. The following assertions are equivalent.*

(a) The complex $\mathcal{E}$ has finite extraordinary fibers (in the sense of definition 15.3.2.1).

(b) For any $n \in \mathbb{Z}$, the module $H^n\mathcal{E}$ has finite extraordinary fibers (in the sense of definition 15.3.2.1).

(c) The complex $\mathcal{E}^{(\bullet)}$ has finite extraordinary fibers (in the sense of definition 15.3.2.3).

(d) For any $n \in \mathbb{Z}$, the module $H^n\mathcal{E}^{(\bullet)}$ has finite extraordinary fibers (in the sense of definition 15.3.2.3).

(e) For any divisor D de P, $({}^{\dagger}D)(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}({}^{\dagger}T))$.

(f) There exists a divisor T' containing T such that $({}^{\dagger}T')(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T')_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

Proof. The implications $(b) \Rightarrow (a)$ is obvious. Conversely, suppose for any $n \in \mathbb{Z}$, the module $H^n\mathcal{E}$ has finite extraordinary fibers. Using the spectral sequence $E_2^{r,s} = H^r i^!_x(H^s(\mathcal{E})) \Rightarrow H^{r+s} i^!_x(\mathcal{E})$, since $E_2^{r,s} = 0$ is $r \notin \{0,1\}$, then we get the exact sequence for any $n \in \mathbb{Z}$:

$$0 \to H^1 i^!_x(H^n(\mathcal{E})) \to H^{n+1} i^!_x(\mathcal{E}) \to H^0 i^!_x(H^{n+1}(\mathcal{E})) \to 0.$$

Since $H^n i^!_x(\mathcal{E})$ is a K-vector space of finite dimension for any $n \in \mathbb{Z}$, then so are $H^0 i^!_x(H^n(\mathcal{E}))$ an $H^1 i^!_x(H^n(\mathcal{E}))$ which means that $H^n(\mathcal{E})$ has finite extraordinary fibers. The equivalence between (b) and (d) is a consequence of 14.3.3.10. The implications $(d) \Rightarrow (c) \to (a)$ are straightforward.

It follows from 14.3.3.1 that $\mathcal{E}$ has finite extraordinary fibers if and only if for any divisor D_x of P whose support is a closed point x, $\mathbb{R}\underline{\Gamma}^{\dagger}_{D_x}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Since a reduced divisor of P has dimension 0 then it is finite and etale over k and then D is sum of its connected components which are closed points. Hence, using 13.1.4.16.1, we get the equivalence between (c) and (e).

It remains to check $(a) \Leftrightarrow (f)$. Suppose $\mathcal{E}$ has finite extraordinary fibers. Then following 15.3.2.5 there exists a divisor $T' \supset T$ of P such that $({}^{\dagger}T')(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Since $\mathcal{E}$ has finite extraordinary fibers then we have also $\mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ (see above). Hence, we are done. Conversely, suppose $\mathcal{E}$ satisfies (f). Suppose there exists a divisor T' such that $({}^{\dagger}T')(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T')_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Then $({}^{\dagger}T')(\mathcal{E})$ has finite extraordinary fibers (indeed, when x is a closed point of P, then $i^!_x(({}^{\dagger}T')(\mathcal{E})) = 0$ if $x \in T'$ otherwise $i^!_x(({}^{\dagger}T')(\mathcal{E})) = i^!_x(\mathcal{E})$). By using the triangle of localisation of $\mathcal{E}$ with respect to T', we get $\mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Using Berthelot-Kashiwara theorem this implies that $\mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E})$ has finite extraordinary fibers. Hence, so is $\mathcal{E}$ by devissage. □

Remark 15.3.3.5. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. If T' is a divisor containing T such that $({}^{\dagger}T')(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T')_{\mathbb{Q}}) \cap D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$, then we get the exact triangle of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E}) \to \mathcal{E} \to ({}^{\dagger}T')(\mathcal{E}) \to +1 \tag{15.3.3.5.1}$$

such that for any $n \in \mathbb{Z}$ we have $H^n(\mathbb{R}\underline{\Gamma}^{\dagger}_{T'}(\mathcal{E})) \in \mathrm{MIC}^{\dagger\dagger}(T', \mathfrak{P}/\mathcal{V})$ and $H^n(({}^{\dagger}T')(\mathcal{E})) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T'/\mathcal{V})$ (see notation 11.2.1.4). Hence, if $\mathcal{E}$ has finite extraordinary fibers then it admits a devissage in overconvergent isocrystals. We will study later such devissages in a wider context.

Corollary 15.3.3.6. *Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$. If $\mathcal{E}$ has finite extraordinary fibers, then it is holonomic.*

Proof. This is a consequence of 15.3.3.1 and 15.3.3.4. □

Proposition 15.3.3.7. *Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$. Then $\mathcal{E}$ is $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-coherent.*

Proof. This be proved later 18.3.2.2 in a wider context. For the case of curves, this can be checked using the finite monodromy theorem. □

Remark 15.3.3.8. Thanks to the proposition 15.3.3.7, we show below that for curves having finite extraordinary fibers is equivalent to be holonomic. In higher dimension this is still an open question. To get a more suitable notion, we will introduce that of overcoherence in the next subsection.

Proposition 15.3.3.9. *Let $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$. The following assertions are equivalent:*

(a) The complex $\mathcal{E}$ has finite extraordinary fibers.

(b) $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$.

(c) For any divisor T of P, $({}^{\dagger}T)\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$.

Proof. We already know $(a) \to (b)$ (see 15.3.3.6). Conversely, suppose $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$. By devissage, we can suppose $\mathcal{E}$ is an holonomic $F\text{-}\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. Thanks to 15.3.1.20, there exists a divisor T of P such that $({}^{\dagger}T)\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$. Hence, $({}^{\dagger}T)\mathcal{E}$ has finite extraordinary fibers. Moreover, following 15.3.3.7, $({}^{\dagger}T)\mathcal{E}$ is therefore $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-coherent. This yields by devissage that $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$. Since $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E})$ has its support in T (which is finite and etale over S), then using Berthelot-Kashiwara theorem we get that $\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{E})$ has extraordinary finite fibers.

Since the property "having finite extraordinary fibers" is stable under the localisation functor by a divisor $({}^{\dagger}T)$ (see 15.3.3.4), then we get from the equivalence between (a) and (b), but we get the equivalence between (b) and (c).

□

15.3.4 Overcoherence (after any base change) in a smooth $\mathfrak{S}$-formal scheme

Definition 15.3.4.1. Let $\mathcal{E}^{(\bullet)} \in (F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

(a) We say that $\mathcal{E}^{(\bullet)}$ is "$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)$-overcoherent in $\mathfrak{P}$" if, for any divisor D of P, we have $({}^{\dagger}D)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. We denote by $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ the full subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ consisting of overcoherent in $\mathfrak{P}$ complexes. We denote by $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ the full subcategory of $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ consisting of objects $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)$-module belonging to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

(b) We say that $\mathcal{E}^{(\bullet)}$ is "$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)$-overcoherent in $\mathfrak{P}$ after any base change" if for any morphism $\mathcal{V} \to \mathcal{V}'$ of $\mathrm{DVR}(\mathcal{V})$ (see notation 9.2.6.12), denoting by $\mathfrak{S}' := \mathrm{Spf}\,\mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f \colon \mathfrak{P}' \to \mathfrak{P}$ the projection, $T' := f^{-1}(T)$, we have $\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}'}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'))$ (see notation 9.2.6.13). We denote by $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ the full subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ consisting of overcoherent after any base in $\mathfrak{P}$ complexes. We denote by $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{oc},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ the full subcategory of $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ consisting of objects $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)$-module belonging to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

Definition 15.3.4.2. Let $\mathcal{E}$ be an object of $(F\text{-})D(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

(a) The complex $\mathcal{E}$ is "$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent in $\mathfrak{P}$" if $\mathcal{E} \in (F\text{-})D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ and if, for any divisor D of P, we have $({}^{\dagger}D)(\mathcal{E}) \in (F\text{-})D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ (see 9.1.6.10 for a definition of the functor $({}^{\dagger}D)$ on $(F\text{-})D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$). We denote by $(F\text{-})D^{\mathrm{b}}_{\mathrm{ovcoh},\mathfrak{P}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ the full subcategory of $(F\text{-})D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ consisting of $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent in $\mathfrak{P}$ complexes. A $(F\text{-})\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module is overcoherent in $\mathfrak{P}$ if so is as an object of $(F\text{-})D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

(b) We say that $\mathcal{E}$ is " $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent in $\mathfrak{P}$ after any base change" if, for any morphism $\mathcal{V} \to \mathcal{V}'$ of $\mathrm{DVR}(\mathcal{V})$, denoting by $\mathfrak{S}' := \mathrm{Spf}\,\mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f \colon \mathfrak{P}' \to \mathfrak{P}$ the projection, $T' := f^{-1}(T)$, we have $\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}'}({}^{\dagger}T')_{\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}}} f^{-1}\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh},\mathfrak{P}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$, i.e. the base change $f^{!}_{T}(\mathcal{E})$ of $\mathcal{E}$ via $\mathcal{V} \to \mathcal{V}'$ is overcoherent in $\mathfrak{P}'$ (see 9.2.7.1). A $(F\text{-})\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module is overcoherent in $\mathfrak{P}$ after any base change if so is as an object of $(F\text{-})D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. We denote by $(F\text{-})D^{\mathrm{b}}_{\mathrm{oc},\mathfrak{P}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ the full subcategory of $(F\text{-})D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ consisting of $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent in $\mathfrak{P}$ after any base change complexes.

Notation 15.3.4.3. In this subsection, let $\natural \in \{\mathrm{ovcoh}, \mathrm{oc}\}$.

Example 15.3.4.4. The $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$ is overcoherent in $\mathfrak{P}$. Indeed, this is a consequence of 12.2.7.1.

Proposition 15.3.4.5. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. The property $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ is equivalent to the property $\underrightarrow{l}^{*}_{\mathbb{Q}}\, \mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\natural,\mathfrak{P}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$, where $\underrightarrow{l}^{*}_{\mathbb{Q}}$ is the equivalence of categories of 12.2.1.6.1). The equivalence of categories $\underrightarrow{l}^{*}_{\mathbb{Q}}$ of 8.7.5.4.1 preserves overcoherence and induces the equivalence of categories of the form $\underrightarrow{l}^{*}_{\mathbb{Q}}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)) \cong D^{\mathrm{b}}_{\natural,\mathfrak{P}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

Proof. Let T' a divisor of P. Since $\underrightarrow{l}^{*}_{\mathbb{Q}} \circ ({}^{\dagger}T')(\mathcal{E}^{(\bullet)}) \underset{9.1.3.2}{\xrightarrow{\sim}} \underrightarrow{l}^{*}_{\mathbb{Q}} \circ ({}^{\dagger}T' \cup T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^{\dagger}T' \cup T, T) \circ \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})$, it is sufficient to apply the corollary 9.1.6.3 to the complex $\mathcal{E}'^{(\bullet)} := ({}^{\dagger}T')(\mathcal{E}^{(\bullet)})$. □

15.3.4.6. It follows from 15.3.4.5 that the properties concerning the overcoherence are still valid replacing the categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}$ by $D^{\mathrm{b}}_{\natural,\mathfrak{P}}$ and vice versa. We will therefore in the following simply write and check one of the two contexts.

Like coherence, we verify that the notion of overcoherent (after any base change) in a smooth $\mathfrak{S}$-formal scheme is local in $\mathfrak{P}$. Likewise, we extend the standard properties from coherent modules as follows:

Proposition 15.3.4.7. Let $\mathcal{E}_1 \to \mathcal{E}_2 \to \mathcal{E}_3 \to \mathcal{E}_4 \to \mathcal{E}_5$ an exact sequence of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules (resp. of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$). If $\mathcal{E}_1$, $\mathcal{E}_2$, $\mathcal{E}_4$, $\mathcal{E}_5$ are overcoherent (after any base change) in $\mathfrak{P}$ then so is $\mathcal{E}_3$.

Proof. Since the respective case is checked similarly, let us treat the non-respective one. Let D be a divisor of P. Since the extension $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}} \to \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T \cup D)_{\mathbb{Q}}$ is flat, then the functor $({}^{\dagger}D)$ from the category of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules in that of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T \cup D)_{\mathbb{Q}}$-modules is exact. We get therefore the exact sequence $({}^{\dagger}D)(\mathcal{E}_1) \to ({}^{\dagger}D)(\mathcal{E}_2) \to ({}^{\dagger}D)(\mathcal{E}_3) \to ({}^{\dagger}D)(\mathcal{E}_4) \to ({}^{\dagger}D)(\mathcal{E}_5)$. Since by hypothesis all terms except the middle one are coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules, then so is the middle one. So, $\mathcal{E}_3$ is an overcoherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module. Similarly, since the base change given by a morphism $\mathcal{V} \to \mathcal{V}'$ of DVR($\mathcal{V}$) is exact (see 9.2.7.1), then we are done. □

Proposition 15.3.4.8. Let $\natural \in \{\mathrm{ovcoh}, \mathrm{oc}\}$. Let $\Phi : \mathcal{E} \to \mathcal{F}$ be a morphism of overcoherent (after any base change) $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules (resp. of $\underrightarrow{LM}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$). Then $\mathrm{Ker}\,\Phi$, $\mathrm{Coker}\,\Phi$ and $\mathrm{Im}\Phi$ are overcoherent (after any base change) $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules (resp. belong to $\underrightarrow{LM}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$).

Proof. Let D be a divisor of P. Since the functor $({}^{\dagger}D)\colon \mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to \mathrm{Coh}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T \cup D)_{\mathbb{Q}})$ is exact, then this functor $({}^{\dagger}D)$ commutes with kernels, cokernels and images. Since the kernels, cokernels, images of a morphism of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules are coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules, then we get the overcoherent case. Similarly, since the base change given by a morphism $\mathcal{V} \to \mathcal{V}'$ of DVR($\mathcal{V}$) is exact (see 9.2.7.1), then we are done. □

Lemma 15.3.4.9. *Let* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

(a) Let $(\mathfrak{P}_i)_i$ *be an open covering of* $\mathfrak{P}$. *We have* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ *if and only if* $\mathcal{E}^{(\bullet)}|\mathfrak{P}_i \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}_i}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}_i}(T \cap P_i))$ *for any* i.

(b) If two terms of a distinguished triangle of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ *belong to* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$*, then so is the third.*

(c) We have $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ *if and only if* $H^j(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{oc},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ *for any integer* $j \in \mathbb{Z}$.

Proof. The two first assertions are obvious. The third results from the fact that the functor $({}^{\dagger}D)$ with D a divisor of X and base change via a morphism of DVR are exact on the category of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules. □

Lemma 15.3.4.10. *Let* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. *The following conditions are equivalent:*

(a) $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ *;*

(b) *For any subscheme (resp. open subscheme, resp. closed subscheme) Y of P, $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.*

Proof. By using the case where Y is equal to P or to the complementary of a divisor (or a divisor and use 15.3.4.9.(b)), we get $(b) \to (a)$. Conversely, let us check the implication $(a) \Rightarrow (b)$. By construction of the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}$ (see 13.1.5.1), using 15.3.4.9.(b) we reduce by devissage to the case where Y is an open subscheme of P and we denote by Z the complementary closed subscheme. Let us denote by n_Z the minimal number of divisor $T_1, \ldots, T_r$ such that $Z = T_1 \cap \cdots \cap T_r$. We check the assertion by induction on n_Z. Suppose $n_Z \leq 1$, i.e. Z is a divisor. For any divisor D of X, we have $({}^{\dagger}D) \circ ({}^{\dagger}Z)(\mathcal{E}) \xrightarrow{\sim} ({}^{\dagger}Z \cup D)(\mathcal{E})$ (see 9.1.3.2) and we are done. Suppose now $r \geq 2$ and the proposition holds for any Z such that $n_Z < r$. Set $Z' = T_2 \cap \cdots \cap T_r$. We conclude by using the induction hypothesis via the following Mayer-Vietoris exact triangles (see 13.1.4.15.2):

$$\mathcal{E}^{(\bullet)} \to ({}^{\dagger}T_1)(\mathcal{E}^{(\bullet)}) \oplus ({}^{\dagger}Z')(\mathcal{E}^{(\bullet)}) \to ({}^{\dagger}T_1 \cup Z')(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}[1]. \tag{15.3.4.10.1}$$

□

Remark 15.3.4.11. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$, $\mathcal{E} := \underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})$ The complex $\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ if and only if $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh},\mathfrak{P}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ (see 15.3.4.5) and thanks to 15.3.4.10 and 14.3.3.1 these properties are equivalent to one of theses properties:

(a) For any subscheme (resp. open subscheme, resp. closed subscheme) Y of P, $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

(b) For any subscheme (resp. open subscheme, resp. closed subscheme) Y of P, $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

However, when Y do not vary this is not clear. More precisely, if X be a closed subscheme of P, if $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ then $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. When X is a divisor of P the converse is true (see 14.3.3.1) but otherwise this is an open question. Because of this remark, if X and X' are closed subschemes P such that $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ and next $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E})) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$, then this is not clear that we have the isomorphism

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X\cap X'}(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E})).$$

Lemma 15.3.4.12. *For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$, for any subscheme Y of P, $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.*

Proof. Since base changes commute with localisation functors (see 13.1.5.7), then we reduce to the case where $\natural = \mathrm{ovcoh}$. Hence, this follows from 15.3.4.10 and 13.1.5.6.1. □

Proposition 15.3.4.13. *Let $f\colon \mathfrak{P} \to \mathfrak{Q}$ be a proper morphism of smooth $\mathfrak{S}$-formal schemes, U be a divisor of Q such that $T = f^{-1}(U)$. X be a closed subscheme Q. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ with support in $f^{-1}(X)$. Then $f_{+}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathbb{Q}}(U))$ with support in X.*

Proof. Since base changes commute to localisation functors (see 13.1.5.7) and to pushforwards (see 9.2.6.9), then we reduce to the case where $\natural = \mathrm{ovcoh}$. This follows from the commutation of the localisation functor to direct images (see 9.4.3.3) and the stability of the coherence by pushforward by a proper morphism (see 9.4.2.4) and 15.3.4.10. □

Remark 15.3.4.14. Let $f\colon \mathfrak{P} \to \mathfrak{Q}$ be a smooth morphism of smooth $\mathfrak{S}$-formal schemes, U be a divisor of Q. It is not clear if $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}}(U))$ then $f^{(\bullet)!}(\mathcal{E}^{(\bullet)})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. We will introduce the notion of overcoherence in order to get this stability by definition (see 15.3.6.1 and 15.3.6.2).

Proposition 15.3.4.15. *Let $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ be a closed immersion of smooth $\mathfrak{S}$-formal schemes. Let $\mathfrak{U}$ the open of $\mathfrak{P}$ complementary to $u(X)$, T a divisor of P such that $T \cap X$ is a divisor of X.*

(a) *For any complex $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$, we have therefore $u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{X}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T \cap X))$.*

(b) *The functors $u^{(\bullet)}_{+}$ and $u^{(\bullet)!}$ induce quasi-inverse equivalences between the category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{X}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T \cap X))$ and the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ consisting of complexes $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}|\mathfrak{U} \xrightarrow{\sim} 0$.*

Proof. Let us check the first assertion. Since base changes commute to localisation functors (see 13.1.5.7) and pullbacks 9.2.6.6, then we reduce to the case where $\natural$ = ovcoh. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ and Y be a subvariety of X. It follows from 15.3.4.10 that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. Since this latter is in particular coherent with support in X, then it follows from Theorem 9.3.5.13 that $u^{(\bullet)!}(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)})) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T\cap X))$. Moreover, using 13.2.1.4.1, we get the canonical isomorphism $u^{(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Y} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)})$. Using 15.3.4.10, this implies $u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{X}}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T\cap X))$. Now let's deal with the assertion (b). Since u is proper, then the functor $u^{(\bullet)}_{+}$ preserves the overcoherence in a smooth $\mathfrak{S}$-formal by 15.3.4.13. Since the overcoherence is a stronger condition than the coherence and is preserved by $u^{(\bullet)}_{+}$ and $u_{(\bullet)+}$, then we conclude thanks to the coherent version of Berthelot-Kashiwara Theorem (see 9.3.5.13.(c)). □

Remark 15.3.4.16. It follows from 15.3.4.15 that overcoherence in $\mathfrak{P}$ is a stronger condition than having finite extraordinary fibers. Hence, an overcoherent in $\mathfrak{P}$ module is generically $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent (see 15.3.1.20).

Proposition 15.3.4.17. *Let $a\colon \mathfrak{Z} \hookrightarrow \mathfrak{P}$ be a closed immersion of smooth affine $\mathfrak{S}$-formal schemes. We suppose $\mathfrak{P}$ endowed with local coordinates $t_1, \ldots, t_n$ such that $\mathfrak{Z} = V(t_1, \ldots, t_r)$. Let $\mathcal{E}$ be a $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module which overcoherent in $\mathfrak{P}$. With notation 9.3.4.1, we have the canonical isomorphism:*

$$a^{*}(E) \xrightarrow{\sim} \Gamma(\mathfrak{Z}, a^{*}(\mathcal{E})). \tag{15.3.4.17.1}$$

Proof. We proceed by induction on r. When $r = 1$, this comes from the lemma 9.3.4.9. Denote by $\mathfrak{P}' := V(t_1)$. Using 15.3.4.9.(c) and 15.3.4.15.(a), denoting by $b\colon \mathfrak{P}' \hookrightarrow \mathfrak{P}$ the canonical closed immersion, we can check that $\mathcal{E}' := b^{*}(\mathcal{E})$ is a $\mathcal{D}^{\dagger}_{\mathfrak{P}',\mathbb{Q}}$-module which is overcoherent in $\mathfrak{P}'$. By noting $c\colon \mathfrak{Z} \hookrightarrow \mathfrak{P}'$ the canonical closed immersion, by induction hypothesis, we get the isomorphisms $b^{*}(E) \xrightarrow{\sim} \Gamma(\mathfrak{P}', b^{*}(\mathcal{E})) = E'$ and $c^{*}(E') \xrightarrow{\sim} \Gamma(\mathfrak{Z}, c^{*}(\mathcal{E}'))$. Since $a^{*}(E) \xrightarrow{\sim} c^{*} \circ b^{*}(E)$ and $a^{*}(\mathcal{E}) \xrightarrow{\sim} c^{*} \circ b^{*}(\mathcal{E})$, we can deduce the result. □

Remark 15.3.4.18. The isomorphism 15.3.4.17.1 is used in the proof of the lemma 15.3.5.3 (see the step II.4)). It is an open question to know if the isomorphism 15.3.4.17.1 is still valid when $\mathcal{E}$ is only a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module.

15.3.5 The overcoherence in $\mathfrak{P}$ after any base change implies the holonomicity

Lemma 15.3.5.1. *Let $f\colon \mathfrak{P} \to \mathfrak{Q}$ be a finite etale morphism of smooth $\mathfrak{S}$-formal schemes, $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module.*

(a) With notation 15.2.4.16, we have the isomorphisms $f_{+}(\mathcal{E}^{\mathrm{hol}}) \xrightarrow{\sim} f_{+}(\mathcal{E})^{\mathrm{hol}}$ and $f_{+}(\mathcal{E}/\mathcal{E}^{\mathrm{hol}}) \xrightarrow{\sim} f_{+}(\mathcal{E})/f_{+}(\mathcal{E})^{\mathrm{hol}}$.

(b) The module $\mathcal{E}$ is holonomic if and only if $f_{+}(\mathcal{E})$ is holonomic.

Proof. Since f is finite, then f is projective. Hence, it follows from the relative duality theorem in the case of a projective morphism (see 9.4.4.5) and of the exactness of the functor f_{+} when f is finite and etale (see 9.2.4.15) that $f_{+}(\mathcal{E}^{*}) \xrightarrow{\sim} (f_{+}(\mathcal{E}))^{*}$. Hence, $f_{+}(\mathcal{E}^{\mathrm{hol}}) \xrightarrow{\sim} (f_{+}(\mathcal{E}))^{\mathrm{hol}}$. By exactness of f_{+}, this yields $f_{+}(\mathcal{E}/\mathcal{E}^{\mathrm{hol}}) \xrightarrow{\sim} f_{+}(\mathcal{E})/f_{+}(\mathcal{E})^{\mathrm{hol}}$. The statement (b) comes from the first isomorphism of (a) via the fact that a monomorphism $\mathcal{E}' \hookrightarrow \mathcal{E}$ of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules is an isomorphism if and only if $f_{+}(\mathcal{E}') \hookrightarrow f_{+}(\mathcal{E})$ is an isomorphism. □

Lemma 15.3.5.2. *Let M be a p-torsion free p-adically separated complete $\mathcal{V}$-module. Let $x_1, \ldots, x_r$ be some elements of $M_K := M \otimes_{\mathcal{V}} K$. Then there exists an integer $N_0 \geq 0$ such that, for every integer n, we have the inclusion:*

$$(Kx_1 + \cdots + Kx_r) \cap p^{N_0+n}M \subset p^{n}(\mathcal{V}x_1 + \cdots + \mathcal{V}P_r). \tag{15.3.5.2.1}$$

Proof. According to the terminology of 7.5.1.7, we have the p-adic norm on M_K given by M. This induces a norm on $Kx_1 + \cdots + Kx_r$. On the other hand, we have the p-adic norm on $Kx_1 + \cdots + Kx_r$ given by $\mathcal{V}x_1 + \cdots + \mathcal{V}x_r$. Since the K-vector space $Kx_1 + \cdots + Kx_r$ is of finite dimension, following [Sch02, 4.13], both norms are equivalent. Hence, the induced topology are the same. A basis of neighborhood of zero of the induced norm is given by $((Kx_1 + \cdots + Kx_r) \cap p^n M)_{n\in\mathbb{N}}$ and the second one is given by $(p^n(\mathcal{V}P_1 + \cdots + \mathcal{V}P_r))_{n\in\mathbb{N}}$. Hence, there exists N_0 such that $(Kx_1 + \cdots + Kx_r) \cap p^{N_0} M \subset \mathcal{V}x_1 + \cdots + \mathcal{V}P_r$ and we are done. □

Lemma 15.3.5.3. *Let $\mathcal{E}$ be a $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-overcoherent after any base change in $\mathfrak{P}$ module. Denote by Z the support of $\mathcal{E}/\mathcal{E}^{\mathrm{hol}}$. By the absurd, we suppose that Z is non-empty. For any irreducible component Z' of Z, then there exists an affine open set $\mathfrak{U}$ of $\mathfrak{P}$ such that*

(a) the open set $U \cap Z'$ is smooth and dense in Z' ;

(b) the module $(\mathcal{E}/\mathcal{E}^{\mathrm{hol}})|\mathfrak{U}$ is holonomic.

Proof. We remark that the finiteness hypothesis on $\mathcal{E}$ is only used at the step $II.4$).

Step I)*: Preliminary, reduction of the problem and notations.*

Step 1). The lemma is Zariski local on $\mathfrak{P}$. Replacing if necessary $\mathfrak{P}$ by an affine open set $\mathfrak{U}$ of $\mathfrak{P}$ such that $U \cap Z' = U \cap Z$ and such that $U \cap Z'$ is a smooth dense open of Z', we can then suppose $\mathfrak{P}$ affine, $Z = Z'$ and Z smooth. Following [SGA1, Exp. III], then there exist a closed immersion of smooth affine $\mathcal{V}$-schemes of the form $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{P}$ which lifts $Z \hookrightarrow P$. Following the theorem 15.3.1.19 and the proposition 15.3.4.15.(a), there exists an open set $\mathfrak{U}$ of $\mathfrak{P}$ such that $\mathfrak{V} := \mathfrak{U} \cap \mathfrak{Z}$ is dense in $\mathfrak{Z}$ and $u^!(\mathcal{E})|\mathfrak{V}$ is $\mathcal{O}_{\mathfrak{V},\mathbb{Q}}$-coherent and therefore holonomic. Hence, following the holonomic version of Berthelot-Kashiwara (see 15.2.4.19), we get that $\mathcal{E}|\mathfrak{U}$ is holonomic. This implies that the dimension of the support of $\mathcal{E}_{\text{n-hol}} := \mathcal{E}/\mathcal{E}^{\mathrm{hol}}$ is smaller than that of P. Denote by $r \geq 1$ the codimension of Z in P.

Shrinking if necessary $\mathfrak{P}$, there exists a finite and etale morphism of the form $h\colon \mathfrak{P} \to \widehat{\mathbb{A}}^d_{\mathcal{V}}$ such that $Z = h^{-1}(\mathbb{A}^{d-r}_k)$ where $\mathbb{A}^{d-r}_k$ is the closed subvariety of $\mathbb{A}^d_k = \operatorname{Spec} k[t_1, \ldots, t_d]$ equal to $V(t_1, \ldots, t_r)$. (see the main theorem of Kedlaya of [Ked05]). Thanks to Proposition 15.3.4.13 and Lemma 15.3.5.1, we reduce then to the case where $\mathfrak{Z} \hookrightarrow \mathfrak{P}$ is the closed immersion $\widehat{\mathbb{A}}^{d-r}_{\mathcal{V}} \hookrightarrow \widehat{\mathbb{A}}^d_{\mathcal{V}}$. In particular, we are in the local situation of the subsection 9.3.3 and 9.3.4 and we will use their notations. Since $\mathcal{E}_{\text{n-hol}}$ is supported in Z, following the theorem of Berthelot-Kashiwara (see 9.3.5.9), there exists a coherent $\mathcal{D}^{\dagger}_{\mathfrak{Z},\mathbb{Q}}$-module $\mathcal{F}$ such that $\mathcal{E}_{\text{n-hol}} \xrightarrow{\sim} u_+(\mathcal{F})$.

Step 2). *It is sufficient to check that there exists a dense open set $\mathfrak{V}$ of $\mathfrak{Z}$ such that $\mathcal{F}|\mathfrak{V}$ is a free $\mathcal{O}_{\mathfrak{V},\mathbb{Q}}$-module of finite type, which will be established in the step* II).

Indeed, suppose $\mathcal{F}|\mathfrak{V}$ is a free $\mathcal{O}_{\mathfrak{V},\mathbb{Q}}$-module of finite type. Let $\mathfrak{U}$ be an open set of $\mathfrak{P}$ such that $U \cap Z = V$. Then $\mathcal{E}_{\text{n-hol}}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(V, \mathfrak{U}/\mathcal{V})$. Hence, $\mathcal{E}_{\text{n-hol}}|\mathfrak{U}$ is a holonomic $\mathcal{D}^{\dagger}_{\mathfrak{V},\mathbb{Q}}$-module (see 15.2.4.20) and we are done.

Step 3). Following 15.3.1.18, thanks to the step 2), we reduce by descent to the case where k is algebraically closed and uncountable.

Step 4). There exist $m_0 \in \mathbb{N}$, a coherent $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Z},\mathbb{Q}}$-module $\mathcal{F}^{(m_0)}$ together with a $\mathcal{D}^{\dagger}_{\mathfrak{Z},\mathbb{Q}}$-linear isomorphism of the form $\mathcal{D}^{\dagger}_{\mathfrak{Z},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Z},\mathbb{Q}}} \mathcal{F}^{(m_0)} \xrightarrow{\sim} \mathcal{F}$. From now, m will always be an integer greater or equal than m_0. Denote by $\mathcal{F}^{(m)} := \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Z},\mathbb{Q}}} \mathcal{F}^{(m_0)}$. We have the canonical $\widehat{D}^{(m)}_{\mathfrak{Z},\mathbb{Q}}$-linear morphisms $\rho_m\colon F^{(m)} \to F^{(m+1)}$ (recall according to notation 9.3.3 that sheaves are denoted with curly letters and the corresponding straight letters mean their global sections). Let $\mathring{\mathcal{F}}^{(m_0)}$ be a coherent p-torsion free $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Z}}$-module together with a $\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Z},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{F}}^{(m_0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{F}^{(m_0)}$. For any $m \geq m_0 + 1$, let $\mathring{\mathcal{F}}^{(m)}$ be the quotient of the coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}}$-module $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}} \otimes_{\widehat{\mathcal{D}}^{(m_0)}_{\mathfrak{Z}}} \mathring{\mathcal{F}}^{(m_0)}$ by its p-torsion part. Then $\mathring{\mathcal{F}}^{(m)}$ is a p-torsion free coherent $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}}$-module $\mathring{\mathcal{F}}^{(m)}$ and we have the $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z},\mathbb{Q}}$-linear isomorphism $\mathring{\mathcal{F}}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{F}^{(m)}$ and such that $\rho_{m-1}(\mathring{F}^{(m-1)}) \subset \mathring{F}^{(m)}$. Since $\mathring{\mathcal{F}}^{(m)}$ is p-torsion free, then we get the isomorphism: $\mathring{\mathcal{F}}^{(m)}_i := \mathcal{V}/\pi^{i+1}\mathcal{V} \otimes^{\mathbb{L}}_{\mathcal{V}} \mathring{\mathcal{F}}^{(m)} \xrightarrow{\sim} \mathcal{V}/\pi^{i+1}\mathcal{V} \otimes_{\mathcal{V}} \mathring{\mathcal{F}}^{(m)}$.

Next, we set $\mathring{\mathcal{E}}^{(m)}_{\text{n-hol}} := u^{(m)}_+(\mathring{\mathcal{F}}^{(m)})$ and $\mathcal{E}^{(m)}_{\text{n-hol}} := \mathring{\mathcal{E}}^{(m)}_{\text{n-hol},\mathbb{Q}}$. Thanks to 15.3.1.16, there exists a dense open set $\mathfrak{Z}_m$ of $\mathfrak{Z}$ such that $\mathring{\mathcal{F}}^{(m)}|\mathfrak{Z}_m$ is isomorphic to the p-adic completion of a free $\mathcal{O}_{\mathfrak{Z}_m}$-module. Hence, we have an $\mathcal{O}_{\mathfrak{Z}_m}$-linear isomorphism of the form $\mathring{\mathcal{F}}^{(m)}|\mathfrak{Z}_m \xrightarrow{\sim} (\mathcal{O}^{(A_m)}_{\mathfrak{Z}_m})^{\wedge}$ where A_m is a set.

Let $t_1, \dots, t_d$ be such that $\mathfrak{P} = \operatorname{Spf} \mathcal{V}\{t_1, \dots, t_d\}$ and $\mathfrak{Z} = V(t_1, \dots, t_r)$. We obtain some closed $\mathfrak{S}$-formal subschemes of $\mathfrak{P}$ by setting $\mathfrak{P}' := V(t_{r+1}, \dots, t_d)$ and $\mathfrak{Z}' := V(t_1, \dots, t_d)$. We obtain then the canonical diagram cartesien:

$$\begin{array}{ccc} \mathfrak{Z} & \overset{u}{\hookrightarrow} & \mathfrak{P} \\ {\scriptstyle b}\uparrow & & \uparrow{\scriptstyle a} \\ \mathfrak{Z}' & \overset{u'}{\hookrightarrow} & \mathfrak{P}'. \end{array} \tag{15.3.5.3.1}$$

Since k is algebraically closed and uncountable (see the step 3)), by changing the choice of the coordinates $t_{r+1}, \dots, t_d$ if necessary, we can suppose that $|Z'| \in \cap_{m \in \mathbb{N}} \mathfrak{Z}_m$.

Step 5). Since $|Z'| \in \mathfrak{Z}_m$, via moreover 7.5.5.12.(c), we get the isomorphism $b^*(\mathring{\mathcal{F}}^{(m)}) \xrightarrow{\sim} (\mathcal{V}^{(E_m)})^{\wedge}$. So, $b^*(\mathring{\mathcal{F}}^{(m)})$ is p-torsion free, separated and complete for the p-adic topology. With notation 9.3.4.1, following 9.3.4.10.2 and 9.3.4.10.3 we have therefore the last isomorphism

$$b^*(\mathring{\mathcal{F}}^{(m)}) \overset{15.3.1.5}{\xrightarrow{\sim}} b^*(\mathring{F}^{(m)}) \xrightarrow{\sim} \varprojlim_i b_i^*(\mathring{F}_i{}^{(m)}).$$

Step II)*: We prove in this step that there exists an integer $m_1 \geq m_0$ such that $\mathcal{F}|\mathfrak{Z}_{m_1}$ is a free $\mathcal{O}_{\mathfrak{Z}_{m_1},\mathbb{Q}}$-module of finite type.*

Step 1). *Acyclicity.* Following 5.2.4.5.1, we have the isomorphisms $\mathbb{L}a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}) \xrightarrow{\sim} u_{i+}'^{(m)} \circ \mathbb{L}b_i^*(\mathring{\mathcal{F}}_i{}^{(m)})$. As $\mathring{\mathcal{F}}^{(m)}|\mathfrak{Z}_m$ is flat, we get $\mathbb{L}b_i^*(\mathring{\mathcal{F}}_i{}^{(m)}) \xleftarrow{\sim} b_i^*(\mathring{\mathcal{F}}_i{}^{(m)})$. Since the functors $u_{i+}^{(m)}$ and $u_{i+}'^{(m)}$ are exact (see 5.2.3.1), this yields the isomorphisms

$$\mathbb{L}a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}) \xrightarrow{\sim} a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}) \xrightarrow{\sim} u_{i+}'^{(m)} \circ b_i^*(\mathring{\mathcal{F}}_i{}^{(m)}). \tag{15.3.5.3.2}$$

Step 2). *The module $a^*(\mathring{\mathcal{E}}^{(m)}_{\text{n-hol}})$ is pseudo-quasi-coherent (see the definition 7.2.3.5). More precisely, we have the canonical isomorphisms*

$$\mathcal{D}^{(m)}_{P_i'} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'}} \left(a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right) \xrightarrow{\sim} a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}),$$
$$a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)}) \xrightarrow{\sim} \varprojlim_i a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}). \tag{15.3.5.3.3}$$

Proof: Since $u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})$ is coherent, then it follows from 7.5.5.13.(c) that $\mathbb{L}a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})$ is quasi-coherent. This yields

$$\mathbb{L}a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)}) \xrightarrow{\sim} \mathbb{R}\varprojlim_i \mathcal{D}^{(m)}_{P_i'} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'}} \left(\mathbb{L}a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right). \tag{15.3.5.3.4}$$

$$u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}) \overset{7.5.8.8.2}{\xrightarrow{\sim}} \mathcal{D}^{(m)}_{P_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} u_+^{(m)}(\mathring{\mathcal{F}}^{(m)}) \xrightarrow{\sim} \mathcal{D}^{(m)}_{P_i} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} u_+^{(m)}(\mathring{\mathcal{F}}^{(m)}). \tag{15.3.5.3.5}$$

We have the isomorphism:

$$\begin{aligned} \mathcal{D}^{(m)}_{P_i'} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'}} \left(\mathbb{L}a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right) &\overset{9.2.1.11.2}{\xrightarrow{\sim}} \mathbb{L}a_i^* \left(\mathcal{D}^{(m)}_{P_i} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}} u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right) \\ &\overset{7.5.8.8.2}{\xrightarrow{\sim}} \mathbb{L}a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}) \overset{15.3.5.3.2}{\xrightarrow{\sim}} a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}) \end{aligned} \tag{15.3.5.3.6}$$

This yields the isomorphisms:

$$\mathcal{D}^{(m)}_{P_i'} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'}} \left(\mathbb{L}a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right) \xrightarrow{\sim} \mathcal{D}^{(m)}_{P_i'} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'}} \left(a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right) \xrightarrow{\sim} a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}). \tag{15.3.5.3.7}$$

Then it comes from 15.3.5.3.7 and 15.3.5.3.4 the top isomorphisms of the diagram below:

$$\begin{array}{ccccc} \mathbb{L}a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)}) & \xrightarrow{\sim} & \mathbb{R}\varprojlim_i \mathcal{D}^{(m)}_{P_i'} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'}} \left(a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right) & \xrightarrow{\sim} & \mathbb{R}\varprojlim_i a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}) \\ \downarrow\wr & & \wr\uparrow & & \wr\uparrow \\ a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)}) & \xrightarrow{\sim} & \varprojlim_i \mathcal{D}^{(m)}_{P_i'} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'}} \left(a^* \circ u_+^{(m)}(\mathring{\mathcal{F}}^{(m)})\right) & \xrightarrow{\sim} & \varprojlim_i a_i^* \circ u_{i+}^{(m)}(\mathring{\mathcal{F}}_i{}^{(m)}). \end{array}$$

(15.3.5.3.8)

Since the top left horizontal arrow is an isomorphism from a complex of $D^{\leq 0}$ to a complex of $D^{\geq 0}$, then every morphisms of the left square are isomorphisms. Hence so are that of the right square. Hence we are done.

Step 3) *We have the canonical isomorphism* $\theta^{(m)}\colon a^*(\mathring{E}^{(m)}_{\text{n-hol}}) \xrightarrow{\sim} u'^{(m)}_{+} \circ b^*(\mathring{F}^{(m)})$ *which is compatible with the level increasing.*

II) The isomorphism $\theta^{(m)}$ is the composition of the canonical isomorphisms

$$a^*(\mathring{E}^{(m)}_{\text{n-hol}}) \xrightarrow{\sim} \varprojlim_i a_i^* \circ u^{(m)}_{i+}(\mathring{F}_i{}^{(m)}) \xrightarrow{\sim} \varprojlim_i u'^{(m)}_{i+} \circ b_i^*(\mathring{F}_i{}^{(m)}) \xrightarrow{\sim} u'^{(m)}_{+} \circ b^*(\mathring{F}^{(m)}), \qquad (15.3.5.3.9)$$

where the functor $u'^{(m)}_{+}$ is defined at 9.3.3.6.1 (this has a meaning since $b^*(\mathring{F}^{(m)}$ is a p-torsion free separated complete modules).

i) The first isomorphism of 15.3.5.3.2 is the composition of the following isomorphisms:

$$a^*(\mathring{E}^{(m)}_{\text{n-hol}}) = a^*(\Gamma(\mathfrak{P}, u^{(m)}_{+}(\mathring{\mathcal{F}}^{(m)}))) \overset{9.3.4.10.3}{\xrightarrow{\sim}} \Gamma(\mathfrak{P}', a^* \circ u^{(m)}_{+}(\mathring{\mathcal{F}}^{(m)}))$$
$$\xrightarrow{\sim} \Gamma(\mathfrak{P}', \varprojlim_i a_i^* \circ u^{(m)}_{i+}(\mathring{\mathcal{F}}_i{}^{(m)})) \xrightarrow{\sim} \varprojlim_i \Gamma(\mathfrak{P}', a_i^* \circ u^{(m)}_{i+}(\mathring{\mathcal{F}}_i{}^{(m)})) \xrightarrow{\sim} \varprojlim_i a_i^* \circ u^{(m)}_{i+}(\mathring{F}_i{}^{(m)})).$$

These isomorphisms are built as follows: since $u^{(m)}_{+}(\mathring{\mathcal{F}}^{(m)})$ is pseudo quasi-coherent, then we get the first isomorphism. By applying the functor $\Gamma(\mathfrak{P}', -)$ to the composite isomorphism of the bottom horizontal maps of the diagram 15.3.5.3.8 we get the second isomorphism. We obtain therefore the first isomorphism: Since the functor $\Gamma(\mathfrak{P}', -)$ commutes with projective limits, then we get the third isomorphism. By using the theorem of type A for quasi-coherent modules on schemes, we obtain the forth.

Likewise, we obtain the second isomorphism of 15.3.5.3.9 by taking the projective limit of the global section of 15.3.5.3.2. Finally, since $b_i^*(\mathring{F}_i{}^{(m)}) \xrightarrow{\sim} \mathcal{V}/\pi^{i+1}\mathcal{V} \otimes_{\mathcal{V}} b^*(\mathring{F}^{(m)})$, then we get the last isomorphism of 15.3.5.3.9 (recall also the notation 9.3.3.6.1). Hence we are done.

ii) Taking projective limits and global section of the right square of 5.2.4.3.2, we get that the middle isomorphism of 15.3.5.3.9 commutes with the level increasing. Since this is clear for the other isomorphism, hence so is $\theta^{(m}$, i.e. we get the commutative square:

$$\begin{array}{ccc} a^*(\mathring{E}^{(m)}_{\text{n-hol}}) & \underset{\theta^{(m_0)}}{\xrightarrow{\sim}} & u'^{(m_0)}_{+} \circ b^*(\mathring{F}^{(m_0)}) \\ \downarrow & & \downarrow \\ a^*(\mathring{E}^{(m_0+s)}_{\text{n-hol}}) & \underset{\theta^{(m_0+s)}}{\xrightarrow{\sim}} & u'^{(m_0+s)}_{+} \circ b^*(\mathring{F}^{(m_0+s)}). \end{array} \qquad (15.3.5.3.10)$$

Step 4)*: Construction of* $G^{(m)}$.

Via the theorems of type A and B for coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules, we have the $D^\dagger_{\mathfrak{P},\mathbb{Q}}$-linear surjection $E \twoheadrightarrow E_{\text{n-hol}}$. By right exactness of the functor a^*, we get the $D^\dagger_{\mathfrak{P}',\mathbb{Q}}$-linear surjection $a^*(E) \twoheadrightarrow a^*(E_{\text{n-hol}})$. Since by hypothesis $\mathcal{E}$ is overcoherent in $\mathfrak{P}$, thanks to 15.3.4.17.1, then we have the isomorphism $\Gamma(\mathfrak{P}', a^*(\mathcal{E})) \xrightarrow{\sim} a^*(E)$. Since $a^*(\mathcal{E})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{P}',\mathbb{Q}}$-module, via the theorem of type A for coherent $\mathcal{D}^\dagger_{\mathfrak{P}',\mathbb{Q}}$-modules (see 8.7.5.5), we can deduce that $a^*(E_{\text{n-hol}})$ is a $D^\dagger_{\mathfrak{P}',\mathbb{Q}}$-module of finite type. Let $x_1, \ldots, x_N \in a^*(E_{\text{n-hol}})$ be some elements such that $a^*(E_{\text{n-hol}}) = \sum_{l=1}^N D^\dagger_{\mathfrak{P}',\mathbb{Q}} \cdot x_l$.

Since $a^*(E_{\text{n-hol}}) \xrightarrow{\sim} \varinjlim_m a^*(E^{(m)}_{\text{n-hol}})$, by increasing if necessary m_0, there exists $x_1^{(0)}, \ldots, x_N^{(0)} \in a^*(E^{(m_0)}_{\text{n-hol}})$ such that, for any $l = 1, \ldots, N$, $x_l^{(0)}$ is sent on x_l via the morphism $a^*(E^{(m_0)}_{\text{n-hol}}) \to a^*(E_{\text{n-hol}})$. For any $m \geq m_0$, put $G^{(m)} := \sum_{l=1}^N \widehat{D}^{(m)}_{\mathfrak{P}',\mathbb{Q}} \cdot x_l^{(m-m_0)} \subset a^*(E^{(m)}_{\text{n-hol}})$, where $x_l^{(m-m_0)}$ is the image of $x_l^{(0)}$ via the canonical morphism $a^*(E^{(m_0)}_{\text{n-hol}}) \to a^*(E^{(m)}_{\text{n-hol}})$.

Step 5)*: Construction of* $\mathring{G}^{(m)}$.

Since $G^{(m)}$ is $\widehat{D}^{(m)}_{\mathfrak{P}',\mathbb{Q}}$-coherent, then there exists a p-torsion free coherent $\widehat{D}^{(m)}_{\mathfrak{P}'}$-module $\mathring{G}^{(m)}$ such that $\mathring{G}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} G^{(m)}$. Since we have the $\widehat{D}^{(m)}_{\mathfrak{P}',\mathbb{Q}}$-linear inclusion $G^{(m)} \subset a^*(E^{(m)}_{\text{n-hol}})$, since $\left(a^*(\mathring{E}^{(m)}_{\text{n-hol}})\right)_{\mathbb{Q}} \xrightarrow{\sim} a^*(E^{(m)}_{\text{n-hol}})$, by multiplying if necessary $\mathring{G}^{(m)}$ by a convenient power of p, we can moreover suppose $\mathring{G}^{(m)} \subset a^*(\mathring{E}^{(m)}_{\text{n-hol}})$.

Step 6)*: Construction of* $\mathring{H}^{(m)}$ *and* $H^{(m)}$.

We set $\mathring{H}^{(m)} := \theta^{(m)}(\mathring{G}^{(m)})$, and $H^{(m)} := \theta^{(m)}_{\mathbb{Q}}(G^{(m)})$, where $\theta^{(m)}$ is the isomorphism 15.3.5.3.9 and

$$\theta^{(m)}_{\mathbb{Q}} \colon a^*(E^{(m)}_{\text{n-hol}}) \xrightarrow{\sim} (a^*(\mathring{E}^{(m)}_{\text{n-hol}}))_{\mathbb{Q}} \overset{15.3.5.3.9}{\xrightarrow{\sim}} (u'^{(m)}_{+} \circ b^*(\mathring{F}^{(m)}))_{\mathbb{Q}}. \tag{15.3.5.3.11}$$

We get $(\mathring{H}^{(m)})_{\mathbb{Q}} \xrightarrow{\sim} H^{(m)}$.

Step 7)*: With notation 9.3.3.10.1, the* $\mathcal{V}$*-module* $H^0u'^{(m)!}(\mathring{H}^{(m)})$ *is free of finite rank.*

Since $H^0u'^{(m)!}(\mathring{H}^{(m)})$ is p-torsion free, separated and complete for the p-adic topology (see notation and explanation of 9.3.3.10), this one is the p-adic completion of a free $\mathcal{V}$-module (e.g. use 15.3.1.3). It remains to check that it is of finite type over $\mathcal{V}$. Following the step $I.5$), the module $b^*(\mathring{F}^{(m)})$ is p-torsion free, separated and complete for the p-adic topology. Then we have the canonical square

$$\begin{array}{ccc} \mathring{H}^{(m)} & \hookrightarrow & u'^{(m)}_{+} \circ b^*(\mathring{F}^{(m)}) \\ \uparrow & & \uparrow\sim \\ u'^{(m)}_{+} H^0u'^{(m)!}(\mathring{H}^{(m)}) & \hookrightarrow & u'^{(m)}_{+} H^0u'^{(m)!}(u'^{(m)}_{+} \circ b^*(\mathring{F}^{(m)})) \end{array}$$

whose bottom horizontal morphisms is induced by functoriality of the tautological inclusion $\mathring{H}^{(m)} \subset u'^{(m)}_{+} \circ b^*(\mathring{F}^{(m)})$, whose vertical arrows are induced by the adjunction morphisms of 9.3.3.14.1. The square is commutative by functoriality. Following 9.3.3.15.3, the right vertical arrow is an isomorphism. Since the functor $H^0u'^{(m)!}$ is left exact, we get the canonical inclusion $H^0u'^{(m)!}(\mathring{H}^{(m)}) \subset H^0u'^{(m)!}(u'^{(m)}_{+} \circ b^*(\mathring{F}^{(m)}))$. Hence, by applying to it the functor $u'^{(m)}_{+}$, it follows from 9.3.3.7 that the bottom horizontal arrow is injective. This implies that the canonical arrow $u'_{+}H^0u'^{(m)!}(\mathring{H}^{(m)}) \to \mathring{H}^{(m)}$ is injective. Since $\mathring{H}^{(m)}$ is $\widehat{D}^{(m)}_{\mathfrak{P}'}$-coherent, this yields by noetherianity of $\widehat{D}^{(m)}_{\mathfrak{P}'}$ that $u'_{+}H^0u'^{(m)!}(\mathring{H}^{(m)})$ is $\widehat{D}^{(m)}_{\mathfrak{P}'}$-coherent. It comes from the lemma 9.3.3.8 that $H^0u'^{(m)!}(\mathring{H}^{(m)})$ is a free $\mathcal{V}$-module of finite rank.

Step 8)*: By the absurd, we suppose that, for any* $m \geq m_0$, $b^*(\mathring{F}^{(m)})$ *is not of finite type over* $\mathcal{V}$. *We get then a contradiction.*

i) We construct by induction on $s \in \mathbb{N}$ some elements $y^{(0)}_0, \dots, y^{(0)}_s \in b^*(\mathring{F}^{(m_0)})$ and some integers $n_0, \dots, n_s$ as follows.

It comes from 9.3.3.13.1 that the canonical morphism $b^*(\mathring{F}^{(m)}) \to H^0u'^{(m)!}(u'^{(m)}_{+}(b^*(\mathring{F}^{(m)})))$ is an isomorphism. Via this isomorphism, we will identify $H^0u'^{(m)!}(\mathring{H}^{(m)})$ as a subset of $b^*(\mathring{F}^{(m)})$. Setting $H^0u'^{(m)!}(H^{(m)}) := (H^0u'^{(m)!}(\mathring{H}^{(m)}))\otimes_{\mathcal{V}} K$, we will also identify $H^0u'^{(m)!}(H^{(m)})$ as a subset of $b^*(F^{(m)}) = \left(b^*(\mathring{F}^{(m_0)})\right)_{\mathbb{Q}}$. Since $b^*(\mathring{F}^{(m_0)})$ is p-torsion free, separated and complete for the p-adic topology (see the step $I.5$)), since we suppose that $b^*(\mathring{F}^{(m_0)})$ is not a $\mathcal{V}$-module of finite type, then the K-vector space $b^*(F^{(m_0)})$ is not of finite dimension. Since $H^0u'^{(m)!}(\mathring{H}^{(m)})$ is a free $\mathcal{V}$-module of finite type (see the step II.7), then $H^0u'^{(m)!}(H^{(m)})$ then is a K-vector space is of finite dimension. Hence, there exists an element $y^{(0)}_0 \in b^*(\mathring{F}^{(m_0)})$ such that $y^{(0)}_0 \notin H^0u'^{(m)!}(H^{(m_0)})$. Moreover, since the K-vector space $Ky^{(0)}_0 + H^0u'^{(m)!}(H^{(m)})$ is of finite dimension, then following 15.3.5.2 there exists an integer $n_0 \geq 0$ such that, for any integer n, we have the inclusion:

$$\left(Ky^{(0)}_0 \oplus H^0u'^{(m)!}(H^{(m_0)})\right) \cap p^{n_0+n} b^*(\mathring{F}^{(m_0)}) \subset p^n \left(\mathcal{V}y^{(0)}_0 \oplus H^0u'^{(m)!}(\mathring{H}^{(m_0)})\right). \tag{15.3.5.3.12}$$

Suppose now constructed $y^{(0)}_0, \dots, y^{(0)}_s \in b^*(\mathring{F}^{(m_0)})$ as well as the integers $n_0, \dots, n_s$. For any element $y^{(0)}$ of $b^*(F^{(m_0)})$, we denote by $y^{(j)}$ its image via the morphism $b^*(F^{(m_0)}) \to b^*(F^{(m_0+j)})$ for any $j \in \mathbb{N}$. (Remark that if $y^{(0)} \in b^*(\mathring{F}^{(m_0)})$ then $y^{(j)} \in b^*(\mathring{F}^{(m_0+j)})$.) Since for any $m \geq m_0$ the K-vector space $b^*(F^{(m)})$ is not of finite dimension, it comes from 15.3.1.8 that the image of $b^*(F^{(m_0)}) \to b^*(F^{(m)})$ is a K-vector space of infinite dimension. Set $M^{(s+1)} := H^0u'^{(m)!}(H^{(m_0+s+1)}) + \sum_{j=0}^{s} Ky^{(s+1)}_j$. Let $\mathring{M}^{(s+1)}$ be a free $\mathcal{V}$-module such that $\mathring{M}^{(s+1)} \otimes \mathbb{Q} \xrightarrow{\sim} M^{(s+1)}$. Since $M^{(s+1)}$ is of finite dimension on K, then there exists $y^{(0)}_{s+1} \in p^{s+1}b^*(\mathring{F}^{(m_0)})$ such that $y^{(s+1)}_{s+1} \notin M^{(s+1)}$. Multiplying if necessary by a power of p, we can moreover suppose that for any $j = 0, \dots, s$, we have $y^{(j)}_{s+1} \in p^{1+n_j}b^*(\mathring{F}^{(m_0+j)})$. Following 15.3.5.2, then there exists an integer $n_{s+1} \geq n_s + 1$ such that for any integer n we have

$$\left(M^{(s+1)} \oplus Ky^{(s+1)}_{s+1}\right) \cap p^{n_{s+1}+n} b^*(\mathring{F}^{(m_0+s+1)}) \subset p^n \left(\mathring{M}^{(s+1)} \oplus \mathcal{V}y^{(s+1)}_{s+1}\right). \tag{15.3.5.3.13}$$

ii) Set $y^{(0)} := \sum_{j=0}^{\infty} y_j^{(0)} \in b^*(F^{(m_0)})$. Let $x^{(0)} \in a^*(E_{\text{n-hol}}^{(m_0)})$ be the element such that $\theta_{\mathbb{Q}}^{(m_0)}(x^{(0)}) = 1 \otimes y^{(0)}$ (see the description 9.3.3.6.1 of the pushforward to understand the notation $1 \otimes y^{(0)}$). By definition of $G^{(m)}$ (see the step II.4), since $a^*(E_{\text{n-hol}}) \xrightarrow{\sim} \varinjlim_m a^*(E_{\text{n-hol}}^{(m)})$, then there exists $s \geq 1$ large enough such that the image $x^{(s)}$ of $x^{(0)}$ via the canonical morphism $a^*(E_{\text{n-hol}}^{(m_0)}) \to a^*(E_{\text{n-hol}}^{(m_0+s)})$ belongs to $G^{(m_0+s)}$. By tensoring with $\mathbb{Q}$ 15.3.5.3.10 and by functoriality of the first isomorphism of 15.3.5.3.11, we get the commutative diagram

$$\begin{array}{ccc} a^*(E_{\text{n-hol}}^{(m_0)}) & \xrightarrow[\theta_{\mathbb{Q}}^{(m_0)}]{\sim} & (u'^{(m_0)}_{+} \circ b^*(\mathring{F}^{(m_0)}))_{\mathbb{Q}} \\ \downarrow & & \downarrow \\ a^*(E_{\text{n-hol}}^{(m_0+s)}) & \xrightarrow[\theta_{\mathbb{Q}}^{(m_0+s)}]{\sim} & (u'^{(m_0+s)}_{+} \circ b^*(\mathring{F}^{(m_0+s)}))_{\mathbb{Q}}. \end{array} \qquad (15.3.5.3.14)$$

The image of $1 \otimes y^{(0)} = \sum_{j=0}^{\infty} 1 \otimes y_j^{(0)}$ via the right arrow of 15.3.5.3.14 is $1 \otimes y^{(s)}$, where $y^{(s)} := \sum_{j=0}^{\infty} y_j^{(s)} \in b^*(\mathring{F}^{(m_0+s)})$. This implies the equality $\theta_{\mathbb{Q}}^{(m_0+s)}(x^{(s)}) = 1 \otimes y^{(s)}$ and then$1 \otimes y^{(s)} \in H^{(m_0+s)}$. Since $1 \otimes y^{(s)}$ is killed by $t_1, \ldots, t_r$, we have in fact $1 \otimes y^{(s)} \in H^0 u'^{(m)!}(H^{(m_0+s)})$. Modulo the identification of $H^0 u'^{(m)!} H^{(m_0+s)})$ as a subset of $b^*(F^{(m_0+s)})$, we get then $y^{(s)} \in H^0 u'^{(m)!}(H^{(m_0+s)})$. So, $y^{(s)} - \sum_{j=0}^{s} y_j^{(s)} \in (H^0 u'^{(m)!}(H^{(m_0+s)}) + \sum_{j=0}^{s-1} K y_j^{(s)}) + K y_s^{(s)} = M^{(s)} \oplus K y_s^{(s)}$. However, for any $j \geq s+1$, we have $y_j^{(s)} \in p^{1+n_s} b^*(\mathring{F}^{(m_0+s)})$. Since $y^{(s)} - \sum_{j=0}^{s} y_j^{(s)} = \sum_{j=s+1}^{\infty} y_j^{(s)}$, we get $y^{(s)} - \sum_{j=0}^{s} y_j^{(s)} \in \left(M^{(s)} \oplus K y_s^{(s)}\right) \cap p^{1+n_s} b^*(\mathring{F}^{(m_0+s)}) \subset p \left(\mathring{M}^{(s)} \oplus \mathcal{V} y_s^{(s)}\right)$. Since $y^{(s)} - \sum_{j=0}^{s} y_j^{(s)}$ splits in $M^{(s)} \oplus K y_s^{(s)}$ of the form $(y^{(s)} - \sum_{j=0}^{s-1} y_j^{(s)}) - y_s^{(s)}$, we get a contradiction.

Step 9)*: Conclusion*

Following the step 8), there exists an integer m_1 such that $b^*(F^{(m_1)})$ is a K-vector space of finite dimension. By 15.3.1.8, this yields that for any $m \geq m_1$, $b^*(F^{(m)})$ is a K-vector space of finite dimension. Let $m \geq m_1$. Since $b^*(\mathring{\mathcal{F}}^{(m)}) \xrightarrow{\sim} (\mathcal{V}^{(A_m)})^{\wedge}$ (see step I.4), as $(b^*(\mathring{\mathcal{F}}^{(m)})_{\mathbb{Q}} \xrightarrow{\sim} b^*(F^{(m)})$, this yields that A_m is a finite set and therefore $\mathring{\mathcal{F}}^{(m)}|\mathfrak{Z}_m$ is a free $\mathcal{O}_{\mathfrak{Z}_m}$-module of finite rank. Hence, $\mathcal{F}^{(m)}|\mathfrak{Z}_m$ is a free $\mathcal{O}_{\mathfrak{Z}_m,\mathbb{Q}}$-module of rank r. Using Lemma 15.3.1.14, for m large enough $\mathcal{F}|\mathfrak{Z}_m$ is a free $\mathcal{O}_{\mathfrak{Z}_m,\mathbb{Q}}$-module of finite rank. Hence, we are done. □

Theorem 15.3.5.4. *Let $\mathcal{E}$ be an overcoherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module in $\mathfrak{P}$ after any base change. Then $\mathcal{E}$ is $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-holonomic.*

Proof. Following 15.2.4.6, we reduce to the case where the divisor T is empty. Set $\mathcal{E}_{\text{n-hol}} := \mathcal{E}/\mathcal{E}^{\text{hol}}$. Denote by Z the support of $\mathcal{E}_{\text{n-hol}}$. By the absurd, suppose Z is non-empty and let Z' be an irreducible component. Following 15.3.5.3, then there exists an open set $\mathfrak{U}$ of $\mathfrak{P}$ such that the open subset $U \cap Z'$ is smooth and dense in Z' and such that the module $\mathcal{E}_{\text{n-hol}}|\mathfrak{U}$ is holonomic. However, $(\mathcal{E}_{\text{n-hol}}|\mathfrak{U})^{\text{hol}} = (\mathcal{E}_{\text{n-hol}})^{\text{hol}}|\mathfrak{U} = 0$, the last equality coming from 15.2.4.18. Moreover, since the module $\mathcal{E}_{\text{n-hol}}|\mathfrak{U}$ is holonomic, we get the equality $(\mathcal{E}_{\text{n-hol}}|\mathfrak{U})^{\text{hol}} = (\mathcal{E}_{\text{n-hol}}|\mathfrak{U})$ (see 15.2.4.16). Hence we get a contradiction. □

15.3.6 $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherence (after any base change)

Definition 15.3.6.1. Let $\mathcal{E}^{(\bullet)} \in (F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

(a) We say that $\mathcal{E}^{(\bullet)}$ is "$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)$-overcoherent" if, for any smooth morphism of the form $f\colon \mathfrak{P}' \to \mathfrak{P}$, we have $f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}'}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(f^{-1}(T)))$. We denote by $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$) the full subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. of $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$) consisting of overcoherent complexes.

(b) We say that $\mathcal{E}^{(\bullet)}$ is "$\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)$-overcoherent after any base change" if for any morphism $\mathcal{V} \to \mathcal{V}'$ of $\mathrm{DVR}(\mathcal{V})$ (see notation 9.2.6.12), denoting by $\mathfrak{S}' := \operatorname{Spf} \mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f\colon \mathfrak{P}' \to \mathfrak{P}$ the projection,

$T' := f^{-1}(T)$, we have $\mathcal{V}'\widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}}\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'))$ (see notation 9.2.6.13). We denote by $(F$-$)\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $(F$-$)\underrightarrow{LM}_{\mathbb{Q},\mathrm{oc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$) the full subcategory of $(F$-$)\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$) consisting of $\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)$-overcoherent after any base change complexes.

Definition 15.3.6.2. Let $\mathcal{E}$ be an object of $(F$-$)D(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

(a) The complex $\mathcal{E}$ is "$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent" if for any smooth morphism of the form $f\colon \mathfrak{P}' \to \mathfrak{P}$, we have $f^{!}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh},\mathfrak{P}'}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}f^{-1}(T))_{\mathbb{Q}})$. We denote by $(F$-$)D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ the full subcategory of $(F$-$)D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ consisting of $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent complexes.

(b) We say that $\mathcal{E}$ is " $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent after any base change" if, for any morphism $\mathcal{V} \to \mathcal{V}'$ of $\mathrm{DVR}(\mathcal{V})$, denoting by $\mathfrak{S}' := \mathrm{Spf}\,\mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P}\times_{\mathfrak{S}}\mathfrak{S}'$, $f\colon \mathfrak{P}' \to \mathfrak{P}$ the projection, $\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}'}({}^{\dagger}T')_{\mathbb{Q}}\otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S}}({}^{\dagger}T)_{\mathbb{Q}}} f^{-1}\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$, i.e. the base change $f^{!}_{T}(\mathcal{E})$ of $\mathcal{E}$ via $\mathcal{V} \to \mathcal{V}'$ is overcoherent (see 9.2.7.1). We denote by $(F$-$)D^{\mathrm{b}}_{\mathrm{oc}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ the full subcategory of $(F$-$)D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ consisting of $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent after any base change complexes.

Example 15.3.6.3. Since the constant sheaf is stable under base change and inverse images, then it follows from 15.3.4.4 that the $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$ is overcoherent after any base change.

Like coherence, we verify that the notion of overcoherent is local in $\mathfrak{P}$. Likewise, we extend the standard properties from coherent modules to overcoherent modules:

Proposition 15.3.6.4. We have the following properties.

(a) Let $\Phi : \mathcal{E} \to \mathcal{F}$ be a morphism of overcoherent (after any base change) $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules (resp. of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$). Then $\ker\Phi$ and $\mathrm{Im}\Phi$ are overcoherent (after any base change).

(b) Let $\mathcal{E}_1 \to \mathcal{E}_2 \to \mathcal{E}_3 \to \mathcal{E}_4 \to \mathcal{E}_5$ an exact sequence of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules (resp. of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$). If $\mathcal{E}_1$, $\mathcal{E}_2$, $\mathcal{E}_4$, $\mathcal{E}_5$ are overcoherent (after any base change) then so is $\mathcal{E}_3$.

Proof. Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a smooth morphism of $\mathfrak{S}$-formal schemes. Denote by $f^{*} := H^{0}f^{!}[-d_{X'/X}]$ and $T' := f^{-1}(T)$. Since f is smooth, then the functor f^{*} is exact and the image by f^{*} of a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}}$-module. Hence, this functor f^{*} commutes with kernels, cokernels and images, which implies (a) thanks to 15.3.4.8. Moreover, we get the exact sequence $f^{*}(\mathcal{E}_1) \to f^{*}(\mathcal{E}_2) \to f^{*}(\mathcal{E}_3) \to f^{*}(\mathcal{E}_4) \to f^{*}(\mathcal{E}_5)$. Since by hypothesis all terms except the middle one are overcoherent (after any base change) in $\mathfrak{P}$ then thanks to 15.3.4.7 so is $\mathcal{E}_3$. □

The next proposition is obvious.

Proposition 15.3.6.5. *Let $\natural \in \{\mathrm{ovcoh}, \mathrm{oc}\}$.*

(a) A direct summand of a complex of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $D^{\mathrm{b}}_{\natural}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$) is a complex of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $D^{\mathrm{b}}_{\natural}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$).

(b) Let $\mathcal{E}' \to \mathcal{E} \to \mathcal{E}'' \to \mathcal{E}'[1]$ be a distinguished triangle of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},qc}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $D(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$). If two of the three complexes belong to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $D^{\mathrm{b}}_{\natural}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$) then so does the third. In particular, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $D^{\mathrm{b}}_{\natural}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$) $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ (resp. $D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$)

Proposition 15.3.6.6. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. Let $\natural \in \{\mathrm{ovcoh}, \mathrm{oc}\}$. The property $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ is equivalent to the property $\underrightarrow{l}^{*}_{\mathbb{Q}}\ \mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\natural}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Both properties are local in $\mathfrak{P}$. We have the equivalence of categories $\underrightarrow{l}^{*}_{\mathbb{Q}}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T)) \cong D^{\mathrm{b}}_{\natural}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

Proof. It follows from the proposition 15.3.4.5 and from the fact that, for any smooth morphism f of smooth $\mathfrak{S}$-formal schemes, the functor $f^{(\bullet)!}$ preserves the coherence. □

15.3.6.7. It follows from 15.3.6.6 that the properties concerning the overcoherence are still valid replacing the categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural,\mathfrak{P}}$ by $D^{\mathrm{b}}_{\natural,\mathfrak{P}}$ and vice versa. We will therefore in the following simply write and check one of the two contexts.

Let us now move on to the stability properties of overcoherent by cohomological operations.

Lemma 15.3.6.8. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. The following conditions are equivalent:*

(a) $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$;

(b) For any smooth morphism of the form $f\colon \mathfrak{P}' \to \mathfrak{P}$, for any subscheme (resp. open subscheme, resp. closed subscheme) Y' of P', we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'} \circ f^{(\bullet)!}(\mathcal{E}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(f^{-1}(T)))$.

(c) For any smooth morphism of the form $f\colon \mathfrak{P}' \to \mathfrak{P}$, for any subscheme Y' of P', we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'} \circ f^{(\bullet)!}(\mathcal{E}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(f^{-1}(T)))$.

Proof. We proceed therefore similarly to 15.3.4.10. □

Lemma 15.3.6.9. *For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$, for any subscheme Y of P, $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.*

Proof. Since base changes commute to localisation functors (see 13.1.5.7) and pullbacks 9.2.6.6, then we reduce to the case where $\natural = \mathrm{ovcoh}$. Hence, this follows from 15.3.6.8 and 13.1.5.6.1. □

15.3.6.10. If D is any divisor of P, then we have defined the functor $({}^{\dagger}D)$ of 9.1.1.12.1 factors through $({}^{\dagger}D)\colon D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Then copying the proof of 13.1.1.4 where we replace $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$ by $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$, we get the *canonical* functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{D}\colon D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Then, thanks to the stability of the overcoherence, we can copy the proof of 13.1.3.4 which remains valid for $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ instead of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$. Let X be a reduced closed subscheme of P. We can therefore copy the construction of respectively 13.1.3.8 and 13.1.4.4 in order to define the functors $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}$ and $({}^{\dagger}X)$. Let Y be a subscheme of P. Similarly to 13.1.5.1, we construct the functor:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\colon D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}).$$

Notation 15.3.6.11. Let $\natural \in \{\mathrm{ovcoh}, \mathrm{oc}\}$. Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of smooth $\mathcal{V}$-formal schemes, T and T' some divisors of respectively P and P' such that $T' = f^{-1}(T)$.

Proposition 15.3.6.12. *With the notations 15.3.6.11, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$, we have $f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'))$.*

Proof. Since base changes commute to localisation functors (see 13.1.5.7) and pullbacks 9.2.6.6, then we reduce to the case where $\natural = \mathrm{ovcoh}$. Since f decomposes into a closed immersion followed by a smooth morphism and since the case where f is a smooth morphism is immediate, we reduce to the case where f is a closed immersion. Let $g : \mathfrak{Q}' \to \mathfrak{P}'$ be a smooth morphism and Z' a closed subscheme of Q'. It is enough to prove that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} g^{(\bullet)!}(f^{(\bullet)!}(\mathcal{E}^{(\bullet)})) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}'}({}^{\dagger}g^{-1}(T'))_{\mathbb{Q}})$, which is local in $\mathfrak{Q}'$. We can therefore assume that g decomposes into a closed immersion $\mathfrak{Q}' \hookrightarrow \widehat{\mathbb{A}}^{n}_{\mathfrak{P}'}$ followed by the projection $\widehat{\mathbb{A}}^{n}_{\mathfrak{P}'} \to \mathfrak{P}'$. By denoting p the projection $\widehat{\mathbb{A}}^{n}_{\mathfrak{P}} \to \mathfrak{P}$ and i the closed immersion $\mathfrak{Q}' \hookrightarrow \widehat{\mathbb{A}}^{n}_{\mathfrak{P}}$, we obtain $f \circ g = p \circ i$. Hence the isomorphism:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} g^{(\bullet)!}(f^{(\bullet)!}(\mathcal{E}^{(\bullet)})) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} i^{(\bullet)!} p^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \overset{13.2.1.4.1}{\xrightarrow{\sim}} i^{(\bullet)!}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} p^{(\bullet)!}(\mathcal{E}^{(\bullet)}).$$

As $\mathcal{E}^{(\bullet)}$ is overcoherent, since p is smooth, then $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} p^{(\bullet)!}(\mathcal{E}^{(\bullet)})) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\widehat{\mathbb{A}}^{n}_{\mathfrak{P}}}({}^{\dagger}p^{-1}(T))_{\mathbb{Q}})$ (see 15.3.6.8) with support in $Z' \subset P'$. The theorem 9.3.5.13.(c) allows us to conclude. □

Remark 15.3.6.13. The proposition 15.3.6.12 implies that an overcoherent complex has finite extraordinary fibers. Hence, we can apply for instance 15.3.1.19 and 15.3.2.8 for overcoherent complexes.

Proposition 15.3.6.14. *With the notations 15.3.6.11, suppose f is realizable with respect to T in the sense of 13.2.3.1. For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'))$ with proper support over P, we have therefore $f'^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.*

Proof. Since base changes commute to localisation functors (see 13.1.5.7), pullbacks 9.2.6.6 and to push-forwards (see 9.2.6.9), then we reduce to the case where $\natural$ = ovcoh. Let $g\colon \mathfrak{Q} \to \mathfrak{P}$ be a smooth morphism and Z a closed subscheme of Q. Following 15.3.6.8, it is therefore sufficient to check that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z} g^{(\bullet)!} f'^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}}({}^{\dagger}g^{-1}(T))_{\mathbb{Q}})$. We denote by $\mathfrak{Q}' := \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{Q}$, by $f'\colon \mathfrak{Q}' \to \mathfrak{Q}$ and $g'\colon \mathfrak{Q}' \to \mathfrak{P}'$ the two canonical projections. We get the isomorphism:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z} g^{(\bullet)!} f'^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow[\sim]{13.2.3.7} \mathbb{R}\underline{\Gamma}^{\dagger}_{Z} f'^{(\bullet)}_{+} \circ g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) \xrightarrow[\sim]{13.2.1.4.2} f'^{(\bullet)}_{+} \mathbb{R}\underline{\Gamma}^{\dagger}_{f'^{-1}(Z)} g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})$$

However, it results from the characterisation of the overcoherence of 15.3.6.8.(b) that $\mathbb{R}\underline{\Gamma}^{\dagger}_{f'^{-1}(Z)} g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}'}({}^{\dagger}p^{-1}(T'))_{\mathbb{Q}})$. Since f' is realizable with respect to $g^{-1}(T)$, then it follows from 13.2.3.4 that $f'^{(\bullet)}_{+} \mathbb{R}\underline{\Gamma}^{\dagger}_{f'^{-1}(Z)} g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}}({}^{\dagger}g^{-1}(T))_{\mathbb{Q}})$. □

15.3.6.15. By using some devissage in overconvergent isocrystals, we will improve later the stability property of Proposition 15.3.6.14 by removing the assumption of realisability of the morphism (see 16.3.3.1).

In the next section we will need the following lemma.

Lemme 15.3.6.16. Let $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ be a closed immersion of $\mathcal{V}$-smooth formal schemes and $\mathcal{E} \in F\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. We have a canonical compatible to Frobenius isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ of the form $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{+} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)})$ fitting into the canonical diagram

$$\begin{array}{ccc} u^{(\bullet)}_{+} \circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)}) & \xrightarrow{\text{adj}} & \mathcal{E}^{(\bullet)} \\ \downarrow{\scriptstyle\sim} & & \| \\ \mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) & \longrightarrow & \mathcal{E}^{(\bullet)}. \end{array} \tag{15.3.6.16.1}$$

where the top (resp. bottom) horizontal arrow is the adjunction morphism of 9.5.4.5 (resp. is induced by functoriality in X of the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}$).

Proof. This follows from 13.2.1.7. □

15.3.7 $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}Z)_{\mathbb{Q}}$-overcoherence (after any base change)

Let $\mathfrak{P}$ be a smooth formal scheme over $\mathfrak{S}$. Let Z be a closed subscheme of P. Set $\mathfrak{U} := \mathfrak{P} \setminus Z$.

Definition 15.3.7.1. We introduce the following categories.

(a) We denote by $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ the strictly full subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$ consisting of objects $\mathcal{E}^{(\bullet)}$ satisfying the following properties:

  (i) The canonical morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$
  $$\mathcal{E}^{(\bullet)} \to ({}^{\dagger}Z)(\mathcal{E}^{(\bullet)})$$
  is an isomorphism ;

  (ii) For any smooth morphism $f\colon \mathfrak{P}' \to \mathfrak{P}$, for any divisor T' of P' containing $f^{-1}(Z)$ with notation 9.2.1.15 and 15.3.4.1 we have
  $$({}^{\dagger}T')f^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}'}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T')).$$

(b) We denote by $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ the strictly full subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ consisting of complexes $\mathcal{E}^{(\bullet)}$ such that for any morphism $\mathcal{V} \to \mathcal{V}'$ of $\mathrm{DVR}(\mathcal{V})$, denoting by $\mathfrak{S}' := \mathrm{Spf}\,\mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f\colon \mathfrak{P}' \to \mathfrak{P}$ the projection, we have $\mathcal{V}'\widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}}\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}'}(Z'))$.

(c) The objects of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ (resp. $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$) are said to be $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)$-overcoherent $(F\text{-})$complexes (resp. after any base change).

Example 15.3.7.2. When Z is the support of a divisor of P, then both definition 15.3.6.1 and 15.3.7.1 are the same.

From now, let $\natural \in \{\mathrm{ovcoh}, \mathrm{oc}\}$. Let us give the following straightforward properties.

Lemma 15.3.7.3. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$.*

(a) Let $(\mathfrak{P}_i)_{i\in I}$ be an open covering of $\mathfrak{P}$. Set $Z_i := Z \cap P_i$. Then $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ if and only if for any $i \in I$, $\mathcal{E}^{(\bullet)}|\mathfrak{P}_i \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(Z_i))$.

(b) Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a smooth morphism. Then the functor $f^{*(\bullet)}$ (see notation 9.2.1.15) induces

$$f^{*(\bullet)}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(f^{-1}(Z))). \tag{15.3.7.3.1}$$

Proof. Straightforward. □

Lemma 15.3.7.4. *For any closed subscheme Z' of P, the functor $({}^\dagger Z')$ induces*

$$({}^\dagger Z')\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z\cup Z')) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)). \tag{15.3.7.4.1}$$

Proof. Since base changes commute with localisation functors (see 13.1.5.7), then we reduce to the case where $\natural = \mathrm{ovcoh}$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a smooth morphism, T' be a divisor of P' containing $f^{-1}(Z)$. ince the canonical morphism $({}^\dagger Z')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger Z'')(({}^\dagger Z')(\mathcal{E}^{(\bullet)}))$ is an isomorphism for $Z'' = Z'$ or $Z'' = Z' \cup Z$, then we reduce to prove $({}^\dagger T')f^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}'}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T'))$. This is check by using 15.3.4.10 via the isomorphisms:

$$\begin{aligned}({}^\dagger T')f^{*(\bullet)}\left(({}^\dagger Z')(\mathcal{E}^{(\bullet)})\right) &\underset{13.2.1.4.1}{\xrightarrow{\sim}} ({}^\dagger T')({}^\dagger f^{-1}(Z'))f^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \\ &\xrightarrow{\sim} ({}^\dagger f^{-1}(Z'))\left(({}^\dagger T')f^{*(\bullet)}(\mathcal{E}^{(\bullet)})\right) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}'}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T')).\end{aligned}$$

□

Lemma 15.3.7.5. *For any subscheme Y' of P, the functor $\mathbb{R}\underline{\Gamma}^\dagger_{Y'}$ induces*

$$\mathbb{R}\underline{\Gamma}^\dagger_{Y'}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\mathcal{D}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)). \tag{15.3.7.5.1}$$

Proof. By construction of the local cohomological functor, since $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ is a full triangulated subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$, then we reduce to the case where Y' is an open, which is a consequence of 15.3.7.4.1. □

The following proposition is an extension of 8.7.6.11.

Proposition 15.3.7.6. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. The following properties are equivalent.*

(a) $\mathcal{E}^{(\bullet)} \xrightarrow{\sim} 0$.

(b) $\mathcal{E}^{(\bullet)}|\mathfrak{U} \xrightarrow{\sim} 0$.

Proof. The implication $(a) \Rightarrow (b)$ is obvious. Let us treat the converse. We can suppose $\mathfrak{P}$ is integral. Let us denote by n_Z the minimal number of divisor $T_1, \dots, T_r$ such that $Z = T_1 \cap \dots \cap T_r$. We check the proposition by induction on n_Z. The case where $n_Z = 0$ (i.e. is the case where $Z = P$) is obvious and the case $n_Z = 1$ (i.e. the case where Z is a divisor) is a consequence of 8.7.6.11. Suppose now $r \geq 2$ and the proposition holds for any closed subschemes $\widetilde{Z}$ such that $n_{\widetilde{Z}} < r$. Set $Z' = T_2 \cap \dots \cap T_r$. By using Mayer-Vietoris exact triangles (see 13.1.4.15.2), we get the exact triangle

$$\mathcal{E}^{(\bullet)} \to ({}^\dagger T_1)(\mathcal{E}^{(\bullet)}) \oplus ({}^\dagger Z')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger T_1 \cup Z')(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}[1]. \tag{15.3.7.6.1}$$

For $D \in \{T_1, Z', T_1 \cup Z'\}$, set $\mathfrak{U}' := \mathfrak{P} \setminus D \subset \mathfrak{U}$. Since $({}^\dagger D)(\mathcal{E}^{(\bullet)})|\mathfrak{U}' = 0$, then by using the induction hypothesis, $({}^\dagger Z')(\mathcal{E}^{(\bullet)}) = 0$. Hence, we get from 15.3.7.6.1 that $\mathcal{E}^{(\bullet)} = 0$. □

Corollary 15.3.7.7. *Let $\phi\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a homomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. The morphism ϕ is an isomorphism if and only if so is $\phi|\mathfrak{U}$.*

Proof. Suppose $\phi|_{\mathfrak{U}}$ is an isomorphism. Let $\mathcal{G}^{(\bullet)}$ be a mapping cone of ϕ, which is an object of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. Since $\phi|_{\mathfrak{U}}$ is an isomorphism, then $\mathcal{G}^{(\bullet)}|\mathfrak{U} \xrightarrow{\sim} 0$. It follows from 15.3.7.6 that $\mathcal{G}^{(\bullet)} \xrightarrow{\sim} 0$, i.e. ϕ is an isomorphism. □

Proposition 15.3.7.8. *Let $\natural \in \{\mathrm{ovcoh}, \mathrm{oc}\}$. Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ a proper morphism of smooth $\mathcal{V}$-formal schemes, Z be a closed subscheme of P and $Z' := f^{-1}(Z)$. For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$ with proper support over P, we have therefore $f'^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$.*

Proof. Since base changes commute to localisation functors (see 13.1.5.7), pullbacks 9.2.6.6 and to push-forwards (see 9.2.6.9), then we reduce to the case where $\natural = \mathrm{ovcoh}$. Let $g\colon \mathfrak{Q} \to \mathfrak{P}$ be a smooth morphism and T be a divisor of Q containing $f^{-1}(Z)$. It is sufficient to check that $({}^\dagger T) \circ g^{(\bullet)!} f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}}({}^\dagger g^{-1}(T))_{\mathbb{Q}})$. We denote by $\mathfrak{Q}' := \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{Q}$, by $f'\colon \mathfrak{Q}' \to \mathfrak{Q}$ and $g'\colon \mathfrak{Q}' \to \mathfrak{P}'$ the two canonical projections. We get the isomorphism:

$$({}^\dagger T) \circ g^{(\bullet)!} \circ f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \overset{13.2.3.7}{\xrightarrow{\sim}} ({}^\dagger T) \circ f'^{(\bullet)}_{+} \circ g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) \overset{13.2.1.4.2}{\xrightarrow{\sim}} f'^{(\bullet)}_{+} \circ ({}^\dagger f'^{-1}(T)) \circ g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})$$

However, it results from 15.3.8.6.1 and 15.3.7.4.1 $({}^\dagger f'^{-1}(T)) \circ g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}'}({}^\dagger p^{-1}(T'))_{\mathbb{Q}})$. Hence, it remains to prove $f'^{(\bullet)}_{+} \circ ({}^\dagger f'^{-1}(T)) \circ g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}}({}^\dagger g^{-1}(T))_{\mathbb{Q}})$. Since $\mathfrak{Q}'$ is suppose, then we can suppose Q' is integral. So either $f'^{-1}(T)$ is a divisor of Q' or $f'^{-1}(T) = Q'$. The second case is obvious since we get therefore $({}^\dagger f'^{-1}(T)) \circ g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) = 0$. Since f' is proper, then the first case is a consequence of 15.3.6.14 and we are done.

□

15.3.7.9. The stability under extraordinary pullbacks will be checked in the next subsection (see 15.3.8.27) because its proof uses an overcoherent version of Berthelot-Kashiwara theorem.

15.3.8 Partial overcoherence and t-structure over a c-frame $(Y, X, \mathfrak{P}, Z/\mathfrak{S})$

Let Z and X be two closed subschemes of P. Set $\mathfrak{U} := \mathfrak{P} \setminus Z$, $Y := X \setminus Z$ and $\mathfrak{V} := \mathfrak{P} \setminus X$.

Definition 15.3.8.1. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. Since $\mathcal{E}^{(\bullet)}|\mathfrak{U} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$, then its support $\mathrm{Supp}(\mathcal{E}^{(\bullet)}|\mathfrak{U})$ is well defined (see definition 13.1.4.17). We define the support of $\mathcal{E}^{(\bullet)}$ as the closure in P of $\mathrm{Supp}(\mathcal{E}^{(\bullet)}|\mathfrak{U})$. We denote by $\mathrm{Supp}(\mathcal{E}^{(\bullet)})$ the support of $\mathcal{E}^{(\bullet)}$.

We extend the proposition 13.1.4.8 as follows.

Proposition 15.3.8.2. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. The following assertions are equivalent:*

(a) $\mathrm{Supp}(\mathcal{E}^{(\bullet)}) \subset X$.

(b) We have in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{V}/\mathfrak{S}})$ the isomorphism $\mathcal{E}^{(\bullet)}|\mathfrak{V} \xrightarrow{\sim} 0$.

(c) *The canonical morphism* $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ *is an isomorphism in* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$.

(d) *We have in* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$ *the isomorphism* $({}^{\dagger}X)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$.

Proof. i) First, let us check the equivalence between (a) and (b). By definition, we have the equivalences $\mathrm{Supp}(\mathcal{E}^{(\bullet)}) \subset X \Leftrightarrow \mathrm{Supp}(\mathcal{E}^{(\bullet)}|\mathfrak{U}) \subset X \cap U \Leftrightarrow \mathcal{E}^{(\bullet)}|\mathfrak{U}\cap\mathfrak{V} \xrightarrow{\sim} 0$. Since $\mathcal{E}^{(\bullet)}|\mathfrak{V} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{V}/\mathfrak{S}}(Z\cap V))$ (see 15.3.7.3), then it follows from 15.3.7.6 the equivalence $\mathcal{E}^{(\bullet)}|\mathfrak{V}\cap\mathfrak{U} \xrightarrow{\sim} 0 \Leftrightarrow \mathcal{E}^{(\bullet)}|\mathfrak{V} \xrightarrow{\sim} 0$. Hence, we are done.

ii) The equivalence between (c) and (d) is a consequence of the exact triangle

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)} \to ({}^{\dagger}X)(\mathcal{E}^{(\bullet)}) \to +1.$$

iii) The implication (d) ⇒ (b) is obvious. Let us now check the converse implication. We can suppose $\mathfrak{P}$ is integral. Let us denote by n_Z the minimal number of divisor $T_1, \ldots, T_r$ such that $Z = T_1 \cap \cdots \cap T_r$. We check the proposition by induction on n_Z. The case where $n_Z = 0$ (i.e. is the case where $Z = X$) is obvious and the case $n_Z = 1$ (i.e. the case where Z is a divisor) follows from the proposition 13.1.4.8. Suppose now $r \geq 2$ and the proposition holds for any closed subscheme $\widetilde{Z}$ such that $n_{\widetilde{Z}} < r$. Set $Z' = T_2 \cap \cdots \cap T_r$. By using Mayer-Vietoris exact triangles (see 13.1.4.15.2), we get the exact triangle

$$\mathcal{E}^{(\bullet)} \to ({}^{\dagger}T_1)(\mathcal{E}^{(\bullet)}) \oplus ({}^{\dagger}Z')(\mathcal{E}^{(\bullet)}) \to ({}^{\dagger}T_1 \cup Z')(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}[1].$$

For $D \in \{T_1, Z', T_1 \cup Z'\}$, we have $({}^{\dagger}D)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(D))$ and $({}^{\dagger}D)(\mathcal{E}^{(\bullet)})|\mathfrak{V} \xrightarrow{\sim} 0$. Hence, by using the induction hypothesis we get $({}^{\dagger}X)(\mathcal{E}^{(\bullet)}({}^{\dagger}D)) \xrightarrow{\sim} 0$ and we are done. □

Definition 15.3.8.3. We denote by $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{povcoh}}(Y, X, \mathfrak{P}, Z/\mathfrak{S})$ (resp. $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}(Y, X, \mathfrak{P}, Z/\mathfrak{S})$) the subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ (resp. $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$) consisting of ($F$-)complexes $\mathcal{E}^{(\bullet)}$ with support in X (see definition 15.3.8.1). The objects of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$ are called "partially overcoherent over $(X, \mathfrak{P}, Z/\mathfrak{S})$ (F-)complexes (resp. after any base change)" when $\natural$ = povcoh (resp. $\natural$ = poc).

From now, in this subsection, let $\natural \in \{\mathrm{povcoh}, \mathrm{poc}\}$. We can simply write $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$ instead of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(Y, X, \mathfrak{P}, Z/\mathfrak{S})$ and when Z is empty we can remove it in the notation.

Example 15.3.8.4. When $X = P$, we have $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{povcoh}}(P, \mathfrak{P}, Z/\mathfrak{S}) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}(P, \mathfrak{P}, Z/\mathfrak{S}) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$.

Remark 15.3.8.5. We have added the word "partially" to avoid confusion between $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{povcoh}}(P, \mathfrak{P}, Z/\mathfrak{S})$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ that we will denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}/\mathfrak{S})$ where $Y = P \setminus Z$ (see 19.1.2.2 and 19.2.1.5).

Lemma 15.3.8.6. *Let* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$.

(a) *Let* $(\mathfrak{P}_i)_{i\in I}$ *be an open covering of* $\mathfrak{P}$. *Set* $Z_i := Z \cap P_i$ *and* $X_i := X \cap P_i$. *Then* $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$ *if and only if for any* $i \in I$, $\mathcal{E}^{(\bullet)}|\mathfrak{P}_i \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X_i, \mathfrak{P}_i, Z_i/\mathfrak{S})$.

(b) *Let* $f\colon \mathfrak{P}' \to \mathfrak{P}$ *be a smooth morphism. Then the functor* $f^{*(\bullet)}$ *induces*

$$f^{*(\bullet)}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(f^{-1}(X), \mathfrak{P}', f^{-1}(Z)/\mathfrak{S}). \tag{15.3.8.6.1}$$

Proof. Straightforward. □

Lemma 15.3.8.7. *Let* X' *be a closed subscheme of* X. *We have the inclusion* $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X', \mathfrak{P}, Z/\mathfrak{S}) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. *This inclusion has the left adjoint* $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X', \mathfrak{P}, Z/\mathfrak{S})$.

Proof. This is a consequence of 15.3.7.5.1. □

Remark 15.3.8.8. Beware that if Z' is a closed subscheme of P containing Z, then we can not compare a priori $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z'/\mathfrak{S})$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$. Moreover, it follows from 15.3.7.4.1 that the functor $({}^\dagger Z')$ of is a right adjoint to the inclusion of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z'/\mathfrak{S})\cap\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$.

Notation 15.3.8.9. Let $n\in\mathbb{Z}$. Following 13.1.4.18, we have a canonical t-structure on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$ and the truncated categories are denoted by $\underrightarrow{LD}^{\leq n}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$ and $\mathcal{E}^{(\bullet)}|\mathfrak{U}\in\underrightarrow{LD}^{\geq n}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$.

We denote by $\underrightarrow{LD}^{\leq n}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$ (resp. $\underrightarrow{LD}^{\geq n}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$) the strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$ of complexes $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}|\mathfrak{U}\in\underrightarrow{LD}^{\leq n}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$ (resp. $\mathcal{E}^{(\bullet)}|\mathfrak{U}\in\underrightarrow{LD}^{\geq n}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$). We have the obvious equalities $\underrightarrow{LD}^{\leq n}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})=\underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})[-n]$, $\underrightarrow{LD}^{\geq n}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})=\underrightarrow{LD}^{\geq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})[-n]$ and the inclusions $\underrightarrow{LD}^{\geq 1}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})\subset\underrightarrow{LD}^{\geq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$, $\underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})\subset\underrightarrow{LD}^{\leq 1}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$.

Example 15.3.8.10. When Z is the support of a divisor T of P, the definitions of 15.3.8.9 is related to that of 13.1.4.18 via the equalities

$$\underrightarrow{LD}^{\star}_{\mathbb{Q},\natural}(X,\mathfrak{P},T/\mathfrak{S})=\underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))\cap\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},T/\mathfrak{S}),\qquad(15.3.8.10.1)$$

where $\star$ is either "$\leq n$" or "$\geq n$". Hence, the natural t-structure on $\underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ induces a natural t-structure on $\underrightarrow{LD}^{\star}_{\mathbb{Q},\natural}(X,\mathfrak{P},T/\mathfrak{S})$.

Lemma 15.3.8.11. *Let Z' be a closed subscheme of P.*

(a) For any $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\star}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$, we have $({}^\dagger Z')(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\star}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z\cup Z'/\mathfrak{S})$, where $\star$ is either "b" or "$\leq n$" or "$\geq n$".

(b) Let $f\colon\mathcal{E}^{(\bullet)}\to\mathcal{F}^{(\bullet)}$ be an homomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$ such that $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$, $\mathcal{F}^{(\bullet)}\in\underrightarrow{LD}^{\geq 1}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z\cup Z'/\mathfrak{S})$. Then we have $f=0$.

Proof. The assertion (a) is obvious. Let us prove the part (b). The morphism f factors through a morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z\cup Z'/\mathfrak{S})$ of the form $({}^\dagger Z')(\mathcal{E}^{(\bullet)})\to\mathcal{F}^{(\bullet)}$. Since $({}^\dagger Z')(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z\cup Z'/\mathfrak{S})$, then we reduce to the case where Z' is empty. We can suppose that P is integral. We proceed by induction on n_Z, the minimal number r of divisors $T_1,\dots,T_r$ of P such that $Z=T_1\cap\dots\cap T_r$. The case $n_Z=0$ and $n_Z=1$ follows from 15.3.8.10.1. Suppose now $n_Z\geq 2$ and the proposition holds for $n_Z\leq r-1$. Set $Z_2=T_2\cap\dots\cap T_r$. We have the commutative diagram:

$$\begin{array}{ccccccc}
\mathcal{E}^{(\bullet)} & \longrightarrow & ({}^\dagger T_1)(\mathcal{E}^{(\bullet)})\oplus({}^\dagger Z_2)(\mathcal{E}^{(\bullet)}) & \longrightarrow & ({}^\dagger T_1\cup Z_2)(\mathcal{E}^{(\bullet)}) & \longrightarrow & \mathcal{E}^{(\bullet)}[1]\ . \\
\downarrow{\scriptstyle f} & & \downarrow{\scriptstyle ({}^\dagger T_1)(f)\oplus({}^\dagger Z_2)(f)} & & \downarrow{\scriptstyle ({}^\dagger T_1\cup Z_2)(f)} & & \downarrow{\scriptstyle f[1]} \\
\mathcal{F}^{(\bullet)} & \longrightarrow & ({}^\dagger T_1)(\mathcal{F}^{(\bullet)})\oplus({}^\dagger Z_2)(\mathcal{F}^{(\bullet)}) & \longrightarrow & ({}^\dagger T_1\cup Z_2)(\mathcal{F}^{(\bullet)}) & \longrightarrow & \mathcal{F}^{(\bullet)}[1],
\end{array}\qquad(15.3.8.11.1)$$

where lines are Mayer-Vietoris exact triangles (see 13.1.4.15.2). By induction hypotheses and using the part (a) of the Lemma, we get $({}^\dagger T_1)(f)\oplus({}^\dagger Z_2)(f)=0$ and $({}^\dagger T_1\cup Z_2)(f)=0$. Let $g\colon\mathcal{E}^{(\bullet)}\to({}^\dagger T_1\cup Z_2)(\mathcal{F}^{(\bullet)})[-1]$ be a morphism. The morphism g factors through a morphism $h\colon({}^\dagger T_1\cup Z_2)(\mathcal{E}^{(\bullet)})\to({}^\dagger T_1\cup Z_2)(\mathcal{F}^{(\bullet)})[-1]$. Since $({}^\dagger T_1\cup Z_2)(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},T_1\cup Z_2/\mathfrak{S})$ and $({}^\dagger T_1\cup Z_2)(\mathcal{F}^{(\bullet)})[-1]\in\underrightarrow{LD}^{\geq 2}_{\mathbb{Q},\natural}(X,\mathfrak{P},T_1\cup Z_2/\mathfrak{S})\subset\underrightarrow{LD}^{\geq 1}_{\mathbb{Q},\natural}(X,\mathfrak{P},T_1\cup Z_2/\mathfrak{S})$, then by induction hypotheses, we get $h=0$ and then $g=0$. This yields f is the unique morphism making commutative the (left square of the) diagram 15.3.8.11.1 whose vertical morphisms of the middle square are zero. Hence, $f=0$. □

Proposition 15.3.8.12 (existence of t-structure)**.** We keep notation 15.3.8.9. Let $n\in\mathbb{N}$ and $\star$ means either $\leq n$ or $\geq n$.

(a) The paire $(\underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S}),\underrightarrow{LD}^{\geq 0}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S}))$ defines a t-structure, called the *canonical t-structure*, on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$. We denote by

$$\tau^{\star}_Z\colon\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})\to\underrightarrow{LD}^{\star}_{\mathbb{Q},\natural}(X,\mathfrak{P},Z/\mathfrak{S})$$

the truncation functors given by the canonical t-structure.

(b) For any morphism $\mathcal{V} \to \mathcal{V}'$ of DVR($\mathcal{V}$), denoting by $\mathfrak{S}' := \mathrm{Spf}\, \mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f\colon \mathfrak{P}' \to \mathfrak{P}$ the projection, $X' := f^{-1}(X)$, the functor

$$\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} - \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}(X', \mathfrak{P}', Z'/\mathfrak{S}) \tag{15.3.8.12.1}$$

is t-exact, i.e. preserves the bounded categories of the form $\underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{poc}}$ (see definition [HTT08, 8.1.13]).

(c) For any smooth morphism $f\colon \mathfrak{P}' \to \mathfrak{P}$, the functor

$$f^{*(\bullet)}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(f^{-1}(X), \mathfrak{P}', f^{-1}(Z)/\mathfrak{S}).$$

of 15.3.8.6.1 is t-exact.

(d) For any closed subscheme Z' of P, the functor

$$({}^{\dagger}Z')\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z \cup Z'/\mathfrak{S}) \tag{15.3.8.12.2}$$

is t-exact.

(e) For any divisor T of P, the functor

$$({}^{\dagger}T)\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \tag{15.3.8.12.3}$$

is t-exact

Proof. 1) We prove now the t-exactness of 15.3.8.12.1. We have to check the isomorphism:

$$\tau^{\star}_{Z'}(\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \tau^{\star}_{Z}(\mathcal{E}^{(\bullet)}).$$

i) We check that the objects $\tau^{\star}_{Z'}(\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \mathcal{E}^{(\bullet)})$ and $\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}}(\tau^{\star}_{Z}(\mathcal{E}^{(\bullet)}))$ belong to $\underrightarrow{LD}^{\star}_{\mathbb{Q},poc}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}'}(Z'))$ as follows. We reduce by definition to check it outside Z and Z', i.e. we can suppose Z is empty. The base change functor $\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} - \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}'})$ corresponds via the equivalence of categories $\underrightarrow{l}^{*}_{\mathbb{Q}}$ of 15.3.6.6 to the functor $\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}',\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}} f^{-1} - \colon D^{\mathrm{b}}_{\mathrm{poc}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'/\mathfrak{S}',\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{poc}}(\mathcal{D}^{\dagger}_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}})$ which is exact. Hence, we are done.

ii) We conclude by using the distinguished triangles:

$$\tau^{\leq 0}_{Z'}(\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \mathcal{E}^{(\bullet)}) \to \mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \mathcal{E}^{(\bullet)} \to \tau^{\geq 1}_{Z'}(\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \mathcal{E}^{(\bullet)}) \to +1,$$
$$\mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}}(\tau^{\leq 0}_{Z}(\mathcal{E}^{(\bullet)})) \to \mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}} \mathcal{E}^{(\bullet)} \to \mathcal{V}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{V}}(\tau^{\geq 1}_{Z}(\mathcal{E}^{(\bullet)})) \to +1.$$

2) Since the case $\natural = \mathrm{ovcoh}$ implies the other one (because of 15.3.8.12.1), let us prove the proposition for $\natural = \mathrm{ovcoh}$. We can suppose $\mathfrak{P}$ is integral. Let us denote by n_Z the minimal number of divisor $T_1, \dots, T_r$ such that $Z = T_1 \cap \cdots \cap T_r$. We check the proposition by induction on n_Z. The case where $n_Z = 0$ (i.e. is the case where $Z = X$) or $n_Z = 1$ (i.e. the case where Z is a divisor) follows from 15.3.8.10.1. Suppose now $r \geq 2$ and the proposition holds for any closed subscheme Z' such that $n_{Z'} < n_Z = r$. Let $\star$ equal to "≤ 0" or "≥ 1". Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X, \mathfrak{P}, Z/\mathfrak{S})$.

1) We prove in this step the part (a).

i) Thanks to Lemma 15.3.8.11 (used in the case where Z' is empty), it remains to check that there exists a distinguished triangle of the form

$$(\mathcal{E}^{(\bullet)})^{\leq 0} \to \mathcal{E}^{(\bullet)} \to (\mathcal{E}^{(\bullet)})^{\geq 1} \xrightarrow{+1},$$

where $(\mathcal{E}^{(\bullet)})^{\leq 0} \in \underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\mathrm{ovcoh}}(X, \mathfrak{P}, Z/\mathfrak{S})$ and $(\mathcal{E}^{(\bullet)})^{\geq 1} \in \underrightarrow{LD}^{\geq 1}_{\mathbb{Q},\mathrm{ovcoh}}(X, \mathfrak{P}, Z/\mathfrak{S})$.

We set $Z_2 := T_2 \cap \cdots \cap T_r$, $\mathcal{E}^{(\bullet)}_1 := \mathcal{E}^{(\bullet)}({}^{\dagger}T_1)$, $\mathcal{E}^{(\bullet)}_2 := \mathcal{E}^{(\bullet)}({}^{\dagger}Z_2)$, $\mathcal{E}^{(\bullet)}_{12} := \mathcal{E}^{(\bullet)}({}^{\dagger}T_1 \cup Z_2)$. We have the canonical morphism $\alpha_1\colon \mathcal{E}^{(\bullet)} \to \mathcal{E}^{(\bullet)}_1$, $\alpha_2\colon \mathcal{E}^{(\bullet)} \to \mathcal{E}^{(\bullet)}_2$, $\beta_1\colon \mathcal{E}^{(\bullet)}_1 \to \mathcal{E}^{(\bullet)}_{12}$, $\beta_2\colon \mathcal{E}^{(\bullet)}_2 \to \mathcal{E}^{(\bullet)}_{12}$. We get the Mayer-Vietoris exact triangle

$$\mathcal{E}^{(\bullet)} \xrightarrow{\alpha_1 + \alpha_2} \mathcal{E}^{(\bullet)}_1 \oplus \mathcal{E}^{(\bullet)}_2 \xrightarrow{(\beta_1, -\beta_2)} \mathcal{E}^{(\bullet)}_{12} \to \mathcal{E}^{(\bullet)}[1].$$

By using the induction hypothesis, since $\mathcal{E}_1^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},T_1/\mathfrak{S})$, then we can set $\mathcal{E}_1^{(\bullet)\star} := \tau^{\star}_{T_1}\mathcal{E}_1^{(\bullet)}$, where $\star$ is either "≤ 0" or "≥ 1". Similarly, as $\mathcal{E}_2^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z_2/\mathfrak{S})$, then we can put $\mathcal{E}_2^{(\bullet)\star} := \tau^{\star}_{Z_2}\mathcal{E}_2^{(\bullet)}$; since $\mathcal{E}_{12}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},T_1\cup Z_2/\mathfrak{S})$, then we can set $\mathcal{E}_{12}^{(\bullet)\star} := \tau^{\star}_{T_1\cup Z_2}\mathcal{E}_{12}^{(\bullet)}$.

ii) Let us check that $\mathcal{E}_2^{(\bullet)\star} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z/\mathfrak{S})$. Let $f\colon \mathfrak{P}'\to\mathfrak{P}$ be a smooth morphism, $T'_i := f^{-1}(T_i)$ for any i, $Z'_2 := T'_2\cap\cdots\cap T'_r$, $Z' := f^{-1}(Z)$, $X' := f^{-1}(X)$. We have to prove $({}^\dagger T')\circ f^{*(\bullet)}\circ \tau^{\star}_{Z_2}\circ({}^\dagger Z_2)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}'}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T'))$. By using the induction hypothesis for the part (c) of the proof (and use [HTT08, 8.1.15]), we get the first isomorphism:

$$f^{*(\bullet)}\circ\tau^{\star}_{Z_2}\circ({}^\dagger Z_2)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^{\star}_{Z'_2}\circ f^{*(\bullet)}\circ({}^\dagger Z_2)(\mathcal{E}^{(\bullet)}) \underset{13.2.1.4.1}{\xrightarrow{\sim}} \tau^{\star}_{Z'_2}\circ({}^\dagger Z'_2)\circ f^{*(\bullet)}(\mathcal{E}^{(\bullet)}).$$

Since $f^{*(\bullet)}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X',\mathfrak{P}',Z'/\mathfrak{S})$ (see 15.3.8.6.1), then we reduce to the case $f=\mathrm{id}$, i.e. we only need to prove that for any divisor T of P containing Z, we have $({}^\dagger T)\circ\tau^{\star}_{Z_2}\circ({}^\dagger Z_2)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$.

We have the distinguished triangles:

$$({}^\dagger T)\circ\tau^{\leq 0}_{Z_2}(\mathcal{E}_2^{(\bullet)}) \to ({}^\dagger T)(\mathcal{E}_2^{(\bullet)}) \to ({}^\dagger T)\circ\tau^{\geq 1}_{Z_2}(\mathcal{E}^{(\bullet)}) \to +1,$$
$$({}^\dagger Z_2)\circ\tau^{\leq 0}_{T}\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \to ({}^\dagger Z_2)\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \to ({}^\dagger Z_2)\circ\tau^{\geq 1}_{T}\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \to +1.$$

It follows from 15.3.8.11.(a) that $({}^\dagger Z_2)\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger T)(\mathcal{E}_2^{(\bullet)})$ are in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},T\cup Z_2/\mathfrak{S})$, $({}^\dagger T)\circ\tau^{\star}_{Z_2}(\mathcal{E}_2^{(\bullet)}) \in \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},T\cup Z_2/\mathfrak{S})$ and $({}^\dagger Z_2)\circ\tau^{\star}_{T}\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},T\cup Z_2/\mathfrak{S})$. Hence, it follows from the standard property of a t-structure that we get the isomorphism of $\underrightarrow{LD}^{\star}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},T\cup Z_2/\mathfrak{S})$:

$$({}^\dagger T)\circ\tau^{\star}_{Z_2}(\mathcal{E}_2^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger Z_2)\circ\tau^{\star}_{T}\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}).$$

Since $\tau^{\star}_{T}\circ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh},\mathfrak{P}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$, then so is $({}^\dagger Z_2)\circ\tau^{\star}_{T}\circ({}^\dagger T)(\mathcal{E}^{(\bullet)})$ (see 15.3.4.10) and we are done.

ii') Similarly, we check that $\mathcal{E}_1^{(\bullet)\star}, \mathcal{E}_{12}^{(\bullet)\star} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z/\mathfrak{S})$.

iii) By using the induction hypothesis of 15.3.8.12.2 we get the t-exactness of the functor $({}^\dagger T_1\cup Z_2)$ and then we have the isomorphisms $\mathcal{E}_{12}^{(\bullet)\star} \xrightarrow{\sim} ({}^\dagger T_1\cup Z_2)(\mathcal{E}_1^{(\bullet)\star})$ and $\mathcal{E}_{12}^{(\bullet)\star} \xrightarrow{\sim} ({}^\dagger T_1\cup Z_2)(\mathcal{E}_2^{(\bullet)\star})$. Hence, we get a unique morphism $(\beta_1^{\leq 0}, -\beta_2^{\leq 0})\colon \mathcal{E}_1^{(\bullet)\leq 0}\oplus\mathcal{E}_2^{(\bullet)\leq 0} \to \mathcal{E}_{12}^{(\bullet)\leq 0}$, making commutative the diagram of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z/\mathfrak{S})$:

$$\begin{array}{ccc}
\mathcal{E}_1^{(\bullet)\leq 0}\oplus\mathcal{E}_2^{(\bullet)\leq 0} & \xrightarrow{(\beta_1^{\leq 0},-\beta_2^{\leq 0})} & \mathcal{E}_{12}^{(\bullet)\leq 0} \\
\downarrow & & \downarrow \\
\mathcal{E}_1^{(\bullet)}\oplus\mathcal{E}_2^{(\bullet)} & \xrightarrow{(\beta_1,-\beta_2)} & \mathcal{E}_{12}^{(\bullet)}.
\end{array}$$

Choose a distinguished triangle of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z/\mathfrak{S})$ of the form

$$\mathcal{F}^{(\bullet)} \longrightarrow \mathcal{E}_1^{(\bullet)\leq 0}\oplus\mathcal{E}_2^{(\bullet)\leq 0} \xrightarrow{(\beta_1^{\leq 0},-\beta_2^{\leq 0})} \mathcal{E}_{12}^{(\bullet)\leq 0} \longrightarrow \mathcal{F}^{(\bullet)}[1]. \tag{15.3.8.12.4}$$

Set $\mathfrak{U}_1 := \mathfrak{P}\setminus T_1$, $\mathfrak{U}_2 := \mathfrak{P}\setminus Z_2$. We have $\mathcal{E}_1^{(\bullet)\leq 0}|\mathfrak{U}_1 = \mathcal{E}^{(\bullet)\leq 0}|\mathfrak{U}_1$, $\mathcal{E}_2^{(\bullet)\leq 0}|\mathfrak{U}_1 = \mathcal{E}_{12}^{(\bullet)\leq 0}|\mathfrak{U}_1$, and $\beta_2^{\leq 0}|\mathfrak{U}_1 = \mathrm{id}$. Hence, $\mathcal{F}^{(\bullet)}|\mathfrak{U}_1 \xrightarrow{\sim} \mathcal{E}^{(\bullet)\leq 0}|\mathfrak{U}_1$. Similarly, we get $\mathcal{F}^{(\bullet)}|\mathfrak{U}_2 \xrightarrow{\sim} \mathcal{E}^{(\bullet)\leq 0}|\mathfrak{U}_2$. This yields that $\mathcal{F}^{(\bullet)}|\mathfrak{U} \in \underrightarrow{LD}^{\leq n}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$. Hence, we have checked $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\leq 0}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z/\mathfrak{S})$.

Following [Sta22, 05R0] (more precisely this is checked in the proof, up to a shift), there exist $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z/\mathfrak{S})$ and morphisms in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X,\mathfrak{P},Z/\mathfrak{S})$ denoted by dotted arrows making commutative, except for the lower right square which is anticommutative, the diagram:

$$\begin{array}{ccccccc}
\mathcal{F}^{(\bullet)} & \longrightarrow & \mathcal{E}_1^{(\bullet)\leq 0} \oplus \mathcal{E}_2^{(\bullet)\leq 0} & \longrightarrow & \mathcal{E}_{12}^{(\bullet)\leq 0} & \longrightarrow & \mathcal{F}^{(\bullet)}[1] \\
\vdots & & \downarrow & & \downarrow & & \vdots \\
\mathcal{E}^{(\bullet)} & \xrightarrow{\alpha_1+\alpha_2} & \mathcal{E}_1^{(\bullet)} \oplus \mathcal{E}_2^{(\bullet)} & \xrightarrow{(\beta_1,-\beta_2)} & \mathcal{E}_{12}^{(\bullet)} & \longrightarrow & \mathcal{E}^{(\bullet)}[1] \\
\vdots & & \downarrow & & \downarrow & & \vdots \\
\mathcal{G}^{(\bullet)} & \cdots\to & \mathcal{E}_1^{(\bullet)\geq 1} \oplus \mathcal{E}_2^{(\bullet)\geq 1} & \cdots\to & \mathcal{E}_{12}^{(\bullet)\geq 1} & \longrightarrow & \mathcal{G}^{(\bullet)}[1] \\
\vdots & & \downarrow & & \downarrow & & \vdots \\
\mathcal{F}^{(\bullet)}[1] & \longrightarrow & \mathcal{E}_1^{(\bullet)\leq 0} \oplus \mathcal{E}_2^{(\bullet)\leq 0}[1] & \longrightarrow & \mathcal{E}_{12}^{(\bullet)\leq 0}[1] & \longrightarrow & \mathcal{F}^{(\bullet)}[2]
\end{array}$$

where lines and columns are distinguished triangles. From the third line, we get $\mathcal{G}^{(\bullet)} \in \underrightarrow{LD}^{\geq 1}_{\mathbb{Q},\mathrm{ovcoh}}(X, \mathfrak{P}, Z/\mathfrak{S})$. Hence, the distinguished triangle of the left column is the desired one.

3) To check the t-exactness of the assertions c),d),e), we reduce by definition to check it outside Z or $Z \cup Z'$, which is already well known. $\square$

Definition 15.3.8.13. We denote by $\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$ the heart of the canonical t-structure on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. When $X = P$, we can simply write $\underrightarrow{LM}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. We define for any integer n, the n-th cohomology functor $H^n_Z \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$ by putting $H^n_Z(\mathcal{E}^{(\bullet)}) := \tau^{\leq 0}_Z \tau^{\geq 0}_Z(\mathcal{E}^{(\bullet)}[n])$ for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. Beware that when Z is not a divisor of P, we do have to distinguish H^n_Z with the standard cohomological functor H^n of $D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}))$ (see the counter-example 15.3.8.22 or 15.3.8.20.1 for a comparison), Moreover, beware that $\mathcal{H}^{\dagger,n}_Z$ has another meaning (see notation 13.1.5.3).

Example 15.3.8.14. When Z is the support of a divisor of P, the category $\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$ is simply the category of overcoherent $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)$-modules (after any base change) with support in X. In particular, when $X = P$, we retrieve the (usual) heart of the category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$.

15.3.8.15. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$, $\widetilde{Z}$ be a closed subscheme of P containing Z, T be a divisor of P. Let $\star$ be either "$\leq n$" or "$\geq n$". Let $f \colon \mathfrak{P}' \to \mathfrak{P}$ be smooth morphism, $Z' := f^{-1}(Z)$ (e.g. f is the open immersion $\mathfrak{U} \subset \mathfrak{P}$ and therefore Z' is empty). It follows from the t-exactness properties of 15.3.8.12.c-e and of [HTT08, 8.1.15] that we have the isomorphisms

$$f^{*(\bullet)} \circ \tau^{\star}_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^{\star}_{Z'} \circ f^{*(\bullet)}(\mathcal{E}^{(\bullet)}), \qquad f^{*(\bullet)} \circ H^n_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} H^n_{Z'} \circ f^{*(\bullet)}(\mathcal{E}^{(\bullet)}), \tag{15.3.8.15.1}$$

$$({}^\dagger \widetilde{Z}) \circ \tau^{\star}_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^{\star}_{\widetilde{Z}} \circ ({}^\dagger \widetilde{Z})(\mathcal{E}^{(\bullet)}), \quad ({}^\dagger \widetilde{Z}) \circ H^n_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} H^n_{\widetilde{Z}} \circ ({}^\dagger \widetilde{Z})(\mathcal{E}^{(\bullet)}), \tag{15.3.8.15.2}$$

$$({}^\dagger T) \circ \tau^{\star}_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^{\star}_Z \circ ({}^\dagger T)(\mathcal{E}^{(\bullet)}), \quad ({}^\dagger T) \circ H^n_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} H^n_Z \circ ({}^\dagger T)(\mathcal{E}^{(\bullet)}). \tag{15.3.8.15.3}$$

15.3.8.16. The following properties are straightforward:

(a) For any closed subscheme Z' of P, the t-exact functor 15.3.8.12.2 induces the exact functor

$$({}^\dagger Z') \colon \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z \cup Z'/\mathfrak{S}). \tag{15.3.8.16.1}$$

(b) For any divisor T of P, the t-exact functor 15.3.8.12.3 induces the exact functor

$$({}^\dagger T) \colon \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}). \tag{15.3.8.16.2}$$

Lemma 15.3.8.17. *Let $\phi \colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a homomorphism of $\underrightarrow{LM}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. The morphism ϕ is an isomorphism (resp. a monomorphism, an epimorphism) if and only if so is $\phi|\mathfrak{U}$.*

Proof. Let $\mathcal{K}^{(\bullet)}$ be the kernel or the cokernel of ϕ. Then following 15.3.7.6 the object $\mathcal{K}^{(\bullet)}$ is null if and only if so is $\mathcal{K}^{(\bullet)}|\mathfrak{U}$. $\square$

Lemma 15.3.8.18. *The restriction functor*

$$|\mathfrak{U}\colon \underrightarrow{LM}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)) \to \underrightarrow{LM}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{U}/\mathfrak{S}})$$

is faithful.

Proof. Let $\phi\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a homomorphism of $\underrightarrow{LM}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. The property $\phi = 0$ is equivalent to saying that the morphism $\ker\phi \to \mathcal{E}^{(\bullet)}$ is an isomorphism. Hence, the lemma 15.3.8.17 implies that $\phi = 0 \Leftrightarrow \phi|\mathfrak{U} = 0$. □

15.3.8.19. Let $T_1, \dots, T_r$ be divisors of P such that $Z = T_1 \cap \dots \cap T_r$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/K)$. Set $\mathcal{E}^{(\bullet)}_{ij} := ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)})$ and $\mathcal{E}^{(\bullet)}_{i} := ({}^\dagger T_i)\mathcal{E}^{(\bullet)}$ for any $i, j \in \{1, \dots, r\}$. We get the morphism $\theta^1_{ij}\colon \mathcal{E}^{(\bullet)}_i \to ({}^\dagger T_i \cup T_j)\mathcal{E}^{(\bullet)}_i = \mathcal{E}^{(\bullet)}_{ij}$. Following 15.3.8.16.2, this is a map of the abelian category $\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. This yields the maps $\theta^1\colon \oplus_{i=1}^r \mathcal{E}^{(\bullet)}_i \to \oplus_{i,j=1}^r \mathcal{E}^{(\bullet)}_{ij}$. Similarly, for any i, j we have the maps $\theta^2_{ij}\colon \mathcal{E}^{(\bullet)}_j \to ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}_j) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}_{ij}$, which yields the map $\theta^2\colon \oplus_{i=1}^r \mathcal{E}^{(\bullet)}_i \to \oplus_{i,j=1}^r \mathcal{E}^{(\bullet)}_{ij}$ of $\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. We get the exact sequence of $\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$:

$$0 \to \mathcal{E}^{(\bullet)} \to \oplus_{i=1}^r ({}^\dagger T_i)(\mathcal{E}^{(\bullet)}) \xrightarrow{\theta^2 - \theta^1} \oplus_{i,j=1}^r ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}). \tag{15.3.8.19.1}$$

Indeed, to check the exactness, by using 15.3.8.17 we reduce to the case where Z is empty. Set $\mathfrak{U}_i = \mathfrak{P} \backslash T_i$ for any $i = 1, \dots, r$. Let $i \in \{1, \dots, r\}$. We reduce to check that the sequence 15.3.8.19.1 is exact over $\mathfrak{U}_i$, i.e. to the case where the divisor T_i is empty, which is a straighforward computation.

Remark 15.3.8.20. (a) Let $\mathcal{E} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$. Let $\star$ be either "$\leq n$" or "$\geq n$". Then for any divisor T containing Z, we have $({}^\dagger T) \circ \tau^\star(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^\star \circ ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^\star_T \circ ({}^\dagger T)(\mathcal{E}^{(\bullet)})$, where $\tau^\star$ is the usual truncation for coherent complexes (see 13.1.4.18). This yields that $({}^\dagger Z) \circ \tau^\star(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^\star_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. Hence, we get the morphisms

$$({}^\dagger Z) \circ \tau^{\leq n}(\mathcal{E}^{(\bullet)}) \to \tau^{\leq n}_Z(\mathcal{E}^{(\bullet)}), \qquad \tau^{\geq n}_Z(\mathcal{E}^{(\bullet)}) \to ({}^\dagger Z) \circ \tau^{\geq n}(\mathcal{E}^{(\bullet)}) \tag{15.3.8.20.1}$$

which are isomorphisms since this is the case outside Z. This yields the isomorphism

$$({}^\dagger Z) \circ H^n(\mathcal{E}) \xrightarrow{\sim} H^n_Z(\mathcal{E}).$$

(b) For any $n \in \mathbb{Z}$, $\mathcal{E} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$, it follows from 15.3.8.15.1 that we have $H^n_Z(\mathcal{E})|\mathfrak{U} \xrightarrow{\sim} H^n(\mathcal{E}|\mathfrak{U})$. Hence, from Lemma 15.3.7.6, we get $H^n_Z(\mathcal{E}) = 0$ if and only if $H^n(\mathcal{E}|\mathfrak{U}) = 0$.

(c) We have the inclusion $\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) \subset \underrightarrow{LD}^{\geq 0}_{\mathbb{Q}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$ (see 13.1.4.19 for the t-structure on the right side). Indeed, by using Mayer-Vietoris exact triangles and by induction on the minimal number of divisors whose intersection is Z, we reduce to the case where Z is a divisor.

Proposition 15.3.8.21. *Let D be a divisor of P and Let $\widetilde{Z} := Z \cup D$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, \widetilde{Z}/\mathfrak{S}) \cap \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. Then we have the canonical isomorphisms*

$$\tau^\star_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^\star_{\widetilde{Z}}(\mathcal{E}^{(\bullet)}),\ H^n_{\widetilde{Z}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} H^n_Z(\mathcal{E}^{(\bullet)}),$$

where $\star$ means either $\leq n$ or $\geq n$ with $n \in \mathbb{Z}$.

Proof. Since the morphism $\mathcal{E}^{(\bullet)} \to ({}^\dagger Z')(\mathcal{E}^{(\bullet)})$ is an isomorphism for any closed subscheme Z' included in $\widetilde{Z}$, then we get the first and the last isomorphisms:

$$\tau^\star_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^\star_Z \circ ({}^\dagger D)(\mathcal{E}^{(\bullet)}) \underset{15.3.8.15.3}{\xrightarrow{\sim}} ({}^\dagger D) \circ \tau^\star_Z(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger \widetilde{Z}) \circ \tau^\star_Z(\mathcal{E}^{(\bullet)})$$
$$\underset{15.3.8.15.2}{\xrightarrow{\sim}} \tau^\star_{\widetilde{Z}} \circ ({}^\dagger \widetilde{Z})(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \tau^\star_{\widetilde{Z}}(\mathcal{E}^{(\bullet)}).$$

□

Remark 15.3.8.22. Let us give a counter-example of the proposition 15.3.8.21 when D is not a divisor of P and Z is empty. Suppose D is a rational closed point of $\mathbb{P}^2_k$, $\mathfrak{P} = \widehat{\mathbb{P}}^2_{\mathcal{V}}$, $X = \mathbb{P}^2_k$, and $Y := X \setminus D$. Since $({}^\dagger D)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})|\mathfrak{U} \xrightarrow{\sim} \mathcal{O}^{(\bullet)}_{\mathfrak{U}}$, we get $({}^\dagger D)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \in \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, D/\mathfrak{S})$. However, by using the localization triangle with respect to D of $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$, we have $\tau^{\leq 0}(({}^\dagger D)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})) \xrightarrow{\sim} \mathcal{O}^{(\bullet)}_{\mathfrak{P}} \notin \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, D/\mathfrak{S})$, where $\tau^{\leq 0}$ is the standard truncation functor of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$. Now, let $u\colon \mathfrak{D} \to \mathfrak{P}$ be a lifting of the closed immersion $D \hookrightarrow P$. We have $\mathbb{R}\underline{\Gamma}^\dagger_D(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \cong u^{(\bullet)}_+ u^{(\bullet)!}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \cong u^{(\bullet)}_+(\mathcal{O}^{(\bullet)}_{\mathfrak{D}})[-2]$. Using again the localization triangle, we have $\tau_{\geq 1}(({}^\dagger D)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})) \xrightarrow{\sim} u^{(\bullet)}_+(\mathcal{O}^{(\bullet)}_{\mathfrak{D}})[-1]$. Hence, the object $({}^\dagger D)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$ is not an element of $\underrightarrow{LM}_{\mathbb{Q}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$, i.e. a module in the usual sense.

Proposition 15.3.8.23. *Let T be a divisor of P and let $\widetilde{Z} := Z \cup T$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, \widetilde{Z}/\mathfrak{S})$. Then both assertions are equivalent.*

(a) $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$;

(b) for any $n \in \mathbb{Z}$, we have $H^n_{\widetilde{Z}}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$.

Proof. We easily check by devissage the implication $(b) \Rightarrow (a)$. The implication $(a) \Rightarrow (b)$ is a consequence of 15.3.8.21. ☐

Proposition 15.3.8.24. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. We have the equality*

$$\operatorname{Supp} \mathcal{E}^{(\bullet)} = \cup_{j \in \mathbb{Z}} \operatorname{Supp} H^j_Z(\mathcal{E}^{(\bullet)}). \tag{15.3.8.24.1}$$

Proof. For any closed subscheme X' of P, it follows from 13.1.4.20.1 the last equivalence: $\operatorname{Supp} \mathcal{E}^{(\bullet)} \subset X' \Leftrightarrow \operatorname{Supp}(\mathcal{E}^{(\bullet)}|\mathfrak{U}) \subset X' \cap U \Leftrightarrow \forall j \in \mathbb{Z}$, $\operatorname{Supp} H^j(\mathcal{E}^{(\bullet)}|\mathfrak{U}) \subset X' \cap U$. It follows from 15.3.8.15.1 that we have $H^j_Z(\mathcal{E})|\mathfrak{U} \xrightarrow{\sim} H^j(\mathcal{E}|\mathfrak{U})$. Hence, $\forall j \in \mathbb{Z}$, $\operatorname{Supp} H^j(\mathcal{E}^{(\bullet)}|\mathfrak{U}) \subset X' \cap U \Leftrightarrow \forall j \in \mathbb{Z}$, $\operatorname{Supp} H^j_Z(\mathcal{E}^{(\bullet)}) \subset X'$. ☐

Lemma 15.3.8.25. *Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, X, X' be two smooth closed subschemes of P, Z, Z' be two closed subschemes of P such that $Z \cap X = Z' \cap X'$. We get then the equality: $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S}) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X', \mathfrak{P}, Z'/\mathfrak{S})$.*

Proof. 1) Suppose $Z = Z'$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/\mathfrak{S})$. We have to prove that $\mathcal{E}^{(\bullet)}$ has support in X'. We have to check that the canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ is an isomorphism (see 15.3.8.2. Since $\mathcal{E}^{(\bullet)} \to ({}^\dagger Z)\mathcal{E}^{(\bullet)}$ is an isomorphism, then we get the isomorphisms

$$\mathbb{R}\underline{\Gamma}^\dagger_X(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_X({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \underset{13.1.5.1.1}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^\dagger_{X'}({}^\dagger Z)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{X'}(\mathcal{E}^{(\bullet)}). \tag{15.3.8.25.1}$$

2) Suppose $X = X'$ and $Z \subset Z'$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/K)$. Since $X \setminus Z = X \setminus Z'$, then the canonical morphism $\mathcal{E}^{(\bullet)} \to ({}^\dagger Z')(\mathcal{E}^{(\bullet)})$ is an isomorphism. Since $({}^\dagger Z')(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/K)$, this yields the inclusion $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z/K) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z'/K)$. Conversely, let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, Z'/K)$. We have to check that $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$.

a) Suppose Z and Z' are the support of some divisors T and T'. Since this is of local nature in $\mathfrak{P}$, we can suppose $\mathfrak{P}$ affine and X is integral. Let us choose then $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ is a closed immersion of smooth formal $\mathfrak{S}$-schemes which is a lifting of $X \hookrightarrow P$. Either $T \cap X$ is a divisor of X or T contains X. When T contains X, the considered categories are reduced to the zero object. Suppose now that $Z := T \cap X$ is a divisor of X. Following the Berthelot-Kashiwara theorem (see 9.3.5.13) and from the stability of the overcoherence in the divisor case (see 15.3.6.11 and 15.3.6.14) that the functor $u^{(\bullet)}_{T+}$ (resp. $u^{(\bullet)}_{T'+}$) induces an equivalence of categories between $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{X}, T \cap X)$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T)$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T')$). Following 9.2.4.19, the functors $u^{(\bullet)}_{T+}$ and $\mathrm{forg}_{T,T'} \circ u^{(\bullet)}_{T'+}$ are isomorphic. Hence, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T')$.

b) Suppose now Z' (and not Z) is the support of some divisors T'. Let T divisor of P containing Z. It remains to prove $({}^\dagger T)\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. We have $({}^\dagger T)(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger T \cup T')(\mathcal{E}^{(\bullet)}) \in$

$\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},T\cup T'/K)$. Since $X\setminus T=X\setminus(T\cup T')$, then it follows from the case a) that $({}^\dagger T)(\mathcal{E}'^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},T/K)$ and we are done.

c) We have to check that for any divisor T of P containing Z we have $({}^\dagger T)\mathcal{E}'^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. Since $({}^\dagger T)(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}({}^\dagger T\cup Z')(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},T\cup Z'/K)$, then it follows from the case b) that $({}^\dagger T)(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}({}^\dagger T\cup Z')(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(X,\mathfrak{P},T/K)$, and we are done.

3) Since $X\setminus Z=X\setminus(Z\cup Z')=X'\setminus(Z\cup Z')=X'\setminus Z'$, then we get the general case from the two preceding cases. □

Theorem 15.3.8.26 (Overcoherent version of Berthelot-Kashiwara Theorem)**.** *Let $\natural\in\{\mathrm{ovcoh},\mathrm{oc}\}$. Let $u\colon\mathfrak{P}'\hookrightarrow\mathfrak{P}$ be a closed immersion of log smooth formal log $\mathcal{V}$-schemes. Let $\mathfrak{U}$ be the open set of $\mathfrak{P}$ complementary to $u(P')$, Z be a closed subscheme of P and $Z':=Z\cap P'$. Let $\mathcal{F}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$, $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$ with support in Z'.*

(a) We have the canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$:

$$\mathcal{F}^{(\bullet)}\xrightarrow{\sim}u^{(\bullet)!}\circ u^{(\bullet)}_{+}(\mathcal{F}^{(\bullet)}).\qquad(15.3.8.26.1)$$

(b) We have $u^{(\bullet)!}(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$ and we benefit from the canonical isomorphism

$$u^{(\bullet)}_{+}\circ u^{(\bullet)!}(\mathcal{E}^{(\bullet)})\xrightarrow{\sim}\mathcal{E}^{(\bullet)}.\qquad(15.3.8.26.2)$$

(c) The functors $u^{(\bullet)}_{+}$ and $u^{(\bullet)!}$ induce t-exact quasi-inverse equivalences between the category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$ (resp. $\underrightarrow{LD}^{0}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$) and the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$ (resp. $\underrightarrow{LD}^{0}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$) consisting of complexes $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}|\mathfrak{U}\xrightarrow{\sim}0$.

Proof. 1) Let us prove $u^{(\bullet)!}(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$. Following 15.3.8.25, we have $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z'))$. Let T' be a divisor of P' containing P. Let us check $({}^\dagger T')u^{(\bullet)!}(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T'))$. Since this is of local nature in $\mathfrak{P}$, we can suppose $\mathfrak{P}$ affine and there exists a global section $f\in\Gamma(\mathfrak{P},\mathcal{O}_{\mathfrak{P}})$ whose image $\overline{f}'$ via $\Gamma(\mathfrak{P},\mathcal{O}_{\mathfrak{P}})\twoheadrightarrow\Gamma(P',\mathcal{O}_{P'})$ gives a equation of the divisor T'. Let T be the divisor of P given by $\overline{f}$, the image of f via $\Gamma(\mathfrak{P},\mathcal{O}_{\mathfrak{P}})\to\Gamma(P,\mathcal{O}_{P})$. Since T contains Z' then $({}^\dagger T)(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. since $T'=T\cap X$, then it follows from 15.3.6.12 that $u^{(\bullet)!}(({}^\dagger T)(\mathcal{E}^{(\bullet)}))\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'))$. Since $u^{(\bullet)!}(({}^\dagger T)(\mathcal{E}^{(\bullet)}))\xrightarrow{\sim}({}^\dagger T')u^{(\bullet)!}(\mathcal{E}^{(\bullet)})$, then we are done.

2) The stability by $u^{(\bullet)}_{+}$ comes from the stability of overcoherence by a proper morphism (see 15.3.7.8

3) It follows from 5.2.6.3 that we have the canonical adjunction morphism $\mathcal{F}^{(\bullet)}\to u^{(\bullet)!}\circ u^{(\bullet)}_{+}(\mathcal{F}^{(\bullet)})$ of $D({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'\sharp})$. Using the part 1) and 2) of the proof, this induces a morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}({}^{1}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$. To check that this morphism is an isomorphism, using 15.3.8.17, we reduce to the case where Z is empty, which is already known (see 9.3.5.13).

4) We get the isomorphism 15.3.8.26.2 from 15.3.8.2 and 13.2.1.5.1

5) To check the t-exactness of the functors induced by $u^{(\bullet)}_{+}$ and $u^{(\bullet)!}$, by definition (see 15.3.8.12) we reduce to the case where Z is empty, which is already known (see 9.3.5.13). □

Corollary 15.3.8.27. *Let $\natural\in\{\mathrm{ovcoh},\mathrm{oc}\}$. Let $f\colon\mathfrak{P}'\to\mathfrak{P}$ be a morphism of smooth $\mathcal{V}$-formal schemes, Z a closed subscheme of P, and $Z':=f^{-1}(Z)$. For any $\mathcal{E}^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$, we have $f^{(\bullet)!}(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(Z'))$.*

Proof. Since base changes commute to localisation functors (see 13.1.5.7) and pullbacks 9.2.6.6, then we reduce to the case where $\natural=\mathrm{ovcoh}$. Since f decomposes into a closed immersion followed by a smooth morphism and since the case where f is a smooth morphism is immediate, we reduce to the case where f is a closed immersion. Then this follows from $\mathbb{R}\underline{\Gamma}^{\dagger}_{P'}(\mathcal{E}^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$ (see 15.3.7.5.1), from 15.3.8.26 and the isomorphism

$$f^{(\bullet)!}(\mathcal{E}^{(\bullet)})\xrightarrow{\sim}f^{(\bullet)!}\circ\mathbb{R}\underline{\Gamma}^{\dagger}_{P'}(\mathcal{E}^{(\bullet)}).$$

□

Chapter 16

Arithmetic $\mathcal{D}$-modules associated with overconvergent isocrystals

Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. When we work with F-complex, we suppose there exists an automorphism $\sigma \colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining.

16.1 Partially overcoherent isocrystals: divisorial case

16.1.1 1-holonomicity of overconvergent isocrystals on completely smooth d-frames

Let $\mathfrak{P}$ be a smooth $\mathfrak{S}$-formal scheme, T a divisor of P.

16.1.1.1 (1-overholonomicity)**.** Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. We say that $\mathcal{E}$ is 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overholonomic if $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ (see notation 15.3.6.2) and if for all smooth morphism $\alpha \colon \mathfrak{Q} \to \mathfrak{P}$, for all divisor D of Q, putting $U := \alpha^{-1}(T)$, we get $\mathbb{D}_{\mathfrak{Q},U} \circ ({}^{\dagger}D) \circ \alpha^{!}_{T}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}}({}^{\dagger}U)_{\mathbb{Q}})$.

We denote by $D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ the strictly full subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ consisting of 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overholonomic complexes.

Remark 16.1.1.2. It is unclear whether the 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overholonomicity is preserved by dual functor. We will define later the notion of n-$\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-overholonomicity for any integer n (see 18.1.2.1), this might be extend to the notion of n-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overholonomicity but we will not need it.

Lemma 16.1.1.3. *As the fact that an object of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ belongs to $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ is local on $\mathfrak{P}$, then the 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-holonomicity is local on $\mathfrak{P}$, i.e., if $(\mathfrak{P}_{\alpha})_{\alpha\in\Lambda}$ is an open covering of $\mathfrak{P}$, then $\mathcal{E}$ is 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-holonomic if and only if $\mathcal{E}|_{\mathfrak{P}_{\alpha}}$ is 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}_{\alpha}}({}^{\dagger}T \cap P_{\alpha})_{\mathbb{Q}}$-holonomic for all $\alpha \in \Lambda$.*

Lemma 16.1.1.4. *Let $\mathcal{E} \in D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Then for all morphism $\alpha \colon \mathfrak{Q} \to \mathfrak{P}$ such that $U := \alpha^{-1}(T)$ is a divisor of Q, for any subscheme $Y \subset Q$, we have $\mathbb{D}_{\mathfrak{Q},U}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\alpha^{!}_{T}(\mathcal{E})) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}}({}^{\dagger}U)_{\mathbb{Q}})$*

Proof. We have a splitting of the form $\alpha = p\circ\gamma$, where $p \colon \mathfrak{P}' \to \mathfrak{P}$ is a smooth morphism and $\gamma \colon \mathfrak{Q} \hookrightarrow \mathfrak{P}'$ is a closed immersion ($\mathfrak{P}'$ is an open of $\mathfrak{Q} \times \mathfrak{P}$ and γ is induced by the graph of α). Since $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$, then $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\alpha^{!}_{T}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}}({}^{\dagger}U)_{\mathbb{Q}})$. Hence, $\mathbb{D}_{\mathfrak{Q},U}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\alpha^{!}_{T}(\mathcal{E})) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}}({}^{\dagger}U)_{\mathbb{Q}})$. By Kashiwara's theorem, we get therefore the first isomorphism: theorem of relative duality and the commutation of local cohomology with direct image, putting $T' = p^{-1}(T)$, we have

$$\begin{aligned}
\mathbb{D}_{\mathfrak{Q},U}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\alpha^{!}_{T}(\mathcal{E})) &\underset{9.3.5.9}{\xrightarrow{\sim}} \gamma^{!}_{T'}\gamma_{T'+}\mathbb{D}_{\mathfrak{Q},U}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\alpha^{!}_{T}(\mathcal{E})) \underset{9.4.5.2.1}{\xrightarrow{\sim}} \gamma^{!}_{T'}\mathbb{D}_{\mathfrak{P}',T'}\gamma_{T'+}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\alpha^{!}_{T}(\mathcal{E})) \\
&\underset{13.2.1.4.2}{\xrightarrow{\sim}} \gamma^{!}_{T'}\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\gamma_{T'+}(\alpha^{!}_{T}(\mathcal{E})) \xrightarrow{\sim} \gamma^{!}_{T'}\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\gamma_{T'+}\gamma^{!}_{T'}p^{!}_{T}(\mathcal{E}) \\
&\xrightarrow{\sim} \gamma^{!}_{T'}\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\mathbb{R}\underline{\Gamma}^{\dagger}_{Q}p^{!}_{T}(\mathcal{E}) \xrightarrow{\sim} \gamma^{!}_{T'}\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}p^{!}_{T}(\mathcal{E}).
\end{aligned}$$

Using localization exact triangles, since p is smooth then we get by devissage that $\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}p^{!}_{T}(\mathcal{E})$ is overcoherent. We conclude by stability of the overcoherence by extraordinary inverse image of Proposition 15.3.6.12. □

Proposition 16.1.1.5. Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of smooth $\mathfrak{S}$-formal schemes such that $T' := f^{-1}(T)$ is a divisor of Q.

(a) For any subscheme Y' of P', for any $\mathcal{E} \in D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$, we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'}f^{!}_{T}(\mathcal{E}) \in D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$.

(b) If f is proper then, for any $\mathcal{E}' \in D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$, $f_{T,+}(\mathcal{E}') \in D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$.

Proof. The first assertion results from 16.1.1.2.(iii) and from the commutation of extraordinary inverse image with local cohomology (see 13.2.1.4.1) and with composition. Next we prove the second assertion. Let $\alpha\colon \mathfrak{Q} \to \mathfrak{P}$ be a smooth morphism and Z a closed subscheme of Q. Write $\mathfrak{Q}' := \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{Q}$, $\alpha'\colon \mathfrak{Q}' \to \mathfrak{P}'$ and $f'\colon \mathfrak{Q}' \to \mathfrak{Q}$ the projections, $U := \alpha^{-1}(T)$, $U' := \alpha'^{-1}(T')$ and $Z' := f'^{-1}(Z)$. We get: $\mathbb{D}_{\mathfrak{Q},U}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}\alpha^{!}_{T}(f_{T,+}(\mathcal{E}')) \xrightarrow{\sim} f'_{T,+}\mathbb{D}_{\mathfrak{Q}',U'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'}\alpha'^{!}_{T}(\mathcal{E}')$ because of 9.4.5.1, 13.2.1.4 and 13.2.3.7.

Since $\mathbb{D}_{\mathfrak{Q}',U'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'}\alpha'^{!}_{T}(\mathcal{E}')$ is by definition $\mathcal{D}^{\dagger}_{\mathfrak{Q}'}({}^{\dagger}U')_{\mathbb{Q}}$-overcoherent, then it follows from 15.3.6.14 From this we derive the $\mathcal{D}^{\dagger}_{\mathfrak{Q}}({}^{\dagger}U)_{\mathbb{Q}}$-overcoherence of $f'_{T,+}\mathbb{D}_{\mathfrak{Q}',U'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'}\alpha'^{!}_{T}(\mathcal{E}')$. □

16.1.1.6. Let $\theta = (b, a, f)\colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ be a morphism of smooth d-frames.

(a) We have therefore the factorisations

$$\theta^{!} := \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{!}_{T',T}\colon D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}}) \tag{16.1.1.6.1}$$

$$\theta^{+} := \mathbb{D}_{T'} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{!}_{T',T} \circ \mathbb{D}_{T}\colon D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}) \to D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}}). \tag{16.1.1.6.2}$$

(b) Suppose f is proper and $T' = f^{-1}(T)$ and set $\theta_{+} := f_{T+}$. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ and $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$. Since f is proper, then we get by adjunction (see 9.4.5.5) the morphisms: $f_{T+} \circ f^{!}_{T}(\mathcal{E}) \to \mathcal{E}$ and $\mathcal{E}' \to f^{!}_{T} \circ f_{T+}(\mathcal{E}')$. This yields $(\theta_{+}, \theta^{!})$ is an adjoint paire (on overcoherent categories) and we get the morphisms

$$\theta_{+} \circ \theta^{!}(\mathcal{E}) \to \mathcal{E} \text{ and } \mathcal{E}' \to \theta^{!} \circ \theta_{+}(\mathcal{E}'). \tag{16.1.1.6.3}$$

Let $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ and $\mathcal{F}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$. Suppose $\mathbb{D}_{T}(\mathcal{F}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ and $\mathbb{D}_{T'}(\mathcal{F}') \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$, e.g. $\mathcal{F} \in D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$ and $\mathcal{F}' \in D^{\mathrm{b}}_{1\text{-ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$. Since f is proper, using the relative duality theorem (see 9.4.5.2), we get by duality from 16.1.1.6.3 the morphisms:

$$\mathcal{F} \to \theta_{+} \circ \theta^{+}(\mathcal{F}) \text{ and } \theta^{+} \circ \theta_{+}(\mathcal{F}') \to \mathcal{F}'. \tag{16.1.1.6.4}$$

Theorem 16.1.1.7. *Let X be a smooth closed subscheme of P such that $T_X := T \cap X$ is a divisor of X. Let $\mathfrak{U}$ (resp. Y) denote the open complement of T (resp. T_X) in $\mathfrak{P}$ (resp. X). Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ (see notation 12.2.1.4). Then $\mathcal{E}$ is 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overholonomic (see definition 16.1.1.1).*

Proof. 0) As the theorem is local on $\mathfrak{P}$, we can suppose that P and X are affine and irreducible. The closed immersion $X \hookrightarrow P$ lifts to a closed immersion of smooth $\mathfrak{S}$-formal schemes. By 16.1.1.5, we are therefore reduced to treat the case where $X = P$. We write T for T_X and $\mathfrak{X}$ for $\mathfrak{P}$.

Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{X}, T/\mathcal{V})$ (see 12.2.1.6) be an object $\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}$. Let Z be any closed subscheme of X. Firstly, since the categories of the form $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ are preserved by pullbacks (more precisely, see 12.2.1.14.1), then it suffices to prove that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(T))$ and next that $\mathbb{D}_{\mathfrak{X},T}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$. Remark that the property a) is equivalent to saying $\mathcal{E}$ is $\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent but according to the remark 15.3.4.11, then this is wiser to work with $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}(T))$ before knowing the overcoherence.

According to the desingularisation theorem of de Jong ([dJ96]), there exists a projective, surjective, generically finite and étale morphism $a\colon X' \to X$ such that X' is irreducible and k-smooth, and such that $a^{-1}(Z)$ is a strict normal crossing divisor of X'. As a is projective, there exists thus a smooth $\mathfrak{S}$-formal scheme $\mathfrak{P}'$, a closed immersion $u'\colon X' \hookrightarrow \mathfrak{P}'$, a smooth proper morphism $f\colon \mathfrak{P}' \to \mathfrak{X}$ such that $f \circ u' = u \circ a$. Write $T' = f^{-1}(T)$ and $Y' := a^{-1}(Y)$.

1) i) Since f is proper then we get by adjunction (see 9.4.5.5) the last morphism:

$$f_{T+}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}(\mathcal{E}) \to f_{T+}f^{!}_{T}(\mathcal{E}) \to \mathcal{E}.$$

ii) By applying the functor $\mathbb{D}_{\mathfrak{X},T}$ to the similar morphism $f_{T+}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}(\mathbb{D}_{\mathfrak{X},T}(\mathcal{E})) \to \mathbb{D}_{\mathfrak{X},T}(\mathcal{E})$, via the theorem of relative duality and of biduality (see 9.4.5.2 and 8.7.7.3) we obtain:

$$\mathcal{E} \to f_{T+}\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}\mathbb{D}_{\mathfrak{X},T}(\mathcal{E}).$$

iii) Now, as X' is irreducible and T' is a divisor of P', $X' \cap T'$ is then either a divisor of X' or is equal to X'. Since a is generically finite and étale, we cannot have $X' \cap T' = X'$. From this we conclude that $X' \cap T'$ is a divisor of X'. Thus it follows from 12.2.4.1.2 that we have the natural isomorphisms of $\mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}', T'/\mathcal{V})$ of the form: $\mathcal{E}' := \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}(\mathcal{E}) \xrightarrow{\sim} \mathrm{sp}_{X'\hookrightarrow\mathfrak{P}',T',+}(a^{*}(E))$, $\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}\mathbb{D}_{\mathfrak{X},T}(\mathcal{E}) \xrightarrow{\sim} \mathrm{sp}_{X'\hookrightarrow\mathfrak{P}',T'+}(a^{*}(E^{\vee})^{\vee}) \xrightarrow{\sim} \mathrm{sp}_{X'\hookrightarrow\mathfrak{P}',T'+}(a^{*}(E))$ (12.2.5.6).

iv) From i) (resp. ii), resp. iii)), we get the left (resp. right, resp. middle isomorphism):

$$\mathcal{E} \to f_{T+}\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}\mathbb{D}_{\mathfrak{X},T}(\mathcal{E}) \xrightarrow{\sim} f_{T+}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}(\mathcal{E}) \to \mathcal{E}$$

is an isomorphism. Indeed, using the third part of Proposition 11.2.1.14.c, since this composition is a morphism of the abelian category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/\mathcal{V})$, we reduce to check that its restriction to a dense open subset is an isomorphism. Hence, we can suppose that T is empty and $a\colon X' \to X$ is finite and étale, which is easy.

v) Hence, $\mathcal{E}$ is a direct factor of $f_{T+}(\mathcal{E}')$. Hence, $\mathcal{E}$ is a direct factor of $f_{T+}\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}(\mathcal{E})$. Since $\mathcal{E}'^{(\bullet)} := \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}f^{!}_{T}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V})$ (see 12.2.1.11.2), then it is in particular coherent and since f is proper we get therefore $f^{(\bullet)}_{T,+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T))$ together with the isomorphism $\underrightarrow{l}^{*}_{\mathbb{Q}}(f^{(\bullet)}_{T,+}(\mathcal{E}'^{(\bullet)})) \xrightarrow{\sim} (\mathcal{E}')$. Since $\underrightarrow{l}^{*}_{\mathbb{Q}}$ is fully faithful on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T))$, then $\mathcal{E}^{(\bullet)}$ is a direct factor of $f^{(\bullet)}_{T,+}(\mathcal{E}'^{(\bullet)})$. By 16.1.1.5 and by 13.2.1.4, it is therefore sufficient to prove $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T'))$ and next that $\mathbb{D}_{\mathfrak{P}',T'}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'}(\mathcal{E}') \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T')_{\mathbb{Q}})$. In other word, we reduce to the case where Z is strict normal crossing divisor of X.

2) By means of Mayer-Vietoris exact triangles (see 13.1.4.15.2), proceeding by induction on the number of irreducible components of Z, it remains to treat the case where Z is a smooth integral closed subscheme of X. Thus we have two cases: either $Z \subset T$, or $Z \cap T$ is a divisor of Z. The first case gives the equalities $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}) = 0$ and $\mathbb{D}_{\mathfrak{X},T}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}) = 0$. Now consider the second case. The two properties being local on $\mathfrak{X}$, we can suppose that the closed immersion $Z \hookrightarrow X$ lifts to a closed immersion $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ of smooth $\mathfrak{S}$-formal schemes.

i) Since we have the isomorphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} u^{(\bullet)}_{+}u^{(\bullet)!}(\mathcal{E}^{(\bullet)})$ and $u^{(\bullet)!}(\mathcal{E})[-d_{Z/X}] \in \mathrm{MIC}^{(\bullet)}(Z, \mathfrak{Z}, T\cap Z/\mathcal{V})$ (see 12.2.1.9), then $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}(T))$. Hence, we have proved that $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$.

ii) Since $\mathbb{D}_{\mathfrak{Z},T\cap Z}u^{!}(\mathcal{E})[-d_{Z/X}] \in \mathrm{MIC}^{\dagger\dagger}(Z, \mathfrak{Z}, T\cap Z/\mathcal{V})$, then from the part 2.i), we get $\mathbb{D}_{\mathfrak{Z},T\cap Z}u^{!}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{Z}}({}^{\dagger}T\cap Z)_{\mathbb{Q}})$. Hence, following 15.3.6.14, we obtain $\mathbb{D}_{\mathfrak{X},T}\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}) \xrightarrow{\sim} u_{+}\mathbb{D}_{\mathfrak{Z},T\cap Z}u^{!}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^{\dagger}_{\mathfrak{X}}({}^{\dagger}T)_{\mathbb{Q}})$. □

16.1.2 Overcoherent isocrystals on completely smooth d-frames, (extraordinary) pullbacks

Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, T be a divisor of P, X be a closed subscheme of P, $\mathfrak{U}$ the open set of $\mathfrak{P}$ complementary to T. We suppose that $Y := X \setminus T$ is a smooth k-scheme.

Definition 16.1.2.1. We define the category $(F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ to be the full subcategory of that of coherent $(F\text{-})\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules with support in X consisting of objects $\mathcal{E}$ such that

(i) $\mathcal{E}|\mathfrak{U}$ is in the essential image of the functor $\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}$.

(ii) $\mathcal{E}$ and $\mathbb{D}_{\mathfrak{P},T}(\mathcal{E})$ are $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-surcoherent.

When the divisor T is empty, we omit T from the notation. The objects of $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ are "the partially overcoherent isocrystals over $(X, \mathfrak{P}, T/\mathcal{V})$".

Example 16.1.2.2. It follows from Theorem 16.1.1.7 that when X/S is smooth this notation coincides with that of 12.2.1.4. Remark that the condition (i) of 16.1.2.1 is equivalent to the property $\mathcal{E}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$.

Notation 16.1.2.3. We will denote by $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$ the strictly full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$ such that the equivalence of categories of 8.4.5.6 induces the equivalence of categories

$$\underrightarrow{l}^{*}_{\mathbb{Q}} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \cong \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}). \qquad (16.1.2.3.1)$$

16.1.2.4. We keep notation 16.1.2.3.

(a) Following 11.2.2.5.2 we have the equality

$$\mathrm{MIC}^{(\bullet)}(\mathcal{P}, T, P/\mathcal{V}) = \mathrm{MIC}^{(\bullet)}(\mathcal{P}, T/\mathcal{V}) := \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathcal{P}}(T)) \cap \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\mathcal{B}^{(\bullet)}_{\mathcal{P}}(T)). \qquad (16.1.2.4.1)$$

(b) It follows from 15.3.6.6 that we have $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

The stability by inverse image of the categories of the form $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ is not straightforward. To go around this technical difficulty, let us introduce the temporary notation of the categories of 16.1.2.5 (this is temporary because they will turn out to be equal to $\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ following 16.1.6.11). Their stability by (extraordinary) inverse images is almost tautological (see the proposition 16.1.2.8), which will allows us by descent to the completely smooth case. But, on the other hand until the end of this section (more precisely until 16.1.6.11) beware that we will have to do without the stability by dual functor when we work with the categories of 16.1.2.5.

Notation 16.1.2.5. (a) We denote by $\mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V})$ the strictly full subcategory of $\mathrm{Coh}(X, \mathfrak{P}, T/\mathcal{V})$ (see notation 9.3.7.4) consisting of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules $\mathcal{E}$ such that $\mathbb{D}_T(\mathcal{E})$ is $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent and $\mathcal{E}|\mathfrak{U}$ is in the essential image of the functor $\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}$.

(b) We denote by $\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$ the strictly full subcategory of $\mathrm{Coh}(X, \mathfrak{P}, T/\mathcal{V})$ of overcoherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules $\mathcal{E}$ such that $\mathcal{E}|\mathfrak{U}$ is in the essential image of the functor $\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}$.

When the divisor T is empty, we do not indicate it in the notations 16.1.2.5 above.

16.1.2.6 (Completely smooth case)**.** When X is smooth, it follows from 16.1.1.7 that we have the equalities $\mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$.

Remark 16.1.2.7. With the notations 16.1.2.5, we have the two properties straightforward below.

(a) Let $\mathcal{E} \in \mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V})$. Since the functor $\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}$ commutes with duality (see 11.2.7.5.1), then using 12.2.5.6 for any integer $j \neq 0$ we have the vanishing $H^j(\mathbb{D}(\mathcal{E}|\mathfrak{U})) = 0$. By 8.7.6.11, this yields, for any integer $j \neq 0$, $H^j(\mathbb{D}_T(\mathcal{E})) = 0$. Finally, following 16.1.2.6, we have the equalities $\mathrm{MIC}^{*}(Y, \mathfrak{U}/\mathcal{V}) = \mathrm{MIC}^{**}(Y, \mathfrak{U}/\mathcal{V}) = \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$.

(b) Since the functor $\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}$ commutes with duality (see 11.2.7.5.1) and via the biduality theorem (see 8.7.7.3), then we check the functor $\mathbb{D}_T$ induced an equivalence between the categories $\mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V})$ and $\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$. In fact, we will establish that these two categories are equal (see 16.1.6.11) but before we have to distinguish them.

Proposition 16.1.2.8. *Let $\theta = (b, a, f) \colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ be a morphism of smooth d-frames. Let $\mathcal{E}$ be an object of $(F\text{-})\mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V})$ and $\mathcal{F}$ an object of $(F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$.*

(a) For any integer $j \in \mathbb{Z} \setminus \{0\}$, the following equalities are satisfied: $H^j(({}^{\dagger}T')\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{!}(\mathcal{F})[-d_{X'/X}]) = 0$, $H^j(\mathbb{D}_{T'}({}^{\dagger}T')\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{!}\mathbb{D}_T(\mathcal{E})[-d_{X'/X}]) = 0$.

(b) We have therefore the factorisations [1]

$$\theta^{!} := \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{!}_{T',T}[-d_{X'/X}] \colon (F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{**}(X', \mathfrak{P}', T'/\mathcal{V}) \quad (16.1.2.8.1)$$

$$\theta^{+} := \mathbb{D}_{T'} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{!}_{T',T}[-d_{X'/X}] \circ \mathbb{D}_T \colon (F\text{-})\mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{*}(X', \mathfrak{P}', T'/\mathcal{V})). \quad (16.1.2.8.2)$$

[1] To stay in the abelian categories of the form MIC and to simplify notation we added some shift $[-d_{X'/X}]$ which should not appear for complexes

These functors are transitive with respect to the composition: if $\theta' = (b', a', f') \colon (Y'', X'', \mathfrak{P}'', T'') \to (Y', X', \mathfrak{P}', T')$ is a morphism of smooth d-frames, we have the canonical isomorphisms $\theta'^! \circ \theta^! \xrightarrow{\sim} (\theta \circ \theta')^!$ and $\theta'^+ \circ \theta^+ \xrightarrow{\sim} (\theta \circ \theta')^+$.

Proof. To establish the two vanishing formulas, by using 8.7.6.11, we can reduce to the case where the divisor T is empty, which is already checked (see 12.2.1.14). By stability of the overcoherence by extraordinary inverse images and local cohomological functor with proper support (see 15.3.6.12 and 15.3.6.9), to check the factorisations 16.1.2.8.1 and 16.1.2.8.2 we reduce therefore to check $\theta^!(\mathcal{F})|\mathfrak{U}' \in \mathrm{MIC}^{\dagger\dagger}(Y', \mathfrak{U}'/\mathcal{V}))$ and $\theta^+(\mathcal{F})|\mathfrak{U}' \in \mathrm{MIC}^{\dagger\dagger}(Y', \mathfrak{U}'/\mathcal{V}))$, where $\mathfrak{U}' := \mathfrak{P}' \setminus T'$. Hence, we come back to the completely smooth case, which was already proved (see 12.2.1.14). The transitivity with respect to the composition of morphisms is a consequence of that of the extraordinary inverse image functors and of the commutation isomorphisms of the extraordinary inverse images to local cohomological functors. □

Lemma 16.1.2.9. *With the notations of 16.1.2.5 denote by "?" one of the symbol "$*$", "$**$" or "$\dagger\dagger$". Let $\overline{Y}$ the closure of Y in X. Let $Y_1, \ldots, Y_N$ the irreducible components of Y and $\overline{Y}_1, \ldots, \overline{Y}_N$ their closure in X.*

(a) We have the equality $(F\text{-})\mathrm{MIC}^?(\overline{Y}, \mathfrak{P}, T/\mathcal{V}) = (F\text{-})\mathrm{MIC}^?(X, \mathfrak{P}, T/\mathcal{V})$.

(b) We have a canonical equivalence of categories:
$(F\text{-})\mathrm{MIC}^?(X, \mathfrak{P}, T/\mathcal{V}) \cong \prod_{r=1}^N (F\text{-})\mathrm{MIC}^?(\overline{Y}_r, \mathfrak{P}, T/\mathcal{V})$.

Proof. a) Let us start with the case $? = **$. The inclusion of the first equality is obvious. Conversely, is $\mathcal{E} \in (F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$. By stability of the overcoherence by local cohomological functor (see 15.3.6.12), then we have therefore the canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}}(\mathcal{E}) \to \mathcal{E}$ of $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$. Since this is the case outside T (because $\overline{Y} \setminus T = Y$), with 8.7.6.11, this morphism is then an isomorphism. The sheaf $\mathcal{E}$ is then with support in $\overline{Y}$. Hence the converse inclusion. With the second remark of 16.1.2.7, this yields by duality the first equality when $? = *$. By using the first two first cases, this yields the case where $? = \dagger\dagger$.

b) Let $\mathcal{E} \in (F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$. The canonical morphism $\oplus_{r=1}^N \mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}_r} \mathcal{E} \to \mathcal{E}$ of $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ is an isomorphism (because so is outside T and use theorem 8.7.6.11). We know $\mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}_r} \mathcal{E} \in (F\text{-})\mathrm{MIC}^{**}(\overline{Y}_r, \mathfrak{P}, T/\mathcal{V})$ (see 16.1.2.8.1). If moreover $\mathcal{E} \in (F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$, this yields $\mathbb{D}_T(\mathcal{E}) \xrightarrow{\sim} \oplus_{r=1}^N \mathbb{D}_T(\mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}_r} \mathcal{E})$. Hence, $\mathbb{D}_T(\mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}_r} \mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$. This yields $\mathbb{D}_T(\mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}_r} \mathcal{E}) \in (F\text{-})\mathrm{MIC}^{\dagger\dagger}(\overline{Y}_r, \mathfrak{P}, T/\mathcal{V})$. Hence the functor $\oplus_{r=1}^N \mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}_r}$ induces the equivalence of categories: $(F\text{-})\mathrm{MIC}^?(X, \mathfrak{P}, T/\mathcal{V}) \cong \prod_{r=1}^N (F\text{-})\mathrm{MIC}^?(\overline{Y}_r, \mathfrak{P}, T/\mathcal{V})$ for $? = **$ or for $? = \dagger\dagger$. From the case $? = **$, we get the case $? = *$ by duality (more precisely, the equivalence of categories is given by $\mathbb{D}_T \circ (\oplus_{r=1}^N \mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}_r}) \circ \mathbb{D}_T$). □

Remark 16.1.2.10. The rigid version of the lemma 16.1.2.9 is well known (see [LS07] or [Ber96b]). More precisely, with the notations of 16.1.2.9, we have the equality $(F\text{-})\mathrm{MIC}^\dagger(Y, \overline{Y}/\mathcal{V}) = (F\text{-})\mathrm{MIC}^\dagger(Y, X/\mathcal{V})$ and the canonical equivalence of categories: $(F\text{-})\mathrm{MIC}^\dagger(Y, X/\mathcal{V}) \cong \prod_{r=1}^N (F\text{-})\mathrm{MIC}^\dagger(Y_r, \overline{Y}_r/\mathcal{V})$

Lemma 16.1.2.11. *Let $f \colon \mathfrak{P}' \to \mathfrak{P}$ be a realizable with respect to T (in the sense of 13.2.3.1) morphism of separated and smooth $\mathfrak{S}$-formal schemes, X be a closed subscheme of P' such that the induced morphism $X \to P$ is a closed immersion, Y an open set of X, T be a divisor of P such that $T' := f^{-1}(T)$ is a divisor of P' and such that $Y = X \setminus T$ (and then $Y = X \setminus T'$). We suppose Y smooth.*

(a) Let $\mathcal{E} \in (F\text{-})\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$, $\mathcal{F} \in (F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$. For $? = *$ or $? = **$, let $\mathcal{E}' \in (F\text{-})\mathrm{MIC}^?(X, \mathfrak{P}', T'/\mathcal{V})$). For any integer $j \in \mathbb{Z} \setminus \{0\}$, the following equalities are then satisfied:

$$H^j(\mathbb{D}_{T'} \mathbb{R}\underline{\Gamma}^\dagger_X f^!_T \mathbb{D}_T(\mathcal{E})) = 0, \qquad H^j(\mathbb{R}\underline{\Gamma}^\dagger_X f^!_T(\mathcal{F})) = 0, \qquad H^j(f_{T+}(\mathcal{E}')) = 0.$$

(b) The functors $\mathbb{R}\underline{\Gamma}^\dagger_X f^!_T$ (resp. $\mathbb{D}_{T'} \mathbb{R}\underline{\Gamma}^\dagger_X f^!_T \mathbb{D}_T$) and f_{T+} induce quasi-inverse equivalences between the categories $(F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$ and $(F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}', T'/\mathcal{V})$ (resp. between $(F\text{-})\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$ and $(F\text{-})\mathrm{MIC}^*(X, \mathfrak{P}', T'/\mathcal{V})$).

Proof. The other vanishing formulas of (a) being already well known (see 16.1.2.8), then let us treat the last. It follows from the stability of the overcoherence of 15.3.6.14), since $\mathcal{E}'$ has proper support over P, then $f_{T+}(\mathcal{E}')$ is an overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T')_{\mathbb{Q}}$-module. By 8.7.6.11, it is therefore sufficient to check it outside T, which reduce to the case where X is smooth and T is empty. Since this is local on $\mathfrak{P}$, suppose P affine. Since X is an affine and smooth k-scheme then there exists an affine and smooth $\mathfrak{S}$-formal scheme $\mathfrak{X}$ which is a lifting of X. Since $\mathfrak{P}'$ is smooth and since $\mathfrak{P}$ is affine, then we have a lifting of $X \to P'$ of the form $u'\colon \mathfrak{X} \to \mathfrak{P}'$. By setting $u := f \circ u'$, we get then a lifting $u\colon \mathfrak{X} \to \mathfrak{P}$ of $X \to P$. By hypothesis, there exists $\mathcal{G}$ a coherent $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-module, $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$-coherent such that $\mathcal{E}' \xrightarrow{\sim} u'_+(\mathcal{G})$. Hence $f_+(\mathcal{E}') \xrightarrow{\sim} u_+(\mathcal{G})$. Since u is a closed immersion, then the functor u_+ is exact. This yields then that for any $j \in \mathbb{Z} \setminus \{0\}$, $H^j(f_+(\mathcal{E}')) = 0$.

Let us consider now (b). Suppose $? = **$. Let $\mathcal{F}' \in (F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}', T'/\mathcal{V})$. Since f is realisable with respect to T, then we have the adjunction morphisms $f_{T+} \circ \mathbb{R}\underline{\Gamma}^\dagger_X f^!_T(\mathcal{F}) \to \mathcal{F}$ and $\mathcal{F}' \to \mathbb{R}\underline{\Gamma}^\dagger_X f^!_T \circ f_{T+}(\mathcal{F}')$ (see 13.2.4.3). In order the check that these morphisms are isomorphisms, by 8.7.6.11 it is sufficient to prove it outside respectively the divisor T and T', i.e. we reduce to the case where T and T' are empty. Since this is local, then we can suppose as above that there exists a lifting $u'\colon \mathfrak{X} \to \mathfrak{P}'$ of $X \to P'$. Set $u = f \circ u'$. Then $f_+ \circ \mathbb{R}\underline{\Gamma}^\dagger_X f^!(\mathcal{F}) \to \mathcal{F}$ is canonically isomorphic to the natural map $u_+ \circ u^!(\mathcal{F}) \to \mathcal{F}$ which is an isomorphism thanks to Kashiwara-Berthelot theorem. Moreover, the map $\mathcal{F}' \to \mathbb{R}\underline{\Gamma}^\dagger_X f^! \circ f_+(\mathcal{F}')$ is canonical isomorphic to the image under u'_+ of $\mathcal{G}' \to u^! \circ u_+(\mathcal{G}')$, where $\mathcal{G}' = u'^!(\mathcal{F}')$. Using again Kashiwara-Berthelot theorem, the map is therefore an isomorphism. Hence we are done. □

Remark 16.1.2.12. The lemma 16.1.2.11 will be extended (the morphism f is not necessarily realizable and the divisor T' is independent from T) in Lemma 16.2.7.6. However, before establishing this more general case, Lemma 16.1.2.11 will be used to build the adjunction morphisms in the proof of Lemma 16.1.10.4 (more precisely in fact, in the proof of the lemma 16.1.10.3 that allow to establish 16.1.10.4). This will imply that the category $(F\text{-})\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$ does only depend on the pair (Y, X).

Lemma 16.1.2.13. *The category* $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$ *is stable under kernels, images, cokernels.*

Proof. Let ϕ be a morphism of $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$. Since the category $\mathrm{MIC}^\dagger(Y, Y/K)$ is stable under kernels, images and cokernels, since we have the equivalence of categories $\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}\colon \mathrm{MIC}^\dagger(Y, Y/K) \cong \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$ of 12.2.2.6.1, then so is $\mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$. Let $\mathcal{E}$ be the kernel or the image or the cokernel of ϕ. This yields, for any integer $j \neq 0$, the equality $H^j(\mathbb{D}(\mathcal{E}|\mathfrak{U})) = 0$ (use 12.2.5.6). Using 8.7.6.11, this implies, for any integer $j \neq 0$, the vanishing $H^j\mathbb{D}_T(\mathcal{E}) = 0$. This yields that the dual of the kernel (resp. the image, resp. the cokernel) of ϕ is the cokernel (resp. the image, resp. the kernel) of $\mathbb{D}_T(\phi)$. Moreover, since $\mathbb{D}_T(\phi)$ is a morphism of overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules, its kernel, its image, its cokernel are $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overcoherent. □

Notation 16.1.2.14 (Finite and etale outside singularities case)**.** Let the commutative diagram

$$\begin{array}{ccccc} Y^{(0)} & \overset{j^{(0)}}{\hookrightarrow} & X^{(0)} & \overset{u^{(0)}}{\hookrightarrow} & \mathfrak{P}^{(0)} \\ \downarrow b & \square & \downarrow a & & \downarrow f \\ Y & \overset{j}{\hookrightarrow} & X & \overset{u}{\hookrightarrow} & \mathfrak{P}, \end{array} \tag{16.1.2.14.1}$$

where the left square is cartesian, f is a proper smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes, a is a proper surjective morphism of k-varieties, b is a finite and etale morphism of smooth k-varieties, j and $j^{(0)}$ are open immersions, u and $u^{(0)}$ are closed immersions. We suppose moreover there exists a divisor T of P such that $Y = X \setminus T$. We denote by $\mathfrak{U} := \mathfrak{P} \setminus T$, $T^{(0)} := f^{-1}(T)$, $\mathfrak{U}^{(0)} := \mathfrak{P}^{(0)} \setminus T^{(0)}$ and $g\colon \mathfrak{U}^{(0)} \to \mathfrak{U}$ the morphism induced by f. We suppose $Y^{(0)} = X^{(0)} \setminus T^{(0)}$. We get the morphism $\theta = (b, a, f)$ of smooth d-frames over $\mathfrak{S}$ (see definition 12.2.1.1). By abuse of notation, it might happen that we denote by $a := (b, a, f)$ and $b := (b, b, g)\colon (Y^{(0)}, Y^{(0)}, \mathfrak{U}^{(0)}/\mathfrak{S}) \to (Y, Y, \mathfrak{U}/\mathfrak{S})$ the morphism of smooth d-frames over $\mathfrak{S}$.

16.1.2.15 (b_+ is a left and right adjoint functor of b^+)**.** We keep the notations of 16.1.2.14.

(a) Following 12.2.2.6.1, we have the equivalence of categories of the form $\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}\colon \mathrm{MIC}^\dagger(Y, Y/K) \cong \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$. The functors of the form $\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}$ commute with duality and with (extraordinary) inverse images (see 12.2.5.6 and 12.2.4.1). Both functors $b^! := \mathbb{R}\underline{\Gamma}^\dagger_{Y^{(0)}} \circ g^!$ and $b^+ := \mathbb{D} \circ \mathbb{R}\underline{\Gamma}^\dagger_{Y^{(0)}} \circ g^! \circ \mathbb{D}$ of $\mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V})$ are then isomorphic. Hence, we get the commutative diagram (up to canonical isomorphism):

$$\begin{array}{ccc} \mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}/K) & \xrightarrow[\cong]{\mathrm{sp}_{Y^{(0)} \hookrightarrow \mathfrak{U}^{(0)},+}} & \mathrm{MIC}^{\dagger\dagger}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V}) \\ {\scriptstyle b^*}\uparrow & & \uparrow{\scriptstyle b^+} \\ \mathrm{MIC}^\dagger(Y, Y/K) & \xrightarrow[\cong]{\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}} & \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V}). \end{array} \qquad (16.1.2.15.1)$$

(b) Moreover, since b is finite and etale, the functor g_+ factors as follows $g_+ \colon \mathrm{MIC}^{\dagger\dagger}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$. Indeed, since this is local on $\mathfrak{U}$, we can suppose $\mathfrak{U}$ affine. Since in this case Y is affine and smooth, then there exists a smooth $\mathfrak{S}$-formal scheme $\mathfrak{Y}$ which is a lifting of Y. By smoothness of $\mathfrak{U}$ and affinity of $\mathfrak{Y}$, this yields a lifting $\mathfrak{Y} \hookrightarrow \mathfrak{U}$ of $Y \hookrightarrow U$. Similarly, since $Y^{(0)}$ is affine and smooth, since $\mathfrak{Y} \times_{\mathfrak{U}} \mathfrak{U}^{(0)}$ is smooth, we get a lifting $\mathfrak{Y}^{(0)} \hookrightarrow \mathfrak{Y} \times_{\mathfrak{U}} \mathfrak{U}^{(0)}$ of $Y^{(0)} \hookrightarrow Y \times_U U^{(0)}$. This yields of liftings $\mathfrak{Y}^{(0)} \to \mathfrak{Y}$ and $\mathfrak{Y}^{(0)} \to \mathfrak{U}^{(0)}$ inducing the same morphism over $\mathfrak{U}$. Via the theorem of Berthelot-Kashiwara (see 9.3.5.9), we reduce therefore to the case where $Y = U$ and $Y^{(0)} = U^{(0)}$. In this case, since g is finite and etale, then the functor g_+ preserves both the $\mathcal{D}^\dagger$-coherence and the $\mathcal{O}$-coherence, and we are done. We denote by b_+ this factorisation.

(c) Since g is proper then $g^!$ is right adjoint to g_+. This yields that the functor $b^!$ is right adjoint to b_+. Since g is proper, using the relative duality theorem (see 9.4.5.2), this yields that the functor b^+ is left adjoint to b_+.

(d) Since $b^! \xrightarrow{\sim} b^+$, this yields therefore that $b^!$ is left adjoint to b_+ and that b^+ is a right adjoint to b_+.

(e) Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$. We get by adjunction the maps:

$$\mathcal{E} \to b_+ b^+(\mathcal{E}) \to \mathcal{E}, \qquad (16.1.2.15.2)$$

whose composition is an isomorphism. Indeed, using Berthelot-Kashiwara theorem we reduce to the case where $Y = U$. In that case $b_+ = b_*$ and $b^+ = b^*$ and we are done.

Remark 16.1.2.16. With the notations of 16.1.2.15, since b is finite and etale, we have the direct image functor $b_* \colon \mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}/K) \to \mathrm{MIC}^\dagger(Y, Y/K)$ (see [Tsu02, 5]). The functor b^* is left adjoint to the functor b_*. By uniqueness of the adjoint functors, we get the commutative diagram (up to canonical isomorphism):

$$\begin{array}{ccc} \mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}/K) & \xrightarrow[\cong]{\mathrm{sp}_{Y^{(0)} \hookrightarrow \mathfrak{U}^{(0)},+}} & \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}^{(0)}/\mathcal{V}) \\ \downarrow{\scriptstyle b_*} & & \downarrow{\scriptstyle b_+} \\ \mathrm{MIC}^\dagger(Y, Y/K) & \xrightarrow[\cong]{\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}} & \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V}), \end{array} \qquad (16.1.2.16.1)$$

so that the adjunction morphisms are compatible.

In order to define 16.1.3.1, we will need the notion of the direct image by a morphism which is finite and etale outside overconvergent singularities as defined in the proposition 16.1.2.17 below.

Lemma 16.1.2.17. *We keep the notations of 16.1.2.14.*

(a) We have the factorisation $\theta_+ := f_{T,T^{(0)}+} \colon \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \to \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$.

(b) The functor θ_+ *is right adjoint to* θ^+ *(defined at 16.1.2.8.2). We denote by* adj_a *the adjunction morphisms* $\mathrm{id} \to \theta_+ \circ \theta^+$ *and* $\theta^+ \circ \theta_+ \to \mathrm{id}$. *These adjunction morphisms are transitive with respect to the composition of diagram of the form 16.1.2.14.1 and satisfying the required conditions.*

Proof. First let us prove (a). Let $\mathcal{E}^{(0)}$ an object of $\mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V})$. Since f is proper, then f_+ commutes with duality (see 9.4.5.2) and the (over)coherence is closed by f_+ (see 15.3.6.14). This yields that $f_+(\mathcal{E}^{(0)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ is coherent and $\mathbb{D}_T \circ f_+(\mathcal{E}^{(0)}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$. Moreover, $f_+(\mathcal{E}^{(0)})|\mathfrak{U} \xrightarrow{\sim} g_+(\mathcal{E}^{(0)}|\mathfrak{U}^{(0)})$. Following the second point of 16.1.2.15, this yields $f_+(\mathcal{E}^{(0)})|\mathfrak{U} \in$

$\mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$, i.e., $f_+(\mathcal{E}^{(0)})|\mathfrak{U}$ is in the essential image of $\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}$. By 8.7.6.11, this yields that $f_+(\mathcal{E}^{(0)}) \in \mathrm{Coh}(X, \mathfrak{P}, T/\mathcal{V})$. We get then the required factorisation of f_+.

We construct canonically the adjunction morphisms between θ_+ and θ^+ as follows: let $\mathcal{E}^{(0)} \in \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V})$ and $\mathcal{E} \in \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$. Since the functor f_+ is left adjoint to $f^!$ (for the overcoherent complexes) we get the morphism $f_+ \circ f^! \circ \mathbb{D}_T(\mathcal{E}) \to \mathbb{D}_T(\mathcal{E})$. Via the canonical morphism $\mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}} \to \mathrm{id}$, we get by functoriality $f_+ \circ \mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}} \circ f^! \circ \mathbb{D}_T(\mathcal{E}) \to \mathbb{D}_T(\mathcal{E})$. By applying the functor $\mathbb{D}_T$ this yields the morphism

$$\mathcal{E} \xrightarrow[\sim]{8.7.7.3} \mathbb{D}_T \circ \mathbb{D}_T(\mathcal{E}) \to \mathbb{D}_T \circ f_+ \circ \mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}} \circ f^! \circ \mathbb{D}_T(\mathcal{E}) \xrightarrow[\sim]{9.4.5.2} f_+ \circ \mathbb{D}_{T^{(0)}} \circ \mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}} \circ f^! \circ \mathbb{D}_T(\mathcal{E}),$$

i.e. we get then the morphism $\mathcal{E} \to \theta_+ \circ \theta^+(\mathcal{E})$. We build similarly the adjunction morphism $\theta^+ \circ \theta_+(\mathcal{E}^{(0)}) \to \mathcal{E}^{(0)}$. □

16.1.2.18. We keep notation of 16.1.2.17. Let $\widetilde{T}$ be a divisor of $\mathfrak{P}$ containing T. Set $\widetilde{T}^{(0)} := f^{-1}(\widetilde{T})$, $\widetilde{b}\colon (X^{(0)} \setminus \widetilde{T}^{(0)}) \to (X \setminus \widetilde{T})$ the morphism induced by a and $\widetilde{\theta} = (f, a, \widetilde{b})$ the associated morphism of smooth d-frames. Since the dual functors commute with localisation outside a divisor (see 9.2.4.22.3), then we get the functors $({}^\dagger \widetilde{T})\colon \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T}/\mathcal{V})$ and $({}^\dagger \widetilde{T}^{(0)})\colon \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \to \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V})$. Moreover, the extraordinary inverse image and direct image functors commute with localisation functors (see 13.2.1.4). This yields that the functors θ^+ and θ_+ of 16.1.2.8 and 16.1.2.17 commute with localisation, i.e., we have some canonical isomorphisms $\widetilde{\theta}^+ \circ ({}^\dagger \widetilde{T}) \xrightarrow{\sim} ({}^\dagger \widetilde{T}^{(0)}) \circ \theta^+$ and $\widetilde{\theta}_+ \circ ({}^\dagger \widetilde{T}^{(0)}) \xrightarrow{\sim} ({}^\dagger \widetilde{T}) \circ \theta_+$.

16.1.3 Finite and etale (outside overconvergent singularities) descent

We keep the notations and hypotheses of 16.1.2.14. Moreover, denote by $\mathfrak{P}^{(1)} := \mathfrak{P}^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$, $\mathfrak{P}^{(2)} := \mathfrak{P}^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$, $f_1, f_2\colon \mathfrak{P}^{(1)} \to \mathfrak{P}^{(0)}$ the left and right projections, $f_{ij}\colon \mathfrak{P}^{(2)} \to \mathfrak{P}^{(1)}$ the projections on the factors of the indices i, j for $i < j$. Similarly, we denote by $X^{(1)} := X^{(0)} \times_X X^{(0)}$, $X^{(2)} := X^{(0)} \times_X X^{(0)} \times_X X^{(0)}$, $a_i\colon X^{(1)} \to X^{(0)}$, $a_{ij}\colon X^{(2)} \to X^{(1)}$ the canonical projections ; similarly by replacing respectively a by b (resp. by g) and X by Y (resp. $\mathfrak{U}$). We denote by $T^{(1)} := f_1^{-1}(T^{(0)}) = f_2^{-1}(T^{(0)})$, $T^{(2)} := f_{12}^{-1}(T^{(1)}) = f_{23}^{-1}(T^{(1)}) = f_{13}^{-1}(T^{(1)})$. By abuse of notation, $a := (b, a, f)$, $a_i := (b_i, a_i, f_i)$ and $a_{ij} := (b_{ij}, a_{ij}, f_{ij})$ can be viewed as morphisms of smooth d-frames over $\mathfrak{S}$ which satisfy the same properties as in 16.1.2.14, i.e. they are finite and etale outside overconvergent singularities. Hence, we can use 16.1.2.17 and its notation, e.g. $a_{ij}^+ := \mathbb{D}_{T^{(2)}} \circ \mathbb{R}\underline{\Gamma}^\dagger_{X^{(2)}} \circ f^!_{ij, T^{(2)}, T^{(1)}} \circ \mathbb{D}_{T^{(1)}}$ and $a_{ij+} := f_{ij, T^{(2)}, T^{(1)}+}$. By abuse of notation, $b_i := (b_i, b_i, g_i)$ and $b_{ij} := (b_{ij}, b_{ij}, g_{ij})$ can be viewed as morphisms of completely smooth d-frames over $\mathfrak{S}$ (with empty divisors). We can use 16.1.2.17 and its notation, e.g. $b_{ij}^+ := \mathbb{D} \circ \mathbb{R}\underline{\Gamma}^\dagger_{Y^{(2)}} \circ g^!_{ij} \circ \mathbb{D}$ and $b_{ij+} := g_{ij+}$.

Definition 16.1.3.1. We define the category $\mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$ as follows:

(i) The objects are the sheaves $\mathcal{E}^{(0)} \in \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V})$ together with a glueing datum, i.e., an isomorphism in $\mathrm{MIC}^*(X^{(1)}, \mathfrak{P}^{(1)}, T^{(1)}/\mathcal{V})$ of the form $\epsilon\colon a_2^+(\mathcal{E}^{(0)}) \xrightarrow{\sim} a_1^+(\mathcal{E}^{(0)})$ satisfying the cocycle condition: $a_{13}^+(\epsilon) = a_{12}^+(\epsilon) \circ a_{23}^+(\epsilon)$.

(ii) The morphisms $(\mathcal{E}^{(0)}, \epsilon) \to (\mathcal{F}^{(0)}, \tau)$ are the $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-linear morphisms $\phi\colon \mathcal{E}^{(0)} \to \mathcal{F}^{(0)}$ commuting to glueing data, i.e. such that $\tau \circ a_2^+(\phi) = a_1^+(\phi) \circ \epsilon$.

When the divisors are empty, as usual we remove them in the notation.

16.1.3.2. We have the functor $\mathcal{L}oc\colon \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$ defined by $\mathcal{E} \mapsto (a^+(\mathcal{E}), \epsilon)$, where ϵ is the isomorphism induced by the transitivity with respect to the composition of the functors of the form a^+ (see 16.1.2.17).

16.1.3.3. We build the functor $\mathcal{G}lue\colon \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V}) \to \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$ as follows: let $(\mathcal{E}^{(0)}, \epsilon) \in \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$. Set $\widetilde{a} := a \circ a_1 = a \circ a_2$, $\widetilde{b} = b \circ b_1 = b \circ b_2$ and $\widetilde{f} = f \circ f_1 = f \circ f_2$. By abuse of notation, we write $\widetilde{a} := (\widetilde{b}, \widetilde{a}, \widetilde{f})$. Remark the equality $\widetilde{a} = a \circ a_1 = a \circ a_2$ still holds as morphism of smooth d-frames over $\mathfrak{S}$. We have the composition morphism

$$\phi_1\colon a_+(\mathcal{E}^{(0)}) \underset{16.1.2.17.b}{\xrightarrow{\mathrm{adj}_{a_1}}} a_+ \circ a_{1+} \circ a_1^+(\mathcal{E}^{(0)}) \xrightarrow{\sim} \tilde{a}_+ \circ a_1^+(\mathcal{E}^{(0)}).$$

On the other hand, we get a second composition morphism:

$$\phi_2 \colon a_+(\mathcal{E}^{(0)}) \underset{16.1.2.17.b}{\overset{\mathrm{adj}_{a_2}}{\longrightarrow}} a_+ \circ a_{2+} \circ a_2^+(\mathcal{E}^{(0)}) \xrightarrow{\sim} \tilde{a}_+ \circ a_2^+(\mathcal{E}^{(0)}) \underset{\epsilon}{\xrightarrow{\sim}} \tilde{a}_+ \circ a_1^+(\mathcal{E}^{(0)}).$$

We set $\mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) = \ker \left(a_+(\mathcal{E}^{(0)}) \underset{\phi_2}{\overset{\phi_1}{\rightrightarrows}} \tilde{a}_+ \circ a_1^+(\mathcal{E}^{(0)}) \right)$. With 16.1.2.13 and 16.1.2.17, we check $\mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) \in \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$.

16.1.3.4. Let $\widetilde{T}$ be a divisor of P containing T and $\widetilde{T}^{(0)} := f^{-1}(\widetilde{T})$. Via the remark of 16.1.2.18, we easily check that the functors $\mathcal{L}oc$ of 16.1.3.2 and $\mathcal{G}lue$ of 16.1.3.3 commute with localisation outside a divisor, i.e., we have some canonical isomorphisms $\mathcal{G}lue \circ ({}^\dagger\widetilde{T}^{(0)}) \xrightarrow{\sim} ({}^\dagger\widetilde{T}) \circ \mathcal{G}lue$ and $\mathcal{L}oc \circ ({}^\dagger\widetilde{T}) \xrightarrow{\sim} ({}^\dagger\widetilde{T}^{(0)}) \circ \mathcal{L}oc$ (the functors $\mathcal{L}oc$ and $\mathcal{G}lue$ indicate the functors of 16.1.3.2 and 16.1.3.3, are similarly replacing T by $\widetilde{T}$).

Before considering the general case of this subsection, first let us consider the finite and etale descent of convergent isocrystals over smooth k-schemes, which corresponds to the case where the overconvergent singularities are empty:

Lemma 16.1.3.5 (Outside overconvergent singularities)**.** *The canonical functors* $\mathcal{L}oc \colon \mathrm{MIC}^*(Y, \mathfrak{U}/\mathcal{V}) \to \mathrm{MIC}^*(Y^{(\bullet)}, \mathfrak{U}^{(\bullet)}/\mathcal{V})$ *and* $\mathcal{G}lue \colon \mathrm{MIC}^*(Y^{(\bullet)}, \mathfrak{U}^{(\bullet)}/\mathcal{V}) \to \mathrm{MIC}^*(Y, \mathfrak{U}/\mathcal{V})$ *defined respectively in 16.1.3.2 and 16.1.3.3 are quasi-inverse.*

Proof. Let $\mathcal{E} \in \mathrm{MIC}^*(Y, \mathfrak{U}/\mathcal{V})$ and $(\mathcal{E}^{(0)}, \epsilon) \in \mathrm{MIC}^*(Y^{(\bullet)}, \mathfrak{U}^{(\bullet)}/\mathcal{V})$. Following the steps I.1) and II.1) of the proof of 16.1.3.6 (these two steps do not use 16.1.3.5), we have the morphisms $\mathcal{E} \to \mathcal{G}lue \circ \mathcal{L}oc(\mathcal{E})$ and $b^+ \circ \mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) \to \mathcal{E}^{(0)}$. The check that the first (resp. second) morphism is an isomorphism (resp. commutes with glueing data and is an isomorphism) is local. Via the theorem of Berthelot-Kashiwara (see 9.3.5.9), we reduce therefore to suppose $Y = U$ and $Y^{(0)} = U^{(0)}$. In this case $g = b$ is a finite and etale morphism and b_+ (resp. b^+) is canonically isomorphic to b_* (resp. b^*), and similarly by adding indices i or ij at the bottom.

In the case where $g = b$, via the classic theory of the faithfully flat descent, we check the following assertions:

(a) The category $\mathrm{MIC}^{\dagger\dagger}(Y, Y/\mathcal{V})$ is equivalent to that of objects $\mathcal{E}^{(0)} \in \mathrm{MIC}^{\dagger\dagger}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V})$ endowed with a glueing datum, i.e., an isomorphism $\epsilon \colon b_2^*(\mathcal{E}^{(0)}) \xrightarrow{\sim} b_1^*(\mathcal{E}^{(0)})$ satisfying the usual cocycle condition.

(b) The quasi-inverse functor of this equivalence of categories is given by the glueing functor defined by setting $\mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) = \ker \left(b_*(\mathcal{E}^{(0)}) \underset{\phi_2}{\overset{\phi_1}{\rightrightarrows}} \widetilde{b}_* \circ b_1^*(\mathcal{E}^{(0)}) \right)$, where $\phi_1 \colon b_*(\mathcal{E}^{(0)}) \xrightarrow{\mathrm{adj}_{b_1}} b_* \circ b_{1*} \circ b_1^*(\mathcal{E}^{(0)}) \xrightarrow{\sim} \widetilde{b}_* \circ b_1^*(\mathcal{E}^{(0)})$ and where $\phi_2 \colon b_*(\mathcal{E}^{(0)}) \xrightarrow{\mathrm{adj}_{b_2}} b_* \circ b_{2*} \circ b_2^*(\mathcal{E}^{(0)}) \xrightarrow{\sim} \widetilde{b}_* \circ b_2^*(\mathcal{E}^{(0)}) \underset{\epsilon}{\xrightarrow{\sim}} \widetilde{b}_* \circ b_1^*(\mathcal{E}^{(0)})$.

(c) The morphism induced by adjunction $b^*\mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) \to (\mathcal{E}^{(0)}, \epsilon)$ is an isomorphism which commutes with glueing data (see for example, [Mil80, beginning of the page 19]).

□

Proposition 16.1.3.6. *The functors $\mathcal{L}oc$ and $\mathcal{G}lue$ induce quasi-inverse equivalences between the categories* $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$ *and* $\mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$.

Proof. I) Let $\mathcal{E} \in \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$. Let us establish the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{G}lue \circ \mathcal{L}oc(\mathcal{E})$.

1) Construction of this morphism: we put $(\mathcal{E}^{(0)}, \epsilon) := \mathcal{L}oc(\mathcal{E})$. Consider the diagram below:

$$\begin{array}{ccccccc}
\mathcal{E} & \xrightarrow{\mathrm{adj}_a} & a_+(\mathcal{E}^{(0)}) & \xrightarrow{\mathrm{adj}_{a_2}} & a_+ \circ a_{2+} \circ a_2^+(\mathcal{E}^{(0)}) & \xrightarrow{\sim} & \widetilde{a}_+ \circ a_2^+(\mathcal{E}^{(0)}) \\
\| & & \downarrow \mathrm{adj}_{a_1} & & & \swarrow_{\epsilon}^{\sim} & \downarrow \sim \\
\| & & a_+ \circ a_{1+} \circ a_1^+(\mathcal{E}^{(0)}) & \xrightarrow{\sim} & \widetilde{a}_+ \circ a_1^+(\mathcal{E}^{(0)}) & & \\
\| & & \downarrow \sim & \swarrow^{\sim} & & & \\
\mathcal{E} & \xrightarrow{\mathrm{adj}_{\mathbf{a}}} & \widetilde{a}_+ \circ \widetilde{a}^+(\mathcal{E}) & = & = & = & \widetilde{a}_+ \circ \widetilde{a}^+(\mathcal{E}).
\end{array} \tag{16.1.3.6.1}$$

The middle triangle is commutative by definition of the isomorphism $a_+ \circ a_{1+} \circ a_1^+(\mathcal{E}^{(0)}) \xrightarrow{\sim} \widetilde{a}_+ \circ \widetilde{a}^+(\mathcal{E})$. The right triangle is commutative by definition of the isomorphism ϵ. By transitivity of the adjunction morphism, the left rectangle of the diagram is commutative. For the same reason, the outer of 16.1.3.6.1 is commutative. In the trapeze of the top, we notice that the composition $a_+(\mathcal{E}^{(0)}) \to \widetilde{a}_+ \circ a_1^+(\mathcal{E}^{(0)})$ going through the bottom (resp. the top) is ϕ_1 (resp. ϕ_2). This yields the factorisation: $\mathcal{E} \to \mathcal{G}lue \circ \mathcal{L}oc(\mathcal{E})$.

2) Let us now check that this is an isomorphism. Following 8.7.6.11, it is sufficient to establish it outside T. We reduce then to the situation where T is empty, i.e. to the case where $\mathfrak{U} = \mathfrak{P}$, i.e., to the situation of 16.1.3.5. Hence we are done.

II) Conversely, is $(\mathcal{E}^{(0)}, \epsilon) \in \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$ and let us check the isomorphism $\mathcal{L}oc \circ \mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) \xrightarrow{\sim} (\mathcal{E}^{(0)}, \epsilon)$.

1) Let us construct canonically this morphism. By definition, we have the inclusion $\mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) \subset a_+(\mathcal{E}^{(0)})$. By adjunction (see 16.1.2.17), this yields the morphism $\phi\colon a^+ \circ \mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon) \to \mathcal{E}^{(0)}$.

2) Denote by τ the glueing datum of $a^+ \circ \mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon)$ satisfying the equality $(a^+ \circ \mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon), \tau) = \mathcal{L}oc \circ \mathcal{G}lue(\mathcal{E}^{(0)}, \epsilon)$. We have to check that ϕ is an isomorphism commuting to respective glueing data, i.e., such that $\tau \circ a_2^+(\phi) = a_1^+(\phi) \circ \epsilon$. By 8.7.6.11, it is sufficient to establish it outside T, which reduces to the situation of 16.1.3.5. □

Corollary 16.1.3.7. *We suppose moreover $X^{(0)}$ smooth over k. We have the equalities:* $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$.

Proof. With the remark 16.1.2.7.(b), it is sufficient to prove the equality $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$. We have the inclusion $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) \supset \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$. Conversely, let $\mathcal{E} \in \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$. Set

$$a^! := \mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}} \circ f^!_{T^{(0)},T} \colon D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) \xrightarrow{f^!_{T^{(0)},T}} D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^{(0)}}({}^\dagger T^{(0)})_{\mathbb{Q}}) \xrightarrow{\mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}}} D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P}^{(0)}}({}^\dagger T^{(0)})_{\mathbb{Q}}).$$

Since $\mathbb{D}_T(\mathcal{E})$ is an overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module, by stability of the overcoherence by extraordinary inverse images and local cohomological functor (see 15.3.6.12 and 15.3.6.9), we get $a^!(\mathbb{D}_T(\mathcal{E})) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}^{(0)}}({}^\dagger T^{(0)})_{\mathbb{Q}})$. Moreover, since $\mathcal{E}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$, then following the smooth case treated in 12.2.1.11.2, we have

$$a^!(\mathbb{D}_T(\mathcal{E}))|\mathfrak{U}^{(0)} \xrightarrow{\sim} b^!(\mathcal{E}\mathfrak{U}) \in \mathrm{MIC}^{\dagger\dagger}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V}).$$

With 8.7.6.11, this yields that $a^!(\mathbb{D}_T(\mathcal{E}))$ is (isomorphic to) an (over)coherent $\mathcal{D}^\dagger_{\mathfrak{P}^{(0)}}({}^\dagger T^{(0)})_{\mathbb{Q}}$-module. Since $X^{(0)}$ is smooth, via the characterization of 12.2.1.5, this yields $a^!(\mathbb{D}_T(\mathcal{E})) \in \mathrm{MIC}^{\dagger\dagger}(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V})$. Hence, $a^!(\mathbb{D}_T(\mathcal{E}))$ is 1-$\mathcal{D}^\dagger_{\mathfrak{P}^{(0)}}({}^\dagger T^{(0)})_{\mathbb{Q}}$-overholonomic (see 16.1.1.7). This implies in particular that $a^+(\mathcal{E})$ is an overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}^{(0)}}({}^\dagger T^{(0)})_{\mathbb{Q}}$-module and (moreover by using the isomorphism of biduality of 8.7.7.3) that $a_1^+(a^+(\mathcal{E}))$ is an overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}^{(1)}}({}^\dagger(T^{(1)}))_{\mathbb{Q}}$-module. By preservation of the overcoherence by kernel and by direct image by a proper smooth morphism, this yields $\mathcal{G}lue \circ \mathcal{L}oc(\mathcal{E})$ is an overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. Moreover, following 16.1.3.6, $\mathcal{E} \xrightarrow{\sim} \mathcal{G}lue \circ \mathcal{L}oc(\mathcal{E})$. Hence we are done. □

16.1.4 Full faithfulness of the localisation outside a divisor functor

With the notations 16.1.2.5, the theorem below is the analogue of the theorem of Tsuzuki [Tsu02, 4.1.1] or of the extended version of Kedlaya of [Ked07, 5.2.1]:

Theorem 16.1.4.1. *Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, $T \subset T'$ two divisors of P, X be a closed subscheme of P. By setting $Y := X \setminus T$, $Y' := X \setminus T'$, we suppose moreover Y smooth and Y' dense in Y. The functor $({}^\dagger T')$ induced the fully faithful functors:*

$$({}^\dagger T')\colon (F\text{-})\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^*(X, \mathfrak{P}, T'/\mathcal{V}), \tag{16.1.4.1.1}$$

$$({}^\dagger T')\colon (F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{**}(X, \mathfrak{P}, T'/\mathcal{V}), \tag{16.1.4.1.2}$$

$$({}^\dagger T')\colon (F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T'/\mathcal{V}). \tag{16.1.4.1.3}$$

Proof. To lighten the notation, we omit indicating "$(F\text{-})$". Since the functor $\mathbb{D}_T$ (resp. $\mathbb{D}_{T'}$) induced an equivalence between $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$ and $\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$ (resp. between $\mathrm{MIC}^*(X, \mathfrak{P}, T'/\mathcal{V})$ and

$\mathrm{MIC}^{**}(X, \mathfrak{P}, T'/\mathcal{V})$), since we have the canonical isomorphism $\mathbb{D}_{T'} \circ ({}^\dagger T') \xrightarrow{\sim} ({}^\dagger T') \circ \mathbb{D}_T$, then it is sufficient to check 16.1.4.1.2.

Let $\mathcal{E}_1$, $\mathcal{E}_2$ be two objects of $\mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V})$. Set $\mathfrak{U} := \mathfrak{P} \setminus T$, $\mathfrak{U}' := \mathfrak{P} \setminus T'$. Via the lemma 16.1.2.9 and the remark 16.1.2.10, we reduce to the case where Y is integral and dense in X.

1) *For any $i = 1, 2$, the canonical morphism $\mathcal{E}_i \to \mathcal{E}_i({}^\dagger T')$ is injective.*

Proof: let $\mathcal{E}'_i$ be the kernel of $\mathcal{E}_i \to \mathcal{E}_i({}^\dagger T')$. By 8.7.6.11, since $\mathcal{E}'_i$ is an (over)coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module, it is sufficient to establish that $\mathcal{E}'_i|\mathfrak{U} = 0$. We reduce then to the case where T is empty. In this case since $X = Y$ is smooth, as the assertion is local in $\mathfrak{P}$, then we can suppose there exists a morphism $\mathfrak{X} \hookrightarrow \mathfrak{P}$ of affine and smooth $\mathfrak{S}$-formal schemes which is a lifting of $X \hookrightarrow P$. Since Y' is dense in $Y = X$, then T' does not contains X. Hence, $T' \cap X$ is a divisor of X (because X is integral and smooth). By using the theorem of Berthelot-Kashiwara (see 9.3.5.9), it follows that the functors $u_{T',+}$ and $u^!_{T'}$ (resp. u_+ and $u^!$) induce quasi-inverse equivalences of categories between $\mathrm{MIC}^{**}(X, \mathfrak{X}, T' \cap X/\mathcal{V})$ and $\mathrm{MIC}^{**}(X, \mathfrak{P}, T'/\mathcal{V})$ (resp. between $\mathrm{MIC}^{**}(X, \mathfrak{X}/\mathcal{V})$ and $\mathrm{MIC}^{**}(X, \mathfrak{P}/\mathcal{V})$). We reduce then to treat the case where $X = P$ (P is still affine and T empty). Following 11.2.1.14, the category $\mathrm{MIC}^{**}(P, \mathfrak{P}/\mathcal{V})$ is equal to the category of coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules which are locally projective $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-module of finite type. In particular, $\mathcal{E}_1$ and $\mathcal{E}_2$ are projective $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-modules. Since the canonical morphism $\mathcal{O}_{\mathfrak{P},\mathbb{Q}} \to \mathcal{O}_{\mathfrak{P}}({}^\dagger T')_{\mathbb{Q}}$ is injective, then so is of $\mathcal{E}_i \to \mathcal{E}_i({}^\dagger T')$.

2) This is a consequence of the step 1) that the functor 16.1.4.1.2 is faithful.

3) Let $\phi\colon \mathcal{E}_1({}^\dagger T') \to \mathcal{E}_2({}^\dagger T')$ be a morphism of $\mathrm{MIC}^{**}(X, \mathfrak{P}, T'/\mathcal{V})$. It remains to prove that ϕ comes by extension from a morphism of the form $\mathcal{E}_1 \to \mathcal{E}_2$. Following the step 2), this is local. We can therefore suppose $\mathfrak{P}$ affine and $\mathfrak{P}/\mathfrak{S}$ is endowed with coordinates.

4) Denote by $\mathcal{G}$ the image of the composition: $\mathcal{E}_1 \hookrightarrow \mathcal{E}_1({}^\dagger T') \xrightarrow{\phi} \mathcal{E}_2({}^\dagger T')$. Since $\mathcal{G}$, $\mathcal{E}_2$ are (over) coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-submodules of the (over)coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module $\mathcal{E}_2({}^\dagger T')$, the sheaf $\mathcal{G} \cap \mathcal{E}_2$ (equal by definition to the kernel of $\mathcal{G} \to \mathcal{E}_2({}^\dagger T')/\mathcal{E}_2$) is also an (over)coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-submodule of $\mathcal{E}_2({}^\dagger T')$.

5) *The inclusion $\mathcal{G} \cap \mathcal{E}_2 \subset \mathcal{G}$ is an isomorphism.*

Proof: via 8.7.6.11, we reduce to the case where T is empty. Moreover, via the theorem of Berthelot-Kashiwara (see 9.3.5.9), we can suppose $X = P$. By using the theorem of type A for the coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules, since $\mathcal{G}$ is the image of a morphism of coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules of the form $\mathcal{E}_1 \to \mathcal{E}_2({}^\dagger T')$, we get a $\Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$-linear surjective map $\Gamma(\mathfrak{P}, \mathcal{E}_1) \to \Gamma(\mathfrak{P}, \mathcal{G})$. Moreover, via the theorem of type A for coherent $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-modules, $\Gamma(\mathfrak{P}, \mathcal{E}_1)$ is $\Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$-coherent. By notherianite of $\Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$, this yields $\Gamma(\mathfrak{P}, \mathcal{G})$ and $\Gamma(\mathfrak{P}, \mathcal{G} \cap \mathcal{E}_2)$ are $\Gamma(\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$-coherent. Since $\mathcal{G}$ and $\mathcal{G} \cap \mathcal{E}_2$ are moreover $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-coherent, using 11.1.1.8 this implies that $\mathcal{G}$ and $\mathcal{G} \cap \mathcal{E}_2$ are $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-coherent. The morphism $\mathcal{G} \cap \mathcal{E}_2 \subset \mathcal{G}$ is then a morphism of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}/\mathcal{V})$. Hence, $\mathcal{G}/\mathcal{G} \cap \mathcal{E}_2 \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}/\mathcal{V})$. Let $E \in \mathrm{MIC}^\dagger(P, P/K)$ be a convergent isocrystal over P such that $\mathrm{sp}_* E \xrightarrow{\sim} \mathcal{G}/\mathcal{G} \cap \mathcal{E}_2$ (see 11.1.1.2). Since $\mathcal{G}/\mathcal{G} \cap \mathcal{E}_2 | \mathfrak{U}' = 0$, the isocrystal convergent over U' induced by E is null. Since $\mathfrak{U}'$ is dense in $\mathfrak{P}$, this yields $E = 0$, i.e. $\mathcal{G}/\mathcal{G} \cap \mathcal{E}_2 = 0$.

6) From 5), we get the morphisms $\theta\colon \mathcal{E}_1 \twoheadrightarrow \mathcal{G} \xleftarrow{\sim} \mathcal{G} \cap \mathcal{E}_2 \hookrightarrow \mathcal{E}_2$ whose composition with $\mathcal{E}_2 \to \mathcal{E}_2({}^\dagger T')$ is equal to the composition morphism $\mathcal{E}_1 \hookrightarrow \mathcal{E}_1({}^\dagger T') \xrightarrow{\phi} \mathcal{E}_2({}^\dagger T')$. Since $({}^\dagger T')(\epsilon)|\mathfrak{U}' = \phi|\mathfrak{U}'$, this yields by faithfulness of $|\mathfrak{U}'$ the equality $({}^\dagger T')(\theta) = \phi$. □

Remark 16.1.4.2. The theorem 16.1.4.1 is wrong if Y' is not dense in Y. For example, if we take $\mathfrak{P}$ a curve, Y a point and Y' the empty set.

16.1.5 Full faithfulness of the "restriction-inverse image" functor

We keep in the rest of this subsection 16.1.5 the following notations: let the commutative diagram

$$\begin{array}{ccccccc} \widetilde{Y}^{(0)} & \overset{l^{(0)}}{\hookrightarrow} & Y^{(0)} & \overset{j^{(0)}}{\hookrightarrow} & X^{(0)} & \overset{u^{(0)}}{\hookrightarrow} & \mathfrak{P}^{(0)} \\ \downarrow c & \square & \downarrow b & \square & \downarrow a & & \downarrow f \\ \widetilde{Y} & \overset{l}{\hookrightarrow} & Y & \overset{j}{\hookrightarrow} & X & \overset{u}{\hookrightarrow} & \mathfrak{P}, \end{array} \qquad (16.1.5.0.1)$$

where the left and middle squares are cartesian, f is a proper smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes, a is a proper surjective morphism of k-varieties, b is a morphism of smooth k-varieties, c is a finite and etale morphism, l, $l^{(0)}$, j and $j^{(0)}$ are open immersions, u and $u^{(0)}$ are closed immersions, $\widetilde{Y}$ is dense in Y and $\widetilde{Y}^{(0)}$ is dense in $Y^{(0)}$. We denote by $\widetilde{j}\colon \widetilde{Y} \hookrightarrow X$ and $\widetilde{j}^{(0)}\colon \widetilde{Y}^{(0)} \hookrightarrow X^{(0)}$ the induced open immersions. We suppose moreover there exists a divisor T (resp. $\widetilde{T}$) of P such that $Y = X \setminus T$ (resp. $\widetilde{Y} = X \setminus \widetilde{T}$). We denote by $\mathfrak{U} := \mathfrak{P} \setminus T$, $T^{(0)} := f^{-1}(T)$, $\mathfrak{U}^{(0)} := \mathfrak{P}^{(0)} \setminus T^{(0)}$ and $g\colon \mathfrak{U}^{(0)} \to \mathfrak{U}$ the morphism induced by f ; the same by adding tildes (e.g. we set $\widetilde{\mathfrak{U}} := \mathfrak{P} \setminus \widetilde{T}$ etc.).

Denote by $\mathfrak{P}^{(1)} := \mathfrak{P}^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$, $\mathfrak{P}^{(2)} := \mathfrak{P}^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$, $f_1, f_2\colon \mathfrak{P}^{(1)} \to \mathfrak{P}^{(0)}$ the left and right projections, $f_{ij}\colon \mathfrak{P}^{(2)} \to \mathfrak{P}^{(1)}$ the projections on the factors of the indices i, j for $i < j$. Similarly, we denote by $X^{(1)} := X^{(0)} \times_X X^{(0)}$, $X^{(2)} := X^{(0)} \times_X X^{(0)} \times_X X^{(0)}$, $a_i\colon X^{(1)} \to X^{(0)}$, $a_{ij}\colon X^{(2)} \to X^{(1)}$ the canonical projections ; similarly by replacing respectively a by b, c or g and X by Y, $\widetilde{Y}$ or $\mathfrak{U}$. We denote by $T^{(1)} := f_1^{-1}(T^{(0)}) \cup f_2^{-1}(T^{(0)})$, $T^{(2)} := f_{12}^{-1}(T^{(1)}) \cup f_{23}^{-1}(T^{(1)}) \cup f_{13}^{-1}(T^{(1)})$; similarly with tildes.

By abuse of notation, $a := (c, a, f)$, $a_i := (c_i, a_i, f_i)$ and $a_{ij} := (c_{ij}, a_{ij}, f_{ij})$ can be viewed as morphisms of smooth d-frames over $\mathfrak{S}$ which satisfy the same properties as in 16.1.2.14, i.e. they are finite and etale outside overconvergent singularities. Hence, we can use 16.1.2.17 and its notation, e.g. $a_{ij}^{+} := \mathbb{D}_{T^{(2)}} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X^{(2)}} \circ f^{!}_{ij,T^{(2)},T^{(1)}} \circ \mathbb{D}_{T^{(1)}}$ and $a_{ij+} := f_{ij,T^{(2)},T^{(1)}+}$. If we denote by $\mathfrak{j} := (\mathrm{id}, j, |\mathfrak{U})$ and $\widetilde{\mathfrak{j}} := (\mathrm{id}, \widetilde{j}, |\widetilde{\mathfrak{U}})$, then with notation 16.1.2.8.2 we get the functors $\mathfrak{j}^{+}\colon (F\text{-})\mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{*}(Y, \mathfrak{U}/\mathcal{V})$ and $\widetilde{\mathfrak{j}}^{+}\colon (F\text{-})\mathrm{MIC}^{*}(X, \mathfrak{P}, \widetilde{T}/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{*}(\widetilde{Y}, \widetilde{\mathfrak{U}}/\mathcal{V})$ which are respectively canonically isomorphic to the restriction functors $|\mathfrak{U}$ and $|\widetilde{\mathfrak{U}}$.

By abuse of notation, we denote by $a = (b, a, f)$ the morphism of smooth d-frames. Following 16.1.2.8.2, we get the functor $a^{+}\colon \mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^{*}(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V})$. Beware that we have two distinguished functors a^{+} but it will be obvious which one is used following the context.

Lemma 16.1.5.1. *The functor*

$$(a^{+}, |\widetilde{\mathfrak{U}})\colon \mathrm{MIC}^{*}(X, \mathfrak{P}, \widetilde{T}/\mathcal{V}) \to \mathrm{MIC}^{*}(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^{*}(\widetilde{\mathfrak{U}}^{(0)}, \widetilde{Y}^{(0)}/\mathcal{V})} \mathrm{MIC}^{*}(\widetilde{Y}, \widetilde{\mathfrak{U}}/\mathcal{V}) \quad (16.1.5.1.1)$$

is fully faithful.

Proof. Since the functor $|\widetilde{\mathfrak{U}}$ is faithful (see 8.7.6.8), the functor $(a^{+}, |\widetilde{\mathfrak{U}})$ is faithful. It remains to prove that this faithfulness is full. Let $\mathcal{E}_1, \mathcal{E}_2 \in \mathrm{MIC}^{*}(X, \mathfrak{P}, \widetilde{T}/\mathcal{V})$. By setting $\mathcal{E}_1^{(0)} := a^{+}(\mathcal{E}_1)$, $\mathcal{E}_2^{(0)} := a^{+}(\mathcal{E}_2)$ let $\phi^{(0)}\colon \mathcal{E}_1^{(0)} \to \mathcal{E}_2^{(0)}$ and $\psi\colon \mathcal{E}_1|\widetilde{\mathfrak{U}} \to \mathcal{E}_2|\widetilde{\mathfrak{U}}$ be two morphisms inducing canonically the same morphism in $\mathrm{MIC}^{*}(\widetilde{\mathfrak{U}}^{(0)}, \widetilde{Y}^{(0)}/\mathcal{V})$. Consider the square:

$$\begin{array}{ccc} a_2^{+}(\mathcal{E}_1^{(0)}) & \xrightarrow[\epsilon_1]{\sim} & a_1^{+}(\mathcal{E}_1^{(0)}) \\ \downarrow a_1^{+}(\phi^{(0)}) & & \downarrow a_2^{+}(\phi^{(0)}) \\ a_2^{+}(\mathcal{E}_2^{(0)}) & \xrightarrow[\epsilon_2]{\sim} & a_1^{+}(\mathcal{E}_2^{(0)}) \end{array} \quad (16.1.5.1.2)$$

of $\mathrm{MIC}^{*}(X^{(1)}, \mathfrak{P}^{(1)}, \widetilde{T}^{(1)}/\mathcal{V})$, where ϵ_1 and ϵ_2 are the canonical isomorphisms induced by transitivity (see 16.1.2.8). Since the morphisms $\phi^{(0)}$ and ψ are compatible, the diagram 16.1.5.1.2 becomes commutative after applying the functor $|\widetilde{\mathfrak{U}}^{(1)}$. Thanks to the proposition 8.7.6.11, this yields the commutativity of 16.1.5.1.2. Hence, we have the morphism $\phi^{(0)}\colon (\mathcal{E}_1^{(0)}, \epsilon_1) \to (\mathcal{E}_2^{(0)}, \epsilon_2)$ of $\mathrm{MIC}^{*}(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, \widetilde{T}^{(\bullet)}/\mathcal{V})$. Hence the morphism $\phi^{(0)}|\widetilde{\mathfrak{U}}$ commutes with glueing data and we still denote by $\phi^{(0)}|\widetilde{\mathfrak{U}}\colon (\mathcal{E}_1^{(0)}|\widetilde{\mathfrak{U}}, \epsilon_1|\widetilde{\mathfrak{U}}^{(1)}) \to (\mathcal{E}_2^{(0)}|\widetilde{\mathfrak{U}}, \epsilon_2|\widetilde{\mathfrak{U}}^{(1)})$ the induced morphism of $\mathrm{MIC}^{*}(\widetilde{Y}^{(\bullet)}, \widetilde{\mathfrak{U}}^{(\bullet)}/\mathcal{V})$. Moreover, for $i = 1, 2$, $\mathcal{L}oc(\mathcal{E}_i) = (\mathcal{E}_i^{(0)}, \epsilon_i)$. Since the functor $\mathcal{L}oc$ is fully faithful (see 16.1.3.6), then there exists a morphism $\phi\colon \mathcal{E}_1 \to \mathcal{E}_2$ such that $\mathcal{L}oc(\phi) = \phi^{(0)}$, and in particular we get $a^{+}(\phi) = \phi^{(0)}$. Since $\mathcal{L}oc(\phi|\widetilde{\mathfrak{U}}) = \phi^{(0)}|\widetilde{\mathfrak{U}}^{(0)} = \mathcal{L}oc(\psi)$, by faithfulness of $\mathcal{L}oc$, this yields $\phi|\widetilde{\mathfrak{U}} = \psi$. Hence, we have checked $(a^{+}, |\widetilde{\mathfrak{U}})(\phi) = (\phi^{(0)}, \psi)$. □

Proposition 16.1.5.2. *The functor*

$$(a^{+}, |\mathfrak{U})\colon \mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^{*}(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^{*}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V})} \mathrm{MIC}^{*}(Y, \mathfrak{U}/\mathcal{V}) \quad (16.1.5.2.1)$$

is fully faithful.

Proof. Consider the following diagram

$$\begin{array}{ccc} \mathrm{MIC}^{*}(X, \mathfrak{P}, T/\mathcal{V}) & \xrightarrow{(a^{+}, |\mathfrak{U})} & \mathrm{MIC}^{*}(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^{*}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V})} \mathrm{MIC}^{*}(Y, \mathfrak{U}/\mathcal{V}) \\ \downarrow ({}^{\dagger}\widetilde{T}) & & \downarrow (({}^{\dagger}\widetilde{T}^{(0)}), |\widetilde{\mathfrak{U}}) \\ \mathrm{MIC}^{*}(X, \mathfrak{P}, \widetilde{T}/\mathcal{V}) & \xrightarrow{(a^{+}, |\widetilde{\mathfrak{U}})} & \mathrm{MIC}^{*}(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^{*}(\widetilde{Y}^{(0)}, \widetilde{\mathfrak{U}}^{(0)}/\mathcal{V})} \mathrm{MIC}^{*}(\widetilde{Y}, \widetilde{\mathfrak{U}}/\mathcal{V}). \end{array} \quad (16.1.5.2.2)$$

Following 13.2.1.4, the local functors commute with extraordinary inverse images. It follows from 4.6.4.7.1, the localisation outside a divisor commutes with duality. This yields the commutativity up to canonical isomorphism of the diagram 16.1.5.2.2. Since following 16.1.4.1 (resp. 16.1.5.1) the left functor (resp. bottom) is fully faithful, as the right one is faithful, the upper functor is then fully faithful. □

16.1.6 An equivalence of categories induced by the "localisation-inverse image" functor

In this section, we keep the notations and hypotheses of the section 16.1.5.

Lemma 16.1.6.1. *The canonical functor below induced by* $(a^+,\, ({}^\dagger \widetilde{T}))$*:*

$$\mathrm{MIC}^*(X,\mathfrak{P},T/\mathcal{V}) \to \mathrm{MIC}^*(X^{(0)},\mathfrak{P}^{(0)},T^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^*(X^{(0)},\mathfrak{P}^{(0)},\widetilde{T}^{(0)}/\mathcal{V})} \mathrm{MIC}^*(X,\mathfrak{P},\widetilde{T}/\mathcal{V}) \quad (16.1.6.1.1)$$

is fully faithful.

Proof. Since the functor $({}^\dagger \widetilde{T})$ is faithful, then $(a^+,\, ({}^\dagger \widetilde{T}))$ is faithful. Since $({}^\dagger \widetilde{T})$ is fully faithful (see the theorem 16.1.4.1) and since $({}^\dagger \widetilde{T}^{(0)})$ is faithful, we check the faithfulness of $(a^+,\, ({}^\dagger \widetilde{T}))$ is full. □

Lemma 16.1.6.2. *Let* $\widetilde{\mathcal{E}} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger \widetilde{T})_{\mathbb{Q}})$.

(a) If $\widetilde{\mathcal{E}} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$*, then the canonical morphism of* $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger \widetilde{T})_{\mathbb{Q}})$

$$\widetilde{\mathcal{E}} \to ({}^\dagger \widetilde{T}, T)(\widetilde{\mathcal{E}}) \quad (16.1.6.2.1)$$

is a isomorphism. We have the isomorphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger \widetilde{T})_{\mathbb{Q}})$*:*

$$({}^\dagger \widetilde{T}, T) \circ \mathbb{D}_T(\widetilde{\mathcal{E}}) \xrightarrow{\sim} \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}). \quad (16.1.6.2.2)$$

(b) If $\mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$*, then there exists a canonical morphism of* $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ *of the form:*

$$\iota\colon \mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \to \widetilde{\mathcal{E}}. \quad (16.1.6.2.3)$$

Proof. a) Since the map 16.1.6.2.1 is a morphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger \widetilde{T})_{\mathbb{Q}})$ which an isomorphism outside $\widetilde{T}$, then it follows from 8.7.6.11 that 16.1.6.2.1 is an isomorphism. Hence, we get:

$$({}^\dagger \widetilde{T}, T) \circ \mathbb{D}_T(\widetilde{\mathcal{E}}) \underset{4.6.4.4.1}{\xrightarrow{\sim}} \mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T}, T)(\widetilde{\mathcal{E}}) \overset{16.1.6.2.1}{\xleftarrow{\sim}} \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}).$$

b) It follows from a) that the canonical morphism $\mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \to ({}^\dagger \widetilde{T}, T)(\mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}))$ is an isomorphism. Hence, we build the morphism 16.1.6.2.3 by composition as follows:

$$\mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \to ({}^\dagger \widetilde{T}, T) \circ \mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \overset{4.6.4.4.1}{\xrightarrow{\sim}} \mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T}, T) \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \underset{16.1.6.2.1}{\xleftarrow{\sim}} \mathbb{D}_{\widetilde{T}} \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \overset{8.7.7.3}{\xrightarrow{\sim}} \widetilde{\mathcal{E}}.$$

□

Lemma 16.1.6.3. *We suppose* X *smooth. Let* $\mathcal{E} \in \mathrm{MIC}^*(X,\mathfrak{P},T/\mathcal{V})$*. Then we have the following properties hold:*

(a) $({}^\dagger \widetilde{T})(\mathcal{E})$ *and* $\mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T})(\mathcal{E})$ *are both overcoherent and holonomic as* $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$*-module.*

(b) We have a canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathrm{Im}\left(\mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T})(\mathcal{E}) \overset{16.1.6.2.3}{\longrightarrow} ({}^\dagger \widetilde{T})(\mathcal{E})\right)$.

Proof. Since X is smooth, following 16.1.1.7 $\mathcal{E}$ is therefore 1-$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overholonomic. With 15.3.2.8, this yields $\mathcal{E}({}^\dagger \widetilde{T})$ is both overcoherent and holonomic as $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. Since the category $\mathrm{MIC}^*(X,\mathfrak{P},T/\mathcal{V})$ is stable under the functor $\mathbb{D}_T$ (see 16.1.2.6), this yields similarly that $\mathbb{D}_{\widetilde{T}}(\mathcal{E}({}^\dagger \widetilde{T})) \overset{4.6.4.4.1}{\xrightarrow{\sim}} ({}^\dagger \widetilde{T})\mathbb{D}_T(\mathcal{E})$ is both overcoherent and holonomic as $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module.

We denote by α the morphisms induced by functoriality by $\mathrm{id} \to ({}^\dagger \widetilde{T})$. Let $\mathcal{F}$ be the image of the morphism $\iota\colon \mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T})(\mathcal{E}) \to ({}^\dagger \widetilde{T})(\mathcal{E})$ constructed at 16.1.6.2.3. Since ι is an isomorphism outside $\widetilde{T}$, then so is the canonical morphism $\rho\colon ({}^\dagger \widetilde{T})(\mathcal{F}) \to \mathcal{E}({}^\dagger \widetilde{T})$ of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger \widetilde{T})_{\mathbb{Q}}$-modules (which factors by definition through the canonical inclusion $\mathcal{F} \subset \mathcal{E}({}^\dagger \widetilde{T})$). By 8.7.6.11, this morphism ρ is an isomorphism.

Following the step 1) of the proof of 16.1.4.1, since $\mathcal{E}, \mathbb{D}_T(\mathcal{E}) \in \mathrm{MIC}^{**}(X,\mathfrak{P},T/\mathcal{V})$, the canonical morphisms $\alpha\colon \mathcal{E} \to ({}^\dagger \widetilde{T})(\mathcal{E})$ and $\alpha\colon \mathbb{D}_T(\mathcal{E}) \to ({}^\dagger \widetilde{T})(\mathbb{D}_T(\mathcal{E}))$ are injective. Thanks to **??**, by applying to it $\mathbb{D}_T$, we get the surjection $\alpha^*\colon \mathbb{D}_T({}^\dagger \widetilde{T})(\mathbb{D}_T(\mathcal{E})) \twoheadrightarrow \mathbb{D}_T\mathbb{D}_T(\mathcal{E})$. Since the morphism $({}^\dagger \widetilde{T})(\alpha^*)$ is an isomorphism outside $\widetilde{T}$, this is an isomorphism. We get by functoriality the commutativity of squares of the bottom of the following diagram:

$$\begin{array}{ccccccc}
\mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T}) \circ \mathbb{D}_{\widetilde{T}}(({}^\dagger \widetilde{T})(\mathcal{E})) & \xrightarrow{\sim} & \mathbb{D}_{\widetilde{T}} \circ \mathbb{D}_{\widetilde{T}}(({}^\dagger \widetilde{T})(\mathcal{E})) & \xleftarrow{\sim} & \mathbb{D}_{\widetilde{T}} \circ \mathbb{D}_{\widetilde{T}}(({}^\dagger \widetilde{T})(\mathcal{E})) & \xrightarrow[8.7.7.3]{\sim} & ({}^\dagger \widetilde{T})(\mathcal{E}) \\
\sim \uparrow {\scriptstyle 4.6.4.4.1} & & & & & & \| \\
({}^\dagger \widetilde{T}) \circ \mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T})(\mathcal{E}) & \xrightarrow[4.6.4.4.1]{\sim} & ({}^\dagger \widetilde{T}) \circ \mathbb{D}_T \circ ({}^\dagger \widetilde{T})(\mathbb{D}_T(\mathcal{E})) & \xrightarrow[({}^\dagger \widetilde{T})(\alpha^*)]{\sim} & ({}^\dagger \widetilde{T}) \circ \mathbb{D}_T(\mathbb{D}_T(\mathcal{E})) & \xrightarrow[8.7.7.3]{\sim} & ({}^\dagger \widetilde{T})(\mathcal{E}) \\
\alpha \uparrow & & \alpha \uparrow & & \alpha \uparrow & & \alpha \uparrow \\
\mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}} \circ ({}^\dagger \widetilde{T})(\mathcal{E}) & \xrightarrow[4.6.4.4.1]{\sim} & \mathbb{D}_T \circ ({}^\dagger \widetilde{T})(\mathbb{D}_T(\mathcal{E})) & \underset{\alpha^*}{\twoheadrightarrow} & \mathbb{D}_T(\mathbb{D}_T(\mathcal{E})) & \xrightarrow[8.7.7.3]{\sim} & \mathcal{E}.
\end{array} \tag{16.1.6.3.1}$$

To validate the commutativity of the (top) rectangle of the diagram 16.1.6.3.1, since all terms are coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger \widetilde{T})_{\mathbb{Q}}$-modules, then it is sufficient via 8.7.6.11 to establish it outside $\widetilde{T}$, which is straightforward.

We see that the morphism ι is equal to the composition of the morphisms from the left and next from the top of the diagram 16.1.6.3.1. We get therefore the commutative diagram below:

$$\begin{array}{ccccc}
\mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(\mathcal{E}({}^\dagger \widetilde{T})) & \twoheadrightarrow & \mathcal{F} & \hookrightarrow & \mathcal{E}({}^\dagger \widetilde{T}) \\
\| & & & & \| \\
\mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(({}^\dagger \widetilde{T})(\mathcal{E})) & \twoheadrightarrow & \mathcal{E} & \overset{\alpha}{\hookrightarrow} & ({}^\dagger \widetilde{T})(\mathcal{E}),
\end{array} \tag{16.1.6.3.2}$$

whose bottom surjective arrow is the composition of the bottom morphisms of the diagram 16.1.6.3.1. This yields the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{F}$. □

Lemma 16.1.6.4. *Let $\mathcal{E}_1, \mathcal{E}_2$ two overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules such that $\mathbb{D}_T(\mathcal{E}_1), \mathbb{D}_T(\mathcal{E}_2)$ are $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overcoherent. Let $\phi\colon \mathcal{E}_1 \to \mathcal{E}_2$ be a $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-linear morphism. Let $\mathcal{K}$ be either the kernel of ϕ, or its image or its cokernel. Then $\mathcal{K}$, $H^0\mathbb{D}_T(\mathcal{K})$ are overcoherent and holonomic as a $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules.*

Proof. Using Theorem 15.3.2.8 implies that $\mathcal{E}_1$ and $\mathcal{E}_2$ are $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-holonomic. With 15.2.4.14 and 15.2.4.15, this yields $\mathcal{K}$, $H^0\mathbb{D}_T(\mathcal{K})$, are holonomic as a$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules. Moreover, since the overcoherence is stable under kernel, image and cokernel, then $\mathcal{K}$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overcoherent. Since the functor $H^0\mathbb{D}_T$ is an exact functor over the category of holonomic $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules, this yields $H^0\mathbb{D}_T(\mathcal{K})$ is either the cokernel, or the image, or the kernel of $\mathbb{D}_T(\phi)$. Using the $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overcoherence of $\mathbb{D}_T(\mathcal{E}_1), \mathbb{D}_T(\mathcal{E}_2)$, we are done. □

Lemma 16.1.6.5. *We suppose $X^{(0)}$ smooth. Let $\widetilde{\mathcal{E}}^{(0)} \in \mathrm{MIC}^*(X^{(0)},\mathfrak{P}^{(0)},\widetilde{T}^{(0)}/\mathcal{V})$. Then we have the canonical isomorphism $a_{1+} \circ a_1^+(\widetilde{\mathcal{E}}^{(0)}) \xrightarrow{\sim} a_{1+} \circ a_1^!(\widetilde{\mathcal{E}}^{(0)})$.*

Proof. We remark first that since $X^{(0)}$ is smooth, $\widetilde{\mathcal{E}}^{(0)} \in \mathrm{MIC}^*(X^{(0)},\mathfrak{P}^{(0)},\widetilde{T}^{(0)}/\mathcal{V}) = \mathrm{MIC}^{**}(X^{(0)},\mathfrak{P}^{(0)},\widetilde{T}^{(0)}/\mathcal{V})$. Following the de Jong 's desingularisation theorem (of the form 10.4.1.2), we have a surjective, projective, generically finite and etale morphism $\alpha\colon X'' \to X^{(1)}$ such that X'' is smooth and $\alpha^{-1}(T^{(1)} \cap X^{(1)})$ is a divisor of X''. Then there exists a projective and smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes of the form $f''\colon \mathfrak{P}'' \to \mathfrak{P}^{(1)}$, a closed immersion $X'' \hookrightarrow \mathfrak{P}''$ such that their composition gives the composite morphism $X'' \to X^{(1)} \hookrightarrow \mathfrak{P}^{(1)}$. Set $T'' := (f'')^{-1}(\widetilde{T}^{(0)})$, $Y'' := X'' \setminus T''$, $\beta\colon Y'' \to Y^{(1)}$ the morphism induced by α and $\alpha := (\beta, \alpha, f'')\colon (Y'', X'', \mathfrak{P}'', \widetilde{T}''/\mathcal{V}) \to (Y^{(1)}, X^{(1)}, \mathfrak{P}^{(1)}, \widetilde{T}^{(1)}/\mathcal{V})$. Moreover, since $a_1 \circ \alpha\colon (X'', \mathfrak{P}'', \widetilde{T}''/\mathcal{V}) \to (X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V})$ is a morphism of completely smooth frames, then we can use the commutation isomorphisms 12.2.1.14.2 and 12.2.1.14.3. Hence, we get the middle isomorphism:

$$\alpha^+ \circ a_1^+(\widetilde{\mathcal{E}}^{(0)}) \xrightarrow{\sim} (a_1 \circ \alpha)^+(\widetilde{\mathcal{E}}^{(0)}) \xrightarrow{\sim} (a_1 \circ \alpha)^!(\widetilde{\mathcal{E}}^{(0)}) \xrightarrow{\sim} \alpha^! \circ a_1^!(\widetilde{\mathcal{E}}^{(0)}).$$

This yields the middle morphism:

$$a_{1+} \circ a_1^+(\widetilde{\mathcal{E}}^{(0)}) \overset{16.1.1.6.4}{\longrightarrow} a_{1+} \circ \alpha_+ \circ \alpha^+ \circ a_1^+(\widetilde{\mathcal{E}}^{(0)}) \xrightarrow{\sim} a_{1+} \circ \alpha_+ \circ \alpha^! \circ a_1^!(\widetilde{\mathcal{E}}^{(0)}) \overset{16.1.1.6.3}{\longrightarrow} a_{1+} \circ a_1^!(\widetilde{\mathcal{E}}^{(0)}).$$

To establish that this morphism is an isomorphism, it is sufficient to check it outside $\widetilde{T}^{(0)}$, which reduces the case where the divisor $\widetilde{T}^{(0)}$ is empty and in particular the case where $X^{(1)}$ is also smooth. In this case, we have the canonical isomorphism $a_1^+(\widetilde{\mathcal{E}}^{(0)}) \xrightarrow{\sim} a_1^!(\widetilde{\mathcal{E}}^{(0)})$ and the composition of the canonical morphisms $\mathrm{id} \to \alpha_+ \circ \alpha^+ \xrightarrow{\sim} \alpha_+\alpha^! \to \mathrm{id}$ of functors defined over $\mathrm{MIC}^{\dagger\dagger}(X^{(1)}, \mathfrak{P}^{(1)}/\mathcal{V}) \cap D^{\mathrm{b}}_{\text{1-ovhol}}(\mathcal{D}^\dagger_{\mathfrak{P}^{(1)}}({}^\dagger T^{(1)})_{\mathbb{Q}})$ is an isomorphism (indeed, since this is a morphism of overconvergent isocrystals, it is sufficient to check it over a dense open subset of $X^{(1)}$ where the induced by α morphism is finite and etale). □

Lemma 16.1.6.6. *We suppose that the k-variety $X^{(0)}$ is smooth. Let $(\mathcal{E}^{(0)}, \widetilde{\mathcal{E}}, \rho)$ be an object of the category* $\mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V})} \mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T}/\mathcal{V})$. *Then $\widetilde{\mathcal{E}}$, $\mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}})$, $\mathbb{D}_T(\widetilde{\mathcal{E}})$, $\mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}})$ are overcoherent and holonomic as $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module.*

Proof. By definition of the $\mathcal{L}oc\colon \mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T}/\mathcal{V}) \to \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, \widetilde{T}^{(\bullet)}/\mathcal{V})$, we have $\mathcal{L}oc(\widetilde{\mathcal{E}}) = (a^+(\widetilde{\mathcal{E}}), \theta)$ where θ is the isomorphism induced by the transitivity with respect to the composition of pullbacks functors (see 16.1.3.2).

Since c is a finite and etale morphism (recall notation 16.1.5.0.1), then following Proposition 16.1.3.6, the functors $\mathcal{L}oc$ and $\mathcal{G}lue$ are quasi-inverse equivalence of categories. Hence, $\widetilde{\mathcal{E}} \xrightarrow{\sim} \mathcal{G}lue(a^+(\widetilde{\mathcal{E}}), \theta)$. By definition of 16.1.3.3 of the functor $\mathcal{G}lue$, $\widetilde{\mathcal{E}}$ is then isomorphic to the kernel of a morphism of the form $a_+(\widetilde{\mathcal{E}}) \to a_+ \circ a_{1+} \circ a_1^+(\widetilde{\mathcal{E}})$. By hypothesis, we have the isomorphism $\rho\colon a^+(\widetilde{\mathcal{E}}) \xrightarrow{\sim} \mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})$. Hence, it follows from the Proposition 16.1.6.5 that $\widetilde{\mathcal{E}}$ is isomorphic to the kernel of a morphism of the form:

$$\phi\colon a_+(\mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})) \to \tilde{a}_+ \circ a_1^!(\mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})).$$

Moreover, since $X^{(0)}$ is smooth, then following Theorem 16.1.1.7 $\mathcal{E}^{(0)}$ is 1-$\mathcal{D}^\dagger_{\mathfrak{P}^{(0)}}({}^\dagger T^{(0)})_{\mathbb{Q}}$-overholonomic. By stability of this property by extraordinary inverse images, functor of localisation and direct image by a proper morphism (see 16.1.1.5), this yields the two terms of the morphism ϕ are 1-$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overholonomic. Since $\widetilde{\mathcal{E}}$ is isomorphic to the kernel of ϕ, then it follows from Lemma 16.1.6.4 that $\widetilde{\mathcal{E}}$ and $\mathbb{D}_T(\widetilde{\mathcal{E}})$ are overcoherent and holonomic as $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules.

Since $H^0\mathbb{D}_T$ is an exact functor on the category of holonomic as $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules, then $\mathbb{D}_T(\widetilde{\mathcal{E}})$ is the cokernel of $\mathbb{D}_T(\phi)$. By using 16.1.6.2.2, we get $({}^\dagger \widetilde{T}, T) \circ \mathbb{D}_T(\phi) \xrightarrow{\sim} \mathbb{D}_{\widetilde{T}}(\phi)$. Since the functor $({}^\dagger \widetilde{T}, T)$ is exact over the category of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules, this yields that $\mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}})$ is the cokernel $\mathbb{D}_{\widetilde{T}}(\phi)$. Using again 16.1.6.4, to conclude the proof, it is therefore sufficient to prove that both terms of the morphism $\mathbb{D}_{\widetilde{T}}(\phi)$ are 1-$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overholonomic. On one hand, we have

$$\mathbb{D}_{\widetilde{T}} \circ a_+(\mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})) \overset{9.4.5.2.1}{\xrightarrow{\sim}} a_+ \circ \mathbb{D}_{\widetilde{T}^{(0)}}(\mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})) \overset{4.6.4.4.1}{\xrightarrow{\sim}} a_+ \circ ({}^\dagger \widetilde{T}^{(0)})(\mathbb{D}_{T^{(0)}}(\mathcal{E}^{(0)})). \tag{16.1.6.6.1}$$

On the other hand, we get

$$\begin{aligned} \mathbb{D}_{\widetilde{T}} \circ \tilde{a}_+ \circ a_1^!(\mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})) &\overset{9.4.5.2.1}{\xrightarrow{\sim}} \tilde{a}_+ \circ \mathbb{D}_{\widetilde{T}^{(1)}} \circ a_1^!(\mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})) \overset{8.7.7.3}{\xrightarrow{\sim}} \tilde{a}_+ \circ a_1^+ \circ \mathbb{D}_{\widetilde{T}^{(0)}}(\mathcal{E}^{(0)}({}^\dagger \widetilde{T}^{(0)})) \\ &\overset{4.6.4.4.1}{\xrightarrow{\sim}} \tilde{a}_+ \circ a_1^+ \circ ({}^\dagger \widetilde{T}^{(0)})(\mathbb{D}_{T^{(0)}}(\mathcal{E}^{(0)})) \overset{16.1.6.5}{\xrightarrow{\sim}} \tilde{a}_+ \circ a_1^! \circ ({}^\dagger \widetilde{T}^{(0)})(\mathbb{D}_{T^{(0)}}(\mathcal{E}^{(0)})) \end{aligned} \tag{16.1.6.6.2}$$

Since $\mathbb{D}_{T^{(0)}}(\mathcal{E}^{(0)}) \in \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V})$, then the last term of respectively 16.1.6.6.1 and 16.1.6.6.2 is 1-$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overholonomic. This yields that both terms of $\mathbb{D}_{\widetilde{T}}(\phi)$ are 1-$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overholonomic, and we are done. □

Notation 16.1.6.7. We denote by $\mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T} \supset T/\mathcal{V})$ the full subcategory of $\mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T}/\mathcal{V})$ consisting of objects $\widetilde{\mathcal{E}}$ such that there exists $\mathcal{G} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$ together with an isomorphism of the form $\widetilde{\mathcal{E}}|\mathfrak{U} \xrightarrow{\sim} ({}^\dagger \widetilde{T} \cap U)(\mathcal{G})$.

We have the factorisation $({}^\dagger \widetilde{T})\colon \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T} \supset T/\mathcal{V})$.

Theorem 16.1.6.8. *Suppose $X^{(0)}$ smooth. With the notations of 16.1.6.7, the canonical functor*

$$(a^+, ({}^\dagger \widetilde{T}))\colon \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V})} \mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T} \supset T/\mathcal{V}) \tag{16.1.6.8.1}$$

is an equivalence of categories. We have moreover a canonical quasi-inverse functor denoted by $\mathcal{G}lue$.

Proof. I) Following Lemma 16.1.6.1, we already know that the functor $(a^+, ({}^\dagger \widetilde{T}))$ is fully faithful.

II) 1) Let us construct the quasi-inverse to $(a^+, ({}^\dagger \widetilde{T}))$ functor $\mathcal{G}lue$.

Let $(\mathcal{E}^{(0)}, \widetilde{\mathcal{E}}, \rho) \in \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V})} \mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T} \supset T/\mathcal{V})$. By using 16.1.6.6), the canonical morphism of overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules $\phi\colon \mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \to \widetilde{\mathcal{E}}$ of 16.1.6.2.3 is such that $\mathbb{D}_T(\phi)$ is a morphism of overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules. We can therefore define a $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module $\mathcal{E}$ by setting

$$\mathcal{E} := \mathcal{G}lue(\mathcal{E}^{(0)}, \widetilde{\mathcal{E}}, \rho) := \mathrm{Im}(\mathbb{D}_T \circ \mathbb{D}_{\widetilde{T}}(\widetilde{\mathcal{E}}) \xrightarrow{\phi} \widetilde{\mathcal{E}}). \tag{16.1.6.8.2}$$

Following the Lemma 16.1.6.4, $\mathcal{E}$ and $\mathbb{D}_T(\mathcal{E})$ are overcoherent and holonomic as $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module. By definition of 16.1.6.7, there exists $\mathcal{G} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/\mathcal{V})$ together with and isomorphism of the form $\widetilde{\mathcal{E}}|\mathfrak{U} \xrightarrow{\sim} ({}^\dagger \widetilde{T} \cap U)(\mathcal{G})$. Hence,

$$\mathcal{E}|\mathfrak{U} \xrightarrow{\sim} \mathrm{Im}(\mathbb{D} \circ \mathbb{D}_{\widetilde{T} \cap U}(({}^\dagger \widetilde{T} \cap U)(\mathcal{G})) \xrightarrow{\phi|\mathfrak{U}} ({}^\dagger \widetilde{T} \cap U)(\mathcal{G})).$$

Since Y/S is smooth, then it follows from 16.1.6.3 that $\mathcal{E}|\mathfrak{U} \xrightarrow{\sim} \mathcal{G} \in \mathrm{MIC}^*(Y, \mathfrak{U}/\mathcal{V})$. Hence, $\mathcal{E}|\mathfrak{U}$ is in the essential image of the functor $\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}$. Hence, we have checked that $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$ and therefore $\mathcal{E} \in \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V})$.

2) Since $({}^\dagger \widetilde{T})(\phi)$ is an isomorphism, then so is the canonical arrow $\mathcal{E}({}^\dagger \widetilde{T}) \to \widetilde{\mathcal{E}}$. By full faithfulness of $({}^\dagger \widetilde{T}^{(0)})$ (see 16.1.4.1), this yields the isomorphism: $(a^+, ({}^\dagger \widetilde{T})) \circ \mathcal{G}lue(\mathcal{E}^{(0)}, \widetilde{\mathcal{E}}, \rho) = (a^+(\mathcal{E}), \mathcal{E}({}^\dagger \widetilde{T})) \xrightarrow{\sim} (\mathcal{E}^{(0)}, \widetilde{\mathcal{E}}, \rho)$. Since the functor $(a^+, ({}^\dagger \widetilde{T}))$ is fully faithful, this yields the functors $(a^+, ({}^\dagger \widetilde{T}))$ and $\mathcal{G}lue$ are quasi-inverse. □

Remark 16.1.6.9. Following the proof of 16.1.6.8, the functor $\mathcal{G}lue$ of 16.1.6.8.2 factorizes as follows:

$$\mathcal{G}lue\colon \mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^*(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V})} \mathrm{MIC}^*(X, \mathfrak{P}, \widetilde{T} \supset T/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V}).$$

Lemma 16.1.6.10. *Let P be a smooth k-variety, T be a divisor of P, Y be an integral closed subscheme of $P \setminus T$, Y' be a non-empty open subset of Y. Then there exists a divisor $T' \supset T$ such that $Y \setminus T'$ is included in Y' and is non-empty.*

Proof. We can suppose that P is integral. Set $U := P \setminus T$ and let $(U_i)_{i \in I}$ be a finite covering of U with affine open subschemes. Put $Y_i := Y \cap U_i$, $Y'_i := Y' \cap U_i$. Since Y' is dense in Y, then Y'_i is empty if and only if Y_i is empty. Let I' be the set of the elements $i \in I$ such that Y_i is non-empty. Let $i \in I'$. Then there exists a divisor T'_i of U_i such that $Y_i \setminus T'_i$ is included in Y'_i and is non-empty. By setting $Z' := \cup_{i \in I'} T'_i$, this yields that Z' does not contain the generic point of Y. Moreover, for any $i \in I'$, $Y_i \setminus Z' \subset Y_i \setminus T'_i \subset Y'_i$. For any $i \in I \setminus I'$, we have $Y_i \setminus Z' \subset Y'_i$ because they are both empty. Hence, we have checked $Y \setminus Z'$ is not empty and $Y \setminus Z' \subset Y'$. So, it is sufficient to choose T' equal to the union of T and of the closure of Z' in P.

□

Corollary 16.1.6.11. *Let $(Y, X, \mathfrak{P}, T)$ be a smooth d-frame over $\mathfrak{S}$ (see the definition 12.2.1.1). We have the equalities $\mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{**}(X, \mathfrak{P}, T/\mathcal{V}) = \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/\mathcal{V})$. Moreover, the functor $\mathbb{D}_T$ preserves these categories.*

Proof. With the lemma 16.1.2.9 (and the remark 16.1.2.10), we can suppose Y integral and dense in X. By using de Jong 's desingularisation theorem, there exists a diagram of the form 16.1.5.0.1 with $X^{(0)}$ smooth and satisfying the conditions which are required. Indeed, the existence of the diagram 16.1.5.0.1 is straightforward (thanks to de Jong). Moreover, since Y is integral, then it follows from 16.1.6.10 that shrinking $\widetilde{Y}$ if necessary, we can suppose there exists a divisor $\widetilde{T}$ of P such that $\widetilde{Y} = X \setminus \widetilde{T}$. We can therefore use any result of this section. Hence, the equalities follow from the theorem 16.1.6.8 and of the remark 16.1.6.9. Thanks to the second remark of 16.1.2.7, this yields the last assertion. □

16.1.6.12. Following 16.1.2.8 and 16.1.6.11, and since these functors commutes with Frobenius, then we get the functor exact:

$$\theta^* := \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{!}_{T',T}[-d_{Y'/Y}] \colon (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V}). \qquad (16.1.6.12.1)$$

16.1.7 The equivalence sp_+: finite and etale (outside overconvergent singularities) case

By using the notations and hypotheses of 16.1.3, suppose moreover $X^{(0)}$ smooth over k.

Definition 16.1.7.1. We define the category $\mathrm{MIC}^{\dagger}(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/\mathcal{V})$ as follows:

(i) The objects are the sheaves $E^{(0)} \in \mathrm{MIC}^{\dagger}(Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}/K)$ together with a glueing datum, i.e., an isomorphism in $\mathrm{MIC}^{*}(Y^{(1)}, X^{(1)}, \mathfrak{P}^{(1)}/K)$ of the form $\epsilon \colon a^{*}_{2K}(E^{(0)}) \xrightarrow{\sim} a^{*}_{1K}(E^{(0)})$ satisfying the cocycle condition: $a^{*}_{13K}(\epsilon) = a^{*}_{12K}(\epsilon) \circ a^{*}_{23K}(\epsilon)$ (see notation 10.2.2.8).

(ii) The morphisms $(E^{(0)}, \epsilon) \to (F^{(0)}, \tau)$ are morphisms $\phi \colon E^{(0)} \to F^{(0)}$ of $\mathrm{MIC}^{\dagger}(Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}/K)$ commuting to glueing data, i.e. such that $\tau \circ a^{*}_{2K}(\phi) = a^{*}_{1K}(\phi) \circ \epsilon$.

Proposition 16.1.7.2. *With the notations of 16.1.7.1 and 16.1.3.1, we have the canonical equivalence of categories of the form* $\mathrm{sp}_{X^{(\bullet)} \hookrightarrow \mathfrak{P}^{(\bullet)}, T^{(\bullet)},+} \colon \mathrm{MIC}^{\dagger}(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K) \cong \mathrm{MIC}^{*}(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$.

Proof. Via the lemma 16.1.2.9 and the remark 16.1.2.10, by noticing that the closure of a irreducible component of $Y^{(0)}$ is still smooth, we reduce to the case where Y (resp. $Y^{(0)}$) is integral and dense in X (resp. $X^{(0)}$). Following the theorem of desingularization of de Jong (of the form 10.4.1.2), we have a surjective, projective, generically finite and etale morphism, $\alpha \colon X'' \to X^{(1)}$ such that X'' is smooth and $\alpha^{-1}(T^{(1)} \cap X^{(1)})$ is a divisor of X''. Then there exists a projective and smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes of the form $f'' \colon \mathfrak{P}'' \to \mathfrak{P}^{(1)}$, a closed immersion $X'' \hookrightarrow \mathfrak{P}''$ such that their composition gives the composite morphism $X'' \to X^{(1)} \hookrightarrow \mathfrak{P}^{(1)}$. Set $T'' := (f'')^{-1}(\widetilde{T}^{(0)})$, $Y'' := X'' \setminus T''$, $\mathfrak{U}'' := \mathfrak{P}'' \setminus T''$, $\beta \colon Y'' \to Y^{(1)}$ the morphism induced by α and $\alpha := (\beta, \alpha, f'') \colon (Y'', X'', \mathfrak{P}'', \widetilde{T}''/\mathcal{V}) \to (Y^{(1)}, X^{(1)}, \mathfrak{P}^{(1)}, \widetilde{T}^{(1)}/\mathcal{V})$.

I) Construction of $\mathrm{sp}_{X^{(\bullet)} \hookrightarrow \mathfrak{P}^{(\bullet)}, T^{(\bullet)},+} \colon \mathrm{MIC}^{\dagger}(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K) \to \mathrm{MIC}^{*}(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$. Let $(E^{(0)}, \epsilon) \in \mathrm{MIC}^{\dagger}(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K)$. Since $X^{(0)}$ is smooth, we can use the functor of 12.2.2.6.1 and we set $\mathcal{E}^{(0)} := \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)},+}(E^{(0)})$. Set $\mathcal{F}_1 := a_1^{+}(\mathcal{E}^{(0)})$ and $\mathcal{F}_2 := a_2^{+}(\mathcal{E}^{(0)})$.

i) Construction of the isomorphism $\varepsilon'' \colon \alpha^{+}(\mathcal{F}_2) \xrightarrow{\sim} \alpha^{+}(\mathcal{F}_1)$.

a) For $i = 1, 2$, since X'' and $X^{(0)}$ are smooth, by commutativity of functors of the form $\mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)},+}$ with inverse images (see 12.2.4.1) and dual functors (see 12.2.5.6), we get the canonical isomorphism $(\alpha \circ a_i)^{+} \circ \mathcal{E}^{(0)} \xrightarrow{\sim} \mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'',+} \circ {}^{\vee} \circ (\alpha \circ a_i)^{*}_{K} \circ {}^{\vee}(E^{(0)})$, where $\vee$ is the dual functor in the categories of overconvergent isocrystals. Moreover, since dual functors and inverse images commute over the category of overconvergent isocrystals, then we get the isomorphism: $(\alpha \circ a_i)^{*}_{K}(E^{(0)}) \xrightarrow{\sim} {}^{\vee} \circ (\alpha \circ a_i)^{*}_{K} \circ {}^{\vee}(E^{(0)})$. Moreover, by transitivity of the inverse image, $\alpha^{+}(\mathcal{F}_i) \xrightarrow{\sim} (\alpha \circ a_i)^{+} \circ \mathcal{E}^{(0)}$. Hence, $\alpha^{+}(\mathcal{F}_i) \xrightarrow{\sim} \mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'',+} \circ (\alpha \circ a_i)^{*}_{K}(E^{(0)})$.

b) By applying α^{*}_{K} to the glueing structural isomorphism $\epsilon \colon a^{*}_{2K}(E^{(0)}) \xrightarrow{\sim} a^{*}_{1K}(E^{(0)})$, we get the isomorphism $\epsilon'' \colon (\alpha \circ a_2)^{*}_{K}(E^{(0)}) \xrightarrow{\sim} (\alpha \circ a_1)^{*}_{K}(E^{(0)})$. This yields the canonical isomorphism $\varepsilon'' \colon \alpha^{+}(\mathcal{F}_2) \xrightarrow{\sim} \alpha^{+}(\mathcal{F}_1)$ making commutative the following diagram:

$$\begin{array}{ccccc} \alpha^{+}(\mathcal{F}_2) & = & \alpha^{+} \circ a_2^{+}(\mathcal{E}^{(0)}) & \xrightarrow{\sim} & \mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'',+} \circ (\alpha \circ a_2)^{*}(E^{(0)}) \\ {\scriptstyle \varepsilon''} \downarrow {\scriptstyle \sim} & & {\scriptstyle \varepsilon''} \downarrow {\scriptstyle \sim} & & {\scriptstyle \sim} \downarrow {\scriptstyle \mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'',+}(\epsilon'')} \\ \alpha^{+}(\mathcal{F}_1) & = & \alpha^{+} \circ a_1^{+}(\mathcal{E}^{(0)}) & \xrightarrow{\sim} & \mathrm{sp}_{X'' \hookrightarrow \mathfrak{P}'', T'',+} \circ (\alpha \circ a_1)^{*}(E^{(0)}) \end{array} \qquad (16.1.7.2.1)$$

whose horizontal isomorphisms are built just above at I.i)a).

ii) Denote by $\widehat{E}^{(0)} := E^{(0)}|]Y^{(0)}[_{\mathfrak{U}^{(0)}}$ and by $\widehat{\epsilon}\colon b_2^*(\widehat{E}^{(0)}) \xrightarrow{\sim} b_1^*(\widehat{E}^{(0)})$ the canonically induced by ϵ isomorphism of $\mathrm{MIC}^\dagger(Y^{(1)}, Y^{(1)}, \mathfrak{U}^{(1)}/K)$. We get the canonical isomorphism $\widehat{\varepsilon}\colon \mathcal{F}_2|\mathfrak{U}^{(1)} \xrightarrow{\sim} \mathcal{F}_1|\mathfrak{U}^{(1)}$ making commutative the diagram below:

$$\begin{array}{ccccc} \mathcal{F}_2|\mathfrak{U}^{(1)} & \xrightarrow{\sim} & b_2^+(\mathcal{E}^{(0)}|\mathfrak{U}^{(0)}) & \xrightarrow{\sim} & \mathrm{sp}_{Y^{(1)}\hookrightarrow\mathfrak{U}^{(1)},+}\circ b_2^*(\widehat{E}^{(0)}) \\ {\scriptstyle\widehat{\varepsilon}}\downarrow\wr & & & & \wr\downarrow{\scriptstyle\mathrm{sp}_{Y^{(1)}\hookrightarrow\mathfrak{U}^{(1)},+}(\widehat{\epsilon})} \\ \mathcal{F}_1|\mathfrak{U}^{(1)} & \xrightarrow{\sim} & b_1^+(\mathcal{E}^{(0)}|\mathfrak{U}^{(0)}) & \xrightarrow{\sim} & \mathrm{sp}_{Y^{(1)}\hookrightarrow\mathfrak{U}^{(1)},+}\circ b_1^*(\widehat{E}^{(0)}) \end{array} \tag{16.1.7.2.2}$$

whose horizontal isomorphisms are built similarly to that of 16.1.7.2.1 (because b_1 and b_2 are morphisms of completely smooth frames and so we can use 12.2.4.1 and 12.2.5.6).

iii) The morphisms ε'', $\widehat{\varepsilon}$ induce canonically the same morphism of the form $\alpha^+(\mathcal{F}_2)|\mathfrak{U}'' \xrightarrow{\sim} \alpha^+(\mathcal{F}_1)|\mathfrak{U}''$. This means that the pair $(\varepsilon'', \widehat{\varepsilon})$ is a morphism of $\mathrm{MIC}^*(X'', \mathfrak{P}'', T''/\mathcal{V}) \times_{\mathrm{MIC}^*(Y'',\mathfrak{U}''/\mathcal{V})} \mathrm{MIC}^*(Y^{(1)}, \mathfrak{U}^{(1)}/\mathcal{V})$. Moreover, following 16.1.5.2 the canonical functor

$$(\alpha^+, |\mathfrak{U}^{(1)})\colon \mathrm{MIC}^*(X^{(1)}, \mathfrak{P}^{(1)}, T^{(1)}/\mathcal{V}) \to \mathrm{MIC}^*(X'', \mathfrak{P}'', T''/\mathcal{V}) \times_{\mathrm{MIC}^*(Y'',\mathfrak{U}''/\mathcal{V})} \mathrm{MIC}^*(Y^{(1)}, \mathfrak{U}^{(1)}/\mathcal{V})$$

is fully faithful. Let $\varepsilon\colon \mathcal{F}_2 \xrightarrow{\sim} \mathcal{F}_1$ be the morphism such that $(\alpha^+, |\mathfrak{U}^{(1)})(\varepsilon) = (\varepsilon'', \widehat{\varepsilon})$. By faithfulness of the restriction functor $|\mathfrak{U}^{(2)}$, this isomorphism $\varepsilon\colon a_2^+(\mathcal{E}^{(0)}) \xrightarrow{\sim} a_1^+(\mathcal{E}^{(0)})$ satisfies the cocycle condition. Hence, we have built the functor $\mathrm{sp}_+\colon \mathrm{MIC}^\dagger(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K) \to \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$ by setting $\mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}(E^{(0)}, \epsilon) := (\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}(E^{(0)}), \varepsilon)$.

II) Let check that the functor $\mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}$ induces an equivalence of categories.

i) Since $\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}$ is faithful, then so is of $\mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}$. We prove the fullness as follow: Let $(E^{(0)}, \epsilon), (\widetilde{E}^{(0)}, \varepsilon) \in \mathrm{MIC}^\dagger(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K)$. Set $(\mathcal{E}^{(0)}, \varepsilon) := \mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}(E^{(0)}, \epsilon)$, $(\widetilde{\mathcal{E}}^{(0)}, \widetilde{\varepsilon}) := \mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}(\widetilde{E}^{(0)}, \widetilde{\epsilon})$. Let

$$\psi\colon (\mathcal{E}^{(0)}, \varepsilon) \to (\widetilde{\mathcal{E}}^{(0)}, \widetilde{\varepsilon})$$

be a morphism of $\mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$. We keep notation of the step I) of the proof concerning the morphisms ε'', $\widehat{\varepsilon}$, ε, ϵ'', $\widehat{\epsilon}$ induced by ϵ ; similarly by adding tildes. Since $X^{(0)}$ is smooth, then the functor $\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}$ of 12.2.2.6.1 is fully faithful. Let $\phi\colon E^{(0)} \to \widetilde{E}^{(0)}$ be morphism such that $\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}(\phi) = \psi$. It remains to prove that ϕ commutes with the respective glueing data. Consider the diagram below:

$$\begin{array}{ccccccc} & & \alpha^+\circ a_2^+(\widetilde{\mathcal{E}}^{(0)}) & \longrightarrow & & & \mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}\circ(\alpha\circ a_2)^*(\widetilde{E}^{(0)}) \\ & \nearrow^{\psi} & & & & \nearrow^{\phi} & \\ \alpha^+\circ a_2^+(\mathcal{E}^{(0)}) & \longrightarrow & & & \mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}\circ(\alpha\circ a_2)^*(E^{(0)}) & & \downarrow{\scriptstyle\mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}(\widetilde{\epsilon}'')} \\ & & \downarrow{\scriptstyle\widetilde{\varepsilon}''} & & & & \\ {\scriptstyle\varepsilon''}\downarrow & & \alpha^+\circ a_1^+(\widetilde{\mathcal{E}}^{(0)}) & \longrightarrow & \downarrow{\scriptstyle\mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}(\epsilon'')} & \longrightarrow & \mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}\circ(\alpha\circ a_1)^*(\widetilde{E}^{(0)}) \\ & \nearrow_{\psi} & & & & \nearrow_{\phi} & \\ \alpha^+\circ a_1^+(\mathcal{E}^{(0)}) & \longrightarrow & & & \mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}\circ(\alpha\circ a_1)^*(E^{(0)}), & & \end{array} \tag{16.1.7.2.3}$$

where the horizontal arrows toward the back are the ones canonically induced by ϕ or ψ. Since ψ commutes with glueing data, the left square is commutative. The horizontal squares are commutative by functoriality, while the commutativity of the front and back squares are by definition (see 16.1.7.2.1). Since the five other squares of the cube 16.1.7.2.3 are commutative, then so is the right square. Since the functor $\mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}$ is faithful, this square remains commutative without $\mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}$.

Similarly, using the cube deduced from 16.1.7.2.2 by functoriality, we can check the morphism $\phi|]Y^{(0)}[_{\mathfrak{U}^{(0)}}\colon E^{(0)}|]Y^{(0)}[_{\mathfrak{U}^{(0)}} \to \widetilde{E}^{(0)}|]Y^{(0)}[_{\mathfrak{U}^{(0)}}$ of $\mathrm{MIC}^\dagger(Y^{(0)}, Y^{(0)}, \mathfrak{U}^{(0)}/K)$ commutes with glueing data. By faithfulness of the functor $(\alpha^*, j^{(0)*})$ (see the theorem 10.4.1.1), this yields ϕ commutes to glueing data and we are done.

ii) Let $(\mathcal{E}^{(0)}, \varepsilon) \in \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V})$. Since the functor $\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}$ is essentially surjective, then there exists $E^{(0)} \in \mathrm{MIC}^\dagger(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/\mathcal{V})$ together with an isomorphism

$$\iota\colon \mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}(E^{(0)}) \xrightarrow{\sim} \mathcal{E}^{(0)}.$$

Since the functor $\mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}$ is fully faithful, then there exists an unique isomorphism $\epsilon''\colon \alpha_K^*\circ a_{2K}^*(E^{(0)})\xrightarrow{\sim}\alpha_K^*\circ a_{1K}^*(E^{(0)})$ making commutative the following diagram:

$$\begin{array}{ccccc}\alpha^+\circ a_2^+(\mathcal{E}^{(0)}) & \xrightarrow[\iota]{\sim} & \alpha^+\circ a_2^+(\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}(E^{(0)})) & \xrightarrow{\sim} & \mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}\circ\alpha_K^*\circ a_{2K}^*(E^{(0)}) \\ {\scriptstyle \alpha^+(\varepsilon)}\downarrow\wr & & & & \wr\downarrow{\scriptstyle \mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}(\epsilon'')} \\ \alpha^+\circ a_1^+(\mathcal{E}^{(0)}) & \xrightarrow[\iota]{\sim} & \alpha^+\circ a_1^+(\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}(E^{(0)})) & \xrightarrow{\sim} & \mathrm{sp}_{X''\hookrightarrow\mathfrak{P}'',T'',+}\circ\alpha_K^*\circ a_{1K}^*(E^{(0)})\end{array} \quad (16.1.7.2.4)$$

whose horizontal right isomorphisms are built as above at I.i)a).

Set $\widehat{E}^{(0)}:=E^{(0)}|]Y^{(0)}[_{\mathfrak{U}^{(0)}}$. Since the functor $\mathrm{sp}_{Y^{(1)}\hookrightarrow\mathfrak{U}^{(1)},+}$ is fully faithful, then there exists a unique isomorphism $\widehat{\epsilon}\colon b_2^*(\widehat{E}^{(0)})\xrightarrow{\sim} b_1^*(\widehat{E}^{(0)})$ making commutative the diagram below:

$$\begin{array}{ccccc}b_2^+(\mathcal{E}^{(0)}|\mathfrak{U}^{(0)}) & \xrightarrow[\iota]{\sim} & b_2^+(\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}(E^{(0)})|\mathfrak{U}^{(0)}) & \xrightarrow{\sim} & \mathrm{sp}_{Y^{(1)}\hookrightarrow\mathfrak{U}^{(1)},+}\circ b_2^*(\widehat{E}^{(0)}) \\ {\scriptstyle \varepsilon|\mathfrak{U}^{(0)}}\downarrow\wr & & & & \wr\downarrow{\scriptstyle \mathrm{sp}_{Y^{(1)}\hookrightarrow\mathfrak{U}^{(1)},+}(\widehat{\epsilon})} \\ b_1^+(\mathcal{E}^{(0)}|\mathfrak{U}^{(0)}) & \xrightarrow[\iota]{\sim} & b_1^+(\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}(E^{(0)})|\mathfrak{U}^{(0)}) & \xrightarrow{\sim} & \mathrm{sp}_{Y^{(1)}\hookrightarrow\mathfrak{U}^{(1)},+}\circ b_1^*(\widehat{E}^{(0)})\end{array} \quad (16.1.7.2.5)$$

Following 10.4.1.1, the canonical functor

$$(\alpha_K^*,\,|]Y^{(1)}[_{\mathfrak{U}^{(1)}})\colon \mathrm{MIC}^\dagger(X^{(1)},\mathfrak{P}^{(1)},T^{(1)}/\mathcal{V})\to\mathrm{MIC}^\dagger(Y'',X'',\mathfrak{P}''/\mathcal{V})\times_{\mathrm{MIC}^\dagger(Y'',\mathfrak{U}''/\mathcal{V})}\mathrm{MIC}^\dagger(Y^{(1)},\mathfrak{U}^{(1)}/\mathcal{V})$$

is fully faithful. Let $\epsilon\colon a_{2K}^*(E^{(0)})\xrightarrow{\sim} a_{1K}^*(E^{(0)})$ be the morphism such that $(\alpha_K^*,\,|]Y^{(1)}[_{\mathfrak{U}^{(1)}})(\epsilon)=(\epsilon'',\widehat{\epsilon})$. By faithfulness of the restriction functor $|]Y^{(2)}[_{\mathfrak{U}^{(2)}}$, this isomorphism ϵ satisfies the cocycle condition. By construction of the functor $\mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}$ (see the part I), we can check that ι induces the isomorphism: $\iota\colon \mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}(E^{(0)},\epsilon)\xrightarrow{\sim}(\mathcal{E}^{(0)},\varepsilon)$. Hence, we are done. □

Corollary 16.1.7.3. *With the notations and hypotheses of the section, we have the canonical equivalence of categories* $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}\colon\mathrm{MIC}^\dagger(Y,X,\mathfrak{P}/K)\cong\mathrm{MIC}^*(X,\mathfrak{P},T/\mathcal{V})$.

Proof. By using the lemma 16.1.2.9 and the remark 16.1.2.10, we reduce to the case where Y (resp. $Y^{(0)}$) is integral and dense in X (resp. $X^{(0)}$).

I) Construction of $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}$.

Denote by $\mathcal{L}oc\colon\mathrm{MIC}^\dagger(Y,X,\mathfrak{P}/K)\to\mathrm{MIC}^\dagger(Y^{(\bullet)},X^{(\bullet)},\mathfrak{P}^{(\bullet)}/K)$ the canonical functor (built similarly to 16.1.3.2). Following the descent theorem of Shiho (see [Shi07, 7.3]), this functor $\mathcal{L}oc$ is an equivalence of categories. We get the functor $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}$ by setting

$$\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}:=\mathcal{G}lue\circ\mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}\circ\mathcal{L}oc.$$

Moreover, following 16.1.7.2 (resp. 16.1.3.6) the functor $\mathrm{sp}_{X^{(\bullet)}\hookrightarrow\mathfrak{P}^{(\bullet)},T^{(\bullet)},+}$ (resp. $\mathcal{G}lue$) is also an equivalence of categories. Then so is the functor $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}$.

II) Let's check now that this equivalence is canonical i.e. does not depend up to canonical isomorphism on the morphism $(Y^{(0)},X^{(0)},\mathfrak{P}^{(0)},T^{(0)})\to(Y,X,\mathfrak{P},T)$ of smooth d-frames (see the definition 12.2.1.1) such that $X^{(0)}$ is integral, smooth and whose corresponding conditions of the paragraph 16.1.2.14 are satisfied.

Let $(b',a',f')\colon(Y'^{(0)},X'^{(0)},\mathfrak{P}'^{(0)},T'^{(0)})\to(Y,X,\mathfrak{P},T)$ be a second morphism of smooth d-frames such that $X'^{(0)}$ is integral and smooth, $Y'^{(0)}$ is dense in $X'^{(0)}$ and whose conditions of the paragraph 16.1.2.14 are fulfilled. Concerning this second choice, we keep the similar to 16.1.3 notations by adding primes. We denote by $\mathrm{sp}_{X'^{(\bullet)}\hookrightarrow\mathfrak{P}'^{(\bullet)},T'^{(\bullet)},+}$ the functor defined at 16.1.7.2 by replacing the glueing data over $X^{(0)}$ by that over $X'^{(0)}$. Moreover, in order to distinguish between the two choices, denote by $\mathcal{L}oc'\colon\mathrm{MIC}^*(X,\mathfrak{P},T/\mathcal{V})\to\mathrm{MIC}^*(X'^{(\bullet)},\mathfrak{P}'^{(\bullet)},T'^{(\bullet)}/\mathcal{V})$ and $\mathcal{L}oc'\colon\mathrm{MIC}^\dagger(Y,X,\mathfrak{P}/K)\to\mathrm{MIC}^\dagger(Y'^{(\bullet)},X'^{(\bullet)},\mathfrak{P}'^{(\bullet)}/K)$ the usually denoted by $\mathcal{L}oc$ functors. Similarly, the glueing functor of the second choice is denoted by $\mathcal{G}lue'\colon\mathrm{MIC}^*(X'^{(\bullet)},\mathfrak{P}'^{(\bullet)},T'^{(\bullet)}/\mathcal{V})\to\mathrm{MIC}^*(X,\mathfrak{P},T/\mathcal{V})$.

By setting $\mathrm{sp}'_{X\hookrightarrow\mathfrak{P},T,+}:=\mathcal{G}lue'\circ\mathrm{sp}_{X'^{(\bullet)}\hookrightarrow\mathfrak{P}'^{(\bullet)},T'^{(\bullet)},+}\circ\mathcal{L}oc'$, it is a question of establishing that the two functors $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}$ and $\mathrm{sp}'_{X\hookrightarrow\mathfrak{P},T,+}$ are canonically isomorphic.

i) We reduce to the case where $(b',a',f')\colon(Y'^{(0)},X'^{(0)},\mathfrak{P}'^{(0)},T'^{(0)})\to(Y,X,\mathfrak{P},T)$ factors through $(Y'^{(0)},X'^{(0)},\mathfrak{P}'^{(0)},T'^{(0)})\to(Y^{(0)},X^{(0)},\mathfrak{P}^{(0)},T^{(0)})$.

Following de Jong 's desingularisation theorem (of the form 10.4.1.2), there exists a projective, surjective, generically finite and etale morphism $\alpha\colon X''^{(0)}\to X'^{(0)}\times_X X^{(0)}$ with $X''^{(0)}$ smooth. As this latter morphism is projective, then there exists a projective and smooth morphism of the form $q\colon \mathfrak{P}''^{(0)} \to \mathfrak{P}'^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$, a closed immersion $X''^{(0)} \hookrightarrow \mathfrak{P}''^{(0)}$ such that their composition gives the composite morphism $X''^{(0)} \to X'^{(0)} \times_X X^{(0)} \hookrightarrow \mathfrak{P}'^{(0)} \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$. Then we get a morphism $(Y''^{(0)}, X''^{(0)}, \mathfrak{P}''^{(0)}, T''^{(0)}) \to (Y, X, \mathfrak{P}, T)$ which factors through $(Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}) \to (Y, X, \mathfrak{P}, T)$ and $(Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y, X, \mathfrak{P}, T)$.

Since α is generically finite and etale, there exists then a divisor $\widetilde{T}$ containing T such that $\widetilde{Y} := X \setminus \widetilde{T}$ is dense in X and such that the morphism $X''^{(0)} \to X$ is finite and etale outside $\widetilde{T}$. Following 16.1.3.4, the functor $\mathcal{G}lue$ of 16.1.3.3 commute with the functors of the form $({}^\dagger \widetilde{T})$. Moreover, so is the functors of the form $\mathcal{L}oc\colon \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) \to \mathrm{MIC}^\dagger(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K)$ or of the form $\mathrm{sp}_{X^{(\bullet)} \hookrightarrow \mathfrak{P}^{(\bullet)}, T^{(\bullet)},+}$. Since $X \setminus \widetilde{T}$ is dense in Y, then according to 16.1.4.1, the functor extension $({}^\dagger \widetilde{T})$ is fully faithful. Hence, we can suppose the morphism $Y''^{(0)} \to Y$ finite and etale. Hence, we are done.

ii) a) Denote the factorization by $\alpha^{(0)}\colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$. We remark that the morphism $\alpha^{(0)}$ induced the factorisation $\alpha^{(1)}\colon (Y'^{(1)}, X'^{(1)}, \mathfrak{P}'^{(1)}, T'^{(1)}) \to (Y^{(1)}, X^{(1)}, \mathfrak{P}^{(1)}, T^{(1)})$ such that, for $i := 1, 2$, $\alpha^{(0)} \circ a'_i = a_i \circ \alpha^{(1)}$. Let $(E^{(0)}, \epsilon) \in \mathrm{MIC}^\dagger(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K)$. The glueing isomorphism ϵ induces then canonically a glueing isomorphism over $\alpha_K^{(0)*}(E^{(0)})$ that we denote by ϵ'. We get the functor $\mathcal{L}oc^{(0)}\colon \mathrm{MIC}^\dagger(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K) \to \mathrm{MIC}^\dagger(Y'^{(\bullet)}, X'^{(\bullet)}/K)$ by setting $\mathcal{L}oc^{(0)}(E^{(0)}, \epsilon) := (\alpha_K^{(0)*}(E^{(0)}), \epsilon')$. We have moreover the canonical isomorphism $\mathcal{L}oc^{(0)} \circ \mathcal{L}oc \xrightarrow{\sim} \mathcal{L}oc'$. Similarly, we build the functor $\mathcal{L}oc^{(0)}\colon \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V}) \to \mathrm{MIC}^*(X'^{(\bullet)}, \mathfrak{P}'^{(\bullet)}, T'^{(\bullet)}/\mathcal{V})$ and we get the canonical isomorphism $\mathcal{L}oc^{(0)} \circ \mathcal{L}oc \xrightarrow{\sim} \mathcal{L}oc'$.

b) Let $E \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$ and $(E^{(0)}, \epsilon) := \mathcal{L}oc(E) \in \mathrm{MIC}^\dagger(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K)$. Since $\alpha^{(0)}$ is a morphism of completely smooth frames, then we have the canonical isomorphism

$$\alpha^{(0)+} \circ \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)},+}(E^{(0)}) \xrightarrow{\sim} \mathrm{sp}_{X'^{(0)} \hookrightarrow \mathfrak{P}'^{(0)}, T'^{(0)},+} \circ \alpha_K^{(0)*}(E^{(0)}).$$

In order to check that this latter isomorphism commutes with glueing data induced by ϵ, by faithfulness of the functor $|\mathfrak{U}'^{(1)}$, we reduce to the case where the divisor T is empty (i.e. $Y = X$), which is straightforward. Hence, we get the isomorphism

$$\mathcal{L}oc^{(0)} \circ \mathrm{sp}_{X^{(\bullet)} \hookrightarrow \mathfrak{P}^{(\bullet)}, T^{(\bullet)},+}(\mathcal{L}oc(E)) \xrightarrow{\sim} \mathrm{sp}_{X'^{(\bullet)} \hookrightarrow \mathfrak{P}'^{(\bullet)}, T'^{(\bullet)},+} \circ \mathcal{L}oc^{(0)}(\mathcal{L}oc(E)). \qquad (16.1.7.3.1)$$

To check that $\mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T,+}(E)$ and $\mathrm{sp}'_{X \hookrightarrow \mathfrak{P}, T,+}(E)$ are canonically isomorphic, it is sufficient to construct a canonical functorial isomorphism of the form $\mathcal{L}oc' \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T,+}(E) \xrightarrow{\sim} \mathcal{L}oc' \circ \mathrm{sp}'_{X \hookrightarrow \mathfrak{P}, T,+}(E)$. Moreover, since $\mathcal{L}oc^{(0)} \circ \mathcal{L}oc \xrightarrow{\sim} \mathcal{L}oc'$ and $\mathcal{L}oc \circ \mathcal{G}lue \xrightarrow{\sim} \mathrm{id}$ (see the proof of 16.1.3.6), the term $\mathcal{L}oc' \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T,+}(E)$ is canonically isomorphic to the left term of 16.1.7.3.1. Similarly, $\mathcal{L}oc' \circ \mathrm{sp}'_{X \hookrightarrow \mathfrak{P}, T,+}(E)$ is canonically isomorphic to the right one.

□

Remark 16.1.7.4. With the notations of 16.1.7.3, when X is smooth, the functor $\mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T,+}$ is by construction (e.g. see the step II) of the proof of 16.1.7.3) canonically isomorphic to that built in the smooth case (see 12.2.2.6.1).

16.1.7.5. With the notations of 16.1.7.3, for any $E \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$, by construction of the functor $\mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T,+}$ (see the step I) of the proof of 16.1.7.3) we have the canonical isomorphism:

$$a^+ \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T,+}(E) \xrightarrow{\sim} \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)},+} \circ a^*(E). \qquad (16.1.7.5.1)$$

Remark 16.1.7.6. With the notations of 16.1.7.3, we will see later that $a^+ = a^!$ (see Theorem 16.1.10.5. But beware that we do not have *by construction* and isomorphism of the form 16.1.7.5.1 where a^+ replaced by $a^!$.

16.1.7.7. Let T' be a divisor containing T. Denote by $Y' := X \setminus T'$, $Y'^{(0)} := X^{(0)} \setminus T'^{(0)}$, $j'\colon Y' \hookrightarrow X$, $j'^{(0)}\colon Y'^{(0)} \hookrightarrow X^{(0)}$ the induced open immersions etc (i.e. we add primes). Consider the diagram

$$\begin{array}{ccccccc}
\mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) & \xrightarrow{\mathcal{L}oc} & \mathrm{MIC}^\dagger(Y^{(\bullet)}, X^{(\bullet)}, \mathfrak{P}^{(\bullet)}/K) & \xrightarrow{\mathrm{sp}_{X^{(\bullet)} \hookrightarrow \mathfrak{P}^{(\bullet)}, T^{(\bullet)},+}} & \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T^{(\bullet)}/\mathcal{V}) & \xrightarrow{\mathcal{G}lue} & \mathrm{MIC}^*(X, \mathfrak{P}, T/\mathcal{V}) \\
\downarrow j'^\dagger & & \downarrow j'^{(0)\dagger} & & \downarrow ({}^\dagger T'^{(0)}) & & \downarrow ({}^\dagger T') \\
\mathrm{MIC}^\dagger(Y', X, \mathfrak{P}/K) & \xrightarrow{\mathcal{L}oc} & ({}^\dagger T'^{(0)})\mathrm{MIC}^\dagger(Y'^{(\bullet)}, X^{(\bullet)}/K) & \xrightarrow{\mathrm{sp}_{X^{(\bullet)} \hookrightarrow \mathfrak{P}^{(\bullet)}, T'^{(\bullet)},+}} & \mathrm{MIC}^*(X^{(\bullet)}, \mathfrak{P}^{(\bullet)}, T'^{(\bullet)}/\mathcal{V}) & \xrightarrow{\mathcal{G}lue} & \mathrm{MIC}^*(X, \mathfrak{P}, T'/\mathcal{V})
\end{array} \qquad (16.1.7.7.1)$$

where $({}^{\dagger}T'^{(0)})$ (resp. $({}^{\dagger}T'^{(0)})$) is the canonical functor induced by $({}^{\dagger}T'^{(0)})$ (resp. $({}^{\dagger}T'^{(0)})$). Since the functors of the form $\mathrm{sp}_{X'^{(0)}\hookrightarrow\mathfrak{P}'^{(0)},T'^{(0)},+}$ (i.e., the functors sp_+ built at 12.2.2.6.1 in the case of a completely smooth d-frame) canonically commute to the functors of the form $j'^{\dagger}$ or $({}^{\dagger}T')$ (this is a special case of 12.2.4.1), then we get the commutativity up to canonical isomorphism of the central square of the diagram 16.1.7.7.1. Since so is two other squares (straightforward for the left square and see 16.1.3.4 for the right one), then we have the canonical isomorphism:

$$({}^{\dagger}T')\circ \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+} \xrightarrow{\sim} \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T',+}\circ j'^{\dagger}. \tag{16.1.7.7.2}$$

16.1.8 The equivalence sp_+

16.1.8.1 (Kedlaya contagiosity phenomena)**.** Let X be a k-variety. Let $j\colon Y\subset X$ and $j'\colon Y'\subset X$ be two open immersions such that Y is k-smooth and Y' is included and dense in Y. The contagiosity theorem of Kedlaya [Ked07, 5.3.7] means that the functor

$$(j'^{\dagger}, j^{*})\colon \mathrm{MIC}^{\dagger}(Y,X/K)\to \mathrm{MIC}^{\dagger}(Y',X/K)\times_{\mathrm{MIC}^{\dagger}(Y',Y/K)}\mathrm{MIC}^{\dagger}(Y,Y/K) \tag{16.1.8.1.1}$$

is an equivalence of categories.

Lemma 16.1.8.2. *With the notations of the section 16.1.5, the functor* $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}$ *built in 16.1.7.3 induces the equivalence of categories:* $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}\colon \mathrm{MIC}^{\dagger}(\widetilde{Y}\subset Y,X/K)\cong \mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V})$*, where* $\mathrm{MIC}^{\dagger}(\widetilde{Y}\subset Y,X/K)$ *the essential image of the fully faithful functor* $\widetilde{j}^{\dagger}\colon \mathrm{MIC}^{\dagger}(Y,X/K)\to\mathrm{MIC}^{\dagger}(\widetilde{Y},X/K)$ *(see 10.4.3.1) and the second category is defined at 16.1.6.7.*

Proof. Let $E\in\mathrm{MIC}^{\dagger}(Y,X/K)$, $\widetilde{E}:=\widetilde{j}^{\dagger}E\in\mathrm{MIC}^{\dagger}(\widetilde{Y}\subset Y,X/K)$, and $\widetilde{\mathcal{E}}:=\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}\widetilde{E}$. Let $G:=E|(Y,Y)\in\mathrm{MIC}^{\dagger}(Y,Y/K)$ be the convergent isocrystal on Y induced by restriction from E, and $\widetilde{G}:=\widetilde{E}|(\widetilde{Y},Y)\in\mathrm{MIC}^{\dagger}(\widetilde{Y},Y/K)$ be the induced restriction by an open immersion. We have the canonical isomorphism $\widetilde{\mathcal{E}}|\mathfrak{U}\xrightarrow{\sim}\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},\widetilde{T}\cap U,+}(\widetilde{G})\overset{16.1.7.7.2}{\xrightarrow{\sim}}({}^{\dagger}\widetilde{T}\cap U)\circ\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}(G)$. Hence, $\widetilde{\mathcal{E}}\in\mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V})$. In other words, we get the commutative (up to canonical isomorphism) diagram below

$$\begin{array}{ccc}\mathrm{MIC}^{\dagger}(\widetilde{Y}\subset Y,X/K) & \hookrightarrow & \mathrm{MIC}^{\dagger}(\widetilde{Y},X/K)\\ \downarrow{\scriptstyle \mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}} & & {\scriptstyle 16.1.7.3}\downarrow{\scriptstyle \mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}}\\ \mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V}) & \hookrightarrow & \mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}/\mathcal{V}).\end{array} \tag{16.1.8.2.1}$$

Since the bottom, top and right functor of the diagram 16.1.8.2.1 are fully faithful then so is the left one. It remains to prove its essential surjectivity. Let $\widetilde{\mathcal{E}}\in\mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V})$. Since the right functor $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}$ of the diagram 16.1.8.2.1 is essentially surjective (see 16.1.7.3), then there exists an isocrystal $\widetilde{E}$ of $\mathrm{MIC}^{\dagger}(\widetilde{Y},X/K)$ such that $\widetilde{\mathcal{E}}\xrightarrow{\sim}\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}(\widetilde{E})$. Denote by $\widetilde{G}:=\widetilde{E}|(\widetilde{Y},Y)\in\mathrm{MIC}^{\dagger}(\widetilde{Y},Y/K)$. We get $\widetilde{\mathcal{E}}|\mathfrak{U}\xrightarrow{\sim}\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},\widetilde{T}\cap U,+}(\widetilde{G})$. By hypothesis, there exists $\mathcal{G}\in\mathrm{MIC}^{\dagger\dagger}(Y,\mathfrak{U}/\mathcal{V})$ together with an isomorphism of the form $\widetilde{\mathcal{E}}|\mathfrak{U}\xrightarrow{\sim}({}^{\dagger}\widetilde{T}\cap U)(\mathcal{G})$. Following 12.2.2.6.1, there exists $G\in\mathrm{MIC}^{\dagger}(Y,Y,\mathfrak{U}/K)$ together with an isomorphism $\mathcal{G}\xrightarrow{\sim}\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}(G)$. Hence,

$$\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},\widetilde{T}\cap U,+}(\widetilde{G})\xrightarrow{\sim}({}^{\dagger}\widetilde{T}\cap U)(\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},+}(G))\overset{16.1.7.7.2}{\xrightarrow{\sim}}\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},\widetilde{T}\cap U,+}(G|(\widetilde{Y},Y)).$$

Since the functor $\mathrm{sp}_{Y\hookrightarrow\mathfrak{U},\widetilde{T}\cap U,+}$ is fully faithful, we get the isomorphism $\widetilde{E}|(\widetilde{Y},Y)\xrightarrow{\sim}G|(\widetilde{Y},Y)$, i.e. $(\widetilde{E},G)$ is an object of $\mathrm{MIC}^{\dagger}(\widetilde{Y},X/K)\times_{\mathrm{MIC}^{\dagger}(\widetilde{Y},Y/K)}\mathrm{MIC}^{\dagger}(Y,Y/K)$. Hence, by using the theorem of contagiosity of Kedlaya (see 16.1.8.1), $\widetilde{E}$ comes from an isocrystal of $\mathrm{MIC}^{\dagger}(Y,X/K)$, i.e. $\widetilde{E}\in\mathrm{MIC}^{\dagger}(\widetilde{Y}\subset Y,X/K)$. □

Remark 16.1.8.3. The fully faithful functor $({}^{\dagger}\widetilde{T})$ of 16.1.4.1 factors through:

$$({}^{\dagger}\widetilde{T})\colon \mathrm{MIC}^{*}(X,\mathfrak{P},T/\mathcal{V})\to\mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V}). \tag{16.1.8.3.1}$$

However, this is not obvious that it is essentially surjective (but this is a consequence of the theorem 16.1.8.4 below). The category $\mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V})$ (and not the essential image of 16.1.8.3.1) was defined so that we get almost for free the equivalence of categories of 16.1.8.2.

Theorem 16.1.8.4. *Let $(Y,X,\mathfrak{P},T)$ be a smooth d-frame (see the definition 12.2.1.1). We have a canonical equivalence of categories denoted by* $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}\colon \mathrm{MIC}^{\dagger}(Y,X/K)\cong \mathrm{MIC}^{*}(X,\mathfrak{P},T/K)$.

Proof. With the lemma 16.1.2.9 (and the remark 16.1.2.10), we can suppose Y integral and dense in X. By using de Jong 's desingularisation theorem, there exists a divisor $\widetilde{T}$ containing T and a diagram of the form 16.1.5.0.1 satisfying the required conditions of 16.1.5 and such that moreover $X^{(0)}$ is smooth.

With the notations of the subsection 16.1.5, we define the functor $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}$ as the one making commutative the diagram below:

$$\begin{array}{ccc}
\mathrm{MIC}^{\dagger}(Y,X/K) & \xrightarrow{(a^*,\widetilde{j}^{\dagger})} & \mathrm{MIC}^{\dagger}(Y^{(0)},X^{(0)}/K)\times_{\mathrm{MIC}^{\dagger}(\widetilde{Y}^{(0)},X^{(0)}/K)}\mathrm{MIC}^{\dagger}(\widetilde{Y}\subset Y,X/K)\\
\Big\downarrow{\scriptstyle \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}} & & \Big\downarrow{\scriptstyle \mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}\times\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}}\\
\mathrm{MIC}^{*}(X,\mathfrak{P},T/\mathcal{V}) & \xleftarrow[\mathcal{G}lue]{} & \mathrm{MIC}^{*}(X^{(0)},\mathfrak{P}^{(0)},T^{(0)}/\mathcal{V})\times_{\mathrm{MIC}^{*}(X^{(0)},\mathfrak{P}^{(0)},\widetilde{T}^{(0)}/\mathcal{V})}\mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V}),
\end{array}\tag{16.1.8.4.1}$$

whose bottom functor is the equivalence of categories built at 16.1.6.8.2 in the proof of Theorem 16.1.6.8. Following 10.4.3.2 (resp. 16.1.8.2, resp. 12.2.2.6.1), so is the top functor $(a^*,\widetilde{j}^{\dagger})$ (resp. the right functor $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}$, resp. the right functor $\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}$). This yields the left functor of 16.1.8.4.1 is an equivalence of categories.

It remains to prove that this functor does not depend on the choice of the a diagram of the form 16.1.5.0.1 and satisfying the required conditions. First, lLet us consider the independance in $\widetilde{T}$. Let $\widetilde{T}'$ be a second divisor such that $a^{-1}(X\setminus\widetilde{T}')\to(X\setminus\widetilde{T}')$ is finite and etale. By considering $\widetilde{T}\cup\widetilde{T}'$ if necessary, we can suppose $\widetilde{T}'\supset\widetilde{T}$. Denote by $\widetilde{j}'\colon X\setminus\widetilde{T}'\subset X$ the canonical inclusion. Following 16.1.7.7.2, we have the canonical isomorphisms $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T}',+}\circ\widetilde{j}'^{\dagger}\xrightarrow{\sim}({}^{\dagger}\widetilde{T}')\circ\mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}$. Moreover, following 16.1.6.8 (and its proof), we have the canonical isomorphisms $\mathcal{L}oc\circ\mathcal{G}lue\xrightarrow{\sim}\mathrm{id}$, with is $\mathcal{L}oc=(a^+,({}^{\dagger}\widetilde{T}))$ or $\mathcal{L}oc=(a^+,({}^{\dagger}\widetilde{T}'))$ and the quasi-inverse functor $\mathcal{G}lue$ (see 16.1.6.8.2). We get the canonical isomorphism $\mathcal{G}lue\circ(\mathrm{id}\times({}^{\dagger}\widetilde{T}'))\xrightarrow{\sim}\mathcal{G}lue$. Using the canonical isomorphisms of 16.1.7.7.2 and 12.2.4.1.2, this yields the independance from $\widetilde{T}$.

Denote by $\eta=(b,a,f)\colon(Y^{(0)},X^{(0)},\mathfrak{P}^{(0)})\to(Y,X,\mathfrak{P},T)$ the morphism of d-frames that we have chosen and make a second choice: Let $\eta'=(b',a',f')\colon(Y'^{(0)},X'^{(0)},\mathfrak{P}'^{(0)})\to(Y,X,\mathfrak{P},T)$ be a morphism of d-frames such that denoting by $\widetilde{Y}'^{(0)}:=Y'^{(0)}\setminus f'^{-1}(\widetilde{T})$, we get a diagram of the form 16.1.5.0.1 diagram where we replace "(0)" by "$\prime$(0)" and which satisfies the required conditions of 16.1.5. Suppose moreover $X'^{(0)}$ is smooth. Similarly to in the step II.i) of the proof of 16.1.7.3, desingularising $X'^{(0)}\times_X X^{(0)}$ (by using de Jong theorem) and increasing $\widetilde{T}$ if necessary, we reduce to suppose that we have the strict morphisms of smooth d-frames $\tau\colon(Y'^{(0)},X'^{(0)},\mathfrak{P}'^{(0)},T'^{(0)})\to(Y^{(0)},X^{(0)},\mathfrak{P}^{(0)},T^{(0)})$ and $\widetilde{\tau}\colon(\widetilde{Y}'^{(0)},X'^{(0)},\mathfrak{P}'^{(0)},\widetilde{T}'^{(0)})\to(\widetilde{Y}^{(0)},X^{(0)},\mathfrak{P}^{(0)},\widetilde{T}^{(0)})$ (which factors the diagram 16.1.5.0.1 where we replace "(0)" by "$\prime$(0)"). We have the canonical isomorphism $\eta^+\circ\mathrm{sp}_{X^{(0)}\hookrightarrow\mathfrak{P}^{(0)},T^{(0)},+}\xrightarrow{\sim}\mathrm{sp}_{X'^{(0)}\hookrightarrow\mathfrak{P}'^{(0)},T'^{(0)},+}\circ\tau^*$ (use the commutation with extraordinary inverse image and dual functors of 12.2.4.1 12.2.5.6). Since $\mathcal{L}oc\circ\mathcal{G}lue\xrightarrow{\sim}\mathrm{id}$ with $\mathcal{L}oc=(\eta^+,({}^{\dagger}\widetilde{T}))$ or $\mathcal{L}oc=(\eta'^+,({}^{\dagger}\widetilde{T}))$, we check the canonical isomorphism $\mathcal{G}lue\circ(\eta^+\times\mathrm{id})\xrightarrow{\sim}\mathcal{G}lue$. By using 12.2.4.1.2, we are done. □

16.1.8.5. It follows from the commutative up to canonical isomorphism diagram 16.1.8.4.1 that we get the commutative up to canonical isomorphism diagram:

$$\begin{array}{ccc}
\mathrm{MIC}^{\dagger}(Y,X/K) & \xrightarrow[\cong]{\widetilde{j}^{\dagger}} & \mathrm{MIC}^{\dagger}(\widetilde{Y}\subset Y,X/K)\\
\cong\Big\downarrow{\scriptstyle \mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}} & & \cong\Big\downarrow{\scriptstyle \mathrm{sp}_{X\hookrightarrow\mathfrak{P},\widetilde{T},+}}\\
\mathrm{MIC}^{*}(X,\mathfrak{P},T/\mathcal{V}) & \xrightarrow{({}^{\dagger}\widetilde{T})} & \mathrm{MIC}^{*}(X,\mathfrak{P},\widetilde{T}\supset T/\mathcal{V}).
\end{array}\tag{16.1.8.5.1}$$

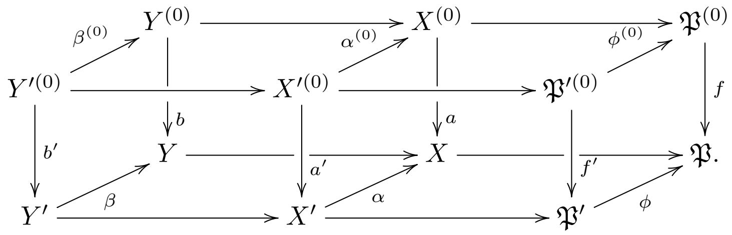
This implies that the bottom functor $({}^{\dagger}\widetilde{T})$ is an equivalence of categories.

Before establishing via the proposition 16.1.11.6 that this equivalence of categories commutes with the duality, Let us check first its commutation to inverse images via the proposition 16.1.8.6:

Proposition 16.1.8.6. *Let $\theta\colon(Y',X',\mathfrak{P}',T')\to(Y,X,\mathfrak{P},T)$ be a morphism of smooth d-frames. We have the canonical isomorphism:*

$$\mathrm{sp}_{X'\hookrightarrow\mathfrak{P}',T',+}\circ\theta^*\xrightarrow{\sim}\theta^+\circ\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}.\tag{16.1.8.6.1}$$

Proof. Set $\theta = (\beta, \alpha, \phi)$. With the lemma 16.1.2.9 (and the remark 16.1.2.10), we reduce to the case where Y (resp. Y') is integral and dense in X (resp. X'). When X and X' are smooth, this theorem of commutation is already well known (see 12.2.4.1.2). To obtain the general case, the idea is to come down to the smooth case thanks to theorem of full faithfulness 16.1.5.2 as follows: by using de Jong 's desingularisation theorem, there exists a morphism of smooth d-frames of the form $\eta = (b, a, f) \colon (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}) \to (Y, X, \mathfrak{P}, T)$ such that $X^{(0)}$ is smooth, f is projective and smooth, a is projective, surjective, generically finite and etale, $f^{-1}(T) = T^{(0)}$ and $T^{(0)} \cap X^{(0)}$ is a (strict normal crossing) divisor of $X^{(0)}$. Similarly by using the de Jong 's desingularisation theorem of the form 10.4.1.2 (applied to $X' \times_X X^{(0)}$ element of $(Y', X', \mathfrak{P}', T') \times_{(Y,X,\mathfrak{P},T)} (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$ and to its divisor complementary to $Y' \times_Y Y^{(0)}$), we build a frame $(Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)})$ smooth with $X'^{(0)}$ smooth and two morphisms of the form $\eta' = (b', a', f') \colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y', X', \mathfrak{P}', T')$ and $\theta^{(0)} = (\beta^{(0)}, \alpha^{(0)}, \phi^{(0)}) \colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$ such that $\theta \circ \eta' = \eta \circ \theta^{(0)}$ and such that f' is projective and smooth, a' is projective, surjective, generically finite and etale, $(f')^{-1}(T') = T'^{(0)}$ and $T'^{(0)} \cap X'^{(0)}$ is a (strict normal crossing) divisor of $X'^{(0)}$. The diagram illustrates our notation:



(16.1.8.6.2)

By full faithfulness of the localisation outside a divisor functor (see the theorem 16.1.4.1), increasing T and T' if necessary, it follows from 16.1.8.5 that we reduce to the case where b and b' are finite and etale. Set $\mathfrak{U} := \mathfrak{P} \setminus T$ and $\mathfrak{U}' := \mathfrak{P}' \setminus T'$ and let $\widehat{\theta} \colon (Y', Y', \mathfrak{U}') \to (Y, Y, \mathfrak{U})$ be the morphism of smooth d-frames induced by θ. Following the case of the smooth partial compactification (use 12.2.4.1 and 12.2.5.6), we have the canonical isomorphism $\mathrm{sp}_{Y' \hookrightarrow \mathfrak{U}',+} \circ \widehat{\theta}^* \xrightarrow{\sim} \widehat{\theta}^+ \circ \mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}$. Hence:

$$|\mathfrak{U}' \circ \mathrm{sp}_{X' \hookrightarrow \mathfrak{P}',T',+} \circ \theta^* \xrightarrow{\sim} \mathrm{sp}_{Y' \hookrightarrow \mathfrak{U}',+} \circ \widehat{\theta}^* \circ |\mathfrak{U} \xrightarrow{\sim} \widehat{\theta}^+ \circ \mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+} \circ |\mathfrak{U} \xrightarrow{\sim} |\mathfrak{U}' \circ \theta^+ \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P},T,+}. \quad (16.1.8.6.3)$$

Moreover, following 16.1.5.2, the functor $(\eta'^+, |\mathfrak{U}')$ is fully faithful. Hence, it remains then to build a compatible with 16.1.8.6.3 isomorphism of the form $\eta'^+ \circ \mathrm{sp}_{X' \hookrightarrow \mathfrak{P}',T',+} \circ \theta^* \xrightarrow{\sim} \eta'^+ \circ \theta^+ \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P},T,+}$. Since $X^{(0)}$ and $X'^{(0)}$ are smooth, then $\mathrm{sp}_{X'^{(0)} \hookrightarrow \mathfrak{P}'^{(0)},T'^{(0)},+} \circ (\theta^{(0)})^* \xrightarrow{\sim} (\theta^{(0)})^+ \circ \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)},T^{(0)},+}$ (use 12.2.4.1 and 12.2.5.6). Moreover, following 16.1.7.5, since b and b' are finite and etale, then we have the isomorphisms $\eta^+ \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P},T,+} \xrightarrow{\sim} \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)},T^{(0)},+} \circ \eta^*$ and $\eta'^+ \circ \mathrm{sp}_{X' \hookrightarrow \mathfrak{P}',T',+} \xrightarrow{\sim} \mathrm{sp}_{X'^{(0)} \hookrightarrow \mathfrak{P}'^{(0)},T'^{(0)},+} \circ \eta'^*$. This yields the canonical isomorphisms

$$\begin{aligned} \eta'^+ \circ \mathrm{sp}_{X' \hookrightarrow \mathfrak{P}',T',+} \circ \theta^* &\xrightarrow{\sim} \mathrm{sp}_{X'^{(0)} \hookrightarrow \mathfrak{P}'^{(0)},T'^{(0)},+} \circ \eta'^* \circ \theta^* \\ &\xrightarrow{\sim} \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)},T^{(0)},+} \circ \theta^{(0)*} \circ \eta^* \xrightarrow{\sim} \theta^{(0)+} \circ \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)},T^{(0)},+} \circ \eta^* \\ &\xrightarrow{\sim} \theta^{(0)+} \circ \eta^{(0)+} \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P},T,+} \xrightarrow{\sim} \eta^{(0)+} \circ \theta^+ \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P},T,+}. \end{aligned} \quad (16.1.8.6.4)$$

Hence we are done. □

16.1.9 Canonical independance in completely smooth d-frame

In this section, when X is smooth we study the independance in $\mathfrak{P}$ and T of the category $(F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$.

Lemma 16.1.9.1. *Let $\mathfrak{P}$ be a smooth $\mathfrak{S}$-formal scheme, $T \subset T'$ two divisors of P and $\mathcal{E}$ a coherent $(F\text{-})\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module.*

(a) There exists a structure of coherent $(F\text{-})\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T')_{\mathbb{Q}}$-module on $\mathcal{E}$ extending its structure of $(F\text{-})\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module.

(b) The canonical morphism $\mathcal{E} \to \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T')_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}$ is an isomorphism.

In particular, the existence of such a structure is local on $\mathfrak{P}$ and such coherent (F-)$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T')_{\mathbb{Q}}$-module is unique if it exists.

Proof. This follows from 8.7.6.11. □

Lemma 16.1.9.2. *Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, X, X' be two smooth closed subschemes of P, T, T' be two divisors of P such that $T \cap X = T' \cap X'$. Let $\natural \in \{\mathrm{coh}, \mathrm{ovcoh}, \mathrm{oc}\}$. We get then the equalities: $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T) = (F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X', \mathfrak{P}, T')$ and $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/K) = (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}, T'/K)$*

Proof. Since the other equality is checked similarly, let us only prove the equality $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T) = (F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X', \mathfrak{P}, T')$. 1) Suppose $T = T'$. Let $\mathcal{E}^{(\bullet)} \in (F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T)$. We have to prove that $\mathcal{E}^{(\bullet)}$ has support in X'. We have to check that the canonical morphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ is an isomorphism (see 13.1.4.8). Since $\mathcal{E}^{(\bullet)} \to ({}^{\dagger}T)\mathcal{E}^{(\bullet)}$ is an isomorphism, then we get the isomorphisms

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X}({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \underset{13.1.5.1.1}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X'}(\mathcal{E}^{(\bullet)}). \tag{16.1.9.2.1}$$

2) Suppose $X = X'$ and $T \subset T'$. Since this is of local nature in $\mathfrak{P}$, we can suppose $\mathfrak{P}$ affine and X is integral. Let us choose then $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ is a closed immersion of smooth formal $\mathfrak{S}$-schemes which is a lifting of $X \hookrightarrow P$. Either $T \cap X$ is a divisor of X or T contains X. When T contains X, the considered categories are reduced to the zero object (this is a consequence of 8.7.6.11). Suppose now that $Z := T \cap X$ is a divisor of X.

Let $\mathcal{E}^{(\bullet)}$ be an object of $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T)$. Following the Berthelot-Kashiwara theorem (see 9.3.5.13 or respectively 15.3.8.26), the functor $u^{(\bullet)}_{T+}$ (resp. $u^{(\bullet)}_{T'+}$) induces an equivalence of categories between $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{X}, Z)$ and $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T)$ (resp. $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T')$). Following 9.2.4.19, the functors $u^{(\bullet)}_{T+}$ and $\mathrm{forg}_{T,T'} \circ u^{(\bullet)}_{T'+}$ are isomorphic. Hence, $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T) = (F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T')$.

3) Since $X \setminus T = X \setminus (T \cup T') = X' \setminus (T \cup T') = X' \setminus T'$, then to check the general case we deduce to the two preceding cases.

□

Lemma 16.1.9.3. *Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of separated and smooth $\mathfrak{S}$-formal schemes, X be a smooth closed subscheme of P' such that the morphism induced $X \to P$ is a closed immersion, Y an open set of X, T be a divisor of P (resp. T' be a divisor of P') such that $Y = X \setminus T$ (resp. $Y = X \setminus T'$). Let $\natural \in \{\mathrm{coh}, \mathrm{ovcoh}, \mathrm{oc}\}$.*

(a) For any $\mathcal{E}^{(\bullet)} \in (F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T)$, for any $\mathcal{E}'^{(\bullet)} \in (F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}', T')$, for any $j \in \mathbb{Z} \setminus \{0\}$,

$$H^j(\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})) = 0, H^j(f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)})) = 0.$$

(b) The functors $\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}$ and $f^{(\bullet)}_{+}$ induce then quasi-inverse equivalences between the categories $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T)$ and $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}', T')$ (resp. between $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/K)$ and $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}', T'/K)$).

Proof. In order to lighten notations, the case with Frobenius structure being similar, we avoid indicating "(F-)" in all categories. It is harmless to suppose P and P' integral. Similarly, since X is smooth and since modules have support in X, then we reduce to the case where X integral. We distinguish then two case: either Y is empty or $T \cap X = T' \cap X$ is a divisor of X. The first case is straightforward since the categories are in this case null. Let us consider now the second case. In this case $f^{-1}(T)$ is a divisor of P'. By 16.1.9.2, since $f^{-1}(T) \cap X = T' \cap X$, then we can suppose $T' = f^{-1}(T)$.

Let us fix $(\mathfrak{P}_{\alpha})_{\alpha \in \Lambda}$ an affine open covering of $\mathfrak{P}$. We denote by $X_{\alpha} := X \cap P_{\alpha}$, $\mathfrak{P}'_{\alpha} := f^{-1}(\mathfrak{P}_{\alpha})$, For any $\alpha \in \Lambda$, let us choose $\mathfrak{X}_{\alpha}$ some smooth formal $\mathfrak{S}$-schemes which is a lifting of X_{α} Let $u'_{\alpha}\colon \mathfrak{X}_{\alpha} \to \mathfrak{P}'_{\alpha}$ some liftings of $X_{\alpha} \to P'_{\alpha}$ We denote by $f_{\alpha}\colon \mathfrak{P}'_{\alpha} \to \mathfrak{P}_{\alpha}$ the morphism induced by f. We set $u_{\alpha} := f_{\alpha} \circ u'_{\alpha}\colon \mathfrak{X}_{\alpha} \to \mathfrak{P}_{\alpha}$. Remark when we will have to check the commutations to glueing data, we have to fix other liftings (e.g. of $X_{\alpha} \cap X_{\beta}$, $X_{\alpha} \cap X_{\beta} \cap X_{\gamma}$) similarly to 9.3.7, but we leave the details to the reader as an exercise. Since the overcoherence (after any base change) is stable under proper pushforward and extraordinary pullbacks, then Theorem 9.3.7.12 still holds replacing the coherence by the overcoherence (after any base change).

1) i) We have the canonical isomorphisms:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})|\mathfrak{P}'_{\alpha} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{X_\alpha} f^{(\bullet)!}_{\alpha}(\mathcal{E}^{(\bullet)}|\mathfrak{P}_{\alpha}) \underset{\sim}{\overset{13.2.1.5.1}{\longrightarrow}} u'^{(\bullet)}_{\alpha+} \circ u'^{(\bullet)!}_{\alpha} \circ f^{(\bullet)!}_{\alpha}(\mathcal{E}^{(\bullet)}|\mathfrak{P}_{\alpha}) \xrightarrow{\sim} u'^{(\bullet)}_{\alpha+} \circ u^{(\bullet)!}_{\alpha}(\mathcal{E}^{(\bullet)}|\mathfrak{P}_{\alpha}). \tag{16.1.9.3.1}$$

Since this is local on $\mathfrak{P}'$, since $\mathcal{E}^{(\bullet)}$ has in support in X, then by using Berthelot-Kashiwara theorem (see 9.3.5.13 or respectively 15.3.8.26) this yields, for any integer $j \neq 0$, we have $H^j(\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})) = 0$ and $\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}', T')$.

ii) The equivalence of categories $u_0^{(\bullet)!} \colon \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T) \cong \underrightarrow{LM}_{\mathbb{Q},\natural}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, T \cap X)$ of 9.3.7.12.(a) is defined by setting $u_0^{(\bullet)!}(\mathcal{E}^{(\bullet)}) = (u_\alpha^{(\bullet)!}(\mathcal{E}^{(\bullet)}|\mathfrak{P}_\alpha))_\alpha$, this latter is endowed with its canonical glueing data. Similarly with of primes. Moreover, by applying $u'^{(\bullet)!}_{\alpha} \circ \underrightarrow{l}^{*}_{\mathbb{Q}}$ to 16.1.9.3.1, via the theorem Berthelot-Kashiwara (see 9.3.5.13 or respectively 15.3.8.26), we get the canonical isomorphism $u'^{(\bullet)!}_{\alpha}(\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})|\mathfrak{P}'_\alpha) \xrightarrow{\sim} u^{(\bullet)!}_{\alpha}(\mathcal{E}^{(\bullet)}|\mathfrak{P}_\alpha)$, this isomorphism commuting to the respective glueing data. Then we have the commutative diagram (up to canonical isomorphism):

$$\begin{array}{ccc} \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}, T) & \underset{\cong}{\xrightarrow{u_0^{(\bullet)!}}} & \underrightarrow{LM}_{\mathbb{Q},\natural}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, T \cap X) \\ \downarrow{\scriptstyle \mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}} & & \| \\ \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}', T') & \underset{\cong}{\xrightarrow{u'^{(\bullet)!}_0}} & \underrightarrow{LM}_{\mathbb{Q},\natural}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, T' \cap X). \end{array} \tag{16.1.9.3.2}$$

2) i) Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\natural}(X, \mathfrak{P}', T')$. Following the theorem of Berthelot-Kashiwara (see 9.3.5.13 or respectively 15.3.8.26), since $\mathcal{E}'^{(\bullet)}|\mathfrak{P}'_\alpha$ has its support in X_α, then $u'^{!}_{\alpha}(\mathcal{E}'^{(\bullet)}|\mathfrak{P}'_\alpha) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}_\alpha}(T' \cap X_\alpha))$ and we have the isomorphism: $\mathcal{E}'^{(\bullet)}|\mathfrak{P}'_\alpha \xrightarrow{\sim} u'^{(\bullet)}_{\alpha+} \circ u'^{(\bullet)!}_{\alpha}(\mathcal{E}'^{(\bullet)}|\mathfrak{P}'_\alpha)$. Hence we get the isomorphism $f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)})|\mathfrak{P}_\alpha \xrightarrow{\sim} f^{(\bullet)}_{\alpha+}(\mathcal{E}'^{(\bullet)}|\mathfrak{P}'_\alpha) \xrightarrow{\sim} u^{(\bullet)}_{\alpha+} \circ u'^{!}_{\alpha}(\mathcal{E}'^{(\bullet)}|\mathfrak{P}'_\alpha)$. Since this is local on $\mathfrak{P}$, this yields, for $j \neq 0$, $H^j(f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)})) = 0$ and $f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{P}, T)$.

ii) The equivalence of categories $u'^{(\bullet)}_{0+} \colon \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{P}_\alpha)_{\alpha\in\Lambda}, T' \cap X) \cong \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{P}', T')$ of b is defined by $(\mathcal{E}^{(\bullet)}_{\alpha})_\alpha \mapsto (u'^{(\bullet)}_{\alpha+}(\mathcal{E}^{(\bullet)}_{\alpha}))_\alpha$, where $(u'^{(\bullet)}_{\alpha+}(\mathcal{E}^{(\bullet)}_{\alpha}))_\alpha$ is endowed with a canonical glueing data. Similarly without primes. This yields the commutative canonical diagram (up to canonical isomorphism):

$$\begin{array}{ccc} \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, T \cap X) & \underset{\cong}{\xrightarrow{u_{0+}^{(\bullet)}}} & \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{P}, T) \\ \| & & \uparrow{\scriptstyle f_+^{(\bullet)}} \\ \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, T' \cap X) & \underset{\cong}{\xrightarrow{u'^{(\bullet)}_{0+}}} & \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{P}', T'). \end{array} \tag{16.1.9.3.3}$$

3) Since the functors $u_0^{(\bullet)!}$ and $u_{0+}^{(\bullet)}$ are quasi-inverse (see 9.3.7.12), via the commutative diagrams (up to canonical isomorphism) 16.1.9.3.2 and 16.1.9.3.3, this yields the functors $\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}$ and $f_+^{(\bullet)}$ induce quasi-inverse equivalences between the categories $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{P}, T)$ and $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{P}', T')$.

4) Concerning the equivalence of categories between $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/K)$ and $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}', T'/K)$, we proceed in the same way: We replace respectively in the proof the category $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, T \cap X)$ by $\mathrm{MIC}^{(\bullet)}((\mathfrak{X}_\alpha)_{\alpha\in\Lambda}, T \cap X/\mathcal{V})$ and the category $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(X, \mathfrak{P}, T)$ by $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$ and similarly with primes (and replace the use of 9.3.7.12 by that of 12.2.2.5). □

Notation 16.1.9.4. Let $f \colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of separated and smooth $\mathfrak{S}$-formal schemes, X be a smooth closed subscheme of P' such that the morphism induced $X \to P$ is a closed immersion, Y an open set of X, T be a divisor of P (resp. T' be a divisor of P') such that $Y = X \setminus T$ (resp. $Y = X \setminus T'$).

Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ such that $\underrightarrow{l}^{*}_{\mathbb{Q}}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}$ (see notation 9.1.6.1). Then we write

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X} f^{(\bullet)!}(\mathcal{E}) := \underrightarrow{l}^{*}_{\mathbb{Q}} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)}).$$

Beware that since $f^!(\mathcal{E})$ is not in general coherent (if f is not smooth and $\mathcal{E}$ is not overcoherent), then $\mathbb{R}\underline{\Gamma}^{\dagger}_{X}(f^!(\mathcal{E}))$ has a priori no meaning.

Corollary 16.1.9.5. *We keep notation 16.1.9.4.*

(a) For any $\mathcal{E} \in (F\text{-})\mathrm{Coh}(X, \mathfrak{P}, T)$, for any $\mathcal{E}' \in (F\text{-})\mathrm{Coh}(X, \mathfrak{P}', T')$, for any $j \in \mathbb{Z} \setminus \{0\}$,

$$H^j(\mathbb{R}\underline{\Gamma}^\dagger_X f^!(\mathcal{E})) = 0, H^j(f_+(\mathcal{E}') = 0.$$

(b) The functors $\mathbb{R}\underline{\Gamma}^\dagger_X f^!$ and f_+ induce then quasi-inverse equivalences between the categories $(F\text{-})\mathrm{Coh}(X, \mathfrak{P}, T)$ and $(F\text{-})\mathrm{Coh}(X, \mathfrak{P}', T')$ (resp. between $(F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$ and $(F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}', T'/K)$).

Remark 16.1.9.6. The lemma 16.1.9.3 will have a variation at 16.2.7.6 in the case of isocrystals.

16.1.10 Isomorphism between inverse images and extraordinary inverse images of partially overcoherent isocrystals

Lemma 16.1.10.1. *Consider the commutative diagram below*

$$\begin{array}{ccc} \mathfrak{P}'^{(0)} & \xrightarrow{\phi^{(0)}} & \mathfrak{P}^{(0)} \\ \downarrow f' & & \downarrow f \\ \mathfrak{P}' & \xrightarrow{\phi} & \mathfrak{P}, \end{array} \qquad (16.1.10.1.1)$$

where ϕ and $\phi^{(0)}$ are proper morphisms of smooth formal $\mathfrak{S}$-schemes, f and f' are smooth morphisms of smooth formal $\mathfrak{S}$-schemes. Let T be a divisor of P such that $T' := \phi^{-1}(T)$ is a divisor of P'. We set $T^{(0)} := f^{-1}(T)$ and $T'^{(0)} := f'^{-1}(T')$. Let $\mathcal{E}'^{(\bullet)} \in D^{\mathrm b}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T')_{\mathbb{Q}})$. Hence, we get the canonical adjunction morphisms: $\phi^{(0)}_+ \circ f'^!(\mathcal{E}'^{(\bullet)}) \to f^! \circ \phi_+(\mathcal{E}'^{(\bullet)})$ and $f^+ \circ \phi^{(0)}_+(\mathcal{E}'^{(\bullet)}) \to \phi_+ \circ f'^+(\mathcal{E}'^{(\bullet)})$. Moreover, when the diagram 16.1.10.1.1 is cartesian, these two morphisms are isomorphisms.

Proof. By using the isomorphism of relative duality of 9.4.5.2.1, we construct the second adjunction morphism from the first one by duality. Hence, we reduce to treat the first adjunction morphism. Let $\mathfrak{P}'' := \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$, $\iota \colon \mathfrak{P}'^{(0)} \to \mathfrak{P}''$, $f'' \colon \mathfrak{P}'' \to \mathfrak{P}'$ and $\phi'' \colon \mathfrak{P}'' \to \mathfrak{P}^{(0)}$ the canonical morphisms. Since ϕ'' and $\phi^{(0)}$ are proper, ι then so is. Hence, we have the adjunction morphism $\iota_+ \circ \iota^! \to \mathrm{id}$ (see 9.4.5.5).

Since f'' is smooth, then the functor $f''^{(\bullet)!}$ preserves the coherence (see 9.4.1.7). Hence, via the equivalence of categories $\underrightarrow{l}^*_{\mathbb{Q}}$ of 8.7.5.4 (i.e. of the form $\underrightarrow{LD}^{\mathrm b}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T)) \cong D^{\mathrm b}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}^\sharp}(T)_{\mathbb{Q}})$) we get the transitivity isomorphism: $f'^!(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \iota^! \circ f''^!(\mathcal{E}'^{(\bullet)})$ (see 9.2.1.14 and 9.2.1.24). Since f' is smooth, this yields that $\iota^! \circ f''^!(\mathcal{E}'^{(\bullet)})$ is coherent. Since ι is proper, following the proposition 13.2.3.7 this yields we have the canonical isomorphism $\iota_+ \circ \iota^! \circ f''^!(\mathcal{E}'^{(\bullet)}) \to f''^!(\mathcal{E}'^{(\bullet)})$. Hence, we get:

$$\phi^{(0)}_+ \circ f'^!(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \phi''_+ \circ \iota_+ \circ \iota^! \circ f''^!(\mathcal{E}'^{(\bullet)}) \to \phi''_+ \circ f''^!(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f^! \circ \phi_+(\mathcal{E}'^{(\bullet)}).$$

When the diagram 16.1.10.1.1 is cartesian, ι is an isomorphism and the adjunction morphism $\iota_+ \circ \iota^! \to \mathrm{id}$ is an isomorphism. Hence, we get the last assertion. □

Notation 16.1.10.2 (Finite and etale outside singularities case)**.** Let $\theta = (\beta, \alpha, \phi) \colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$, $\eta = (b, a, f) \colon (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}) \to (Y, X, \mathfrak{P}, T)$, $\theta^{(0)} = (\beta^{(0)}, \alpha^{(0)}, \phi^{(0)}) \colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$ and $\eta' = (b', a', f') \colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y', X', \mathfrak{P}', T')$ four morphisms of smooth d-frames such that $\theta \circ \eta' = \eta \circ \theta^{(0)}$. We get then the rectangular parallelepiped of 16.1.8.6.2.

In order to give a meaning to the notion of the direct image (on the formal side), we suppose that the four rectangle of 16.1.8.6.2 (i.e., the faces of the front side, of the back side, of the top, bottom) satisfy the hypotheses of 16.1.2.14.1, i.e. they are "finite and etale outside singularities morphisms of d-frames"

Lemma 16.1.10.3. *With the notations and hypotheses of 16.1.10.2, for any $\mathcal{E}' \in \mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}', T'/K)$, we have the functorial in $\mathcal{E}'$ canonical morphisms:*

$$\theta^{(0)}_+ \circ \eta'^!(\mathcal{E}') \to \eta^! \circ \theta_+(\mathcal{E}'^{(\bullet)}), \qquad \eta^+ \circ \theta_+(\mathcal{E}'^{(\bullet)}) \to \theta^{(0)}_+ \circ \eta'^+(\mathcal{E}'). \qquad (16.1.10.3.1)$$

When the left face of 16.1.8.6.2 is cartesian, both morphisms are isomorphisms.

Proof. Via the isomorphism of relative duality (see 9.4.5.2.1) and of biduality (see 8.7.7.3), the second morphism is build by applying the dual functor to the first. We define the first morphism as equal to the composition:

$$\theta^{(0)}_+ \circ \eta'^!(\mathcal{E}') = \phi^{(0)}_+ \circ \mathbb{R}\underline{\Gamma}^\dagger_{X'^{(0)}} \circ f'^!(\mathcal{E}') \to \phi^{(0)}_+ \circ \mathbb{R}\underline{\Gamma}^\dagger_{(\phi^{(0)})^{-1}(X^{(0)})} \circ f'^!(\mathcal{E}') \underset{13.2.1.4.2}{\xrightarrow{\sim}}$$
$$\mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}} \circ \phi^{(0)}_+ \circ f'^!(\mathcal{E}') \underset{16.1.10.1}{\longrightarrow} \mathbb{R}\underline{\Gamma}^\dagger_{X^{(0)}} \circ f^! \circ \phi_+(\mathcal{E}') = \eta^! \circ \theta_+(\mathcal{E}'^{(\bullet)}). \qquad (16.1.10.3.2)$$

Suppose now that the left face of 16.1.8.6.2 is cartesian and let us check that the composite morphism 16.1.10.3.2 becomes an isomorphism. Thanks to 8.7.6.11, we reduce to the case where T is empty, i.e., the face of the middle of 16.1.8.6.2 is equal to the left one and is in particular cartesian. We get a similar to 16.1.8.6.2 commutative diagram where $\mathfrak{P}'^{(0)}$ is replaced by $\mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$ (indeed, we have a canonically induced closed immersion: $X' \times_X X^{(0)} \hookrightarrow \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$). Then denote by $\iota\colon \mathfrak{P}'^{(0)} \to \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$ the canonical morphism.

Since ι is proper (because the morphisms f, f', ϕ, $\phi^{(0)}$ are proper), following the lemma 16.1.2.11, ι_+ and $\iota^!$ induce quasi-inverse equivalences between $\mathrm{MIC}^{\dagger\dagger}(X'^{(0)}, \mathfrak{P}'^{(0)}/K)$ and $\mathrm{MIC}^{\dagger\dagger}(X'^{(0)}, \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{P}^{(0)}/K)$. We reduce therefore to the case where $\mathfrak{P}'^{(0)} = \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$. In this case, following 16.1.10.1, the last morphism of 16.1.10.3.2 is an isomorphism. Moreover, $(\phi^{(0)})^{-1}(X^{(0)}) = P' \times_P X^{(0)}$. Moreover, since $\mathcal{E}'$ has its support in X', $f'^!(\mathcal{E}')$ has its support in $(f')^{-1}(X') = X' \times_P P^{(0)}$. Since $(P' \times_P X^{(0)}) \cap (X' \times_P P^{(0)}) = X' \times_X X^{(0)} = X'^{(0)}$, this yields $\mathbb{R}\underline{\Gamma}^\dagger_{(\phi^{(0)})^{-1}(X^{(0)})} \circ f'^!(\mathcal{E}')$ has its support in $X'^{(0)}$. The first morphism of 16.1.10.3.2 is then an isomorphism. Hence we are done. □

Lemma 16.1.10.4. *Let $\theta = (\beta, \alpha, \phi)\colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ be a strict morphism of smooth d-frames such that ϕ is proper and smooth, α is proper, surjective and β is finite and etale. The functor $\theta_+\colon \mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}', T'/K) \to \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$ is a left adjoint functor of θ^+.*

Proof. 0) With the lemma 16.1.2.9 (and the remark 16.1.2.10), we reduce to the case where Y (resp. Y') is integral and dense in X (resp. X'). By using de Jong 's desingularisation theorem, then there exists a completely smooth d-frame $(Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$ together with a strict morphism $\eta = (b, a, f)\colon (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}) \to (Y, X, \mathfrak{P}, T)$ such that f is projective and smooth, a is projective, surjective, generically finite and etale, and $T^{(0)} \cap X^{(0)}$ is a (strict normal crossing) divisor of $X^{(0)}$.

Moreover, following 16.1.4.1, for any divisor $\widetilde{T}'$ containing T' and such that $X' \setminus \widetilde{T}'$ is dense in Y', the functor $({}^\dagger\widetilde{T}')$ is fully faithful. Hence, increasing T if necessary (and using 13.2.1.4), we can suppose that b is finite and etale. Set $Y'^{(0)} := Y' \times_Y Y^{(0)}$, $X''^{(0)} := X' \times_X X^{(0)}$ $\mathfrak{P}''^{(0)} := \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{P}^{(0)}$. Denote by $\varpi\colon X'^{(0)} \to X''^{(0)}$ the normalisation map (which is the identity over $Y'^{(0)}$). Since $X''^{(0)}$ is an integral k-variety, then ϖ is finite. Hence, there exists a strict morphism of d-frame of the form $(Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y'^{(0)}, X''^{(0)}, \mathfrak{P}''^{(0)}, T''^{(0)})$ such that $\mathfrak{P}'^{(0)} \to \mathfrak{P}''^{(0)}$ is projective and smooth. Let $\theta^{(0)} = (\beta^{(0)}, \alpha^{(0)}, \phi^{(0)})\colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$ and $\eta' = (b', a', f')\colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y', X', \mathfrak{P}', T')$ be the strict morphisms of frames induced by the projections. Then we are in the context of 16.1.10.2 with moreover $X^{(0)}$ smooth, $X'^{(0)}$ normal and the left face of the diagram of 16.1.8.6.2 cartesian.

1) Construction of the morphism $\theta^{(0)}_+ \circ \theta^{(0)+} \to \mathrm{id}$.

Since $\alpha^{(0)}$ is proper and surjective with $X^{(0)}$ smooth and $X'^{(0)}$ normal, since $\beta^{(0)}$ is finite and etale, Tsuzuki has built in this context (see the section [Tsu02, 5]), the pushforward functor of the form $\theta^{(0)}_*\colon \mathrm{MIC}^\dagger(Y'^{(0)}, X'^{(0)}/K) \to \mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K)$ which is right and left adjoint to the pullback functor $(\theta^{(0)})^*$. To lighten the notations, we set $\mathrm{sp}_+ := \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +}$ and $\mathrm{sp}'_+ := \mathrm{sp}_{X'^{(0)} \hookrightarrow \mathfrak{P}'^{(0)}, T'^{(0)}, +}$. Let $E^{(0)} \in \mathrm{MIC}^\dagger(Y^{(0)}, X^{(0)}/K)$, $E'^{(0)} \in \mathrm{MIC}^\dagger(Y'^{(0)}, X'^{(0)}/K)$.

i) Since sp_+ is fully faithful and since $\theta^{(0)}_*$ is right adjoint of $(\theta^{(0)})^*$, we get the canonical functorial isomorphism in $E^{(0)}$ and $E'^{(0)}$:

$$\mathrm{Hom}_{\mathrm{MIC}^\dagger(Y'^{(0)}, X'^{(0)}/K)}((\theta^{(0)})^*(E^{(0)}), E'^{(0)}) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{MIC}^{\dagger\dagger}(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/K)}(\mathrm{sp}_+(E^{(0)}), \mathrm{sp}_+ \circ \theta^{(0)}_*(E'^{(0)}))$$

ii) Following 16.1.8.6, we have the isomorphism $\mathrm{sp}'_+ \circ (\theta^{(0)})^* \xrightarrow{\sim} (\theta^{(0)})^+ \circ \mathrm{sp}_+$. Moreover, following 16.1.2.17.b, the functor $\theta^{(0)}_+$ is right adjoint to $(\theta^{(0)})^+$. Since the functor sp'_+ is fully faithful, using these two facts the functorial in $E^{(0)}$ and $E'^{(0)}$ canonical isomorphism:

$$\mathrm{Hom}_{\mathrm{MIC}^\dagger(Y'^{(0)}, X'^{(0)}/K)}((\theta^{(0)})^*(E^{(0)}), E'^{(0)}) \xrightarrow{\sim} \mathrm{Hom}_{\mathrm{MIC}^{\dagger\dagger}(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/K)}(\mathrm{sp}_+(E^{(0)}), \theta^{(0)}_+ \circ \mathrm{sp}'_+(E'^{(0)}))$$

iii) Using both bijections of i) and ii), we get the functorial in $E'^{(0)}$ canonical isomorphism:

$$\mathrm{sp}_+ \circ \theta_*^{(0)}(E'^{(0)}) \xrightarrow{\sim} \theta_+^{(0)} \circ \mathrm{sp}'_+(E'^{(0)}). \qquad (16.1.10.4.1)$$

iv) Let $\mathcal{E}^{(0)} \in \mathrm{MIC}^{\dagger\dagger}(X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}/K)$, $\mathcal{E}'^{(0)} \in \mathrm{MIC}^{\dagger\dagger}(X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}/K)$. Since the functor sp_+ is essentially surjective, there exists $E_1^{(0)}$, $E_2^{(0)}$ (we make two choices in order to check the canonicity) such that $\mathcal{E}^{(0)} \xleftarrow{\sim} \mathrm{sp}_+(E_1^{(0)})$ and $\mathcal{E}^{(0)} \xrightarrow{\sim} \mathrm{sp}_+(E_2^{(0)})$. Since $\theta_*^{(0)}$ is left adjoint to $(\theta^{(0)})^*$ (resp. using 16.1.10.4.1 and 16.1.8.6), we get the bottom (resp. top) vertical isomorphisms of the diagram:

$$\begin{array}{ccccc} \theta_+^{(0)} \circ \theta^{(0)+} \circ \mathrm{sp}_+(E_1^{(0)}) & \xrightarrow{\sim} & \theta_+^{(0)} \circ \theta^{(0)+}(\mathcal{E}^{(0)}) & \xrightarrow{\sim} & \theta_+^{(0)} \circ \theta^{(0)+} \circ \mathrm{sp}_+(E_2^{(0)}) \\ \downarrow\sim & & & & \downarrow\sim \\ \mathrm{sp}_+ \circ \theta_*^{(0)} \circ \theta^{(0)*}(E_1^{(0)}) & & & & \mathrm{sp}_+ \circ \theta_*^{(0)} \circ \theta^{(0)*}(E_2^{(0)}) \\ \downarrow \mathrm{adj} & & & & \downarrow \mathrm{adj} \\ \mathrm{sp}_+(E_1^{(0)}) & \xrightarrow{\sim} & \mathcal{E}^{(0)} & \xrightarrow{\sim} & \mathrm{sp}_+(E_2^{(0)}) \end{array} \qquad (16.1.10.4.2)$$

Since sp_+ is fully faithful, the bottom composite isomorphism $\mathrm{sp}_+(E_1^{(0)}) \xrightarrow{\sim} \mathrm{sp}_+(E_2^{(0)})$ comes from an isomorphism $E_1^{(0)} \xrightarrow{\sim} E_2^{(0)}$. By functoriality of the vertical isomorphisms, this yields that the diagram 16.1.10.4.2 is commutative. Hence, we get a canonical morphism $\theta_+^{(0)} \circ \theta^{(0)+}(\mathcal{E}^{(0)}) \to \mathcal{E}^{(0)}$.

1 bis) Similarly to the step 1)iv), since $\theta_*^{(0)}$ is left adjoint to $(\theta^{(0)})^*$, then using 16.1.10.4.1 and 16.1.8.6, we build the canonical morphism $\mathcal{E}'^{(0)} \to \theta^{(0)+} \circ \theta_+^{(0)}(\mathcal{E}'^{(0)})$.

2) Construction of the canonical morphism $\theta_+ \circ \theta^+ \to \mathrm{id}$.

Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$, $\mathcal{E}' \in \mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}', T'/K)$. Following 16.1.10.3, we have the change base isomorphism $\eta^+ \circ \theta_+(\mathcal{E}'^{(\bullet)}) \to \theta_+^{(0)} \circ \eta'^+(\mathcal{E}')$. With the morphism $\theta_+^{(0)} \circ \theta^{(0)+} \to \mathrm{id}$ constructed at the step 1), we get the canonical morphism:

$$\eta^+ \circ \theta_+ \circ \theta^+(\mathcal{E}) \xrightarrow{\sim} \theta_+^{(0)} \circ \eta'^+ \circ \theta^+(\mathcal{E}) \xrightarrow{\sim} \theta_+^{(0)} \circ \theta^{(0)+} \circ \eta^+(\mathcal{E}) \xrightarrow{\mathrm{adj}} \eta^+(\mathcal{E}). \qquad (16.1.10.4.3)$$

On the other hand, denoting by $\mathfrak{U} := \mathfrak{P} \setminus T$, $\mathfrak{U}' := \mathfrak{P}' \setminus T'$, $\varphi \colon \mathfrak{U}' \to \mathfrak{U}$ the induced map by ϕ and $\vartheta = (\beta, \beta, \phi) \colon (Y', Y', \mathfrak{U}', T') \to (Y, Y, \mathfrak{U})$, following 16.1.2.15, we have the adjunction morphism

$$|\mathfrak{U} \circ \theta_+ \circ \theta^+(\mathcal{E}) \xrightarrow{\sim} \vartheta_+ \circ \vartheta^+(\mathcal{E}|\mathfrak{U}) \xrightarrow{\mathrm{adj}} \mathcal{E}|\mathfrak{U}. \qquad (16.1.10.4.4)$$

Since the functor $(\eta^+, |\mathfrak{U})$ is fully faithful (see proposition 16.1.5.2), then via the canonical morphisms of 16.1.10.4.3 and 16.1.10.4.4, we get the canonical morphism $\theta_+ \circ \theta^+(\mathcal{E}) \to \mathcal{E}$.

2 bis) Similarly, we build the morphism $\mathcal{E}'^{(\bullet)} \to \theta^+ \circ \theta_+(\mathcal{E}')$.

3) To deduce that θ_+ is left adjoint to θ^+, then it is sufficient (thanks to the proposition 8.7.6.11) to check it outside the divisor. We reduce then to the situation of 16.1.2.15. □

Theorem 16.1.10.5. *Let* $\theta = (\beta, \alpha, \phi) \colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ *be a morphism of smooth d-frames. The functors* $\theta^+, \theta^! \colon \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K) \to \mathrm{MIC}^{\dagger\dagger}(X', \mathfrak{P}', T'/K)$ *are canonically isomorphic.*

Proof. 0) With the lemma 16.1.2.9, we reduce to the case where Y (resp. Y') is integral and dense in X (resp. X').

1) Let us first check the theorem when ϕ is proper and smooth, $T' = \phi^{-1}(T)$, α is proper, surjective, generically finite and etale.

Thanks to 16.1.4.1, for any divisor $\widetilde{T}'$ containing T' and such that $X' \setminus \widetilde{T}'$ is dense in Y', the localisation functor $({}^\dagger \widetilde{T}')$ is fully faithful. Increasing T if necessary, we reduce therefore to the case where β is finite and etale. In this case, following 16.1.10.4, the functor θ^+ is then right adjoint to θ_+ Moreover, then so is $\theta^!$ (see 16.1.1.6.3). Hence we are done.

2) General case. Via the de Jong 's desingularisation theorem, we check (as in the proof of 16.1.8.6) there exists $\eta = (b, a, f) \colon (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)}) \to (Y, X, \mathfrak{P}, T)$, $\theta^{(0)} = (\beta^{(0)}, \alpha^{(0)}, \phi^{(0)}) \colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$ and $\eta' = (b', a', f') \colon (Y'^{(0)}, X'^{(0)}, \mathfrak{P}'^{(0)}, T'^{(0)}) \to (Y', X', \mathfrak{P}', T')$ three strict morphisms of smooth d-frames such that $\theta \circ \eta' = \eta \circ \theta^{(0)}$, f and f' are projective and smooth, a and a' are projective, generically finite and etale, $X'^{(0)}$ and $X^{(0)}$ are smooth, $T^{(0)} \cap X^{(0)}$ is a (strict normal crossing) divisor of $X^{(0)}$, $T'^{(0)} \cap X'^{(0)}$ is a (strict normal crossing) divisor of $X'^{(0)}$. It follows from the step 1) that the functors η^+ and $\eta^!$ (resp. η'^+ and $\eta'^!$) are canonically isomorphic. Moreover, following the proposition 16.1.5.2, the functor $(\eta'^+, |\mathfrak{P}'^{(0)} \setminus T'^{(0)})$ is fully faithful. Hence, we reduce the case where X and X' are smooth, which is already well known (this follows from 12.2.4.1 and 12.2.5.6). $\square$

Remark 16.1.10.6. The main goal of this section was to establish 16.1.10.5. Beware, following [Abe14a, 5.6], to get a compatible with Frobenius isomorphism between θ^+ and $\theta^!$, we have to add a twist. However, when we have a Frobenius structure, this isomorphism can be checked more easily since we then have the theorem of full faithfulness of Kedlaya of [Ked04a]. Indeed, thanks to this theorem of full faithfulness, we reduce to the situation of the smooth partially compactification (i.e., that of 12.2).

This isomorphism of 16.1.10.5 is a fundamental ingredient in the proof of 16.1.11.2.

16.1.11 1-overholonomicity of partially overcoherent isocrystals, duality

Lemma 16.1.11.1. *Let $\mathfrak{P}$ be a separated and smooth $\mathfrak{S}$-formal scheme, $X \hookrightarrow P$ be a closed immersion with X integral, Z be a closed subscheme of P not containing X and such that $Y := X \setminus Z$ is smooth. Then there exists a commutative diagram of the form*

$$\begin{array}{ccccc} X' & \xrightarrow{u'} & \mathbb{P}^N_P & \longrightarrow & \widehat{\mathbb{P}}^N_{\mathfrak{P}} \\ {\scriptstyle a}\downarrow & & \downarrow & \square & \downarrow{\scriptstyle q} \\ X & \xrightarrow{u} & P & \longrightarrow & \mathfrak{P}, \end{array} \tag{16.1.11.1.1}$$

where X' is smooth over k, q is the canonical projection, u' is a closed immersion, $a^{-1}(Z \cap X)$ is a strict normal crossing divisor of X', a is proper, surjective, generically finite and etale.

Proof. By using de Jong 's desingularisation theorem, there exists a quasi-projective smooth variety X', a projective generically finite and etale morphism $a\colon X' \to X$ such that $a^{-1}(Z \cap X)$ is a strict normal crossing divisor of X'. Then there exists an immersion of the form $X' \hookrightarrow \mathbb{P}^N_k$. Since a is proper, the induced immersion $X' \hookrightarrow \mathbb{P}^N_X$ is closed. Hence we get a closed immersion: $X' \hookrightarrow \widehat{\mathbb{P}}^N_{\mathfrak{P}}$ which gives the existence of the commutative diagram 16.1.11.1.1 satisfying the required properties. $\square$

Lemma 16.1.11.2. *Let $\mathfrak{P}$ be a separated and smooth $\mathfrak{S}$-formal scheme, $X \hookrightarrow P$ be a closed immersion with X integral, T be a divisor of P not containing X and such that $Y := X \setminus T$ is dense and smooth. Suppose given a commutative diagram of the form*

$$\begin{array}{ccccc} X' & \xrightarrow{u'} & P' & \longrightarrow & \mathfrak{P}' \\ {\scriptstyle a}\downarrow & & \downarrow & \square & \downarrow{\scriptstyle q} \\ X & \xrightarrow{u} & P & \longrightarrow & \mathfrak{P}, \end{array} \tag{16.1.11.2.1}$$

where X' is smooth over k, q is a proper morphism of smooth $\mathfrak{S}$-formal schemes such $T' := q^{-1}(T)$ is a divisor of P', u' is a closed immersion, $a^{-1}(T \cap X)$ is a divisor of X', a is proper, surjective, generically finite and etale. Let and $\eta := (b, a, q)\colon (Y', X', \mathfrak{P}', T') \to (Y, X, \mathfrak{P}, T)$ be the morphism of smooth d-frames given by the diagram 16.1.11.2.1. Let $\mathcal{E} \in (F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$ (resp. $\mathcal{E}^{(\bullet)} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/K)$). Then $\mathcal{E}$ (resp. $\mathcal{E}^{(\bullet)}$) is a direct summand of $\eta_+ \circ \eta^!(\mathcal{E})$ (resp. $\eta_+^{(\bullet)} \circ \eta^{(\bullet)!}(\mathcal{E}^{(\bullet)})$), where $\eta_+ := q_+$ (resp. $\eta_+^{(\bullet)} := q_+^{(\bullet)}$).

Proof. Since the respective case is treated similarly, then let's only prove the non-respective one. Since q is proper, since $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ and $\mathbb{D}_T(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$ then it follows from 16.1.1.6.(b) that we have the morphisms $\mathcal{E} \to \eta_+ \circ \eta^+(\mathcal{E})$ and $\eta_+ \circ \eta^!(\mathcal{E}) \to \mathcal{E}$. Moreover, following 16.1.10.5, $\eta^!(\mathcal{E}) \xrightarrow{\sim} \eta^+(\mathcal{E})$. Hence, we get the sequence $\mathcal{E} \to \eta_+ \circ \eta^!(\mathcal{E}) \to \mathcal{E}$. Let $T \subset T'$ be a divisor such that $Y' := X \setminus T'$ is dense in Y. Since the functor $|\mathfrak{U}'$, where $\mathfrak{U}' := \mathfrak{P} \setminus T'$, is faithful (use 8.7.6.11 and 16.1.4.1), then to check that the composition of $\mathcal{E} \to \eta_+ \circ \eta^!(\mathcal{E}) \to \mathcal{E}$ is an isomorphism we reduce to the case where a is finite and etale and T is empty, which is already known (see 16.1.2.15.2). $\square$

Proposition 16.1.11.3. *Let $(Y, X, \mathfrak{P}, T)$ be a smooth d-frame over $\mathfrak{S}$.*

(a) *For any object* $\mathcal{E} \in (F\text{-})\mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$*,* $\mathcal{E}$ *is* 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$*-overholonomic (see the definition 16.1.1.1).*

(b) *We have the inclusion:*

$$\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T)). \tag{16.1.11.3.1}$$

(c) *The functor* $\mathbb{D}^{(\bullet)}_{T}$ *of 9.2.4.20 induces the equivalence of categories:*

$$\mathbb{D}^{(\bullet)}_{T} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}). \tag{16.1.11.3.2}$$

Proof. a) By using the lemma 16.1.11.1, we get a diagram of the form 16.1.11.1.1 and satisfying the required conditions. It follows from 16.1.11.2 that $\mathcal{E}$ is therefore a direct summand of $\eta_{+} \circ \eta^{!}(\mathcal{E})$. Since $\eta^{!}(\mathcal{E}) \in \mathrm{MIC}^{\dagger\dagger}(X', \widehat{\mathbb{P}}^{N}_{\mathfrak{P}}, q^{-1}(T)/K)$, as X' is smooth, it follows from 16.1.1.7 that $\eta'^{!}(\mathcal{E})$ is 1-$\mathcal{D}^{\dagger}_{\widehat{\mathbb{P}}^{N}_{\mathfrak{P}}}({}^{\dagger}q^{-1}(T))_{\mathbb{Q}}$-overholonomic By stability 1-overholonomicity by direct image by the a proper morphism (see 16.1.1.5), $\eta_{+} \circ \eta^{!}(\mathcal{E})$ is 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overholonomic. Hence we are done.

b) and c) When X is smooth, this is already known (see respectively 12.2.1.7.1 and 12.2.1.13.1). Hence, we proceed similarly to the part a) by using the stability of perfectness by pushforward of a proper morphism (see 9.4.2.6) and the relative duality isomorphism 9.4.5.2.1. □

Let us give some applications of 16.1.11.3.(a):

Proposition 16.1.11.4. *Let* $\mathfrak{P}$ *be a smooth separated* $\mathfrak{S}$*-formal scheme,* $T \subset T'$ *two divisors of* P*,* X *be a closed subscheme of* P*. We set* $\mathfrak{U} := \mathfrak{P} \setminus T$*,* $\mathfrak{U}' := \mathfrak{P} \setminus T'$*,* $Y := X \setminus T$*,* $Y' := X \setminus T'$*. We suppose moreover* Y *smooth and* Y' *dense in* Y*. Let* $\mathcal{E}' \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T'/K)$*. If there exists* $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$ *such that* $\mathcal{E}' \xrightarrow{\sim} ({}^{\dagger}T')(\mathcal{E})$*, then* $\mathcal{E} \xrightarrow{\sim} \mathrm{Im}\,(\mathbb{D}_{T} \circ \mathbb{D}_{T'}(\mathcal{E}') \to \mathcal{E}')$*.*

Proof. By applying the functor $\mathbb{D}_{T}$ to the isomorphism $\mathcal{E}' \xrightarrow{\sim} ({}^{\dagger}T')(\mathcal{E})$ we get the first isomorphism:

$$\mathbb{D}_{T} \circ \mathbb{D}_{T'}(\mathcal{E}') \xleftarrow{\sim} \mathbb{D}_{T} \circ \mathbb{D}_{T'} \circ ({}^{\dagger}T')(\mathcal{E}) \overset{9.2.4.22.3}{\xrightarrow{\sim}} \mathbb{D}_{T} \circ ({}^{\dagger}T') \circ \mathbb{D}_{T}(\mathcal{E}). \tag{16.1.11.4.1}$$

Since $\mathbb{D}_{T}(\mathcal{E}) \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$, then following 16.1.11.3 $\mathbb{D}_{T}(\mathcal{E})$ is 1-$\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overholonomic. Hence, it follows from the isomorphisms 16.1.11.4.1 that $\mathbb{D}_{T} \circ \mathbb{D}_{T'}(\mathcal{E}')$ is $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent. Since $\mathcal{E}' \xrightarrow{\sim} ({}^{\dagger}T')(\mathcal{E})$, as $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$, then $\mathcal{E}'$ is $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-overcoherent. Hence we get the morphism of overcoherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules $\mathbb{D}_{T} \circ \mathbb{D}_{T'}(\mathcal{E}') \to \mathcal{E}'$ and we denote by $\mathcal{F}$ its image, which is also an overcoherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-module. Moreover, following the smooth case 16.1.6.3, $\mathcal{F}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(Y, \mathfrak{U}/K)$. In of the other terms, $\mathcal{F}|\mathfrak{U}$ is in the essential image of the functor $\mathrm{sp}_{Y \hookrightarrow \mathfrak{U},+}$. Hence $\mathcal{F} \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{P}, T/K)$.

The canonical inclusion $\mathcal{F} \subset \mathcal{E}'$ induced the canonical isomorphism $({}^{\dagger}T')(\mathcal{F}) \xrightarrow{\sim} \mathcal{E}'$ (Indeed, via 8.7.6.11, it is sufficient to check it outside T'). By full faithfulness of the functor $({}^{\dagger}T')$ (see the theorem 16.1.4.1), this yields $\mathcal{F} \xrightarrow{\sim} \mathcal{E}$. □

Lemma 16.1.11.5. *Let* $\mathfrak{P}$ *be a smooth formal scheme over* $\mathfrak{S}$*. Let* Z *and* X *be two closed subschemes of* P*. Set* $\mathfrak{U} := \mathfrak{P} \setminus Z$*,* $Y := X \setminus Z$ *and* $\mathfrak{V} := \mathfrak{P} \setminus X$*. We suppose* Y *smooth. For any divisor* T *of* P *containing* Z*, we have the factorisation:*

$$\mathbb{D}^{(\bullet)}_{T} \circ ({}^{\dagger}T) \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S}) \cap \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathfrak{S}), \tag{16.1.11.5.1}$$

where $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ *is defined at 16.2.1.1.*

Proof. Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S})$. It follows from 16.2.1.5.2 and 16.1.11.3.2, that $\mathbb{D}^{(\bullet)}_{T} \circ ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathfrak{S})$. Let us now check that $\mathbb{D}^{(\bullet)}_{T} \circ ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S})$. Let T' be a divisor of P containing Z. We get the isomorphisms:

$$({}^{\dagger}T') \circ \mathbb{D}^{(\bullet)}_{T} \circ ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^{\dagger}T \cup T') \circ \mathbb{D}^{(\bullet)}_{T} \circ ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \underset{9.2.4.20.4}{\xrightarrow{\sim}} \mathbb{D}^{(\bullet)}_{T \cup T'} \circ ({}^{\dagger}T \cup T')(\mathcal{E}^{(\bullet)}).$$

By symmetry in T and T', this yields the canonical isomorphism

$$({}^{\dagger}T') \circ \mathbb{D}^{(\bullet)}_{T} \circ ({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^{\dagger}T) \circ \mathbb{D}^{(\bullet)}_{T'} \circ ({}^{\dagger}T')(\mathcal{E}^{(\bullet)}).$$

It follows from 16.1.11.3.2 that $\mathbb{D}^{(\bullet)}_{T'} \circ ({}^{\dagger}T')(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, T'/\mathfrak{S})$. Hence, $({}^{\dagger}T) \circ \mathbb{D}^{(\bullet)}_{T'} \circ ({}^{\dagger}T')(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, T'/\mathfrak{S})$ and we are done. □

Here is a corollary of the theorem 16.1.10.5:

Proposition 16.1.11.6. *Let $(Y, X, \mathfrak{P}, T)$ be a smooth d-frame over $\mathfrak{S}$ (see the definition 12.2.1.1). Let $E \in \mathrm{MIC}^{\dagger}(Y, X, \mathfrak{P}/K)$. We have the canonical isomorphism:*

$$\mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E^{\vee}) \xrightarrow{\sim} \mathbb{D}_T \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E),$$

where $\vee$ is the dual in $\mathrm{MIC}^{\dagger}(Y, X/K)$ and $\mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}$ was defined in theorem 16.1.8.4.

Proof. With the lemma 16.1.2.9 (and the remark 16.1.2.10), we reduce to the case where X is integral and Y is dense in X. When X is smooth, this proposition was established at 12.2.5.6. To reduce to the case where X is smooth, we use the theorem of full faithfulness 16.1.5.2 as follows: Following the de Jong 's desingularisation theorem, there exists a divisor $\widetilde{T}$ containing T and a diagram of the form 16.1.5.0.1 satisfying the required conditions of 16.1.5 and such that moreover $X^{(0)}$ is smooth. We keep the corresponding notations. We have the following isomorphisms:

$$\begin{aligned} a^{+} \circ \mathbb{D}_T \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E) &\overset{8.7.7.3}{\xrightarrow{\sim}} \mathbb{D}_{T^{(0)}} \circ a^{!} \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E) \\ \overset{16.1.10.5}{\xrightarrow{\sim}} \mathbb{D}_{T^{(0)}} \circ a^{+} \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E) &\overset{16.1.7.5.1}{\xrightarrow{\sim}} \mathbb{D}_{T^{(0)}} \circ \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +} \circ a^{*}(E). \end{aligned} \tag{16.1.11.6.1}$$

On the other hand, we have:

$$\begin{aligned} a^{+} \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E^{\vee}) &\overset{16.1.7.5.1}{\xrightarrow{\sim}} \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +} \circ a^{*}(E^{\vee}) \xrightarrow{\sim} \\ \xrightarrow{\sim} \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +}((a^{*}(E))^{\vee}) &\overset{12.2.5.6}{\xrightarrow{\sim}} \mathbb{D}_{T^{(0)}} \circ \mathrm{sp}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +} \circ a^{*}(E). \end{aligned} \tag{16.1.11.6.2}$$

By 16.2.6.3.2 and 16.1.11.6.2, we get the canonical isomorphism $a^{+} \circ \mathbb{D}_T \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E) \xrightarrow{\sim} a^{+} \circ \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}(E^{\vee})$. Set $\mathfrak{U} := \mathfrak{P} \setminus T$, $\mathfrak{U}^{(0)} := \mathfrak{P}^{(0)} \setminus T^{(0)}$ and $\widehat{E} \in \mathrm{MIC}^{\dagger}(Y, Y, \mathfrak{U}/K)$ be the induced convergent isocrystal on $(Y, Y, \mathfrak{U}/K)$. By applying the functor $\mathfrak{U}^{(0)}$ to this latter isomorphism, we get an arrow isomorphic to the image by b^{+} of the canonical isomorphism $\mathbb{D} \circ \mathrm{sp}_{Y \hookrightarrow \mathfrak{U}, +}(\widehat{E}) \xrightarrow{\sim} \mathrm{sp}_{Y \hookrightarrow \mathfrak{U}, +}(\widehat{E}^{\vee})$. Hence we are done by full faithfulness of $(a^{+}, |\mathfrak{P} \setminus T)$ (see 16.1.5.2).

□

16.2 Partially overcoherent isocrystals

16.2.1 Definition and the equivalence sp_{+}

Let $\mathfrak{P}$ be a smooth separated formal scheme over $\mathfrak{S}$. Let Z and X be two closed subschemes of P. Set $\mathfrak{U} := \mathfrak{P} \setminus Z$, $Y := X \setminus Z$ and $\mathfrak{V} := \mathfrak{P} \setminus X$. We suppose Y/S smooth.

Notation 16.2.1.1. We denote by $(F\text{-})\mathrm{MIC}^{(\bullet)}(Y, X, \mathfrak{P}, Z/\mathfrak{S})$ or by $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S})$ the strictly full abelian subcategory of $(F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S})$ (see definition 15.3.8.13) consisting of $(F\text{-})$complexes $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}|\mathfrak{U} \in \mathrm{MIC}^{(\bullet)}(Y, \mathcal{U}, \emptyset/\mathcal{V})$, where the latter category is defined in 16.1.2.3.

Example 16.2.1.2. When Z is a divisor, the category $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S})$ defined at 16.2.1.1 is the same as that defined at 16.1.2.3.

Remark 16.2.1.3. It is not clear if the following functor

$$\underrightarrow{l}^{*}_{\mathbb{Q}} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \to D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}) \tag{16.2.1.3.1}$$

is fully faithful. So the analogue of $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ in term of $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module is not clear. With the equivalence of categories 16.2.1.10.1, this is another argument to prefer to work with categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$.

Lemma 16.2.1.4. *Let $\overline{Y}$ the closure of Y in X. Let $Y_1, \ldots, Y_N$ the irreducible components of Y and $\overline{Y}_1, \ldots, \overline{Y}_N$ their closure in X.*

(a) We have the equality $(F\text{-})\mathrm{MIC}^{(\bullet)}(\overline{Y}, \mathfrak{P}, Z/\mathcal{V}) = (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$.

(b) We have a canonical equivalence of categories:

$$\oplus_{r=1}^{N} \mathbb{R}\underline{\Gamma}^{\dagger}_{\overline{Y}_r} \colon (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \cong \prod_{r=1}^{N} (F\text{-})\mathrm{MIC}^{(\bullet)}(\overline{Y}_r, \mathfrak{P}, Z/\mathcal{V}). \tag{16.2.1.4.1}$$

Proof. The inclusion of the equality of (a) is obvious. Conversely, is $\mathcal{E} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$. According to 15.3.7.5.1, we have the canonical morphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{\overline{Y}}(\mathcal{E}) \to \mathcal{E}$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. Since this is the case outside Z (because $\overline{Y} \setminus Z = Y$), then it follows from 15.3.7.6 that this morphism is an isomorphism. Hence, the sheaf $\mathcal{E}$ has its support in $\overline{Y}$ and we get the inclusion inverse.

Similarly, it follows from 15.3.7.6 that the functor $\oplus_{r=1}^{N} \mathbb{R}\underline{\Gamma}^{\dagger}_{\overline{Y}_r}$ induces the equivalence of categories 16.2.1.4.1. □

16.2.1.5. The following properties are straightforward:

(a) For any closed subscheme $\widetilde{Z} \supset Z$ of P, the t-exact functor 15.3.8.12.2 induces the functor

$$({}^{\dagger}\widetilde{Z}) \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, \widetilde{Z}/\mathfrak{S}). \tag{16.2.1.5.1}$$

(b) For any divisor T of P, the t-exact functor 15.3.8.12.3 induces the functor

$$({}^{\dagger}T) \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S}) \cap \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathfrak{S}). \tag{16.2.1.5.2}$$

Notation 16.2.1.6. Let Z_1 and Z_2 be two closed subschemes of P such that $Z_1 \cap Z_2 = Z$. We write $Y_i := X \setminus Z_i$, for $i = 1, 2$.

(a) We define the category $\mathrm{MIC}^{\dagger}((Y_1, Y_2), X, \mathfrak{P}/\mathfrak{S})$ as follows. An object (E_1, E_2, ϵ) of the category $\mathrm{MIC}^{\dagger}((Y_1, Y_2), X, \mathfrak{P}/\mathfrak{S})$ consists of the data of an object $E_i \in \mathrm{MIC}^{\dagger}(Y_i, X, \mathfrak{P}/\mathfrak{S})$ for $i = 1, 2$ and of an isomorphism $\epsilon \colon j^{\dagger}_{Y_1 \cap Y_2} E_2 \xrightarrow{\sim} j^{\dagger}_{Y_1 \cap Y_2} E_1$.

(b) We denote by $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, (Z_1, Z_2)/\mathfrak{S})$ the following category. An object $(\mathcal{E}^{(\bullet)}_1, \mathcal{E}^{(\bullet)}_2, \theta)$ of the category $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, (Z_1, Z_2)/\mathfrak{S})$ consists of the data of an object $\mathcal{E}^{(\bullet)}_1 \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S}) \cap \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z_1/\mathfrak{S})$, an object $\mathcal{E}^{(\bullet)}_2 \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S}) \cap \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z_2/\mathfrak{S})$ and of an isomorphism $\theta \colon ({}^{\dagger}Z_1 \cup Z_2)(\mathcal{E}^{(\bullet)}_2) \xrightarrow{\sim} ({}^{\dagger}Z_1 \cup Z_2)(\mathcal{E}^{(\bullet)}_1)$.

Proposition 16.2.1.7. *We keep the notation 16.2.1.6.*

(a) The canonical morphism $\mathrm{Loc} \colon \mathrm{MIC}^{\dagger}(Y, X, \mathfrak{P}/\mathfrak{S}) \to \mathrm{MIC}^{\dagger}((Y_1, Y_2), X, \mathfrak{P}/\mathfrak{S})$ *given by* $E \mapsto (j^{\dagger}_{Y_1} E, j^{\dagger}_{Y_2} E, \epsilon_E)$, *where* ϵ_E *is the canonical isomorphism, is an equivalence of categories and has a canonical quasi-inverse functor.*

(b) The canonical morphism $\mathrm{Loc} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S}) \to \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, (Z_1, Z_2)/\mathfrak{S})$ *given by* $\mathcal{E}^{(\bullet)} \mapsto (({}^{\dagger}Z_1)(\mathcal{E}^{(\bullet)}), ({}^{\dagger}Z_2)(\mathcal{E}^{(\bullet)}), \theta_{\mathcal{E}^{(\bullet)}})$, *where* $\theta_{\mathcal{E}^{(\bullet)}}$ *is the canonical isomorphism, is an equivalence of categories and has a canonical quasi-inverse functor.*

Proof. I) The first statement is well known.

II) 1) We construct a canonical quasi-inverse functor as follows. Let $(\mathcal{E}^{(\bullet)}_1, \mathcal{E}^{(\bullet)}_2, \theta) \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, (Z_1, Z_2)/\mathfrak{S})$. We set $\mathcal{E}^{(\bullet)}_{12} := ({}^{\dagger}Z_1 \cup Z_2)(\mathcal{E}^{(\bullet)}_1)$. We get the canonical morphism $\alpha \colon \mathcal{E}^{(\bullet)}_1 \to \mathcal{E}^{(\bullet)}_{12}$ and $\beta \colon \mathcal{E}^{(\bullet)}_2 \to ({}^{\dagger}Z_1 \cup Z_2)(\mathcal{E}^{(\bullet)}_2) \overset{\theta}{\xrightarrow{\sim}} \mathcal{E}^{(\bullet)}_{12}$. Let $\mathrm{Glue}(\mathcal{E}^{(\bullet)}_1, \mathcal{E}^{(\bullet)}_2, \theta)$ be the kernel of the morphism $(\alpha, -\beta) \colon \mathcal{E}^{(\bullet)}_1 \oplus \mathcal{E}^{(\bullet)}_2 \to \mathcal{E}^{(\bullet)}_{12}$ of the abelian category $\underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S})$.

2) We check in this step that $\mathcal{F}^{(\bullet)} := \mathrm{Glue}(\mathcal{E}^{(\bullet)}_1, \mathcal{E}^{(\bullet)}_2, \theta) \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S})$. Since $\mathcal{F}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S})$, it remains to prove that $\mathcal{F}^{(\bullet)}|\mathfrak{U} \in \mathrm{MIC}^{(\bullet)}(Y, \mathfrak{U}, \emptyset/\mathfrak{S})$.

Set $\mathfrak{U}_i := \mathfrak{P} \setminus Z_i$, for $i = 1, 2$. Since $\alpha|\mathfrak{U}_2 = \mathrm{id}$, then $\mathcal{F}^{(\bullet)}|\mathfrak{U}_2 \xrightarrow{\sim} \mathcal{E}^{(\bullet)}_2|\mathfrak{U}_2 \in \mathrm{MIC}^{(\bullet)}(X \cap U_2, \mathfrak{U}_2, \emptyset/\mathfrak{S})$. Similarly, since $\beta|\mathfrak{U}_1 = \theta|\mathfrak{U}_1$ is an isomorphism then we get the isomorphism $\mathcal{F}^{(\bullet)}|\mathfrak{U}_1 \xrightarrow{\sim} \mathcal{E}^{(\bullet)}_1|\mathfrak{U}_1 \in \mathrm{MIC}^{(\bullet)}(X \cap U_1, \mathfrak{U}_1, \emptyset/\mathfrak{S})$. Since $\mathfrak{U} = \mathfrak{U}_1 \cup \mathfrak{U}_2$, then we are done.

3) By setting $:= (\alpha, -\beta) \colon \mathcal{E}_1^{(\bullet)} \oplus \mathcal{E}_2^{(\bullet)} \to \mathcal{E}_{12}^{(\bullet)}$, we get the funcor Glue: $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, (Z_1, Z_2)/\mathfrak{S}) \to \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathfrak{S})$.

4) The fact that Loc and Glue are quasi-inverse is easy. □

Definition 16.2.1.8. We define the category of c-frames (over $\mathfrak{S}$) which extends that of d-frames (see 12.2.1.1) as follows:

(a) A "c-frame $(Y, X, \mathfrak{P}, Z)/\mathfrak{S}$" over $\mathfrak{S}$ is the data of a separated and smooth $\mathfrak{S}$-formal scheme $\mathfrak{P}$, of two closed subschemes Z and X of P such that $Y = X \setminus Z$. A c-frame $(Y, X, \mathfrak{P}, Z)/\mathfrak{S}$ is "smooth" if Y is smooth. A c-frame $(Y, X, \mathfrak{P}, Z)/\mathfrak{S}$ can simply be written $(X, \mathfrak{P}, Z)/\mathfrak{S}$ or even $(X, \mathfrak{P}, Z)$.

(b) A morphism $\theta \colon (Y', X', \mathfrak{P}', Z') \to (Y, X, \mathfrak{P}, Z)$ of c-frames is the data of a morphism $f \colon \mathfrak{P}' \to \mathfrak{P}$ of formal schemes such that $X' \subset f^{-1}X$ and $Z' \supset f^{-1}(Z)$.

Remark we have a forgetful functor from the category of c-frames to that of frames (see definition 10.1.1.4) given by $(Y, X, \mathfrak{P}, Z)/\mathfrak{S} \mapsto (Y, X, \mathfrak{P})/\mathfrak{S}$. The letter c stands for "closed subscheme" instead of "d" for "divisor".

16.2.1.9. When Z is a divisor that we prefer to denote by T, it follows from 16.1.8.4 and 16.1.2.3.1 that we have the canonical equivalence of categories

$$\mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, T, +} \colon \mathrm{MIC}^{\dagger}(X, \mathfrak{P}, T/K) \cong \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}), \tag{16.2.1.9.1}$$

so that $\underrightarrow{l}^*_{\mathbb{Q}} \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, T, +} = \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T, +}$.

Theorem 16.2.1.10. *We have the canonical equivalence of categories*

$$\mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +} \colon \mathrm{MIC}^{\dagger}(X, \mathfrak{P}, Z/K) \cong \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}), \tag{16.2.1.10.1}$$

which is 16.2.1.9.1 when Z is a divisor.

Proof. Following 16.2.1.9.1, the equivalence of categories of 16.2.1.10.1 are already known when Z is a divisor. To check the general case, we can suppose P is integral. We proceed therefore by induction on the number of divisors $T_1, \dots, T_r$ such that $Z = T_1 \cap \dots \cap T_r$. To do so, we use 16.2.1.7. It remains to check the independence of the construction of 16.2.1.10.1 from the choice of the writing of Z as an intersection of divisors of P. Make a second choice $Z = T_{r+1} \cap \dots \cap T_{r+s}$. Then we show that both constructions of the isomorphism 16.2.1.10.1 are canonically isomorphic to the one in the case of $Z = T_1 \cap \dots \cap T_{r+s}$. □

16.2.1.11. Let T be a divisor containing Z and $j_T \colon (X \setminus T, X, \mathfrak{P}) \to (X \setminus T, X, \mathfrak{P})$ the induced frame morphism. By construction of equivalence 16.2.1.10.1

$$({}^{\dagger}T) \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +} \xrightarrow{\sim} \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, T, +} \circ j_T^{\dagger}. \tag{16.2.1.11.1}$$

16.2.1.12. Let $T_1, \dots, T_r$ be divisors of P such that $Z = T_1 \cap \dots \cap T_r$. Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$. Since $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ is an abelian subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathcal{V})$, then it follows from 15.3.8.19.1 that we have the exact sequence

$$0 \to \mathcal{E}^{(\bullet)} \to \oplus_{i=1}^r ({}^{\dagger}T_i)(\mathcal{E}^{(\bullet)}) \xrightarrow{\theta^2 - \theta^1} \oplus_{i,j=1}^r ({}^{\dagger}T_i \cup T_j)(\mathcal{E}^{(\bullet)}). \tag{16.2.1.12.1}$$

where $\theta^n \colon \oplus_{i=1}^r ({}^{\dagger}T_i)(\mathcal{E}^{(\bullet)}) \to \oplus_{i,j=1}^r ({}^{\dagger}T_i \cup T_j)(\mathcal{E}^{(\bullet)})$ for $n = 0, 1$ are the canonical maps defined at 15.3.8.19.

16.2.2 Full faithfulness of the localisation functor

Theorem 16.2.2.1. *Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, $Z \subset Z'$ two closed subschemes of P, X be a closed subscheme of P. By setting $Y := X \setminus Z$, $Y' := X \setminus Z'$, we suppose moreover Y smooth and Y' dense in Y. The functor $({}^{\dagger}Z')$ induced the fully faithful functors:*

$$({}^{\dagger}Z') \colon (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z'/\mathcal{V}). \tag{16.2.2.1.1}$$

Proof. 0) Let us check the faithfulness of the functor $({}^\dagger Z')$. Let $\mathfrak{U} := \mathfrak{P} \setminus Z$, $\mathfrak{U}' := \mathfrak{P} \setminus Z'$. It follows from 15.3.8.18 that we reduce to check the faithfulness of the functor $\mathfrak{U}' \colon (F\text{-})\mathrm{MIC}^{(\bullet)}(Y, \mathfrak{U}/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{(\bullet)}(Y', \mathfrak{U}'/\mathcal{V})$. We conclude using 16.1.4.1.1. Let us now check that faithfulness is full. Since this is local in $\mathfrak{P}$ and we can therefore suppose Y is integral. Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ together with a morphism $\psi \colon \mathcal{E}^{(\bullet)}({}^\dagger Z') \to \mathcal{F}^{(\bullet)}({}^\dagger Z')$.

1) First suppose $Z = T$ is a divisor of P. Let $T_1, \ldots, T_r$ be divisors of P such that $Z' = T_1 \cap \cdots \cap T_r$. Since Y' is dense in Y, then there exists at least on divisor T_i which does not contain Y. Let Z'' be the intersection of such divisors. Since $Z' \subset Z''$, we reduce to the case where all divisors T_i do not contain Y. Following 16.1.4.1.1, since $Y \setminus T_i$ is dense in Y, then the functor $({}^\dagger T_i) \colon (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V}) \to (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T_i/\mathcal{V})$ is fully faithful. Hence, there exists $\phi_i \colon \mathcal{E}^{(\bullet)}({}^\dagger T_i) \to \mathcal{F}^{(\bullet)}({}^\dagger T_i)$ making commutative the left diagram

$$\begin{array}{ccccc}
\mathcal{E}^{(\bullet)} & \longrightarrow & ({}^\dagger T_i)(\mathcal{E}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i)(\mathcal{E}^{(\bullet)}({}^\dagger Z')) \\
\downarrow{\scriptstyle \phi_i} & & \downarrow{\scriptstyle ({}^\dagger T_i)(\phi_i)} & & \downarrow{\scriptstyle ({}^\dagger T_i)\psi} \\
\mathcal{F}^{(\bullet)} & \longrightarrow & ({}^\dagger T_i)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i)(\mathcal{F}^{(\bullet)}({}^\dagger Z')),
\end{array}
\qquad
\begin{array}{ccccc}
\mathcal{E}^{(\bullet)} & \longrightarrow & ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}({}^\dagger Z')) \\
\downarrow{\scriptstyle \phi_i} & & \downarrow{\scriptstyle ({}^\dagger T_i \cup T_j)(\phi_i)} & & \downarrow{\scriptstyle ({}^\dagger T_i \cup T_j)\psi} \\
\mathcal{F}^{(\bullet)} & \longrightarrow & ({}^\dagger T_i \cup T_j)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i \cup T_j)(\mathcal{F}^{(\bullet)}({}^\dagger Z'))
\end{array}
\tag{16.2.2.1.2}$$

This yields the commutative right diagram of 16.2.2.1.2. Since $({}^\dagger T_i \cup T_j)(\phi_i) = ({}^\dagger T_i \cup T_j)(\phi_j)$, then by faithfulness of the functor $({}^\dagger T_i \cup T_j)$ we get $\phi_i = \phi_j$ that we denote by ϕ. $({}^\dagger Z')(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ then following 16.2.2.1.1 we get the exact sequence:

$$\begin{array}{ccccc}
\mathcal{E}^{(\bullet)} & \longrightarrow & \oplus_{i=1}^r ({}^\dagger T_i)(\mathcal{E}^{(\bullet)}) & \xrightarrow{\theta^2_{\mathcal{E}} - \theta^1_{\mathcal{E}}} & \oplus_{i,j=1}^r ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}) \\
\downarrow{\scriptstyle \phi} & & \downarrow{\scriptstyle \oplus_i ({}^\dagger T_i)\phi} & & \downarrow{\scriptstyle \oplus_{ij} ({}^\dagger T_i \cup T_j)\phi} \\
\mathcal{F}^{(\bullet)} & \longrightarrow & \oplus_{i=1}^r ({}^\dagger T_i)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\theta^2_{\mathcal{F}} - \theta^1_{\mathcal{F}}} & \oplus_{i,j=1}^r ({}^\dagger T_i \cup T_j)(\mathcal{F}^{(\bullet)})
\end{array}
\tag{16.2.2.1.3}$$

where $\theta^n_{\mathcal{E}} \colon \oplus_{i=1}^r \mathcal{E}_i^{(\bullet)} \to \oplus_{i,j=1}^r \mathcal{E}_{ij}^{(\bullet)}$ for $n = 0, 1$ are the canonical maps defined at 15.3.8.19. Since $({}^\dagger Z')(\mathcal{E}^{(\bullet)}) = \ker(\theta^2_{\mathcal{E}} - \theta^1_{\mathcal{E}})$ and $({}^\dagger Z')(\mathcal{F}^{(\bullet)}) = \ker(\theta^2_{\mathcal{F}} - \theta^1_{\mathcal{F}})$ (see 16.2.7.4.1), then we are done.

2) Let $T_1, \ldots, T_r$ be divisors of P such that $Z = T_1 \cap \cdots \cap T_r$. By using the step 1), there exists $\phi_i \colon \mathcal{E}^{(\bullet)}({}^\dagger T_i) \to \mathcal{F}^{(\bullet)}({}^\dagger T_i)$ making commutative the diagram

$$\begin{array}{ccccc}
({}^\dagger T_i)(\mathcal{E}^{(\bullet)}) & \longrightarrow & ({}^\dagger Z')(({}^\dagger T_i)\mathcal{E}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i)(\mathcal{E}^{(\bullet)}({}^\dagger Z')) \\
\downarrow{\scriptstyle \phi_i} & & \downarrow{\scriptstyle ({}^\dagger Z')\phi_i} & & \downarrow{\scriptstyle ({}^\dagger T_i)\psi} \\
({}^\dagger T_i)(\mathcal{F}^{(\bullet)}) & \longrightarrow & ({}^\dagger Z')(({}^\dagger T_i)\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i)(\mathcal{F}^{(\bullet)}({}^\dagger Z')),
\end{array}
\tag{16.2.2.1.4}$$

where the horizontal isomorphisms are the canonical ones. Since we have the commutative diagram

$$\begin{array}{ccccc}
({}^\dagger T_i)(\mathcal{E}^{(\bullet)}) & \longrightarrow & ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}({}^\dagger Z')) \\
\downarrow{\scriptstyle \phi_i} & & \downarrow{\scriptstyle ({}^\dagger T_i \cup T_j)(\phi_i)} & & \downarrow{\scriptstyle ({}^\dagger T_i \cup T_j)\psi} \\
({}^\dagger T_i)(\mathcal{F}^{(\bullet)}) & \longrightarrow & ({}^\dagger T_i \cup T_j)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\sim} & ({}^\dagger T_i \cup T_j)(\mathcal{F}^{(\bullet)}({}^\dagger Z')),
\end{array}
\tag{16.2.2.1.5}$$

then $({}^\dagger T_i \cup T_j)(\phi_i) = ({}^\dagger T_i \cup T_j)(\phi_j)$. Hence, we get the unique map ϕ making commutative the diagram:

$$\begin{array}{ccccccc}
0 & \longrightarrow & \mathcal{E}^{(\bullet)} & \longrightarrow & \oplus_{i=1}^r ({}^\dagger T_i)(\mathcal{E}^{(\bullet)}) & \xrightarrow{\theta^2_{\mathcal{E}} - \theta^1_{\mathcal{E}}} & \oplus_{i,j=1}^r ({}^\dagger T_i \cup T_j)(\mathcal{E}^{(\bullet)}) \\
 & & \downarrow{\scriptstyle \phi} & & \downarrow{\scriptstyle \oplus_i ({}^\dagger T_i)\phi_i} & & \downarrow{\scriptstyle \oplus_{ij} ({}^\dagger T_i \cup T_j)\phi_i} \\
0 & \longrightarrow & \mathcal{F}^{(\bullet)} & \longrightarrow & \oplus_{i=1}^r ({}^\dagger T_i)(\mathcal{F}^{(\bullet)}) & \xrightarrow{\theta^2_{\mathcal{F}} - \theta^1_{\mathcal{F}}} & \oplus_{i,j=1}^r ({}^\dagger T_i \cup T_j)(\mathcal{F}^{(\bullet)})
\end{array}
\tag{16.2.2.1.6}$$

□

16.2.3 Duality, commutation with sp_+

Proposition 16.2.3.1. *Let $\mathfrak{P}$ be a smooth formal scheme over $\mathfrak{S}$. Let Z and X be two closed subschemes of P. Set $\mathfrak{U} := \mathfrak{P} \setminus Z$, $Y := X \setminus Z$ and $\mathfrak{V} := \mathfrak{P} \setminus X$. We have the equivalence of categories*

$$\mathbb{D}_Z^{(\bullet)} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \tag{16.2.3.1.1}$$

which is characterized by the following property: for any $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$, for any divisor T containing Z, we have the canonical isomorphism of $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$:

$$({}^\dagger T) \circ \mathbb{D}_Z^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{D}_T^{(\bullet)} \circ ({}^\dagger T)(\mathcal{E}^{(\bullet)}). \tag{16.2.3.1.2}$$

Proof. Let $T_1, \ldots, T_r$ be divisors of P such that $Z = T_1 \cap \cdots \cap T_r$. Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/K)$. Set $\mathcal{E}_{ij}^{(\bullet)} := ({}^\dagger T_i \cup T_j)\mathcal{E}^{(\bullet)}$ and $\mathcal{E}_i^{(\bullet)} := ({}^\dagger T_i)\mathcal{E}^{(\bullet)}$ for any $i, j \in \{1, \ldots, r\}$. We get the morphism

$$\theta_{ij}^1 \colon \mathbb{D}_{T_i}^{(\bullet)} \mathcal{E}_i^{(\bullet)} \to ({}^\dagger T_i \cup T_j) \circ \mathbb{D}_{T_i}^{(\bullet)} \mathcal{E}_i^{(\bullet)} \underset{9.2.4.20.4}{\xrightarrow{\sim}} \mathbb{D}_{T_i \cup T_j}^{(\bullet)} \mathcal{E}_{ij}^{(\bullet)}.$$

Following 16.1.11.5.1, this is a map of the abelian category $\underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S})$. This yields the maps

$$\theta^1 \colon \oplus_{i=1}^r \mathbb{D}_{T_i}^{(\bullet)} \mathcal{E}_i^{(\bullet)} \to \oplus_{i,j=1}^r \mathbb{D}_{T_i \cup T_j}^{(\bullet)} \mathcal{E}_{ij}^{(\bullet)}.$$

Similarly, for any i, j we have the maps

$$\theta_{ij}^2 \colon \mathbb{D}_{T_j}^{(\bullet)} \mathcal{E}_j^{(\bullet)} \to ({}^\dagger T_i \cup T_j) \circ \mathbb{D}_{T_j}^{(\bullet)} \mathcal{E}_j^{(\bullet)} \underset{9.2.4.20.4}{\xrightarrow{\sim}} \mathbb{D}_{T_i \cup T_j}^{(\bullet)} \mathcal{E}_{ij}^{(\bullet)},$$

which yields the map $\theta^2 \colon \oplus_{i=1}^r \mathbb{D}_{T_i}^{(\bullet)} \mathcal{E}_i^{(\bullet)} \to \oplus_{i,j=1}^r \mathbb{D}_{T_i \cup T_j}^{(\bullet)} \mathcal{E}_{ij}^{(\bullet)}$ of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S})$.

We remark that if T_{r+1} is a divisor containing Z, then denoting by for $k = 1, 2$ the map $\theta'^k \colon \oplus_{i=1}^{r+1} \mathbb{D}_{T_i}^{(\bullet)} \mathcal{E}_i^{(\bullet)} \to \oplus_{i,j=1}^{r+1} \mathbb{D}_{T_i \cup T_j}^{(\bullet)} \mathcal{E}_{ij}^{(\bullet)}$ constructed as above, we compute $\ker(\theta^2 - \theta^1) = \ker(\theta'^2 - \theta'^1)$. Hence, we define canonically an object of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, Z/\mathfrak{S})$ by setting $\mathbb{D}_Z^{(\bullet)}(\mathcal{E}^{(\bullet)}) := \ker(\theta^2 - \theta^1)$. It remains to prove that $\mathbb{D}_Z^{(\bullet)}(\mathcal{E}^{(\bullet)})|\mathfrak{U} \in \mathrm{MIC}^{(\bullet)}(Y, \mathfrak{U}/\mathcal{V})$, i.e. we reduce to the case where Z is a (empty) divisor. In that case $\mathbb{D}_Z^{(\bullet)}(\mathcal{E}^{(\bullet)}) = \mathbb{D}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}/\mathcal{V})$ (choose $r = 1$ and $T_1 = Z$). □

Proposition 16.2.3.2 (Biduality)**.** *Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$. We have the canonical isomorphism of $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$:*

$$\mathbb{D}_Z^{(\bullet)} \circ \mathbb{D}_Z^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}. \tag{16.2.3.2.1}$$

Proof. With the lemma 16.2.1.4, we reduce to the case where Y is integral and dense in X. Since Z is the intersection of some divisors of P, then there exists a divisor T of P containing Z such that $X \setminus T$ is dense in Y. We have the isomorphisms of $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$:

$$({}^\dagger T) \circ \mathbb{D}_Z^{(\bullet)} \circ \mathbb{D}_Z^{(\bullet)}(\mathcal{E}^{(\bullet)}) \overset{16.2.3.1.2}{\xrightarrow{\sim}} \mathbb{D}_T^{(\bullet)} \circ \mathbb{D}_T^{(\bullet)} \circ ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \overset{8.7.7.3}{\xrightarrow{\sim}} ({}^\dagger T)(\mathcal{E}^{(\bullet)}).$$

We conclude by using the full faithfulness of the functor $({}^\dagger T)$ of Theorem 16.2.2.1. □

Proposition 16.2.3.3. *Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$. For any closed subset Z' of P containing Z, we have the canonical isomorphism of $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z'/\mathcal{V})$:*

$$({}^\dagger Z') \circ \mathbb{D}_Z^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{D}_{Z'}^{(\bullet)} \circ ({}^\dagger Z')(\mathcal{E}^{(\bullet)}). \tag{16.2.3.3.1}$$

Proof. With the lemma 16.2.1.4, we reduce to the case where Y is integral and dense in X. If Z' contains X, then the isomorphism 16.2.3.3.1 is $0 \xrightarrow{\sim} 0$. Suppose now $Y' := X \setminus Z'$ is dense in Y. Since Z' is the intersection of some divisors of P, then there exists a divisor T' of P containing Z' such that $X \setminus T'$ is dense in Y' (and in Y). By using the full faithfulness of the functor $({}^\dagger T')$ (see 16.2.2.1) and the commutation of the duality with localisation outside a divisor (see 16.2.3.1.2), we are done. □

Proposition 16.2.3.4. *Let $(Y, X, \mathfrak{P}, Z)$ be a smooth c-frame over $\mathfrak{S}$. Let $E \in \mathrm{MIC}^{\dagger}(X, \mathfrak{P}, Z/K)$. We have the canonical isomorphism:*

$$\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}(E^{\vee}) \xrightarrow{\sim} \mathbb{D}^{(\bullet)}_{Z} \circ \mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}(E),$$

where $\vee$ is the dual in $\mathrm{MIC}^{\dagger}(X, \mathfrak{P}, Z/K)$ and $\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}$ was defined at theorem 16.2.1.10.1.

Proof. With the lemma 16.2.1.4, we reduce to the case where Y is integral and dense in X. Since Z is the intersection of some divisors of P, then there exists a divisor T of P containing Z such that $X \setminus T$ is dense in Y. By using the full faithfulness of $({}^{\dagger}T)$ (see 16.2.2.1) and the commutation of the duality with localisation (see 16.2.3.1.2), we reduce to the case where Z is a divisor, which was already checked (see 16.1.11.6). □

16.2.4 (Extraordinary) pullbacks, commutation with sp_{+}

Proposition 16.2.4.1. *Let $\theta = (b, a, f) \colon (Y', X', \mathfrak{P}', Z') \to (Y, X, \mathfrak{P}, Z)$ be a morphism of smooth c-frames. Let $\mathcal{E}^{(\bullet)}$ be an object of $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/K)$. Hence, for any integer $j \in \mathbb{Z}\setminus\{0\}$, the following equality is satisfied: $H^{j}_{Z}(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})[-d_{X'/X}]) = 0$ (see notation 15.3.8.13). Moreover, we have the factorisation*

$$\theta^{(\bullet)!} := \mathbb{R}\underline{\Gamma}^{\dagger}_{Y'} \circ f^{(\bullet)!}[-d_{X'/X}] \colon (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/K) \to (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/K). \tag{16.2.4.1.1}$$

These functors are transitive with respect to the composition: if $\theta' = (b', a', f') \colon (Y'', X'', \mathfrak{P}'', Z'') \to (Y', X', \mathfrak{P}', Z')$ is a morphism of smooth c-frames, we have the canonical isomorphism $\theta'^{(\bullet)!} \circ \theta^{(\bullet)!} \xrightarrow{\sim} (\theta \circ \theta')^{(\bullet)!}$.

Proof. By definition of the t-structure, we reduce to check $H^{j}(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})[-d_{X'/X}])|\mathfrak{U}' = 0$, where $\mathfrak{U}' := \mathfrak{P}' \setminus Z'$, i.e. we reduce to the case where Z is empty. This case was proved at 12.2. □

Notation 16.2.4.2. Let $\theta = (b, a, f) \colon (Y', X', \mathfrak{P}', Z') \to (Y, X, \mathfrak{P}, Z)$ be a morphism of smooth c-frames. Let $\mathcal{E}^{(\bullet)}$ be an object of $(F\text{-})\mathrm{MIC}^{*}(X, \mathfrak{P}, Z/K)$. With 16.2.4.1.1 and 16.2.3.1.1, we set

$$\theta^{(\bullet)+} := \mathbb{D}^{(\bullet)}_{Z'} \circ \theta^{(\bullet)!} \circ \mathbb{D}^{(\bullet)}_{Z} \colon (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/K) \to (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/K). \tag{16.2.4.2.1}$$

It follows from 16.2.3.2 and 16.2.4.1 that these functors are transitive with respect to the composition: if $\theta' = (b', a', f') \colon (Y'', X'', \mathfrak{P}'', Z'') \to (Y', X', \mathfrak{P}', Z')$ is a morphism of smooth c-frames, we have the canonical isomorphism $\theta'^{(\bullet)+} \circ \theta^{(\bullet)+} \xrightarrow{\sim} (\theta \circ \theta')^{(\bullet)+}$.

Corollary 16.2.4.3. *Let $\theta = (\beta, \alpha, \phi) \colon (Y', X', \mathfrak{P}', Z') \to (Y, X, \mathfrak{P}, Z)$ be a morphism of smooth c-frames.*

(a) The functors $\theta^{(\bullet)+}, \theta^{(\bullet)!} \colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/K) \to \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/K)$ are canonically isomorphic. [2] *We can denote them by $\theta^{(\bullet)*}$.*

(b) We have the canonical isomorphism:

$$\mathrm{sp}^{(\bullet)}_{X'\hookrightarrow\mathfrak{P}',Z',+} \circ \theta^{*} \xrightarrow{\sim} \theta^{(\bullet)+} \circ \mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}. \tag{16.2.4.3.1}$$

Proof. With the lemma 16.2.1.4, we reduce to the case where Y (resp. Y') is integral and dense in X (resp. X'). Let $T_1, \ldots, T_r$ be some of divisors of P such that $Z = T_1 \cap \cdots \cap T_r$. Since $Z' \supset \phi^{-1}(T_1) \cap \cdots \cap \phi^{-1}(T_r)$ and Z' does not contains X' then there exists i_0 such that T_{i_0} (resp. $\phi^{-1}(T_{i_0})$) does not contains X (resp. X'). In particular $\widetilde{Y} := X \setminus T_{i_0}$ is dense in Y. Set $\widetilde{T} := T_{i_0}$. Similarly, since $Z' \cup \phi^{-1}(T_{i_0})$ is an intersection of some divisor $T'_1, \ldots T'_{r'}$, there exists i'_0 such that $T'_{i'_0}$ does not contains X', i.e. $\widetilde{Y}' := X' \setminus T'_{i'_0}$ is dense in Y'. Set $\widetilde{T}' := T'_{i'_0}$. Let $\widetilde{\theta} = (\widetilde{\beta}, \alpha, \phi) \colon (\widetilde{Y}', X', \mathfrak{P}', \widetilde{T}') \to (\widetilde{Y}, X, \mathfrak{P}, \widetilde{T})$, $\iota \colon (\widetilde{Y}, X, \mathfrak{P}, \widetilde{T}) \to (Y, X, \mathfrak{P}, Z)$ and $\iota' \colon (\widetilde{Y}', X', \mathfrak{P}', \widetilde{T}') \to (Y', X', \mathfrak{P}', Z')$ be the induced morphism of smooth c-frames. Let $\widetilde{j} \colon (\widetilde{Y}, X, \mathfrak{P}) \to (Y, X, \mathfrak{P})$ and $\widetilde{j}' \colon (\widetilde{Y}', X', \mathfrak{P}') \to (Y', X', \mathfrak{P}')$ be the frame morphism.

[2] Beware this isomorphism is not compatible with Frobenius, so for the Frobenius structure we need to distinguish both inverse image functors: for instance, see 11.3.5.1.1

(a) Since $\iota^! = ({}^\dagger \widetilde{T})$ and $\iota^+ \xrightarrow{\sim} ({}^\dagger \widetilde{T})$ (use 16.2.3.3.1 and 16.2.3.3.1), then by transitivity we get the isomorphism:

$$\widetilde{\theta}^{(\bullet)+} \circ ({}^\dagger \widetilde{T}) \xrightarrow{\sim} ({}^\dagger \widetilde{T}') \circ \theta^{(\bullet)+}, \qquad \widetilde{\theta}^{(\bullet)!} \circ ({}^\dagger \widetilde{T}) \xrightarrow{\sim} ({}^\dagger \widetilde{T}') \circ \theta^{(\bullet)!}.$$

Hence, by full faithfulness of $({}^\dagger \widetilde{T}')$ (see 16.2.2.1), we reduce to check the canonical isomorphism $\widetilde{\theta}^{(\bullet)+} \xrightarrow{\sim} \widetilde{\theta}^{(\bullet)!}$, which is Theorem 16.1.10.5.

(b) We get the isomorphisms:

$$({}^\dagger \widetilde{T}') \circ \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}', Z', +} \circ \theta^* \overset{16.2.1.11.1}{\xrightarrow{\sim}} \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}', \widetilde{T}', +} \circ \widetilde{j}'^\dagger \circ \theta^* \xrightarrow{\sim} \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}', \widetilde{T}', +} \circ \widetilde{\theta}^* \circ \widetilde{j}^\dagger$$
$$\overset{16.1.8.6.1}{\xrightarrow{\sim}} \widetilde{\theta}^{(\bullet)+} \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, \widetilde{T}, +} \circ \widetilde{j}^\dagger \overset{16.2.1.11.1}{\xrightarrow{\sim}} \widetilde{\theta}^{(\bullet)+} \circ ({}^\dagger \widetilde{T}) \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +} \xrightarrow{\sim} ({}^\dagger \widetilde{T}') \circ \theta^{(\bullet)+} \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}.$$

Hence, we conclude by using the full faithfulness of $({}^\dagger \widetilde{T}')$ (see 16.2.2.1). □

16.2.5 Full faithfulness of the "restriction-inverse image" functor

Notation 16.2.5.1. Consider the commutative diagram

$$\begin{array}{ccccc} Y^{(0)} & \overset{j^{(0)}}{\hookrightarrow} & X^{(0)} & \overset{u^{(0)}}{\hookrightarrow} & \mathfrak{P}^{(0)} \\ \downarrow b & \square & \downarrow a & & \downarrow f \\ Y & \underset{j}{\hookrightarrow} & X & \underset{u}{\hookrightarrow} & \mathfrak{P}, \end{array} \tag{16.2.5.1.1}$$

where the left and middle squares are cartesian, f is a proper smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes, a is a proper surjective morphism of k-varieties, b is a generically finite and etale morphism of smooth k-varieties, j and $j^{(0)}$ are open immersions, u and $u^{(0)}$ are closed immersions. Let Z be a closed subscheme of P such that $Y = X \setminus Z$. We denote by $\mathfrak{U} := \mathfrak{P} \setminus Z$, $Z^{(0)} := f^{-1}(Z)$, $\mathfrak{U}^{(0)} := \mathfrak{P}^{(0)} \setminus Z^{(0)}$ and $g\colon \mathfrak{U}^{(0)} \to \mathfrak{U}$ the morphism induced by f. We denote by $a = (b, a, f)$ the induced morphism of smooth c-frames.

Proposition 16.2.5.2. *With notation 16.2.5.1, the functor*

$$(a^{(\bullet)+}, |\mathfrak{U})\colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X^{(0)}, \mathfrak{P}^{(0)}, Z^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^{(\bullet)}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V})} \mathrm{MIC}^{(\bullet)}(Y, \mathfrak{U}/\mathcal{V}) \tag{16.2.5.2.1}$$

is fully faithful.

Proof. We can suppose $\mathfrak{P}$ is integral. Since Z is a finite intersection of divisors of P, then there exists a divisor T of P containing Z such that $\widetilde{Y} := X \setminus T$ is dense in Y. We denote by $\widetilde{\mathfrak{U}} := \mathfrak{P} \setminus \widetilde{T}$, $\widetilde{T}^{(0)} := f^{-1}(\widetilde{T})$, $\widetilde{\mathfrak{U}}^{(0)} := \mathfrak{P}^{(0)} \setminus \widetilde{T}^{(0)}$, $\widetilde{Y}^{(0)} := X^{(0)} \setminus \widetilde{T}^{(0)}$, $c\colon \widetilde{Y}^{(0)} \to \widetilde{Y}$ the morphism induced by a. Then $\widetilde{Y}^{(0)}$ is dense in $Y^{(0)}$. We denote by $\widetilde{a} = (c, a, f)$ the induced morphism of smooth d-frames. We denote by $\widetilde{j}\colon \widetilde{Y} \hookrightarrow X$ and $\widetilde{j}^{(0)}\colon \widetilde{Y}^{(0)} \hookrightarrow X^{(0)}$ the induced open immersions. Consider the following diagram

$$\begin{array}{ccc} \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) & \xrightarrow{(a^{(\bullet)+}, |\mathfrak{U})} & \mathrm{MIC}^{(\bullet)}(X^{(0)}, \mathfrak{P}^{(0)}, Z^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^{(\bullet)}(Y^{(0)}, \mathfrak{U}^{(0)}/\mathcal{V})} \mathrm{MIC}^{(\bullet)}(Y, \mathfrak{U}/\mathcal{V}) \\ \downarrow ({}^\dagger \widetilde{T}) & & \downarrow (({}^\dagger \widetilde{T}^{(0)}), |\widetilde{\mathfrak{U}}) \\ \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, \widetilde{T}/\mathcal{V}) & \xrightarrow{(\widetilde{a}^{(\bullet)+}, |\widetilde{\mathfrak{U}})} & \mathrm{MIC}^{(\bullet)}(X^{(0)}, \mathfrak{P}^{(0)}, \widetilde{T}^{(0)}/\mathcal{V}) \times_{\mathrm{MIC}^{(\bullet)}(\widetilde{Y}^{(0)}, \widetilde{\mathfrak{U}}^{(0)}/\mathcal{V})} \mathrm{MIC}^{(\bullet)}(\widetilde{Y}, \widetilde{\mathfrak{U}}/\mathcal{V}). \end{array} \tag{16.2.5.2.2}$$

Following 13.2.1.4, the local functors commute with extraordinary inverse images. It follows from 16.2.3.3.1, the localisation outside a divisor commutes with duality. This yields the commutativity up to canonical isomorphism of the diagram 16.2.5.2.2. Since following 16.2.2.1 (resp. 16.1.5.2) the left functor (resp. bottom) is fully faithful, as the right one is faithful, the upper functor is then fully faithful. □

Remark 16.2.5.3. The extension from the case of divisors to that of closed subschemes in 16.1.11.4 is not clear since we need first to define the dual functor $\mathbb{D}^{(\bullet}_Z$ in this context.

16.2.5.4. Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, $Z \subset Z'$ be two closed subschemes of P, X be a closed subscheme of P. We set $\mathfrak{U} := \mathfrak{P} \setminus Z$, $\mathfrak{U}' := \mathfrak{P} \setminus Z'$, $Y := X \setminus Z$, $Y' := X \setminus Z'$, $j \colon Y \subset X$ and $j' \colon Y' \subset X$ the canonical open immersions. We suppose moreover Y smooth and Y' dense in Y.

(a) Following the contagiosity theorem of Kedlaya (see 16.1.8.1), the bottom functor of the square

$$\begin{array}{ccc} \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z/K) & \xrightarrow{((^\dagger Z'),|\mathfrak{U})} & \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z'/K) \times_{\mathrm{MIC}^{(\bullet)}(Y,\mathfrak{U},Z'\cap U/K)} \mathrm{MIC}^{(\bullet)}(Y,\mathfrak{U}/K) \\ \uparrow \mathrm{sp}_{X\hookrightarrow \mathfrak{P},Z,+} & & \uparrow (\mathrm{sp}_{X\hookrightarrow \mathfrak{P},Z',+},\mathrm{sp}_{Y\hookrightarrow \mathfrak{U},+}) \\ \mathrm{MIC}^{\dagger}(Y,X/K) & \xrightarrow{(j'^\dagger,j^*)} & \mathrm{MIC}^{\dagger}(Y',X/K) \times_{\mathrm{MIC}^{\dagger}(Y',Y/K)} \mathrm{MIC}^{\dagger}(Y,Y/K) \end{array} \tag{16.2.5.4.1}$$

is an equivalence of categories. Since this square is commutative up to canonical isomorphism, since the vertical functors are equivalences of categories (see 16.2.1.10.1), then so is the top functor $((^\dagger Z'),|\mathfrak{U})$.

(b) When Z and Z' are in fact the support of some divisors T and T', then by using to 16.1.11.4, we can explicitly build the quasi-inverse functor $\mathcal{G}lue$ of $((^\dagger T'),|\mathfrak{U})$ by setting, for any object $(\mathcal{E}',\mathcal{F}_{\mathfrak{U}},\rho) \in \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T'/K) \times_{\mathrm{MIC}^{\dagger\dagger}(Y,\mathfrak{U},T'/K)} \mathrm{MIC}^{\dagger\dagger}(Y,\mathfrak{U}/K)$,

$$\mathcal{G}lue(\mathcal{E}',\mathcal{F}_{\mathfrak{U}},\rho) := \mathrm{Im}\left(\mathbb{D}_T \circ \mathbb{D}_{T'}(\mathcal{E}') \to \mathcal{E}'\right).$$

16.2.6 Tensor products, commutation with sp_+

Let $(Y,X,\mathfrak{P},Z)$ and $(Y',X',\mathfrak{P}',Z')$ be two smooth c-frames (see the definition 16.2.1.8). We set $\mathfrak{P}'' := \mathfrak{P}\times\mathfrak{P}'$, $X'' := X \times X'$, $Y'' := Y \times Y'$, $j \colon Y \subset X$, $j' \colon Y' \subset X'$ and $j'' \colon Y'' \subset X''$ the canonical inclusions. We denote by $\theta = (b,a,p) \colon (Y'',X'',\mathfrak{P}'',Z'') \to (Y,X,\mathfrak{P},Z)$ and $\theta' = (b',a',p') \colon (Y'',X'',\mathfrak{P}'',Z'') \to (Y',X',\mathfrak{P}',Z')$ the morphisms of d-frames induced by the canonical projections, where $Z'' = p^{-1}(Z) \cup p'^{-1}(Z')$.

Divisorial case: When Z (resp. Z') are the support of a divisor T (resp. T'), then we get smooth d-frames (see the definition 12.2.1.1) and θ and θ' becomes morphisms of d-frames.

Lemma 16.2.6.1. *Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z/\mathcal{V})$, $\mathcal{E}'^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X',\mathfrak{P}',Z'/\mathcal{V})$.*

(a) For any integer $j \neq 0$, we have $H^j(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} 0$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''}(Z''))$. Moreover, $H^0(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X'',\mathfrak{P}'',Z''/\mathcal{V})$.

(b) We have $H^0(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}[d_{Y/P}]) \in \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z/\mathcal{V})$ and the isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$:

$$\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}[d_{Y/P}] \xrightarrow{\sim} H^0(\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}[d_{Y/P}]).$$

Proof. 1) Suppose Z (resp. Z') are the support of a divisor T (resp. T').

a) Let us check (a). Let us denote by $\mathfrak{U} := \mathfrak{P}\setminus T$, $\mathfrak{U}' := \mathfrak{P}'\setminus T'$, $\mathfrak{U}'' := \mathfrak{P}''\setminus T''$. As $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}|\mathfrak{U}'' = \mathcal{E}^{(\bullet)}|\mathfrak{U}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}|\mathfrak{U}'$, following the already known case of completely smooth d-frames (see 12.2.1.8), then we have $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}|\mathfrak{U}'' \in \mathrm{MIC}^{(\bullet)}(Y'',\mathfrak{U}''/\mathcal{V})$. It is then sufficient to prove that $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''}(T''))$. As $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''}(T''))$ the idea is as usual to proceed by descent: with the lemma 16.1.2.9 (and the remark 16.1.2.10), we reduce to the case where Y is dense in X with X integral and where Y' is dense in X' with X' integral. Following 16.1.11.1 there exist a morphism of d-frames of the form $\alpha = (h,g,f) \colon (\widetilde{Y},\widetilde{X},\widetilde{\mathfrak{P}},\widetilde{T}) \to (Y,X,\mathfrak{P},T)$ where $\widetilde{X}$ is smooth, $\widetilde{T} = f^{-1}(T)$ and $\widetilde{T}\cap\widetilde{X}$ is a strict normal crossing divisor of $\widetilde{X}$, f is a proper and smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes, g is a proper, surjective, generically finite etale morphism of k-varieties. We set $\widetilde{\mathfrak{P}}'' := \widetilde{\mathfrak{P}}\times\mathfrak{P}'$, $\widetilde{X}'' := \widetilde{X}\times X'$, $\widetilde{Y}'' := \widetilde{Y}\times Y'$, $\alpha'' = (h'',g'',f'') \colon (\widetilde{Y}'',\widetilde{X}'',\widetilde{\mathfrak{P}}'',\widetilde{T}'') \to (Y'',X'',\mathfrak{P}'',T'')$ the morphism of d-frames induced by α, where $\widetilde{T}'' = f''^{-1}(T'')$. We denote by $\widetilde{\theta} = (\widetilde{b},\widetilde{a},\widetilde{p}) \colon (\widetilde{Y}'',\widetilde{X}'',\widetilde{\mathfrak{P}}'',\widetilde{T}'') \to (\widetilde{\mathfrak{P}},\widetilde{T},\widetilde{X},\widetilde{Y})$ and $\widetilde{\theta}' = (\widetilde{p}',\widetilde{a}',\widetilde{b}') \colon (\widetilde{Y}'',\widetilde{X}'',\widetilde{\mathfrak{P}}'',\widetilde{T}'') \to (Y',X',\mathfrak{P}',T')$ the morphisms of d-frames induced by the canonical projections. Let us denote by $\widetilde{\mathcal{E}}^{(\bullet)} := \alpha^{(\bullet)}(\mathcal{E}^{(\bullet)}) = \mathbb{R}\underline{\Gamma}^{\dagger}_{\widetilde{X}} f_T^{(\bullet)!}(\mathcal{E}^{(\bullet)})$. By stability of the overcoherence by extraordinary inverse image (see 15.3.6.12), we get $\widetilde{\mathcal{E}}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\widetilde{\mathfrak{P}}}(\widetilde{T}))$.

Following 16.1.11.2, $\mathcal{E}^{(\bullet)}$ is a direct summand of $f_{T+}^{(\bullet)}(\widetilde{\mathcal{E}}^{(\bullet)})$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. This implies that $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}$ is a direct summand of $f_{T+}^{(\bullet)}(\widetilde{\mathcal{E}}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}$ in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''}(T''))$. Moreover, following 9.4.4.2.2, we have the isomorphism $f_{T,+}^{(\bullet)}(\widetilde{\mathcal{E}}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)} \xrightarrow{\sim} f''^{(\bullet)}_{T'',+}\left(\widetilde{\mathcal{E}}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)}\right)$. By stability of the overcoherence by the direct image of a proper morphism, we reduce then to the case where X is smooth and $T\cap X$ is strict normal crossing divisor of X. In the same way, we reduce then to the case where X' is smooth and $T'\cap X'$ is a strict normal crossing divisor of X'. In that case, following 12.2.1.8, we obtain $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X'',\mathfrak{P}'',T''/\mathcal{V})$.

b) Let us check (b). Let $\delta\colon \mathfrak{P}\hookrightarrow\mathfrak{P}\times\mathfrak{P}$ be the diagonal immersion. By using 9.2.5.15.1 (recall also 9.1.2.8.1 and 9.2.5.3) in the case where $(Y,X,\mathfrak{P},T) = (Y',X',\mathfrak{P}',T')$, we get $\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} \xrightarrow{\sim} \delta^{(\bullet)!}(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{F}^{(\bullet)})[-d_P]$. According to (a), we have $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''}(T''))$. By stability of the overcoherence by extraordinary inverse image (see 15.3.6.12, this yields that $\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T))$. Hence, it is sufficient to check the lemma apart from T (e.g. we use 8.7.6.11, the characterization of categories of the form $\mathrm{MIC}^{(\bullet)}$ (see 16.2.1.1)

Let us denote by $\mathfrak{U} := \mathfrak{P}\backslash T$. Using the case treated in 12.2.1.13, this yields that $\mathcal{E}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathcal{F}^{(\bullet)}[d_{Y/P}]|_{\mathfrak{U}} = \mathcal{E}^{(\bullet)}|_{\mathfrak{U}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{U}}}\mathcal{F}^{(\bullet)}|_{\mathfrak{U}}[d_{Y/U}] \xrightarrow{\sim} H^0(\mathcal{E}^{(\bullet)}|_{\mathfrak{U}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{U}}}\mathcal{F}^{(\bullet)}|_{\mathfrak{U}}[d_{Y/U}]) \in \mathrm{MIC}^{(\bullet)}(Y,\mathfrak{U}/\mathcal{V})$.

2) Let us go back to the general case. Since tensor products commute with extraordinary pullbacks and with localisation functors (see 13.1.2.1), then the part (b) follows from the divisorial case. Since the categories of the form $\mathrm{MIC}^{(\bullet)}$ commutes with inverse images, the part (a) is a consequence of (b) (recall definition 9.2.5.1.5). ☐

Corollary 16.2.6.2 (Divisorial case)**.** *Suppose Z (resp. Z') are the support of a divisor T (resp. T'). Let $\mathcal{E},\mathcal{F} \in \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V})$, $\mathcal{E}' \in \mathrm{MIC}^{\dagger\dagger}(X',\mathfrak{P}',T'/\mathcal{V})$.*

(a) We have $H^0(\mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{F}[d_{Y/P}]) \in \mathrm{MIC}^{\dagger\dagger}(X,\mathfrak{P},T/\mathcal{V})$ and the isomorphism

$$\mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{F}[d_{Y/P}] \xrightarrow{\sim} H^0(\mathcal{E}\overset{\mathbb{L}}{\otimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{F}[d_{Y/P}]).$$

(b) For any integer $j\neq 0$, we have the isomorphism $H^j(\mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},T,T'}\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} 0$ and $H^0(\mathcal{E}\overset{\mathbb{L}}{\boxtimes}{}^{\dagger}_{\mathcal{O}_{\mathfrak{S}},T,T'}\mathcal{E}'^{(\bullet)}) \in \mathrm{MIC}^{\dagger\dagger}(X'',\mathfrak{P}'',T''/\mathcal{V})$.

Lemma 16.2.6.3. *Let $E,F \in \mathrm{MIC}^{\dagger}(Y,X,\mathfrak{P}/K)$. We have the canonical isomorphism in* $\mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z/\mathcal{V})$*:*

$$\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}(E\otimes_{j^{\dagger}\mathcal{O}_{]X[_{\mathfrak{P}}}}F) \xrightarrow{\sim} \mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}(E)\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}(F)[d_{Y/P}].$$

Proof. Following 16.2.1.10.1, we have the equivalence of categories $\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}\colon \mathrm{MIC}^{\dagger}(Y,X,\mathfrak{P}/K) \cong \mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z/\mathcal{V})$. Following the lemma 16.2.6.1.(b), this yields that the two terms are in $\mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z/\mathcal{V})$. With the lemma 16.2.1.4 (and the remark 16.1.2.10), we reduce to the case where X is integral and Y is dense in X. To come down to the case where X is smooth (already known case in 12.2.6.5), we use the fully faithfulness theorem 16.2.5.2 as follows: following the theorem of desingularisation of de Jong (see [dJ96, 4.1]), there exist a diagram of the form

$$\begin{array}{ccccc} Y^{(0)} & \xhookrightarrow{j^{(0)}} & X^{(0)} & \xhookrightarrow{u^{(0)}} & \mathfrak{P}^{(0)} \\ \downarrow b & \square & \downarrow a & & \downarrow f \\ Y & \xhookrightarrow{j} & X & \xhookrightarrow{u} & \mathfrak{P}, \end{array} \qquad (16.2.6.3.1)$$

where the left square is cartesian, $X^{(0)}$ is smooth, f is a proper and smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes, a is a proper, surjective, generically finite etale morphism of k-varieties,

$T^{(0)} := f^{-1}(Z)$ is a divisor of $P^{(0)}$, j and $j^{(0)}$ are open immersions, u and $u^{(0)}$ are closed immersions. Let us denote by $\theta := (b, a, f)$ the morphism of c-frames. We have the isomorphisms:

$$\begin{aligned}
\theta^* \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}(E \otimes_{j^\dagger \mathcal{O}_{]X[_\mathfrak{P}}} F) &\xrightarrow[16.2.4.3.1]{\sim} \mathrm{sp}^{(\bullet)}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +} \circ \theta^*(E \otimes_{j^\dagger \mathcal{O}_{]X[_\mathfrak{P}}} F) \\
&\xrightarrow{\sim} \mathrm{sp}^{(\bullet)}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +} \left(\theta^*(E) \otimes_{j^{(0)\dagger} \mathcal{O}_{]X^{(0)}[_{\mathfrak{P}^{(0)}}}} \theta^*(F) \right) \\
&\xrightarrow[12.2.6.5.1]{\sim} \mathrm{sp}^{(\bullet)}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +}(\theta^*(E)) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}^{(0)}}} \mathrm{sp}^{(\bullet)}_{X^{(0)} \hookrightarrow \mathfrak{P}^{(0)}, T^{(0)}, +}(\theta^*(F))[d_{Y^{(0)}/P^{(0)}}] \\
&\xrightarrow[16.2.4.3.1]{\sim} \theta^* \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}(E) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}^{(0)}}} \theta^* \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}(F)[d_{Y^{(0)}/P^{(0)}}] \\
&\xrightarrow{\sim} \theta^* \left(\mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}(E) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}(F)[d_{Y/P}] \right). \qquad (16.2.6.3.2)
\end{aligned}$$

Outside the divisor $T^{(0)}$, this isomorphism is 12.2.6.5.1. As the functor $(\theta^*, |\mathfrak{U})$ is fully faithful (see 12.2.6.5, this yields the proposition. □

Notation 16.2.6.4. Let $E \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$ and $E' \in \mathrm{MIC}^\dagger(Y', X', \mathfrak{P}'/K)$. With the notations of 16.1.2.8 (see also 16.1.6.11), we define the bifunctor $- \boxtimes -: \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K) \times \mathrm{MIC}^\dagger(Y', X', \mathfrak{P}'/K) \to \mathrm{MIC}^\dagger(Y'', X'', \mathfrak{P}''/K)$ by setting

$$E \boxtimes E' := \theta^*(E) \otimes_{j''^\dagger \mathcal{O}_{]X''[_{\mathfrak{P}''}}} \theta'^*(E').$$

Proposition 16.2.6.5. *With the notations 16.2.6.4, we have the canonical isomorphism in* $\mathrm{MIC}^{(\bullet)}(X'', \mathfrak{P}'', Z''/\mathcal{V})$*:*

$$\mathrm{sp}^{(\bullet)}_{X'' \hookrightarrow \mathfrak{P}'', Z'', +}(E \boxtimes E') \xrightarrow{\sim} \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}(E) \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_\mathfrak{S}} \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}', Z', +}(E'). \qquad (16.2.6.5.1)$$

Proof. By using 16.2.6.1.(a), the right term of 16.2.6.5.1 belongs to $\mathrm{MIC}^{(\bullet)}(X'', \mathfrak{P}'', Z''/\mathcal{V})$. Since so is the the left one, then using 15.3.8.2 and replacing the use of Proposition 12.2.6.5 by that of Lemma 16.2.6.3, 12.2.4.1.2 by 16.2.4.3, we can copy the proof of 12.2.6.7. □

Theorem 16.2.6.6. *We suppose $\mathfrak{P}' = \mathfrak{P}$ and that $(Y \cap Y', X \cap X', \mathfrak{P}, Z \cup Z')$ is a smooth c-frame. Let us denote by $i: (Y \cap Y', X \cap X', \mathfrak{P}, Z \cup Z') \to (Y, X, \mathfrak{P}, Z)$, $i': (Y \cap Y', X \cap X', \mathfrak{P}, Z \cup Z') \to (Y', X', \mathfrak{P}, Z')$ the canonical morphisms of c-frames and $\widetilde{j}: Y \cap Y' \subset X \cap X'$ be the canonical inclusion.*

(a) For any $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$, $\mathcal{E}'^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}, Z'/\mathcal{V})$, we have the canonical isomorphism in $\mathrm{MIC}^{(\bullet)}(X \cap X', \mathfrak{P}, Z \cup Z'/\mathcal{V})$ of the form:

$$\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_\mathfrak{P}} \mathcal{E}'^{(\bullet)}[d_Y + d_{Y'} - d_{Y \cap Y'} - d_P] \xrightarrow{\sim} i^{(\bullet)*}(\mathcal{E}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_\mathfrak{P}} i'^{(\bullet)*}(\mathcal{E}'^{(\bullet)})[d_{Y \cap Y'/P}]. \qquad (16.2.6.6.1)$$

(b) For any $E \in \mathrm{MIC}^\dagger(Y, X, \mathfrak{P}/K)$ and $E' \in \mathrm{MIC}^\dagger(Y', X', \mathfrak{P}'/K)$, we have the canonical isomorphism in $\mathrm{MIC}^{(\bullet)}(X \cap X', \mathfrak{P}, Z \cup Z'/\mathcal{V})$:

$$\begin{aligned}
&\mathrm{sp}^{(\bullet)}_{X \cap X' \hookrightarrow \mathfrak{P}, Z \cup Z', +}(i^*(E) \otimes_{\widetilde{j}^\dagger \mathcal{O}_{]X \cap X'[_\mathfrak{P}}} i'^*(E')) \\
&\xrightarrow{\sim} \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +}(E) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_\mathfrak{P}} \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}, Z', +}(E')[d_Y + d_{Y'} - d_{Y \cap Y'} - d_P]. \qquad (16.2.6.6.2)
\end{aligned}$$

Proof. Let us treat first 16.2.6.6.1. Since we have the isomorphisms $\mathbb{R}\underline{\Gamma}^\dagger_Y \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$, $\mathbb{R}\underline{\Gamma}^\dagger_{Y'} \mathcal{E}'^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'^{(\bullet)}$ and since $\mathbb{R}\underline{\Gamma}^\dagger_Y \circ \mathbb{R}\underline{\Gamma}^\dagger_{Y'} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Y \cap Y'}$ (see 13.1.5.6.1), then we get from 13.1.5.6.2 the isomorphism:

$$\begin{aligned}
\mathcal{E}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_\mathfrak{P}} \mathcal{E}'^{(\bullet)} &\xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Y \cap Y'}(\mathcal{E}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_\mathfrak{P}} \mathbb{R}\underline{\Gamma}^\dagger_{Y \cap Y'}(\mathcal{E}'^{(\bullet)}) \\
&= i^{(\bullet)*}(\mathcal{E}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_\mathfrak{P}} i'^{(\bullet)*}(\mathcal{E}'^{(\bullet)})[2d_{Y \cap Y'} - (d_Y + d_{Y'})]. \qquad (16.2.6.6.3)
\end{aligned}$$

It follows from 16.2.4.3 that $i^{(\bullet)*}(\mathcal{E}^{(\bullet)})$, $i'^{(\bullet)*}(\mathcal{E}'^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X \cap X', \mathfrak{P}, Z \cup Z'/\mathcal{V})$. The lemma 16.2.6.1.(b) allow us to conclude the check of 16.2.6.6.1. Finally, the isomorphism 16.2.6.6.2 can be built by composing the isomorphisms below:

$$\begin{aligned}
&\mathrm{sp}^{(\bullet)}_{X\cap X' \hookrightarrow \mathfrak{P}, Z\cup Z',+}(i^*(E) \otimes_{\widetilde{j}^\dagger \mathcal{O}_{]X\cap X'[_{\mathfrak{P}}}} i'^*(E')) \\
&\overset{16.2.6.3}{\underset{\sim}{\longrightarrow}} \mathrm{sp}^{(\bullet)}_{X\cap X' \hookrightarrow \mathfrak{P}, Z\cup Z',+}(i^*(E)) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathrm{sp}^{(\bullet)}_{X\cap X' \hookrightarrow \mathfrak{P}, Z\cup Z',+}(i'^*(E'))[d_{Y\cap Y'/P}] \\
&\underset{16.2.4.3.1}{\overset{\sim}{\longrightarrow}} i^{(\bullet)*} \circ \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z,+}(E) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} i'^{(\bullet)*} \circ \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}, Z',+}(E')[d_{Y\cap Y'/P}] \\
&= \mathbb{R}\underline{\Gamma}^\dagger_{Y\cap Y'} \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z,+}(E) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathbb{R}\underline{\Gamma}^\dagger_{Y\cap Y'} \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}, Z',+}(E')[d_Y + d_{Y'} - d_{Y\cap Y'} - d_P] \\
&\overset{16.2.6.6.3}{\underset{\sim}{\longrightarrow}} \mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z,+}(E) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} \mathrm{sp}^{(\bullet)}_{X' \hookrightarrow \mathfrak{P}, Z',+}(E')[d_Y + d_{Y'} - d_{Y\cap Y'} - d_P].
\end{aligned}$$

□

16.2.7 Canonical independence in smooth c-frame

Lemma 16.2.7.1. *Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of separated and smooth $\mathfrak{S}$-formal schemes, $u'\colon X' \hookrightarrow P'$ be a closed immersion with X' integral, Z be a closed subscheme of P such that $Z' := f^{-1}(Z)$ is a closed subscheme of P' not containing X' and such that $Y' := X' \setminus Z'$ is smooth. We suppose $f \circ u'$ proper. Let $\mathcal{E}'^{(\bullet)} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$.*

(a) We have $f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$.

(b) If Z is the support of some divisor T and $\mathcal{E}' := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$ then $\mathbb{D}_T \circ f_{T,+}(\mathcal{E}'^{(\bullet)!}) \in (F\text{-})D^{\mathrm{b}}_{\mathrm{oc}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$.

(c) Suppose the induced morphism $Y' \to P$ is an immersion. Let X be the closure of Y' in P. Then $f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$.

Proof. Let us prove a): by using the stability of our category with respect to (extraordinary) inverse images (see 16.2.4.3), by using the commutation of the pushforward by a proper morphism to the extraordinary pullback (see 13.2.3.7), we reduce to check that for any divisor T of P containing Z we have $({}^\dagger T) f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. We get

$$({}^\dagger T) \circ f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \overset{13.2.1.4.2}{\underset{\sim}{\longrightarrow}} f^{(\bullet)}_+ \circ ({}^\dagger f^{-1}(T))(\mathcal{E}'^{(\bullet)}).$$

We can suppose P' is integral. So either $f^{-1}(T)$ is a divisor of P' or $f^{-1}(T) = P'$. Since the second case is obvious (because we get therefore $({}^\dagger f^{-1}(T))(\mathcal{E}'^{(\bullet)}) = 0$, then we can suppose $T' := f^{-1}(T)$ is a divisor of P'. Set $\widetilde{Y}' := X' \setminus T'$. Set $\widetilde{\mathcal{E}}'^{(\bullet)} := ({}^\dagger T')(\mathcal{E}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', T'/\mathcal{V})$. It follows from de Jong desingularization theorem that there exists a diagram of the form:

$$\begin{array}{ccccccccc}
\widetilde{Y}'' & \longrightarrow & Y'' & \xrightarrow{j''} & X'' & \xrightarrow{u''} & \widehat{\mathbb{P}}^N_{\mathfrak{P}'} & \xrightarrow{\widehat{\mathbb{P}}^N_f} & \widehat{\mathbb{P}}^N_{\mathfrak{P}} \\
\downarrow{\scriptstyle c'} & \Box & \downarrow{\scriptstyle b'} & \Box & \downarrow{\scriptstyle a'} & & \downarrow{\scriptstyle q'} & \Box & \downarrow{\scriptstyle q} \\
\widetilde{Y}' & \longrightarrow & Y' & \xrightarrow{j'} & X' & \xrightarrow{u'} & \mathfrak{P}' & \xrightarrow{f} & \mathfrak{P},
\end{array} \qquad (16.2.7.1.1)$$

where X'' is quasi-projective and smooth over k, q and q' are the canonical projections, u'' is a closed immersion, $a'^{-1}(T' \cap X')$ is a strict normal crossing divisor of X'', a' is proper, surjective, generically finite and etale. More precisely, there exists an immersion $\iota\colon X'' \hookrightarrow \widehat{\mathbb{P}}^N_{\mathfrak{S}}$ such that u'' is the composition of the graph of $u' \circ a'$ with $\iota \times \mathrm{id}\colon X' \times \mathfrak{P}' \hookrightarrow \widehat{\mathbb{P}}^N_{\mathfrak{P}'}$. Since $u' \circ a'$ and q are proper, then so is u'' which is therefore a closed immersion. Similarly, we can check that the morphism $\tilde{f} \circ u''$ is an immersion which is closed because of the properness of $f \circ u' \circ a$ and q. Denote by $\tilde{f} := \widehat{\mathbb{P}}^N_f$, $\widetilde{\mathfrak{P}} := \widehat{\mathbb{P}}^N_{\mathfrak{P}}$, $\widetilde{T} := q^{-1}(T)$,$\eta' := (c', a', q')$ and $\widetilde{\mathcal{E}}''^{(\bullet)} := \eta'^{!}(\widetilde{\mathcal{E}}'^{(\bullet)})$.

Since $T'' \cap X'' = \widetilde{T} \cap X''$, via 16.1.9.3.(b), then we get $\tilde{f}^{(\bullet)}_+(\widetilde{\mathcal{E}}''^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X'', \widetilde{\mathfrak{P}}, \widetilde{T}/\mathcal{V})$. Since q is proper, $q^{(\bullet)}_+$ preserves the overcoherence (see 15.3.6.14). Moreover, by transitivity of the direct image $f^{(\bullet)}_+ \circ q'^{(\bullet)}_+(\widetilde{\mathcal{E}}''^{(\bullet)}) \xrightarrow{\sim} q^{(\bullet)}_+ \circ \tilde{f}^{(\bullet)}_+(\widetilde{\mathcal{E}}''^{(\bullet)})$. This yields that $f^{(\bullet)}_+ \circ q'^{(\bullet)}_+(\widetilde{\mathcal{E}}''^{(\bullet)}) \in (F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^*\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. Since $\widetilde{\mathcal{E}}'^{(\bullet)}$ is a direct summand of $q'^{(\bullet)}_+(\widetilde{\mathcal{E}}''^{(\bullet)})$, then $f^{(\bullet)}_+(\widetilde{\mathcal{E}}'^{(\bullet)})$ is a direct summand of $f^{(\bullet)}_+ \circ q'^{(\bullet)}_+(\widetilde{\mathcal{E}}''^{(\bullet)})$ Hence $f^{(\bullet)}_+(\widetilde{\mathcal{E}}'^{(\bullet)}) \in (F\text{-})D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$.

Let us check (b). In the case where $Z = T$ and $Z' = T'$, set $\mathcal{E}''^{(\bullet)} := \eta'^{!}(\widetilde{\mathcal{E}}'^{(\bullet)})$ and $\mathcal{E}'' := \mathcal{E}''^{(\bullet)}$. Since $f_+ \circ q'_+(\mathcal{E}'') \xrightarrow{\sim} q_+ \circ \tilde{f}_+(\mathcal{E}'')$. Since $\tilde{f}^{(\bullet)}_+(\mathcal{E}''^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X'', \widetilde{\mathfrak{P}}, \widetilde{T}/\mathcal{V})$, then it follows from 16.1.11.3 that $\mathbb{D}_T \circ f_+ \circ q'_+(\mathcal{E}'') \in (F\text{-})D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$. Hence, we get $\mathbb{D}_T \circ f_+(\mathcal{E}'^{(\bullet)})$ is a direct summand of $\mathbb{D}_T \circ f_+ \circ q'_+(\mathcal{E}'')$. Hence $\mathbb{D}_T \circ f_+(\mathcal{E}') \in (F\text{-})D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}})$.

Let us consider now c). Following a), it is already known that $f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. Hence, it remains more to prove that $f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})|\mathfrak{U} \in \mathrm{MIC}^{(\bullet)}(Y', \mathfrak{U}/\mathcal{V})$, where $\mathfrak{U} := \mathfrak{P} \setminus T$. This is a consequence of the completely smooth d-frame case which was already treated at 16.1.9.3. Hence we are done. □

Corollary 16.2.7.2. *With notation 16.2.7.1, let $g\colon \mathfrak{Q} \to \mathfrak{P}$ be a smooth morphism of $\mathfrak{S}$-smooth formal schemes. We denote by $\mathfrak{Q}' := \mathfrak{P}' \times_{\mathfrak{P}} \mathfrak{Q}$, by $f'\colon \mathfrak{Q}' \to \mathfrak{Q}$ and $g'\colon \mathfrak{Q}' \to \mathfrak{P}'$ the two canonical projections, $U := g^{-1}(Z)$, $U' := g'^{-1}(Z')$. There then exists a canonical isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Q}/\mathfrak{S}}(U))$:*

$$g^{(\bullet)!} \circ f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} f'^{(\bullet)}_+ \circ g'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}). \tag{16.2.7.2.1}$$

Proof. Using Lemma 16.2.7.1 and replacing the coherent version by the overconvergent version of Berthelot-Kashiwara theorem (see 15.3.8.26), then we can indeed copy the proof of 13.2.3.7.

□

Lemma 16.2.7.3. *Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, X, X' be two smooth closed subschemes of P, Z, Z' be two closed subschemes of P such that $Z \cap X = Z' \cap X'$. We get then the equality: $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) = (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}, Z'/\mathcal{V})$.*

Proof. This is checked similarly to 15.3.8.25 □

Proposition 16.2.7.4. Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, X, Z, X' and Z' be some closed subschemes of P such that $Y := X \setminus Z$ is smooth and $X \setminus Z = X' \setminus Z'$. Then we have the equality $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) = (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}, Z'/\mathcal{V})$. In particular, writing the schematic closure of Y in P by $\overline{Y}$, we get $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) = (F\text{-})\mathrm{MIC}^{(\bullet)}(\overline{Y}, \mathfrak{P}, \overline{Y} \setminus Y/\mathcal{V})$.

Proof. 1) Suppose $Z = Z'$. This case is checked similarly to the part 1) of the proof of 16.1.9.2. we are reduced to the case where $X = X' = \overline{Y}$ and $X \setminus Z$ is not empty.

2) Suppose $X = X'$ and $Z \subset Z'$. Similarly to the part 2) of the proof of 16.1.9.2, we get $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \subset (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z'/\mathcal{V})$. Conversely, let $\mathcal{E}'^{(\bullet)}$ be an object of $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z'/\mathcal{V})$. By 16.2.1.4, we can suppose that X is irreducible. It remains to show that $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ (indeed, the second condition of the definition 16.2.1.1 holds since we are in the completely smooth context of 16.2.7.3). By using the stability of our category with respect to (extraordinary) inverse images (see 16.2.4.3), we reduce to check that for any divisor T of P containing Z we have $({}^\dagger T)\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. Since X is integral, then either $T \cap X$ is a divisor of X or $T \cap X = X$. Since the second case is obvious (because we get therefore $({}^\dagger T)(\mathcal{E}'^{(\bullet)}) = 0$, then we can suppose $D := T \cap X$ is a divisor of X. Set $\widetilde{Y} := X \setminus T$. Set $\widetilde{\mathcal{E}}'^{(\bullet)} := ({}^\dagger T)(\mathcal{E}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T \cup Z'/\mathcal{V})$. We have to check that $\widetilde{\mathcal{E}}'^{(\bullet)} := ({}^\dagger T)(\mathcal{E}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$.

Let $T'_1, \ldots, T'_r$ be some divisors of P such that $T \cup Z' = T'_1 \cap \cdots \cap T'_r$. Since $\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T \cup Z'/\mathcal{V})$ is an abelian subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{poc}}(X, \mathfrak{P}, T \cup Z'/\mathcal{V})$, then it follows from 15.3.8.19.1 that we have the exact sequence

$$0 \to \widetilde{\mathcal{E}}'^{(\bullet)} \to \oplus_{i=1}^r ({}^\dagger T'_i)(\widetilde{\mathcal{E}}'^{(\bullet)}) \xrightarrow{\theta^2 - \theta^1} \oplus_{i,j=1}^r ({}^\dagger T'_i \cup T'_j)(\widetilde{\mathcal{E}}'^{(\bullet)}). \tag{16.2.7.4.1}$$

where $\theta^n\colon \widetilde{\mathcal{E}}'^{(\bullet)} \to \oplus_{i=1}^{r} ({}^\dagger T'_i)(\widetilde{\mathcal{E}}'^{(\bullet)}) \to \oplus_{i,j=1}^{r} ({}^\dagger T'_i \cup T'_j)(\widetilde{\mathcal{E}}'^{(\bullet)})$ for $n = 0, 1$ are the canonical maps defined at 15.3.8.19. Hence, we reduce to check that for any divisor T' containing $T \cup Z'$, we have $({}^\dagger T')(\widetilde{\mathcal{E}}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T/\mathcal{V})$.

Set $\widetilde{Y} := X \setminus T$ and $\widetilde{Y}' := X \setminus T'$. It follows from de Jong desingularization theorem that there exists a diagram of the form:

$$\begin{array}{ccccccccc} \widetilde{Y}'^{(0)} & \xrightarrow{l^{(0)}} & \widetilde{Y}^{(0)} & \xrightarrow{l^{(0)}} & Y^{(0)} & \xrightarrow{j^{(0)}} & X^{(0)} & \xrightarrow{u^{(0)}} & \mathfrak{P}^{(0)} \\ \downarrow d & \square & \downarrow c & \square & \downarrow b & \square & \downarrow a & & \downarrow f \\ \widetilde{Y}' & \xrightarrow{l} & \widetilde{Y} & \xrightarrow{l} & Y & \xrightarrow{j} & X & \xrightarrow{u} & \mathfrak{P}, \end{array} \qquad (16.2.7.4.2)$$

where the left and middle squares are cartesian, f is a proper smooth morphism of separated and smooth $\mathfrak{S}$-formal schemes, a is a proper surjective morphism of k-varieties, b is a morphism of smooth k-varieties, c is a generically finite and etale morphism, l, $l^{(0)}$, j and $j^{(0)}$ are open immersions, u and $u^{(0)}$ are closed immersions, $\widetilde{Y}$ is dense in Y and $\widetilde{Y}^{(0)}$ is dense in $Y^{(0)}$. We denote by $\widetilde{j}\colon \widetilde{Y} \hookrightarrow X$ and $\widetilde{j}^{(0)}\colon \widetilde{Y}^{(0)} \hookrightarrow X^{(0)}$ the induced open immersions. We set $\mathfrak{U} := \mathfrak{P} \setminus Z$, $Z^{(0)} := f^{-1}(Z)$, $Z'^{(0)} := f^{-1}(Z')$, $T^{(0)} := f^{-1}(T)$,$T'^{(0)} := f^{-1}(T')$, $\mathfrak{U}^{(0)} := \mathfrak{P}^{(0)} \setminus Z^{(0)}$ and $g\colon \mathfrak{U}^{(0)} \to \mathfrak{U}$ the morphism induced by f.

We denote by $\eta = (c, a, f)$ and $\eta' = (d, a, f)$ the induced morphism of smooth d-frames. Since $\widetilde{\mathcal{E}}^{(\bullet)}({}^\dagger T') \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, T'/\mathcal{V})$, then it follows from 16.1.11.2 that $\widetilde{\mathcal{E}}^{(\bullet)}({}^\dagger T')$ is a direct factor of $\eta'^{(\bullet)}_{+} \circ \eta'^{(\bullet)!}(\widetilde{\mathcal{E}}^{(\bullet)}({}^\dagger T'))$, where $\eta'^{(\bullet)}_{+} := f^{(\bullet)}_{+}$. According to 16.2.4.1.1, we have $\eta^{(\bullet)!}(\widetilde{\mathcal{E}}'^{(\bullet)}) := \mathbb{R}\underline{\Gamma}^{\dagger}_{\widetilde{Y}^{(0)}} \circ f^{(\bullet)!}(\widetilde{\mathcal{E}}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(\widetilde{Y}^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, Z'^{(0)} \cup T^{(0)})$. With 16.2.7.3, since $(Z'^{(0)} \cup T^{(0)}) \cap X^{(0)} = T^{(0)} \cap X^{(0)}$, this implies $\eta^{(\bullet)!}(\widetilde{\mathcal{E}}'^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(\widetilde{Y}^{(0)}, X^{(0)}, \mathfrak{P}^{(0)}, T^{(0)})$. By stability of the overcoherence, via the isomorphism

$$\eta'^{(\bullet)}_{+} \circ \eta'^{(\bullet)!}(\widetilde{\mathcal{E}}^{(\bullet)}({}^\dagger T')) \xrightarrow{\sim} ({}^\dagger T') \circ \eta^{(\bullet)}_{+}\left(\eta^{(\bullet)!}(\widetilde{\mathcal{E}}^{(\bullet)})\right),$$

(where $\eta^{(\bullet)}_{+} := f^{(\bullet)}_{+}$) we get $\eta'^{(\bullet)}_{+} \circ \eta'^{(\bullet)!}(\widetilde{\mathcal{E}}^{(\bullet)}({}^\dagger T')) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathcal{P}}(T))$. Hence, so is $\widetilde{\mathcal{E}}^{(\bullet)}({}^\dagger T')$ and we are done.

3) Since $X \setminus Z = X \setminus (Z \cup Z') = X' \setminus (Z \cup Z') = X' \setminus Z'$, then to check the general case we deduce to the two preceding cases.

□

Notation 16.2.7.5. Let $\mathfrak{P}$ be a smooth separated $\mathfrak{S}$-formal scheme, Y be some subscheme of P. We write $(F\text{-})\mathrm{MIC}^{(\bullet)}(Y, \mathfrak{P}/\mathcal{V}) := (F\text{-})\mathrm{MIC}^{(\bullet)}(\overline{Y}, \mathfrak{P}, \overline{Y} \setminus Y/\mathcal{V})$.

Proposition 16.2.7.6. *Let $\theta = (\mathrm{id}, a, f)\colon (Y, X', \mathfrak{P}', Z') \to (Y, X, \mathfrak{P}, Z)$ be a morphism of smooth c-frames (see definition 16.2.1.8) such that a is proper.*

(a) Let $\mathcal{E}^{(\bullet)} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$, $\mathcal{E}'^{(\bullet)} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$. For any $l \in \mathbb{Z} \setminus \{0\}$,

$$H^l(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})) = 0, \qquad\qquad H^l(f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)})) = 0.$$

(b) The functors $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y} f^{(\bullet)!}$ and $f^{(\bullet)}_{+}$ induce canonically quasi-inverse equivalences between the categories $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ and $(F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$.

Proof. Let $\mathcal{E}^{(\bullet)} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$, $\mathcal{E}'^{(\bullet)} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$. Denote by $\mathfrak{U} := \mathfrak{P} \setminus Z$ and $\mathfrak{U}' := \mathfrak{P}' \setminus Z'$. Using 16.2.7.4, we can suppose Y is dense in X'. Since a is proper, then the open immersion $Y \hookrightarrow X' \setminus f^{-1}(Z)$ is also closed. Hence, $f^{-1}(Z)$ is a closed subscheme of P' such that $X' \setminus f^{-1}(Z) = Y$. Following 16.2.7.4, we can suppose $Z' = f^{-1}(Z)$. Moreover, using lemma 16.2.1.4, we reduce to the case where Y integral.

Since a is proper, then it follows from lemma 16.2.7.1.(c) (resp. thanks to the proposition 16.2.4.1), we obtain the assertion (a) for the direct image (resp. the other functor) and $f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)!}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ (resp. $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$).

Let us now check that we have the canonical isomorphism: $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{(\bullet)!} \circ f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}'^{(\bullet)!}$. It follows from the lemma 16.1.11.1), that there exists a diagram of the form 16.2.7.1.1 and satisfying the required conditions. With these notations, since the functor $(a'^{(\bullet)!}, |\mathfrak{U}')$ is fully faithful (see 16.2.5.2), it is sufficient to build two compatible isomorphisms $a'^{(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{(\bullet)!} \circ f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} a'^{(\bullet)!}(\mathcal{E}'^{(\bullet)!})$

and $|\mathfrak{U}' \circ \mathbb{R}\underline{\Gamma}^\dagger_{X'} \circ f^{(\bullet)!} \circ f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}'^{(\bullet)!}|\mathfrak{U}'$. The second isomorphism is a consequence of the case of the smooth partial compactification (see 16.1.9.5). Let us establish now the first. We recall that $a'^{(\bullet)!} = \mathbb{R}\underline{\Gamma}^\dagger_{X''} \circ q'^!$. Denote by $\tilde{f} := \widehat{\mathbb{P}}^N_f : \widehat{\mathbb{P}}^N_{\mathfrak{P}'} \to \widehat{\mathbb{P}}^N_{\mathfrak{P}}$. Following 16.2.7.1.a, $f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)})$ is coherent. We have the isomorphisms:

$$a'^{(\bullet)!} \circ \mathbb{R}\underline{\Gamma}^\dagger_{X'} \circ f^{(\bullet)!} \circ f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{X''} \circ \widetilde{f}^{(\bullet)!} \circ q^{(\bullet)!} \circ f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)}) \overset{16.2.7.2}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^\dagger_{X''} \circ \widetilde{f}^{(\bullet)!} \circ \widetilde{f}_+^{(\bullet)} \circ q'^!(\mathcal{E}'^{(\bullet)})$$
$$\xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{X''} \circ \widetilde{f}^{(\bullet)!} \circ \widetilde{f}_+^{(\bullet)} \circ a'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} a'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}),$$

the last isomorphism, since X'' is smooth, coming from the completely smooth case of 16.1.9.5.

Similarly, we established the canonical isomorphism and $f_+^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^\dagger_{X'} \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$. Hence we are done. □

Corollary 16.2.7.7. *Let $(Y, X, \mathfrak{P}, Z)$ be a smooth c-frame over $\mathfrak{S}$. Denote by $p_1 : \mathfrak{P} \times \mathfrak{P} \to \mathfrak{P}$ and $p_2 : \mathfrak{P} \times \mathfrak{P} \to \mathfrak{P}$ the left and right projections. For any $\mathcal{E}^{(\bullet)} \in (F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$, we have the canonical isomorphisms:*

$$\mathbb{R}\underline{\Gamma}^\dagger_X p_1^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xleftarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_X p_1^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_X p_2^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_Y p_2^{(\bullet)!}(\mathcal{E}^{(\bullet)}), \tag{16.2.7.7.1}$$

where by abuse of notation X is $\delta(X)$ and Y is $\delta(Y)$.

Proof. Since $\delta(X) \cap (P \times Y) = \delta(X) \cap (Y \times P) = \delta(Y)$, then we get the first and the last isomorphisms. Let $\delta : \mathfrak{P} \hookrightarrow \mathfrak{P} \times \mathfrak{P}$ be the diagonal immersion. Pour $i = 1, 2$, set $\mathcal{F}_i^{(\bullet)} := \mathbb{R}\underline{\Gamma}^\dagger_X p_i^{(\bullet)!}(\mathcal{E}^{(\bullet)})$. We have therefore the canonical isomorphisms:

$$\mathcal{F}_i^{(\bullet)} \overset{16.2.7.6}{\xrightarrow{\sim}} \delta_+^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^\dagger_X \delta^{(\bullet)!}(\mathcal{F}_i^{(\bullet)}) \xrightarrow{\sim} \delta_+^{(\bullet)}(\mathcal{E}^{(\bullet)}),$$

the last one coming from $p_i \circ \delta = \mathrm{id}$. Hence, we are done. □

Definition 16.2.7.8. A "realizable pair $(Y, X)/\mathcal{V}$(of k-varieties)" is the data of a k-variety X, of an open set Y of X such that there exists a c-frame of the form $(Y, X, \mathfrak{P}, Z)$. In that case we say that $(Y, X, \mathfrak{P}, Z)$ is a c-frame enclosing $(Y, X)/\mathcal{V}$. A morphism $(Y', X') \to (Y, X)$ of realizable pairs of k-varieties is a morphism of varieties $a : X' \to X$ such that $a(Y') \subset Y$.

Proposition 16.2.7.9 (and Definition)**.** *Let $(Y, X, \mathfrak{P}, Z)$ be a c-frame.*

(a) The category $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ does not depend, up to canonical equivalence of categories, on the choice of the c-frame enclosing $(Y, X)/\mathcal{V}$.

(b) If there is no ambiguity, we denote therefore by $(F\text{-})\mathrm{MIC}^{(\bullet)}(Y, X/\mathcal{V})$ instead of $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$. Its objects are the "$(F\text{-})$partially overcoherent isocrystals over $(Y, X)/\mathcal{V}$" or simply "$(F\text{-})$overcoherent isocrystals over $(Y, X)/\mathcal{V}$".

Proof. Let $(Y, X, \mathfrak{P}', Z')$ be another c-frame enclosing (Y, X). Set $\mathfrak{P}'' := \mathfrak{P} \times \mathfrak{P}'$. Let $q : \mathfrak{P}'' \to \mathfrak{P}$, $q' : \mathfrak{P}'' \to \mathfrak{P}'$ the canonical projections and $Z'' := q^{-1}(Z)$. Following 16.2.7.6, the functors $q_+^{(\bullet)}$ and $\mathbb{R}\underline{\Gamma}^\dagger_X q^{(\bullet)!}$ (resp. $q'^{(\bullet)}_+$ and $\mathbb{R}\underline{\Gamma}^\dagger_X q'^!$) induce then quasi-inverse equivalences between the categories $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ and $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}'', Z''/\mathcal{V})$ (resp. $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}', Z'/\mathcal{V})$ and $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}'', Z''/\mathcal{V})$). Hence we are done. □

16.2.7.10. Suppose there exists an automorphism $\sigma : \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. Let $(Y, X, \mathfrak{P}, Z)$ be a smooth c-frames. We denote by $\mathfrak{P}' := \mathfrak{P}^\sigma$ the $\mathcal{V}$-formal scheme deduced from $\mathfrak{P}$ by the base change defined by σ. We denote by $Z' := Z^\sigma$, $X' := X^\sigma$, $Y' := Y^\sigma$. Let $F^s_{Y/S} : Y \to Y'$ be the relative Frobenius of Y. The functor $F^{*(\bullet)}_{\mathfrak{X}} : \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}) \to \underrightarrow{LD}^-_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ defined at 9.5.1.2.2 (with empty divisors) induces the functor:

$$F^{*(\bullet)}_{\mathfrak{X}} : \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}). \tag{16.2.7.10.1}$$

Composing the graph $\gamma_{F^s_{Y/S}} : Y \hookrightarrow Y \times Y'$ of $F^s_{Y/S}$ with the immersion $Y \times Y' \hookrightarrow \mathfrak{P} \times \mathfrak{P}'$, we get the immersion $\gamma : Y \hookrightarrow \mathfrak{P} \times \mathfrak{P}'$. Let X'' be the closure Y in $P \times P'$ and $Z'' := (Z \times P') \cup (P \times Z')$, we get the c-frame $(Y, X'', \mathfrak{P}\times\mathfrak{P}', Z'')$. We get the morphisms of c-frames $\theta_2 = (F^s_{Y/S}, a, p_2)\colon (Y, X'', \mathfrak{P}\times\mathfrak{P}', Z'') \to (Y', X', \mathfrak{P}', Z')$, $\theta_1 = (\mathrm{id}, a, p_1)\colon (Y, X'', \mathfrak{P}\times\mathfrak{P}', Z'') \to (Y, X, \mathfrak{P}, Z)$ where p_1 and p_2 are respectively the left and the right projection. It follows from 16.2.7.6 that p_{1+} induces canonically the equivalence of categories $\theta^{(\bullet)}_{1+} = p^{(\bullet)}_{1+}\colon F\text{-MIC}^{(\bullet)}(X'', \mathfrak{P}\times\mathfrak{P}', Z''/\mathcal{V}) \cong F\text{-MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$. We get the functor

$$\theta^{(\bullet)}_{1+}\circ\theta^{(\bullet)!}_{2}\colon F\text{-MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V}) \to F\text{-MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}). \qquad (16.2.7.10.2)$$

which is canonically isomorphic to the functor $F^{*(\bullet)}_{\mathfrak{X}}$ defined of 16.2.7.10.1.

It follows from 16.2.7.6 and 16.2.4.1.1, that for any $\mathcal{E}^{(\bullet)} \in F\text{-MIC}^{(\bullet)}(X'', \mathfrak{P}\times\mathfrak{P}', Z''/\mathcal{V})$, we get the isomorphism:

$$\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}\circ\theta^{(\bullet)}_{1+}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \theta^{(\bullet)}_{1+}\circ\mathrm{sp}^{(\bullet)}_{X''\hookrightarrow\mathfrak{P}\times\mathfrak{P}',Z'',+}(\mathcal{E}^{(\bullet)}).$$

Using again 16.2.4.1.1, since both functors 16.2.7.10.2 and 16.2.7.10.2 are isomorphic, this yields for any $\mathcal{E}'^{(\bullet)} \in F\text{-MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$

$$\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}\circ F^{*(\bullet)}_{\mathfrak{X}}(\mathcal{E}'^{(\bullet)}) \xrightarrow{\sim} F^{*(\bullet)}_{\mathfrak{X}}\mathrm{sp}^{(\bullet)}_{X'\hookrightarrow\mathfrak{P}',Z',+}(\mathcal{E}'^{(\bullet)}). \qquad (16.2.7.10.3)$$

16.2.7.11. Let (Y, X) be a pair of k-varieties. Following lemma 16.2.1.4, if $\overline{Y}$ is the closure of Y in X then $(F\text{-})\mathrm{MIC}^{(\bullet)}(Y, \overline{Y}/\mathcal{V}) = (F\text{-})\mathrm{MIC}^{(\bullet)}(Y, X/\mathcal{V})$.

Let $(Y, X, \mathfrak{P}, Z)$ be a c-frame enclosing (Y, X). Since the equivalence of categories of 16.2.1.10.1 commutes with base change, using 16.2.7.10.3, we obtain the functor:

$$\mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+}\ :\ (F\text{-})\mathrm{MIC}^{\dagger}(Y, X/\mathcal{V}) \cong (F\text{-})\mathrm{MIC}^{(\bullet)}(Y, X/\mathcal{V}), \qquad (16.2.7.11.1)$$

which does not depend canonically on the choice of the c-frame $(Y, X, \mathfrak{P}, Z)$ enclosing (Y, X) and will be simply denoted by $\mathrm{sp}^{(\bullet)}_{(Y,X),+}$. When X/S is proper, $\mathrm{sp}^{(\bullet)}_{(Y,X),+}$ only depends on Y and will simply be denoted by $\mathrm{sp}^{(\bullet)}_{Y+}$.

Proposition 16.2.7.12 (and Definition)**.** *Let Y be a smooth k-variety. We suppose there exists a c-frame of the form $(Y, X, \mathfrak{P}, Z)$, with X a proper k-variety.*

(a) The category $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$ does not depend, up to canonical equivalence of categories, on the choice of the c-frame of the form $(Y, X, \mathfrak{P}, Z)$, with X a proper k-variety.

(b) We denote then by $(F\text{-})\mathrm{MIC}^{(\bullet)}(Y/\mathcal{V})$ instead of $(F\text{-})\mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V})$. Its objects are called "$(F\text{-})$overcoherent isocrystals over Y".

Proof. Let $(Y, X', \mathfrak{P}', Z')$ be another c-frame with X' proper. Let X'' be the closure of Y in $X\times X'$. Since the projection $X''\to X$ and $X''\to X'$ are proper, we conclude the proof by using 16.2.7.6. □

Notation 16.2.7.13. Let $\theta = (b, a, f)\colon (Y', X', \mathfrak{P}', Z') \to (Y, X, \mathfrak{P}, Z)$ be a morphism of smooth c-frames. The functors $\theta^{(\bullet)+}, \theta^{(\bullet)!}\colon \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(X', \mathfrak{P}', Z'/\mathcal{V})$ of 16.2.4.3 only depends on the morphism of realizable pairs $(b, a)\colon (X', Y') \to (Y, X)$. Following 16.2.4.3, those are isomorphic. Hence we will denote it without ambiguity $(b, a)^*$.

16.3 Devissability in overconvergent isocrystals

16.3.1 Definition and first properties

Let $\mathfrak{P}$ be a separated and smooth $\mathfrak{S}$-formal scheme.

Definition 16.3.1.1. Let Y be a subvariety of P. We say that Y is "d-embedabble in P" if there exist a divisor T of P such that Y is closed in $P\setminus T$. We remark that this is equivalent to suppose that there exist a d-frame of the form $(Y, X, \mathfrak{P}, T)$. Moreover, if Y', Y are d-embedabble in P two subvarieties, then $Y\cap Y'$ is d-embedabble in P.

Definition 16.3.1.2. Let Y be a subvariety of P.

(a) A "stratification of Y" is the data (for a certain integer $r \geq 1$) of r subvarieties $(Y_1, Y_2, \ldots, Y_r)$ such that, by setting $Y_0 := \emptyset$, for any integer i satisfying $1 \leq i \leq r-1$, the variety Y_i is an open of $Y \setminus (\cup_{0 \leq j \leq i-1} Y_j)$ and such that $Y_r = Y \setminus (\cup_{0 \leq j \leq r-1} Y_j)$. In other words, we have the direct sum $Y = \sqcup_{i=1,\ldots,r} Y_i$ such that, for any $1 \leq i \leq r-1$, the variety Y_i is an open subset of $\sqcup_{j=i,\ldots,r} Y_j$. Taking care of the order, we also say such a split $Y = \sqcup_{i=1,\ldots,r} Y_i$ is a stratification of Y.

(b) Let $Y = \sqcup_{i=1,\ldots,r} Y_i$ be a stratification. We say that $Y = \sqcup_{i=1,\ldots,r} Y_i$ or $(Y_1, Y_2, \ldots, Y_r)$ is a smooth stratification (resp. a d-stratification in P, resp. is a smooth d-stratification) if, for any $1 \leq i \leq r$, the variety Y_i is smooth (resp. is d-embeddable, resp. is smooth and d-embeddable).

Remark 16.3.1.3. Let Y be a subvariety of P and $Y = \sqcup_{i=1,\ldots,r} Y_i$ be a stratification. For any, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$, for any $1 \leq i \leq r-1$, we have distinguished triangle of localisation

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{\sqcup_{j=i+1,\ldots,r} Y_j}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{\sqcup_{j=i,\ldots,r} Y_j}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{Y_i}(\mathcal{E}^{(\bullet)}) \to +1$$

Notation 16.3.1.4. Let Y be a smooth subvariety of P. Let us choose X and Z be two closed subschemes of P, such that $Y = X \setminus Z$. We denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},X}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$ the strictly full triangulated subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{poc}}(Y, X, \mathfrak{P}, Z/\mathfrak{S})$ (see notation 15.3.8.3) of complexes $\mathcal{E}^{(\bullet)}$ such that for any $j \in \mathbb{Z}$, with notation 15.3.8.13 we have

$$H^j_Z(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}).$$

This category do not depend on the choice of the closed subschemes X an Z such that $Y = X \setminus Z$. Indeed, let X', Z' be a closed subschemes of P such that $X' \setminus Z' = Y$. It follows from 16.2.7.4 by devissage in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},X}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$ the inclusion $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},X}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z)) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},X'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z'))$. By symmetry, we get this inclusion is an equality.

Hence, we can then simply denote $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},X}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(Z))$ by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$.

The following notion of devissability into overconvergent isocrystals extends that of [Car06a] since we do not bother with divisors (but both notions are equal).

Definition 16.3.1.5. Let Y be a subvariety of P. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$.

(a) The complex $\mathcal{E}^{(\bullet)}$ "splits into overconvergent isocrystals on Y" if there exists a smooth stratification of Y (see Definition 16.3.1.2) of the form $Y = \sqcup_{i=1,\ldots,r} Y_i$ such that, for any $i = 1, \ldots, r$, we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y_i}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y_i}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. We also say that the complex "$\mathcal{E}^{(\bullet)}$ splits (or is devissable) into overconvergent isocrystals on the smooth stratification $Y = \sqcup_{i=1,\ldots,r} Y_i$".

(b) When $Y = P$, we say that $\mathcal{E}^{(\bullet)}$ splits (or is devissable) into overconvergent isocrystals. We will denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ of devissable into overconvergent isocrystals complexes.

Lemma 16.3.1.6. *Let Y, Y' be two smooth subvarieties of P such that $Y' \subset Y$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. If $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ then $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$.*

Proof. Following 16.2.4.3 and with notation 16.2.7.5 we have the exact functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'} \colon \mathrm{MIC}^{(\bullet)}(Y, \mathfrak{P}/\mathcal{V}) \to \mathrm{MIC}^{(\bullet)}(Y', \mathfrak{P}/\mathcal{V})$. Hence we are done. □

Lemma 16.3.1.7. *Let Y be a subvariety of P, $Y = \sqcup_{i=1,\ldots,r} Y_i$ be a stratification. For any $i = 1, \ldots, r$, let $Y_i = \sqcup_{j=1,\ldots,j_i} Y_{i,j}$ a smooth stratification (see definition 16.3.1.2). Hence $Y = (\sqcup_{j=1,\ldots,j_1} Y_{1,j}) \sqcup \cdots \sqcup (\sqcup_{j=1,\ldots,j_r} Y_{r,j})$ is a smooth stratification. We say that such a stratification is a "smooth substratification" of $Y = \sqcup_{i=1,\ldots,r} Y_i$.*

Proof. Let $1 \leq i \leq r$ and $1 \leq j \leq j_i$. As Y_i is an open subset of $\sqcup_{i'=i,\ldots,r} Y_{i'}$, then $\sqcup_{j'=j,\ldots,j_i} Y_{i,j'}$ is an open subset of $Z_{i,j} := (\sqcup_{j'=j,\ldots,j_i} Y_{i,j'}) \sqcup (\sqcup_{j=1,\ldots,j_{i+1}} Y_{i+1,j}) \sqcup \cdots \sqcup (\sqcup_{j=1,\ldots,j_r} Y_{r,j})$. As $Y_{i,j}$ is an open subset of $\sqcup_{j'=j,\ldots,j_i} Y_{i,j'}$, then $Y_{i,j}$ is an open subset of $Z_{i,j}$. □

Proposition 16.3.1.8. *Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$, Y be a subvariety of P and $Y = \sqcup_{i=1,\dots,r} Y_i$ be a stratification of Y. If, for any $i = 1, \dots r$, the complex $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y_i, then the complex $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y and more precisely on the smooth substratification of $Y = \sqcup_{i=1,\dots,r} Y_i$ constructed from the smooth stratifications of Y_i on which $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals.*

Proof. For any $i = 1, \dots, r$, let $Y_i = \sqcup_{j=1,\dots,j_i} Y_{i,j}$ a smooth stratification such that, for any $j = 1, \dots, j_i$, we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y_{ij}}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y_{ij}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. Then we conclude with lemma 16.3.1.7. □

Lemma 16.3.1.9. *Let Y be a subvariety of P. There exists a smooth d-stratification of Y in P.*

Proof. As P is smooth, we reduce to the case where P is integral (indeed, if $(P_n)_n$ are the irreducible components of P, if we have d-stratifications of the form $P_n \cap Y = \sqcup_{i=1,\dots,r_n} Y_{n,i}$, then by setting $Y_i := \sqcup_n Y_{n,i}$ we obtain the d-stratification $Y = \sqcup_{i \geq 1} Y_i$). Let us denote by X the closure of Y. The case where $Y = X$ is obvious. If not, then there exist some divisors $T_1, \dots, T_r$ of P such that $X \setminus Y = \cap_{j=1,\dots,r} T_j$. If y is a generic point of an irreducible component of dimension equal to $\dim Y$, then there exist a j such that $y \notin T_j$. We set then $Y_1 := X \setminus T_j \subset Y$. Proceeding by lexicographic induction on the dimension of Y and on the number of irreducible components of maximal degree, this yields a smooth d-stratification of $Y \setminus Y_1$. Hence we are done. □

Lemma 16.3.1.10. *Let Y be a subvariety of P, Y' be a subvariety of Y. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. If $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y then so is on Y'. In particular, the converse of the proposition 16.3.1.8 is valid.*

Proof. Let $Y = \sqcup_{i=1,\dots,r} Y_i$ be a smooth stratification on which $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals. We get the stratification $Y' = \sqcup_{i=1,\dots,r}(Y_i \cap Y')$. By using 16.3.1.8, we reduce then to the case where Y is smooth and where $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. Following 16.3.1.9, there exists a smooth stratification $Y' = \sqcup_{i=1,\dots,r} Y'_i$. It follows from the lemma 16.3.1.6 that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'_i}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'_i}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. Hence, $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on the stratification $Y' = \sqcup_{i=1,\dots,r} Y'_i$.

□

Proposition 16.3.1.11. *Let Y be a subvariety of P, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. The following conditions are equivalent:*

(a) The complex $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y.

(b) There exists a smooth d-stratification of Y in P of the form $Y = \sqcup_{i=1,\dots,r} Y_i$ such that, for any $i = 1, \dots, r$, we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y_i}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y_i}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$.

Proof. The implication $(b) \Rightarrow (a)$ is tautological. The converse follows from 16.3.1.8, 16.3.1.9 and 16.3.1.10. □

Proposition 16.3.1.12. *Let Y be a subvariety of P.*

(a) Let $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ be devissable in overconvergent isocrystals on Y objects. Then there exists a smooth stratification of Y such that $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ split simultaneously into overconvergent isocrystals on this one.

(b) The full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{1}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ of devissable in overconvergent isocrystals on Y complexes is triangulated.

Proof. a) Let $Y = \sqcup_{i=1,\dots,r} Y_i$ be a smooth stratification of Y on which $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals. Following 16.3.1.10, $\mathcal{F}^{(\bullet)}$ splits into overconvergent isocrystals on each Y_i. Following 16.3.1.8, the complex $\mathcal{F}^{(\bullet)}$ splits into overconvergent isocrystals on a smooth substratification of $Y = \sqcup_{i=1,\dots,r} Y_i$. Following 16.3.1.6, this is also the case of $\mathcal{E}^{(\bullet)}$ on this latter.

b) By devissage in overconvergent isocrystals of $\mathcal{E}^{(\bullet)}, \mathcal{F}^{(\bullet)}$ on the same smooth stratification, we reduce then to the case where Y is smooth and where $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ are objects of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$, which is straightforward. □

Proposition 16.3.1.13. *Let Y, Y' be two subvarieties of P. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. The complex $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on $Y \cup Y'$ if and only if the complex $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y and on Y'.*

Proof. The necessity follows from 16.3.1.10.

Let us suppose that the complex $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y and on Y'. Since $Y \cup Y' = Y \sqcup (Y' \setminus Y)$, since $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on $Y' \subset Y$ (use again 16.3.1.10), then replacing Y' by $Y' \setminus Y$ if necessary we can suppose Y and Y' are disjoint. Let $Y = \sqcup_{i=1,\dots,r} Y_i$ (resp. $Y' = \sqcup_{i'=1,\dots,r'} Y'_{i'}$) be a smooth stratification on which $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals. By symmetry, we can suppose $r' \leq r$. For any $r'+1 \leq i' \leq r$, we set $Y'_{i'} := \emptyset$. For any $j = 1, \dots r$, we set $Y''_j := Y_j \cup Y'_j$. Then we get the smooth stratification $Y \cup Y' = \sqcup_{j=1,\dots,r} Y''_j$. Since $Y_j \cap Y'_j$ is empty, then by using the distinguished triangle of Mayer-Vietoris we get the isomorphism

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Y''_j}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Y_j}(\mathcal{E}^{(\bullet)}) \oplus \mathbb{R}\underline{\Gamma}^{\dagger}_{Y'_j}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y''_j}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}).$$

Hence, we are done. □

16.3.1.14. It follows from 16.3.1.12.(b), that the category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ is the smallest full triangulated subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ containing $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$, for any smooth subvariety Y' of P.

Notation 16.3.1.15. Let Y be a subvariety of P. We denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y, \mathfrak{P}/\mathcal{V})$ the strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ of complexes $\mathcal{E}^{(\bullet)}$ such that there exist an isomorphism of the form $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$.

Lemma 16.3.1.16. *Let Y be a subvariety of P. The category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y, \mathfrak{P}/\mathcal{V})$ is equal to the strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ of complexes $\mathcal{E}^{(\bullet)}$ devissable in overconvergent isocrystals on Y and such that there exists an isomorphism of the form $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$.*

Proof. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. If $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y, \mathfrak{P}/\mathcal{V})$, then $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y (see 16.3.1.10). Conversely, suppose $\mathcal{E}^{(\bullet)}$ devissable in overconvergent isocrystals on Y and such that we have an isomorphism of the form $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$. Let X and Z be two closed subschemes of P such that $Y = X \setminus Z$. We get the stratification $P = (P \setminus X) \sqcup Y \sqcup (X \cap Z)$. Since $\mathbb{R}\underline{\Gamma}^{\dagger}_{P \setminus X}(\mathcal{E}^{(\bullet)}) = 0$, $\mathbb{R}\underline{\Gamma}^{\dagger}_{X \cap Z}(\mathcal{E}^{(\bullet)}) = 0$ (use 13.1.5.6.1 and $\mathbb{R}\underline{\Gamma}^{\dagger}_{\emptyset} = 0$) and $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals on Y, then we conclude via 16.3.1.8. □

Lemma 16.3.1.17. *Let $(Y, X, \mathfrak{P}, Z)$ be a c-frame. For any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{povcoh}}(X, \mathfrak{P}, Z/\mathfrak{S})$, there exists a smooth, dense open Y' of Y such that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'}(\mathcal{E}^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(Y', \mathfrak{P}/\mathcal{V})$.*

Proof. Since P is the sum of its irreducible components, we reduce to the case where P is integral. Let $\mathfrak{U}'$ be an affine open formal subscheme of $\mathfrak{P}$ included in $\mathfrak{P} \setminus Z$ such that $Y' := U' \cap X$ is smooth and dense open of Y. Hence, $\mathcal{E}|\mathfrak{U}' \in (F\text{-})\underrightarrow{LM}_{\mathbb{Q},\mathrm{povcoh}}(Y', \mathfrak{U}'/\mathcal{V})$. Via 15.3.1.19 and 15.3.8.26, shrinking $\mathfrak{U}'$ if necessary, we can suppose that $\mathcal{E}|\mathfrak{U}' \in (F\text{-})\mathrm{MIC}^{(\bullet)}(Y', \mathfrak{U}'/\mathcal{V})$. Since $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{povcoh}}(X, \mathfrak{P}, Z/\mathfrak{S})$, this yields $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'}(\mathcal{E}^{(\bullet)}) \in (F\text{-})\mathrm{MIC}^{(\bullet)}(Y', \mathfrak{P}/\mathcal{V})$. □

Theorem 16.3.1.18. *Let $(Y, X, \mathfrak{P}, Z)$ be a c-frame. We have the inclusion*

$$(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{povcoh}}(X, \mathfrak{P}, Z/\mathfrak{S}) \subset (F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y, \mathfrak{P}/\mathfrak{S}).$$

Proof. When $\dim Y = 0$, this is obvious. We proceed by induction on the dimension of Y by using the preceding lemma 16.3.1.17. □

16.3.2 Stability by tensor product of the devissability in isocrystals

Let $\mathfrak{P}$ and $\mathfrak{P}'$ be a two separated and smooth $\mathfrak{S}$-formal schemes. Let Y (resp. Y') be a subvariety of $\mathfrak{P}$ (resp. $\mathfrak{P}'$). Set $\mathfrak{P}'' := \mathfrak{P} \times \mathfrak{P}'$ and $Y'' := Y \times Y'$.

Lemma 16.3.2.1. *Suppose Y (resp. Y') is a smooth subvariety of $\mathfrak{P}$ (resp. $\mathfrak{P}'$).*

(a) The bifunctor $-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}-$ induces

$$-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y''}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''}). \tag{16.3.2.1.1}$$

(b) If $\mathfrak{P} = \mathfrak{P}'$ and if $Y \cap Y'$ is smooth, the bifunctor $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{P}}}-$ induces:

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{P}}}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y\cap Y'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}). \tag{16.3.2.1.2}$$

Proof. As the category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y''}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y\cap Y'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$) is a triangulated subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$), using distinguished triangles of truncation and proceeding by induction on the number of nonzero cohomological space if necessary, we reduce to the case where the complexes of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'})$) are objects of $\mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},T/\mathcal{V})$ (resp. $\mathrm{MIC}^{(\bullet)}(X',\mathfrak{P}',T'/\mathcal{V})$), i.e. to the situation already treated in respectively 16.2.6.1.(a) and 16.2.6.6.1. □

Theorem 16.3.2.2. *We have the factorisations*

$$-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y,\mathfrak{P}/\mathcal{V}) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y',\mathfrak{P}'/\mathcal{V}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y'',\mathfrak{P}''/\mathcal{V}), \tag{16.3.2.2.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}}-\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y,\mathfrak{P}/\mathcal{V}) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y,\mathfrak{P}/\mathcal{V}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y,\mathfrak{P}/\mathcal{V}). \tag{16.3.2.2.2}$$

Proof. Let us check first 16.3.2.2.1. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y,\mathfrak{P}/\mathcal{V})$ and $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y',\mathfrak{P}'/\mathcal{V})$. Let $Y = \sqcup_{i=1,\dots,r} Y_i$ be a smooth stratification of Y on which $\mathcal{E}^{(\bullet)}$ splits into overconvergent isocrystals. Let $Y' = \sqcup_{j=1,\dots,s} Y'_j$ be a smooth stratification of Y' in P' on which $\mathcal{E}'^{(\bullet)}$ splits into overconvergent isocrystals. As $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y'',\mathfrak{P}''/\mathcal{V})$ is a triangulated subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''})$, we reduce by devissage (see the remark 16.3.1.3) to the case where $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y_i}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ and $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'_j}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'})$. By using 16.3.2.1.1, this yields that $\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}}\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y_i\times Y'_j}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}''}) \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y'',\mathfrak{P}''/\mathcal{V})$ (the inclusion is a consequence of 16.3.1.16). Hence we are done. Let us treat now 16.3.2.2.2. Following 16.3.1.12, there exists $Y = \sqcup_{i=1,\dots,r} Y_i$ a smooth stratification of Y on which $\mathcal{E}^{(\bullet)}$ and $\mathcal{E}'^{(\bullet)}$ both split into overconvergent isocrystals. We proceed then similarly to the check of 16.3.2.2.1 but by using 16.3.2.1.2 instead of 16.3.2.1.1. □

16.3.3 Stability of the overcoherence by pushforward, base change isomorphism

The following proposition improves 13.2.3.4 by removing the hypothesis on realizability of the morphism.

Proposition 16.3.3.1. Let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of separated and smooth $\mathfrak{S}$-formal schemes, $u'\colon X' \hookrightarrow P'$ be a closed immersion with X' integral, Z be a closed subscheme of P. We set $Z' := f^{-1}(Z)$. We suppose $f \circ u'$ proper. For any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X',\mathfrak{P}',Z'/\mathcal{V})$, we have $f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$.

Proof. By commutation of the local functors with pushforwards (see 13.2.1.4.2), by definition of the overcoherence we can suppose Z is the support of a divisor T of P. We can suppose P' is integral. So either $f^{-1}(T)$ is a divisor of P' or $f^{-1}(T) = P'$. Since the second case is obvious (because we get therefore $({}^{\dagger}f^{-1}(T))(\mathcal{E}'^{(\bullet)}) = 0$, then we can suppose $T' := f^{-1}(T)$ is a divisor of P'. Set $Y' := X' \setminus T'$. Following 16.3.1.18, 16.3.1.11 and by stability of the overcoherence by local functors (see 15.3.7.5.1), there exists a smooth d-stratification $\sqcup_{i=1,\dots,r} Y'_i$ of Y' in P' such that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'_i}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{isoc},Y'_i}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}) \cap$

$\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(X',\mathfrak{P}',T'/\mathcal{V})$, for any for any $i=1,\dots,r$. Since $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ is a triangle subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$, we reduce by devissage to check that $g_+\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'_i}(\mathcal{E}'^{(\bullet)})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. We can suppose Y'_i integral. Let X'_i be the closure of Y'_i in P'_i, T'_i be a divisor of P' such that $Y'_i=X'_i\setminus T'_i$. Again by devissage, we reduce to check $g_+\left(H^j(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'_i}(\mathcal{E}'^{(\bullet)}))\right)\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ for any integer $j\in\mathbb{Z}$.

We have $\mathcal{E}'^{(\bullet)}_{i,j}:=H^j(\mathbb{R}\underline{\Gamma}^{\dagger}_{Y'_i}(\mathcal{E}'^{(\bullet)}))\in\mathrm{MIC}^{(\bullet)}(X'_i,\mathfrak{P}',T'_i,/\mathcal{V})\cap\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'/\mathfrak{S}}(T'))$. It follows from de Jong desingularization theorem that there exists a diagram of the form:

$$\begin{array}{ccccccc} X''_i & \xrightarrow{u''} & \mathbb{P}^N_{P'} & \longrightarrow & \widehat{\mathbb{P}}^N_{\mathfrak{P}'} & \xrightarrow{\widehat{\mathbb{P}}^N_g} & \widehat{\mathbb{P}}^N_{\mathfrak{P}} \\ \downarrow{a'} & & \downarrow & & \downarrow{q'} & & \downarrow{q} \\ X'_i & \xrightarrow{u'} & P' & \longrightarrow & \mathfrak{P}' & \xrightarrow{g} & \mathfrak{P}, \end{array} \tag{16.3.3.1.1}$$

where X''_i is k-smooth, q and q' are the canonical projections, u'' is a closed immersion, $a'^{-1}(T'_i\cap X'_i)$ is a strict normal crossing divisor of X''_i, a' is surjective, generically finite and etale. Set $T''_i:=q'^{-1}(T'_i)$, $D':=q'^{-1}(T')$, $D:=q^{-1}(T)$. Put $\mathcal{E}''^{(\bullet)}_{i,j}:=\mathbb{R}\underline{\Gamma}^{\dagger}_{X''_i}q'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}_{i,j})\in\mathrm{MIC}^{(\bullet)}(X''_i,\widehat{\mathbb{P}}^N_{\mathfrak{P}'},T''_i,/\mathcal{V})\cap\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\widehat{\mathbb{P}}^N_{\mathfrak{P}'}/\mathfrak{S}}(D'))$. Following 16.1.11.2, since $\mathcal{E}'^{(\bullet)}_{i,j}\in\mathrm{MIC}^{(\bullet)}(X'_i,\mathfrak{P}',T'_i,/\mathcal{V})$, then $\mathcal{E}'^{(\bullet)}_{i,j}$ is a direct factor of $q'^{(\bullet)}_+(\mathcal{E}''^{(\bullet)}_{i,j})$.

By construction, the morphism $X''_i\to\widehat{\mathbb{P}}^N_{\mathfrak{P}}$ is an immersion (indeed, this is the composition of the graph of $X''_i\to\mathfrak{P}$ with the immersion $X''_i\times\mathfrak{P}\hookrightarrow\widehat{\mathbb{P}}^N_{\mathfrak{P}}$ induced by an immersion of the form $X''_i\hookrightarrow\widehat{\mathbb{P}}^N_{\mathfrak{S}}$). Since X''_i is proper over P then $X''_i\to\widehat{\mathbb{P}}^N_{\mathfrak{P}}$ is more precisely a closed immersion. Since $\mathcal{E}''^{(\bullet)}_{i,j}\in\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\widehat{\mathbb{P}}^N_{\mathfrak{P}'}/\mathfrak{S}}(D'))$, then it follows from 16.1.9.3.(b) that $(\widehat{\mathbb{P}}^N_g)^{(\bullet)}_+(\mathcal{E}''^{(\bullet)}_{i,j})\in\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\widehat{\mathbb{P}}^N_{\mathfrak{P}}/\mathfrak{S}}(D))$. Since q is proper, then $q^{(\bullet)}_+$ preserves the overcoherence and then $g^{(\bullet)}_+q'_+(\mathcal{E}''^{(\bullet)}_{i,j})\xrightarrow{\sim}q^{(\bullet)}_+\circ(\widehat{\mathbb{P}}^N_g)^{(\bullet)}_+(\mathcal{E}''^{(\bullet)}_{i,j})\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$. Since $\mathcal{E}'^{(\bullet)}_{i,j}$ is a direct factor of $q'^{(\bullet)}_+(\mathcal{E}''^{(\bullet)}_{i,j})$, then $g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}_{i,j})$ is a direct factor of $g^{(\bullet)}_+q'^{(\bullet)}_+(\mathcal{E}''^{(\bullet)}_{i,j})$. Hence, $g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}_{i,j})\in\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T))$ and we have done. □

Proposition 16.3.3.2. Let $f\colon\mathfrak{Y}\to\mathfrak{X}$, and $g\colon\mathfrak{X}'\to\mathfrak{X}$ be two morphisms of separated smooth $\mathfrak{S}$-formal schemes. We suppose f smooth. Let $f'\colon\mathfrak{Y}\times_{\mathfrak{X}}\mathfrak{X}'\to\mathfrak{X}'$, and $g'\colon\mathfrak{Y}\times_{\mathfrak{X}}\mathfrak{X}'\to\mathfrak{Y}$ be the structural projections. Let Z be a closed subscheme of X, $Z':=g^{-1}(Z)$, $Z':=g^{-1}(Z)$, $U':=f'^{-1}(Z')$, $U:=f^{-1}(Z)$. For any $\mathcal{E}'^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}(Z'))$ with proper support over X, we have the base change isomorphism in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}}(U))$ of the form

$$f^{(\bullet)!}g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}g'^{(\bullet)}_+f'^{(\bullet)!}(\mathcal{E}'^{(\bullet)}). \tag{16.3.3.2.1}$$

Proof. This is analogue to the proof 13.2.3.7: let $\mathcal{E}'^{(\bullet)}\in\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'}(Z'))$ with proper support over X. First, we remark that by using 16.3.3.1, both objects of 16.3.3.2.1 belongs to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}}(U))$. The morphism f is the composition of its graph $\gamma\colon\mathfrak{Y}\hookrightarrow\mathfrak{X}\times\mathfrak{Y}$ with the projection $\pi\colon\mathfrak{X}\times\mathfrak{Y}\to\mathfrak{X}$. Let $g''\colon\mathfrak{X}'\times\mathfrak{Y}\to\mathfrak{X}\times\mathfrak{Y}$, and $\pi'\colon\mathfrak{X}'\times\mathfrak{Y}'\to\mathfrak{X}'$ be the canonical projections. Let $\gamma'\colon\mathfrak{X}'\times_{\mathfrak{X}}\mathfrak{Y}\hookrightarrow\mathfrak{X}'\times\mathfrak{Y}$ be the closed immersion induced by base change via g'' of γ. Following Theorem 9.4.4.3, we have the isomorphism $\pi^{(\bullet)!}g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}g''^{(\bullet)}_+\pi'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})$. This yields the second isomorphism $\gamma^{(\bullet)}_+f^{(\bullet)!}g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}\gamma^{(\bullet)}_+\gamma^{(\bullet)!}\pi^{(\bullet)!}g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}\gamma^{(\bullet)}_+\gamma^{(\bullet)!}g''^{(\bullet)}_+\pi'^{!}(\mathcal{E}'^{(\bullet)})$. Using the commutation isomorphism 13.2.1.4.2 and Corollary 13.2.1.5, we get the first isomorphism $\gamma^{(\bullet)}_+\gamma^{(\bullet)!}g'^{(\bullet)}_+\pi'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}g''^{(\bullet)}_+\gamma'^{(\bullet)}_+\gamma'^{(\bullet)!}\pi'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}\gamma^{(\bullet)}_+g'^{(\bullet)}_+f'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})$. Hence, by composition, we get the isomorphism $\gamma^{(\bullet)}_+f^{(\bullet)!}g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}\gamma^{(\bullet)}_+g'^{(\bullet)}_+f'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})$. Following Proposition 16.3.3.1, $f^{(\bullet)!}g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})$ and $g'^{(\bullet)}_+f'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})$ belongs to $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}}(U))$. Hence we can use Berthelot-Kashiwara theorem of the form 15.3.8.26: by applying $\gamma^{(\bullet)!}$ to the isomorphism $\gamma^{(\bullet)}_+f^{(\bullet)!}g^{(\bullet)}_+(\mathcal{E}'^{(\bullet)})\xrightarrow{\sim}\gamma^{(\bullet)}_+g'^{(\bullet)}_+f'^{(\bullet)!}(\mathcal{E}'^{(\bullet)})$ we get the isomorphism 16.3.3.2.1. □

Chapter 17

Arithmetic $\mathcal{D}$-modules associated with overconvergent F-isocrystals over affine and smooth varieties

Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. When we work with F-complex, we suppose there exists an automorphism $\sigma \colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining.

17.1 Weak formal schemes

We give some reminders on weak formal schemes defined by Meredith in [Mer72].

17.1.1 p-adic weak completion of commutative algebra, smooth w.c.f.g $\mathcal{V}$-algebra

Let R be a noetherian $\mathcal{V}$-algebra.

Definition 17.1.1.1. Let A be an R-algebra. Let $\widehat{A}$ be the p-adic completion of A and $\iota \colon A \to \widehat{A}$ be the canonical morphism. Let $S \subset A$. We denote by $S^\dagger$ the subset of $\widehat{A}$ consisting of elements x having representations

$$x = \sum_{j=0}^{\infty} P_j(a_1, \ldots, a_n)$$

where $a_1, \ldots, a_n \in \iota(S)$, $P_j \in p^j \cdot R[X_1, \ldots X_n]$ and there exists a constant c such that $\deg P_j \leq c(j+1)$ for all j. Beware that $S^\dagger$ depends on the basis R and we might write $A^{\dagger/R}$ if we would like to clarify.

The "p-adic weak completion as R-algebra of A" is $A^\dagger$. We denote by $w_A \colon A \to A^\dagger$ the canonical $\mathcal{V}$-algebra homomorphism. We say that A is (p-adically) weakly complete (as R-algebra) if the canonical map w_A is a bijection.

We denote by $\mathrm{Alg}(R)$ the category of commutative R-algebras, by $\mathrm{Alg}_{\mathrm{wc}}(R)$ the full subcategory of $\mathrm{Alg}(R)$ consisting of p-adically weakly complete R-algebras.

Example 17.1.1.2. The p-adic weak completion as R-algebra of R is $\widehat{R}$, i.e. $R^{\dagger/R} = \widehat{R}$. Beware in general, $A^{\dagger/R} \neq \widehat{A}$.

Remark 17.1.1.3. We will extend the notion of the weak completion in the non-commutative case later (see 17.7.1.1).

Theorem 17.1.1.4. *Let A be an R-algebra.*

(a) Then $A^\dagger$ is p-adically weakly complete.

(b) $pA^\dagger$ is contained in the Jacobson radical of $A^\dagger$.

(c) *Let $f\colon A \to B$ be a morphism of R-algebra. Then there exists a unique homomorphism $f^\dagger\colon A^\dagger \to B^\dagger$ such that $f^\dagger \circ w_A = w_B \circ f$. If f is surjective, then so is $f^\dagger$.*

Proof. See [MW68, 1] (and the last sentence is obvious). □

Remark 17.1.1.5. Let A be an R-algebra. Since $R^{\dagger/R} = \widehat{R}$, then it follows from 17.1.1.4.(c) that $A^{\dagger/R}$ is an $\widehat{R}$-algebra. Moreover, $A^{\dagger/R} = (A^{\dagger/R})^{\dagger/\widehat{R}}$. However, it is more convenient (e.g. see 17.1.1.13 in the case where A and R are w.c.f.g. $\mathcal{V}$-algebras) not to assume R is p-adically complete.

Definition 17.1.1.6. Let A be an R-algebra. A subset S of A is said to be a set of *weak generators* of the R-algebra A if $A = S^\dagger$. In that case A is said to be a weakly complete R-algebra A which is weakly generated by S.

A *w.c.f.g. R-algebra* is a weakly complete R-algebra A having a finite set of weak generators. The letters "w.c.f.g." stand for weakly complete weakly finitely generated.

A w.c.f.g. R-algebra is naturally equipped with the p-adic topology. A morphism of w.c.f.g. R-algebras is a map between two w.c.f.g. R-algebras which is a (unitary) ring morphism; such a morphism is always continuous.

We denote by $\mathrm{Alg}_{\mathrm{wcfg}}(R)$ the full subcategory of $\mathrm{Alg}(R)$ consisting of w.c.f.g. R-algebras.

Proposition 17.1.1.7. *Let $B(d) := R[t_1, \dots, t_d]^{\dagger/R}$ be the weak completion of the polynomial ring with d variables. Then*

$$B(d) := \left\{ \sum_{\underline{n}\in\mathbb{N}^d} a_{\underline{n}} \underline{t}^{\underline{n}} \mid a_{\underline{n}} \in \widehat{R}, \exists\, \lambda > 0 \text{ such that } v_p(a_{\underline{n}}) \geq \frac{|\underline{n}|}{\lambda} - 1 \right\} \subset \widehat{R}\{t_1, \dots, t_d\}.$$

Proof. See [MW68, 2.3]. □

Example 17.1.1.8. Following Theorem 17.1.1.7, we get the equality $B(d) = \{t_1, \dots, t_d\}^{\dagger/R}$. Hence, $B(d)$ is a w.c.f.g. R-algebra.

Theorem 17.1.1.9. *Let A be a w.c.f.g. R-algebra. Then A is noetherian.*

Proof. See [Ful69]. □

Corollary 17.1.1.10. *A w.c.f.g. R-algebra is a Zariski noetherian ring. In particular, a quotient of a w.c.f.g. R-algebra is a w.c.f.g R-algebra.*

Proof. This follows from theorem 17.1.1.4.(b), 17.1.1.9 and [Mat80, Theorem 56]. □

Corollary 17.1.1.11. *Let A be an R-algebra. The following conditions are equivalent:*

(a) *A is weakly generated by d elements.*

(b) *A is a quotient of $B(d)$.*

Proof. This is more or less contained in the proof of [MW68, 2.2]. □

17.1.1.12. Let A be a finitely generated R-algebra, i.e. is a quotient of $R[t_1, \dots, t_d]$. Then $A^\dagger$ is a quotient of $B(d)$ (see the last statement of 17.1.1.4.(c)). Hence, $A^{\dagger/R}$ is a w.c.f.g. R-algebra (see 17.1.1.11). In other words, the image in $A^\dagger$ of a finite set of generators of A provides a finite set of weak generators of $A^\dagger$.

Conversely, if B is an R-algebra having a finite set S of weak generators, denoting by A the R-subalgebra of B which is generated by S, then $B = A^{\dagger/R}$.

Theorem 17.1.1.13. *Let A be a w.c.f.g. R-algebra. Then the following conditions are equivalent.*

(a) *A is flat over R.*

(b) *$A/\pi A$ is a flat $R/\pi R$-algebra and A is p-torsion free.*

(c) *$A/\pi^{i+1} A$ is flat over $R/\pi^{i+1} R$-algebra, for any $i \in \mathbb{N}$.*

Proof. This follows from [MW68, 2.4] applied in the case where the ideal is πA. □

Theorem 17.1.1.14. *Let A be a w.c.f.g. R-algebra. Then the following conditions are equivalent.*

(a) $A/\pi A$ is a smooth (resp. étale) $R/\pi R$-algebra and A is p-torsion free.

(b) $A/\pi A$ is a smooth (resp. étale) $R/\pi R$-algebra and A is flat over R.

(c) $A/\pi^{i+1}A$ is a smooth (resp. étale) $R/\pi^{i+1}R$-algebra, for any $i \in \mathbb{N}$.

Proof. This follows from [MW68, 2.5] (for the respective case, the proof is the same) and 17.1.1.13. □

Definition 17.1.1.15. Let A be a w.c.f.g. R-algebra. We say that A is a smooth w.c.f.g. R-algebra if the equivalent conditions of 17.1.1.14 hold. Beware that a smooth w.c.f.g. R-algebra is not a smooth R-algebra.

Theorem 17.1.1.16. *Let $A/\pi A$ be a smooth (resp. étale) $R/\pi R$-algebra.*

(a) There exist a smooth R-algebra such that $A/\pi A \xrightarrow{\sim} A_0$. Such an A is called a smooth R-algebra lifting of A_0.

(b) Let A be a smooth R-algebra lifting of A_0. The R-algebra $A^\dagger$ is a smooth w.c.f.g. R-algebra such that $A^\dagger/\pi A^\dagger \xrightarrow{\sim} A_0$. Such an $A^\dagger$ is called a w.c.f.g. smooth R-algebra lifting of A_0.

Proof. This first part is [Ara01, 1.3.1]. The second one is obvious. □

Remark 17.1.1.17. In the practice, we will use the lifting Theorem 17.1.1.16 in the case where $R = \mathcal{V}$. In that case, this lifting theorem was proven by Elkik in [Elk73].

Proposition 17.1.1.18. *Let $A \to B$ and $A \to C$ be two morphisms of w.c.f.g. R-algebras. Then $B \otimes^\dagger_A C$, the weak completion of $B \otimes_A C$, is a w.c.f.g. R-algebra.*

Proof. As B is a quotient of $B(n)$ and C is a quotient of $B(m)$ for some integers n and m (see 17.1.1.11), then $B \otimes_R C$ is a quotient of $B(n) \otimes_R B(m)$. Using the last sentence of 17.1.1.4, this yields that $B \otimes^\dagger_A C$ is a quotient of $B(n) \otimes^\dagger_R B(m)$. Since $B(n) \otimes^\dagger_R B(m) \xrightarrow{\sim} B(n+m)$, then we are done. □

Theorem 17.1.1.19. *Let $f \colon A \to B$ be a homomorphism of w.c.f.g. R-algebras. Let $\overline{f} \colon A/\pi A \to B/\pi B$ be the induced homomorphism.*

(a) If $\overline{f}$ is injective, then so is f.

(b) If $\overline{f}$ is bijective and B is flat over R, then f is bijective.

(c) If $\overline{f}$ is injective and B is flat over R and $\pi^j R/\pi^{j+1}$ is flat over $R/\pi R$ for any $j \in \mathbb{N}$, then f is injective.

Proof. This is a particular case of [MW68, Theorem 3.2]. □

Corollary 17.1.1.20. *Let A_0 be a smooth (resp. étale) $R/\pi R$-algebra. Let A and B be two smooth w.c.f.g. R-algebra lifting of A_0. Then A and B are (non-canonically) isomorphic.*

We recall the notion of very smooth morphisms:

Definition 17.1.1.21. Let $* \in \{\mathrm{wc}, \mathrm{wcfg}\}$. An algebra $A \in \mathrm{Alg}_*(R)$ is said to be "very smooth in $\mathrm{Alg}_*(R)$" when the following two conditions are verified:

(a) The algebra $\overline{A} := A/\pi A$ is smooth on $\overline{R} := R/\pi R$.

(b) For any pair of morphisms of R-algebras $B \overset{p}{\twoheadrightarrow} C \overset{\phi}{\longleftarrow} A$, where $B, C \in \mathrm{Alg}_*(R)$ and p is surjective (of arbitrary kernel), and for each morphism of R-algebras $\overline{h} \colon A/\pi A \to B/\pi B$ verifying $\overline{\phi} = \overline{p} \circ \overline{h}$, there exists a lifting $h \colon A \to B$ of $\overline{h}$, such that $\phi = p \circ h$.

Theorem 17.1.1.22 (Arabia)**.** *Let A_0 be a smooth $R/\pi R$-algebra.*

(a) For any R-smooth lifting A of A_0, the algebra $A^\dagger$ is very smooth in $\mathrm{Alg}_{\mathrm{wc}}(R)$. *For any other R-smooth lifting A' of A_0, the algebras $A^\dagger$ and $A'^\dagger$ are isomorphic.*

(b) Any w.c.f.g. smooth R-algebra lifting of A_0 is very smooth in $\mathrm{Alg}_{\mathrm{wc}}(R)$.

(c) Let A be a smooth w.c.f.g. R-algebra and $B \in \mathrm{Alg}_{\mathrm{wc}}(R)$. Then, any morphism $\overline{h}\colon A/\pi A \to B/\pi B$ admits a lifting $h\colon A \to B$.

Proof. The first assertion is [Ara01, 3.3.2.(b)]. The second one is a consequence of (a) and of 17.1.1.16, 17.1.1.20. The last assertion, is a consequence of (b) and of [Ara01, 3.3.4]. □

Remark 17.1.1.23. For our purpose, we will use 17.1.1.22.(c) in the case where B is w.c.f.g. smooth, which was proved by van der Put (see [vdP86, 2.4.4.(ii)])

17.1.2 Affine weak formal schemes

Let A be a w.c.f.g. $\mathcal{V}$-algebra. We put $A_0 := A/\pi A$. For any $f \in A$, let $\overline{f}$ be the image de f in A_0 and $A_{[f]}$ be the weak completion of A_f.

Definition 17.1.2.1. We denote by $|\mathrm{Spff}(A)|$ the set of open prime ideals of A. We endow $|\mathrm{Spff}(A)|$ with a topology so that the canonical bijection $\iota\colon |\mathrm{Spff}(A)| \to |\operatorname{Spec} A_0|$ given by $\mathfrak{P} \mapsto \mathfrak{P}/\pi\mathfrak{P}$ is bicontinuous. We denote by $D(f) := \{\, \mathfrak{P} \in |\mathrm{Spff}(A)|\,;\, f \notin \mathfrak{P}\}$. Then $\iota(D(f)) = D(\overline{f})$. A principal open subset of $|\mathrm{Spff}(A)|$ is an open of the form $D(f)$ for some $f \in A$.

For any $f, g \in A$, we have $D(\overline{g}) \subset D(\overline{f})$ iff there exists a (unique) A_0-algebra morphism $(A_0)_{\overline{f}} \to (A_0)_{\overline{g}}$ iff $\overline{f} \in (A_0)_{\overline{g}}^\times$ iff $f \in A_{[g]}^\times$ iff there exists a (unique) A-algebra morphism $A_{[f]} \to A_{[g]}$ iff $D(g) \subset D(f)$.

Set $|X| := \mathrm{Spff}(A)$ this topological space. Let $\mathcal{O}_X$ be the presheaf on $|X|$ such that for any $f, g \in A$ such that $D(g) \subset D(f)$, $\mathcal{O}_X(D(f)) \to \mathcal{O}_X(D(g))$ is the natural map $A_{[f]} \to A_{[g]}$. Following Meredith, $\mathcal{O}_X$ is in fact a sheaf and the *affine weak formal scheme* associated with A, is the ringed topological space

$$\mathrm{Spff}(A) := (|\mathrm{Spff}(A)|, \mathcal{O}_X).$$

For any $f \in A$, we have $D(f) \xrightarrow{\sim} \mathrm{Spff}(A_{[f]})$.

17.1.2.2. We have type A theorem on $X = \mathrm{Spff}\,(A)$ ([Mer72, 3.3]): the functors $M \mapsto \widetilde{M} := \mathcal{O}_X \otimes_A M$ and $\mathcal{M} \mapsto \Gamma(X, \mathcal{M})$ are quasi-inverse equivalences between the category of coherent $\mathcal{O}_X$-modules and that of A-modules of finite type. In addition, we have the theorem of type B ([Mer72, 2.14]): for any coherent $\mathcal{O}_X$-module $\mathcal{M}$,for all integer $i > 0$, $H^i(X, \mathcal{M}) = 0$.

Notation 17.1.2.3. Let $\mathfrak{P}$ be an open ideal of A. Put $A_{[\mathfrak{P}]} = \varinjlim_{f \notin \mathfrak{P}} A_{[f]}$ (the inductive system is filtered). This is equipped with the ideal $\mathfrak{P}A_{[\mathfrak{P}]} = \varinjlim_{f \notin \mathfrak{P}} \mathfrak{P}A_{[f]}$.

Proposition 17.1.2.4. Let $\mathfrak{P}$ be an open ideal of A. $A_{[\mathfrak{P}]}$ is a local ring with maximal ideal $\mathfrak{P}A_{[\mathfrak{P}]}$. Its residue field is isomorphic to the field of fractions of $A/\mathfrak{P}$.

Proof. 1) Since $A_{[f]}/\pi A_{[f]} \xrightarrow{\sim} (A_0)_{\overline{f}}$, then for any $f \notin \mathfrak{P}$,

$$A_{[f]}/\mathfrak{P}A_{[f]} \xrightarrow{\sim} A/\mathfrak{P} \otimes_A A_{[f]} \xrightarrow{\sim} A/\mathfrak{P} \otimes_{A_0} A_0 \otimes_A A_{[f]} \xrightarrow{\sim} A/\mathfrak{P} \otimes_{A_0} (A_0)_{\overline{f}} \xrightarrow{\sim} (A_0)_{\overline{f}}/(\mathfrak{P}/\pi A)_{\overline{f}} \neq 0. \tag{17.1.2.4.1}$$

This implies that $\mathfrak{P}A_{[f]} \neq A_{[f]}$ and a fortiori $\mathfrak{P}A_{[\mathfrak{P}]} \neq A_{[\mathfrak{P}]}$ (one verifies that $1 \notin \mathfrak{P}A_{[\mathfrak{P}]}$).

2) Let x be an element of $A_{[\mathfrak{P}]}$ not in $\mathfrak{P}A_{[\mathfrak{P}]}$. To prove the first assertion, we have to check that x is invertible. There exists $f \notin \mathfrak{P}$ such that x comes from an element y of $A_{[f]}$. It follows from 17.1.2.4.1 that the canonical image $\overline{y}$ of y in $A_{[f]}/\pi A_{[f]} \xrightarrow{\sim} (A_0)_{\overline{f}}$ does not belong to $(\mathfrak{P}/\pi A)_{\overline{f}}$. This implies that $\overline{y} = \overline{a}/\overline{f}^r$, where $a \in A \setminus \mathfrak{P}$ and $r \in \mathbb{N}$. Thus, $g := af \notin \mathfrak{P}$ and the canonical image of $\overline{y}$ in $(A_0)_{\overline{g}}$ is invertible. As $\pi A[g]$ is included in the Jacobson ideal of $A[g]$, it follows that the canonical image of y in $A[g]$ is invertible. Hence x is invertible.

Let $S = \widehat{A} \setminus \widehat{\mathfrak{P}}$. By [Gro60, 0.7.6.17], $\widehat{A}\{S\}$ is a local ring with maximal ideal $\widehat{\mathfrak{P}}\widehat{A}\{S\}$. The canonical homomorphism $A_{[\mathfrak{P}]} \to \widehat{A}\{S\}$ is local. It induces a morphism $A_{[\mathfrak{P}]} \to \widehat{A}\{S\}/\widehat{\mathfrak{P}}\widehat{A}\{S\} \xleftarrow{\sim} \mathrm{Frac}(A/\mathfrak{P})$ (since $A/\mathfrak{P} \xrightarrow{\sim} \widehat{A}/\widehat{\mathfrak{P}}\widehat{A}$, then the isomorphism follows from [Gro60, 0.7.6.17]). Since any element of $A/\mathfrak{P}$ comes from an element of $A_{[\mathfrak{P}]}$, then the last homomorphism is surjective. This yields the isomorphism of residue fields: $A_{[\mathfrak{P}]}/\mathfrak{P}A_{[\mathfrak{P}]} \xrightarrow{\sim} \widehat{A}\{S\}/\widehat{\mathfrak{P}}\widehat{A}\{S\}$. □

17.1.2.5. The proposition 17.1.2.4 means that Spff A is a locally ringed space.

Lemma 17.1.2.6. *Let $\phi, \psi\colon A \to B$ be two morphisms of weakly complete $\mathcal{V}$-algebras. Let $\widehat{\phi}, \widehat{\psi}\colon \widehat{A} \to \widehat{B}$ be the induced morphisms.*

(a) We have $\widehat{\phi} = \widehat{\psi}$ if and only if $\phi = \psi$.

(b) Suppose A is a w.c.f.g. $\mathcal{V}$-algebra. The morphism ϕ is an isomorphism if and only if so is $\widehat{\phi}$.

Proof. Since $B \subset \widehat{B}$ then the equality $\widehat{\phi} = \widehat{\psi}$ implies $\phi = \psi$. The converse is obvious. Suppose $\widehat{\phi}$ is an isomorphism. Since $A \subset \widehat{A}$ then ϕ is injective. Let C be a w.c.f.g. $\mathcal{V}$-algebra included in B and containing $\phi(A)$. It follows from [vdP86, 2.4.3] that the morphism $A \to C$ given by $a \mapsto \phi(a)$ admit a left inverse ψ so that the composition $C \to \widehat{C} \to \widehat{B} \xleftarrow{\sim} \widehat{A}$ is the composition of ψ with the inclusion $A \to \widehat{A}$. Hence ψ is injective and therefore bijective. Hence the morphism $A \to C$ given by $a \mapsto \phi(a)$ must be bijective (for any such a choice C) and then $C = B$. □

17.1.2.7. Let $\phi\colon A \to B$ be a morphism of w.c.f.g. $\mathcal{V}$-algebras, $(X, \mathcal{O}_X) :=$ Spff A and $(Y, \mathcal{O}_Y) :=$ Spff B. We get a morphism of topological spaces ${}^a\phi\colon Y \to X$ defined by $\mathfrak{Q} \mapsto \phi^{-1}(\mathfrak{Q})$. For any element f of A, according to 17.1.1.4.(c) we have a unique morphism $A_{[f]} \to B_{[\phi(f)]}$ compatible with the canonical morphism $A_f \to B_{\phi(f)}$. Moreover, for any multiple f' of f, we have the commutative diagram:

$$\begin{array}{ccc} A_{[f]} & \longrightarrow & B_{[\phi(f)]} \\ \downarrow & & \downarrow \\ A_{[f']} & \longrightarrow & B_{[\phi(f')]}. \end{array}$$

As ${}^a\phi^{-1}(D(f)) = D(\phi(f))$, these homomorphisms define therefore a homomorphism of sheaves of rings $\widetilde{\phi}\colon \mathcal{O}_X \to {}^a\phi_*\mathcal{O}_Y$. Thus we have constructed a morphism $({}^a\phi, \widetilde{\phi})\colon$ Spff $B \to$ Spff A of ringed spaces. Moreover, for any open prime ideal $\mathfrak{Q}$ of B, we have a homomorphism of local rings $A_{[\phi^{-1}(\mathfrak{Q})]} \to B_{[\mathfrak{Q}]}$. The homomorphism $({}^a\phi, \widetilde{\phi})$ is thus a homomorphism of locally ringed spacess. Via the proposition above, they are all of this form.

Proposition 17.1.2.8. Let A and B be two w.c.f.g. $\mathcal{V}$-algebras and let $X =$ Spff A, $Y =$ Spff B. A morphism $u = (\psi, \theta)\colon Y \to X$ of ringed spaces is of the form $({}^a\phi, \widetilde{\phi})$, where ϕ is a homomorphism of rings $A \to B$ if and only if u is a morphism of locally ringed spaces.

Proof. By using 17.1.2.7, this is checked similarly to [Gro60, 10.2.2]. □

Remark 17.1.2.9. Let X and Y be two affine $\mathfrak{S}$-weak formal schemes. If $X/\mathfrak{S}$ is smooth and if $f_0\colon Y_0 \to X_0$ is a morphism of k schemes, then there exists a morphism $Y \to X$ of $\mathfrak{S}$-weak formal schemes lifting f_0. Indeed, since X is smooth, then there exists a lifting $\widehat{Y} \to \widehat{X}$ of f_0. We then conclude with [vdP86, 2.4.3].

17.1.3 Weak formal schemes and morphisms of weak formal schemes

Definition 17.1.3.1. The category of $\mathfrak{S}$-weak formal schemes is defined as follows: An $\mathfrak{S}$-*weak formal scheme* is a locally ringed $\mathcal{V}$-algebras space $X = (|X|, \mathcal{O}_X)$ locally isomorphic to an affine $\mathfrak{S}$-weak formal scheme (see [Mer72]). A *morphism* $f\colon Y \to X$ of $\mathfrak{S}$-weak formal schemes is a morphism of locally ringed spaces.

Let $f\colon Y \to X$ a morphism of $\mathfrak{S}$-weak formal schemes. For any integer i, the $\mathcal{V}/\pi^{i+1}\mathcal{V}$-scheme induced by reduction modulo π^{i+1} is denoted by X_i. Moreover, $\widehat{X}$ or $\mathfrak{X}$ denotes the $\mathfrak{S}$-formal scheme obtained by p-adic completion of X, i.e. $\widehat{X} := \varinjlim_i X_i$. Write $f_i\colon Y_i \to X_i$ and $\hat{f}\colon \mathfrak{Y} \to \mathfrak{X}$ for the induced morphisms. By abuse of notations, we sometimes denote them by f. We say that such a morphism is *smooth* (resp. *étale*) if for all i, the f_i are smooth (resp. étale) morphisms. Finally, f is *separated* when f_0 is separated. An $\mathfrak{S}$-weak formal scheme X is separated if so is its structural morphism $X \to$ Spff $\mathcal{V}$. The usual properties of separated morphisms remain true.

An *affine open* $\mathfrak{S}$-weak formal subscheme of X is an open $\mathfrak{S}$-weak formal subscheme Y of X which is also an affine $\mathfrak{S}$-weak formal scheme.

A morphism $f\colon Y \to X$ of $\mathfrak{S}$-weak formal schemes is said to be *affine* if, for all affine open X' of X, $f^{-1}(X')$ is an affine open of Y.

Proposition 17.1.3.2. Let Y be an $\mathfrak{S}$-weak formal scheme, $X = \operatorname{Spff} A$ an affine $\mathfrak{S}$-weak formal scheme. There exists a bijective correspondence between the morphisms of $\mathfrak{S}$-weak formal schemes of the form $Y \to X$ and the ring homomorphisms of the form $A \to \Gamma(Y, \mathcal{O}_Y)$.

Proof. By using proposition 17.1.2.8, we can follows the algebraic or formal proof of [Gro60, 2.2.4 or 10.4.6]. □

Proposition 17.1.3.3. The category of $\mathfrak{S}$-weak formal schemes has fiber products.

Proof. If $A \to B$ and $A \to C$ are two morphisms of w.c.f.g. $\mathcal{V}$-algebras, then it follows from 17.1.3.2 and 17.1.1.4.(c) that the $\mathfrak{S}$-weak formal scheme $\operatorname{Spff}(B) \times_{\operatorname{Spff}(A)} \operatorname{Spff}(C) := \operatorname{Spff}(B \otimes^{\dagger}_A C)$ satisfies the universal property of fiber products. For the general case, one proceeds by glueing (in the same manner as in the case of schemes: see [Gro60]). □

17.1.3.4. Let X be an $\mathfrak{S}$-scheme of finite type. Meredith ([Mer72, 4]) constructs the sheaf $\mathcal{O}^{\dagger}_X$ as follows: if $U \subset V \subset X$ are affine open of X, then $\Gamma(U, \mathcal{O}^{\dagger}_X) := \Gamma(U, \mathcal{O}_X)^{\dagger}$, $\Gamma(V, \mathcal{O}^{\dagger}_X) := \Gamma(V, \mathcal{O}_X)^{\dagger}$ and $\Gamma(V, \mathcal{O}^{\dagger}_X) \to \Gamma(U, \mathcal{O}^{\dagger}_X)$ is the canonical morphism induced by $\Gamma(V, \mathcal{O}_X) \to \Gamma(U, \mathcal{O}_X)$ (see 17.1.1.4.(c)). Denoting by $|X_0|$ the underlying topological space of $X_0 = X \times_{\operatorname{Spec}\mathcal{V}} \operatorname{Spec}(k)$, one verifies that the ringed space $X^{\dagger} := (|X_0|, \mathcal{O}^{\dagger}_X)$ is an $\mathfrak{S}$-weak formal scheme and that we have a canonical morphism $X^{\dagger} \to X$, which is called the weak completion of X. We can check moreover that the map $X \mapsto X^{\dagger}$ induces canonically (via 17.1.1.4.(c)) a functor from the category of $\mathfrak{S}$-schemes of finite type in that of $\mathfrak{S}$-weak formal schemes.

For instance, $\mathbb{A}^{d\dagger}_{\mathfrak{S}} := (\mathbb{A}^d_{\mathfrak{S}})^{\dagger}$ and $\mathbb{P}^{d\dagger}_{\mathfrak{S}} := (\mathbb{P}^d_{\mathfrak{S}})^{\dagger}$. If Y is an $\mathfrak{S}$-weak formal scheme, $\mathbb{A}^{d\dagger}_Y := \mathbb{A}^{d\dagger}_{\mathfrak{S}} \times Y$ and $\mathbb{P}^{d\dagger}_Y := \mathbb{P}^{d\dagger}_{\mathfrak{S}} \times Y$ (recall 17.1.3.3).

Definition 17.1.3.5. Let U be an $\mathfrak{S}$-weak formal scheme. We say that a finite set $t_1, \ldots, t_d$ of elements of $\Gamma(U, \mathcal{O}_U)$ are "coordinates of $U/\mathfrak{S}$" if the corresponding $\mathfrak{S}$-morphism $U \to \mathbb{A}^{d\dagger}_{\mathfrak{S}}$ is étale.

Proposition 17.1.3.6. *Let U be a p-torsion free $\mathfrak{S}$-weak formal scheme and $\mathfrak{U}$ be the p-adic completion of U. Then U_0/S_0 has coordinates if and only if U/S has coordinates if and only if $\mathfrak{U}/\mathfrak{S}$ has coordinates. Let $t_1, \ldots, t_d \in \Gamma(U, \mathcal{O}_U)$ and $\bar{t}_1, \ldots, \bar{t}_d \in \Gamma(U_0, \mathcal{O}_{U_0})$ be the images. The following conditions are equivalent:*

(a) The map $U_0 \to \mathbb{A}^d_{S_0}$ induced by $\bar{t}_1, \ldots, \bar{t}_d$ is étale ;

(b) The map $\mathfrak{U} \to \widehat{\mathbb{A}}^d_{\mathfrak{S}}$ induced by $t_1, \ldots, t_d$ is étale ;

(c) The map $U \to \mathbb{A}^{d\dagger}_{\mathfrak{S}}$ induced by $t_1, \ldots, t_d$ is étale.

Proof. Let $f_0 \colon U_0 \to \mathbb{A}^d_{S_0}$ be an étale map. We can lift this map to a map $f \colon U \to \mathbb{A}^{d\dagger}_{\mathfrak{S}}$ (use 17.1.3.2 and 17.1.1.4.(c)). Hence, following 17.1.1.14, since U is p-torsion free then f is étale and so is its p-adic completion $\widehat{f} \colon \mathfrak{U} \to \widehat{\mathbb{A}}^d_{\mathfrak{S}}$. Conversely, an étale map $\mathfrak{U} \to \widehat{\mathbb{A}}^d_{\mathfrak{S}}$ induces by base change the étale map $U_0 \to \mathbb{A}^d_{S_0}$. □

Lemma 17.1.3.7. *Let $f, g \colon X \to Y$ be two morphisms of $\mathfrak{S}$-weak formal schemes. We have $\widehat{f} = \widehat{g}$ if and only if $f = g$. Moreover, $\widehat{f}$ is an isomorphism if and only if so is f.*

Proof. Suppose $\widehat{f} = \widehat{g}$. To check that $f = g$, we reduce to the case where Y is affine. Since $\Gamma(X, \mathcal{O}_X) \to \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ is injective, then we conclude via the Proposition 17.1.3.2 (and its formal analogue [Gro60, 10.4.6]) that $f = g$.

Suppose $\widehat{f}$ is an isomorphism. To check that f is an isomorphism, we reduce to the case where Y is of the form $Y = \operatorname{Spff} A$. Since $\widehat{f}$ is an isomorphism, then the p-adic completion of $A \to \Gamma(X, \mathcal{O}_X)$ is an isomorphism. Via 17.1.2.6, this implies that $A \to \Gamma(X, \mathcal{O}_X)$ is an isomorphism. For any $a \in A$, let $X_a := f_0^{-1}(D(a))$. Similarly, we check that the canonical morphism $A_{[a]} \to \Gamma(X_a, \mathcal{O}_X)$ is an isomorphism. Since f is an homeomorphism (because $f = f_0$ as morphism of topological spaces), then the family $\{X_a\}_{a \in A}$ is an open neighborhoods basis of $|X|$. Hence the canonical map $f_* \mathcal{O}_X \to \mathcal{O}_Y$ is an isomorphism. This yields the map $X \to Y$ is an isomorphism as morphism of ringed topological spaces. □

Proposition 17.1.3.8. *Let X be a p-torsion free $\mathfrak{S}$-weak formal scheme such that X_0 is affine. Then the canonical morphism $X \to \operatorname{Spff}\Gamma(X, \mathcal{O}_X)$ is an isomorphism. In particular, X is an affine $\mathfrak{S}$-weak formal scheme.*

Proof. Set $Y := \mathrm{Spff}\,\Gamma(X, \mathcal{O}_X)$ and let $f\colon X \to Y$ be the canonical morphism. By hypothesis, f_0 is an isomorphism. Since X_i/S_i and Y_i/S_i are flat, and f_0 is étale then so is f_i. Since $(f_i)_{\mathrm{red}} = (f_0)_{\mathrm{red}}$ is a universal homeomorphism, then so is f_i (see [Gro65, 2.4.3]). Hence f_i is an isomorphism (use [Gro67, 17.9.1]). This yields that $\widehat{f}$ is an isomorphism. We conclude therefore by using 17.1.3.7. □

17.1.4 Immersions

Proposition 17.1.4.1. Let X be a $\mathfrak{S}$-weak formal scheme and $\mathcal{I}$ a coherent ideal of $\mathcal{O}_X$. Let Y be the support of $\mathcal{O}_X/\mathcal{I}$.

(a) Y is a closed subspace of $|X|$.

(b) The ringed topological space $(Y, (\mathcal{O}_X/\mathcal{I})|_Y)$ is a $\mathfrak{S}$-weak formal scheme. More precisely, if X is affine, then $(Y, (\mathcal{O}_X/\mathcal{I})|_Y)$ is canonically isomorphic to $\mathrm{Spff}\,(A/I)$, where $A := \Gamma(X, \mathcal{O}_X)$, $I := \Gamma(X, \mathcal{I})$.

(c) The canonical morphism $(Y, (\mathcal{O}_X/\mathcal{I})|_Y) \to (X, \mathcal{O}_X)$ is affine.

Proof. 1) Suppose X is affine and let $A := \Gamma(X, \mathcal{O}_X)$, $I := \Gamma(X, \mathcal{I})$. Since coherent $\mathcal{O}_X$-modules satisfy theorem of type A, then the canonical morphism $I \otimes_A \mathcal{O}_X \to \mathcal{I}$ is an isomorphism. By flatness of $A \to \mathcal{O}_X$, this yields $A/I \otimes_A \mathcal{O}_X \xrightarrow{\sim} \mathcal{O}_X/\mathcal{I}$.

i) Let us check the equality: $Y = \{\mathfrak{P} \in \mathrm{Spff}\,A\ ;\ \mathfrak{P} \supset I\}$. Let $x \in |X|$ and $\mathfrak{P}$ be the associated open prime ideal of A. Since $\mathcal{O}_{X,x} = A_{[\mathfrak{P}]}$, then we have $(\mathcal{O}_X/\mathcal{I})_x \xrightarrow{\sim} A/I \otimes_A A_{[\mathfrak{P}]} \xrightarrow{\sim} A_{[\mathfrak{P}]}/IA_{[\mathfrak{P}]}$. Suppose $I \subset \mathfrak{P}$. Since $A_{[\mathfrak{P}]}/IA_{[\mathfrak{P}]} \twoheadrightarrow A_{[\mathfrak{P}]}/\mathfrak{P}A_{[\mathfrak{P}]} \neq 0$, then we get $(\mathcal{O}_X/\mathcal{I})_x \neq 0$. Otherwise, suppose there exists $f \in I \setminus \mathfrak{P}$.Then $A/I \otimes_A A_f \xrightarrow{\sim} 0$. Hence $A/I \otimes_A A_{[\mathfrak{P}]} \xrightarrow{\sim} (A/I \otimes_A A_f) \otimes_{A_f} A_{[\mathfrak{P}]} \xrightarrow{\sim} 0$, and we are done.

ii) Following a), we get the bijection $\varepsilon\colon Y \xrightarrow{\sim} |\mathrm{Spff}\,A/I|$ given by $\mathfrak{P} \to \mathfrak{P}/I$. Let $\iota\colon |\mathrm{Spff}\,(A/I)| \xrightarrow{\sim} |\,\mathrm{Spec}(A_0/I_0)|$ be the canonical bijection given by $\mathfrak{P}/I \to (\mathfrak{P}/\pi A)/I_0$, where $I_0 = I/\pi A$ (see 17.1.2.1). Let $f \in I$ and $\overline{f}$ be its image in A/I. We compute $\varepsilon^{-1}(D(\overline{f})) = D(f) \cap Y$. Hence, ε is an homeomorphism and Y is a closed subspace of $|X|$.

iii) Let us now prove that ε induces the isomorphism of ringed topological spaces of the form $(Y, (A/I \otimes_A \mathcal{O}_X)|_Y) \xrightarrow{\sim} \mathrm{Spff}\,(A/I) =: V(\mathcal{I})$. Since $A/I \otimes_A \mathcal{O}_X$ has its support in the closed subspace Y, then we get for any $f \in A$ the isomorphism:

$$\epsilon\colon \Gamma(D(f) \cap Y, (A/I \otimes_A \mathcal{O}_X)|_Y) = \Gamma(D(f), A/I \otimes_A \mathcal{O}_X) \xrightarrow{\sim} A/I \otimes_A A_{[f]}.$$

On the other hand, $\Gamma(D(\overline{f}), V(\mathcal{I})) \xrightarrow{\sim} (A/I)_{[\overline{f}]}$. Hence, we have to check that for any $f \in A$ and any $g \in A$ which is a multiple of f, we have a canonical isomorphism $A/I \otimes_A A_{[f]} \xrightarrow{\sim} (A/I)_{[\overline{f}]}$ inducing the commutative diagram

$$\begin{array}{ccc} A/I \otimes_A A_{[f]} & \longrightarrow & A/I \otimes_A A_{[g]} \\ \downarrow\wr & & \downarrow\wr \\ (A/I)_{[\overline{f}]} & \longrightarrow & (A/I)_{[\overline{g}]}, \end{array}$$

where $\overline{f}, \overline{g} \in A/I$ are the canonical images of f and g respectively.

The epimorphism $A_f \twoheadrightarrow (A/I)_{\overline{f}}$ induces the following one $(A_f)^\dagger \twoheadrightarrow ((A/I)_{\overline{f}})^\dagger$ (see 17.1.1.4.(c)) and therefore $A/I \otimes_A (A_f)^\dagger \twoheadrightarrow ((A/I)_{\overline{f}})^\dagger$. It is immediate that this is functorial in f. It remains to check injectivity which results from the commutative diagram

$$\begin{array}{ccc} A/I \otimes_A (A_f)^\dagger & \longrightarrow & ((A/I)_{\overline{f}})^\dagger \\ \downarrow & & \downarrow \\ A/I \widehat{\otimes}_A (A_f)^\dagger & \xrightarrow{\sim} & ((A/I)_{\overline{f}})^\wedge, \end{array}$$

where the vertical arrows are injective (because both top objects are w.c.f.g. $\mathcal{V}$-algebras) and the bottom arrow is an isomorphism.

2) It follows from the par 1) that the support Y is a closed subset of X and that $(Y, (\mathcal{O}_X/\mathcal{I})|_Y)$ is a $\mathfrak{S}$-weak formal scheme.

3) Suppose $X = \mathrm{Spff}\,A$ and $I := \Gamma(X, \mathcal{I})$ as in 1). The canonical morphism $A \to A/I$ induces $\mathrm{Spff}\,(A/I) \to \mathrm{Spff}\,(A)$ (see 17.1.2.8). We compute that the composition of this latter morphism with the isomorphism ε is the canonical map $(Y, (\mathcal{O}_X/\mathcal{I})|_Y) \to \mathrm{Spff}\,(A)$. Hence, $(Y, (\mathcal{O}_X/\mathcal{I})|_Y) \to X$ is affine. □

Definition 17.1.4.2. We introduce the following terminology.

(a) A closed $\mathfrak{S}$-weak formal subscheme of an $\mathfrak{S}$-weak formal scheme X is a $\mathfrak{S}$-weak formal scheme of the form $(Y, (\mathcal{O}_X/\mathcal{I})|_Y)$, where $\mathcal{I}$ is a coherent ideal of $\mathcal{O}_X$; we say that this is the closed $\mathfrak{S}$-weak formal subscheme defined by $\mathcal{I}$.

(b) A morphism $f: Y \to X$ of $\mathfrak{S}$-weak formal schemes is a "closed immersion" (resp. "an open immersion") if it factorises into $Y \overset{g}{\to} X' \overset{u}{\to} X$, where X' is a closed $\mathfrak{S}$-weak formal subscheme of X (resp. X' is an open of X) and g an isomorphism.

(c) An "immersion" is the composition of a closed immersion followed by an open immersion.

17.1.4.3. A closed immersion is an affine morphism. Moreover, similarly to [Gro60, 10.14.4], we have the following characterization of a closed immersion. Let $f: Y \to X$ be a morphism of $\mathfrak{S}$-weak formal schemes, and let (X_α) be a covering of $f(Y)$ by affine opens of X, such that the $f^{-1}(X_\alpha)$ are affine opens of Y. The following conditions are therefore equivalent:

(a) f is a closed immersion.

(b) $f(Y)$ is a closed subset of X and, for all α, the homomorphism $\Gamma(X_\alpha, \mathcal{O}_X) \to \Gamma(f^{-1}(X_\alpha), \mathcal{O}_Y)$, induced via 17.1.2.8 by the restriction of f to $f^{-1}(X_\alpha)$, is surjective.

Proposition 17.1.4.4. We have the following properties.

(a) If $f: Z \to Y$ and $g: Y \to X$ are closed immersions (resp. immersions) of $\mathfrak{S}$-weak formal schemes, then $g \circ f$ is a closed immersion (resp. immersion).

(b) Let X, Y, Z be three $\mathfrak{S}$-weak formal schemes, $f: Y \to X$ a closed immersion (resp. immersion) and $Z \to X$ a morphism. The morphism $Y \times_X Z \to Z$ is a closed immersion (resp. immersion).

(c) Let X be an $\mathfrak{S}$-weak formal scheme. Suppose that the X-morphisms $f: Y \to Y'$ and $g: Z \to Z'$ are closed immersions (resp. immersions), then $f \times_X g$ is a closed immersion (resp. immersion).

Proof. 1) First, let us prove the proposition in the non-respective case. Let $A \to C$ be a morphism of w.c.f.g. $\mathcal{V}$-algebras, I an ideal of A and $B := A/I$. The algebra $B \otimes_A C$ is a w.c.f.g. $\mathcal{V}$-algebra. Thus, $C/IC \xrightarrow{\sim} B \otimes_A C \xrightarrow{\sim} B \otimes^\dagger_A C$. With this remark, the proof is analogous to [Gro60, 10.14.5].

2) Let us treat now the respective case. First consider (i). Let $j: Z \to Y$ be an open immersion and $u: Y \to X$ a closed immersion. The image of Z by j is an open subset of Y. Thus there exists an open subset X' of X such that $u^{-1}(X') = j(Z)$. Let $u': j(Z) \to X'$ denote the closed immersion induced by u, $u \circ j$ decomposes into $Z \overset{j}{\to} j(Z) \overset{u'}{\to} X' \subset X$. Thus, $u \circ j$ is the composition of a closed immersion followed by an open immersion.

The assertions (ii) and (iii) follows from (i). □

The following proposition gives examples of closed immersions.

Proposition 17.1.4.5. Let $f: Z \to Y$ and $g: Y \to X$ be morphisms of $\mathfrak{S}$-weak formal schemes. If g is separated then the graph of f, $\Gamma_f = (\mathrm{id}, f)_X : Z \to Z \times_X Y$, is a closed immersion.

Proof. Similar to [Gro60, 10.15.4]. □

Proposition 17.1.4.6. Let $f: X \to Y$ be a morphism of $\mathfrak{S}$-weak formal schemes. The canonical morphism $\delta = (\mathrm{id}, \mathrm{id})_Y : X \to X \times_Y X$ is an immersion. We call it the " diagonal immersion ".

Proof. Let (X_α) and (Y_α) be coverings of respectively X and Y by affine opens such that f factors through $X_\alpha \to Y_\alpha$. By construction of the fiber product $X \times_Y X$, the $\mathfrak{S}$-weak formal scheme $X_\alpha \times_{Y_\alpha} X_\alpha$ is an open subset of $X \times_Y X$ and $\delta^{-1}(X_\alpha \times_{Y_\alpha} X_\alpha) = X_\alpha$. Denote by Y' the union of $X_\alpha \times_{Y_\alpha} X_\alpha$. The morphism δ factors through a morphism $\delta': X \to Y'$. According to the characterisation 17.1.4.3 of closed immersions, in order to prove that δ' is a closed immersion, it suffices to check that the canonical homomorphisms $\Gamma(X_\alpha, \mathcal{O}_{X_\alpha}) \to \Gamma(X_\alpha \times_{Y_\alpha} X_\alpha, \mathcal{O}_{X_\alpha \times_{Y_\alpha} X_\alpha})$ are surjective, which is immediate. □

Corollaire 17.1.4.7. Let $f: X \to S$, $g: Y \to S$ and $\phi: S \to T$ be morphisms of $\mathfrak{S}$-weak formal schemes. The canonical morphism $X \times_S Y \to X \times_T Y$ induced by ϕ is an immersion. In particular, when $S = Y$, the graph of f, $X \to X \times_T Y$, is an immersion.

Proof. This results from $X \times_S Y \xrightarrow{\sim} S \times_{(S \times_T S)} (X \times_T Y)$, 17.1.4.6 and from the fact that the closed immersions are stable by base change (17.1.4.4).

□

17.2 $\mathcal{D}$-modules over smooth $\mathfrak{S}$-weak formal schemes

Let U be a smooth $\mathfrak{S}$-weak formal scheme and $m \in \mathbb{N}$.

17.2.1 Sheaf of differential operators of level m

Lemma 17.2.1.1. *Let U an affine $\mathfrak{S}$-weak formal scheme equipped with coordinates $t_1, \dots, t_d$ and $\tau_1 = 1 \otimes t_1 - t_1 \otimes 1, \dots, \tau_d = 1 \otimes t_d - t_d \otimes 1$. The sequence $\tau_1, \dots, \tau_d$ is a regular sequence of generators of the ideal defining the closed immersion $U \hookrightarrow U \times_{\mathfrak{S}} U$.*

Proof. This results from the "formal case". Indeed, let A be the w.c.f.g. $\mathcal{V}$-algebra of U and I the ideal of $A \otimes^{\dagger}_{\mathcal{V}} A$ corresponding to the closed immersion $U \hookrightarrow U \times U$. The canonical images of $t_1, \dots, t_d$ in $\widehat{A}$ are coordinates of $\widehat{U}$. Hence, it follows from [Gro67, 16.9.3] that the images of $\tau_1, \dots, \tau_d$ in $A \widehat{\otimes}_{\mathcal{V}} A$ is a quasi-regular sequence of $\widehat{I}$ and then by noetherianity (see [Gro67, 16.9.10]) is a regular sequence of $\widehat{I}$. Moreover, by faithful flatness of $A \otimes^{\dagger}_{\mathcal{V}} A \to A \widehat{\otimes}_{\mathcal{V}} A$, as $\widehat{I} \xrightarrow{\sim} I \otimes_{A \otimes^{\dagger}_{\mathcal{V}} A} A \widehat{\otimes}_{\mathcal{V}} A$ is generated by the images of $\tau_1, \dots, \tau_d$, then $\tau_1, \dots, \tau_d$ generates I. In addition, $I/(\tau_1, \dots, \tau_r) \to \widehat{I}/(\tau_1, \dots, \tau_r)$ is injective. As multiplication by τ_{r+1} est injective in $\widehat{I}/(\tau_1, \dots, \tau_r)$, then so is in $I/(\tau_1, \dots, \tau_r)$. □

17.2.1.2. We denote by $\mathcal{I}$ the coherent ideal of the diagonal immersion: $U \hookrightarrow U \times_{\mathfrak{S}} U$. Let $\mathfrak{B}$ be the category of affine opens of U and Alg be that of $\mathcal{V}$-algebra. The contravariant functor $\mathfrak{B} \to$ Alg given by $U' \mapsto \mathcal{P}^n_{(m)}(\Gamma(U' \times_{\mathfrak{S}} U'))$ is a sheaf. We define the *algebra of principal parts of level m and order $\leq n$ of* U which we denote by $\mathcal{P}^n_{U,(m)}$, this sheaf also called the divided power envelop of level m and order $\leq n$ of $\mathcal{I}$. The two canonical projections $U \times_{\mathfrak{S}} U \to U$ induce two structures of O_U-algebras on $\mathcal{P}^n_{U,(m)}$: the left structure and the right structure. It follows from 1.3.3.11 and 17.2.1.1 that, if $U/\mathfrak{S}$ is equipped with coordinates $t_1, \dots, t_d$, for each of these structures of $\mathcal{O}_U$-algebras, the sheaf $\mathcal{P}^n_{U,(m)}$ is a free $\mathcal{O}_U$-module and $\underline{\tau}^{\{\underline{k}\}} = \tau_1^{\{k_1\}} \cdots \tau_d^{\{k_d\}}$, for $\underline{k} \leq n$, form a base.

The *sheaf of differential operators of level m and order $\leq n$ on U*, denote by $\mathcal{D}^{(m)}_{U,n}$, is the $\mathcal{O}_U$-linear dual of $\mathcal{P}^n_{U,(m)}$ for its left structure of $\mathcal{O}_U$-algebras. The *sheaf of differential operators of level m on U* is the union: $\mathcal{D}^{(m)}_U := \cup_{n \in \mathbb{N}} \mathcal{D}^{(m)}_{U,n}$. Similarly to 1.4.2.1, we equip this sheaf with the structure of ring and of two structures of $\mathcal{O}_U$-algebra, one right and the other left.

If $U/\mathfrak{S}$ is equipped with coordinates, with the base of $\mathcal{P}^n_{U,(m)}$ consisting of $\underline{\tau}^{\{\underline{k}\}}$ for $\underline{k} \leq n$, the elements of the corresponding dual base of $\mathcal{D}^{(m)}_{U,n}$ will be denoted by $\underline{\partial}^{\langle \underline{k} \rangle}$. The $\underline{\partial}^{\langle \underline{k} \rangle}$ form thus a base of $\mathcal{D}^{(m)}_U$.

The proposition 1.4.2.7 and the paragraph 1.4.2.8 remain true when we replace "scheme" by "$\mathfrak{S}$-weakly formal scheme". Likewise the definitions and results on the m-PD-stratifications (2.1) are again true when we replace "formal" by "weakly formal".

17.2.2 Coherent $\mathcal{D}^{(m)}_U$-modules

Lemma 17.2.2.1. *Suppose U is affine. The ring $\Gamma(U, \mathcal{D}^{(m)}_U)$ (resp. $\mathcal{D}^{(m)}_{U,x}$ for any $x \in U$) is left and right noetherian.*

Proof. By using 17.1.1.9, we proceed similarly to 1.4.2.11. □

Proposition 17.2.2.2. Let $j \colon U \hookrightarrow P$ be an open immersion of smooth $\mathfrak{S}$-weak formal scheme such that $P_0 \setminus U_0$ is the support of a divisor. The sheaf of rings $\mathcal{D}^{(m)}_P$ and $j_* \mathcal{D}^{(m)}_U$ are left and right coherent.

Proof. The left and right coherence of $\mathcal{D}^{(m)}_P$ is a particular case of that of $j_* \mathcal{D}^{(m)}_U$. Let us prove the left coherence of $j_* \mathcal{D}^{(m)}_U$. There exists a basis $\mathcal{B}$ consisting of open subsets of P such that for any $V \in \mathcal{B}$, the $\mathfrak{S}$-weak formal schemes V and $V \cap U$ are affine. By 17.2.2.1, the ring $\Gamma(V, j_* \mathcal{D}^{(m)}_U) = \Gamma(U \cap V, \mathcal{D}^{(m)}_U)$ is left and right noetherian. Moreover, for any open subsets $V' \subset V$ of $\mathcal{B}$, $\Gamma(U \cap V, \mathcal{O}_U) \to \Gamma(U \cap V', \mathcal{O}_U)$ is flat (since this is a homomorphism of smooth w.c.f.g. $\mathcal{V}$-algebras whose reduction modulo π is flat then this follows from Theorem 17.1.1.13). As $\Gamma(U \cap V', \mathcal{O}_U) \otimes_{\Gamma(U\cap V,\mathcal{O}_U)} \Gamma(V, j_*\mathcal{D}_U^{(m)}) \xrightarrow{\sim} \Gamma(V', j_*\mathcal{D}_U^{(m)})$, $\Gamma(V, j_*\mathcal{D}_U^{(m)}) \to \Gamma(V', j_*\mathcal{D}_U^{(m)})$ is flat. We conclude via 1.4.5.2. □

17.2.2.3. For any integers n and n', we denote by $\mathcal{D}_{U,n}^{(m)} \cdot \mathcal{D}_{U,n'}^{(m)}$ the image of the left and right $\mathcal{O}_U$-linear homomorphism $\mathcal{D}_{U,n}^{(m)} \otimes_{\mathcal{O}_U} \mathcal{D}_{U,n'}^{(m)} \to \mathcal{D}_{U,n+n'}^{(m)}$.

Proposition 17.2.2.4. For $n < 0$, we put $\mathcal{D}_{U,n}^{(m)} := 0$. For any pair $(r, s) \in \mathbb{N}^2$, $\sum_{j=0,\ldots,p^m-1} \mathcal{D}_{U,r-j}^{(m)} \cdot \mathcal{D}_{U,s+j}^{(m)} = \mathcal{D}_{U,r+s}^{(m)}$.

Proof. Same computation as 4.1.3.5. □

Similarly to 4.1.3.7, we introduce the following definition.

Definition 17.2.2.5. Let $\mathcal{M}$ be a $\mathcal{D}_U^{(m)}$-module. A *filtration* of $\mathcal{M}$ is a family $(\mathcal{M}_r)_{r\in\mathbb{N}}$ of sub-$\mathcal{O}_U$-modules of $\mathcal{M}$ such that:

(i) For all $r,\ s \in \mathbb{N}$: $\mathcal{M}_r \subset \mathcal{M}_{r+1}$, $\mathcal{D}_{U,r}^{(m)} \cdot \mathcal{M}_s \subset \mathcal{M}_{r+s}$,

(ii) $\mathcal{M} = \cup_{r\in\mathbb{N}}\mathcal{M}_r$.

Definition 17.2.2.6. Let $\mathcal{M}$ be a left $\mathcal{D}_U^{(m)}$-module equipped with a filtration. The filtration is *good* if and only if:

(i) For any $r \in \mathbb{N}$, $\mathcal{M}_r$ is $\mathcal{O}_U$-coherent;

(ii) There exists an integer $r_1 \in \mathbb{N}$ such that for any integer $r \geq r_1$, we have

$$\mathcal{M}_r = \sum_{j=0}^{p^m-1} \mathcal{D}_{U,r-r_1+j}^{(m)} \cdot \mathcal{M}_{r_1-j}.$$

Example 17.2.2.7. According to proposition 17.2.2.4, the family $(\mathcal{D}_{U,r}^{(m)})_{r\in\mathbb{N}}$ is a filtration of $\mathcal{D}_U^{(m)}$ satisfying condition (ii) of 17.2.2.6 for any integer r_1. Since the condition (i) holds also, then this filtration is therefore good. We call it the *order filtration*.

Proposition 17.2.2.8. A $\mathcal{D}_U^{(m)}$-module which is globally of finite presentation admits a good filtration.

Proof. Similar to 4.1.3.16. □

Theorem 17.2.2.9 (Theorem B)**.** *Suppose U is affine and that $\mathcal{M}$ is a $\mathcal{D}_U^{(m)}$-module which is globally of finite presentation. Then, for all integer $i \neq 0$, $H^i(U, \mathcal{M}) = 0$.*

Proof. This follows from 17.2.2.8, from theorem of type B for coherent $\mathcal{O}_U$-modules and from the fact that, for all integer $i \neq 0$, since U is coherent then the functor $H^i(U, \mathcal{M})$ commutes with filtered inductive limits (see [SGA4.2, VI.5.3]). □

Theorem 17.2.2.10 (Theorem A)**.** *Suppose U is affine.*

(a) The functors $\mathcal{M} \mapsto \Gamma(U, \mathcal{M})$ and $M \mapsto \widetilde{M}$ are exact quasi-inverse equivalences between the category of $\mathcal{D}_U^{(m)}$-modules globally of finite presentation and the category of $\Gamma(U, \mathcal{D}_U^{(m)})$-modules of finite type.

(b) Let $u\colon M \to N$ be a morphism of $\Gamma(U, \mathcal{D}_U^{(m)})$-modules of finite type. The $\mathcal{D}_U^{(m)}$-modules associated to Ker u, Imu, Coker u, *are respectively* Ker $\tilde{u}$, Im$\tilde{u}$, Coker $\tilde{u}$. *In particular, the category of $\mathcal{D}_U^{(m)}$-modules globally of finite presentation is an abelian category.*

Proof. We can copy the proof of 4.1.3.19 to check the first part. The exactness of $M \mapsto \widetilde{M}$ (resp. $\mathcal{M} \mapsto \Gamma(U, \mathcal{M})$) follows from the flatness of $\Gamma(U, \mathcal{D}_U^{(m)}) \to \mathcal{D}_U^{(m)}$ (resp. from 17.2.2.9). We get the second statement by using the exactness of $M \mapsto \widetilde{M}$ and the exact sequences:

$$0 \to \operatorname{Ker} u \to M \to \operatorname{Im} u \to 0, \qquad 0 \to \operatorname{Im} u \to N \to \operatorname{Coker} u \to 0. \tag{17.2.2.10.1}$$

□

Remark 17.2.2.11. As the sheaf of rings $\mathcal{D}_U^{(m)}$ is coherent (17.2.2.2), a $\mathcal{D}_U^{(m)}$-module $\mathcal{M}$ is coherent if and only if it is locally of finite presentation, i.e., according to 17.2.2.10, if and only if it is locally of the form $\widetilde{M}$, where M is a $\Gamma(U, \mathcal{D}_U^{(m)})$-module of finite type.

Theorem 17.2.2.12. *Let $\mathcal{M}$ be a $\mathcal{D}_U^{(m)}$-module. Then $\mathcal{M}$ is coherent if and only if it admits good filtrations locally.*

Proof. Similar to 4.1.3.21. □

Proposition 17.2.2.13. Let $j: U \subset P$ be an open immersion of smooth $\mathfrak{S}$-weak formal scheme such that $P_0 \setminus U_0$ is the support of a divisor and $\mathcal{M}$ a $\mathcal{D}_U^{(m)}$-module which is locally in P of finite presentation (i.e. there exists a covering by open subsets of $P = \cup_\alpha P_\alpha$ such that, for all α, $\mathcal{M}|_{U \cap P_\alpha}$ is globally of finite presentation). Then:

(a) The canonical morphism $j_*\mathcal{M} \to \mathbb{R}j_*\mathcal{M}$ is an isomorphism;

(b) For all smooth morphism $P \to P'$ of $\mathfrak{S}$-weak formal schemes, for all open subset U' of P' such that $U = f^{-1}(U')$, the canonical morphism $j_*(\Omega^\bullet_{U/U'} \otimes_{\mathcal{O}_U} \mathcal{M}) \to \mathbb{R}j_*(\Omega^\bullet_{U/U'} \otimes_{\mathcal{O}_U} \mathcal{M})$ is an isomorphism;

(c) The $j_*\mathcal{D}_U^{(m)}$-module $j_*\mathcal{M}$ is coherent. Moreover, if U is affine and $\mathcal{M}$ is a $\mathcal{D}_U^{(m)}$-module globally of finite presentation, then $j_*\mathcal{M}$ is a $j_*\mathcal{D}_U^{(m)}$-module globally of finite presentation.

Proof. Proof of (a). As $P_0 \setminus U_0$ is a divisor, the assertion being local, we can suppose that P_α and $U \cap P_\alpha$ are affine. For any integer i, $(H^i j_*\mathcal{M})|_{P_\alpha} \xrightarrow{\sim} H^i j_{\alpha *}(\mathcal{M}|_{U \cap P_\alpha})$, where $j_\alpha: U \cap P_\alpha \hookrightarrow P_\alpha$. Since $H^i j_{\alpha *}(\mathcal{M}_{U \cap P_\alpha})$ is the sheaf associated to the presheaf which to any principal open subset P' of P_α associate $H^i(U \cap P', \mathcal{M})$, then by theorem B of the form 17.2.2.9 we conclude the proof of (a).

The assertion (b) follows from (a) and from the fact that $\Omega_{U/U'}$ is a $\mathcal{O}_U$-module which is locally in P free of finite type (one take the open basis consisting of open subsets of P having coordinates above P').

Now we treat the assertion (c). Thanks to 17.2.2.2, it is sufficient to check the last statement. Suppose we have a finite presentation of the form: $(\mathcal{D}_U^{(m)})^r \stackrel{\phi}{\to} (\mathcal{D}_U^{(m)})^s \stackrel{\epsilon}{\to} \mathcal{M} \to 0$. It results from (a) and 17.2.2.10.(b) that the functor j_* is exact on the category of $\mathcal{D}_U^{(m)}$-modules globally of finite presentation. Hence, by applying the functor j_* we get the exact sequence: $j_*(\mathcal{D}_U^{(m)})^r \stackrel{j_*\phi}{\to} j_*(\mathcal{D}_U^{(m)})^s \stackrel{j_*\epsilon}{\to} j_*\mathcal{N} \to 0$. □

17.2.3 Ind-coherent $\mathcal{D}_U^{(m)}$-modules

Suppose U is affine.

Definition 17.2.3.1. Let M be a $\Gamma(U, \mathcal{O}_U)$-module (resp. $\Gamma(U, \mathcal{D}_U^{(m)})$-module). The $\mathcal{O}_U$-module (resp. $\mathcal{D}_U^{(m)}$-module) *associated to* M is $\widetilde{M} := \mathcal{O}_U \otimes_{\Gamma(U,\mathcal{O}_U)} M$ (resp. $\mathcal{D}_U^{(m)} \otimes_{\Gamma(U,\mathcal{D}_U^{(m)})} M$). Such a module is said to be ind-*coherent*.

If $u: M' \to M$ is a homomorphism of $\Gamma(U, \mathcal{O}_U)$-modules (resp. $\Gamma(U, \mathcal{D}_U^{(m)})$-modules), $\widetilde{u}: \widetilde{M'} \to \widetilde{M}$ denotes the canonically induced homomorphism. Since $\Gamma(U, \mathcal{O}_U) \to \mathcal{O}_U$ and $\Gamma(U, \mathcal{D}_U^{(m)}) \to \mathcal{D}_U^{(m)}$ are flat, then both functors $\sim: M \mapsto \widetilde{M}$ are exact.

Remark 17.2.3.2. (a) The sheaf $\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)}$ is not ind-coherent as $\mathcal{D}_U^{(m)}$-module.

(b) A left $\mathcal{D}_U^{(m)}$-module is ind-coherent as $\mathcal{D}_U^{(m)}$-module if and only if it is ind-coherent as $\mathcal{O}_U$-module. Indeed, as $\mathcal{D}_U^{(m)}$ is a filtered inductive limit of coherent $\mathcal{O}_U$-modules and since the functors $\mathcal{O}_U \otimes_{\Gamma(U,\mathcal{O}_U)} -$ and $\Gamma(U, -)$ commute with filtered inductive limit, then we benefit from the canonical morphism $\mathcal{O}_U \otimes_{\Gamma(U,\mathcal{O}_U)} \Gamma(U, \mathcal{D}_U^{(m)}) \to \mathcal{D}_U^{(m)}$ is an isomorphism. This remark can be interpreted via the isomorphism 17.5.1.7.1.

Proposition 17.2.3.3. We have the following properties.

(a) Let $u: M \to N$ be a morphism of $\Gamma(U, \mathcal{D}_U^{(m)})$-modules. The $\mathcal{D}_U^{(m)}$-modules associated to $\operatorname{Ker} u$, $\operatorname{Im} u$, $\operatorname{Coker} u$, are respectively $\operatorname{Ker} \tilde{u}$, $\operatorname{Im} \tilde{u}$, $\operatorname{Coker} \tilde{u}$.

(b) If M is an inductive limit (resp. direct sum) of a family of $\Gamma(U, \mathcal{D}_U^{(m)})$-modules (M_λ), $\widetilde{M}$ is the inductive limit (resp. direct sum) of the family $(\widetilde{M_\lambda})$, up to canonical isomorphism.

(c) If M and N are two $\Gamma(U, \mathcal{D}_U^{(m)})$-modules, then the $\mathcal{D}_U^{(m)}$-modules associated to $M \otimes_{\Gamma(U,\mathcal{O}_U)} N$ and $\mathrm{Hom}_{\Gamma(U,\mathcal{O}_U)}(M, N)$ are respectively $\widetilde{M} \otimes_{\mathcal{O}_U} \widetilde{N}$ and $\mathcal{H}om_{\mathcal{O}_U}(\widetilde{M}, \widetilde{N})$.

We have identical results when $\mathcal{O}_U$ replaces $\mathcal{D}_U^{(m)}$.

Proof. Since the functor $\sim\colon M \mapsto \widetilde{M}$ is exact, then we prove (a) similarly to 17.2.2.10.(b). Assertion (b) results from the fact that inductive limit commutes with tensor product while (c) is easy and is left as an exercise. □

Remark 17.2.3.4. We have the following properties.

(a) A $\Gamma(U, \mathcal{D}_U^{(m)})$-module is the filtered inductive limit of its sub-$\Gamma(U, \mathcal{D}_U^{(m)})$-modules of finite type. Via 17.2.3.3.(b), this yields that an ind-coherent $\mathcal{D}_U^{(m)}$-module is the filtered inductive limit of its sub-$\mathcal{D}_U^{(m)}$-modules globally of finite presentation. Hence, the category of ind-coherent $\mathcal{D}_U^{(m)}$-modules is the smallest category stable by inductive limit and containing the $\mathcal{D}_U^{(m)}$-modules which are globally of finite presentation, which justifies the name.

(b) Let M be a $\Gamma(U, \mathcal{D}_U^{(m)})$-module and U' a principal open subset of U. As tensor product and $\Gamma(U', -)$ commute with filtered inductive limite, it follows from remark (i) and theorem of type A (17.2.2.10) applied to U and U' that $\Gamma(U', \widetilde{M}) \xrightarrow{\sim} \Gamma(U', \mathcal{D}_U^{(m)}) \otimes_{\Gamma(U,\mathcal{D}_U^{(m)})} M$.

Theorem 17.2.3.5 (Theorem B)**.** *For all* ind*-coherent* $\mathcal{D}_U^{(m)}$*-module* $\mathcal{M}$*, for all integer* $i \neq 0$, $H^i(U, \mathcal{M}) = 0$. *In particular, the functor* $\Gamma(U, -)$ *is exact on the category of* ind*-coherent* $\mathcal{D}_U^{(m)}$*-modules.*

Proof. This follows from 17.2.2.9, 17.2.3.4(a) and the fact that for all integer $i \neq 0$, the functor $H^i(U, \mathcal{M})$ commutes with filtered inductive. □

Proposition 17.2.3.6. We have the following properties:

(a) The functors $M \mapsto \widetilde{M}$ and $\mathcal{M} \mapsto \Gamma(U, \mathcal{M})$ induces exact quasi-inverse equivalences between the category of $\Gamma(U, \mathcal{D}_U^{(m)})$-modules and that of ind-coherent $\mathcal{D}_U^{(m)}$-modules.

(b) The category of ind-coherent $\mathcal{D}_U^{(m)}$-modules is a full abelian subcategory of that of $\mathcal{D}_U^{(m)}$-modules.

We get identical results when $\mathcal{O}_U$ replaces $\mathcal{D}_U^{(m)}$.

Proof. a) Let M be a $\Gamma(U, \mathcal{D}_U^{(m)})$-module. According to the remark above 17.2.3.4.(b), $\Gamma(U, \widetilde{M}) \xrightarrow{\sim} M$. Conversely, for any $\mathcal{D}_U^{(m)}$-module $\mathcal{M}$ isomorphic to $\widetilde{M}$, $\Gamma(U, \mathcal{M})^{\sim} \xrightarrow{\sim} \Gamma(U, \widetilde{M})^{\sim} \xrightarrow{\sim} \widetilde{M} \xrightarrow{\sim} \mathcal{M}$. The exactness of $\mathcal{M} \mapsto \Gamma(U, \mathcal{M})$ follows from 17.2.3.5, while the other one is already known.

b) The statement (b) is a consequence of the part (a) and of 17.2.3.3.(a). □

Proposition 17.2.3.7. Let $0 \to \mathcal{E}' \to \mathcal{E} \to \mathcal{E}'' \to 0$ be an exact sequence of $\mathcal{D}_U^{(m)}$-modules. If two of these modules are ind-coherent, so is the third.

Proof. The case where $\mathcal{E}$ is ind-coherent is deduced from 17.2.3.3.(a). Suppose now $\mathcal{E}'$ and $\mathcal{E}''$ are of the form $\widetilde{E}'$ and $\widetilde{E}''$. Via the theorem B for the ind-coherent $\mathcal{D}_U^{(m)}$-modules, we get that the sequence $0 \to E' \to \Gamma(U, \mathcal{E}) \to E'' \to 0$ is exact. By applying the exact functor $\sim$, using the five lemma we conclude that the canonical homomorphism $\Gamma(U, \mathcal{E})^{\sim} \to \mathcal{E}$ is an isomorphism. □

17.2.4 Extraordinary pullbacks and pushforwards of finite order

Let $g\colon U' \to U$ and $g'\colon U'' \to U'$ be two morphisms of smooth $\mathfrak{S}$-weak formal schemes.

Notation 17.2.4.1. Similarly to 5.1.1.2, we introduce the following transfert sheaves:

(a) The sheaf $g^*\mathcal{D}_U^{(m)}$ is equipped with a canonical structure of $(\mathcal{D}_{U'}^{(m)}, g^{-1}\mathcal{D}_U^{(m)})$-bimodule, which we denote $\mathcal{D}_{U'\to U}^{(m)}$.

(b) We write $\mathcal{D}_{U\leftarrow U'}^{(m)} := \omega_{U'} \otimes_{\mathcal{O}_{U'}} g_{\mathrm{l}}^*(\mathcal{D}_U^{(m)} \otimes_{\mathcal{O}_U} \omega_U^{-1})$, the index l indicating that we choose the left structure of left $\mathcal{D}_U^{(m)}$-module.

17.2.4.2. Similarly to 5.1.1.4, we get the notion of extraordinary pullbacks as follows:

(a) The extraordinary inverse image by g of a complex $\mathcal{E} \in D^-({}^{\mathrm{l}}\mathcal{D}_U^{(m)})$ is defined by putting

$$g^{(m)!}(\mathcal{E}) := \mathcal{D}_{U'\to U}^{(m)} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_U^{(m)}} g^{-1}\mathcal{E}[d_{U'/U}], \tag{17.2.4.2.1}$$

where $d_{U'/U}$ is the relative dimension of U_0'/U_0.

(b) The extraordinary inverse image by g of a complex $\mathcal{M} \in D^-({}^{\mathrm{r}}\mathcal{D}_U^{(m)})$ is defined by putting

$$g^{(m)!}(\mathcal{M}) := g^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_U^{(m)}} \mathcal{D}_{U\leftarrow U'}^{(m)}[d_{U'/U}],$$

(c) Similarly to 5.1.1.5.1, we have for any $\mathcal{M} \in D^-({}^{\mathrm{r}}\mathcal{D}_U^{(m)})$ the isomorphism

$$g^{(m)!}(\mathcal{M}) \otimes_{\mathcal{O}_{U'}} \omega_{U'}^{-1} \xrightarrow{\sim} g^{(m)!}(\mathcal{M} \otimes_{\mathcal{O}_U} \omega_U^{-1}).$$

(d) If there is no confusion on the level, we write $g^!$ instead. We have an isomorphism $g'^! \circ g^! \xrightarrow{\sim} (g \circ g')^!$.

17.2.4.3. Let $\mathcal{E} \in D^-({}^{\mathrm{l}}\mathcal{D}_{U,\mathbb{Q}})$. For any integer $m \leq m'$, since the canonical morphisms $\mathcal{D}_{U,\mathbb{Q}}^{(m)} \to \mathcal{D}_{U,\mathbb{Q}}^{(m')} \to \mathcal{D}_{U,\mathbb{Q}}$ are isomorphisms, then $g^{(m)!}(\mathcal{E}) \to g^{(m')!}(\mathcal{E}) \to g^!(\mathcal{E})$ are isomorphisms, where

$$g^!(\mathcal{E}) := \mathcal{D}_{U'\to U,\mathbb{Q}} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_{U,\mathbb{Q}}} g^{-1}\mathcal{E}[d_{U'/U}] \tag{17.2.4.3.1}$$

and $\mathcal{D}_{U'\to U}$ is the $(\mathcal{D}_{U'}, g^{-1}\mathcal{D}_U)$-bimodule $g^*\mathcal{D}_U$. We have similar result for $\mathcal{M} \in D^-({}^{\mathrm{r}}\mathcal{D}_{U,\mathbb{Q}})$.

Definition 17.2.4.4. A (left or right) $\mathcal{D}_U^{(m)}$-module $\mathcal{E}$ is said to be locally ind-coherent if there exists a open basis $\{U_i\}_{i\in I}$ of U by affine $\mathfrak{S}$-weak formal schemes such that $\mathcal{E}|U_i$ is ind-coherent (see definition 17.2.3.1). Remark that a locally ind-coherent $\mathcal{D}_U^{(m)}$-module is locally a quotient of a free $\mathcal{D}_U^{(m)}$-module. This is therefore a notion in the case of $\mathfrak{S}$-weak formal scheme which is similar to that of quasi-coherence in the case of schemes (e.g. see 17.2.4.6) but beware this is a priori different from the notion of quasi-coherence defined later (see 17.3.1.3).

For any $* \in \{-,+,\mathrm{b}\}$, we denote by $D^*_{\mathrm{lic}}({}^{\mathrm{r}}\mathcal{D}_U^{(m)})$ the strictly full subcategory of $D^*_{\mathrm{lic}}({}^{\mathrm{r}}\mathcal{D}_U^{(m)})$ consisting of objects $\mathcal{E}$ such that for any $j \in \mathbb{N}$ the $\mathcal{D}_U^{(m)}$-module $H^j(\mathcal{E})$ is locally ind-coherent.

Example 17.2.4.5. The sheaf $\mathcal{D}_{U'\to U}^{(m)}$ is a locally ind-coherent left $\mathcal{D}_{U'}^{(m)}$-module. The sheaf $\mathcal{D}_{U\leftarrow U'}^{(m)}$ is a locally ind-coherent right $\mathcal{D}_{U'}^{(m)}$-module. We check that the functors $\omega_U \otimes_{\mathcal{O}_U} -$ and $- \otimes_{\mathcal{O}_U} \omega_U^{-1}$ induce quasi-inverse equivalences between the category of left locally ind-coherent left $\mathcal{D}_U^{(m)}$-modules and that of right locally ind-coherent left $\mathcal{D}_U^{(m)}$-modules.

Proposition 17.2.4.6. *Let $\mathcal{F} \in D({}^{\mathrm{r}}\mathcal{D}_U^{(m)})$ and $\mathcal{G} \in D({}^{\mathrm{l}}g^{-1}\mathcal{D}_U^{(m)})$.*

(i) We have the canonical morphism in $D(\mathbb{Z}_U)$:

$$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{D}_U^{(m)}} \mathbb{R}g_*(\mathcal{G}) \to \mathbb{R}g_*\left(g^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_U^{(m)}} \mathcal{G}\right). \tag{17.2.4.6.1}$$

Let $\mathcal{D}$ be a sheaf of rings such that $(\mathcal{D}, \mathcal{D}_U^{(m)})$ is right solvable and let $\mathcal{F} \in D_{\mathrm{r-sol}}(\mathcal{D}, \mathcal{D}_U^{(m)})$ (see definition and notation 4.6.3.2). Then the morphism 17.2.4.6.1 can also be viewed as a morphism of $D(\mathcal{D})$.

(ii) Suppose f is quasi-compact and quasi-separated. Suppose one of the following conditions:

(a) either $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{lic}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_U)$, and $\mathcal{G} \in D({}^{\mathrm{l}}g^{-1}\mathcal{D}^{(m)}_U)$,

(b) or $\mathcal{F} \in D^{-}_{\mathrm{lic}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_U)$, and $\mathcal{G} \in D^{-}({}^{\mathrm{l}}g^{-1}\mathcal{D}^{(m)}_U)$.

Then the morphism 17.2.4.6.1 is an isomorphism.

Proof. With the remark of 17.2.4.4, we can copy the proof of 5.1.2.5. □

Corollary 17.2.4.7. *Let $*, ** \in \{\mathrm{l}, \mathrm{r}\}$ such that both are not equal to* r. *Suppose f is quasi-compact and quasi-separated. Suppose moreover one of the following conditions:*

(a) either $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{lic}}({}^{*}\mathcal{D}^{(m)}_U)$, and $\mathcal{G} \in D({}^{**}g^{-1}\mathcal{D}^{(m)}_U)$,

(b) or $\mathcal{F} \in D^{-}_{\mathrm{lic}}({}^{*}\mathcal{D}^{(m)}_U)$, and $\mathcal{G} \in D^{-}({}^{**}g^{-1}\mathcal{D}^{(m)}_U)$.

Then we have the following isomorphism of $D^{-}({}^{**}\mathcal{D}^{(m)}_U)$ (see 5.1.2.7 for the right term):

$$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{R}g_*(\mathcal{G}) \xrightarrow{\sim} \mathbb{R}g_*\left(g^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} \mathcal{G}\right). \tag{17.2.4.7.1}$$

Proof. Similarly to 5.1.2.8, this is a consequence of 17.2.4.6. □

17.2.4.8. Similarly to 5.1.3.1, we get the notion of pushforward as follows:

(a) As $g_0 \colon U'_0 \to U_0$ is a quasi-separated and quasi-compact morphism between noetherian schemes of finite Krull dimension, the functor $g_{0*} = g_*$ is of finite cohomological dimension. The direct image by g is the functor $g^{(m)}_+ \colon D^{-}({}^{\mathrm{l}}\mathcal{D}^{(m)}_{U'}) \to D^{-}({}^{\mathrm{l}}\mathcal{D}^{(m)}_U)$ which is defined by setting for any $\mathcal{E}' \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{(m)}_{U'})$:

$$g^{(m)}_+(\mathcal{E}') := \mathbb{R}g_*(\mathcal{D}^{(m)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}').$$

(b) The direct image by g is the functor $g^{(m)}_+ \colon D^{-}({}^{\mathrm{r}}\mathcal{D}^{(m)}_{U'}) \to D^{-}({}^{\mathrm{r}}\mathcal{D}^{(m)}_U)$ which is defined by setting for any $\mathcal{M}' \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{(m)}_{U'})$:

$$g^{(m)}_+(\mathcal{M}') := \mathbb{R}g_*(\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{D}^{(m)}_{U'\to U}).$$

(c) Similarly to 5.1.3.2.1 (indeed, the isomorphism of the form 17.2.4.7.1 holds because it is used in the case where $\mathcal{F} = \omega_U$ is locally free of rank one), we have for any $\mathcal{E}' \in D^{-}({}^{\mathrm{l}}\mathcal{D}^{(m)}_{U'})$ the isomorphism

$$\omega_U \otimes_{\mathcal{O}_U} g^{(m)}_+(\mathcal{E}') \xrightarrow{\sim} g^{(m)}_+(\omega_{U'} \otimes_{\mathcal{O}_{U'}} \mathcal{E}), \tag{17.2.4.8.1}$$

(d) This is also written as g_+. Thanks to 17.2.4.7.1, we can copy the proof in the context of schemes (see 5.1.3.8.1) to construct the canonical isomorphism $g_+ \circ g'_+(\mathcal{E}'') \xrightarrow{\sim} (g \circ g')_+(\mathcal{E}'')$ which is functorial in $\mathcal{E}'' \in D^{-}(\mathcal{D}^{(m)}_{U''})$.

17.2.4.9. For any integer $m \leq m'$, since the canonical morphisms $\mathcal{D}^{(m)}_{U,\mathbb{Q}} \to \mathcal{D}^{(m')}_{U,\mathbb{Q}} \to \mathcal{D}_{U,\mathbb{Q}}$ are isomorphisms, then for any $\mathcal{E}' \in D^{-}({}^{\mathrm{l}}\mathcal{D}_{U',\mathbb{Q}})$, the morphisms $g^{(m)}_+(\mathcal{E}') \to g^{(m')}_+(\mathcal{E}') \to g_+(\mathcal{E}')$ are isomorphisms, where

$$g_+(\mathcal{E}') := \mathbb{R}g_*(\mathcal{D}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}_{U'}} \mathcal{E}')$$

and $\mathcal{D}^{(m)}_{U\leftarrow U'} := \omega_{U'} \otimes_{\mathcal{O}_{U'}} g^*_{\mathrm{l}}(\mathcal{D}_U \otimes_{\mathcal{O}_U} \omega^{-1}_U)$. We have similar result for $\mathcal{M}' \in D^{-}({}^{\mathrm{r}}\mathcal{D}_{U',\mathbb{Q}})$.

17.2.5 Closed immersion: adjunction, preservation of the coherence by push-forward

Let $m \in \mathbb{N}$. Let $v\colon Y \hookrightarrow U$ be a closed immersion of smooth $\mathfrak{S}$-weak formal schemes. Let $\mathcal{I}$ be the ideal of $\mathcal{O}_U$ given by v.

17.2.5.1 (Local description)**.** Suppose $U/\mathfrak{S}$ has coordinates $t_1, \ldots, t_d$ such that $t_{r+1}, \ldots, t_d$ generated $\mathcal{I}$ and the image of $t_1, \ldots, t_r$ in $\Gamma(Y, \mathcal{O}_Y)$ are coordinates of $Y/\mathfrak{S}$. Let $\mathcal{F}^{(m)} \in D(\mathcal{D}^{(m)}_Y)$. Using similar to 5.2.2.4.1 isomorphism, we compute $u^{(m)}_+(\mathcal{F}^{(m)}) \xrightarrow{\sim} \mathcal{V}\{\partial_{r+1}, \ldots, \partial_d\}^{(m)} \otimes_{\mathcal{V}} \mathcal{F}^{(m)}$ (see notation 5.2.2.2). Let $\mathcal{F} \in D(\mathcal{D}_{Y,\mathbb{Q}})$. Using similar to 5.2.2.4.1 isomorphism (of level ∞), we compute $u_+(\mathcal{F}) \xrightarrow{\sim} \mathcal{V}[\partial_{r+1}, \ldots, \partial_d] \otimes_{\mathcal{V}} \mathcal{F}^{(m)}$.

It follows from these local description that the functors u_+ and $u^{(m)}_+$ are exact.

Proposition 17.2.5.2. *Let $* \in \{\mathrm{r}, \mathrm{l}\}$, $\mathcal{M} \in D({}^*\mathcal{D}^{(m)}_U)$, $\mathcal{N} \in D({}^*\mathcal{D}^{(m)}_Y)$. We have the isomorphisms*

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_Y}(v^{(m)}_+(\mathcal{N}), \mathcal{M}) \xrightarrow{\sim} v_* \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_Y}(\mathcal{N}, v^!(\mathcal{M})).$$

Proof. This is checked similarly to 5.2.6.3. □

17.2.5.3. Let $\mathcal{F}^{(m)} \in D(\mathcal{D}^{(m)}_Y)$. It follows from 17.2.5.2 that we have the adjunction morphism

$$\mathcal{F}^{(m)} \to v^{!^{(m)}} \circ v^{(m)}_+(\mathcal{F}^{(m)}). \tag{17.2.5.3.1}$$

Suppose is p-torsion free. Then similarly to 9.3.3.13 we compute that the adjunction morphism 17.2.5.3.1 is an isomorphism. When $\mathcal{F}^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_Y)$, the adjunction map 17.2.5.3.1 is compatible with the standard one available on formal schemes of 9.3.2.5, i.e. we get the commutative diagram:

$$\begin{array}{ccc}
\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_Y} \mathcal{F}^{(m)} & \xrightarrow{17.2.5.3.1} & \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_Y} \left(v^{!^{(m)}} \circ v^{(m)}_+(\mathcal{F}^{(m)}))\right) \\
\downarrow{\scriptstyle 9.3.2.5} & & \sim\downarrow{\scriptstyle 17.3.2.6.1} \\
\widehat{v}^{!^{(m)}} \circ \widehat{v}^{(m)}_+ \left(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_Y} \mathcal{F}^{(m)}\right) & \underset{17.3.3.1.1}{\xleftarrow{\sim}} & \widehat{v}^{!^{(m)}} \left(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_U} v^{(m)}_+(\mathcal{F}^{(m)}))\right)
\end{array} \tag{17.2.5.3.2}$$

Let $\mathcal{E}^{(m)} \in D(\mathcal{D}^{(m)}_U)$. It follows from 17.2.5.2 that we have the adjunction morphism

$$v^{(m)}_+ \circ v^{!^{(m)}}(\mathcal{E}^{(m)}) \to \mathcal{E}^{(m)}. \tag{17.2.5.3.3}$$

For any $\mathcal{E}^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_U)$ such that $v^{!^{(m)}}(\mathcal{E}^{(m)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_Y)$, we get the commutative diagram:

$$\begin{array}{ccc}
\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_U} v^{(m)}_+ \circ v^{!^{(m)}}(\mathcal{E}^{(m)}) & \xrightarrow{17.2.5.3.3} & \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_U} \mathcal{E}^{(m)} \\
\sim\downarrow{\scriptstyle 17.3.3.1.1} & & \uparrow{\scriptstyle 9.3.2.5} \\
\widehat{v}^{(m)}_+ \left(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_Y} v^{!^{(m)}}(\mathcal{E}^{(m)})\right) & \underset{\sim}{\xrightarrow{17.3.2.6.1}} & \widehat{v}^{(m)}_+ \circ \widehat{v}^{!^{(m)}} \left(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_U} \mathcal{F}^{(m)})\right)
\end{array} \tag{17.2.5.3.4}$$

Proposition 17.2.5.4. Suppose Y and U are affine. For all right globally of finite presentation $\mathcal{D}^{(m)}_Y$-module $\mathcal{M}$, $v_+(\mathcal{M})$ is globally of finite presentation and we have a canonical isomorphism:

$$\Gamma(U, v_+(\mathcal{M})) \xrightarrow{\sim} \Gamma(Y, \mathcal{M}) \otimes_{\Gamma(Y, \mathcal{D}^{(m)}_Y)} \Gamma(Y, \mathcal{D}^{(m)}_{Y \hookrightarrow U}).$$

The same holds when “right module ” is replaced by “ left module”.

Proof. As $\mathcal{M}$ is a right $\mathcal{D}^{(m)}_Y$-module globally of finite presentation, then we get from Theorem of type A of 17.2.2.10 the canonical isomorphism:

$$\mathcal{M} \otimes_{\mathcal{D}^{(m)}_Y} \mathcal{D}^{(m)}_{Y \hookrightarrow U} \xrightarrow{\sim} \Gamma(Y, \mathcal{M}) \otimes_{\Gamma(Y, \mathcal{D}^{(m)}_Y)} \mathcal{D}^{(m)}_{Y \hookrightarrow U}.$$

For any integer n, it follows from the $\mathcal{O}_U$-coherence of $\mathcal{D}^{(m)}_{U,n}$ and theorem of type A for coherent $\mathcal{O}_U$-modules that the canonical morphism $\Gamma(Y, \mathcal{O}_Y) \otimes_{\Gamma(U,\mathcal{O}_U)} \Gamma(U, \mathcal{D}^{(m)}_{U,n}) \to \Gamma(Y, v^*\mathcal{D}^{(m)}_{U,n})$ is an isomorphism. Since tensor products and the functor $\Gamma(U, -)$ commute with filtered inductive limits (see [SGA4.2, VI.5.3]), then the morphism $\Gamma(Y, \mathcal{O}_Y) \otimes_{\Gamma(U,\mathcal{O}_U)} \Gamma(U, \mathcal{D}^{(m)}_U) \to \Gamma(Y, \mathcal{D}^{(m)}_{Y\hookrightarrow U})$ is an isomorphism. Let U' be a principal open subset of U and $Y' := Y \cap U'$. We get $\Gamma(Y', \mathcal{O}_Y) \otimes_{\Gamma(U',\mathcal{O}_U)} \Gamma(U', \mathcal{D}^{(m)}_U) \xrightarrow{\sim} \Gamma(Y', \mathcal{D}^{(m)}_{Y\hookrightarrow U})$. Moreover, $\Gamma(Y', \mathcal{O}_Y) \xrightarrow{\sim} \Gamma(Y, \mathcal{O}_Y) \otimes_{\Gamma(U,\mathcal{O}_U)} \Gamma(U', \mathcal{O}_U)$ (use the part 1) of the proof of 17.1.4.4). Finally, we get:

$$\Gamma(Y, \mathcal{D}^{(m)}_{Y\hookrightarrow U}) \otimes_{\Gamma(U,\mathcal{D}^{(m)}_U)} \Gamma(U', \mathcal{D}^{(m)}_U) \xrightarrow{\sim} \Gamma(Y', \mathcal{D}^{(m)}_{Y\hookrightarrow U}).$$

As the functor "sheafification" commute with v_* (indeed, v is a closed immersion), $v_*(\mathcal{M} \otimes_{\mathcal{D}^{(m)}_Y} \mathcal{D}^{(m)}_{Y\hookrightarrow U})$ is the sheaf associated with the presheaf defined on the principal open subsets U' of U by: $U' \mapsto \Gamma(Y, \mathcal{M}) \otimes_{\Gamma(Y,\mathcal{D}^{(m)}_Y)} \Gamma(Y, \mathcal{D}^{(m)}_{Y\hookrightarrow U}) \otimes_{\Gamma(U,\mathcal{D}^{(m)}_U)} \Gamma(U', \mathcal{D}^{(m)}_U)$. Hence, following Theorem of type A of 17.2.2.10, it remains thus to check that $\Gamma(Y, \mathcal{M}) \otimes_{\Gamma(Y,\mathcal{D}^{(m)}_Y)} \Gamma(Y, \mathcal{D}^{(m)}_{Y\hookrightarrow U})$ is a right $\Gamma(U, \mathcal{D}^{(m)}_U)$-module of finite type. Since tensor product is right exact and $\Gamma(Y, \mathcal{M})$ is a right $\Gamma(Y, \mathcal{D}^{(m)}_Y)$-module of finite type, then it suffices to prove that $\Gamma(Y, \mathcal{D}^{(m)}_{Y\hookrightarrow U})$ is a right $\Gamma(U, \mathcal{D}^{(m)}_U)$-module of finite type. We conclude via $\Gamma(U, \mathcal{D}^{(m)}_U) \twoheadrightarrow \Gamma(Y, \mathcal{O}_Y) \otimes_{\Gamma(U,\mathcal{O}_U)} \Gamma(U, \mathcal{D}^{(m)}_U) \xrightarrow{\sim} \Gamma(Y, \mathcal{D}^{(m)}_{Y\hookrightarrow U})$.

□

Corollaire 17.2.5.5. For all coherent $\mathcal{D}^{(m)}_Y$-module $\mathcal{M}$, $v_+(\mathcal{M})$ is $\mathcal{D}^{(m)}_U$-coherent.

17.3 Comparaison between weak formal and formal cohomological operations without overconvergent singularities

17.3.1 Quasi-coherent complexes over smooth $\mathfrak{S}$-weak formal schemes

Let U be a smooth $\mathfrak{S}$-weak formal scheme and $m \in \mathbb{N}$. We keep notation 17.1.3.1, e.g. $U_i := U \times_{\mathfrak{S}} S_i$ for all $i \in \mathbb{N}$. Let $* \in \{\mathrm{l}, \mathrm{r}\}$.

17.3.1.1. We denote by $U_\bullet$ the topos $\mathrm{Top}(U)_{\mathbb{N}}$ given by the canonical maps $U_{i+1} \to U_i$. The family of maps $\mathcal{D}^{(m)}_{U_{i+1}} \to \mathcal{D}^{(m)}_{U_i}$ induces a sheaf of rings $\mathcal{D}^{(m)}_{U_\bullet}$ on $U_\bullet$ We get the morphism of ringed topoi $\underleftarrow{l}_U \colon (U_\bullet, \mathcal{D}^{(m)}_{U_\bullet}) \to (|U|, \mathcal{D}^{(m)}_U)$. From [Sta22, 07A6] (or see 5.3.5.4), this yields the functors $\mathbb{R}\underleftarrow{l}_{U*} \colon D({}^*\mathcal{D}^{(m)}_{U_\bullet}) \to D({}^*\mathcal{D}^{(m)}_U)$ and $\mathbb{L}\underleftarrow{l}^*_U \colon D({}^*\mathcal{D}^{(m)}_U) \to D({}^*\mathcal{D}^{(m)}_{U_\bullet})$ which are adjoint:

$$\mathrm{Hom}_{D(\mathcal{D}^{(m)}_{U_\bullet})}(\mathbb{L}\underleftarrow{l}^*_U(\mathcal{E}), \mathcal{F}_\bullet) = \mathrm{Hom}_{D(\mathcal{D}^{(m)}_U)}(\mathcal{E}, \mathbb{R}\underleftarrow{l}_{U*}(\mathcal{F}_\bullet)) \tag{17.3.1.1.1}$$

for any $\mathcal{E} \in D({}^*\mathcal{D}^{(m)}_U)$ and any $\mathcal{F}_\bullet \in D({}^*\mathcal{D}^{(m)}_{U_\bullet})$.

We have also the morphism of ringed topoi $\underleftarrow{l}_U \colon (U_\bullet, \mathcal{O}_{U_\bullet}) \to (|U|, \mathcal{O}_U)$. The bijection 17.3.1.1.1 still holds. Both functors $\mathbb{L}\underleftarrow{l}^*_U$ (or $\mathbb{R}\underleftarrow{l}_{U*}$) are canonically isomorphic (modulo the forgetful functor $D({}^*\mathcal{D}^{(m)}_{U_\bullet}) \to D({}^*\mathcal{O}_{U_\bullet})$ and $D({}^*\mathcal{D}^{(m)}_U) \to D({}^*\mathcal{O}_U)$, so this is harmless to write them the same.

Notation 17.3.1.2. Let $\mathcal{E}$ be an object of $D^-({}^{\mathrm{l}}\mathcal{D}^{(m)}_U)$ and $\mathcal{F} \in D^-({}^{\mathrm{r}}\mathcal{D}^{(m)}_U)$. Put $\mathcal{E}_\bullet := \mathbb{L}\underleftarrow{l}^*_U(\mathcal{E}) := \mathcal{D}^{(m)}_{U_\bullet} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_U} \mathcal{E}$, $\mathcal{F}_\bullet := \mathbb{L}\underleftarrow{l}^*_U(\mathcal{F}) := \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_U} \mathcal{D}^{(m)}_{U_\bullet}$ and

$$\mathcal{F} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_U} \mathcal{E} := \mathbb{R}\underleftarrow{l}_{U*}(\mathcal{F}_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U_\bullet}} \mathcal{E}_\bullet) = \mathbb{R} \varprojlim_i \mathcal{F}_i \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U_i}} \mathcal{E}_i.$$

The same with $\mathcal{D}^{(m)}_U$ replaced by $\mathcal{O}_U$ or $\widehat{\mathcal{D}}^{(m)}_U$ or more generally a sheaf of rings on U. Choosing a flat resolution of $\mathcal{E}$ and $\mathcal{F}$, we construct a canonical morphism $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_U} \mathcal{E} \to \mathcal{F} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_U} \mathcal{E}$ which is bifunctorial in $\mathcal{E}$ and $\mathcal{F}$ (i.e., a cube is commutative).

Definition 17.3.1.3. We define $D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}^{(m)}_U)$, with $* = \mathrm{l}$ or $* = \mathrm{r}$, the full sub-category of $D^{\mathrm{b}}({}^*\mathcal{D}^{(m)}_U)$ consisting of complexes $\mathcal{E}$ such that, for all $i \in \mathbb{N}$, $\mathcal{E}_i \in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}^{(m)}_{U_i})$. Its objects will be called *quasi-coherent complexes.*

Example 17.3.1.4. When U is affine, a ind-coherent $\mathcal{D}_U^{(m)}$-module $\mathcal{E}$ (17.2.3.1) is a quasi-coherent complex. Indeed, this is a consequence of the equivalence of categories 17.2.3.6: taking a flat resolution $P^\bullet$ of $\Gamma(U,\mathcal{E})$ we get $\widetilde{P}^\bullet$ a flat resolution of $\mathcal{E}$ by ind-coherent $\mathcal{D}_U^{(m)}$-module and we are done.

More generally, $D^{\mathrm{b}}_{\mathrm{lic}}({}^*\mathcal{D}_U^{(m)})$ is a full subcategory of $D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}_U^{(m)})$ (see notation 17.2.4.4).

17.3.1.5. Let $\mathcal{E}\in D^{\mathrm{b}}({}^*\mathcal{D}_U^{(m)})$. The following properties are equivalent:

(a) $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}_U^{(m)})$

(b) $\mathcal{E}_\bullet:=\mathbb{L}\underleftarrow{l}_U^*\mathcal{E}:=\mathcal{O}_{U_\bullet}\otimes^{\mathbb{L}}_{\mathcal{O}_U}\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{U_\bullet})$ (see notation 7.3.1.10).

(c) $\mathcal{E}_\bullet:=\mathbb{L}\underleftarrow{l}_U^*\mathcal{E}:=\mathcal{D}_{U_\bullet}^{(m)}\otimes^{\mathbb{L}}_{\mathcal{D}_U^{(m)}}\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U_\bullet}^{(m)})$ (see notation 7.3.1.12).

Lemma 17.3.1.6. *The category $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_U^{(m)})$ is a triangulated subcategory of $D^{\mathrm{b}}(\mathcal{D}_U^{(m)})$. The category $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m)})$ is a triangulated subcategory of $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_U^{(m)})$.*

Proof. This follows from the fact that $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U_i}^{(m)})$ is a triangulated subcategory of $D^{\mathrm{b}}(\mathcal{D}_U^{(m)})$ (resp. $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{U_i}^{(m)})$ is a triangulated subcategory of $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U_i}^{(m)})$ and that $\mathbb{L}\underleftarrow{l}_U^*$ preserves the coherence). □

17.3.1.7. By adjunction (see 17.3.1.1), for any $\mathcal{E}\in D^{\mathrm{b}}({}^*\mathcal{D}_U^{(m)})$, we have the canonical morphism $c_{\mathcal{E}}\colon\mathcal{E}\to\widehat{\mathcal{E}}$ where

$$\widehat{\mathcal{E}}:=\mathbb{R}\underleftarrow{l}_{U*}\mathbb{L}\underleftarrow{l}_U^*(\mathcal{E}).$$

When $*=\mathrm{l}$, we remark that the canonical morphism $\mathcal{O}_U\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_U}\mathcal{E}\to\mathcal{D}_U^{(m)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}_U^{(m)}}\mathcal{E}$ is an isomorphism and they are isomorphic to $\widehat{\mathcal{E}}$; similarly when $*=\mathrm{r}$. We get the functor $D^{\mathrm{b}}({}^*\mathcal{D}_U^{(m)})\to D^{\mathrm{b}}({}^*\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$, given by $\mathcal{E}\mapsto\widehat{\mathcal{E}}$.

Following 7.3.2.10, the functor $\mathbb{R}\underleftarrow{l}_{U*}\colon D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U_\bullet}^{(m)})\to D^{\mathrm{b}}(\mathcal{D}_U^{(m)})$ factorises through the equivalence of categories $\mathbb{R}\underleftarrow{l}_{U*}\colon D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U_\bullet}^{(m)})\cong D^{\mathrm{b}}_{\mathrm{qc}}(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$. Hence, we get the functor $D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}_U^{(m)})\to D^{\mathrm{b}}_{\mathrm{qc}}({}^*\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$, given by $\mathcal{E}\mapsto\widehat{\mathcal{E}}$.

Lemma 17.3.1.8. *Let $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}_U^{(m)})$, $\mathcal{F}\in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$ any morphism $f\colon\mathcal{E}\to\mathcal{F}$ a morphism of $D^{\mathrm{b}}({}^*\mathcal{D}_U^{(m)})$. With notation 17.3.1.7, there exists a unique morphism $g\colon\widehat{\mathcal{E}}\to\mathcal{F}$ such that $g\circ c_{\mathcal{E}}=f$.*

Proof. Remark first that for any $\mathcal{G}\in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}_U^{(m)})$, we have $\mathcal{G}\in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$ if and only if $c_{\mathcal{G}}$ is an isomorphism. Hence, by functoriality of $\mathcal{E}\mapsto c_{\mathcal{E}}$ we can check that $g=\mathbb{R}\underleftarrow{l}_{U*}\mathbb{L}\underleftarrow{l}_U^*(f)$ is the unique factorisation. □

17.3.2 Extraordinary pullbacks

Let $m\in\mathbb{N}$.

Lemma 17.3.2.1. *Let U be a smooth $\mathfrak{S}$-weak formal scheme and $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m)})$. The canonical morphism: $\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)}\otimes_{\mathcal{D}_U^{(m)}}\mathcal{E}\to\widehat{\mathcal{E}}$ is an isomorphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$.*

Proof. With notation 17.3.1.7, since $\widehat{\mathcal{E}}\in D^{\mathrm{b}}_{\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$ then the morphism $c_{\mathcal{E}}\colon\mathcal{E}\to\widehat{\mathcal{E}}$ induces canonically via the flat extension $\mathcal{D}_U^{(m)}\to\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)}$ the morphism $\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)}\otimes_{\mathcal{D}_U^{(m)}}\mathcal{E}\to\widehat{\mathcal{E}}$. To check that this morphism is an isomorphism is local. Moreover, since the both side functors are wayout left, then we reduce to the case where $\mathcal{E}$ is a free $\mathcal{D}_U^{(m)}$-module of finite type, which is obvious. □

Lemma 17.3.2.2. *Let $A\to A'$ be a morphism of smooth w.c.f.g. $\mathcal{V}$-algebras. Let $g\colon U'\to U$ be the induced morphism of affine smooth $\mathfrak{S}$-weak formal schemes. For any* ind*-coherent left $\mathcal{D}_U^{(m)}$-module $\mathcal{E}$, the left $\mathcal{D}_{U'}^{(m)}$-module $\mathcal{D}_{U'\to U}^{(m)}\otimes_{g^{-1}\mathcal{D}_U^{(m)}}g^{-1}\mathcal{E}$ is* ind*-coherent. Moreover, we have the canonical morphisms:*

$$A'\otimes_A\Gamma(U,\mathcal{E})\to\Gamma(U',\mathcal{D}_{U'\to U}^{(m)})\otimes_{\Gamma(U,\mathcal{D}_U^{(m)})}\Gamma(U,\mathcal{E})\to\Gamma(U',\mathcal{D}_{U'\to U}^{(m)}\otimes_{g^{-1}\mathcal{D}_U^{(m)}}g^{-1}\mathcal{E})\qquad(17.3.2.2.1)$$

are isomorphisms.

Proof. Since $\mathcal{O}_{U'} \otimes_{g^{-1}\mathcal{O}_U} g^{-1}\mathcal{D}_U^{(m)} = \mathcal{D}_{U'\to U}^{(m)}$, then by associativity of the tensor product we get that the morphism $\mathcal{O}_{U'} \otimes_{g^{-1}\mathcal{O}_U} g^{-1}\mathcal{E} \to \mathcal{D}_{U'\to U}^{(m)} \otimes_{g^{-1}\mathcal{D}_U^{(m)}} g^{-1}\mathcal{E}$ is an isomorphism. Hence, these are ind-coherent. Set $E := \Gamma(U, \mathcal{E})$. Since $\mathcal{E}$ is ind-coherent as $\mathcal{O}_U$-module (see 17.2.3.2.(b)), then the canonical morphism $\mathcal{O}_U \otimes_A E \to \mathcal{E}$ is an isomorphism. This yields, the canonical morphism $\mathcal{O}_{U'} \otimes_A E \to \mathcal{O}_{U'} \otimes_{g^{-1}\mathcal{O}_U} g^{-1}\mathcal{E}$ is an isomorphism. Since $\mathcal{O}_{U'} \otimes_A E \xrightarrow{\sim} \mathcal{O}_{U'} \otimes_{A'} (A' \otimes_A E)$, then it follows from 17.2.3.6 that $\mathcal{E}' := \mathcal{D}_{U'\to U}^{(m)} \otimes_{g^{-1}\mathcal{D}_U^{(m)}} g^{-1}\mathcal{E}$ is ind-coherent as $\mathcal{O}_{U'}$-module (and therefore as $\mathcal{D}_{U'}^{(m)}$-module) and that the canonical morphism $A' \otimes_A \Gamma(U, \mathcal{E}) \to \Gamma(U', \mathcal{E}')$ is an isomorphism. Taking $\mathcal{E} = \mathcal{D}_U^{(m)}$, this implies that the canonical morphism $A' \otimes_A \Gamma(U, \mathcal{D}_U^{(m)}) \to \Gamma(U', \mathcal{D}_{U'\to U}^{(m)})$ is an isomorphism. Hence, the left morphism of 17.3.2.2.1 is an isomorphism and we are done. □

Lemma 17.3.2.3. *Let $g\colon U' \to U$ be a smooth morphism of affine smooth $\mathfrak{S}$-weak formal schemes. For all $\mathcal{D}_U^{(m)}$-module $\mathcal{E}$ globally of finite presentation, $\mathcal{D}_{U'\to U}^{(m)} \otimes_{g^{-1}\mathcal{D}_U^{(m)}} g^{-1}\mathcal{E}$ is a $\mathcal{D}_{U'}^{(m)}$-module globally of finite presentation.*

Proof. Via 17.2.2.10, it follows from Lemma 17.3.2.2 that it suffices to prove that $\Gamma(U', \mathcal{D}_{U'\to U}^{(m)}) \otimes_{\Gamma(U, \mathcal{D}_U^{(m)})} \Gamma(U, \mathcal{E})$ is of finite type on $\Gamma(U', \mathcal{D}_{U'}^{(m)})$. Similarly to 5.3.2.1.1, by calculating in local coordinates, we can check that the morphism $\mathcal{D}_{U'}^{(m)} \to \mathcal{D}_{U'\to U}^{(m)}$ is surjective. By 17.2.3.3.(a) and 17.2.3.6, this yields the surjective map $\Gamma(U', \mathcal{D}_{U'}^{(m)}) \twoheadrightarrow \Gamma(U', \mathcal{D}_{U'\to U}^{(m)})$. □

Proposition 17.3.2.4. *Let $g\colon U' \to U$ be a morphism of smooth $\mathfrak{S}$-weak formal schemes and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_U^{(m)})$ (see notation 17.3.1.3).*

(a) Then $g^!(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U'}^{(m)})$ (see notation 17.2.4.2.1) and the canonical morphism

$$\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}_{U'}^{(m)}} g^!(\mathcal{E}) \to \hat{g}^!(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}_U^{(m)}} \mathcal{E}), \tag{17.3.2.4.1}$$

where $\hat{g}^!$ is the extraordinary pullback by $\hat{g}\colon \mathfrak{U}' \to \mathfrak{U}$ of level m (see definition 7.5.5.6.1), is an isomorphism of $D^{\mathrm{b}}_{\mathrm{qc}}(\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m)})$. Moreover, these are transitive with respect to the composition of such morphism g.

(b) If $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m)})$ and $g^!(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{U'}^{(m)})$, then the canonical morphism $\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m)} \otimes_{\mathcal{D}_{U'}^{(m)}} g^!(\mathcal{E}) \to \hat{g}^!(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)} \otimes_{\mathcal{D}_U^{(m)}} \mathcal{E})$ is an isomorphism.

Proof. 1) According to notation 7.5.5.4, we write $\mathcal{D}_{U'_\bullet\to U_\bullet}^{(m)}$ the $(\mathcal{D}_{U'_\bullet}^{(m)}, g^{-1}\mathcal{D}_{U_\bullet}^{(m)})$-bimodule given by the canonical maps $\mathcal{D}_{U'_{i+1}\to U_{i+1}}^{(m)} \to \mathcal{D}_{U'_i\to U_i}^{(m)}$. Since the canonical morphism $\mathcal{O}_{U'_\bullet} \otimes_{\mathcal{O}_{U'}} \mathcal{D}_{U'}^{(m)} \to \mathcal{D}_{U'_\bullet}^{(m)}$ is an isomorphism, then so is the canonical map $\mathcal{D}_{U'_\bullet}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{D}_{U'}^{(m)}} \mathcal{D}_{U'\to U}^{(m)} \to \mathcal{D}_{U'_\bullet\to U_\bullet}^{(m)}$. Hence,

$$\mathcal{D}_{U'_\bullet}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{D}_{U'}^{(m)}} (\mathcal{D}_{U'\to U}^{(m)} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_U^{(m)}} g^{-1}\mathcal{E}) \xrightarrow{\sim} \mathcal{D}_{U'_\bullet\to U_\bullet}^{(m)} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_U^{(m)}} g^{-1}\mathcal{E} \xrightarrow{\sim} \mathcal{D}_{U'_\bullet\to U_\bullet}^{(m)} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_{U_\bullet}^{(m)}} g^{-1}(\mathcal{D}_{U_\bullet}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{D}_U^{(m)}} \mathcal{E}). \tag{17.3.2.4.2}$$

Since $\mathcal{D}_{U_\bullet}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{D}_U^{(m)}} \mathcal{E} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U_\bullet}^{(m)})$, then following 7.5.5.8, the left term of 17.3.2.4.2 belongs to $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U'_\bullet}^{(m)})$. Hence,we obtain from 17.3.2.4.2 that $\mathcal{D}_{U'\to U}^{(m)} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{D}_U^{(m)}} g^{-1}\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U'_\bullet}^{(m)})$ (see 17.3.1.5).

Since the canonical morphism $\widehat{\mathcal{E}} \to \widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}_U^{(m)}} \mathcal{E}$ is an isomorphism, then following 17.3.1.7, we have $\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}_U^{(m)}} \mathcal{E} \in D^{\mathrm{b}}_{\mathrm{qc}}(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)})$. We get the isomorphism of 17.3.2.4.1 by applying $\mathbb{R}\underleftarrow{l}_{U*}$ to 17.3.2.4.2. □

Corollary 17.3.2.5. *Let $g\colon U' \to U$ be a smooth morphism of smooth $\mathfrak{S}$-weak formal schemes. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m)})$.*

(a) $g^{(m)!}(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{U'}^{(m)})$.

(b) The canonical morphism $\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m)} \otimes_{\mathcal{D}_{U'}^{(m)}} g^{(m)!}(\mathcal{E}) \to \hat{g}^{(m)!}(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)} \otimes_{\mathcal{D}_U^{(m)}} \mathcal{E})$ is an isomorphism.

Proof. The first part is a consequence of 17.3.2.3. Via 17.3.2.4, this yields the second assertion. □

Proposition 17.3.2.6. Let m_0 be an integer, $g\colon U' \to U$ a morphism of smooth $\mathfrak{S}$-weak formal schemes. Let $\mathcal{D}_U^{(m_0+\bullet)}$ be the inductive system of rings $\mathcal{D}_U^{(m} \to \mathcal{D}_U^{(m')}$ for any $m' \geq m \geq 0$. Let $\mathcal{E}^{(m_0+\bullet)} \in D^{\mathrm{b}}(\mathcal{D}_U^{(m_0+\bullet)})$. For all integer $m \geq m_0$, put $\widehat{\mathcal{E}}^{(m)} = \widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)} \otimes_{\mathcal{D}_U^{(m)}} \mathcal{E}^{(m)}$ and $\widehat{\mathcal{E}}_{\mathbb{Q}}^{(m)} = \widehat{\mathcal{D}}_{\mathfrak{U},\mathbb{Q}}^{(m)} \otimes_{\mathcal{D}_U^{(m)}} \mathcal{E}^{(m)}$.

(a) Let $m \geq m_0$ such that $\mathcal{E}_{\mathbb{Q}}^{(m_0)} \to \mathcal{E}_{\mathbb{Q}}^{(m)}$ is an isomorphism. Suppose for $m' \in \{m_0, m\}$ we have $\mathcal{E}^{(m')} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m')})$ and $g^{(m')!}(\mathcal{E}^{(m')}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{U'}^{(m')})$. Then the canonical morphism

$$\widehat{\mathcal{D}}_{\mathfrak{U}',\mathbb{Q}}^{(m)} \otimes_{\widehat{\mathcal{D}}_{\mathfrak{U}',\mathbb{Q}}^{(m_0)}} \hat{g}^{(m_0)!}(\widehat{\mathcal{E}}_{\mathbb{Q}}^{(m_0)}) \to \hat{g}^{(m)!}(\widehat{\mathcal{E}}_{\mathbb{Q}}^{(m)}), \qquad (17.3.2.6.1)$$

where $\hat{g}^{(m')!}$ is defined at 7.5.5.14.1, is an isomorphism.

(b) Suppose for any $m \geq m_0$, the morphisms $\mathcal{E}_{\mathbb{Q}}^{(m_0)} \to \mathcal{E}_{\mathbb{Q}}^{(m)}$ are isomorphisms, $\mathcal{E}^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m)})$ and $g^{(m)!}(\mathcal{E}^{(m)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{U'}^{(m)})$. Then the morphism

$$\mathcal{D}^{\dagger}_{\mathfrak{U}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}_{\mathfrak{U}',\mathbb{Q}}^{(m_0)}} \hat{g}^{(m_0)!}(\widehat{\mathcal{E}}_{\mathbb{Q}}^{(m_0)}) \to \hat{g}^{!\dagger}(\mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}_{\mathfrak{U},\mathbb{Q}}^{(m_0)}} \widehat{\mathcal{E}}_{\mathbb{Q}}^{(m_0)}) \qquad (17.3.2.6.2)$$

is an isomorphism. Moreover, these are transitive with respect to the composition of such a morphism g.

Proof. a) If m is an integer such that $\mathcal{E}^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m)})$ and $g^{(m)!}(\mathcal{E}^{(m)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_{U'}^{(m)})$ then it follows from 17.3.2.4.(b) that the canonical morphism $\widehat{\mathcal{D}}_{\mathfrak{U}',\mathbb{Q}}^{(m)} \otimes_{\mathcal{D}_{\mathfrak{U}',\mathbb{Q}}} g^{!}(\widehat{\mathcal{E}}_{\mathbb{Q}}^{(m)}) \to \hat{g}^{(m)!}(\widehat{\mathcal{E}}_{\mathbb{Q}}^{(m)})$ (see notation 17.2.4.3.1 concerning the functor $g^{!}$) is an isomorphism. This implies that 17.3.2.6.1 is an isomorphism.

b) Using the part a), by tensoring with $\mathbb{Q}$ the following morphism

$$f\colon \widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m_0+\bullet)} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m_0)}} \hat{g}^{(m_0)!}(\widehat{\mathcal{E}}^{(m_0)}) \to \hat{g}^{(m_0+\bullet)!}(\widehat{\mathcal{E}}^{(m_0+\bullet)}), \qquad (17.3.2.6.3)$$

we get an isomorphism. Hence, it follows from 8.4.2.9 that that f is an isomorphism of $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m_0+\bullet)})$.

i) On one hand, we have $\underrightarrow{l}^{*}_{\mathbb{Q}}(\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m_0+\bullet)} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_{\mathfrak{U}'}^{(m_0)}} \hat{g}^{(m_0)!}(\widehat{\mathcal{E}}^{(m_0)})) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{U}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}_{\mathfrak{U}',\mathbb{Q}}^{(m_0)}} \hat{g}^{(m_0)!}(\widehat{\mathcal{E}}_{\mathbb{Q}}^{(m_0)})$.

ii) Since the morphism $\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m_0+\bullet)} \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m_0)}} \widehat{\mathcal{E}}^{(m_0)} \to \widehat{\mathcal{E}}^{(m_0+\bullet)}$ is an isomorphism after tensoring with $\mathbb{Q}$, then this is an isomorphism of $\underrightarrow{D}^{\mathrm{b}}_{\mathbb{Q}}(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m_0+\bullet)})$ (use 8.4.2.9). Hence, $\widehat{\mathcal{E}}^{(m_0+\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m_0+\bullet)})$. Since $\underrightarrow{l}^{*}_{\mathbb{Q}}(\widehat{\mathcal{E}}^{(m_0+\bullet)}) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}_{\mathfrak{U},\mathbb{Q}}^{(m_0)}} \widehat{\mathcal{E}}_{\mathbb{Q}}^{(m_0)}$, then then it follows from 9.2.1.24 that by applying the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ to right term of 17.3.2.6.3, we get the right term of 17.3.2.6.2 up to canonical isomorphism.

iii) Hence, by applying the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ to 17.3.2.6.3, it follows from i) and ii) that we get the isomorphism 17.3.2.6.2. □

Corollary 17.3.2.7. *Let $g\colon U' \to U$ be a smooth morphism of smooth $\mathfrak{S}$-weak formal schemes and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}_U^{(m)})$. The canonical morphism*

$$\mathcal{D}^{\dagger}_{\mathfrak{U}',\mathbb{Q}} \otimes_{\mathcal{D}_{U'}^{(m)}} g^{!^{(m)}}(\mathcal{E}) \to g^{!\dagger}(\mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}_U^{(m)}} \mathcal{E}) \qquad (17.3.2.7.1)$$

is an isomorphism. Moreover, these are transitive with respect to the composition of such morphism g.

Proof. This follows from17.3.2.5 and 17.3.2.6 (or 9.4.1.7.1 since g is smooth). □

17.3.3 Pushforwards

Let $m \in \mathbb{N}$.

Lemma 17.3.3.1. *Let $g\colon U' \to U$ be a morphism of separated smooth $\mathfrak{S}$-weak formal schemes and $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}_{U'}^{(m)})$ (see definition 17.3.1.3).*

(a) We have $g_+^{(m)}(\mathcal{E}') \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_U)$*.*

(b) The canonical morphism

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_U} g_+^{(m)}(\mathcal{E}') \to \hat{g}_+^{(m)}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') \tag{17.3.3.1.1}$$

is an isomorphism. Moreover, these are transitive with respect to the composition of such morphism g*. In particular, if* $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{U'})$ *and* $g_+^{(m)}(\mathcal{E}') \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_U)$ *the canonical morphism* $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}} \otimes_{\mathcal{D}^{(m)}_U} g_+^{(m)}(\mathcal{E}') \to \hat{g}_+^{(m)}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'} \otimes_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}')$ *is an isomorphism.*

Proof. a) Via the exact sequence $0 \to \mathcal{O}_U \xrightarrow{\pi^{i+1}} \mathcal{O}_U \to \mathcal{O}_{U_i} \to 0$, we see that the projection map $\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{R}g_*(\mathcal{F}') \to \mathbb{R}g_*(g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} \mathcal{F}')$ is a functorial in $\mathcal{F}' \in D(g^{-1}\mathcal{D}^{(m)}_U)$ isomorphism. This yields the commutative diagram:

$$\begin{array}{ccc}
\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{R}g_*(\mathcal{D}^{(m)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') & \xrightarrow{\sim} & \mathbb{R}g_*(g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} (\mathcal{D}^{(m)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}')) \\
\downarrow & & \downarrow \\
\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{R}g_*(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') & \xrightarrow{\sim} & \mathbb{R}g_*(g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}')) \\
\downarrow & & \downarrow \\
\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{R}g_*(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') & \xrightarrow{\sim} & \mathbb{R}g_*(g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}'))
\end{array} \tag{17.3.3.1.2}$$

Moreover, the canonical morphisms $\mathcal{D}^{(m)}_{U\leftarrow U'} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \to \mathcal{D}^{(m)}_{U_i\leftarrow U'_i}$ induce the isomorphisms: $g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} \mathcal{D}^{(m)}_{U\leftarrow U'} \xrightarrow{\sim} g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \xrightarrow{\sim} \mathcal{D}^{(m)}_{U_i\leftarrow U'_i}$. From this we have a commutative diagram:

$$\begin{array}{ccc}
\mathbb{R}g_*(g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} (\mathcal{D}^{(m)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}')) & \xrightarrow{\sim} & \mathbb{R}g_*(\mathcal{D}^{(m)}_{U_i\leftarrow U'_i} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'_i}} \mathcal{E}'_i) \\
\downarrow & & \| \\
\mathbb{R}g_*(g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}')) & \xrightarrow{\sim} & \mathbb{R}g_*(\mathcal{D}^{(m)}_{U_i\leftarrow U'_i} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'_i}} \mathcal{E}'_i) \\
\downarrow & & \| \\
\mathbb{R}g_*(g^{-1}\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{g^{-1}\mathcal{O}_U} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}')) & \xrightarrow{\sim} & \mathbb{R}g_*(\mathcal{D}^{(m)}_{U_i\leftarrow U'_i} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'_i}} \mathcal{E}'_i).
\end{array} \tag{17.3.3.1.3}$$

Hence, by composing the top isomorphisms of 17.3.3.1.2 and 17.3.3.1.3, using 5.1.3.5 we get $g_+^{(m)}(\mathcal{E}') \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_U)$.

b) By using 17.3.1.8, it follows from the part a) that the arrow 17.3.3.1.1 is therefore the unique morphism of $D^{\mathrm{b}}_{\mathrm{qc}}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}})$ making commutative the diagram below

$$\begin{array}{ccc}
g_+(\mathcal{E}') = \mathbb{R}g_*(\mathcal{D}^{(m)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') & \longrightarrow & \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_U} g_+(\mathcal{E}') \\
\downarrow & & \vdots \\
\mathbb{R}g_*(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') & & \vdots \\
\downarrow & & \downarrow \\
\mathbb{R}g_*(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}\leftarrow \mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') & = & \hat{g}_+(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}')
\end{array} \tag{17.3.3.1.4}$$

Applying $\mathcal{O}_{U_i} \otimes^{\mathbb{L}}_{\mathcal{O}_U} -$ to 17.3.3.1.4, because of 17.3.3.1.2 and 17.3.3.1.3, the composition on the left becomes an isomorphism. It follows by construction that 17.3.3.1.1 is an isomorphism. Finally, the transitivity in g of the construction of 17.3.3.1.4 is easy and is left as an exercice. □

Proposition 17.3.3.2. Let $g\colon U' \to U$ be a morphism of smooth $\mathfrak{S}$-weak formal schemes. For any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{U'})$ such that $g_+^{(m)}(\mathcal{E}') \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_U)$, the canonical morphism

$$\mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_U} g_+^{(m)}(\mathcal{E}') \to g_+^{\dagger}(\mathcal{D}^{\dagger}_{\mathfrak{U}',\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') \tag{17.3.3.2.1}$$

is an isomorphism. Moreover, these are transitive with respect to the composition of such morphism g.

Proof. Let $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_{U'})$. It follows from 17.3.3.1,7.5.8.14.1 that the canonical morphism

$$\widehat{\mathcal{D}}^{(m+\bullet)}_{\mathfrak{U}} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U}} g^{(m)}_{+}(\mathcal{E}') \to \hat{g}^{(m+\bullet)}_{+}(\widehat{\mathcal{D}}^{(m+\bullet)}_{\mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') \tag{17.3.3.2.2}$$

is an isomorphism. Suppose $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{U'})$ and $g^{(m)}_{+}(\mathcal{E}') \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{U})$. Therefore, since $\underrightarrow{l}^{*}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(m+\bullet)}_{\mathfrak{U}'} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}') \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{U}',\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{U'}} \mathcal{E}'$ and $\underrightarrow{l}^{*}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(m+\bullet)}_{\mathfrak{U}} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{D}^{(m)}_{U}} g^{(m)}_{+}(\mathcal{E}')) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{U}} g^{(m)}_{+}(\mathcal{E}')$, then by applying the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ to 17.3.3.2.2 we get 17.3.3.2.1. □

17.3.4 Closed immersion: adjunction

Let $m \in \mathbb{N}$. Let $v \colon Y \hookrightarrow U$ be a closed immersion of smooth $\mathfrak{S}$-weak formal schemes.

17.3.4.1. Let $\mathcal{E}^{(m_0+\bullet)} \in D^{\mathrm{b}}(\mathcal{D}^{(m_0+\bullet)}_{U})$ such that for any $m \geq m_0$, the morphisms $\mathcal{E}^{(m_0)}_{\mathbb{Q}} \to \mathcal{E}^{(m)}_{\mathbb{Q}}$ are isomorphisms, $\mathcal{E}^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{U})$ and $v^{(m)!}(\mathcal{E}^{(m)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{Y})$. We have a commutative diagram

$$\begin{array}{ccc}
\mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{U}} v^{(m)}_{+} v^{!(m_0)}(\mathcal{E}^{(m_0)}) & \xrightarrow[\text{adj}]{17.2.5.3.3} & \mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m_0)}_{U}} \mathcal{E}^{(m_0)} \\
\downarrow \wr & & \| \\
\widehat{v}_{+^{\dagger}} \widehat{v}^{!^{\dagger}}(\mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m_0)}_{U}} \mathcal{E}^{(m_0)}) & \xrightarrow[\text{adj}]{9.3.2.5.1} & \mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(m_0)}_{U}} \mathcal{E}^{(m_0)},
\end{array}$$

where the isomorphism on the right follows from 17.2.5.5, 17.3.2.6 and 17.3.3.2.

17.3.4.2. Let $\mathcal{F}^{(m_0+\bullet)} \in D^{\mathrm{b}}(\mathcal{D}^{(m_0+\bullet)}_{Y})$ such that for any $m \geq m_0$, the morphisms $\mathcal{F}^{(m_0)}_{\mathbb{Q}} \to \mathcal{F}^{(m)}_{\mathbb{Q}}$ are isomorphisms, $\mathcal{F}^{(m)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{Y})$ and $v^{!(m)} v^{(m)}_{+}(\mathcal{F}^{(m)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{Y})$. We have the commutative diagram

$$\begin{array}{ccc}
\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{Y}} \mathcal{F}^{(m)} & \xrightarrow{17.2.5.3.1} & \mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{Y}} v^{!(m)} v^{(m)}_{+}(\mathcal{F}^{(m)}) \\
\| & & \downarrow \wr \\
\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{Y}} \mathcal{F}^{(m)} & \xrightarrow[9.3.5.9]{\sim} & v^{!^{\dagger}} v_{+^{\dagger}}(\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{Y}} \mathcal{F}^{(m)}),
\end{array}$$

where the isomorphism on the right follows from 17.3.2.6 and 17.3.3.2. Hence, the top morphism is an isomorphism.

17.4 Comparaison between weak formal and formal cohomological operations with overconvergent singularities

Let $f \colon P' \to P$ be a morphism of separated smooth $\mathfrak{S}$-weak formal schemes, T_0 (resp. T'_0) a divisor of P_0 (resp. P'_0), U (resp. U') the open complement of T_0 (resp. T'_0) in P (resp. P'), $j \colon U \hookrightarrow P$ and $j' \colon U' \hookrightarrow P'$ be the open immersions. Suppose that f factors through $g \colon U' \to U$. Let m be an integer. We have defined the sheaves $\mathcal{O}_{\mathfrak{P}}({}^{\dagger} * T_0)$, $\mathcal{D}^{(m)}_{\mathfrak{P}}({}^{\dagger} * T_0)$ and $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger} * T_0)$ (see 8.7.3.25). Similarly, we set $\mathcal{D}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}} := \mathcal{O}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{P}}} \mathcal{D}^{(m)}_{\mathfrak{P}}$, which does not depend on m up to canonical isomorphism. Finally, we write

$$\begin{aligned}
\mathcal{D}^{(m)}_{\mathfrak{P}' \to \mathfrak{P}}({}^{\dagger} * T'_0) &:= \mathcal{O}_{\mathfrak{P}'}({}^{\dagger} * T'_0) \otimes_{f^{-1}\mathcal{O}_{\mathfrak{P}}({}^{\dagger} * T_0)} f^{-1}\mathcal{D}^{(m)}_{\mathfrak{P}}({}^{\dagger} * T_0) \\
&\xleftarrow{\sim} \mathcal{O}_{\mathfrak{P}'}({}^{\dagger} * T'_0) \otimes_{\mathcal{O}_{\mathfrak{P}'}} (\mathcal{O}_{\mathfrak{P}'} \otimes_{f^{-1}\mathcal{O}_{\mathfrak{P}}} f^{-1}\mathcal{D}^{(m)}_{\mathfrak{P}}) = \mathcal{O}_{\mathfrak{P}'}({}^{\dagger} * T'_0) \otimes_{\mathcal{O}_{\mathfrak{P}'}} \mathcal{D}^{(m)}_{\mathfrak{P}' \to \mathfrak{P}}.
\end{aligned}$$

Similarly we put $\mathcal{D}^{(m)}_{\mathfrak{P} \leftarrow \mathfrak{P}'}({}^{\dagger} * T'_0) := \mathcal{O}_{\mathfrak{P}'}({}^{\dagger} * T'_0) \otimes_{\mathcal{O}_{\mathfrak{P}}} \mathcal{D}^{(m)}_{\mathfrak{P} \leftarrow \mathfrak{P}'}$.

17.4.1 Faithful flatness theorem

17.4.1.1. There exists a canonical homomorphism $j_*\mathcal{O}_U \to \mathcal{O}_{\mathfrak{P}}(^\dagger * T_0)$ making commutative the diagram

$$\begin{array}{ccc} j_*\mathcal{O}_U & \longrightarrow & j_*\mathcal{O}_{\mathfrak{U}} \\ & \searrow & \uparrow \\ & & \mathcal{O}_{\mathfrak{P}}(^\dagger * T_0). \end{array} \tag{17.4.1.1.1}$$

Indeed, following 8.7.6.12, the right arrow is faithfully flat and in particular injective. Hence, to check the factorisation we can suppose $P = \operatorname{Spff} A$ affine and there exists $f \in A$ such that $Z := V(\overline{f})$ where $\overline{f}$ is the image of f in $A/\pi A$. We have $\Gamma(P, j_*\mathcal{O}_U) = A[1/f]^{\dagger/V}$, $\Gamma(P, \mathcal{O}_{\mathfrak{P}}(^\dagger * T_0)) = \widehat{A}[1/f]^{\dagger/\widehat{A}}$ (see 8.7.3.26) and $\Gamma(P, j_*\mathcal{O}_{\mathfrak{U}}) = \widehat{A}\{1/f\}$. The inclusion $A[1/f]^{\dagger/V} \subset \widehat{A}\{1/f\}$ factors through $A[1/f]^{\dagger/V} \subset \widehat{A}[1/f]^{\dagger/\widehat{A}}$ and we are done.

Similarly, we computation in local coordinates, there exists a canonical homomorphism $j_*\mathcal{D}_U^{(m)} \to \mathcal{D}_{\mathfrak{P}}^{(m)}(^\dagger * T_0)$ whose composition with $\mathcal{D}_{\mathfrak{P}}^{(m)}(^\dagger * T_0) \to j_*\mathcal{D}_{\mathfrak{U}}^{(m)}$ gives the canonical morphism $j_*\mathcal{D}_U^{(m)} \to j_*\mathcal{D}_{\mathfrak{U}}^{(m)}$.

Proposition 17.4.1.2. *For all integers m, there exists canonical homomorphisms $j_*\mathcal{O}_U \to \mathcal{O}_{\mathfrak{P}}(^\dagger * T_0)$, $j_*\mathcal{D}_U^{(m)} \to \mathcal{D}_{\mathfrak{P}}^{(m)}(^\dagger * T_0)$ and $j_*\mathcal{D}_{U,\mathbb{Q}} \to \mathcal{D}_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}}$ which are left and right faithfully flat. Moreover, we have the canonical left and right flat homomorphisms $j_*\mathcal{D}_U \to \mathcal{D}_{\mathfrak{P}}^\dagger(^\dagger * T_0)$ and $j_*\mathcal{D}_U^{(m)} \to \mathcal{D}_{\mathfrak{P}}^\dagger(^\dagger T_0)_{\mathbb{Q}}$.*

Proof. Consider first the faithfully flatness. As T_0 is a divisor, then there exists a neighborhood basis of P consisting of affine opens of P whose intersection with U are affine. Now, for any affine opens V of U, the extension $\Gamma(V, \mathcal{O}_U) \to \Gamma(V, \mathcal{O}_{\mathfrak{U}})$ is left and right faithfully flat. The extension $j_*\mathcal{O}_U \to j_*\mathcal{O}_{\mathfrak{U}}$ is therefore left and right faithfully flat. Using 8.7.6.12, this yields so is the morphism $j_*\mathcal{O}_U \to \mathcal{O}_{\mathfrak{P}}(^\dagger * T_0)$ making commutative the diagram 17.4.1.1.1.

For any open P' of P, if $P'/\mathfrak{S}$ has coordinates then so is $P' \cap U/\mathfrak{S}$. Hence, we easily compute that the morphism

$$\mathcal{O}_{\mathfrak{P}}(^\dagger * T_0) \otimes_{j_*\mathcal{O}_U} j_*\mathcal{D}_U^{(m)} \to \mathcal{D}_{\mathfrak{P}}^{(m)}(^\dagger * T_0), \tag{17.4.1.2.1}$$

constructed by extension from the map $j_*\mathcal{D}_U^{(m)} \to \mathcal{D}_{\mathfrak{P}}^{(m)}(^\dagger * T_0)$ of 17.4.1.1, is an isomorphism. Hence, the result for the second morphism is a consequence of the first one. We get the third morphism from the second one by applying the functor $\otimes\mathbb{Q}$, which yields the faithfulness.

Next consider the question of flatness. For all m, the extensions $j_*\mathcal{D}_U^{(m)} \to j_*\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)}$ are flat. Passing the limit on the level, this yields that $j_*\mathcal{D}_U \to j_*\mathcal{D}_{\mathfrak{U}}^\dagger$ is flat. Using Proposition 8.7.6.12, this implies the first case. In addition to the previous arguments the flatness of the second morphism results from the flatness of $j_*\widehat{\mathcal{D}}_{\mathfrak{U}}^{(m)} \to j_*\widehat{\mathcal{D}}_{\mathfrak{U},\mathbb{Q}}^{(m)} \to j_*\mathcal{D}_{\mathfrak{U},\mathbb{Q}}^\dagger$ (for the later, following the proof of 8.7.5.3 we have such flatness for global sections on affine formal schemes, then use the fact that T_0 is a divisor as explained above). □

17.4.2 Extraordinary inverse images

Lemma 17.4.2.1. *There exists a canonical morphism $j'_*\mathcal{D}_{U'\to U}^{(m)} \to \mathcal{D}_{\mathfrak{P}'\to\mathfrak{P}}^{(m)}(^\dagger * T'_0)$ of $(j'_*\mathcal{D}_{U'}^{(m)}, j'_*g^{-1}\mathcal{D}_U^{(m)})$-bimodules. Moreover, the induced by extension morphism, $\mathcal{D}_{\mathfrak{P}'}^{(m)}(^\dagger * T'_0) \otimes_{j'_*\mathcal{D}_{U'}^{(m)}} j'_*\mathcal{D}_{U'\to U}^{(m)} \to \mathcal{D}_{\mathfrak{P}'\to\mathfrak{P}}^{(m)}(^\dagger * T'_0)$, is an isomorphism.*

Proof. The canonical injection $\mathcal{D}_{U'\to U}^{(m)} \hookrightarrow \mathcal{D}_{\mathfrak{U}'\to\mathfrak{U}}^{(m)}$ induces the following one $j'_*\mathcal{D}_{U'\to U}^{(m)} \hookrightarrow j'_*\mathcal{D}_{\mathfrak{U}'\to\mathfrak{U}}^{(m)}$. Since the morphism $\mathcal{O}_{\mathfrak{P}'}(^\dagger * T'_0) \to j'_*\mathcal{O}_{\mathfrak{U}'}$ is injective, by a computation in local coordinates, we get the injections (adjunction of j'_* then completion)

$$\mathcal{D}_{\mathfrak{P}'\to\mathfrak{P}}^{(m)}(^\dagger * T_0) \hookrightarrow j'_*\mathcal{D}_{\mathfrak{U}'\to\mathfrak{U}}^{(m)} \hookrightarrow j'_*\widehat{\mathcal{D}}_{\mathfrak{U}'\to\mathfrak{U}}^{(m)}.$$

Since we have the canonical injection $j'_*\mathcal{O}_{U'} \hookrightarrow \mathcal{O}_{\mathfrak{P}'}(^\dagger * T'_0)$, then via a computation in local coordinates we get the factorisation:

$$\begin{array}{ccc} j'_*\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'\to\mathfrak{U}} & \nwarrow & \\ \uparrow & & \\ j'_*\mathcal{D}^{(m)}_{U'\to U} & \dashrightarrow & \mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger * T'_0). \end{array}$$

where the two other maps has been defined above. By extension, we obtain $\mathcal{O}_{\mathfrak{P}'}(^\dagger * T'_0) \otimes_{j'_*\mathcal{O}_{U'}} j'_*\mathcal{D}^{(m)}_{U'\to U} \to \mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger * T'_0)$. By a computation in local coordinates, we check that this is an isomorphism. We finish using the canonical isomorphism $\mathcal{O}_{\mathfrak{P}'}(^\dagger * T'_0) \otimes_{j'_*\mathcal{O}_{U'}} j'_*\mathcal{D}^{(m)}_{U'\to U} \xrightarrow{\sim} \mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0) \otimes_{j'_*\mathcal{D}^{(m)}_{U'}} j'_*\mathcal{D}^{(m)}_{U'\to U}$ which follows from 17.4.1.2.1. □

Proposition 17.4.2.2. Suppose f is smooth. For any $\mathcal{D}^{(m)}_U$-module $\mathcal{F}$ locally in P of finite presentation, we have a canonical isomorphism of coherent $\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger T'_0)_{\mathbb{Q}}$-modules:

$$\begin{aligned} &\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger T'_0)_{\mathbb{Q}} \otimes_{j'_*\mathcal{D}^{(m)}_{U'}} j'_*(\mathcal{D}^{(m)}_{U'\to U} \otimes_{g^{-1}\mathcal{D}^{(m)}_U} g^{-1}\mathcal{F}) \\ &\xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger T'_0)_{\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}}} f^{-1}(\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{j_*\mathcal{D}^{(m)}_U} j_*\mathcal{F}). \end{aligned} \tag{17.4.2.2.1}$$

In addition, these are transitive with respect to the composition of such morphism f.

Proof. We have the canonical morphisms:

$$\begin{aligned} &\mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger * T'_0) \otimes_{f^{-1}\mathcal{D}^{(m)}_{\mathfrak{P}}(^\dagger * T_0)} f^{-1}(\mathcal{D}^{(m)}_{\mathfrak{P}}(^\dagger * T_0) \otimes_{j_*\mathcal{D}^{(m)}_U} j_*\mathcal{F}) \\ &\xrightarrow{\sim} \mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger * T'_0) \otimes_{f^{-1}j_*\mathcal{D}^{(m)}_U} f^{-1}j_*\mathcal{F} \xrightarrow{\text{adj}} \mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger * T'_0) \otimes_{j'_*g^{-1}\mathcal{D}^{(m)}_U} j'_*g^{-1}\mathcal{F} \\ &\xrightarrow{\sim} \mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0) \otimes_{j'_*\mathcal{D}^{(m)}_{U'}} j'_*\mathcal{D}^{(m)}_{U'\to U} \otimes_{j'_*g^{-1}\mathcal{D}^{(m)}_U} j'_*g^{-1}\mathcal{F} \\ &\xrightarrow{\text{adj}} \mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0) \otimes_{j'_*\mathcal{D}^{(m)}_{U'}} j'_*(\mathcal{D}^{(m)}_{U'\to U} \otimes_{g^{-1}\mathcal{D}^{(m)}_U} g^{-1}\mathcal{F}). \end{aligned} \tag{17.4.2.2.2}$$

where the first adj is induced by canonical morphism $f^{-1}j_* \to j'_*g^{-1}$ (which is constructed by adjunction) and the second adjunction map comes from the adjoint pair (j'^{-1}, j'_*). As $\mathcal{F}$ is locally in P of finite presentation, it follows from 17.3.2.3 that $\mathcal{D}^{(m)}_{U'\to U} \otimes_{g^{-1}\mathcal{D}^{(m)}_U} g^{-1}\mathcal{F}$ is locally in P' of finite presentation. Hence, using 17.2.2.13, the bottom term of 17.4.2.2.2 is locally of finite presentation as $\mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0)$-module, i.e. is a coherent $\mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0)$-module (recall the ring $\mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0)$ is coherent following 8.7.3.27).

It follows from 17.2.2.13 that $\mathcal{D}^{(m)}_{\mathfrak{P}}(^\dagger * T_0) \otimes_{j_*\mathcal{D}^{(m)}_U} j_*\mathcal{F}$ is a coherent $\mathcal{D}^{(m)}_{\mathfrak{P}}(^\dagger * T_0)$-module. Hence, since f is smooth, then similarly to 5.3.2.7 this yields the top term of 17.4.2.2.2 is a coherent $\mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0)$-module. Hence, we get the morphism of coherent.

$$\begin{aligned} &\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger T'_0)_{\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0)} (\mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger * T'_0) \otimes_{f^{-1}\mathcal{D}^{(m)}_{\mathfrak{P}}(^\dagger * T_0)} f^{-1}(\mathcal{D}^{(m)}_{\mathfrak{P}}(^\dagger * T_0) \otimes_{j_*\mathcal{D}^{(m)}_U} j_*\mathcal{F})) \\ &\to \mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger T'_0)_{\mathbb{Q}} \otimes_{j'_*\mathcal{D}^{(m)}_{U'}} j'_*(\mathcal{D}^{(m)}_{U'\to U} \otimes_{g^{-1}\mathcal{D}^{(m)}_U} g^{-1}\mathcal{F}). \end{aligned} \tag{17.4.2.2.3}$$

As 17.4.2.2.2 is an isomorphism above $\mathfrak{U}'$, then it follows from 8.7.6.14 that 17.4.2.2.3 is an isomorphism.

To conclude the construction of the isomorphism of 17.4.2.2, it suffices therefore to check that the canonical homomorphism $\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger T'_0)_{\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{P}'}(^\dagger * T'_0)} \mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger * T'_0) \to \mathcal{D}^\dagger_{\mathfrak{P}'\to\mathfrak{P}}(^\dagger T'_0)_{\mathbb{Q}}$, induced by extension is an isomorphism. As f is smooth, then this is a morphism of coherent $\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger T'_0)_{\mathbb{Q}}$-modules. By 8.7.6.11, il suffices to establish that its restriction to $\mathfrak{U}'$ is an isomorphism. Now, as g is smooth, $\mathcal{D}^{(m)}_{\mathfrak{U}'\to\mathfrak{U}}$ is $\mathcal{D}^{(m)}_{\mathfrak{U}'}$-coherent. The morphism $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{U}'}} \mathcal{D}^{(m)}_{\mathfrak{U}'\to\mathfrak{U}} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'\to\mathfrak{U}}$ is therefore an isomorphism. We get the isomorphism: $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}',\mathbb{Q}} \otimes_{\mathcal{D}^{(m)}_{\mathfrak{U}'}} \mathcal{D}^{(m)}_{\mathfrak{U}'\to\mathfrak{U}} \xrightarrow{\sim} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'\to\mathfrak{U},\mathbb{Q}}$. It follows from 9.4.1.7.1, that we get the canonical isomorphism $\mathcal{D}^\dagger_{\mathfrak{U}',\mathbb{Q}} \otimes_{\widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}',\mathbb{Q}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{U}'\to\mathfrak{U},\mathbb{Q}} \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{U}'\to\mathfrak{U},\mathbb{Q}}$. Hence, we are done. □

Remark 17.4.2.3. We can check that the restriction on $\mathfrak{U}'$ of the morphism 17.4.2.2.1 is canonically isomorphic to 17.3.2.7.1.

17.4.3 Pushforwards

Lemma 17.4.3.1. *For all integer m, there exists a canonical homomorphism $j'_*\mathcal{D}^{(m)}_{U\leftarrow U'} \to \mathcal{D}^{(m)}_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0)$ of $(j'_* g^{-1}\mathcal{D}^{(m)}_U, j'_*\mathcal{D}^{(m)}_{U'})$-bimodules.*

Proof. By adding the sheaf of differential forms of maximum degree, this is verified in a analogous manner as 17.4.2.1. □

Proposition 17.4.3.2. Suppose $T'_0 = f^{-1}(T_0)$. Let $\mathcal{E}'$ be a $\mathcal{D}^{(0)}_{U'}$-module locally in P' of finite presentation such that $g_+(\mathcal{E}')$ is a $\mathcal{D}^{(0)}_U$-module locally in P of finite presentation. We have the canonical morphism:

$$\begin{aligned} &\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger * T_0) \otimes_{j_*\mathcal{D}^{(0)}_U} j_* g_+(\mathcal{E}') \\ &\to \mathbb{R}f_*(\mathcal{D}^\dagger_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger * T'_0)} (\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger * T'_0) \otimes^{\mathbb{L}}_{j'_*\mathcal{D}^{(0)}_{U'}} j'_*\mathcal{E}')). \end{aligned} \quad (17.4.3.2.1)$$

This is an isomorphism on $\mathfrak{U}$. Moreover, these are transitive with respect to the composition of such morphism f.

Proof. I) Let us construct 17.4.3.2.1. 0) The morphism f is the composition of its graph $\gamma\colon P' \hookrightarrow P' \times P$ followed by the projection $\varpi\colon P' \times_{\mathfrak{S}} P \to P$. Set $P'' := P' \times_{\mathfrak{S}} P$, $U'' := U' \times_{\mathfrak{S}} U$. By 17.2.5.4, since γ is a closed immersion (see 17.1.4.5), then $\gamma_+(\mathcal{E}')$ is a $\mathcal{D}^{(0)}_{U''}$-module locally in P'' of finite presentation. Hence, we reduce to the case where f is either smooth or a closed immersion.

1) Since $g_+(\mathcal{E}') = g_*(\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(0)}_{U'}} \mathcal{E}')$ is a $\mathcal{D}^{(0)}_U$-module locally in P of finite presentation, then we get the isomorphism:

$$j_*\mathbb{R}g_*(\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(0)}_{U'}} \mathcal{E}') \overset{17.2.2.13}{\xrightarrow{\sim}} \mathbb{R}j_*\mathbb{R}g_*(\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(0)}_{U'}} \mathcal{E}') \xrightarrow{\sim} \mathbb{R}f_*\mathbb{R}j'_*(\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(0)}_{U'}} \mathcal{E}').$$

2) The morphism $j'_*\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{j'_*\mathcal{D}^{(0)}_{U'}} j'_*\mathcal{E}' \to \mathbb{R}j'_*(\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(0)}_{U'}} \mathcal{E}')$ is an isomorphism.

i) Suppose f is smooth. Similarly to 7.5.10.3.1, we have a canonical quasi-isomorphism $\Omega^\bullet_{U'/U} \otimes_{\mathcal{O}_{U'}} \mathcal{D}^{(0)}_{U'}[d_{U'/U}] \to \mathcal{D}^{(0)}_{U\leftarrow U'}$. In particular, $\mathcal{D}^{(0)}_{U\leftarrow U'}$ admits a bounded resolution by free $\mathcal{D}^{(0)}_{U'}$-modules of finite type and we are done.

ii) If f is a closed immersion, then $\mathcal{D}^{(0)}_{U\leftarrow U'}$ is a free $\mathcal{D}^{(0)}_{U'}$-module and we are done.

3) By composition, we get from 1) and 2) the morphism $j_*g_+(\mathcal{E}') \xrightarrow{\sim} \mathbb{R}f_*(j'_*\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{j'_*\mathcal{D}^{(0)}_{U'}} j'_*\mathcal{E}')$. We have a canonical morphism $\mathcal{D}^{(m)}_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0) \to \mathcal{D}^\dagger_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0)$. By composing with 17.4.3.1, we get $j'_*\mathcal{D}^{(m)}_{U\leftarrow U'} \to \mathcal{D}^\dagger_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0)$. This yields the first morphism:

$$\begin{aligned} \mathbb{R}f_*(j'_*\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{j'_*\mathcal{D}^{(0)}_{U'}} j'_*\mathcal{E}') &\to \mathbb{R}f_*(\mathcal{D}^\dagger_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0) \otimes^{\mathbb{L}}_{j'_*\mathcal{D}^{(0)}_{U'}} j'_*\mathcal{E}') \\ &\xrightarrow{\sim} \mathbb{R}f_*(\mathcal{D}^\dagger_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger * T'_0)} \mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger * T'_0) \otimes^{\mathbb{L}}_{j'_*\mathcal{D}^{(0)}_{U'}} j'_*\mathcal{E}') \end{aligned}$$

We obtain by composition: $\theta\colon j_*g_+(\mathcal{E}') \to \mathbb{R}f_*(\mathcal{D}^\dagger_{\mathfrak{P}\leftarrow\mathfrak{P}'}(^\dagger * T_0) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger * T'_0)} \mathcal{D}^\dagger_{\mathfrak{P}'}(^\dagger * T'_0) \otimes^{\mathbb{L}}_{j'_*\mathcal{D}^{(0)}_{U'}} j'_*\mathcal{E}')$. The construction of the morphism of 17.4.3.2.1 follows by extension.

II) Let us prove that the restriction of 17.4.3.2.1 on $\mathfrak{U}$ is an isomorphism. The restriction to $\mathfrak{U}$ of θ corresponds to the morphism: $\mathbb{R}g_*(\mathcal{D}^{(0)}_{U\leftarrow U'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(0)}_{U'}} \mathcal{E}') \to \mathbb{R}g_*(\mathcal{D}^\dagger_{\mathfrak{U}\leftarrow\mathfrak{U}'} \otimes^{\mathbb{L}}_{\mathcal{D}^{(0)}_{U'}} \mathcal{E}')$, which is an isomorphism according to 17.3.3.2.1. □

17.5 Explicit description of the arithmetic $\mathcal{D}$-module associated to an overconvergent isocrystal on an affine smooth scheme having coordinates

Let $Y^\dagger = \operatorname{Spff} A^\dagger$ be a smooth affine $\mathfrak{S}$-weak formal scheme. By using the lifting property 17.1.1.16 and its unicity 17.1.1.20, there exists a smooth affine $\mathcal{V}$-scheme $Y = \operatorname{Spec} A$ whose weak completion is isomorphic to $Y^\dagger$. We set $D_{Y^\dagger} := \Gamma(Y^\dagger, \mathcal{D}_{Y^\dagger})$ and $D^{(m)}_{Y^\dagger} := \Gamma(Y^\dagger, \mathcal{D}^{(m)}_{Y^\dagger})$ for any $m \in \mathbb{N}$.

17.5.1 Functor $\mathrm{sp}_{Y^\dagger *}$

Notation 17.5.1.1. We introduce the following categories.

(a) We denote by $\mathrm{MIC}(A_K^\dagger/K)$ the category of coherent $A_K^\dagger$-modules endowed with an integral connection, i.e. to the category of left $D_{Y^\dagger,K}$-module which are coherent as $A_K^\dagger$-module.

(b) Let X be the closure of $\mathrm{Spec}\, A$ in some projective space $\mathbb{P}^r_{\mathcal{V}}$ and $j\colon Y_0 \subset X_0$ be the open immersion. Denote by $\mathrm{MIC}(Y_0, X_0, \mathfrak{X}/K)$ the category of coherent $j^\dagger \mathcal{O}_{\mathfrak{X}_K}$ endowed with an integrable connection. Following [Ber96b, 2.5.2], the functor $\Gamma(X_K^{\mathrm{an}}, -)$ induces an equivalence of categories between the category $\mathrm{MIC}(Y_0, X_0, \mathfrak{X}/K)$ and $\mathrm{MIC}(A_K^\dagger/K)$.

(c) We denote by $\mathrm{MIC}^\dagger(A_K^\dagger/K)$ the strictly full subcategory of $\mathrm{MIC}(A_K^\dagger/K)$ so that the functor $\Gamma(X_K^{\mathrm{an}}, -)$ induces an equivalence between the categories $\mathrm{MIC}^\dagger(Y_0, X_0, \mathfrak{X}/K)$ and $\mathrm{MIC}^\dagger(A_K^\dagger/K)$. The objects of $\mathrm{MIC}^\dagger(A_K^\dagger/K)$ are by definition the coherent $A_K^\dagger$-modules endowed with an overconvergent connection.

(d) Denote by $\mathrm{MIC}(Y^\dagger/\mathfrak{S})$ the category of $\mathcal{D}_{Y^\dagger,\mathbb{Q}}$-modules globally of finite presentation which are also $\mathcal{O}_{Y^\dagger,\mathbb{Q}}$-coherent. The functors $\Gamma(Y^\dagger, -)$ and $\mathcal{D}_{Y^\dagger\mathbb{Q}} \otimes_{D_{Y^\dagger\mathbb{Q}}} -$ induce quasi-inverse equivalence between $\mathrm{MIC}(Y^\dagger/\mathfrak{S})$ and $\mathrm{MIC}(A_K^\dagger/K)$. Indeed, for any $E \in \mathrm{MIC}(A_K^\dagger/K)$, the canonical morphism $\mathcal{O}_{Y^\dagger\mathbb{Q}} \otimes_{A_K^\dagger} E \to \mathcal{D}_{Y^\dagger\mathbb{Q}} \otimes_{D_{Y^\dagger\mathbb{Q}}} E$ is an isomorphism. We get therefore by composition the equivalence of categories denoted by : $\mathrm{MIC}(Y_0, X_0, \mathfrak{X}/K) \to \mathrm{MIC}(Y^\dagger/\mathfrak{S})$ denoted by $\mathrm{sp}_{Y^\dagger *}$.

(e) We denote by $\mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$ the strictly full subcategory of $\mathrm{MIC}(Y^\dagger/\mathfrak{S})$ so that the functor $\mathrm{sp}_{Y^\dagger *}$ induces an equivalence between the categories $\mathrm{MIC}^\dagger(Y_0, X_0, \mathfrak{X}/K)$ and $\mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$. The functors $\Gamma(Y^\dagger, -)$ and $\mathcal{D}_{Y^\dagger\mathbb{Q}} \otimes_{D_{Y^\dagger\mathbb{Q}}} -$ induce quasi-inverse equivalence between $\mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$ and $\mathrm{MIC}^\dagger(A_K^\dagger/K)$.

17.5.1.2. When there exists a finite etale morphism of smooth $\mathfrak{S}$-weak formal schemes of the form $Y^\dagger \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$, we will give later a description of $\mathrm{MIC}^\dagger(A_K^\dagger/K)$ in term of $D^\dagger$-module (see 17.7.3.7).

17.5.1.3. Let $b\colon Y'^\dagger \to Y^\dagger$ be a morphism of affine smooth $\mathfrak{S}$-weak formal schemes. Let $A'^\dagger := \Gamma(Y'^\dagger, \mathcal{O}_{Y'^\dagger})$. We have the commutative diagram up to canonical isomorphism:

$$\begin{array}{ccccc}
\mathrm{MIC}^\dagger(Y_0/K) & \xrightarrow[\cong]{17.5.1.1.(b)} & \mathrm{MIC}^\dagger(A_K^\dagger/K) & \xrightarrow[\cong]{\mathcal{D}_{Y^\dagger\mathbb{Q}} \otimes_{D_{Y^\dagger\mathbb{Q}}} -} & \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S}) \\
\downarrow b_0^* & & \downarrow A'^\dagger_K \otimes_{A^\dagger_K} - & & \downarrow \mathcal{D}_{Y'^\dagger \to Y^\dagger,\mathbb{Q}} \otimes_{b^{-1}\mathcal{D}_{Y^\dagger,\mathbb{Q}}} b^{-1}- \\
\mathrm{MIC}^\dagger(Y'_0/K) & \xrightarrow[\cong]{17.5.1.1.(b)} & \mathrm{MIC}^\dagger(A'^\dagger_K/K) & \xrightarrow[\cong]{\mathcal{D}_{Y'^\dagger\mathbb{Q}} \otimes_{D_{Y'^\dagger\mathbb{Q}}} -} & \mathrm{MIC}^{\dagger\dagger}(Y'^\dagger/\mathfrak{S}),
\end{array} \tag{17.5.1.3.1}$$

Indeed, following [Ber96b, 2.5.6], the left square is commutative up to canonical isomorphism. For the right one, this is obvious. For simplicity, set $b^* := \mathcal{D}_{Y'^\dagger \to Y^\dagger,\mathbb{Q}} \otimes_{b^{-1}\mathcal{D}_{Y^\dagger,\mathbb{Q}}} b^{-1}-\colon \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S}) \to \mathrm{MIC}^{\dagger\dagger}(Y'^\dagger/\mathfrak{S})$. When $d_{Y'/Y} = 0$, we prefer the notation $b^!$.

If $b, b'\colon Y'^\dagger \to Y^\dagger$ are two morphisms of affine smooth $\mathfrak{S}$-weak formal schemes such that $b_0 = b'_0$, it follows from the commutative up to canonical isomorphism 17.5.1.3.1 that we have the canonical isomorphism $\tau_{b,b'}\colon b'^* \xrightarrow{\sim} b^*$ of functors $\mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S}) \to \mathrm{MIC}^{\dagger\dagger}(Y'^\dagger/\mathfrak{S})$. We have $\tau_{b,b} = \mathrm{id}$. Let $b''\colon Y'^\dagger \to Y^\dagger$ be a third lifting of b_0. The cocycle condition $\tau_{b,b'} \circ \tau_{b',b''} = \tau_{b,b''}$ holds. For any morphisms $c\colon Z'^\dagger \to Y'^\dagger$ and $d\colon Y^\dagger \to U^\dagger$ of affine smooth $\mathfrak{S}$-weak formal schemes, we have $c^*(\tau_{b,b'}) = \tau_{b\circ c, b'\circ c}$ and $(\tau_{b,b'}) \circ d^* = \tau_{d\circ b, c\circ b'}$ (modulo the transitivity of pullbacks).

17.5.1.4. Let $b\colon Y'^\dagger \to Y^\dagger$ be a finite and étale morphism of affine smooth $\mathfrak{S}$-weak formal schemes. Let $A'^\dagger := \Gamma(Y'^\dagger, \mathcal{O}_{Y'^\dagger})$. We have the commutative diagram up to canonical isomorphism:

$$\begin{array}{ccccc}
\mathrm{MIC}^\dagger(Y'_0/K) & \xrightarrow[\cong]{17.5.1.1.(b)} & \mathrm{MIC}^\dagger(A'^\dagger_K/K) & \xrightarrow[\cong]{\mathcal{D}_{Y'^\dagger,\mathbb{Q}} \otimes_{D_{Y'^\dagger,\mathbb{Q}}} -} & \mathrm{MIC}^{\dagger\dagger}(Y'^\dagger/\mathfrak{S}) \\
\downarrow b_* & & \downarrow \mathfrak{f} & & \downarrow b_+ = b_*(\mathcal{D}_{Y^\dagger \leftarrow Y'^\dagger,\mathbb{Q}} \otimes_{\mathcal{D}_{Y'^\dagger,\mathbb{Q}}} -) \\
\mathrm{MIC}^\dagger(Y_0/K) & \xrightarrow[\cong]{17.5.1.1.(b)} & \mathrm{MIC}^\dagger(A_K^\dagger/K) & \xrightarrow[\cong]{\mathcal{D}_{Y^\dagger\mathbb{Q}} \otimes_{D_{Y^\dagger\mathbb{Q}}} -} & \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S}),
\end{array} \tag{17.5.1.4.1}$$

where the middle vertical functor $\mathfrak{f}$ is the forgetful one and where the left vertical functor is well defined because b is finite and étale (or, if we would like to avoid the use of pushforwards of overconvergent isocrystals, this functor can be defined so that the left square is commutative).

17.5.1.5. With notation 17.5.1.1.(b) and 11.1.1.7, we get the commutative up to canonical isomorphism diagram:

$$\begin{array}{ccc} \mathrm{MIC}(Y_0, X_0, \mathfrak{X}/K) & \xrightarrow[\cong]{\Gamma(X_K^{\mathrm{an}}, -)} & \mathrm{MIC}(A_K^\dagger/K) \\ \downarrow{\scriptstyle |\mathfrak{Y}_K} & & \downarrow{\scriptstyle \widehat{A}_K \otimes_{A_K^\dagger} -} \\ \mathrm{MIC}(Y_0, Y_0, \mathfrak{Y}/K) & \xrightarrow[\cong]{\Gamma(\mathfrak{Y}_K, -)} & \mathrm{MIC}(\widehat{A}_K/K), \end{array} \tag{17.5.1.5.1}$$

where the top equivalence of categories is 17.5.1.1.(b) and the bottom one is 11.1.1.7. We have such a commutative up to canonical isomorphism diagram 17.6.3.2.2 whose horizontal functors are equivalent by adding some symbol †, i.e replacing MIC by $\mathrm{MIC}^\dagger$.

Proposition 17.5.1.6. *Let* $D_{\mathfrak{Y}/\mathfrak{S}} := \Gamma(\mathfrak{Y}, \mathcal{D}_{\mathfrak{Y}/\mathfrak{S}})$ *and* $D^\dagger_{\mathfrak{Y}/\mathfrak{S}} := \Gamma(\mathfrak{Y}, \mathcal{D}^\dagger_{\mathfrak{Y}/\mathfrak{S}})$. *We assume that* $Y^\dagger/\mathfrak{S}$ *has coordinates. Let* $E \in \mathrm{MIC}^\dagger(A_K^\dagger/K)$.

(a) Then the canonical morphisms

$$\widehat{A}_K \otimes_{A_K^\dagger} E \to D_{\mathfrak{Y},K} \otimes_{D_{Y^\dagger,K}} E \to D^\dagger_{\mathfrak{Y},K} \otimes_{D_{Y^\dagger,K}} E \tag{17.5.1.6.1}$$

are isomorphisms.

(b) We have $G := D^\dagger_{\mathfrak{Y},K} \otimes_{D_{Y^\dagger,K}} E \in \mathrm{MIC}^\dagger(\widehat{A}_K/K)$ *and* $\mathcal{G} := \mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{D_{\mathfrak{Y},K}} G \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathcal{V})$.

Proof. a) Since the canonical morphism $\widehat{A}_K \otimes_{A_K^\dagger} D_{Y^\dagger,K} \to D_{\mathfrak{Y},K}$ is an isomorphism, then we get the first isomorphism of 17.5.1.6.1. Since $E \in \mathrm{MIC}^\dagger(A_K^\dagger/K)$ then $D_{\mathfrak{Y},K} \otimes_{D_{Y^\dagger,K}} E \in \mathrm{MIC}^\dagger(\widehat{A}_K/K)$ (see 17.5.1.5). Hence, we get the isomorphism

$$D_{\mathfrak{Y},K} \otimes_{D_{Y^\dagger,K}} E \overset{11.1.1.7.1}{\xrightarrow{\sim}} D^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{D_{\mathfrak{Y},\mathbb{Q}}} (D_{\mathfrak{Y},K} \otimes_{D_{Y^\dagger,K}} E) \xrightarrow{\sim} D_{\mathfrak{Y},K} \otimes_{D_{Y^\dagger,K}} E.$$

b) It follows from 17.5.1.5 and 11.1.1.7. □

Lemma 17.5.1.7 (Theorem A)**.** *We denote by* $\mathrm{MIC}^{(m)}(A^\dagger/\mathcal{V})$ *the category of coherent* $D^{(m)}_{Y^\dagger}$*-modules which are also coherent as* $A^\dagger$*-module. We denote by* $\mathrm{MIC}^{(m)}(Y^\dagger/\mathfrak{S})$ *the category of globally of finite presentation* $\mathcal{D}^{(m)}_{Y^\dagger}$*-modules which are also coherent as* $\mathcal{O}_{Y^\dagger}$*-module.*

(a) The functors $\mathcal{D}^{(m)}_{Y^\dagger} \otimes_{D^\dagger_{Y^\dagger}} -$ *and* $\Gamma(Y^\dagger, -)$ *are quasi-inverse equivalences between* $\mathrm{MIC}^{(m)}(A^\dagger)$ *and* $\mathrm{MIC}^{(m)}(Y^\dagger/\mathfrak{S})$.

(b) For any $E \in \mathrm{MIC}^{(m)}(A^\dagger)$*, the canonical morphism*

$$\mathcal{O}_{Y^\dagger} \otimes_A E \to \mathcal{D}^{(m)}_{Y^\dagger} \otimes_{D^{(m)}_{Y^\dagger}} E \tag{17.5.1.7.1}$$

are isomorphisms.

Proof. According to 17.1.2.2 and 17.2.2.10, coherent $\mathcal{O}_{Y^\dagger}$-modules and globally of finite presentation $\mathcal{D}^{(m)}_{Y^\dagger}$-modules satisfy theorem of type A. Hence, (a) is a consequence of (b). Since the canonical morphism: $\mathcal{O}_{\mathfrak{Y}^\dagger} \otimes_A D^{(m)}_{Y^\dagger} \to \mathcal{D}^{(m)}_{Y^\dagger}$ is an isomorphism (see 17.2.3.2.(b)), then we are done. □

Proposition 17.5.1.8. Suppose $Y^\dagger/\mathfrak{S}$ has coordinates $t_1, \dots, t_d$. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$ and $m \in \mathbb{N}$. There exists a $\mathcal{E}^{(m)} \in \mathrm{MIC}^{(m)}(Y^\dagger/\mathfrak{S})$ together with a $\mathcal{D}_{Y^\dagger,\mathbb{Q}}$-linear isomorphism $\mathcal{E}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$.

Proof. Write $A^\dagger := \Gamma(Y^\dagger, \mathcal{O}_{Y^\dagger})$ and $E := \Gamma(Y^\dagger, \mathcal{E})$. As E is a projective $A_K^\dagger$-module of finite type, there exists a $A_K^\dagger$-module F, an integer r and a $A_K^\dagger$-linear isomorphism: $E \oplus F \xrightarrow{\sim} (A_K^\dagger)^r$. Write $\widehat{E} := \widehat{A}_K \otimes_{A_K^\dagger} E$ and $\widehat{F} := \widehat{A}_K \otimes_{A_K^\dagger} F$,we obtain the isomorphism $\widehat{E} \oplus \widehat{F} \xrightarrow{\sim} (\widehat{A}_K)^r$ as well as canonical injections $E \hookrightarrow \widehat{E}$ and $F \hookrightarrow \widehat{F}$. By abuse of notations, we consider all the sets included in $(\widehat{A}_K)^r$.

We put $E^{(m)} := \{e \in E | \ \forall \underline{k}, \ \ \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} e \in E \cap (A^\dagger)^r\}$. It follows from the formulas 1.4.2.7.1 and 1.4.2.7.(c) which are still valid in $\mathcal{D}_{Y^\dagger}^{(m)}$, that $E^{(m)}$ is a sub-$D_{Y^\dagger}^{(m)}$-module of $E \cap (A^\dagger)^r$. By noetherianity of $A^\dagger$, $E^{(m)}$ is of finite type as $A^\dagger$-module and therefore as $D_{Y^\dagger}^{(m)}$-module. Since $D_{Y^\dagger}^{(m)}$ is noetherian (see 17.2.2.1), this yields that $E^{(m)}$ is of finite presentation. Hence $E^{(m)} \in \mathrm{MIC}^{(m)}(A^\dagger/\mathcal{V})$. Following 17.5.1.7, the module $\mathcal{E}^{(m)} := \mathcal{D}_{Y^\dagger}^{(m)} \otimes_{\Gamma(Y^\dagger, \mathcal{D}_{Y^\dagger}^{(m)})} E^{(m)}$ is a $\mathcal{D}_{Y^\dagger}^{(m)}$-module globally of finite presentation and is also $\mathcal{O}_{Y^\dagger}$-coherent It remains to prove $\mathcal{E}_{\mathbb{Q}}^{(m)} \xrightarrow{\sim} \mathcal{E}$.

Let v_π be the π-adic norm on $\widehat{A}_K$ given by $\widehat{A}$ (see definition 8.7.1.6). Let $\| * \| := p^{-v_\pi(*)}$, which is a Banach norm on $\widehat{A}_K$. We have $\| a \| \leq 1$ if and only if $a \in \widehat{A}$. $\widehat{A}_K{}^N \twoheadrightarrow \widehat{E}$. We still write $\| - \|$ for the norm on E (which is a Banach norm) by restriction via the inclusion $\widehat{E} \subset \widehat{A}_K$. Hence, for any $e \in \widehat{E}$, if $\| e \| \leq 1$ then $e \in \widehat{E} \cap (\widehat{A})^r$.

With notation 1.2.1.2, according to 8.7.1.7, there exists $\eta < 1$, $c \in \mathbb{R}$ such that $|q_k^{(m)}!| \leq c\eta^k$ for all k. For all $e \in \widehat{E}$ and $\underline{k} \in \mathbb{N}^d$, this yields the inequality: $\| \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} e \| = |q_{\underline{k}}^{(m)}!| \ \| \underline{\partial}^{[\underline{k}]} e \| \leq c^d \eta^{|\underline{k}|} \ \| \underline{\partial}^{[\underline{k}]} e \|$. As $\widehat{E} \in \mathrm{MIC}^\dagger(\widehat{A}_K/K)$ (see 17.5.1.5), then the last term tends to 0 when $|\underline{k}|$ goes to infinity (see 11.1.1.7.2). For all $e \in \widehat{E}$, there exists thus an integer N such that $|\underline{k}| \geq N$ implies $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}} e \in \widehat{E} \cap (\widehat{A})^r$.

Since $A^\dagger/\pi A^\dagger \xrightarrow{\sim} \widehat{A}/\pi\widehat{A}$, then $A^\dagger \cap \pi\widehat{A} = \pi A^\dagger$. Since $\widehat{A}$ is p-torsion free, this yields the equality: $A_K^\dagger \cap \widehat{A} = A^\dagger$. Hence, we get the last equality: $E \cap (\widehat{A})^r = E \cap (A_K^\dagger)^r \cap (\widehat{A})^r = E \cap (A^\dagger)^r$. This implies $\forall e \in E$, $\exists N \in \mathbb{N}$, $\forall \underline{k}$ such that $|\underline{k}| \geq N$, $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}} e \in E \cap (A^\dagger)^r$. Hence, $\forall e \in E$, $\exists M \in \mathbb{N}$, $\forall \underline{k}$ we have $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}(p^M e) \in E \cap (A^\dagger)^r$. This yields the canonical inclusion $E_{\mathbb{Q}}^{(m)} \to E$ is in fact an isomorphism. Hence, so is $\mathcal{O}_{Y^\dagger \mathbb{Q}} \otimes_{A^\dagger} E^{(m)} \to \mathcal{O}_{Y^\dagger \mathbb{Q}} \otimes_{A_K^\dagger} E$. Via 17.5.1.1.(d) and 17.5.1.7.1 we are done. □

Proposition 17.5.1.9. *Let $m \in \mathbb{N}$, $\mathcal{E}^{(m)}$ be a left $\mathcal{D}_{Y^\dagger}^{(m)}$-module which is coherent as $\mathcal{O}_{Y^\dagger}$-module.*

(a) We have $\mathcal{E}^{(m)} \in \mathrm{MIC}^{(m)}(Y^\dagger/\mathfrak{S})$.

(b) Let $\widehat{\mathcal{E}}^{(m)}$ be the p-adic completion of $\mathcal{E}^{(m)}$. We have the commutative diagram of isomorphisms:

$$\begin{array}{ccc} \mathcal{O}_{\mathfrak{Y}} \otimes_{\mathcal{O}_{Y^\dagger}} \mathcal{E}^{(m)} & \xrightarrow{\sim} & \widehat{\mathcal{D}}_{\mathfrak{Y}}^{(m)} \otimes_{\mathcal{D}_{Y^\dagger}} \mathcal{E}^{(m)} \\ & \searrow^{\sim} \quad \widehat{\mathcal{E}}^{(m)}. \quad {}^{\sim}\swarrow & \end{array} \tag{17.5.1.9.1}$$

Proof. The first assertion is checked similarly to 7.5.2.1.(a). Since $\mathcal{O}_{\mathfrak{Y}} \otimes_{\mathcal{O}_{Y^\dagger}} \mathcal{E}^{(m)}$ is a coherent $\mathcal{O}_{\mathfrak{Y}}$-module then the left bottom morphism of 17.5.1.9.1 is an isomorphism. Since $\widehat{\mathcal{D}}_{\mathfrak{Y}}^{(m)} \otimes_{\mathcal{D}_{Y^\dagger}} \mathcal{E}^{(m)}$ is a coherent $\widehat{\mathcal{D}}_{\mathfrak{Y}}^{(m)}$-module then the left bottom morphism is an isomorphism. Hence, so is the top morphism of 17.5.1.9.1. □

Corollaire 17.5.1.10. Suppose $Y^\dagger/\mathfrak{S}$ has coordinates $t_1, \ldots, t_d$. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$.

(a) The morphism $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{O}_{Y^\dagger,\mathbb{Q}}} \mathcal{E} \to \mathcal{D}_{\mathfrak{Y},\mathbb{Q}}^\dagger \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \mathcal{E}$ is an isomorphism.

(b) The functor $\mathcal{D}_{\mathfrak{Y},\mathbb{Q}}^\dagger \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} -$ factors through $\mathcal{D}_{\mathfrak{Y},\mathbb{Q}}^\dagger \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} - \colon \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S}) \to \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathfrak{S})$ making commutative up to canonical isomorphism the diagram:

$$\begin{array}{ccc} \mathrm{MIC}^\dagger(Y_0, X_0, \mathfrak{X}/K) & \xrightarrow[\cong]{\mathrm{sp}_{Y^\dagger *}} & \mathrm{MIC}^\dagger(A_K^\dagger/K) \\ \downarrow{\scriptstyle |\mathfrak{Y}_K} & & \downarrow{\scriptstyle \mathcal{D}_{\mathfrak{Y},\mathbb{Q}}^\dagger \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} -} \\ \mathrm{MIC}^\dagger(Y_0, Y_0, \mathfrak{Y}/K) & \xrightarrow[\cong]{\mathrm{sp}_*} & \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathfrak{S}), \end{array} \tag{17.5.1.10.1}$$

where sp_* is the pushforward via the specialisation morphism $\mathrm{sp} \colon \mathfrak{Y}_K \to \mathfrak{Y}$.

(c) The functor $\mathrm{sp}_{Y^\dagger *}$ is exact.

Proof. Let $\mathcal{E}^{(m)} \in \mathrm{MIC}^{(m)}(Y^\dagger/\mathfrak{S})$ together with a $\mathcal{D}_{Y^\dagger,\mathbb{Q}}$-linear isomorphism $\mathcal{E}^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ (see 17.5.1.8). Tensoring with $\mathbb{Q}$ the top isomorphism of 17.5.1.9.1 used for $\mathcal{E}^{(m)}$, we get that the canonical morphism $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{O}_{Y^\dagger,\mathbb{Q}}} \mathcal{E} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \mathcal{E}$ is an isomorphism. We get the first part of the corollary by taking the limit on the level. The second part follows from the first one and from 17.5.1.5. Since the functor $\mathrm{sp}_*\colon \mathrm{MIC}^\dagger(Y_0, Y_0, \mathfrak{Y}/K) \to \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathfrak{S})$ is exact, then we get the last part from the commutativity of 17.5.1.10.1 and the full faithfulness of $\mathcal{O}_{Y^\dagger,\mathbb{Q}} \to \mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$. □

17.5.2 Construction of the functor sp_+

Let $P^\dagger$ be a separated smooth $\mathfrak{S}$-weak formal scheme, T_0 a divisor of P_0, $U^\dagger$ the open complement of T_0 in $P^\dagger$, $j\colon U^\dagger \hookrightarrow P^\dagger$ the open immersion and $v\colon Y^\dagger \hookrightarrow U^\dagger$ a closed immersion of smooth $\mathfrak{S}$-weak formal schemes. Suppose in addition $Y^\dagger$ is affine and $Y^\dagger/\mathfrak{S}$ has coordinates $t_1, \ldots, t_d$. Let X_0 be the schematic closure of Y_0 in P_0 and $(F\text{-})\mathrm{Coh}(X_0, \mathfrak{P}, T_0)$ the category of coherent $(F\text{-})\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$-modules with support in X_0.

Example 17.5.2.1. Let $Y^\dagger$ be an affine $\mathfrak{S}$-weak formal scheme such that $Y^\dagger/\mathfrak{S}$ has coordinates $t_1, \ldots, t_d$. Following 17.1.1.16 and 17.1.1.20, there exists a smooth affine $\mathrm{Spec}(\mathcal{V})$-scheme Y whose weak completion is isomorphic to $Y^\dagger$. Choose a closed immersion $Y \hookrightarrow \mathbb{A}^r_{\mathcal{V}}$. Write $P := \mathbb{P}^r_{\mathcal{V}}$, $U := \mathbb{A}^r_{\mathcal{V}}$ and T the divisor $P \setminus U$. We get a closed immersion $v\colon Y^\dagger \hookrightarrow U^\dagger$ of smooth $\mathfrak{S}$-weak formal schemes and the inclusion $j\colon U^\dagger \subset P^\dagger$.

Remark 17.5.2.2. If X_0 is smooth, then $T_0 \cap X_0$ is a divisor of X_0. Indeed, as X_0 is the direct sum of its irreducible components, we can assume that X_0 is irreducible. Thus since $T_0 \not\supset X_0$, then we are done.

17.5.2.3. Let $E \in \mathrm{MIC}^\dagger(Y_0/K)$ and $\mathcal{E} := \mathrm{sp}_{Y^\dagger *}(E) \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$ be the associated globally of finite presentation $\mathcal{D}_{Y^\dagger,\mathbb{Q}}$-module which is also $\mathcal{O}_{Y^\dagger,\mathbb{Q}}$-coherent (see 17.5.1.1.(e)). We set:

$$\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(E) := \widetilde{\mathrm{sp}}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(\mathcal{E}) := \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}} \otimes_{j_* \mathcal{D}_{U^\dagger,K}} j_* v_+(\mathcal{E}). \tag{17.5.2.3.1}$$

where $v_+(\mathcal{E}) := v_*(\mathcal{D}_{U^\dagger \leftarrow Y^\dagger,\mathbb{Q}} \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \mathcal{E})$.

Choose $\mathcal{E}^{(0)}$, a $\mathcal{D}^{(0)}_{Y^\dagger}$-module globally of finite presentation, $\mathcal{O}_{Y^\dagger}$-coherent and satisfying $\mathcal{E}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$ (see 17.5.1.8). Let $\widehat{E} \in \mathrm{MIC}^\dagger(Y_0, Y_0, \mathfrak{Y}/K)$ be the convergent isocrystal on Y_0 induced by E, i.e. $\widehat{E} = E|\mathfrak{Y}_K$. We set $\widehat{\mathcal{E}} := \mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \mathcal{E}$. Following 17.5.1.10.1, we have the isomorphism: $\widehat{\mathcal{E}} \xrightarrow{\sim} \mathrm{sp}_*(\widehat{E})$. By proposition 17.2.5.4, the $\mathcal{D}^{(0)}_{U^\dagger}$-module $v^{(0)}_+(\mathcal{E}^{(0)})$ is globally of finite presentation. According to 17.2.2.13.(c), $j_*\mathcal{D}^{(0)}_{U^\dagger}$-module $j_* v^{(0)}_+(\mathcal{E}^{(0)})$ is globally of finite presentation. Since we have the isomorphism:

$$\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(E) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}} \otimes_{j_* \mathcal{D}^{(0)}_{U^\dagger}} j_* v^{(0)}_+(\mathcal{E}^{(0)}), \tag{17.5.2.3.2}$$

then $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(E)$ is a $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$-module globally of finite presentation with support in X_0. This yields the functors $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}\colon \mathrm{MIC}^\dagger(Y_0/K) \to \mathrm{Coh}(X_0, \mathfrak{P}, T_0)$ and $\widetilde{\mathrm{sp}}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}\colon \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/K) \to \mathrm{Coh}(X_0, \mathfrak{P}, T_0)$. When T_0 is empty, we omit it in the notation.

Remark 17.5.2.4. The construction of 17.5.2.3.1 is very explicit. However, its defect is (until the proof of the opposite) of not having a generalization for $\mathrm{MIC}^\dagger(Y, X/K)$ instead of $\mathrm{MIC}^\dagger(Y/K)$ when the partial compactification X of Y is not not proper.

Proposition 17.5.2.5. *With notations 17.5.2.3, we have canonical isomorphisms*

$$\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(E)|\mathfrak{U} \xrightarrow{\sim} \mathrm{sp}_{Y_0 \hookrightarrow \mathfrak{U}+}(\widehat{E}) \xrightarrow{\sim} v^\dagger_+ \widehat{\mathcal{E}}.$$

Proof. Choose a $\mathcal{D}^{(0)}_{Y^\dagger}$-module $\mathcal{E}^{(0)}$ globally of finite presentation, $\mathcal{O}_{Y^\dagger}$-coherent and satisfying $\mathcal{E}^{(0)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}$. Since $v^{(0)}_+(\mathcal{E}^{(0)})$ is a coherent $\mathcal{D}^{(0)}_{U^\dagger}$-module, then we get the isomorphism: $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(E)|_{\mathfrak{U}} = \mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{U^\dagger}} v_+(\mathcal{E}^{(0)}) \overset{17.3.3.2.1}{\xrightarrow{\sim}} v^\dagger_+(\mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{Y^\dagger}} \mathcal{E}^{(0)})$. We conclude via $\widehat{\mathcal{E}} \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{Y^\dagger}} \mathcal{E}^{(0)}$ (17.5.1.10) and 17.5.2.3.2. □

With the remark 17.5.2.2, the following corollary is straightforward.

Corollary 17.5.2.6. *With notations 17.5.2.3, suppose X_0 is smooth. Then we have* $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E) \in \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/\mathcal{V})$ *(see notation 12.2.1.4).*

Remark 17.5.2.7. We will check later that the smoothness hypothesis of corollary 17.5.2.6 is useless (see 17.5.2.6)

Proposition 17.5.2.8. The functor $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}$ is exact and faithful.

Proof. According to 17.2.2.13, the canonical morphism $j_* v_+(\mathcal{E}^{(0)}) \to \mathbb{R}j_* v_+(\mathcal{E}^{(0)})$ is an isomorphism for any $\mathcal{D}^{(0)}_{Y^\dagger}$-module $\mathcal{E}^{(0)}$ globally of finite presentation, $\mathcal{O}_{Y^\dagger}$-coherent. Tensoring by $\mathbb{Q}$, using 17.5.1.8, this yields that the the canonical morphism $j_* v_+(\mathcal{E}) \to \mathbb{R}j_* v_+(\mathcal{E})$ is an isomorphism for any $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$. Following 17.5.1.10.(c) (resp. 17.2.5.1), the functor $\mathrm{sp}_{Y^\dagger *}$ (resp. v_+) is exact. Hence, so is the functor $E \mapsto j_* v_+ \mathrm{sp}_{Y^\dagger *}(E)$. As the extension $\mathcal{D}_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$ is left and right flat, it follows from 17.4.1.2 that $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$ is left and right $j_* \mathcal{D}_{U^\dagger, \mathbb{Q}}$-flat. The functor $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}$ is thus exact.

Next we treat the faithfulness. Via 8.7.6.11, it suffices to establish that the faithfulness of $E \mapsto \mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)|\mathfrak{U} \underset{17.5.2.5}{\overset{\sim}{\longrightarrow}} v^\dagger_+ \widehat{\mathcal{E}} \overset{\sim}{\longrightarrow} v^\dagger_+ \circ \mathrm{sp}_*(\widehat{E})$ (see 17.5.2.3). Since the functor $E \mapsto \widehat{E}$ is faithful (this follows from [Ber96b, 2.1.11]), as $\mathrm{sp}_* \colon \mathrm{MIC}^\dagger(Y_0, Y_0, \mathfrak{Y}/K) \to \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathfrak{S})$ is an equivalence of category and $v^\dagger_+$ is fully faithful on the category of coherent $\mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}}$-modules, then the result follows. □

We close this subsection by the following proposition.

Proposition 17.5.2.9. Consider the commutative diagram of smooth $\mathfrak{S}$-weak formal schemes:

$$\begin{array}{ccccc} Y'^\dagger & \overset{v'}{\hookrightarrow} & U'^\dagger & \overset{j'}{\hookrightarrow} & P'^\dagger \\ \downarrow b & & \downarrow g & & \downarrow f \\ Y^\dagger & \overset{v}{\hookrightarrow} & U^\dagger & \overset{j}{\hookrightarrow} & P^\dagger, \end{array} \tag{17.5.2.9.1}$$

where f and g are smooth morphisms, b is a morphism of affine smooth $\mathfrak{S}$-weak formal schemes, j and j' are open immersions, v and v' are closed immersions. We suppose there exists a divisor T_0 of P_0 (resp. T'_0 of P'_0) such that $U^\dagger = P^\dagger \setminus T_0$ (resp. $U'^\dagger = P'^\dagger \setminus T'_0$). Let X_0 (resp. X'_0) denote the closure of of Y_0 (resp. Y'_0) in P_0 (resp. P'_0).

For any object $E \in \mathrm{MIC}^\dagger(Y_0/K)$ such that $\mathbb{R}\underline{\Gamma}^\dagger_{X'_0} f^!_{T'_0,T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T'_0)_{\mathbb{Q}})$, there exists a canonical isomorphism

$$\mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T'_0,+}(b^* E)[d_{Y'_0/Y_0}] \overset{\sim}{\longrightarrow} \mathbb{R}\underline{\Gamma}^\dagger_{X'_0} f^!_{T'_0,T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)) \tag{17.5.2.9.2}$$

making commutative the diagram

$$\begin{array}{ccc} \mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T'_0,+}(b^* E)[d_{Y'_0/Y_0}] & \underset{17.5.2.9.2}{\overset{\sim}{\longrightarrow}} & \mathbb{R}\underline{\Gamma}^\dagger_{X'_0} f^!_{T'_0,T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)) \\ \downarrow 17.5.2.5 & & \downarrow 17.5.2.5 \\ \mathrm{sp}_{Y'_0 \hookrightarrow \mathfrak{U}'+}(b^* \widehat{E})[d_{Y'_0/Y_0}] & \overset{12.2.4.1.2}{\longrightarrow} & \mathbb{R}\underline{\Gamma}^\dagger_{Y'_0} g^! \mathrm{sp}_{Y_0 \hookrightarrow \mathfrak{U}+}(\widehat{E}) \end{array} \tag{17.5.2.9.3}$$

In addition, these are transitive with respect to the composition of diagrams of the form 17.5.2.9.1.

Proof. I) We construct the morphism 17.5.2.9.2. Let $\mathcal{E} := \mathrm{sp}_{Y^\dagger *}(E) \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$. Choose a $\mathcal{D}^{(\bullet)}_{Y^\dagger}$-module $\mathcal{E}^{(\bullet)}$ such that for any $m \in \mathbb{N}$ the module $\mathcal{E}^{(m)}$ is p-torsion free, globally of finite presentation as $\mathcal{D}^{(m)}_{Y^\dagger}$-module, coherent as $\mathcal{O}_{Y^\dagger}$-module and satisfying $\mathcal{E}^{(m)}_{\mathbb{Q}} \overset{\sim}{\longrightarrow} \mathcal{E}$ (use 17.5.1.8).

1) Set $\mathcal{E}'^{(\bullet)} := b^{(\bullet)!}(\mathcal{E}^{(\bullet)})[-d_{Y'_0/Y_0}]$. Then for any $m \in \mathbb{N}$ the module $\mathcal{E}'^{(m)}$ is p-torsion free, globally of finite presentation as $\mathcal{D}^{(m)}_{Y'^\dagger}$-module, coherent as $\mathcal{O}_{Y'^\dagger}$-module. Moreover, it follows from 17.5.1.3.1 that we have the isomorphism $\mathcal{E}'^{(m)}_{\mathbb{Q}} \overset{\sim}{\longrightarrow} \mathrm{sp}_{Y'^\dagger *}(b^*(E))$.

2) We have the morphisms:

$$v'^{(0)}_+ b^{(0)!}(\mathcal{E}^{(0)}) \overset{17.2.5.3.1}{\underset{\sim}{\longrightarrow}} v'^{(0)}_+ b^{(0)!} v^{(0)!} v^{(0)}_+(\mathcal{E}^{(0)}) \overset{\sim}{\longrightarrow} v'^{(0)}_+ v'^{(0)!} g^{(0)!} v^{(0)}_+(\mathcal{E}^{(0)}) \overset{17.2.5.3.3}{\longrightarrow} g^{(0)!} v^{(0)}_+(\mathcal{E}^{(0)}) \tag{17.5.2.9.4}$$

3) We get the morphisms:

$$\begin{aligned} \mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T'_0,+}(b^*E)[d_{Y'_0/Y_0}] &\overset{\text{step 1)}}{\underset{\sim}{\longrightarrow}} \mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T'_0)_{\mathbb{Q}} \otimes_{j'_* \mathcal{D}^{(0)}_{U'^\dagger}} j'_* v'^{(0)}_+ b^{(0)!}(\mathcal{E}^{(0)}) \\ \underset{17.5.2.9.4}{\longrightarrow} \mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T'_0)_{\mathbb{Q}} \otimes_{j'_* \mathcal{D}^{(0)}_{U'^\dagger}} j'_* g^{(0)!} v^{(0)}_+(\mathcal{E}^{(0)}) &\overset{17.4.2.2}{\underset{\sim}{\longrightarrow}} f^!_{T'_0,T_0}\left(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}} \otimes_{j_* \mathcal{D}^{(0)}_{U^\dagger}} j_* v^{(0)}_+(\mathcal{E}^{(0)})\right) \\ &\overset{\sim}{\longrightarrow} f^!_{T'_0,T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)). \end{aligned} \tag{17.5.2.9.5}$$

As $\mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T'_0,+}(b^*E) \in \mathrm{Coh}(\mathfrak{P}', T'_0, X'_0)$, then by applying the functor $\mathbb{R}\underline{\Gamma}^\dagger_{X'_0}$ to the composite morphism 17.5.2.9.5 (this is well defined since this composite is a morphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T'_0)_{\mathbb{Q}})$), we get the arrow 17.5.2.9.2.

II) It remains to check this is an isomorphism. Set $\widehat{\mathcal{E}} := \mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \mathcal{E}$. Using 8.7.6.11, it remains to check that the restriction on $\mathfrak{U}'$ of the arrow 17.5.2.9.2 is an isomorphism. Since $b^{(\bullet)!}(\mathcal{E}^{(\bullet)}))$ and $v'^{(\bullet)}_+ b^{(\bullet)!}(\mathcal{E}^{(\bullet)}))$ satisfy the required conditions of 17.3.2.6 and 17.3.3.2, we get

$$\mathcal{D}^\dagger_{\mathfrak{U}',\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{U'^\dagger}} v'^{(0)}_+ b^{(0)!}(\mathcal{E}^{(0)}) \overset{\sim}{\longrightarrow} v'_+ b^!(\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{U^\dagger}} \mathcal{E}^{(0)}). \tag{17.5.2.9.6}$$

We have the commutative diagram:

$$\begin{array}{ccccc}
\mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T'_0,+}(b^*E)|\mathfrak{U}'[d_{Y'_0/Y_0}] & & \xrightarrow{17.5.2.9.5} & & f^!_{T'_0,T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E))|\mathfrak{U}' \\
\sim \downarrow \text{step 1)} & & & & \uparrow \sim \\
\mathcal{D}^\dagger_{\mathfrak{U}',\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{U'^\dagger}} v'^{(0)}_+ b^{(0)!}(\mathcal{E}^{(0)}) & \xrightarrow{17.5.2.9.4} & \mathcal{D}^\dagger_{\mathfrak{U}',\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{U'^\dagger}} g^{(0)!} v^{(0)}_+(\mathcal{E}^{(0)}) & \underset{\sim}{\xrightarrow{17.4.2.2}} & g^!(\mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{U^\dagger}} v^{(0)}_+(\mathcal{E}^{(0)})) \\
\sim \downarrow 17.5.2.9.6 & & & & \sim \downarrow 17.3.3.2 \\
v'_+ b^!(\mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{Y^\dagger}} \mathcal{E}^{(0)}) & & \longrightarrow & & g^! v_+(\mathcal{D}^\dagger_{\mathfrak{Y},\mathbb{Q}} \otimes_{\mathcal{D}^{(0)}_{Y^\dagger}} (\mathcal{E}^{(0)})) \\
\downarrow \sim & & & & \downarrow \sim \\
\mathrm{sp}_{Y'_0 \hookrightarrow \mathfrak{U}'+}(b^*\widehat{E})[d_{Y'_0/Y_0}] & & \longrightarrow & & g^! \mathrm{sp}_{Y_0 \hookrightarrow \mathfrak{U}+}(\widehat{E})
\end{array} \tag{17.5.2.9.7}$$

where the top morphism of the bottom square is induced by the morphism $v'_+ b^! \to g^! v_+$ constructed by adjunction similarly to 17.5.2.9.4 (but using the formal version of 9.3.2.5). Indeed, the top square is commutative by construction, that of the middle one follows from 17.2.5.3.2 and 17.2.5.3.4 and the bottom one is tautological. By applying the functor $\mathbb{R}\underline{\Gamma}^\dagger_{Y'_0}$ to 17.5.2.9.7 we get 17.5.2.9.3. Since the bottom morphism of 17.5.2.9.3 is an isomorphism, then so is the top one.

□

Example 17.5.2.10. Suppose the left square of the diagram 17.5.2.9.1 is cartesian. Let $E \in \mathrm{MIC}^\dagger(Y_0/K)$. In that case, the morphism $\mathbb{R}\underline{\Gamma}^\dagger_{X'_0} f^!_{T'_0,T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)) \to f^!_{T'_0,T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E))$ is an isomorphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger T'_0)_{\mathbb{Q}})$. Hence, we get the isomorphism:

$$\mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T'_0,+}(b^*E)[d_{X'_0/X_0}] \overset{\sim}{\longrightarrow} f^!_{T_0}(\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)).$$

In particular, when $f = \mathrm{id}$, we have the functorial in $E \in \mathrm{MIC}^\dagger(Y_0/K)$ isomorphism: $({}^\dagger T'_0)\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E) \overset{\sim}{\longrightarrow} \mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T'_0,+}(j'^\dagger E)$.

Lemma 17.5.2.11. *Consider the diagram of smooth $\mathfrak{S}$-weak formal schemes*

$$\begin{array}{ccccc} Y'^{\dagger} & \xrightarrow{v'} & U'^{\dagger} & \xrightarrow{j'} & P'^{\dagger} \\ \downarrow b & & \downarrow g & & \downarrow f \\ Y^{\dagger} & \xrightarrow{v} & U^{\dagger} & \xrightarrow{j} & P^{\dagger}, \end{array} \tag{17.5.2.11.1}$$

where f is proper, j and j' are open immersions, the right square is cartesian, v and v' are closed immersions, b is finite and étale and $Y^{\dagger}$ is affine. Suppose in addition that $T_0 := P_0 \backslash U_0$ and $T'_0 := P'_0 \backslash U'_0$ are the support of divisors.

For any $E' \in \mathrm{MIC}^{\dagger}(Y'_0/K)$, with notation 17.5.1.4.1, we have then a canonical isomorphism

$$\mathrm{sp}_{Y^{\dagger} \hookrightarrow U^{\dagger}, T_0, +}(b_* E') \xrightarrow{\sim} f^{\dagger}_{T_0,+}(\mathrm{sp}_{Y'^{\dagger} \hookrightarrow U'^{\dagger}, T'_0, +}(E')). \tag{17.5.2.11.2}$$

Moreover, these are transitive with respect to the composition of diagrams of the form 17.5.2.11.1.

Proof. Set $\mathcal{E}' := \mathrm{sp}_{Y'^{\dagger}*}(E') \in \mathrm{MIC}^{\dagger\dagger}(Y'^{\dagger}/\mathfrak{S})$. Choose a $\mathcal{D}^{(0)}_{Y'^{\dagger}}$-module $\mathcal{E}'^{(0)}$ such that for any $m \in \mathbb{N}$ the module $\mathcal{E}'^{(m)}$ is p-torsion free, globally of finite presentation as $\mathcal{D}^{(m)}_{Y'^{\dagger}}$-module, coherent as $\mathcal{O}_{Y'^{\dagger}}$-module and satisfying $\mathcal{E}'^{(m)}_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{E}'$ (use 17.5.1.8). We put $\mathcal{F}'^{(0)} := v'^{(0)}_+(\mathcal{E}'^{(0)})$ and $\mathcal{E}^{(0)} := b^{(0)}_+(\mathcal{E}'^{(0)})$.

As $g^{(0)}_+(\mathcal{F}'^{(0)}) = g^{(0)}_+ v'^{(0)}_+(\mathcal{E}'^{(0)}) \xrightarrow{\sim} v^{(0)}_+ b^{(0)}_+(\mathcal{E}'^{(0)})$, then it follows from 17.2.5.4 that $\mathcal{F}'^{(0)}$ (resp. $g^{(0)}_+(\mathcal{F}'^{(0)})$) is locally in $P'^{\dagger}$ (resp. $P^{\dagger}$) of finite presentation. Hence, tensoring by $\mathbb{Q}$ a morphism of the form 17.4.3.2.1, we have therefore the morphism

$$\begin{aligned} \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}} \otimes_{j_* \mathcal{D}^{(0)}_{U^{\dagger}}} j_* g_+(\mathcal{F}'^{(0)}) &\to \mathbb{R}f_*(\mathcal{D}^{\dagger}_{\mathfrak{P} \leftarrow \mathfrak{P}'}({}^{\dagger}T_0)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T'_0)} \mathcal{D}^{\dagger}_{\mathfrak{P}'}({}^{\dagger}T'_0) \otimes^{\mathbb{L}}_{j'_* \mathcal{D}^{(0)}_{U'^{\dagger}}} j'_* \mathcal{F}'^{(0)}) \\ &\overset{17.5.2.3.2}{\xrightarrow{\sim}} f^{\dagger}_{T_0,+}(\mathrm{sp}_{Y'^{\dagger} \hookrightarrow U'^{\dagger}, T'_0, +}(E')). \end{aligned} \tag{17.5.2.11.3}$$

Since 17.5.2.11.3 is an isomorphism on $\mathfrak{U}$, since this is a morphism of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}})$ (because f is proper), then with 8.7.6.11 we get that 17.5.2.11.3 is an isomorphism.

Since $\mathcal{E}^{(0)}$ is a $\mathcal{D}^{(0)}_{Y^{\dagger}}$-module of globally of finite presentation, is $\mathcal{O}_{Y^{\dagger}}$-coherent and since $\mathcal{E}^{(0)}_{\mathbb{Q}} = b^{(0)}_+(\mathcal{E}'^{(0)})_{\mathbb{Q}} \xrightarrow{\sim} b_+(\mathcal{E}') = b_+ \circ \mathrm{sp}_{Y'^{\dagger}*}(E') \overset{17.5.1.4.1}{\xrightarrow{\sim}} \mathrm{sp}_{Y^{\dagger}*}(b_*(E'))$, then we get the isomorphism:

$$\mathrm{sp}_{Y^{\dagger} \hookrightarrow U^{\dagger}, T_0, +}(b_* E') \overset{17.5.2.3.2}{\xrightarrow{\sim}} \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}} \otimes_{j_* \mathcal{D}^{(0)}_{U^{\dagger}}} j_* v^{(0)}_+(\mathcal{E}^{(0)}) \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}} \otimes_{j_* \mathcal{D}^{(0)}_{U^{\dagger}}} j_* g_+(\mathcal{F}'^{(0)}). \tag{17.5.2.11.4}$$

By composing 17.5.2.11.4 with 17.5.2.11.3 we obtain the isomorphism 17.5.2.11.2. □

Proposition 17.5.2.12. *Suppose there exists two liftings $v_1, v_2 \colon Y^{\dagger} \hookrightarrow U^{\dagger}$ of $v_0 \colon Y_0 \hookrightarrow U_0$.*

(a) We have the canonical isomorphism

$$\tau_{v_1,v_2} \colon \mathrm{sp}_{Y^{\dagger} \underset{v_2}{\hookrightarrow} U^{\dagger}, T, +} \xrightarrow{\sim} \mathrm{sp}_{Y^{\dagger} \underset{v_1}{\hookrightarrow} U^{\dagger}, T, +} \qquad \tau_{v_1,v_2} \colon \widetilde{\mathrm{sp}}_{Y^{\dagger} \underset{v_2}{\hookrightarrow} U^{\dagger}, T, +} \xrightarrow{\sim} \widetilde{\mathrm{sp}}_{Y^{\dagger} \underset{v_1}{\hookrightarrow} U^{\dagger}, T, +}. \tag{17.5.2.12.1}$$

(b) With notation 17.5.2.5, for any $E \in \mathrm{MIC}^{\dagger}(Y_0/K)$ we have

$$\begin{array}{ccc} \mathrm{sp}_{Y^{\dagger} \underset{v_2}{\hookrightarrow} U^{\dagger}, T, +}(E) & \xrightarrow[\tau_{v_1,v_2}]{17.5.2.12.1} & \mathrm{sp}_{Y^{\dagger} \underset{v_1}{\hookrightarrow} U^{\dagger}, T, +}(E) \\ \downarrow 17.5.2.5 & & \downarrow 17.5.2.5 \\ v^{\dagger}_{2+} \widehat{\mathcal{E}} & \xrightarrow[\tau_{v_1,v_2}]{9.2.2.3.1} & v^{\dagger}_{1+} \widehat{\mathcal{E}} \end{array} \tag{17.5.2.12.2}$$

(c) Let $v_3 \colon Y^{\dagger} \hookrightarrow U^{\dagger}$ be a third lifting of $Y_0 \hookrightarrow U_0$. The cocycle condition $\tau_{v_1,v_2} \circ \tau_{v_2,v_3} = \tau_{v_1,v_3}$ holds. Moreover, $\tau_{v_1,v_1} = \mathrm{id}$.

Proof. a) Denote by $w = (v_1, v_2): Y^\dagger \hookrightarrow U^\dagger \times U^\dagger$, $H_0 := (P_0 \times P_0) \setminus (U_0 \times U_0)$ the divisor of $P_0 \times P_0$, $p_1 : \mathfrak{P} \times \mathfrak{P} \to \mathfrak{P}$ and $p_2 : \mathfrak{P} \times \mathfrak{P} \to \mathfrak{P}$ the left and right projections. Following the proposition 17.5.2.9 (to be able to use the second proposition, recall the finiteness property of 17.6.1.7), the functors of the form sp_+ commute with inverse images, i.e., we have the canonical isomorphisms

$$\mathrm{sp}_{Y^\dagger \underset{w}{\hookrightarrow} U^\dagger \times U^\dagger, H_0, +} \overset{17.5.2.9}{\underset{\sim}{\longrightarrow}} \mathbb{R}\underline{\Gamma}^\dagger_{X_0} p^!_{1,H_0,T_0} \circ \mathrm{sp}_{Y^\dagger \underset{v_1}{\hookrightarrow} U^\dagger, T, +}$$
$$\xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{X_0} ({}^\dagger H_0) p^!_{1,T_0} \circ \mathrm{sp}_{Y^\dagger \underset{v_1}{\hookrightarrow} U^\dagger, T, +} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Y_0} p^!_{1,T_0} \circ \mathrm{sp}_{Y^\dagger \underset{v_1}{\hookrightarrow} U^\dagger, T, +}. \qquad (17.5.2.12.3)$$

By using 17.5.2.11.2 (in the case where $b = \mathrm{id}$), we get the isomorphism:

$$\mathrm{sp}_{Y^\dagger \underset{v_2}{\hookrightarrow} U^\dagger, T, +} \overset{17.5.2.11.2}{\underset{\sim}{\longrightarrow}} p_{2,T_0,+} \circ \mathrm{sp}_{Y^\dagger \underset{w}{\hookrightarrow} U^\dagger \times U^\dagger, H_0, +} \overset{17.5.2.12.3}{\underset{\sim}{\longrightarrow}} p_{2,T_0,+} \mathbb{R}\underline{\Gamma}^\dagger_{Y_0} p^!_{1,T_0} \circ \mathrm{sp}_{Y^\dagger \underset{v_1}{\hookrightarrow} U^\dagger, T, +}.$$

Following 16.2.7.6, the functor $p_{2,T_0,+} \mathbb{R}\underline{\Gamma}^\dagger_{Y_0} p^!_{1,T_0}$ is an autoequivalence of the category $\mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K)$. We conclude the construction of the canonical isomorphism 17.5.2.12.1 by using Theorem 17.6.1.7.

b) The commutativity of 17.5.2.12.2 follows from 17.5.2.9.3.

c) The last part is a consequence of the similar properties in the formal context (see 9.2.2.3) and of b). □

17.6 On the equivalence between the category of overcoherent isocrystals to that of overconvergent isocrystals over an affine and smooth variety

17.6.1 Overcoherence of the essential image of $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}$

Definition 17.6.1.1. Let Y_0 be a smooth affine k-scheme, $Y_0 \hookrightarrow X_0$ an open immersion. The open immersion $Y_0 \hookrightarrow X_0$ "ideally desingularizes" or "is ideally desingularisable" if there exists a surjective morphism $a_0 : X'_0 \to X_0$, which decompose into a closed immersion $X'_0 \hookrightarrow \mathbb{P}^r_{X_0}$ followed by the canonical projection $\mathbb{P}^r_{X_0} \to X_0$, such that

(i) X'_0 is smooth ;

(ii) the morphism $Y'_0 := a_0^{-1}(Y_0) \to Y_0$ induced by a_0 is finite and étale ;

(iii) the morphism $Y'_0 \hookrightarrow \mathbb{P}^r_{Y_0}$ induced by $X'_0 \hookrightarrow \mathbb{P}^r_{X_0}$ lifts to a morphism of smooth $\mathfrak{S}$-weak formal scheme of the form $Y'^\dagger \to \mathbb{P}^{r\dagger}_{Y^\dagger}$, where $Y^\dagger$ is a smooth affine $\mathfrak{S}$-weak formal scheme lifting Y_0.

Remark 17.6.1.2. We keep notations of 17.6.1.1.

(a) If X_0 is smooth, then $Y_0 \hookrightarrow X_0$ ideally desingularizes.

(b) The condition (iii) is independent of the choice of the smooth lifting $Y^\dagger$ because these are isomorphic (see 17.1.1.20).

(c) If $Y_0 \hookrightarrow X_0$ ideally desingularizes then for all affine open $\widetilde{Y}_0$ of Y_0 so does the induced open immersion $\widetilde{Y}_0 \hookrightarrow X_0$. Indeed, the morphism $\widetilde{Y}'_0 := a_0^{-1}(\widetilde{Y}_0) \to \widetilde{Y}_0$ induced by a_0 is finite and étale. Moreover, noting $\widetilde{Y}^\dagger$ the open subset of $Y^\dagger$ with underlying space $\widetilde{Y}_0$, the projection $Y'^\dagger \times_{\mathbb{P}^{r\dagger}_{Y^\dagger}} \mathbb{P}^{r\dagger}_{\widetilde{Y}^\dagger} \to \mathbb{P}^{r\dagger}_{\widetilde{Y}^\dagger}$ is a lifting of $\widetilde{Y}'_0 \to \mathbb{P}^r_{\widetilde{Y}_0}$.

17.6.1.3. Let $P^\dagger$ be a separated smooth $\mathfrak{S}$-weak formal scheme, T_0 a divisor of P_0, $U^\dagger$ the open complement of T_0 in $P^\dagger$, $j : U^\dagger \hookrightarrow P^\dagger$ the open immersion and $v : Y^\dagger \hookrightarrow U^\dagger$ a closed immersion of $\mathfrak{S}$-weak formal schemes. Suppose in addition that $Y^\dagger$ is smooth affine. Let X_0 be the schematic closure of Y_0 dans P_0.

Theorem 17.6.1.4. *We keep notations 17.6.1.3 and we suppose that $Y_0 \hookrightarrow X_0$ ideally desingularizes. Then, for any $E \in \mathrm{MIC}^\dagger(Y_0/K)$, the $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$-module $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E) \in \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K)$.*

Proof. By hypotheses, there exists a surjective morphism $a_0 \colon X_0' \to X_0$, which decomposes into a closed immersion $X_0' \hookrightarrow \mathbb{P}^r_{X_0}$ followed by the canonical projection $\mathbb{P}^r_{X_0} \to X_0$, such that X_0' is smooth, the morphism $Y_0' = a_0^{-1}(Y_0) \to Y_0$ is finite and étale and such that there exists a lifting $Y'^\dagger \to \mathbb{P}^{r\dagger}_{Y^\dagger}$ of $Y_0' \hookrightarrow \mathbb{P}^r_{Y_0}$. Composing this lifting with the canonical projection $\mathbb{P}^{r\dagger}_{Y^\dagger} \to Y^\dagger$ (resp. with the closed immersion $\mathbb{P}^{r\dagger}_{Y^\dagger} \hookrightarrow \mathbb{P}^{r\dagger}_{U^\dagger}$), we get a surjective finite and étale morphism $b \colon Y'^\dagger \to Y^\dagger$ (resp. a closed immersion $v' \colon Y'^\dagger \hookrightarrow \mathbb{P}^{r\dagger}_{U^\dagger}$). Write $T_0' := f^{-1}T_0$, $U'^\dagger := \mathbb{P}^{r\dagger}_{U^\dagger}$, $P'^\dagger := \mathbb{P}^{r\dagger}_{P^\dagger}$, $j' \colon U'^\dagger \hookrightarrow P'^\dagger$ the open immersion, $f \colon P'^\dagger \to P^\dagger$ and $g \colon U'^\dagger \to U^\dagger$ the projections, we obtain a commutative diagram of the form 17.5.2.11.1, with b surjective.

Let $E \in \mathrm{MIC}^\dagger(Y_0/K)$. It is sufficient to check that $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(E)$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$-overcoherent. According to 17.5.2.11, there is a canonical isomorphism

$$\mathrm{sp}_+(b_* b^* E) \xrightarrow{\sim} f_{T_0,+^\dagger}(\mathrm{sp}'_+(b^*E)), \tag{17.6.1.4.1}$$

where $\mathrm{sp}_+ = \mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}$ and $\mathrm{sp}'_+ = \mathrm{sp}_{Y'^\dagger \hookrightarrow U'^\dagger, T_0',+}$. As X_0' is smooth, then following 17.5.2.6, $\mathrm{sp}'_+(b^*E) \in \mathrm{MIC}^{\dagger\dagger}(X_0', \mathfrak{P}, T_0'/\mathcal{V})$. Now, by 16.1.1.7, this yields $\mathrm{sp}'_+(b^*E)$ is $\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger f^{-1}T_0)_{\mathbb{Q}}$-overcoherent. With 15.3.6.14 and 17.6.1.4.1, it follows that $\mathrm{sp}_+(b_*b^*E)$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$-overcoherent.

Next, since b is finite, étale and surjective, then E is a direct factor of b_*b^*E. The module $\mathrm{sp}_+(E)$ is thus a direct factor of $\mathrm{sp}_+(b_*b^*E)$ and we are done. □

The following proposition is just a simple extension of [Har70, II.3.1].

Proposition 17.6.1.5. Let k be a field, P a smooth proper k-scheme, U an affine and dense open of P, T the closed subscheme of P complementary to U. Then T is the support of a divisor.

Proof. As P is k-smooth then, according to [E.G.A.IV 17.15.2], P is regular. As a regular local ring is integral, then $\mathcal{O}_{P,x}$ is an integral local ring for all $x \in P$. According to [E.G.A. I.4.5.5], P is then the sum of its irreducible components (i.e., the irreducible components of P do not meet, are open and are identical to the connected components). The fact that U is affine and dense in P is equivalent then to the trace of U on each of the irreducible components of P being affine and dense. Moreover, the assertion T is the support of a divisor is equivalent to the trace of T on each of the components irreducible of P is a divisor. We therefore come back to the case where P is a proper, smooth and integrated scheme. The set T is then the support of a divisor if and only if T has pure codimension equal to 1 in P. Let $\overline{k}$ be an algebraic closure of k. $P \otimes_k \overline{k}$ is a proper and smooth $\overline{k}$-scheme, $U \otimes_k \overline{k}$ is an open affine of $P \otimes_k \overline{k}$ complementary to the closed subscheme $T \otimes_k \overline{k}$. According to [E.G.A.IV.4.1.4], $\dim P = \dim P \otimes_k \overline{k}$. Let P' be an irreducible component of $P \otimes_k \overline{k}$. According to [E.G.A.IV.4.4.1.], the image of P' by the projection morphism $P \otimes_k \overline{k} \to P$ is irreducible and therefore is equal to P. As the projection morphism is quasi-compact, we therefore have $\dim P' \geq \dim P$. As we also have $\dim P' \leq \dim P \otimes_k \overline{k} = \dim P$, then the irreducible components of $P \otimes_k \overline{k}$ all have the same dimension which is equal to that of P. Similarly, if T' is an irreducible component of T then the irreducible components of $T' \otimes_k \overline{k}$ are all of the same dimension which is equal to that of T'.

Let us now show that $T \otimes_k \overline{k}$ is of pure dimension equal to $\dim(P \otimes_k \overline{k}) - 1 = \dim P - 1$. As $P \otimes_k \overline{k}$ is smooth with pure dimension equal to $\dim P$, we can further assume that the scheme is $P \otimes_k \overline{k}$ integral. According to [Har70, II.3.1], $T \otimes_k \overline{k}$ has pure codimension equal to 1. Now, according to [Har77, ex.II.3.20], $T \otimes_k \overline{k}$ is of pure codimension equal to 1 if and only if $T \otimes_k \overline{k}$ is of dimension pure $\dim P \otimes_k \overline{k} - 1$.

We have therefore shown that $T \otimes_k \overline{k}$ has dimension $\dim(P \otimes_k \overline{k}) - 1 = \dim -1$.

Finally, if T' is an irreducible component of T, as the dimension of T' is equal to that of irreducible components of $T' \otimes_k \overline{k}$ (which is a subset of the irreducible components of $T \otimes_k \overline{k}$) we therefore deduce that $\dim T' = \dim P - 1$. According to [Har77, ex.II.3.20], we deduces that T has pure codimension equal to 1. As P is smooth, T is therefore the support of a divisor. □

Proposition 17.6.1.6. With notations 17.6.1.3, suppose X_0 is integral and $P^\dagger$ is either proper or affine.

There exists then a divisor $\widetilde{T}_0$ of P_0 containing T_0 such that $\widetilde{Y}_0 := (P_0 \setminus \widetilde{T}_0) \cap X_0$ is affine dense in Y_0 and the open immersion $\widetilde{Y}_0 \hookrightarrow X_0$ ideally desingularizes.

Proof. By de Jong's desingularisation theorem ([dJ96]) and replacing Y_0 by an affine dense open subset, there exists a projective surjective morphism $a_0 \colon X_0' \to X_0$, which decomposes into a closed immersion $X_0' \hookrightarrow \mathbb{P}^r_{X_0}$ followed by the canonical projection $\mathbb{P}^r_{X_0} \to X_0$, such that

(i) X_0' is integral and smooth ;

(ii) the morphism $b_0 \colon Y_0' := a_0^{-1}(Y_0) \to Y_0$ induced by a_0 is finite and étale.

It remains to check that, shrinking Y_0 if necessary, the property (iii) of 17.6.1.1 holds. Write v_0' for the closed immersion $Y_0' \hookrightarrow \mathbb{P}^r_{Y_0}$. If $x_0, \ldots, x_r$ are the projective coordinates of $\mathbb{P}^r_k$, we write, for all integers $\alpha \in \{0, \ldots, r\}$, D_α for the divisor of $\mathbb{P}^r_k$ defined by the equation $x_\alpha = 0$ and $D_{\alpha, Y_0} := D_\alpha \times_{\mathbb{P}^r_k} \mathbb{P}^r_{Y_0}$. As the intersection of the divisors D_{α, Y_0} is empty, there exists a integer α_0 such that $v_0'(Y_0')$ is not included in D_{α_0, Y_0}. As Y_0' is integral, we obtain $\dim Y_0' \cap D_{\alpha_0, Y_0} < \dim Y_0'$. Via [Gro65, 5.4.2], the finiteness of b_0 implies $\dim b_0(Y_0' \cap D_{\alpha_0, Y_0}) = \dim Y_0' \cap D_{\alpha_0, Y_0}$. As b_0 is surjective, we also have $\dim Y_0' = \dim Y_0$ and thus $\dim b_0(Y_0' \cap D_{\alpha_0, Y_0}) < \dim Y_0$. It follows from the last inequality that there exists an affine open subset $\widetilde{U}_0$ of U_0 such that the open subset $\widetilde{Y}_0 := \widetilde{U}_0 \cap Y_0$ of Y_0 is dense and is included in $Y_0 \setminus b_0(Y_0' \cap D_{\alpha_0, Y_0})$. Set $\widetilde{T}_0 := P_0 \setminus \widetilde{U}_0$. Then using 17.6.1.5 in the case where P is proper or choosing $\widetilde{U}_0$ to be a standard open subset of P_0 in the affine case, we can suppose that $\widetilde{T}_0$ is the support of divisor of P_0.

Put $\widetilde{T}_{X_0} = \widetilde{T}_0 \cap X_0$ and $\widetilde{T}_{X_0'} := a_0^{-1}(\widetilde{T}_{X_0})$. The inclusion $b_0(Y_0' \cap D_{\alpha_0, Y_0}) \subset \widetilde{T}_{X_0}$ (resp. $X_0 \setminus \widetilde{T}_{X_0} \subset Y_0$) implies then $Y_0' \cap D_{\alpha_0, Y_0} \subset \widetilde{T}_{X_0'}$ (resp. $X_0' \setminus \widetilde{T}_{X_0}' \subset Y_0'$). From this follows the factorisation $\widetilde{Y}_0' := X_0' \setminus \widetilde{T}_{X_0'} \hookrightarrow (\mathbb{P}^r_k \setminus D_{\alpha_0}) \times (X_0 \setminus \widetilde{T}_{X_0}) = \mathbb{A}^r_{\widetilde{Y}_0}$.

As $\widetilde{Y}_0 / S_0$ (resp. $\widetilde{Y}_0'/S_0$) is smooth affine, then there exists a very smooth affine $\mathfrak{S}$-weak formal scheme $\widetilde{Y}^\dagger$ (resp. $\widetilde{Y}'^\dagger$) lifting it (see 17.1.1.20 and 17.1.1.22.(c)). We get a lifting $\widetilde{Y}'^\dagger \to \widetilde{Y}^\dagger$ of the map $\widetilde{Y}_0' \to \mathbb{A}^r_{\widetilde{Y}_0}$ (we might invoke 17.1.1.22.(c)) but here this is obvious). Thus the canonical morphism $\widetilde{Y}_0' \to \mathbb{P}^r_{X_0 \setminus \widetilde{T}_{X_0}}$ lifts to a morphism of smooth $\mathfrak{S}$-weak formal scheme of the form $\widetilde{Y}'^\dagger \to \mathbb{P}^{r\dagger}_{\widetilde{Y}^\dagger}$. Hence, the open immersion $\widetilde{Y}_0 \hookrightarrow X_0$ ideally desingularizes. □

Theorem 17.6.1.7. *With the notations of 17.5.2, we have* $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(E) \in \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K)$, *for any* $E \in \mathrm{MIC}^\dagger(Y_0/K)$.

Proof. 0 Since this is local in $\mathfrak{P}$, we can suppose that Y_0, U_0 and P_0 are integral and affine. Put $\mathcal{E} := \mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0, +}(E)$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$ be such that $\underrightarrow{l}^*_{\mathbb{Q}}\ \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}$.

I) Let Z_0 be a closed (reduced) subscheme of X_0. We prove, by induction on $(\dim Z_0, \mathrm{cmax} Z_0)$ (for the lexicographical order), where $\mathrm{cmax} Z_0$ denotes the number of irreducible components of Z_0 of dimension $\dim Z_0$, the following assertion:

$$\text{“ If } \mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0)), \text{ then } \mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))\text{”} \qquad (17.6.1.7.1)$$

Beware that $\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}})$ is a priori stronger than $\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$. The reason why we need this stronger property is that when we work with coherent complexes, the composition of local cohomological functors (for instance) might be problematic in categories of the form $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}})$ (contrary to overcoherent complexes).

1) Let us treat the case where $\dim Z_0 = 0$. Since $Z_0 \to S_0$ is finite and étale (see 15.3.3.3), then there exists a finite étale morphism $\mathfrak{Z} \to \mathfrak{S}$ which lift $X_0 \to S_0$. We get a lifting $u \colon \mathfrak{Z} \hookrightarrow \mathfrak{P}$ of $Z_0 \to P_0$. If $\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$, then following Berthelot-Kashiwara $u^{(\bullet)!}\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}})$ and then $\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} u_+^{(\bullet)} u^{(\bullet)!}\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ and we are done.

2) i) Suppose now $\dim Z_0 > 0$. Let C_0 be an irreducible component of Z_0 such that $\dim C_0 = \dim Z_0$. Let C_0' be the union of the other irreducible components of Z_0. If $T_0 \supset C_0$ then $\mathbb{R}\underline{\Gamma}^\dagger_{C_0} \mathcal{E}^{(\bullet)} = 0$ which implies $\mathbb{R}\underline{\Gamma}^\dagger_{C_0'} \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)}$ (use 13.1.4.15) and by using the induction hypotheses this yields $\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}})$. We therefore come back to assuming that $T_0 \not\supset C_0$. Hence, $V_0 := C_0 \cap U_0$ and $C_0 \setminus (C_0' \cup T_0)$ are dense opens of C_0. This yields, there exists a principal open subset $\widetilde{\mathfrak{U}}$ of $\mathfrak{U}$ such that $\widetilde{V}_0 := \widetilde{U}_0 \cap C_0 = \widetilde{U}_0 \cap Z_0$ and $\widetilde{V}_0$ is smooth and dense in C_0. By setting $\widetilde{T}_0 := P_0 \setminus \widetilde{U}_0$, remark $\widetilde{T}_0$ is the support of a divisor. Shrinking $\widetilde{U}_0$ if necessary, by 17.6.1.6, we can furthermore suppose the open

immersion $\widetilde{U}_0 \cap C_0 \hookrightarrow C_0$ ideally desingularizes. Denote by $\widetilde{Y}^\dagger$ (resp. $\widetilde{U}^\dagger$) the open subset of $Y^\dagger$ (resp. $U^\dagger$) complementary to $\widetilde{T}_0$ and by $\widetilde{E} := j^\dagger_{\widetilde{T}_0} E \in \mathrm{MIC}^\dagger(\widetilde{Y}_0/K)$. We set $\widetilde{\mathcal{E}}^{(\bullet)} := ({}^\dagger \widetilde{T}_0)\mathcal{E}^{(\bullet)}$ and $\widetilde{\mathcal{E}} := ({}^\dagger \widetilde{T}_0)\mathcal{E}$. We obtain $\underrightarrow{l}^*_{\mathbb{Q}} \widetilde{\mathcal{E}}^{(\bullet)} \xrightarrow{\sim} \widetilde{\mathcal{E}} \xrightarrow{\sim} \mathrm{sp}_{\widetilde{Y}^\dagger \hookrightarrow \widetilde{U}^\dagger, \widetilde{T}_0,+}(\widetilde{E})$ (see 17.5.2.10).

ii) Since by hypothesis $\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$, since $\widetilde{V}_0 := \widetilde{U}_0 \cap C_0 = \widetilde{U}_0 \cap Z_0$, then

$$\mathbb{R}\underline{\Gamma}^\dagger_{C_0}(\widetilde{\mathcal{E}}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{\widetilde{V}_0}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} ({}^\dagger \widetilde{T}_0)(\mathbb{R}\underline{\Gamma}^\dagger_{Z_0} \mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(\widetilde{T}_0)). \qquad (17.6.1.7.2)$$

As $\widetilde{V}_0/S_0$ is smooth affine, there exists a very smooth affine $\mathfrak{S}$-weak formal scheme $\widetilde{V}^\dagger$ lifting it (see 17.1.1.16). Choose $b\colon \widetilde{V}^\dagger \hookrightarrow \widetilde{Y}^\dagger$ a closed immersion lifting $\widetilde{V}_0 \hookrightarrow \widetilde{Y}_0$ (see 17.1.1.22.(c)). We get the commutative diagram:

$$\begin{array}{ccccc}
\widetilde{V}^\dagger & \overset{\widetilde{v}'}{\hookrightarrow} & \widetilde{U}^\dagger & \overset{j'}{\hookrightarrow} & P^\dagger \\
\downarrow{\scriptstyle a} & & \downarrow{\scriptstyle \mathrm{id}} & & \downarrow{\scriptstyle \mathrm{id}} \\
\widetilde{Y}^\dagger & \overset{\widetilde{v}}{\hookrightarrow} & \widetilde{U}^\dagger & \overset{j}{\hookrightarrow} & P^\dagger,
\end{array} \qquad (17.6.1.7.3)$$

where $\widetilde{v}\colon \widetilde{Y}^\dagger \hookrightarrow \widetilde{U}^\dagger$ is the closed immersion induced by v and $\widetilde{v}' := \widetilde{v} \circ a$. Via 17.5.2.9, since $\widetilde{V}_0$ is dense in C_0, since following the step i) we have $\widetilde{\mathcal{E}} \xrightarrow{\sim} \mathrm{sp}_{\widetilde{Y}^\dagger \hookrightarrow \widetilde{U}^\dagger, \widetilde{T}_0,+}(\widetilde{E})$, this yields the isomorphism:

$$\mathrm{sp}_{\widetilde{V}^\dagger \hookrightarrow \widetilde{U}^\dagger, \widetilde{T}_0,+}(a^* \widetilde{E}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{C_0}(\widetilde{\mathcal{E}})[-d_{\widetilde{V}_0/\widetilde{Y}_0}] =: \widetilde{\mathcal{F}}. \qquad (17.6.1.7.4)$$

With 17.6.1.4, this yields $\widetilde{\mathcal{F}} \in \mathrm{MIC}^{\dagger\dagger}(C_0, \mathfrak{P}, \widetilde{T}_0/K)$, in particular $\widetilde{\mathcal{F}}$ is $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}$-overcoherent. Set $\widetilde{\mathcal{F}}^{(\bullet)} := \mathbb{R}\underline{\Gamma}^\dagger_{C_0}({}^\dagger \widetilde{\mathcal{E}}^{(\bullet)})[-d_{\widetilde{V}_0/\widetilde{Y}_0}] \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(\widetilde{T}_0))$, since $\underrightarrow{l}^*_{\mathbb{Q}} \widetilde{\mathcal{F}}^{(\bullet)} \xrightarrow{\sim} \widetilde{\mathcal{F}}$ then following 15.3.6.6 $\widetilde{\mathcal{F}}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(\widetilde{T}_0))$.

iii) Using de Jong's desingularisation theorem, we obtain the commutative diagram (use 16.1.11.1):

$$\begin{array}{ccccccc}
\widetilde{U}_0 & \longrightarrow & U_0 & \longrightarrow & P_0 & \longrightarrow & \mathfrak{P} \\
\uparrow & \square & \uparrow & \square & \uparrow & & \| \\
\widetilde{Y}_0 & \longrightarrow & Y_0 & \longrightarrow & X_0 & \longrightarrow & \mathfrak{P} \\
{\scriptstyle a}\uparrow & \square & \uparrow & \square & \uparrow & & \| \\
\widetilde{V}_0 & \longrightarrow & V_0 & \longrightarrow & C_0 & \longrightarrow & \mathfrak{P} \\
{\scriptstyle b}\uparrow & \square & \uparrow & \square & {\scriptstyle h}\uparrow & & {\scriptstyle q}\uparrow \\
\widetilde{V}'_0 & \longrightarrow & V'_0 & \longrightarrow & C'_0 & \longrightarrow & \widehat{\mathbb{P}}^N_{\mathfrak{P}},
\end{array}$$

in which the squares in the two columns on the left are cartesian, C'_0 is smooth, q is the canonical projection, h is a projective, surjective, generically finite and étale morphism, such that $h^{-1}(C_0 \cap \widetilde{T}_0)$ is a strict normal crossing divisor divisor of C'_0, the horizontal arrows of the right squares are closed immersions. Put $T'_0 := q^{-1}(T_0)$ and $\widetilde{T}'_0 := q^{-1}(\widetilde{T}_0)$. As C'_0/S_0 is smooth and $C'_0 \cap \widetilde{T}'_0$ is a divisor of C'_0, then $C'_0 \cap T_0$ is also a divisor of C'_0. Since $\mathbb{R}\underline{\Gamma}^\dagger_{C'_0} q^!(\widetilde{\mathcal{F}}) \in \mathrm{MIC}^{\dagger\dagger}(C'_0, \widehat{\mathbb{P}}^N_{\mathfrak{P}}, \widetilde{T}'_0/K)$, since C'_0/S_0 is smooth then following 12.2.2.6 there exists a (unique up to isomorphism) $\widetilde{E}' \in \mathrm{MIC}^\dagger(\widetilde{V}'_0, C'_0, \widehat{\mathbb{P}}^N_{\mathfrak{P}}/K)$ such that

$$\mathbb{R}\underline{\Gamma}^\dagger_{C'_0} q^!(\widetilde{\mathcal{F}}) \xrightarrow{\sim} \mathrm{sp}_{C'_0 \hookrightarrow \mathfrak{P}', \widetilde{T}'_0}(\widetilde{E}'). \qquad (17.6.1.7.5)$$

iv) In this step, we check that $\widetilde{E}' \in \mathrm{MIC}^\dagger(\widetilde{V}'_0, C'_0, \widehat{\mathbb{P}}^N_{\mathfrak{P}}/K)$ comes from an object of $\mathrm{MIC}^\dagger(V'_0, C'_0, \widehat{\mathbb{P}}^N_{\mathfrak{P}}/K)$.

Set $\mathfrak{U}' := \widehat{\mathbb{P}}^N_{\mathfrak{P}} \setminus T'_0$. Since V'_0/S_0 is smooth, then using the theorem of contagiosity of Kedlaya (see 16.1.8.1), we reduce to check that the restriction of $\widetilde{E}'$ on $\mathrm{MIC}^\dagger(\widetilde{V}'_0, V'_0, \mathfrak{U}'/K)$ comes from an object of $\mathrm{MIC}^\dagger(V'_0, V'_0, \mathfrak{U}'/K)$. In other words, we reduce to the case where the divisor T_0 is empty, i.e. $U_0 = P_0$, $C_0 = V_0$, $C'_0 = V'_0$ and T'_0 is empty. In that case, denoting by $G \in \mathrm{MIC}^\dagger(Y_0, Y_0/K)$ the convergent isocrystal on Y_0 associated to E, we get from 17.5.2.5 the isomorphism $\mathcal{E} \xrightarrow{\sim} \mathrm{sp}_{Y_0 \hookrightarrow \mathfrak{U}+}(G)$

of $\mathrm{MIC}^{\dagger\dagger}(Y_0,\mathfrak{U}/K)$. With 17.6.1.7.4 and 17.6.1.7.5 we get therefore the isomorphism:

$$\mathrm{sp}_{V'_0\hookrightarrow\mathfrak{U}',\widetilde{T}'_0}(\widetilde{E'}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{V'_0} q^! \mathbb{R}\underline{\Gamma}^{\dagger}_{V_0}({}^{\dagger}\widetilde{T}_0)(\mathrm{sp}_{Y_0\hookrightarrow\mathfrak{U}+}(G))[-d_{\widetilde{V}_0/\widetilde{Y}_0}]$$

$$\xrightarrow{\sim} ({}^{\dagger}\widetilde{T}'_0)\left(\mathbb{R}\underline{\Gamma}^{\dagger}_{V'_0} q^!(\mathrm{sp}_{Y_0\hookrightarrow\mathfrak{U}+}(G))[-d_{\widetilde{V}_0/\widetilde{Y}_0}]\right) \overset{16.2.4.3}{\xrightarrow{\sim}} ({}^{\dagger}\widetilde{T}'_0)(\mathrm{sp}_{V'_0\hookrightarrow\mathfrak{U}'+}(G')) \overset{16.2.4.3}{\xrightarrow{\sim}} \mathrm{sp}_{V'_0\hookrightarrow\mathfrak{U}',\widetilde{T}'_0}(j^{\dagger}_{\widetilde{T}'_0}G')$$

where $G' = h^*(G) \in \mathrm{MIC}^{\dagger}(V'_0, V'_0/K)$. Since the functor $\mathrm{sp}_{V'_0\hookrightarrow\mathfrak{U}',\widetilde{T}'_0}$ is fully faithfull, then we are done.

v) Set $\mathfrak{P}' := \widehat{\mathbb{P}}^N_{\mathfrak{P}}$. Following the step iv), there exists $E' \in \mathrm{MIC}^{\dagger}(V'_0, C'_0, \mathfrak{P}'/K)$ such that the induced object of $\mathrm{MIC}^{\dagger}(\widetilde{V}'_0, C'_0, \mathfrak{P}'/K)$ is isomorphic to $\widetilde{E}'$. Put $\mathcal{E}' := \mathrm{sp}_{C'_0\hookrightarrow\mathfrak{P}',T'_0}(E')$. Let $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'_0))$ be such that $\underrightarrow{l}^*_{\mathbb{Q}}\ \mathcal{E}'^{(\bullet)} \xrightarrow{\sim} \mathcal{E}'$. It follows from 17.6.1.7.6 the isomorphism:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{C'_0} q^!(\widetilde{\mathcal{F}}) \xrightarrow{\sim} ({}^{\dagger}\widetilde{T}'_0)(\mathcal{E}'). \tag{17.6.1.7.6}$$

Since $\widetilde{\mathcal{F}}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(\widetilde{T}_0))$, then $\mathbb{R}\underline{\Gamma}^{\dagger}_{C'_0} q^{(\bullet)!}(\widetilde{\mathcal{F}}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(\widetilde{T}'_0))$. Since $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'_0))$, then $({}^{\dagger}\widetilde{T}'_0)(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(\widetilde{T}'_0))$. Since $\underrightarrow{l}^*_{\mathbb{Q}}$ is fully faithful on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(\widetilde{T}'_0))$, then we get from 17.6.1.7.6 the isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(\widetilde{T}'_0))$:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{C'_0} q^{(\bullet)!}(\widetilde{\mathcal{F}}^{(\bullet)}) \xrightarrow{\sim} ({}^{\dagger}\widetilde{T}'_0)(\mathcal{E}'^{(\bullet)}). \tag{17.6.1.7.7}$$

Since $({}^{\dagger}\widetilde{T}'_0)(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'}(T'_0))$, then so is $\mathbb{R}\underline{\Gamma}^{\dagger}_{C'_0} q^{(\bullet)!}(\widetilde{\mathcal{F}}^{(\bullet)})$. By 15.3.6.14, this yields $q^{(\bullet)}_{+}\mathbb{R}\underline{\Gamma}^{\dagger}_{C'_0} q^{(\bullet)!}(\widetilde{\mathcal{F}}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$. By 16.1.11.2, $\widetilde{\mathcal{F}}^{(\bullet)}$ is a direct summand of $q^{(\bullet)}_{+}\mathbb{R}\underline{\Gamma}^{\dagger}_{C'_0} q^{(\bullet)!}(\widetilde{\mathcal{F}}^{(\bullet)})$. This yields $\widetilde{\mathcal{F}}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$.

vi) Write the localisation triangle in $\widetilde{T}_0$ of $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z_0}\mathcal{E}$ as:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z_0\cap\widetilde{T}_0}\mathcal{E}^{(\bullet)} \to \mathbb{R}\underline{\Gamma}^{\dagger}_{Z_0}\mathcal{E}^{(\bullet)} \to \mathbb{R}\underline{\Gamma}^{\dagger}_{Z_0}({}^{\dagger}\widetilde{T}_0)\mathcal{E}^{(\bullet)} \to +1. \tag{17.6.1.7.8}$$

The middle term of 17.6.1.7.8 is coherent by hypothesis. Moreover, via the isomorphism 17.6.1.7.2, following the step v) we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z_0}({}^{\dagger}\widetilde{T}_0)\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$. Hence, from 17.6.1.7.8 we get $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z_0\cap\widetilde{T}_0}\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$. As $\widetilde{V}_0$ is dense in C_0, then $\dim C_0\cap\widetilde{T}_0 < \dim C_0 = \dim Z_0$. Hence, either $\dim Z_0\cap\widetilde{T}_0 < \dim Z_0$ or $\dim Z_0\cap\widetilde{T}_0 = \dim Z_0$ and $\mathrm{cmax}(Z_0\cap\widetilde{T}_0) < \mathrm{cmax}(Z_0)$. By the induction hypotheses, it follows that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z_0\cap\widetilde{T}_0}\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}}(T_0))$. We conclude the induction via 17.6.1.7.8.

II) Applying 17.6.1.7.1 to the case $Z_0 = X_0$, we obtain the $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}}$-overcoherence of $\mathcal{E}$. Hence, using 17.5.2.5 we get $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K)$. □

17.6.2 The functor $\mathrm{sp}_{Y\hookrightarrow U^{\dagger},T,+}$

Let $P^{\dagger}$ be a separated and smooth $\mathfrak{S}$-weak formal scheme with special fiber P_0, let T_0 be a divisor of P_0, $U^{\dagger}$ the open set of $P^{\dagger}$ complementary to T_0, U_0 the special fiber of $U^{\dagger}$, $j\colon U^{\dagger}\hookrightarrow P^{\dagger}$ the open immersion, $v_0\colon Y_0\hookrightarrow U_0$ be a closed immersion of smooth k-schemes. We denote by X_0 the closure of Y_0 in P_0. In this subsection, using 17.1.1.22.(c) we fix the following lifting choices:

17.6.2.1. Let $(P^{\dagger}_{\alpha})_{\alpha\in\Lambda}$ be an open covering of $P^{\dagger}$. We set $P^{\dagger}_{\alpha\beta} := P^{\dagger}_{\alpha}\cap P^{\dagger}_{\beta}$, $P^{\dagger}_{\alpha\beta\gamma} := P^{\dagger}_{\alpha}\cap P^{\dagger}_{\beta}\cap P^{\dagger}_{\gamma}$, $U^{\dagger}_{\alpha\beta} := U^{\dagger}\cap P^{\dagger}_{\alpha\beta}$, $U^{\dagger}_{\alpha\beta\gamma} := U^{\dagger}\cap P^{\dagger}_{\alpha\beta\gamma}$. We denote by $Y_{\alpha 0} := Y_0\cap U_{\alpha 0}$, $Y_{\alpha\beta 0} := Y_0\cap U_{\alpha\beta 0}$, $Y_{\alpha\beta\gamma 0} := Y_0\cap U_{\alpha\beta\gamma 0}$. We set $T_{\alpha 0} := T_0\cap P_{\alpha 0}$, $T_{\alpha\beta 0} := T_0\cap P_{\alpha\beta 0}$, $T_{\alpha\beta\gamma 0} := T_0\cap P_{\alpha\beta\gamma 0}$.

We suppose that for every $\alpha\in\Lambda$, $P^{\dagger}_{\alpha}$, $U^{\dagger}_{\alpha}$ are affine and $U^{\dagger}_{\alpha}/\mathfrak{S}$ has coordinates.

For any 3uple $(\alpha,\beta,\gamma)\in\Lambda^3$, fix $Y^{\dagger}_{\alpha}$ (resp. $Y^{\dagger}_{\alpha\beta}$, $Y^{\dagger}_{\alpha\beta\gamma}$) some smooth $\mathfrak{S}$-weak formal scheme lifting $Y_{\alpha 0}$ (resp. $Y_{\alpha\beta 0}$, $Y_{\alpha\beta\gamma 0}$), $p^{\alpha\beta}_1\colon Y^{\dagger}_{\alpha\beta}\to Y^{\dagger}_{\alpha}$ (resp. $p^{\alpha\beta}_2\colon Y^{\dagger}_{\alpha\beta}\to Y^{\dagger}_{\beta}$) some lifting of the inclusions $Y_{\alpha\beta 0}\to Y_{\alpha 0}$ (resp. $Y_{\alpha\beta 0}\to Y_{\beta 0}$).

Similarly, for any $(\alpha,\beta,\gamma)\in\Lambda^3$, fix some lifting $p^{\alpha\beta\gamma}_{12}\colon Y^{\dagger}_{\alpha\beta\gamma}\to Y^{\dagger}_{\alpha\beta}$, $p^{\alpha\beta\gamma}_{23}\colon Y^{\dagger}_{\alpha\beta\gamma}\to Y^{\dagger}_{\beta\gamma}$, $p^{\alpha\beta\gamma}_{13}\colon Y^{\dagger}_{\alpha\beta\gamma}\to Y^{\dagger}_{\alpha\gamma}$, $p^{\alpha\beta\gamma}_{1}\colon Y^{\dagger}_{\alpha\beta\gamma}\to Y^{\dagger}_{\alpha}$, $p^{\alpha\beta\gamma}_{2}\colon Y^{\dagger}_{\alpha\beta\gamma}\to Y^{\dagger}_{\beta}$, $p^{\alpha\beta\gamma}_{3}\colon Y^{\dagger}_{\alpha\beta\gamma}\to Y^{\dagger}_{\gamma}$, $v_{\alpha}\colon Y^{\dagger}_{\alpha}\hookrightarrow U^{\dagger}_{\alpha}$, $v_{\alpha\beta}\colon Y^{\dagger}_{\alpha\beta}\hookrightarrow U^{\dagger}_{\alpha\beta}$ and $v_{\alpha\beta\gamma}\colon Y^{\dagger}_{\alpha\beta\gamma}\hookrightarrow U_{\alpha\beta\gamma}$.

Definition 17.6.2.2. For any $\alpha \in \Lambda$, let $\mathcal{E}_\alpha \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger_\alpha/\mathcal{V})$. A *glueing data* on $(\mathcal{E}_\alpha)_{\alpha\in\Lambda}$ is the data for any α, $\beta \in \Lambda$ of an isomorphism of $\mathrm{MIC}^{\dagger\dagger}(Y^\dagger_{\alpha\beta}/\mathcal{V})$ of the form:

$$\theta_{\alpha\beta} \colon p_2^{\alpha\beta !}(\mathcal{E}_\beta) \xrightarrow{\sim} p_1^{\alpha\beta !}(\mathcal{E}_\alpha),$$

satisfying the cocycle condition: $\theta_{13}^{\alpha\beta\gamma} = \theta_{12}^{\alpha\beta\gamma} \circ \theta_{23}^{\alpha\beta\gamma}$, where $\theta_{12}^{\alpha\beta\gamma}$, $\theta_{23}^{\alpha\beta\gamma}$ and $\theta_{13}^{\alpha\beta\gamma}$ are the isomorphisms making commutative the following diagram

$$\begin{array}{ccc}
p_{12}^{\alpha\beta\gamma !} p_2^{\alpha\beta !}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\tau} & p_2^{\alpha\beta\gamma !}(\mathcal{E}_\beta) \\
\sim\downarrow p_{12}^{\alpha\beta\gamma !}(\theta_{\alpha\beta}) & & \downarrow \theta_{12}^{\alpha\beta\gamma} \\
p_{12}^{\alpha\beta\gamma !} p_1^{\alpha\beta !}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\tau} & p_1^{\alpha\beta\gamma !}(\mathcal{E}_\alpha),
\end{array}
\quad
\begin{array}{ccc}
p_{23}^{\alpha\beta\gamma !} p_2^{\beta\gamma !}(\mathcal{E}_\gamma) & \xrightarrow[\sim]{\tau} & p_3^{\alpha\beta\gamma !}(\mathcal{E}_\gamma) \\
\sim\downarrow p_{23}^{\alpha\beta\gamma !}(\theta_{\beta\gamma}) & & \downarrow \theta_{23}^{\alpha\beta\gamma} \\
p_{23}^{\alpha\beta\gamma !} p_1^{\beta\gamma !}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\tau} & p_2^{\alpha\beta\gamma !}(\mathcal{E}_\beta),
\end{array}
\quad
\begin{array}{ccc}
p_{13}^{\alpha\beta\gamma !} p_2^{\alpha\gamma !}(\mathcal{E}_\gamma) & \xrightarrow[\sim]{\tau} & p_3^{\alpha\beta\gamma !}(\mathcal{E}_\gamma) \\
\sim\downarrow p_{13}^{\alpha\beta\gamma !}(\theta_{\alpha\gamma}) & & \downarrow \theta_{13}^{\alpha\beta\gamma} \\
p_{13}^{\alpha\beta\gamma !} p_1^{\alpha\gamma !}(\mathcal{E}_\alpha) & \xrightarrow[\sim]{\tau} & p_1^{\alpha\beta\gamma !}(\mathcal{E}_\alpha),
\end{array}
\tag{17.6.2.2.1}$$

where τ are the glueing isomorphisms defined at 17.5.1.3.

Definition 17.6.2.3. We define the category $\mathrm{MIC}^{\dagger\dagger}((Y^\dagger_\alpha)_{\alpha\in\Lambda}/\mathcal{V})$ as follows:

(a) an object is a family $(\mathcal{E}_\alpha)_{\alpha\in\Lambda}$ of objects $\mathcal{E}_\alpha \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger_\alpha/\mathcal{V})$ for each $\alpha \in \Lambda$ together with a glueing data $(\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}$,

(b) a morphism $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \to ((\mathcal{E}'_\alpha)_{\alpha\in\Lambda}, (\theta'_{\alpha\beta})_{\alpha,\beta\in\Lambda})$ is a family of morphisms $f_\alpha \colon \mathcal{E}_\alpha \to \mathcal{E}'_\alpha$ of $\mathrm{MIC}^{\dagger\dagger}(Y^\dagger_\alpha/\mathcal{V})$ commuting with glueing data, i.e., such that the following diagrams are commutative:

$$\begin{array}{ccc}
p_2^{\alpha\beta !}(\mathcal{E}_\beta) & \xrightarrow[\sim]{\theta_{\alpha\beta}} & p_1^{\alpha\beta !}(\mathcal{E}_\alpha) \\
p_2^{\alpha\beta !}(f_\beta)\downarrow & & \downarrow p_1^{\alpha\beta !}(f_\alpha) \\
p_2^{\alpha\beta !}(\mathcal{E}'_\beta) & \xrightarrow[\sim]{\theta'_{\alpha\beta}} & p_1^{\alpha\beta !}(\mathcal{E}'_\alpha).
\end{array}
\tag{17.6.2.3.1}$$

17.6.2.4. It follows from 17.5.1.1 that we get an equivalence of categories $\mathrm{sp}_{Y_0 *} \colon \mathrm{MIC}^\dagger(Y/K) \to \mathrm{MIC}^{\dagger\dagger}((Y^\dagger_\alpha)_{\alpha\in\Lambda}/\mathcal{V})$ by setting $\mathrm{sp}_{Y_0 *}(E) := ((\mathrm{sp}_{Y^\dagger_\alpha *}(E|Y_{\alpha 0}))_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}))$, where

$$\theta_{\alpha\beta} \colon p_2^{\alpha\beta !}(\mathcal{E}_\beta) = p_2^{\alpha\beta !}(\mathrm{sp}_{Y^\dagger_\beta *}(E|Y_{\beta 0})) \overset{17.5.1.3.1}{\xrightarrow{\sim}} \mathrm{sp}_{Y^\dagger_{\alpha\beta} *}(E|Y_{\alpha\beta 0})) \overset{17.5.1.3.1}{\xrightarrow{\sim}} p_1^{\alpha\beta !}(\mathrm{sp}_{Y^\dagger_\alpha *}(E|Y_{\alpha 0})) = p_1^{\alpha\beta !}(\mathcal{E}_\alpha),$$

17.6.2.5. We define the functor $\widetilde{\mathrm{sp}}_{Y_0 \hookrightarrow U^\dagger, T, +} \colon \mathrm{MIC}^{\dagger\dagger}((Y^\dagger_\alpha)_{\alpha\in\Lambda}/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K)$ as follows: Let $((\mathcal{E}_\alpha)_{\alpha\in\Lambda}, (\theta_{\alpha\beta})_{\alpha,\beta\in\Lambda}) \in \mathrm{MIC}^{\dagger\dagger}((Y^\dagger_\alpha)_{\alpha\in\Lambda}/\mathcal{V})$. Let $w_1^{\alpha\beta} \colon U^\dagger_{\alpha\beta} \cap Y^\dagger_\alpha \hookrightarrow U^\dagger_{\alpha\beta}$ be the the restriction of v_α. The morphism $w_1^{\alpha\beta}$ is a closed immersion of affine and smooth $\mathfrak{S}$-weak formal scheme which is a lifting of $Y_{\alpha\beta 0} \hookrightarrow U_{\alpha\beta 0}$. Since $p_1^{\alpha\beta} \colon Y^\dagger_{\alpha\beta} \to Y^\dagger_\alpha$ is a lifting of the open inclusion $Y_{\alpha\beta 0} \subset Y_{\alpha 0}$ then $p_1^{\alpha\beta}$ factor through $q_1^{\alpha\beta} \colon Y^\dagger_{\alpha\beta} \to Y^\dagger_\alpha \cap U^\dagger_{\alpha\beta}$. Setting $v_1^{\alpha\beta} := w_1^{\alpha\beta} \circ q_1^{\alpha\beta}$ and $j_1^{\alpha\beta} \colon U^\dagger_{\alpha\beta} \subset U^\dagger_\alpha$, we get the equality $j_1^{\alpha\beta} \circ v_1^{\alpha\beta} = u_\alpha \circ v_1^{\alpha\beta}$. Hence, it follows from 17.5.1.3 and 17.5.2.9 the first isomorphism:

$$\widetilde{\mathrm{sp}}_{Y^\dagger_\alpha \underset{v_\alpha}{\hookrightarrow} U^\dagger_\alpha, T_\alpha, +}(\mathcal{E}_\alpha)|\mathfrak{P}_{\alpha\beta} \xrightarrow{\sim} \widetilde{\mathrm{sp}}_{Y^\dagger_{\alpha\beta} \underset{v_1^{\alpha\beta}}{\hookrightarrow} U^\dagger_{\alpha\beta}, T_{\alpha\beta}, +}(p_1^{\alpha\beta !}(\mathcal{E}_\alpha)) \overset{17.5.2.12}{\xrightarrow{\sim}} \widetilde{\mathrm{sp}}_{Y^\dagger_{\alpha\beta} \underset{v_{\alpha\beta}}{\hookrightarrow} U^\dagger_{\alpha\beta}, T_{\alpha\beta}, +}(p_1^{\alpha\beta !}(\mathcal{E}_\alpha)).
\tag{17.6.2.5.1}$$

Similarly to 17.6.2.5.1, we get the first isomorphism:

$$\tau_{\alpha\beta} \colon \widetilde{\mathrm{sp}}_{Y^\dagger_\beta \underset{v_\beta}{\hookrightarrow} U^\dagger_\beta, T_\beta, +}(\mathcal{E}_\beta)|\mathfrak{P}_{\alpha\beta} \xrightarrow{\sim} \widetilde{\mathrm{sp}}_{Y^\dagger_{\alpha\beta} \underset{v_{\alpha\beta}}{\hookrightarrow} U^\dagger_{\alpha\beta}, T_{\alpha\beta}, +}(p_2^{\alpha\beta !}(\mathcal{E}_\beta))$$

$$\overset{\theta_{\alpha\beta}}{\xrightarrow{\sim}} \widetilde{\mathrm{sp}}_{Y^\dagger_{\alpha\beta} \underset{v_{\alpha\beta}}{\hookrightarrow} U^\dagger_{\alpha\beta}, T_{\alpha\beta}, +}(p_1^{\alpha\beta !}(\mathcal{E}_\alpha)) \overset{17.6.2.5.1}{\xrightarrow{\sim}} \widetilde{\mathrm{sp}}_{Y^\dagger_\alpha \underset{v_\alpha}{\hookrightarrow} U^\dagger_\alpha, T_\alpha, +}(\mathcal{E}_\alpha)|\mathfrak{P}_{\alpha\beta}.
\tag{17.6.2.5.2}$$

It follows from the commutativity of the diagram 17.5.2.12.2 that so is the following one:

$$\begin{array}{ccccccc}
\widetilde{\mathrm{sp}}_{Y^\dagger_\beta \underset{v_\beta}{\hookrightarrow} U^\dagger_\beta, T_\beta, +}(\mathcal{E}_\beta)|\mathfrak{U}_{\alpha\beta} & & \xrightarrow{\qquad\qquad\tau_{\alpha\beta}\qquad\qquad} & & & & \widetilde{\mathrm{sp}}_{Y^\dagger_\alpha \underset{v_\alpha}{\hookrightarrow} U^\dagger_\alpha, T_\alpha, +}(\mathcal{E}_\alpha)|\mathfrak{U}_{\alpha\beta} \\
\downarrow 17.5.2.5 & & & & & & \downarrow 17.5.2.5 \\
\widehat{v}_{\beta +}(\widehat{\mathcal{E}}_\beta) & \xrightarrow{\sim} & \widehat{v}_{\alpha\beta +}(\widehat{p}_2^{\alpha\beta !}(\widehat{\mathcal{E}}_\beta)) & \xrightarrow[\theta_{\alpha\beta}]{\sim} & \widehat{v}_{\alpha\beta +}(\widehat{p}_1^{\alpha\beta !}(\widehat{\mathcal{E}}_\alpha)) & \xrightarrow{\sim} & \widehat{v}_{\alpha +}(\widehat{\mathcal{E}}_\alpha),
\end{array}
\tag{17.6.2.5.3}$$

where the composition of the bottom morphisms is the morphism $\tau_{\alpha\beta}$ constructed at 9.3.7.6.2. Hence, since the family $(\widehat{v}_{\alpha +}(\widehat{\mathcal{E}}_\alpha))_{\alpha\in\Lambda}$ glues (see 9.3.7.6) then so is $(\widetilde{\mathrm{sp}}_{Y^\dagger_\alpha \underset{v_\alpha}{\hookrightarrow} U^\dagger_\alpha, T_\alpha,+}(\mathcal{E}_\alpha))_{\alpha\in\Lambda}$.

17.6.2.6. By setting $\mathrm{sp}_{Y_0\hookrightarrow U^\dagger,T_0,+} := \widetilde{\mathrm{sp}}_{Y_0\hookrightarrow U^\dagger,T_0,+}\circ \mathrm{sp}_{Y_0*}$, we get the functor

$$\mathrm{sp}_{Y_0\hookrightarrow U^\dagger,T_0,+}\colon \mathrm{MIC}^\dagger(Y_0/K)\to \mathrm{MIC}^{\dagger\dagger}(X_0,\mathfrak{P},T_0/K). \qquad (17.6.2.6.1)$$

Remark 17.6.2.7. The functor $\mathrm{sp}_{Y^\dagger\hookrightarrow U^\dagger,T,+}$ is the one we will need to check main Theorem 17.7.4.6 of the whole chapter, i.e. it is be used when Y_0 has a smooth lifting. However, the proof of the comparison between both functors sp_+ (see 17.6.3.2) requires a priori to slightly extend the functor $\mathrm{sp}_{Y^\dagger\hookrightarrow U^\dagger,T,+}$ by glueing in the context of 17.6.2.6.1.

Proposition 17.6.2.8. *Consider the commutative diagram :*

$$\begin{array}{ccccc} Y'_0 & \overset{v'}{\hookrightarrow} & U'^\dagger & \overset{j'}{\hookrightarrow} & P'^\dagger \\ \downarrow b & & \downarrow g & & \downarrow f \\ Y_0 & \overset{v}{\hookrightarrow} & U^\dagger & \overset{j}{\hookrightarrow} & P^\dagger, \end{array} \qquad (17.6.2.8.1)$$

where f and g are smooth morphisms of separated and smooth $\mathfrak{S}$-weak formal schemes, b is a morphism of smooth k-varieties, j and j' are open immersions, v and v' are closed immersions. We suppose there exists a divisor T_0 of P_0 (resp. T'_0 of P'_0) such that $U^\dagger = P^\dagger\setminus T_0$ (resp. $U'^\dagger = P'^\dagger\setminus T'$). Denote by X'_0 the closure of Y'_0 in P'_0. Then we have, for any $E\in\mathrm{MIC}^\dagger(Y/K)$, the canonical isomorphism

$$\mathrm{sp}_{Y'_0\hookrightarrow U'^\dagger,T',+}\circ b^*(E)\xrightarrow{\sim}\mathbb{R}\underline{\Gamma}^\dagger_{Y'_0}\circ f^!\circ \mathrm{sp}_{Y_0\hookrightarrow U^\dagger,T,+}(E)[-d_{Y'_0/Y_0}]. \qquad (17.6.2.8.2)$$

Proof. This is a consequence by glueing of 17.5.2.10 and 17.5.2.9. □

17.6.3 Comparison between $\mathrm{sp}_{Y\hookrightarrow U^\dagger,T,+}$ and $\mathrm{sp}_{X\hookrightarrow\mathfrak{P},T,+}$

Lemma 17.6.3.1. *With the notations of 17.5.2, suppose $U^\dagger$ is affine. Let $\mathcal{M}\in\mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$. Set $M := \Gamma(Y^\dagger,\mathcal{M})\in\mathrm{MIC}^\dagger(A^\dagger_K/K)$ (see 17.5.1.1), $D_{Y^\dagger} := \Gamma(Y^\dagger,\mathcal{D}_{Y^\dagger})$ $D_{U^\dagger\leftarrow Y^\dagger} = \Gamma(Y^\dagger,\mathcal{D}_{U^\dagger\leftarrow Y^\dagger})$, $v_+(M) := D_{U^\dagger\leftarrow Y^\dagger,K}\otimes_{D_{Y^\dagger,K}} M$. We have the canonical isomorphism*

$$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}\otimes_{D_{U^\dagger,K}} v_+(M)\xrightarrow{\sim}\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}\otimes_{j_*\mathcal{D}_{U^\dagger,\mathbb{Q}}} j_*v_+(\mathcal{M}). \qquad (17.6.3.1.1)$$

Proof. We have, for any left $D_{U^\dagger}$-module M, the functorial in M morphism of the form

$$j_*\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} M\to j_*(\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} M). \qquad (17.6.3.1.2)$$

When M is a free $D_{U^\dagger,K}$-module, this is clearly an isomorphism (when M is of finite type this is obvious, otherwise because of the coherence of $U^\dagger$ both functors commute with filtered inductive limits: use[SGA4.2, VI.5.3]). Following 17.2.2.13, the functors $j_*\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} -$ and $j_*(\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} -)$ are right exact on the abelian category of left $D_{U^\dagger,K}$-modules. Hence, by the using the five lemma, this yields the morphism 17.6.3.1.2 is an isomorphism. In particular we get the canonical isomorphism $j_*\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} v_+(M)\xrightarrow{\sim} j_*(\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} v_+(M))$.

Moreover, it follows from 17.2.5.4 (switching from the right to the left module), we have the isomorphism: $\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} v_+(M)\xrightarrow{\sim} v_+(\mathcal{M})$. Hence, $j_*\mathcal{D}_{U^\dagger,\mathbb{Q}}\otimes_{D_{U^\dagger,K}} v_+(M)\xrightarrow{\sim} j_*v_+(\mathcal{M})$. By applying the functor $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}}\otimes_{j_*\mathcal{D}_{U^\dagger,\mathbb{Q}}} -$ to this latter isomorphism, we get 17.6.3.1.1. □

The following proposition 17.6.3.2 will be improved later in 17.6.3.3.

Proposition 17.6.3.2. *With notation 17.6.2, the diagram*

$$\begin{array}{ccc} \mathrm{MIC}^\dagger(Y_0/K) & \xrightarrow{|(Y_0,X_0)} & \mathrm{MIC}^\dagger(Y_0,X_0/K) \\ & {\scriptstyle \mathrm{sp}_{Y_0\hookrightarrow U^\dagger,T,+}}\searrow \qquad \swarrow{\scriptstyle \mathrm{sp}_{X_0\hookrightarrow\mathfrak{P},T_0,+}}\ \cong & \\ & \mathrm{MIC}^{\dagger\dagger}(Y_0,X_0/K) & \end{array} \qquad (17.6.3.2.1)$$

where $|(Y_0,X_0)$ is the canonical restriction, is commutative up to canonical isomorphism.

Proof. I) Firstly, suppose $P^\dagger$ affine and T_0 defined by a equation local and $Z_0 := X_0 \cap T_0$ is a divisor of X_0. Let $U^\dagger$ be the open of $P^\dagger$ which is topologically U_0 and let $j\colon U^\dagger \subset P^\dagger$ be the inclusion. Moreover, let $u\colon X^\dagger \hookrightarrow P^\dagger$ be the closed immersion of affine smooth $\mathfrak{S}$-weak formal schemes which is a lifting of $X_0 \hookrightarrow P_0$. Let $v\colon Y^\dagger \hookrightarrow U^\dagger$ be the induced by u closed immersion. Let $\alpha\colon Y^\dagger \hookrightarrow X^\dagger$ be the open inclusion. Following 17.4.1.1, we have the injections $j_*\mathcal{D}_{Y^\dagger,\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}}$ and $j_*\mathcal{O}_{Y^\dagger,\mathbb{Q}} \to \mathcal{O}_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}}$. Let $E \in \mathrm{MIC}^\dagger(Y_0/K)$ and with 17.5.1.1.(e) let $\mathcal{M} := \mathrm{sp}_{Y^\dagger *}(E) \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$ (we have changed the letter in order to avoid confusion between $\Gamma(Y^\dagger, \mathcal{M})$ and E).

1) We get the commutative diagram up to canonical isomorphism:

$$\begin{array}{ccc}
\mathrm{MIC}^\dagger(Y_0/K) & \xrightarrow[\cong]{\mathrm{sp}_{Y^\dagger *}} & \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S}) \\
\downarrow{\scriptstyle |(Y_0,X_0)} & & \downarrow{\scriptstyle \mathcal{O}_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{O}_{Y^\dagger,\mathbb{Q}}} \alpha_* -} \\
\mathrm{MIC}^\dagger(Y_0, X_0, \mathfrak{X}/K) & \xrightarrow[\cong]{\mathrm{sp}_{\mathfrak{X}*}} & \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{X}, Z_0/K).
\end{array} \tag{17.6.3.2.2}$$

By construction, we have: $\mathrm{sp}_{X_0 \hookrightarrow \mathfrak{P}, T_0,+}(E|(Y_0, X_0)) = u^\dagger_+ \mathrm{sp}_{\mathfrak{X}*}(E|(Y_0, X_0))$. Since $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \alpha_*(\mathcal{M})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}}$-module whose restriction over $\mathfrak{Y}$ belongs to $\mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathfrak{S})$ (see the corollary 17.5.1.10), then $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \alpha_*(\mathcal{M}) \in \mathrm{MIC}^{\dagger\dagger}(X, \mathfrak{X}, Z/K)$ (see 12.2.1.5). In particular, this latter is $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}}$-coherent. Since the canonical arrow

$$\mathcal{O}_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{O}_{Y^\dagger,\mathbb{Q}}} \alpha_*(\mathcal{M}) \to \mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \alpha_*(\mathcal{M})$$

is a morphism of coherent $\mathcal{O}_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}}$-modules which is an isomorphism outside Z_0, then this is an isomorphism. This yields the canonical isomorphism:

$$\mathrm{sp}_{X_0 \hookrightarrow \mathfrak{P}, T_0,+}(E|(Y_0, X_0)) \xrightarrow{\sim} u^\dagger_+ \left(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z_0)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \alpha_*(\mathcal{M}) \right). \tag{17.6.3.2.3}$$

2) Using 17.6.3.1 and with its notations, we get the isomorphism: $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, Z_0,+}(E) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \otimes_{D_{U^\dagger,\mathbb{Q}}} v_+(M)$. Using the canonical map $D_{U^\dagger \leftarrow Y^\dagger,\mathbb{Q}} \to \Gamma(\mathfrak{X}, \mathcal{D}^\dagger_{\mathfrak{P} \leftarrow \mathfrak{X}}({}^\dagger T_0)_{\mathbb{Q}})$, we get the arrow

$$v_+(M) \to u^\dagger_+(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \alpha_*(\mathcal{M}))$$

This yields by extension the canonical morphism

$$\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T,+}(E) \to u^\dagger_+(\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger Z)_{\mathbb{Q}} \otimes_{\alpha_*\mathcal{D}_{Y^\dagger,\mathbb{Q}}} \alpha_*(\mathcal{M})). \tag{17.6.3.2.4}$$

This arrow 17.6.3.2.4 is a morphism of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules whose restriction outside T is an isomorphism (this is a consequence of 17.5.1.10 and 17.5.2.5). Following 8.7.6.11, this implies that the morphism 17.6.3.2.4 is in fact an isomorphism. Hence we are done for the first case.

II) Let us now prove the general case. Let $(P^\dagger_\alpha)_{\alpha \in \Lambda}$ be an affine open covering of $P^\dagger$ such that $T \cap P_\alpha$ is defined by a equation. We denote by $U^\dagger_\alpha := P^\dagger_\alpha \cap U^\dagger$, $Y_{\alpha 0} := P_{\alpha 0} \cap Y_0$, $T_{\alpha 0} := P_{\alpha 0} \cap T_0$, $X_{\alpha 0} := P_\alpha \cap X_0$. Since X_{α_0} is affine and smooth, using the lifting theorem 17.1.1.20, there exists an $\mathfrak{S}$-formal scheme weak affine and smooth $X^\dagger_\alpha$ which is a lifting of $X_{\alpha 0}$. We denote by $j_\alpha\colon P^\dagger_\alpha \subset P^\dagger$ the canonical open immersion. Following 17.1.1.22.(c), there exist $u_\alpha\colon X^\dagger_\alpha \hookrightarrow P^\dagger_\alpha$ a closed immersion which is a lifting of $X_{\alpha 0} \hookrightarrow P_{\alpha 0}$. Since $U^\dagger_\alpha$ is a principal open set of $P^\dagger_\alpha$, then the open set $X^\dagger_\alpha \cap U^\dagger_\alpha$ of $X^\dagger_\alpha$ is also principal. In particular, it is affine. Setting $Y^\dagger_\alpha := X^\dagger_\alpha \cap U^\dagger_\alpha$, we get the open immersion $\alpha_\alpha\colon Y^\dagger_\alpha \hookrightarrow X^\dagger_\alpha$ and the closed immersion $v_\alpha\colon Y^\dagger_\alpha \hookrightarrow U^\dagger_\alpha$ such that $u_\alpha \circ \lambda_\alpha = j_\alpha \circ v_\alpha$. Similarly, we choose lifting of $X_{\alpha\beta 0}$ and $X_{\alpha\beta\gamma 0}$ and we reduce by glueing the general case from the first treated case of I). ☐

Theorem 17.6.3.3. *With notation 17.6.2, the diagram*

$$\begin{array}{ccc}
\mathrm{MIC}^\dagger(Y_0/K) & \longrightarrow & \mathrm{MIC}^\dagger(X_0, \mathfrak{P}, T_0/K) \\
& {\scriptstyle \mathrm{sp}_{Y_0 \hookrightarrow U^\dagger, T_0,+}} \searrow \quad \swarrow {\scriptstyle \mathrm{sp}_{X_0 \hookrightarrow \mathcal{P}, T_0,+}}\ \cong & \\
& \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K) &
\end{array} \tag{17.6.3.3.1}$$

is commutative up to canonical isomorphism.

Proof. Let $E \in \mathrm{MIC}^\dagger(Y_0/K)$ and $E|(Y_0, X_0)$ the induced object of $\mathrm{MIC}^\dagger(Y_0, X_0/K) = \mathrm{MIC}^\dagger(X_0, \mathfrak{P}, T_0/K)$. With the lemma 16.1.2.9 (and the remark 16.1.2.10) we reduce to the case where X_0 is integral and Y_0 is dense in X_0. Via the theorem of desingularisation of de Jong (and with the help of the lemma 16.1.6.10), there exist a divisor $\widetilde{T}_0$ containing T_0 and a diagram of the form

$$\begin{array}{ccccc} Y_0^{(0)} & \xrightarrow{j_0^{(0)}} & X_0^{(0)} & \xrightarrow{u_0^{(0)}} & P_0^{(0)\dagger} \\ \downarrow b_0 & \square & \downarrow a_0 & & \downarrow f \\ Y_0 & \xrightarrow{j_0} & X_0 & \xrightarrow{u_0} & P^\dagger, \end{array} \tag{17.6.3.3.2}$$

where the left square is cartesian, f is a proper and smooth morphism of separated and smooth $\mathfrak{S}$-weak formal schemes, a_0 is a proper, surjective and generically finite étale morphism of k-varieties with $X_0^{(0)}$ smooth, j_0 and $j_0^{(0)}$ are open immersions, u_0 and $u_0^{(0)}$ are closed immersions. We have the canonical isomorphisms:

$$\mathrm{sp}_{Y^{(0)} \hookrightarrow U^{(0)\dagger}, T^{(0)},+} \circ b^*(E) \overset{17.6.2.8}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^\dagger_{Y^{(0)}} \circ f^! \circ \mathrm{sp}_{Y \hookrightarrow U^\dagger, T,+}(E);$$

$$\mathrm{sp}_{X^{(0)} \hookrightarrow \mathcal{P}^{(0)}, T^{(0)},+}(a^*(E|(Y,X))) \overset{16.1.8.6.1}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^\dagger_{Y^{(0)}} \circ f^! \mathrm{sp}_{X \hookrightarrow \mathcal{P}, T,+}(E|(Y,X)). \tag{17.6.3.3.3}$$

As $X^{(0)}$ is smooth, then following 17.6.3.2, the left terms of 17.6.3.3.3 are canonically isomorphic. Then so are similarly right terms. We get moreover the isomorphisms:

$$\mathrm{sp}_{Y_0 \hookrightarrow U^\dagger, T_0,+}(E)|\mathfrak{U} \xrightarrow{\sim} \mathrm{sp}_{Y_0 \hookrightarrow U^\dagger, \emptyset,+}(E) \overset{17.6.3.2}{\xrightarrow{\sim}} \mathrm{sp}_{X_0 \hookrightarrow \mathfrak{U}, \emptyset,+}(E|(Y_0, Y_0)) \xrightarrow{\sim} \mathrm{sp}_{X_0 \hookrightarrow \mathcal{P}, T_0,+}(E|(Y_0, X_0))|\mathfrak{U}.$$

Thanks to the fully faithfulness theorem 16.1.5.2, this yields the result. □

Corollary 17.6.3.4. *With notation 17.6.2, we suppose P_0 proper. The functor $\mathrm{sp}_{Y_0 \hookrightarrow U^\dagger, T_0,+}$ induced then the equivalence of categories:*

$$\mathrm{sp}_{Y_0 \hookrightarrow U^\dagger, T_0,+} \colon \mathrm{MIC}^\dagger(Y/K) \cong \mathrm{MIC}^{\dagger\dagger}(Y_0/K). \tag{17.6.3.4.1}$$

Proof. This is a consequence of 16.1.8.4 and 17.6.3.3. □

17.6.4 Commutation of the tensor product with sp_+ in the weakly smooth case

17.6.4.1. Let $P^\dagger$, $P'^\dagger$ be two smooth weak formal $\mathcal{V}$-schemes and separated, T_0 (resp. T'_0) a divisor of P_0 (resp. P'_0), $U^\dagger$ (resp. $U'^\dagger$) the open of $P^\dagger$ (resp. $P'^\dagger$) complementary to T_0 (resp. T'_0), $j \colon U^\dagger \hookrightarrow P^\dagger$ (resp. $j' \colon U'^\dagger \hookrightarrow P'^\dagger$) the open immersion and $v \colon Y_0 \hookrightarrow U_0$ (resp. $v' \colon Y'_0 \hookrightarrow U'_0$) a closed immersion of k-schemes smooth. We denote by $P''^\dagger := P^\dagger \times P'^\dagger$, $U''^\dagger := U^\dagger \times U'^\dagger$, T''_0 the divisor reduced of P''_0 of space topological $P''_0 \setminus U''_0$, $Y''_0 := Y_0 \times Y'_0$, $b \colon Y''_0 \to Y_0$ and $b' \colon Y''_0 \to Y'_0$ the canonical projections.

Let $E \in \mathrm{MIC}^\dagger(Y_0/K)$ and $E' \in \mathrm{MIC}^\dagger(Y'_0/K)$. We have the canonical functors $b^* \colon \mathrm{MIC}^\dagger(Y_0/K) \to \mathrm{MIC}^\dagger(Y''_0/K)$ and $b'^* \colon \mathrm{MIC}^\dagger(Y'_0/K) \to \mathrm{MIC}^\dagger(Y''_0/K)$ (see [Ber96b, 2.3.6] and [Car07, 1.4.1])). The exterior tensor product of E and E' is defined by setting $E \boxtimes E' := b^*(E) \otimes b'^*(E')$, which gives the bifunctor

$$- \boxtimes - \colon \mathrm{MIC}^\dagger(Y_0/K) \times \mathrm{MIC}^\dagger(Y'_0/K) \to \mathrm{MIC}^\dagger(Y''_0/K).$$

Proposition 17.6.4.2. *With the notations 17.6.4.1, we have a canonical isomorphism*

$$\mathrm{sp}_{Y''_0 \hookrightarrow U''^\dagger, T''_0+}(E \boxtimes E') \xrightarrow{\sim} \mathrm{sp}_{Y_0 \hookrightarrow U^\dagger,+}(E) \overset{\mathbb{L}}{\boxtimes}{}^\dagger_{\mathcal{O}_{\mathfrak{S}}, T_0, T'_0} \mathrm{sp}_{Y'_0 \hookrightarrow U'^\dagger,'+}(E'). \tag{17.6.4.2.1}$$

Proof. Let us denote by X_0 (resp. X'_0, resp. X''_0) the closure of Y_0 in P_0 (resp. of Y'_0 in P'_0, resp. of Y''_0 in P''_0). By using 16.2.6.5, the right square of the canonical diagram

$$\begin{array}{ccccc} \mathrm{MIC}^\dagger(Y_0/K) \times \mathrm{MIC}^\dagger(Y'_0/K) & \longrightarrow & \mathrm{MIC}^\dagger(X_0, \mathfrak{P}, T_0/K) \times \mathrm{MIC}^\dagger(\mathcal{P}', T'_0, X'_0/K) & \xrightarrow{\mathrm{sp}_+ \times \mathrm{sp}_+} & \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K) \times \mathrm{MIC}^\dagger(\mathcal{P}', T'_0, X'_0/K \\ \downarrow -\boxtimes- & & \downarrow -\boxtimes- & & \downarrow -\boxtimes- \\ \mathrm{MIC}^\dagger(Y''_0/K) & \longrightarrow & \mathrm{MIC}^\dagger(\mathcal{P}'', T''_0, X''_0/K) & \xrightarrow{\mathrm{sp}_{X''_0 \hookrightarrow \mathcal{P}'', T''_0,+}} & \mathrm{MIC}^{\dagger\dagger}(\mathcal{P}'', T''_0, X''_0/K). \end{array} \tag{17.6.4.2.2}$$

is commutative, up to canonical isomorphism. As the left square is also commutative, then the theorem 17.6.3.3 allow us to conclude. □

Proposition 17.6.4.3. *With the notations of 17.6.4.1, we suppose moreover on $P^\dagger = P'^\dagger$ and $Y_0 \cap Y'_0$ smooth (e.g., $Y_0 = Y'_0$). By denoting $i^*\colon \mathrm{MIC}^\dagger(Y_0/K) \to \mathrm{MIC}^\dagger(Y_0 \cap Y'_0/K)$ and $i'^*\colon \mathrm{MIC}^\dagger(Y'_0/K) \to \mathrm{MIC}^\dagger(Y_0 \cap Y'_0/K)$ the canonical functors, then we have the canonical isomorphism:*

$$\mathrm{sp}_{Y_0\cap Y'_0\hookrightarrow U^\dagger\cap U'^\dagger, T_0\cup T'_0,+}(i^*(E)\otimes i'^*(E')) \tag{17.6.4.3.1}$$

$$\xrightarrow{\sim} ({}^\dagger T_0 \cup T'_0)\circ \mathrm{sp}_{Y_0\hookrightarrow U^\dagger,+}(E)\overset{\mathbb{L}}{\otimes}{}^\dagger_{\mathcal{O}_{\mathcal{P}_0}({}^\dagger T_0\cup T'_0)_{\mathbb{Q}}}({}^\dagger T_0\cup T'_0)\circ \mathrm{sp}_{Y'_0\hookrightarrow U'^\dagger,'+}(E')[d_{Y_0}+d_{Y'_0}-d_{Y_0\cap Y'_0}-d_{P_0}]. \tag{17.6.4.3.2}$$

Proof. This is a consequence of 16.2.6.6 and of 17.6.3.3. □

17.7 Application: characterization of overconvergent isocrystals on certain subschemes of the affine space

The purpose of this section is to prove Theorem 17.7.4.6 which gives a sufficient condition for that an arithmetical $\mathcal{D}$-module to be an isocrystal overconvergent. This is the main ingredient in the proof of the stability of the holonomicity for projective and smooth $\mathcal{S}$-formal schemes (see the proof of Theorem 18.3.3.1). Roughly speaking, on certain subschemes of projective space, it the arithmetical $\mathcal{D}$-module comes from a convergent isocrystal outside the singularities then it comes from an overconvergent isocrystal. Set $D^{(m)} := \Gamma(\mathbb{A}^n_k, \mathcal{D}^{(m)}_{\mathbb{A}^{n\dagger}_{\mathcal{V}}})$ and $D := \Gamma(\mathbb{A}^n_k, \mathcal{D}_{\mathbb{A}^{n\dagger}_{\mathcal{V}}})$.

17.7.1 p-adic weak completion of non-commutative $\mathcal{V}$-algebra

Let us recall the definition of the p-adic weak completion given by Noot-Huyghe in [Huy03, 1.3] in the case of a not necessarily commutative $\mathcal{V}$-algebra:

Definition 17.7.1.1. For any integer N, we denote by B_N the non-commutative $\mathcal{V}$-algebra of polynomials with N variables with coefficients in $\mathcal{V}$ (i.e. the tensor $\mathcal{V}$-algebra of $\mathcal{V}^N$). Let A be a not necessarily commutative $\mathcal{V}$-algebra. We denote by $\widehat{A}$ the p-adic completion of A and $A^\dagger$ the subset of $\widehat{A}$ of elements z such that there exist a constant $c \in \mathbb{R}$, some elements $x_1, \ldots, x_n \in \mathrm{Im}(A \to \widehat{A})$ and, for any $j \in \mathbb{N}$, some polynomials $P_j \in \pi^j B_n$ such that $\deg P_j \le c(j+1)$ and

$$z = \sum_{j\in\mathbb{N}} P_j(x_1, \ldots, x_n). \tag{17.7.1.1.1}$$

The set $A^\dagger$ is a $\mathcal{V}$-subalgebra of $\widehat{A}$ and is called "the p-adic weak completion of A as $\mathcal{V}$-algebra " or "the p-adic weak completion of A" if there is no ambiguity with basis $\mathcal{V}$. We also say that "z is weakly completely generated on $\mathcal{V}$ by the elements $x_1, \ldots, x_n$ of A".

We denote by $w_A\colon A \to A^\dagger$ the canonical $\mathcal{V}$-algebra homomorphism. We say that A is p-adically weakly complete as $\mathcal{V}$-algebra if the canonical map w_A is a bijection. We write $A_K := A \otimes_{\mathcal{V}} K$ and $A^\dagger_K := A^\dagger \otimes_{\mathcal{V}} K$.

Remark 17.7.1.2. When A is commutative, we retrieve the definition 17.1.1.1.

With the notations of 17.7.1.1, the polynomial P_j appearing in the sum 17.7.1.1.1 can be chosen so that each monomials have a π-adic valuation equal to j. Indeed, let us denote by $R_0 = 0$ and, for any $j \in \mathbb{N}$, define by induction on $j \ge 0$ the polynomials Q_j and R_{j+1} by setting: $R_j + P_j = Q_j + R_{j+1}$ where Q_j is the sum of monomials of $R_j + P_j$ having π-adic valuation equal to j whereas R_{j+1} is the sum of other terms. We have the equality $z = \sum_{j\in\mathbb{N}} Q_j(x_1, \ldots, x_n)$ with $\deg Q_j \le c(j+1)$ and all monomials of Q_j have a π-adic valuation equal to j (also, $\deg R_{j+1} \le c(j+1)$ and $R_{j+1} \in \pi^{j+1} B_n$).

The next proposition gives an important example that we will need by using its corollary 17.7.4.2.

Proposition 17.7.1.3 (Huyghe)**.** *Let $\mathfrak{P}$ be a smooth $\mathfrak{S}$-formal scheme and T_0 be a divisor of P_0. With notation 8.7.3.25, $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger * T_0)$ is a sheaf of weakly complete $\mathcal{V}$-algebras.*

Proof. See a proof in [Huy07, 2.2]. □

Remark 17.7.1.4. In fact, Huyghe proved that The sheaf $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger} * T_0)$ is a sheaf of weakly complete $\mathcal{O}_{\mathfrak{P}}$-algebras, but for our purpose we prefer to focus on the notion of weakly complete $\mathcal{V}$-algebras.

Proposition 17.7.1.5. *Let A be a $\mathcal{V}$-algebra, $c \in \mathbb{R}$, $y_1, \ldots, y_n \in A^{\dagger}$, and, for any $j \in \mathbb{N}$, $P_j \in \pi^j B_n$ be some polynomials such that $\deg P_j \leq c(j+1)$. Hence the element $z := \sum_{j\in\mathbb{N}} P_j(y_1, \ldots, y_n)$ belongs to $A^{\dagger}$. More precisely, if $y_1, \ldots, y_n$ are all weakly completely generated on $\mathcal{V}$ by the elements $x_1, \ldots, x_m$ of A, then z is weakly completely generated on $\mathcal{V}$ by $x_1, \ldots, x_m$. In particular, we have the equality $A^{\dagger} = (A^{\dagger})^{\dagger}$, i.e., the p-adic weak completion of a $\mathcal{V}$-algebra is p-adically weakly complete.*

Proof. 0) Increasing c if necessary, by definition of $A^{\dagger}$, there exist $x_1, \ldots, x_m \in \mathrm{Im}(A \to \widehat{A})$ such that for any $i' = 1, \ldots, n$, for any $k \in \mathbb{N}$, there exist some polynomials $P_{i',k} \in \pi^k B_m$ such that $\deg P_{i',k} \leq c(k+1)$ and $y_{i'} = \sum_{k\in\mathbb{N}} P_{i',k}(x_1, \ldots, x_m)$.

1) For any $j \in \mathbb{N}$, P_j is a finite sum of monomials of the form $P(Y_1, \ldots, Y_n) = \lambda \cdot Y_{\phi(1)} Y_{\phi(2)} \cdots Y_{\phi(r)}$ with $r \in \mathbb{N}$, $\phi(1), \ldots, \phi(r) \in \{1, \ldots, n\}$ and $\lambda \in \mathcal{V}$ are such that $v_\pi(\lambda) \geq j$ and $r \leq c(j+1)$. For such monomial P, we get

$$P(y_1, \ldots, y_n) = \sum_{k_1\in\mathbb{N},\ldots,k_r\in\mathbb{N}} \lambda \cdot P_{\phi(1),k_1}(x_1, \ldots, x_m) \cdots P_{\phi(r),k_r}(x_1, \ldots, x_m).$$

Let us denote by $P_{(k_1,\ldots,k_r)}(X_1, \ldots, X_m) := \lambda \cdot P_{\phi(1),k_1}(X_1, \ldots, X_m) \cdots P_{\phi(r),k_r}(X_1, \ldots, X_m)$ the polynomials of B_m appearing in this sum. Then we have $\deg P_{(k_1,\ldots,k_r)} = \sum_{i=1}^r \deg P_{\phi(i),k_i} \leq c \sum_{i=1}^r (k_i + 1)$. Let us denote by $v_\pi(P_{(k_1,\ldots,k_r)})$ the minimal element of the set of π-adic valuations of the coefficients of $P_{(k_1,\ldots,k_r)}$. By construction, $v_\pi(P_{(k_1,\ldots,k_r)}) \geq j + \sum_{i=1}^r k_i$.

2) Fix $J \in \mathbb{N}$. Moreover, since for any j the polynomial P_j is a finite sum of monomials P such as in the step 1), as $v_\pi(P_{(k_1,\ldots,k_r)}) \geq j + \sum_{i=1}^r k_i$ (see the step 1), then there exist a finite number of such polynomials $P_{(k_1,\ldots,k_r)}$ and such that $v_\pi(P_{(k_1,\ldots,k_r)}) = J$. Let $Q_J(X_1, \ldots, X_m)$ be the sum of all polynomials $P_{(k_1,\ldots,k_r)}(X_1, \ldots, X_m)$ such that $v_\pi(P_{(k_1,\ldots,k_r)}) = J$. Hence $v_\pi(Q_J) \geq J$ and $z = \sum_{J\in\mathbb{N}} Q_J(x_1, \ldots, x_m)$.

3) It remains to find an upper bound of the degree of Q_J: Let $P_{(k_1,\ldots,k_r)}$ be one of these polynomials such that $v_\pi(P_{(k_1,\ldots,k_r)}) = J$. As $r \leq c(j+1)$, as $J \geq j + \sum_{i=1}^r k_i$, this yields then $\deg P_{(k_1,\ldots,k_r)} \leq c(J - j + c(j+1)) \leq c(J + 1 + c(J+1)) = c(1+c)(J+1)$. Let us denote by $C = c(1+c)$. Then we have established $\deg Q_J \leq C(J+1)$. Hence we are done. □

The lemma below is left as an exercise:

Lemma 17.7.1.6. *Let $N_1, N_2 \in \mathbb{N}$, $c \in \mathbb{R}$ and, for any $j \in \mathbb{N}$, let $P_j, Q_j \in \pi^j B_n$ be such that $\deg P_j \leq c(j + N_1)$, $\deg Q_j \leq c(j + N_2)$. We define the following elements of $\mathcal{V}[t_1, \ldots, t_n]^{\dagger}$ by setting: $z = \sum_{j\in\mathbb{N}} P_j(t_1, \ldots, t_n)$, $u = \sum_{j\in\mathbb{N}} Q_j(t_1, \ldots, t_n)$.*

(a) For any $\underline{k} \in \mathbb{N}^n$, there exists a family $\{\widetilde{P}_j\}_{j\in\mathbb{N}}$ of polynomials such that $\widetilde{P}_j \in \pi^j B_n$, $\deg \widetilde{P}_j \leq c(j+N_1)$ and $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}(z) = \sum_{j\in\mathbb{N}} \widetilde{P}_j(t_1, \ldots, t_n)$.

(b) There exists a family $\{R_j\}_{j\in\mathbb{N}}$ of polynomials such that $R_j \in \pi^j B_n$, $\deg R_j \leq c(j + \max\{N_1, N_2\})$ and $z + u = \sum_{j\in\mathbb{N}} R_j(t_1, \ldots, t_n)$.

(c) There exists a family $\{\widetilde{R}_j\}_{j\in\mathbb{N}}$ of polynomials such that $\widetilde{R}_j \in \pi^j B_n$, $\deg \widetilde{R}_j \leq c(j + N_1 + N_2)$ and $zu = \sum_{j\in\mathbb{N}} \widetilde{R}_j(t_1, \ldots, t_n)$.

Proposition 17.7.1.7. *Let A be a $\mathcal{V}$-algebra.*

(a) If B is p-adically separated quotient of $A^{\dagger}$ then B is p-adically weakly complete.

(b) For any $i \in \mathbb{N}$, the canonical map $A/\pi^{i+1}A \to A^{\dagger}/\pi^{i+1}A^{\dagger}$ is an isomorphism.

(c) Let $f \colon A \to B$ be a morphism of $\mathcal{V}$-algebra. Then there exists a unique homomorphism $f^{\dagger} \colon A^{\dagger} \to B^{\dagger}$ such that $f^{\dagger} \circ w_A = w_B \circ f$. If f is surjective, then so is $f^{\dagger}$.

(d) $pA^{\dagger}$ is contained in the Jacobson radical of $A^{\dagger}$.

Proof. This is checked similarly to the commutative case of [MW68, 1]. □

Remark 17.7.1.8. Let A be a $\mathcal{V}$-algebra. If A is left Noetherian then so is its Rees ring $\widetilde{A} := \oplus_{n\in\mathbb{N}} p^n A$. Indeed, if A is left Noetherian then so is the polynomial ring $A[T]$, where T is commuting with A. Since the map $A[T] \to \widetilde{A}$ given by $\sum a_k T^k \mapsto \sum p^k a_k$ is a ring epimorphism then we are done.

Beware that if A is left Noetherian then $A^\dagger$ may not be Noetherian. For instance, take $A = \Gamma(\mathbb{A}^n_k, \mathcal{D}_{\mathbb{A}^{n\dagger}_{\mathcal{V}}})$.

If A is a left Noetherian weakly complete $\mathcal{V}$-algebra then it follows from 17.7.1.7.(d) and from the first remark that A is a Zariskian ring (see [LvO96, II.2.1 Definition]). Beware that $D^\dagger$ is not a Zariskian ring so we are not able to use properties on Zariskian rings in the context of the weak completion of a differential operators ring.

17.7.1.9. Let $\mathfrak{A}$ be the category of $\mathcal{V}$-algebras and $\mathfrak{A}^\dagger$ be the category of p-adic weakly complete $\mathcal{V}$-algebras. It follows from 17.7.1.7.(c) that the functor weak completion $\dagger\colon \mathfrak{A} \to \mathfrak{A}^\dagger$ is a left adjoint of the forgetful functor $\mathfrak{f}\colon \mathfrak{A}^\dagger \to \mathfrak{A}$. Hence, the functor $\dagger\colon \mathfrak{A} \to \mathfrak{A}^\dagger$ commutes with inductive limits. Since the functor $\dagger$ is essentially surjective and since $\mathfrak{A}$ admits injective limits, this yields that $\mathfrak{A}^\dagger$ admits injective limits and if $F\colon I \to \mathfrak{A}^\dagger$ is a functor then $\varinjlim F = (\varinjlim(\mathfrak{f}\circ F))^\dagger$.

When I is filtered then since the set of the elements $x_1, \ldots, x_n$ satisfying 17.7.1.1.1 is finite, then $\varinjlim(\mathfrak{f}\circ F) \in \mathfrak{A}^\dagger$ (this makes a difference with respect to p-adically complete $\mathcal{V}$-algebras). Hence, in that case, both inductive limits computed in $\mathfrak{A}^\dagger$ or in $\mathfrak{A}$ are equal. For example, since $D \xrightarrow{\sim} \varinjlim D^{(m)}$, then we get $D^\dagger \xrightarrow{\sim} \varinjlim_{m\in\mathbb{N}} D^{(m)\dagger}$, where $\varinjlim_{m\in\mathbb{N}}$ is the inductive limit computed in $\mathfrak{A}$.

17.7.2 Weak completion of the global section of the sheaf of differential operators on a finite and etale scheme over an affine space

Let $X^\dagger$ be a smooth $\mathfrak{S}$-weak formal scheme. It follows from Kedlaya's work on etale covers of affines spaces (see [Ked02] or [Ked05]) and from the lifting theorem 17.1.1.20, that there exist an affine dense open $U^\dagger$ of $X^\dagger$ and a finite etale morphism of the form $g\colon U^\dagger \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$. We prove in this section that the canonical homomorphisms $D^{(m)\dagger} \to \Gamma(U^\dagger, \mathcal{D}^{(m)\dagger}_{U^\dagger})$ are $D^\dagger \to \Gamma(U^\dagger, \mathcal{D}^\dagger_{U^\dagger})$ are finite, right and left fully faithful (see 17.7.2.4).

Lemma 17.7.2.1. *Let $f\colon \mathfrak{Y}' \to \mathfrak{Y}$ be an etale morphism of affine smooth $\mathfrak{S}$-formal schemes such that $\mathfrak{Y}/\mathfrak{S}$ is endowed with coordinates. Set $A := \Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{Y}})$, $A' := \Gamma(\mathfrak{Y}', \mathcal{O}_{\mathfrak{Y}'})$, $\widehat{D}^{(m)}_{\mathfrak{Y}} := \Gamma(\mathfrak{Y}, \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}})$ $\widehat{D}^{(m)}_{\mathfrak{Y}'} := \Gamma(\mathfrak{Y}', \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'})$, $D^\dagger_{\mathfrak{Y}} := \Gamma(\mathfrak{Y}, \mathcal{D}^\dagger_{\mathfrak{Y}})$ and $D^\dagger_{\mathfrak{Y}'} := \Gamma(\mathfrak{Y}', \mathcal{D}^\dagger_{\mathfrak{Y}'})$. Since f is etale then following 9.2.1.22 we get the ring homomorphism: $f^{-1}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}} \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Y}'}$ and $f^{-1}\mathcal{D}^\dagger_{\mathfrak{Y}} \to \mathcal{D}^\dagger_{\mathfrak{Y}'}$.*

(a) The induced morphisms $A'\widehat{\otimes}_A \widehat{D}^{(m)}_{\mathfrak{Y}} \to \widehat{D}^{(m)}_{\mathfrak{Y}'}$, $\widehat{D}^{(m)}_{\mathfrak{Y}} \widehat{\otimes}_A A' \to \widehat{D}^{(m)}_{\mathfrak{Y}'}$ are isomorphisms.

(b) If f is moreover finite, then the induced morphisms $A' \otimes_A D^\dagger_{\mathfrak{Y}} \to D^\dagger_{\mathfrak{Y}'}$, $D^\dagger_{\mathfrak{Y}} \otimes_A A' \to D^\dagger_{\mathfrak{Y}'}$ are isomorphisms.

Proof. Let us denote by $f_i\colon Y'_i \to Y_i$ (resp. A_i, A'_i) the reduction modulo π^{i+1} of f (resp. A, A'). Since f_i is étale, then following 5.1.3.6 the canonical morphisms $A'_i \otimes_{A_i} D^{(m)}_{Y_i} \to D^{(m)}_{Y'_i}$, $D^{(m)}_{Y_i} \otimes_{A_i} A'_i \to D^{(m)}_{Y'_i}$ are isomorphisms. Hence we are done by taking projective and inductive limits. □

Lemma 17.7.2.2. *Let $g\colon U'^\dagger \to U^\dagger$ an etale morphism of affine and smooth $\mathfrak{S}$-weak formal schemes.*

(a) The canonical morphism of left $\mathcal{D}^{(m)}_{U'^\dagger}$-modules $\mathcal{D}^{(m)}_{U'^\dagger} \to g^*\mathcal{D}^{(m)}_{U^\dagger}$ is an isomorphism.

(b) The composite morphism $g^{-1}\mathcal{D}^{(m)}_{U^\dagger} \to g^*\mathcal{D}^{(m)}_{U^\dagger} \xleftarrow{\sim} \mathcal{D}^{(m)}_{U'^\dagger}$ is a morphism of $\mathcal{V}$-algebras.

We have similar results replacing $\mathcal{D}^{(m)}$ by $\mathcal{D}$.

Proof. Since this is local, we can suppose $U'^\dagger$ are affine and $U^\dagger/\mathfrak{S}$ has coordinates. Similarly to 5.1.3.6, this is an easy computation (more precisely, see 17.7.2.3). □

17.7.2.3. With notation 17.7.2.2, suppose that $U^\dagger$ and $U'^\dagger$ are affine and $U^\dagger/\mathfrak{S}$ has coordinates. Set $A^\dagger := \Gamma(U^\dagger, \mathcal{O}_{U^\dagger})$, $A'^\dagger := \Gamma(U^\dagger, \mathcal{O}_{U'^\dagger})$. Let E be either $(\Gamma(U, \mathcal{D}^{(m)}_{U^\dagger})$ or $(\Gamma(U, \mathcal{D}_{U^\dagger})$. Let E' be either $(\Gamma(U', \mathcal{D}^{(m)}_{U'^\dagger})$ or $(\Gamma(U', \mathcal{D}_{U'^\dagger})$. By taking the global sections, it follows from 17.7.2.2 that we get a morphism of $\mathcal{V}$-algebras $D^{(m)}_{U^\dagger} \to D^{(m)}_{U'^\dagger}$. Moreover, we compute that the induced maps

$$A'^\dagger \otimes_{A^\dagger} E \to E', \qquad E \otimes_{A^\dagger} A'^\dagger \to E' \tag{17.7.2.3.1}$$

are isomorphisms (which proves locally 17.7.2.2).

By functoriality of the p-adic weak completion of $\mathcal{V}$-algebras, we get the morphism $D^{(m)\dagger}_{U^\dagger} \to D^{(m)\dagger}_{U'^\dagger}$. Taking the inductive limit on the level, this gives the canonical morphism of $\mathcal{V}$-algebras: $D^\dagger_{U^\dagger} \to D^\dagger_{U'^\dagger}$.

Proposition 17.7.2.4. *Let $g\colon U^\dagger \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$ be a finite etale morphism of smooth $\mathcal{S}$-weak formal schemes and $A^\dagger := \Gamma(U^\dagger, \mathcal{O}_{U^\dagger})$. Set $D^{(m)}_{U^\dagger} := \Gamma(U^\dagger, \mathcal{D}^{(m)}_{U^\dagger})$, $D_{U^\dagger} := \Gamma(, U^\dagger, \mathcal{D}_{U^\dagger})$. The induced (from 17.7.2.3) canonical $A^\dagger$-linear morphisms*

$$A^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} D^{(m)\dagger} \to D^{(m)\dagger}_{U^\dagger}, \qquad D^{(m)\dagger} \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger \to D^{(m)\dagger}_{U^\dagger}, \tag{17.7.2.4.1}$$

$$A^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} D^\dagger \to D^\dagger_{U^\dagger}, \qquad D^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger \to D^\dagger_{U^\dagger} \tag{17.7.2.4.2}$$

are isomorphisms.

Proof. By symmetry and by passage to the inductive limit on the level (use 17.7.1.9), we reduce to check that the canonical morphism $\theta\colon A^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} D^{(m)\dagger} \to D^{(m)\dagger}_{U^\dagger}$ is an isomorphism.

As $A^\dagger$ is a finite $\mathcal{V}[\underline{t}]^\dagger$-algebra, then $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger \xrightarrow{\sim} \widehat{A}$. This yields the first isomorphism:

$$A^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} \widehat{D}^{(m)} \xrightarrow{\sim} \widehat{A} \otimes_{\mathcal{V}\{\underline{t}\}} \widehat{D}^{(m)} \xrightarrow{\sim} \widehat{A} \widehat{\otimes}_{\mathcal{V}\{\underline{t}\}} \widehat{D}^{(m)} \overset{17.7.2.1}{\xrightarrow{\sim}} \widehat{D}^{(m)}_{\mathfrak{U}}.$$

This composition isomorphism fits in the commutative diagram:

$$\begin{array}{ccc} A^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} \widehat{D}^{(m)} & \xrightarrow{\sim} & \widehat{D}^{(m)}_{\mathfrak{U}} \\ \uparrow & & \uparrow \\ A^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} D^{(m)\dagger} & \xrightarrow{\theta} & D^{(m)\dagger}_{U^\dagger}. \end{array} \tag{17.7.2.4.3}$$

As $A^\dagger$ is a flat extension of $\mathcal{V}[\underline{t}]^\dagger$, since $D^{(m)\dagger}$ and $D^{(m)\dagger}_{U^\dagger}$ are separated (for the p-adic topology), this yields that the vertical arrows of 17.7.2.4.3 are injective. So we get the injectivity of θ.

Let us now check the surjectivity of θ via the following steps :

0) *Let us fix some notations.* Let $x_1, \ldots, x_s \in A^\dagger$ generating $A^\dagger$ as $\mathcal{V}[t_1, \ldots, t_n]^\dagger$-module. Let us denote by X the column vector of coordinates $x_1, \ldots, x_s$.

i) For any $\underline{a} = (a_1, \ldots, a_n) \leq p^m$ (i.e. $a_1, \ldots, a_n \leq p^m$), let $A^{(\underline{a})} = (a^{(\underline{a})}_{ij})_{1 \leq i,j \leq s} \in M_s(\mathcal{V}[t_1, \ldots, t_n]^\dagger)$ be such that

$$\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}(X) = A^{(\underline{a})} X, \tag{17.7.2.4.4}$$

where $\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}(X)$ is the column vector of coordinates $\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}(x_1), \ldots, \underline{\partial}^{\langle \underline{a} \rangle_{(m)}}(x_s)$. There exists a real constant $c \geq 1$ and, for any $k \in \mathbb{N}$, some polynomials $P^{(\underline{a})}_{ijk} \in \pi^k B_n$ such that $\deg P^{(\underline{a})}_{ijk} \leq c(k+1)$ and $a^{(\underline{a})}_{ij} = \sum_{k \in \mathbb{N}} P^{(\underline{a})}_{ijk}(t_1, \ldots, t_n)$.

ii) For any $1 \leq b \leq s$, let $B^{(b)} = (b^{(b)}_{ij})_{1 \leq i,j \leq s} \in M_s(\mathcal{V}[t_1, \ldots, t_n]^\dagger)$ such that

$$x_b \cdot X = B^{(b)} X, \tag{17.7.2.4.5}$$

where $x_b \cdot X$ is the column vector of coordinates $x_b x_1, \ldots, x_b x_s$. Increasing c if necessary, there exist for any $k \in \mathbb{N}$, some polynomials $P^{(b)}_{ijk} \in \pi^k B_n$ such that $\deg P^{(b)}_{ijk} \leq c(k+1)$ and satisfying $b^{(b)}_{ij} = \sum_{k \in \mathbb{N}} P^{(b)}_{ijk}(t_1, \ldots, t_n)$.

1) Let $z \in D^{(m)\dagger}_{U^\dagger}$. Then there exists some elements $y_1, \ldots, y_e$ of $D^{(m)}_{U^\dagger}$ such that z is weakly completely generated by $y_1, \ldots, y_e$. Since $D^{(m)}_{U^\dagger}$ is a $\mathcal{V}[t_1, \ldots, t_n]^\dagger$-algebra generated by $x_1, \ldots, x_s$ and by

$\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}$ for $\underline{a} \leq p^m$, then every elements $y_1, \dots, y_e$ are weakly completely generated by $x_1, \dots, x_s$, by $t_1, \dots, t_n$ and by $\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}$ for $\underline{a} \leq p^m$. Using 17.7.1.5 this yields that z is weakly completely generated by $x_1, \dots, x_s$, $t_1, \dots, t_n$ and $\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}$ for $\underline{a} \leq p^m$. Let us denote by $N := n + s + n(p^m + 1)$. Hence, there exists for any $J \in \mathbb{N}$, some polynomials $Z_J \in \pi^J B_N$ such that $\deg Z_J \leq c(J+1)$ and $z = \sum_{J \in \mathbb{N}} Z_J(t_1, \dots, t_n, x_1, \dots, x_s, \underline{\partial}^{\langle \underline{a} \rangle_{(m)}}, \underline{a} \leq p^m)$.

2) Following the formulas 1.4.2.7.1 and 1.4.2.7.(d) the passage from the right to the left of a polynomial in $t_1, \dots, t_n$ with respect to an operator of the form $\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}$ do not increase the degree in $t_1, \dots, t_n$. We can then suppose that Z_J is a *finite* sum of monomials of the form :

$$M_J = \pi^J P(t_1, \dots, t_n) Q_1(\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}, \underline{a} \leq p^m) P_1(x_1, \dots, x_s) \cdots Q_r(\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}, \underline{a} \leq p^m) P_r(x_1, \dots, x_s),$$

where P is a monomial of B_n and, for $i = 1, \dots, r$, P_i is a unitary monomial of B_s and Q_i is a unitary monomial $B_{n(p^m+1)}$. We have $\deg M_J = \deg P + \sum_{u=1}^r (\deg P_u + \deg Q_u) \leq c(J+1)$.

3) *Linearisation of* $P_1(x_1, \dots, x_s), \dots, P_r(x_1, \dots, x_s)$. Let $1 \leq u \leq r$. When $\deg(P_u) \leq 1$, then we keep it. If $\deg(P_u) \geq 2$, then there exist a line vector $L^{(u)} = (l_1^{(u)}, \dots, l_s^{(u)})$ with coefficients in $\mathcal{V}[t_1, \dots, t_n]^\dagger$ and, for any $1 \leq i \leq s$ and $j \in \mathbb{N}$, some polynomials $L_{ij}^{(u)} \in \pi^j B_n$ such that $\deg(L_{ij}^{(u)}) \leq c(j + \deg(P_u) - 1)$, $l_i^{(u)} = \sum_{j \in \mathbb{N}} L_{ij}^{(u)}(t_1, \dots, t_n)$ and $P_u(x_1, \dots, x_s) = L^{(u)} X$. Indeed, we proceed by induction on $\deg(P_u)$. When $\deg(P_u) = 2$, this is a consequence of 17.7.2.4.5. The heredity of the induction follows from 17.7.2.4.5 and 17.7.1.6.(b-c).

4) *Passage from the right to the left handside with respect to* $\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}$ *of linear combinations of* $x_1, \dots, x_s$ *with coefficients in* $\mathcal{V}[t_1, \dots, t_n]^\dagger$. For any $\underline{a} \leq p^m$, we have the equalities:

$$\begin{aligned} \underline{\partial}^{\langle \underline{a} \rangle_{(m)}} L^{(u)} X &\overset{1.4.2.7.1}{=} \sum_{\underline{h} \leq \underline{a}} \left\{ \begin{smallmatrix} \underline{a} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{a} - \underline{h} \rangle_{(m)}} (L^{(u)} X) \underline{\partial}^{\langle \underline{h} \rangle_{(m)}} \\ &\overset{4.1.1.2.1}{=} \sum_{\underline{h} \leq \underline{a}} \left\{ \begin{smallmatrix} \underline{a} \\ \underline{h} \end{smallmatrix} \right\} \sum_{\underline{h}' \leq \underline{a} - \underline{h}} \left\{ \begin{smallmatrix} \underline{a} - \underline{h} \\ \underline{h}' \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{a} - \underline{h} - \underline{h}' \rangle_{(m)}} (L^{(u)}) A^{(\underline{h}')} X \underline{\partial}^{\langle \underline{h} \rangle_{(m)}} \\ &= \sum_{\underline{h} \leq \underline{a}} L_{\underline{h}}^{(u, \underline{a})} X \underline{\partial}^{\langle \underline{h} \rangle_{(m)}}, \end{aligned} \tag{17.7.2.4.6}$$

where $L_{\underline{h}}^{(u,\underline{a})} := (l_{\underline{h},1}^{(u,\underline{a})}, \dots, l_{\underline{h},s}^{(u,\underline{a})}) := \left\{ \begin{smallmatrix} \underline{a} \\ \underline{h} \end{smallmatrix} \right\} \sum_{\underline{h}' \leq \underline{a} - \underline{h}} \left\{ \begin{smallmatrix} \underline{a} - \underline{h} \\ \underline{h}' \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{a} - \underline{h} - \underline{h}' \rangle_{(m)}} (L^{(u)}) A^{(\underline{h}')}$ is a line vector with coefficients in $\mathcal{V}[t_1, \dots, t_n]^\dagger$. Moreover, following 17.7.1.6, there exist, for any $i = 1, \dots, s$ and every $j \in \mathbb{N}$, some polynomials $L_{\underline{h},ij}^{(u,\underline{a})} \in \pi^j B_n$ such that $\deg(L_{\underline{h},ij}^{(u,\underline{a})}) \leq c(j + \deg(P_u))$ and $l_{\underline{h},i}^{(u,\underline{a})} = \sum_{j \in \mathbb{N}} L_{\underline{h},ij}^{(u,\underline{a})}(t_1, \dots, t_n)$.

To sum-up: the passage from the right to the left with respect to $\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}$ of linear combinations of $x_1, \dots, x_s$ needs the add of "1" in the inequality of the form $\deg(L_{\underline{h},ij}^{(u,\underline{a})}) \leq c(j + \deg(P_u))$. This number 1 corresponds also to the degree of the monomials $\underline{\partial}^{\langle \underline{h} \rangle_{(m)}}$ (because $\underline{h} \leq p^m$).

5) By reiterating the process of the step 4) (and also using again 17.7.2.4.5 and 17.7.1.6.(b-c) when we multiply two linear combinations of $x_1, \dots, x_s$), the monomial M_J is therefore equal to a finite sum of terms of the form:

$$R_J = \pi^J L X Q(\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}, \underline{a} \leq p^m)$$

where $Q \in B_{n(p^m+1)}$ with $\deg(Q) \leq \deg(Q_1) + \cdots + \deg(Q_r) \leq \deg(M_J)$, $L = (l_1, \dots, l_s)$ is a line vector with coefficients in $\mathcal{V}[t_1, \dots, t_n]^\dagger$ such that for any $i = 1, \dots, s$ and every $j \in \mathbb{N}$, there exist some polynomials $L_{ij} \in B_n$ such that $\deg(L_{ij}) \leq c(j + \deg(M_J))$ and $l_i = \sum_{j \in \mathbb{N}} \pi^j L_{ij}(t_1, \dots, t_n)$.

6) *Conclusion.* Let us denote by $S_{J,j} := L_{ij}(t_1, \dots, t_n) Q(\underline{\partial}^{\langle \underline{a} \rangle_{(m)}}, \underline{a} \leq p^m) \in B_{n+n(p^m+1)}$. So,

$$R_J = \sum_{i=1}^s x_i \sum_{j \in \mathbb{N}} \pi^{J+j} S_{J,j}.$$

As $\deg(M_J) \leq \deg(P_J) \leq c(J+1)$, then $\deg(Q) \leq c(J+1)$ and $\deg(L_{ij}) \leq c(j + c(J+1))$. Hence : $\deg(S_{J,j}) \leq c(j + c(J+1)) + c(J+1) \leq c(1+c)(J+j+1)$.

When j and J are fixed, the set of polynomials of the form $S_{J,j}$ defined as above has a finite cardinal. Let us denote by $\widetilde{S}_{J,j}$ the finite sum of elements of this set. We get then the sum

$$z = \sum_{i=1}^{s} x_i \sum_{J,j\in\mathbb{N}} \pi^{J+j} \widetilde{S}_{J,j}.$$

As $\deg(\widetilde{S}_{J,j}) \leq c(1+c)(J+j+1)$, this yields that $\sum_{J,j\in\mathbb{N}} \pi^{J+j}\widetilde{S}_{J,j} \in D^{(m)\dagger}$. □

Corollary 17.7.2.5. *Let $g\colon U^\dagger \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$ a finite etale morphism of smooth $\mathcal{S}$-weak formal schemes. The canonical homomorphisms $D^{(m)\dagger} \to D^{(m)\dagger}_{U^\dagger}$ are $D^\dagger \to D^\dagger_{U^\dagger}$ are right and left fully faithful (see 17.7.2.3).*

Proof. It follows from 17.7.2.4 that the functors $D^{(m)\dagger}_{U^\dagger} \otimes_{D^{(m)\dagger}} -$, $-\otimes_{D^{(m)\dagger}} D^{(m)\dagger}_{U^\dagger}$ $D^{(m)\dagger}_{U^\dagger} \otimes_{D^{(m)\dagger}} -$ and $-\otimes_{D^{(m)\dagger}} D^{(m)\dagger}_{U^\dagger}$ are canonically isomorphic to $A^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} -$. Since $\mathcal{V}[\underline{t}]^\dagger \to A^\dagger$ is faithfully flat (because so is $\mathcal{V}\{\underline{t}\} \to \widehat{A}$), then we are done. □

Proposition 17.7.2.6. *We keep the notations and hypotheses of 17.7.2.4. The canonical morphisms*

$$D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^\dagger} D^\dagger_{U^\dagger} \to D^\dagger_{\mathfrak{U}}, \qquad D^\dagger_{U^\dagger} \otimes_{D^\dagger} D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \to D^\dagger_{\mathfrak{U}}$$

are isomorphisms.

Proof. By applying the functor $D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^\dagger} -$ to 17.7.2.4 we get:

$$D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^\dagger} D^\dagger_{U^\dagger} \overset{17.7.2.4}{\underset{\sim}{\longleftarrow}} D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^\dagger} D^\dagger \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger \overset{\sim}{\longleftarrow} D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger.$$

Moreover, as $A^\dagger$ is a finite $\mathcal{V}[\underline{t}]^\dagger$-algebra, then $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger \xrightarrow{\sim} \widehat{A}$. Hence, $D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{\mathcal{V}\{\underline{t}\}} \widehat{A} \xrightarrow{\sim} D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger$. The isomorphism $D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{\mathcal{V}\{\underline{t}\}} \widehat{A} \xrightarrow{\sim} D^\dagger_{\mathfrak{U}}$ of 17.7.2.1 allows us to conclude by composing these isomorphisms. □

17.7.3 Explicit description of overconvergent isocrystals on finite and etale schemes over affine spaces

We give a description of overconvergent isocrystals on the affine space (see 17.7.3.3 and 17.7.3.5). Next we deduce, thanks to the preceding section, a description of overconvergent isocrystals on the finite and etale schemes over the affine space (see 17.7.3.7).

In this subsection, we will keep the following notations : let $\mathfrak{P} := \widehat{\mathbb{P}}^n_{\mathcal{V}}$ be the formal projective space on $\mathcal{V}$ of dimension n, $u_0, \dots, u_n$ the projective coordinates of $\mathfrak{P}$, H_0 the hyperplan defined by $u_0 = 0$, i.e., $H_0 := \mathbb{P}^n_k \setminus \mathbb{A}^n_k$. We denote by $\mathcal{O}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$ (resp. $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$) the sheaf of fonctions (resp. differential operators of finite level) on $\mathfrak{P}$ with overconvergent singularities along of H_0 (see [Ber96c, 4.2]). We set moreover on $\mathcal{D}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} := \mathcal{O}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{P},\mathbb{Q}}} \mathcal{D}_{\mathfrak{P},\mathbb{Q}}$, where $\mathcal{D}_{\mathfrak{P}}$ is the sheaf usuel of differential operators on $\mathfrak{P}$.

Following the theorem of comparison of Noot-Huyghe (see [Huy97] or [Huy98]), we have in this geometrical situation the isomorphism: $D^\dagger_K := D^\dagger_{\mathbb{A}^{n\dagger}_{\mathcal{V}},K} \xrightarrow{\sim} \Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}})$. She established moreover on the formula:

$$\Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}) = \left\{ \sum_{\underline{k},\underline{l}\in\mathbb{N}^n} a_{\underline{k},\underline{l}} \underline{t}^{\underline{k}} \underline{\partial}^{[\underline{l}]} \mid a_{\underline{k},\underline{l}} \in K, \exists \eta < 1, \exists c \geq 1 \text{ such that } |a_{\underline{k},\underline{l}}| < c\eta^{|\underline{k}|+|\underline{l}|} \right\},$$

where $t_1 = \frac{u_1}{u_0}, \dots, t_n = \frac{u_n}{u_0}$ are the coordinates on the affine space. Moreover, we set: $\mathcal{V}[\underline{t}]^\dagger_K := \mathcal{V}[t_1, \dots, t_n]^{\dagger/\mathcal{V}} \otimes_{\mathcal{V}} K \xrightarrow{\sim} \Gamma(\mathbb{A}^{n\dagger}_{\mathcal{V}}, \mathcal{O}_{\mathbb{A}^{n\dagger}_{\mathcal{V}},\mathbb{Q}}) \xrightarrow{\sim} \Gamma(,\mathfrak{P}, \mathcal{O}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}})$. We have also: $\Gamma(,\mathfrak{P}, \mathcal{D}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}) \xrightarrow{\sim} D_K$.

17.7.3.1 (Huyghe's theorems of type A)**.** Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-module.

(a) Following the theorem of type A for coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-modules (see [Huy97]), $E := \Gamma(\mathfrak{P}, \mathcal{E})$ is a coherent $D^\dagger_K$-module and the canonical morphism

$$\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} E \to \mathcal{E} \tag{17.7.3.1.1}$$

is an isomorphism. Moreover, the functors $\Gamma(\mathfrak{P}, -)$ and $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} -$ induce quasi-inverse equivalences between the category of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-modules and that of coherent $D^\dagger_K$-modules.

(b) We have Similarly, the functors $\Gamma(\mathfrak{P}, -)$ and $\mathcal{O}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{\mathcal{V}[\underline{t}]^\dagger_K} -$ (resp. $\mathcal{D}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{\mathcal{V}[\underline{t}]^\dagger_K} -$) induce quasi-inverse equivalences between the category of coherent $\mathcal{D}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-modules (resp. coherent $\mathcal{O}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-modules) and that of coherent D_K-modules (resp. coherent $\mathcal{V}[\underline{t}]^\dagger_K$-modules).

(c) For any affine open $\mathfrak{U}' \subset \widehat{\mathbb{A}}^n_{\mathcal{V}}$, following the theorem of type A for coherent $\mathcal{D}^\dagger_{\mathfrak{U}',\mathbb{Q}}$-modules (see 8.7.5.5), the canonical morphism

$$\mathcal{D}^\dagger_{\mathfrak{U}',\mathbb{Q}} \otimes_{D^\dagger_{\mathfrak{U}',K}} \Gamma(\mathfrak{U}', \mathcal{E}) \to \mathcal{E}|\mathfrak{U}' \tag{17.7.3.1.2}$$

is an isomorphism.

(d) By combining 17.7.3.1.2 and 17.7.3.1.1, this yields that the canonical morphism

$$D^\dagger_{\mathfrak{U}',K} \otimes_{D^\dagger_K} E \to \Gamma(\mathfrak{U}', \mathcal{E}) \tag{17.7.3.1.3}$$

is an isomorphism.

17.7.3.2. Using Theorems of 17.7.3.1, since the homomorphism $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \to j_* \mathcal{D}^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}}$ is faithfully flat, then so is the global version analogue $D^\dagger_K \to D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}}$ where $D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}} := \Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}}, \mathcal{D}^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}})$ (use also 8.7.6.2).

17.7.3.3. Denote by $\mathrm{MIC}(\mathfrak{P}, H_0/\mathcal{V})$ the category of $\mathcal{D}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-modules, which are also coherent as $\mathcal{O}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-modules It follows from the theorems of type A of 17.7.3.1 that the functors $\Gamma(\mathfrak{P}, -)$ and $\mathcal{D}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} -$ induce quasi-inverse equivalences between the category $\mathrm{MIC}(\mathfrak{P}, H_0/\mathcal{V})$ and $\mathrm{MIC}(\mathcal{V}[\underline{t}]^\dagger_K/K)$, the category of D_K-modules which are $\mathcal{V}[\underline{t}]^\dagger_K$-coherent (see notation 17.5.1.1).

By using 11.2.1.14, the category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$ is equal to that of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-modules, which are also coherent as $\mathcal{O}_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$-module. Using theorems of type A of 17.7.3.1, this yields the functors $\Gamma(\mathfrak{P}, -)$ and $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} -$ induce quasi-inverse equivalences between the category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$ and the category of coherent $D^\dagger_K$-modules which are $\mathcal{V}[\underline{t}]^\dagger_K$-coherent.

17.7.3.4. By definition(see 17.5.1.1.(c) used in the case where $Y^\dagger = \mathbb{A}^{n\dagger}_{\mathcal{V}}$, $X = \mathbb{P}^n_{\mathcal{V}}$ and then $X^{\mathrm{an}}_K = \mathfrak{P}_K$), the functor $\Gamma(\mathfrak{P}_K, -)$ induces an equivalence between the category $\mathrm{MIC}^\dagger(\mathbb{A}^n_k, \mathbb{P}^n_k, \mathfrak{P}/K)$ and $\mathrm{MIC}^\dagger(\mathcal{V}[\underline{t}]^\dagger_K/K)$. On The functor sp_*, where $\mathrm{sp}\colon \mathfrak{P}_K \to \mathfrak{P}$ is the specialisation morphism, gives an equivalence between $\mathrm{MIC}^\dagger(\mathbb{A}^n_k, \mathbb{P}^n_k, \mathfrak{P}/K)$ and $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$. Since $\Gamma(\mathfrak{P}, -) \circ \mathrm{sp}_* = \Gamma(\mathfrak{P}_K, -)$, then we deduce from 17.7.3.3 that the functor $\Gamma(\mathfrak{P}, -)$ induces an equivalence between $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$ and $\mathrm{MIC}^\dagger(\mathcal{V}[\underline{t}]^\dagger_K/K)$. This yields that $\mathrm{MIC}^\dagger(\mathcal{V}[\underline{t}]^\dagger_K/K)$ is equal to the category of coherent $D^\dagger_K$-modules which are $\mathcal{V}[\underline{t}]^\dagger_K$-coherent

Lemma 17.7.3.5. *Let $\mathcal{E} \in \mathrm{MIC}(\mathfrak{P}, H_0/\mathcal{V})$ and $E := \Gamma(\mathfrak{P}, \mathcal{E}) \in \mathrm{MIC}(\mathcal{V}[\underline{t}]^\dagger_K/K)$. The following assertions are equivalent:*

(a) $E \in \mathrm{MIC}^\dagger(\mathcal{V}[\underline{t}]^\dagger_K/K)$;

(b) $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$;

(c) The canonical morphism $E \to D^\dagger_K \otimes_{D_K} E$ is an isomorphism ;

(d) E is endowed with a structure of coherent $D^\dagger_K$-module extending its structure of D_K-module.

Proof. The equivalence $(b) \Leftrightarrow (a)$ follows from 17.7.3.4. Suppose $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$ and let us check that E satisfies (c). Following 11.2.1.9.2, the canonical morphism $\mathcal{E} \to \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}} \mathcal{E}$ is an isomorphism. We conclude using theorems of type A for respectively coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-modules and coherent $\mathcal{D}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-modules (see 17.7.3.1). By noetherianity of D_K, E is therefore D_K-coherent. Hence, $(c) \Rightarrow (d)$. Using 17.7.3.3 and Theorem of type A (see 17.7.3.1), we get the implication: $(d) \Rightarrow (b)$. ☐

Proposition 17.7.3.6. *Let $g\colon U^{\dagger} \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$ be a finite etale morphism of smooth $\mathfrak{S}$-weak formal schemes, $A^{\dagger} := \Gamma(U^{\dagger}, \mathcal{O}_{U^{\dagger}})$ and $D_{U^{\dagger}} := \Gamma(U^{\dagger}, \mathcal{D}_{U^{\dagger}})$. Let $E \in \mathrm{MIC}(A^{\dagger}_K/K)$ (see 17.5.1.1). Let us denote by $g_*(E)$ the module E viewed as an element of $\mathrm{MIC}(\mathcal{V}[\underline{t}]^{\dagger}_K/K)$ via the ring homomorphism $D_K \to D_{U^{\dagger},K}$. The following assertions are equivalent:*

(a) The connection of E is overconvergente, i.e. $E \in \mathrm{MIC}^{\dagger}(A^{\dagger}_K/K)$;

(b) The connection of $g_*(E)$ is overconvergente, i.e. $g_*(E) \in \mathrm{MIC}^{\dagger}(\mathcal{V}[\underline{t}]^{\dagger}_K/K)$;

(c) E is endowed with a structure of coherent $D^{\dagger}_{U^{\dagger},K}$-module extending its structure of $D_{U^{\dagger},K}$-module ;

(d) The canonical $D_{U^{\dagger},K}$-linear morphism $E \to D^{\dagger}_{U^{\dagger},K} \otimes_{D_{U^{\dagger},K}} (E)$ is an isomorphism.

Proof. By using [LS07, 7.2.15], we get the equivalence between the two first assertions. Following 17.7.2.3.1, we have that the canonical isomorphism: $D_K \otimes_{\mathcal{V}[\underline{t}]^{\dagger}} A^{\dagger} \xrightarrow{\sim} D_{U^{\dagger},K}$. By using 17.7.2.4.2, this yields that the canonical morphism : $D^{\dagger}_K \otimes_{D_K} D_{U^{\dagger},K} \to D^{\dagger}_{U^{\dagger},K}$ is an isomorphism. Via 17.7.3.5, this yields the equivalence between (b) and (d). The implication $(d) \Rightarrow (c)$ is obvious. Moreover, if E is endowed with a structure of coherent $D^{\dagger}_{U^{\dagger},K}$-module extending its structure of $D_{U^{\dagger},K}$-module then g_*E is endowed with a structure of coherent $D^{\dagger}_K$-module extending its structure of D_K-module. Via 17.7.3.5, this proves the implication $(b) \Rightarrow (c)$. ☐

Corollary 17.7.3.7. *Let $g\colon U^{\dagger} \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$ be a finite etale morphism of smooth $\mathfrak{S}$-weak formal schemes, $A^{\dagger} := \Gamma(U^{\dagger}, \mathcal{O}_{U^{\dagger}})$ and $D_{U^{\dagger}} := \Gamma(U^{\dagger}, \mathcal{D}_{U^{\dagger}})$.*

(a) Let $\phi\colon E \to F$ be a $D_{U^{\dagger},K}$-linear map between two objects of $\mathrm{MIC}^{\dagger}(A^{\dagger}_K/K)$. Then ϕ is $D^{\dagger}_{U^{\dagger},K}$-linear.

(b) The category $\mathrm{MIC}^{\dagger}(A^{\dagger}_K/K)$ is equal to the strictly full subcategory of that of $D^{\dagger}_{U^{\dagger},K}$-modules consisting of coherent $D^{\dagger}_{U^{\dagger},K}$-modules which are also coherent as $A^{\dagger}_K$-module.

Lemma 17.7.3.8. *Let $\mathcal{F} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$. Set $F := \Gamma(\mathfrak{P}, \mathcal{F}) \in \mathrm{MIC}^{\dagger}(\mathcal{V}[\underline{t}]^{\dagger}_K/K)$. The canonical morphisms:*

$$\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^{\dagger}} F \to D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^{\dagger}} F \to \Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}}, \mathcal{F})$$

are isomorphisms.

Proof. Using respectively the theorems of type A for coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-modules and coherent $\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-modules (see 17.7.3.1), we get the homomorphisms: $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^{\dagger}} F \to \Gamma(\widehat{\mathbb{A}}^n_{\mathfrak{S}}, \mathcal{F})$ and $D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^{\dagger}} F \to \Gamma(\widehat{\mathbb{A}}^n_{\mathfrak{S}}, \mathcal{F})$ are isomorphisms. Hence, we are done.

☐

Proposition 17.7.3.9. *Let $g\colon U^{\dagger} \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$ be a finite etale morphism of smooth $\mathfrak{S}$-weak formal schemes, $A^{\dagger} := \Gamma(U^{\dagger}, \mathcal{O}_{U^{\dagger}})$ and $D_{U^{\dagger}} := \Gamma(U^{\dagger}, \mathcal{D}_{U^{\dagger}})$. Set $D_{\mathfrak{U}} := \Gamma(\mathfrak{U}, \mathcal{D}_{\mathfrak{U}})$ and $D^{\dagger}_{\mathfrak{U}} := \Gamma(\mathfrak{U}, \mathcal{D}^{\dagger}_{\mathfrak{U}})$. Let $E \in \mathrm{MIC}^{\dagger}(A^{\dagger}_K/K)$.*

(a) Then the canonical morphism

$$\widehat{A}_K \otimes_{A^{\dagger}_K} E \to D^{\dagger}_{\mathfrak{U},K} \otimes_{D^{\dagger}_{U^{\dagger},K}} E$$

is an isomorphism.

(b) We have $G := D^\dagger_{\mathfrak{U},K} \otimes_{D^\dagger_{U^\dagger,K}} E \in \mathrm{MIC}^\dagger(\widehat{A}_K/K)$ *(see notation 11.1.1.7) and* $\mathcal{G} := \mathcal{D}^\dagger_{\mathfrak{U},\mathbb{Q}} \otimes_{D^\dagger_{\mathfrak{U},K}} G \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{U}/\mathcal{V})$.

Proof. a) Let us check the first assertion. i) Following 17.7.3.6, $g_*E \in \mathrm{MIC}^\dagger(\mathcal{V}[\underline{t}]^\dagger_K/K)$. Let $\mathcal{F} := \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} g_*E$ (and then $g_*E = \Gamma(\mathfrak{P}, \mathcal{F})$). Following 17.7.3.5, we have $\mathcal{F} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, H_0/\mathcal{V})$. Using 17.7.3.8, this yields the canonical morphism $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^\dagger} g_*E \to D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^\dagger} g_*E$ is an isomorphism.

ii) As $A^\dagger$ is a finite $\mathcal{V}[\underline{t}]^\dagger$-algebra, then $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^\dagger} A^\dagger \xrightarrow{\sim} \widehat{A}$. Hence, the canonical morphism $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^\dagger} g_*E \to \widehat{A}_K \otimes_{A^\dagger_K} E$ is an isomorphism. It follows from 17.7.2.6 that the canonical morphism $D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}}} \otimes_{D^\dagger} g_*E \to D^\dagger_{\mathfrak{U},K} \otimes_{D^\dagger_{U^\dagger,K}} E$ is an isomorphism. Hence, using the last isomorphism of the part i) of the proof we are done.

b) This follows from a) and from 17.7.3.9. □

Lemma 17.7.3.10. *We keep notation 17.7.3.9. Let* $E \in \mathrm{MIC}^\dagger(A^\dagger_K/K)$*,* $\widehat{F} \in \mathrm{MIC}^\dagger(\widehat{A}_K/K)$.

We suppose that there exist a $D_{U^\dagger,K}$*-linear morphism* $E \to \widehat{F}$ *and such that the induced morphism* $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^\dagger} E \to \widehat{F}$ *is bijective. The induced morphism* $\widehat{A}_K \otimes_{A^\dagger_K} E \to \widehat{F}$ *is therefore an isomorphism of* $\mathrm{MIC}^\dagger(\widehat{A}_K/K)$.

Proof. The canonical morphism $\mathcal{V}\{\underline{t}\} \otimes_{\mathcal{V}[\underline{t}]^\dagger} E \to \widehat{A}_K \otimes_{A^\dagger_K} E \to E$ is an isomorphism. Hence, this follows from 17.7.3.9. □

17.7.4 The main result

We keep notations of 17.7.3. Moreover, let $U^\dagger$ be an affine open subspace of $\mathbb{A}^{n\dagger}_{\mathcal{V}}$, $j\colon U^\dagger \subset \mathbb{P}^{n\dagger}_{\mathcal{V}}$ the open immersion, $\mathfrak{U}$ its p-adic completion, $T_0 := \mathbb{P}^n_k \setminus U_0$ be the reduced divisor of $\mathbb{P}^n_k$ whose support is complementary to U_0 (see 17.6.1.5). We set $D_{U^\dagger} := \Gamma(U^\dagger, \mathcal{D}_{U^\dagger})$ and $D^{(m)}_{U^\dagger} := \Gamma(U^\dagger, \mathcal{D}^{(m)}_{U^\dagger})$ (and similarly replacing $U^\dagger$ by another affine smooth $\mathfrak{S}$-weak formal scheme). Let $v\colon Y^\dagger \hookrightarrow U^\dagger$ be a closed immersion of affine and smooth $\mathfrak{S}$-weak formal schemes, with Y_0 integral and $\dim Y_0 = n - r$ for some integer r. Let X_0 be the closure of Y_0 in P. We suppose moreover there exist a finite etale morphism $g_0\colon U_0 \to \mathbb{A}^n_k$ such that $g_0(Y_0) \subset \mathbb{A}^{n-r}_k$, where $\mathbb{A}^{n-r}_k$ is the closed subscheme defined by the equations $t_1 = 0, \ldots, t_r = 0$. We denote by $g\colon U^\dagger \to \mathbb{A}^{n\dagger}_{\mathcal{V}}$ a lifting of g_0. The p-adic completions of v or g will still be denoted by respectively v or g. The main result of this section is the characterization of 17.7.4.6 of overconvergent isocrystals on Y_0.

17.7.4.1. As $U^\dagger$ is an open subset of $\mathbb{A}^{n\dagger}_{\mathcal{V}}$, we obtain the canonical morphism of restriction (for any level m) $D^{(m)}_{\mathbb{A}^{n\dagger}_{\mathcal{V}}} \to D^{(m)}_{U^\dagger}$. By functoriality of the p-adic weak completion this yields $D^{(m)\dagger}_{\mathbb{A}^{n\dagger}_{\mathcal{V}}} \to D^{(m)\dagger}_{U^\dagger}$. Since $D_{U^\dagger} \xrightarrow{\sim} \varinjlim_m D^{(m)}_{U^\dagger}$, then following 17.7.1.9 we have $D^\dagger_{U^\dagger} \xrightarrow{\sim} \varinjlim_m D^{(m)\dagger}_{U^\dagger}$ (and similarly replacing $U^\dagger$ by $\mathbb{A}^{n\dagger}_{\mathcal{V}}$). By passage to the limit on the level, we get therefore the canonical morphism :

$$\Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}) \xrightarrow{\sim} D^\dagger_{\mathbb{A}^{n\dagger}_{\mathcal{V}}} \to D^\dagger_{U^\dagger}. \tag{17.7.4.1.1}$$

Lemma 17.7.4.2. *We have the canonical maps* $D^\dagger_U \to \Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger * T_0))$ *and* $D^\dagger_{U,K} \to \Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}})$.

Proof. Following 17.4.1.2, we have the homomorphism $j_*\mathcal{D}_U \to \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger * T_0)$. This yields the map $D_U \to \Gamma(\mathcal{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger * T_0))$. Since $\Gamma(\mathcal{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger * T_0))$ is a weakly complete $\mathcal{V}$-algebra (see 17.7.1.3), then using the universal property of a weak completion, we get the first map. Since $\Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger * T_0)_{\mathbb{Q}}) = \Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T_0)_{\mathbb{Q}})$, then we get the second one. □

Remark 17.7.4.3. The $\mathcal{V}$-algebra $\Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}(T_0))$ is weakly complete (use 17.7.1.9 and the fact that a complete $\mathcal{V}$-algebra is a weak $\mathcal{V}$-algebra). However, we do not have a map of the form $D^\dagger_U \to \Gamma(\mathfrak{P}, \mathcal{D}^\dagger_{\mathfrak{P}}(T_0))$.

Lemma 17.7.4.4. *Let* $\alpha\colon \widehat{\mathbb{P}}^{n-r}_{\mathcal{V}} \hookrightarrow \widehat{\mathbb{P}}^n_{\mathcal{V}}$ *be the closed immersion defined by* $u_1 = 0, \ldots, u_r = 0$*. Let* $\mathcal{E}$ *be a coherent* $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}}$*-module with support in* $\mathbb{P}^{n-r}_k$ *and* $E := \Gamma(\widehat{\mathbb{P}}^n_{\mathcal{V}}, \mathcal{E})$*. Then* $\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{E})) \xrightarrow{\sim} \cap_{i=1}^r \ker(t_i\colon E \to E)$.

Proof. Let us denote by $\mathfrak{P}' := \widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}$, $\mathcal{I}$ the ideal of $\mathcal{O}_{\mathfrak{P}}$ given by the closed immersion α. By taking the p-adic completion of $\mathcal{D}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}} \xrightarrow{\sim} \alpha^{-1}(\mathcal{D}^{(m)}_{\mathfrak{P}}/\mathcal{I}\mathcal{D}^{(m)}_{\mathfrak{P}})$, we get $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}'\to\mathfrak{P}} \xrightarrow{\sim} \alpha^{-1}(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}}/\mathcal{I}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}})$. By adding overconvergent singularities along of H_0, by taking the limit on the level and by tensorizing by $\mathbb{Q}$, we get then the isomorphism $\mathcal{D}^{\dagger}_{\mathfrak{P}'\to\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}} \xrightarrow{\sim} \alpha^{-1}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}/\mathcal{I}\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}})$. This implies

$$\alpha^!(\mathcal{E}) = \mathcal{D}^{\dagger}_{\mathfrak{P}'\to\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\alpha^{-1}\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}} \alpha^{-1}\mathcal{E}[-r] \xrightarrow{\sim} \alpha^{-1}(\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}/\mathcal{I}\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}} \mathcal{E})[-r].$$

The ideal $\mathcal{I}\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$ of $\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$ is generated by the global sections $t_1, \dots, t_r$, i.e. via the theorem A of coherent $\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-modules (see 17.7.3.1), $\Gamma(\mathfrak{P}, \mathcal{I}\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}})$ is the ideal of $\mathcal{V}[\underline{t}]^{\dagger}_K$ generated by $t_1, \dots, t_r$. Via the Koszul resolution induced by the regular sequence of elements $t_1, \dots, t_r$ which generate the ideal $\mathcal{I}\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$ of $\mathcal{O}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$, we compute $H^0(\alpha_*\alpha^!(\mathcal{E})) \xrightarrow{\sim} \cap_{i=1}^r \ker(t_i \colon \mathcal{E} \to \mathcal{E})$. Moreover, since $\mathcal{E}$ has its support in $\mathbb{P}^{n-r}_k$, using the theorem of Berthelot-Kashiwara of 9.3.5.9), we get $H^0(\alpha^!(\mathcal{E})) \xrightarrow{\sim} \alpha^!(\mathcal{E})$. Hence $\alpha_*\alpha^!(\mathcal{E}) \xrightarrow{\sim} \cap_{i=1}^r \ker(t_i \colon \mathcal{E} \to \mathcal{E})$. We conclude by applying to this latter the global sections functor. □

Lemma 17.7.4.5. *Let $\alpha\colon \widehat{\mathbb{P}}^{n-r}_{\mathcal{V}} \hookrightarrow \widehat{\mathbb{P}}^n_{\mathcal{V}}$ be the closed immersion defined by $u_1 = 0, \dots, u_r = 0$. Let $\beta\colon \widehat{\mathbb{A}}^{n-r}_{\mathcal{V}} \hookrightarrow \widehat{\mathbb{A}}^n_{\mathcal{V}}$ be the morphism induced by α. Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-module with support in $\mathbb{P}^{n-r}_k$. The canonical diagram*

$$\begin{array}{ccc} \Gamma(\mathbb{P}^{n-r}_k, \alpha^!(\mathcal{E})) & \xrightarrow[17.7.4.4]{\sim} & \cap_{i=1}^r \ker(t_i \colon \Gamma(\mathbb{P}^n_k, \mathcal{E}) \to \Gamma(\mathbb{P}^n_k, \mathcal{E})) \\ \downarrow & & \downarrow \\ \Gamma(\mathbb{A}^{n-r}_k, \alpha^!(\mathcal{E})) = \Gamma(\mathbb{A}^{n-r}_k, \beta^!(\mathcal{E}|\mathbb{A}^n_k)) & \xrightarrow[9.3.1.20.2]{\sim} & \cap_{i=1}^r \ker(t_i \colon \Gamma(\mathbb{A}^n_k, \mathcal{E}) \to \Gamma(\mathbb{A}^n_k, \mathcal{E}), \end{array} \qquad (17.7.4.5.1)$$

where the horizontal isomorphisms come from 17.7.4.4 and 9.3.1.20.2, is commutative.

Proof. This is a consequence of the construction of horizontal isomorphisms. □

Theorem 17.7.4.6. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-module such that $\mathcal{E}|\mathfrak{U} \in \mathrm{MIC}^{\dagger\dagger}(Y_0, \mathfrak{U}/K)$. Then there exists $G \in \mathrm{MIC}^{\dagger}(Y_0/K)$ and a $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T_0)_{\mathbb{Q}}$-linear isomorphism of the form:*

$$\mathrm{sp}_{Y^{\dagger}\hookrightarrow U^{\dagger}, T_0, +}(G) \xrightarrow{\sim} \mathcal{E}({}^{\dagger}T_0).$$

In other words, $\mathcal{E}({}^{\dagger}T_0) \in \mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, T_0/K)$.

Proof. Put $A^{\dagger} := \Gamma(U^{\dagger}, \mathcal{O}_{U^{\dagger}})$, $E := \Gamma(\mathfrak{P}, \mathcal{E})$ and $E' := D^{\dagger}_{U^{\dagger}} \otimes_{D^{\dagger}} E$ where the extension $D^{\dagger} \to D^{\dagger}_{U^{\dagger}}$ defining the tensor product is the one induced by the open immersion $U^{\dagger} \subset A^{n\dagger}_{\mathcal{V}}$, i.e., that of 17.7.4.1.1. Let us denote by $\widetilde{Y}^{\dagger} := g^{-1}(\mathbb{A}^{n-r\dagger}_{\mathcal{V}})$, $a\colon \widetilde{Y}^{\dagger} \to \mathbb{A}^{n-r\dagger}_{\mathcal{V}}$ the finite etale morphism induced by g. Let $w\colon Y^{\dagger} \hookrightarrow \widetilde{Y}^{\dagger}$ (resp. $\widetilde{v}\colon \widetilde{Y}^{\dagger} \hookrightarrow U^{\dagger}$) a lifting of the closed immersion $Y_0 \hookrightarrow \widetilde{Y}_0$ (resp. $\widetilde{Y}_0 \hookrightarrow U_0$). Let us denote by $\beta\colon \mathbb{A}^{n-r\dagger}_{\mathcal{V}} \hookrightarrow \mathbb{A}^{n\dagger}_{\mathcal{V}}$ and $\alpha\colon \mathbb{P}^{n-r\dagger}_{\mathcal{V}} \hookrightarrow \mathbb{P}^{n\dagger}_{\mathcal{V}}$ the canonical closed immersions given by respectively $t_1 = 0, \dots, t_r = 0$ and $u_1 = 0, \dots, u_r = 0$. The p-adic completions of morphisms of smooth $\mathcal{S}$-weak formal schemes are still abusively designated by the same letter, e.g., $\beta\colon \widehat{\mathbb{A}}^{n-r}_{\mathcal{V}} \hookrightarrow \widehat{\mathbb{A}}^n_{\mathcal{V}}$ or $\alpha\colon \widehat{\mathbb{P}}^{n-r}_{\mathcal{V}} \hookrightarrow \widehat{\mathbb{P}}^n_{\mathcal{V}}$. Finally, let us denote by $x_1, \dots, x_n$ the local coordinates of $U^{\dagger}$ corresponding to $t_1, \dots, t_n$ via g^*. Let us denote by $G := \cap_{i=1}^r \ker(x_i \colon E' \to E')$.

I) The module $G \in \mathrm{MIC}^{\dagger}(A^{\dagger}_K/K)$ (see notation 17.5.1.1).

One main problem is to establish that the module G is a coherent $\Gamma(Y^{\dagger}, \mathcal{O}_{Y^{\dagger},\mathbb{Q}})$-module. The idea is to reduce via the morphism g to the case where the compactification of Y_0 in P_0 is smooth.

0) i) The morphism g induces a ring homomorphism $\rho_g\colon D^{\dagger}_K \to D^{\dagger}_{\mathfrak{U},K}$ (see the end of 17.7.2.3). We denote by $g_*(E')$ the module E' viewed as a $D^{\dagger}_K$-module via ρ_g. We construct a canonical isomorphism of coherent $D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K}$-modules of the form $D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^{\dagger}_K} g_*(E') \xrightarrow{\sim} \Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}}, g_+(\mathcal{E}|\mathfrak{U}))$ as follows: We have the $D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K}$-linear isomorphism:

$$D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^{\dagger}_K} g_*(E') \overset{17.7.2.6}{\xrightarrow{\sim}} D^{\dagger}_{\mathfrak{U},K} \otimes_{D^{\dagger}_{U^{\dagger},K}} E' \xrightarrow{\sim} D^{\dagger}_{\mathfrak{U},K} \otimes_{D^{\dagger}_K} E \overset{17.7.3.1.3}{\xrightarrow{\sim}} \Gamma(\mathfrak{U}, \mathcal{E}). \qquad (17.7.4.6.1)$$

Moreover, as g is finite etale, then following 9.2.4.15.2 we have the isomorphism $g_+(\mathcal{E}|\mathfrak{U}) \xrightarrow{\sim} g_*(\mathcal{E}|\mathfrak{U})$ of $\mathcal{D}^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}}$-modules. Since g is proper and $\mathcal{E}|\mathfrak{U}$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}}$-module, then $g_+(\mathcal{E}|\mathfrak{U})$ is more precisely a coherent $\mathcal{D}^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}}$-module. Hence, following the theorem of type A (e.g. see 17.7.3.1.2), we get the isomorphisms of coherent $D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}}$-modules:

$$\Gamma(\mathfrak{U},\mathcal{E}) \xrightarrow{\sim} \Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}}, g_*(\mathcal{E}|\mathfrak{U})) \xrightarrow{\sim} \Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}}, g_+(\mathcal{E}|\mathfrak{U})). \tag{17.7.4.6.2}$$

Composing 17.7.4.6.1 and 17.7.4.6.2, we are done.

ii) Since the extension $D^{\dagger}_K \to D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K}$ is faithfully flat (see 17.7.3.2), since $D^{\dagger}_K$ is a coherent ring, then we deduce from i) that $g_*(E')$ is a coherent $D^{\dagger}_K$-module. Hence, we construct a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-module by setting

$$\mathcal{F} := \mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}} \otimes_{D^{\dagger}_K} g_*(E').$$

1) *Let us check the isomorphism* $\mathcal{F}|\widehat{\mathbb{A}}^n_{\mathcal{V}} \xrightarrow{\sim} g_+(\mathcal{E}|\mathfrak{U})$.

Since $\mathcal{F}|\mathfrak{U} \xrightarrow{\sim} \mathcal{D}^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}} \otimes_{D^{\dagger}_K} g_*(E')$ is a coherent $\mathcal{D}^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}}$-modules, then it follows from theorem of type A the first isomorphism:

$$\Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathcal{F}) \xrightarrow{\sim} D^{\dagger}_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^{\dagger}_K} g_*(E') \overset{0.i)}{\xrightarrow{\sim}} \Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}}, g_+(\mathcal{E}|\mathfrak{U})).$$

Since $\mathcal{F}|\widehat{\mathbb{A}}^n_{\mathcal{V}}$ and $g_+(\mathcal{E}|\mathfrak{U})$ are both coherent, then we conclude via theorem of type A.

2) Put $\mathcal{H} := v^!(\mathcal{E}|\mathfrak{U})$. Since $\mathcal{H} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{Y}/\mathcal{V})$ (see notation 11.1.1.3), then $\mathcal{H}$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}$-module which is also coherent as $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-module (see 11.1.1.2). Moreover, as $\dim \widetilde{Y}_0 = \dim Y_0$ and as $\widetilde{Y}_0$ is smooth, Y_0 is then a connected component of $\widetilde{Y}_0$. This yields that $\widetilde{\mathcal{H}} := w_+(\mathcal{H})$ is a coherent $\mathcal{D}^{\dagger}_{\widetilde{\mathfrak{Y}},\mathbb{Q}}$-module which is coherent as $\mathcal{O}_{\widetilde{\mathfrak{Y}},\mathbb{Q}}$-module, i.e. $\widetilde{\mathcal{H}} \in \mathrm{MIC}^{\dagger\dagger}(\widetilde{\mathfrak{Y}}/\mathcal{V})$.

3) We have the isomorphism $\mathcal{F}|\widehat{\mathbb{A}}^n_{\mathcal{V}} \xrightarrow{\sim} \beta_+ a_+(\widetilde{\mathcal{H}})$. Indeed, since $\mathcal{E}|\mathfrak{U}$ has its support in Y then following the theorem of Berthelot-Kashiwara (see 9.3.5.9), we have the canonical isomorphism $\mathcal{E}|\mathfrak{U} \xrightarrow{\sim} v_+(\mathcal{H})$. Moreover, following the step 1), $\mathcal{F}|\widehat{\mathbb{A}}^n_{\mathcal{V}} \xrightarrow{\sim} g_+(\mathcal{E}|\mathfrak{U})$. This yields: $\mathcal{F}|\widehat{\mathbb{A}}^n_{\mathcal{V}} \xrightarrow{\sim} g_+ v_+(\mathcal{H}) \xrightarrow{\sim} g_+\widetilde{v}_+(\widetilde{\mathcal{H}}) \xrightarrow{\sim} \beta_+ a_+(\widetilde{\mathcal{H}})$.

4) *The sheaf* $\mathcal{F}$ *has its support in* $\mathbb{P}^{n-r}_k$.

Let us denote by $H_1,\dots,H_r$ the hyperplans of $\mathbb{P}^n_k$ corresponding to $u_1 = 0,\dots,u_r = 0$. It follows from the isomorphism of the step 3) that $\mathcal{F}|\widehat{\mathbb{A}}^n_{\mathcal{V}}$ has its support in $\mathbb{A}^{n-r}_k$. So, for any $s = 1,\dots,r$, $\mathcal{F}({}^{\dagger}H_s)$ is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_s \cup H_0)_{\mathbb{Q}}$-module which is null outside $H_s \cup H_0$. By 8.7.6.11, this implies $\mathcal{F}({}^{\dagger}H_s) = 0$. By using the triangle of localisation with respect to H_s, this yields the isomorphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{H_s}(\mathcal{F}) \xrightarrow{\sim} \mathcal{F}$. Since $\mathbb{P}^{n-r}_k = H_1 \cap \cdots \cap H_r$, using 13.1.5.6.1 we get therefore the isomorphism $\mathbb{R}\underline{\Gamma}^{\dagger}_{\mathbb{P}^{n-r}_k}(\mathcal{F}) \xrightarrow{\sim} \mathcal{F}$. This is equivalent to saying that $\mathcal{F}$ has its support in $\mathbb{P}^{n-r}_k$ and we are done.

5) *Let us check that* $\mathcal{F} \in \mathrm{MIC}^{\dagger\dagger}(P', \mathfrak{P}, H_0/\mathcal{V})$ *and* $\alpha^!(\mathcal{F}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}', H_0/\mathcal{V})$*, i.e. they are associated to an isocrystal of* $\mathrm{MIC}^{\dagger}(\mathbb{A}^{n-r}_k/K)$.

Following the step 4), it is sufficient to establish that $\alpha^!(\mathcal{F}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}', H_0/\mathcal{V})$. Following the theorem of Berthelot-Kashiwara, it follows from the step 4) that $\alpha^!(\mathcal{F})$ is a coherent $\mathcal{D}^{\dagger}_{\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}}({}^{\dagger}H_0 \cap \mathbb{P}^{n-r}_k)_{\mathbb{Q}}$-module and we have the isomorphism: $\alpha_+ \circ \alpha^!(\mathcal{F}) \xrightarrow{\sim} \mathcal{F}$. Following the characterization 11.2.1.14.(e) of an overconvergent isocrystal, to check that $\alpha^!(\mathcal{F}) \in \mathrm{MIC}^{\dagger\dagger}(P', \mathfrak{P}', H_0/\mathcal{V})$, it is therefore sufficient to establish that $\alpha^!(\mathcal{F})|\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}} \in \mathrm{MIC}^{\dagger\dagger}(\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}}/\mathcal{V})$. We have the isomorphisms: $\alpha^!(\mathcal{F})|\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}} \xrightarrow{\sim} \beta^!(\mathcal{F}|\widehat{\mathbb{A}}^n_{\mathcal{V}}) \underset{3)}{\xrightarrow{\sim}} \beta^!\beta_+ a_+(\widetilde{\mathcal{H}}) \xrightarrow{\sim} a_+(\widetilde{\mathcal{H}})$. Moreover, following the step 2), $\widetilde{\mathcal{H}} \in \mathrm{MIC}^{\dagger\dagger}(\widetilde{\mathfrak{Y}}/\mathcal{V})$. As a is finite etale, then the functor a_+ factors through $a_+ \colon \mathrm{MIC}^{\dagger\dagger}(\widetilde{\mathfrak{Y}}/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}}/\mathcal{V})$. Hence, we are done.

6) *Set* $\widetilde{A}^{\dagger} := \Gamma(\widetilde{Y}^{\dagger}, \mathcal{O}_{\widetilde{Y}^{\dagger}})$. *The module* G *belongs to* $\mathrm{MIC}^{\dagger}(\widetilde{A}^{\dagger}_K/K)$ *(see notation 17.5.1.1) and* $\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F})) = a_*(G)$.

a) As $\alpha^!(\mathcal{F}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}', H_0/\mathcal{V})$, following 17.7.3.3 (with n replaced by $n-r$), $\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F}))$ is a coherent $D^\dagger_{\mathbb{A}^{n-r\dagger}_{\mathcal{V}},K}$-module, $\mathcal{V}[t_{r+1},\dots,t_n]^\dagger\otimes_{\mathcal{V}}K$-coherent, i.e. $\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}},\alpha^!(\mathcal{F}))\in \mathrm{MIC}^{\dagger\dagger}(\mathbb{A}^{n-r\dagger}_{\mathcal{V}}/\mathcal{V})$.

b) In this step, we check that $G\in \mathrm{MIC}(\widetilde{A}^\dagger_K/K)$.

i) First, let us construct a structure of left $D_{\widetilde{Y}^\dagger,K}$-module on G extending its structure of $\Gamma(\widetilde{Y}^\dagger,\mathcal{O}_{\widetilde{Y}^\dagger})$-module A priori this structure depends on the choice of the coordinates $x_1,\dots,x_r$ (we will not need it but this is left to the reader to check its canonicity).

Let $\widetilde{I}$ be the ideal of $A^\dagger$ generated by $x_1,\dots,x_r$. Then $\widetilde{I}$ is the ideal defining the closed immersion $\widetilde{v}$, i.e. $\Gamma(\widetilde{Y}^\dagger,\mathcal{O}_{\widetilde{Y}^\dagger})=A^\dagger/\widetilde{I}=:\widetilde{B}^\dagger$.

We denote by $D_{\widetilde{v},\underline{x},K}$ the free $A^\dagger_K$-module with the basis $\{\underline{\partial}^{[(\underline{0},\underline{i})]}\mid \underline{i}\in\mathbb{N}^{n-r}\}$, where $\underline{0}:=(0,\dots,0)\in\mathbb{N}^r$. The sheaf $D_{\widetilde{v},\underline{x},K}$ is equal to the sub-$\mathcal{V}$-algebra of $D_{U^\sharp,K}$ which is generated by $A^\dagger_K$, by ∂_i for any $i=n-r+1,\dots,n$.

Since $D_{U^\dagger,K}$ is a free left $D_{\widetilde{v},\underline{x},K}$-module with the basis $\{\underline{\partial}^{[(\underline{h},\underline{0})]}\mid \underline{h}\in\mathbb{N}^r\}$, where $\underline{0}:=(0,\dots,0)\in\mathbb{N}^{n-r}$. This means that the canonical homomorphism of $\mathcal{V}$-algebras

$$\mu\colon \mathcal{V}[\partial_1,\dots,\partial_r]\otimes_{\mathcal{V}}D_{\widetilde{v},\underline{x},K}\xrightarrow{\sim}D_{U^\dagger,K}\tag{17.7.4.6.3}$$

given by $P\otimes Q\mapsto PQ$ is also an isomorphism of left $D_{\widetilde{v},\underline{x},K}$-modules.

Since $x_1,\dots,x_r$ generate $\widetilde{I}$ and are in the center of $D_{\widetilde{v},\underline{x},K}$, then we compute $\widetilde{I}D_{\widetilde{v},\underline{x},K}=D_{\widetilde{v},\underline{x},K}\widetilde{I}$. Hence, we get a canonical $\mathcal{V}$-algebra structure on $D_{\widetilde{v},\underline{x},K}/\widetilde{I}D_{\widetilde{v},\underline{x},K}$ induced by that of $D_{\widetilde{v},\underline{x},K}$. Since $\widetilde{I}D_{\widetilde{v},\underline{x},K}=D_{\widetilde{v},\underline{x},K}\cap\widetilde{I}D_{U^\dagger,K}$, then we get the inclusion

$$D_{\widetilde{v},\underline{x},K}/\widetilde{I}D_{\widetilde{v},\underline{x},K}\hookrightarrow D_{U^\dagger,K}/\widetilde{I}D_{U^\dagger,K}.$$

The morphism 17.7.4.6.3 induces the isomorphism of left $D_{\widetilde{v},\underline{x},K}/\widetilde{I}D_{\widetilde{v},\underline{x},K}$-modules:

$$\mathcal{V}[\partial_1,\dots,\partial_r]\otimes_{\mathcal{V}}(D_{\widetilde{v},\underline{x},K}/\widetilde{I}D_{\widetilde{v},\underline{x},K})\xrightarrow{\sim}D_{U^\dagger,K}/\widetilde{I}D_{U^\dagger,K}.\tag{17.7.4.6.4}$$

Taking the structure of $A^\dagger_K$-module induced by the structure of left $D_{U^\dagger,K}$-module on $D_{\widetilde{v},\underline{x},K}$ (resp. induced by the structure of left $D_{\widetilde{Y}^\dagger,K}$-module on $D_{\widetilde{Y}^\dagger,K}$), we denote by

$$\sigma_{\widetilde{u},\widetilde{x}}\colon D_{\widetilde{v},\underline{x},K}\to D_{\widetilde{Y}^\dagger,K},\tag{17.7.4.6.5}$$

the $A^\dagger_K$-linear morphism given by $\sigma_{\widetilde{u},\widetilde{x}}(\underline{\partial}^{[(\underline{0},\underline{i})]})=\underline{\partial}^{[\underline{i}]}$, for any $\underline{i}\in\mathbb{N}^{n-r}$.

The kernel of $\sigma_{\widetilde{u},\widetilde{x}}$ is $\widetilde{I}D_{\widetilde{v},\underline{x},K}$ and we get therefore the $\widetilde{B}^\dagger_K$-linear isomorphism (for the left structures):

$$\overline{\sigma}_{\widetilde{u},\widetilde{x}}\colon D_{\widetilde{v},\underline{x},K}/\widetilde{I}D_{\widetilde{v},\underline{x},K}=D_{\widetilde{v},\underline{x},K}/D_{\widetilde{v},\underline{x},K}\widetilde{I}\xrightarrow{\sim}D_{\widetilde{Y}^\dagger,K}.\tag{17.7.4.6.6}$$

which satisfies the formula $\overline{\sigma}_{\widetilde{u},\widetilde{x}}(\underline{\xi}^{[(\underline{0},\underline{i})]})=\underline{\partial}^{[\underline{i}]}$, for any $\underline{i}\in\mathbb{N}^{n-r}$, where $\underline{\xi}^{[(\underline{0},\underline{i})]}$ is the image of $\underline{\partial}^{[(\underline{0},\underline{i})]}$. We denote by $\vartheta:=(\overline{\sigma}_{\widetilde{u},\widetilde{x}})^{-1}$ by $[-]_{\widetilde{Y}^\dagger}\colon D_{\widetilde{v},\underline{x},K}\to D_{\widetilde{v},\underline{x},K}/\widetilde{I}D_{\widetilde{v},\underline{x},K}$ the projection.

We define the structure of $D_{\widetilde{Y}^\dagger,K}$-module on G as follows: Let $Q\in D_{\widetilde{Y}^\dagger,K}$. Choose any $Q_{U^\dagger}\in D_{\widetilde{v},\underline{x},K}$ such that $\vartheta(Q)=[Q_{U^\dagger}]_{\widetilde{Y}^\dagger}$. For any $x\in G$, we set

$$Q\cdot x:=Q_{U^\dagger}\cdot x.\tag{17.7.4.6.7}$$

Since G is annihilated by $\widetilde{I}$, then we can check this is well defined.

ii) Since a is finite then $\widetilde{A}^\dagger_K$ is a finite $\mathcal{V}[t_{r+1},\dots,t_n]^\dagger$-algebra. This yields that G is a coherent $\widetilde{A}^\dagger_K$-module, i.e. $G\in\mathrm{MIC}(\widetilde{A}^\dagger_K/K)$.

c) Following 17.7.4.4, as $g_*(E')=\Gamma(\widehat{\mathbb{P}}^n_{\mathcal{V}},\mathcal{F})$, then we obtain the equalities:

$$\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}},\alpha^!(\mathcal{F}))=\cap_{i=1}^r\ker(t_i\colon g_*(E')\to g_*(E'))=\cap_{i=1}^r\ker(x_i\colon E'\to E')=G.\tag{17.7.4.6.8}$$

We denote by $a_*(G)$ the induced coherent $D_{\mathbb{A}^{n-r\dagger}_{\mathcal{V}},K}$-module via the canonical morphism $D_{\mathbb{A}^{n-r\dagger}_{\mathcal{V}},K}\to D_{\widetilde{Y}^\dagger,K}$ induced by a. Comparing the formulas 17.7.4.6.7 and 9.3.1.20.3, we compute that the equality

17.7.4.6.8 is an equality of $D_{\mathbb{A}^{n-r\dagger}_{\mathcal{V}},K}$-modules, i.e. $\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F})) = a_*(G)$. Using 17.7.3.6 and the step a) and b), this yields that $G \in \mathrm{MIC}^\dagger(\widetilde{A}^\dagger_K/K)$.

7) We denote by $O_{\widetilde{\mathfrak{Y}}} := \Gamma(\widetilde{\mathfrak{Y}}, \mathcal{O}_{\widetilde{\mathfrak{Y}}})$ the p-adic completion of $\widetilde{A}^\dagger$. We set $\widehat{G} := D^\dagger_{\widetilde{\mathfrak{Y}},K} \otimes_{D^\dagger_{\widetilde{Y}^\dagger,K}} G \in \mathrm{MIC}^\dagger(O_{\widetilde{\mathfrak{Y}},K}/K)$ (see notation 17.7.3.9). In this step, we check the isomorphism $\widehat{G} \xrightarrow{\sim} \Gamma(\widetilde{\mathfrak{Y}}, \widetilde{\mathcal{H}})$ of $\mathrm{MIC}^\dagger(O_{\widetilde{\mathfrak{Y}},K}/K)$.

a) Following 17.7.2.6, the canonical morphism of $(D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K}, D^\dagger_{U^\dagger,K})$-bimodules $D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^\dagger_K} D^\dagger_{U^\dagger,K} \to D^\dagger_{\mathfrak{U},K}$ is an isomorphism. This yields the $D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K}$-linear isomorphism : $D^\dagger_{\mathfrak{U},K} \otimes_{D^\dagger_{U^\dagger,K}} E' \xleftarrow{\sim} D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^\dagger_K} E'$. Since g is proper, then it follows from 13.2.3.7.1 (see also example 13.2.3.2) that we have the base change isomorphism: $\alpha^! \circ g_+ \xrightarrow{\sim} a_+ \circ \widetilde{v}^!$. Since g and a are finite and etale then $g_+ = g_*$ and $a_+ = a_*$. With 9.3.1.20.2 and via the theorem A for coherent $\mathcal{D}^\dagger_{\widehat{\mathbb{A}}^{n-r},\mathbb{Q}}$-modules (resp. coherent $\mathcal{D}^\dagger_{\widehat{\mathbb{A}}^n,\mathbb{Q}}$-modules), for any $D^\dagger_{\mathfrak{U},K}$-module M the equality $a_*(\cap_{i=1}^r \ker(x_i \colon M \to M)) = \cap_{i=1}^r \ker(t_i \colon g_*M \to g_*M)$ is an equality as $D^\dagger_{\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}},K}$-modules. Hence, we obtain the $D^\dagger_{\widehat{\mathbb{A}}^{n-r},K}$-linear bottom morphism of the following commutative diagram

$$\begin{array}{ccc} G = \cap_{i=1}^r \ker(x_i \colon E' \to E') & = & \cap_{i=1}^r \ker(t_i \colon E' \to E') \\ \downarrow & & \downarrow \\ \cap_{i=1}^r \ker(x_i \colon D^\dagger_{\mathfrak{U},K} \otimes_{D^\dagger_{U^\dagger,K}} E' \to D^\dagger_{\mathfrak{U},K} \otimes_{D^\dagger_{U^\dagger,K}} E') & \xleftarrow{\sim} & \cap_{i=1}^r \ker(t_i \colon D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^\dagger_K} E' \to D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^\dagger_K} E'). \end{array} \tag{17.7.4.6.9}$$

b) It follows from the step 2) and 17.7.3.9 that $\Gamma(\widetilde{\mathfrak{Y}}, \widetilde{\mathcal{H}}) \in \mathrm{MIC}^\dagger(O_{\widetilde{\mathfrak{Y}},K}/K)$. Moreover, the left bottom term of 17.7.4.6.9 is canonically isomorphic to $\Gamma(\widetilde{\mathfrak{Y}}, \widetilde{\mathcal{H}})$. Indeed, as $\widetilde{\mathcal{H}} \xrightarrow{\sim} \widetilde{v}^!(\mathcal{E}|\mathfrak{U})$, then using 9.3.1.20.2 we get the isomorphism: $\Gamma(\widetilde{\mathfrak{Y}}, \widetilde{\mathcal{H}}) \xrightarrow{\sim} \cap_{i=1}^r \ker(x_i \colon \Gamma(\mathfrak{U}, \mathcal{E}) \to \Gamma(\mathfrak{U}, \mathcal{E}))$. Moreover, we have checked in 17.7.4.6.1 the isomorphism $D^\dagger_{\mathfrak{U},K} \otimes_{D^\dagger_{U^\dagger,K}} E' \xrightarrow{\sim} \Gamma(\mathfrak{U}, \mathcal{E})$. Hence we are done.

c) We compute moreover that the left (resp. right) arrow of 17.7.4.6.9 is $D_{\widetilde{Y}^\dagger,K}$-linear (resp. $D_{\mathbb{A}^{n-r\dagger},K}$-linear).

d) According to the theorem of type A of 17.7.3.1.1, we get $\Gamma(\widehat{\mathbb{P}}^n_{\mathcal{V}}, \mathcal{F}) \xrightarrow{\sim} g_*E'$. Via 17.7.3.8, this yields that the injection $\Gamma(\widehat{\mathbb{P}}^n_{\mathcal{V}}, \mathcal{F}) \subset \Gamma(\widehat{\mathbb{A}}^n_{\mathcal{V}}, \mathcal{F})$ is canonically isomorphic the morphism $E' \to D^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},K} \otimes_{D^\dagger_K} E'$. Following 17.7.4.5.1, this yields that the right arrow of 17.7.4.6.9 is isomorphic to the injection $\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F})) \subset \Gamma(\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F}))$. Since $\alpha^!(\mathcal{F}) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}', H_0/\mathcal{V})$ (see step 5), then $\Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F})) \subset \Gamma(\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F}))$ induced by extension the isomorphism $\mathcal{V}\{t_{r+1}, \ldots, t_n\} \otimes_{\mathcal{V}[t_{r+1},\ldots,t_n]^\dagger} \Gamma(\widehat{\mathbb{P}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F})) \xrightarrow{\sim} \Gamma(\widehat{\mathbb{A}}^{n-r}_{\mathcal{V}}, \alpha^!(\mathcal{F}))$ (see 17.7.3.8). This yields that the injection $G \hookrightarrow \Gamma(\widetilde{\mathfrak{Y}}, \widetilde{\mathcal{H}})$ (left arrow of 17.7.4.6.9 modulo the isomorphism of 7.b)) induced by extension the isomorphism

$$\mathcal{V}\{t_{r+1}, \ldots, t_n\} \otimes_{\mathcal{V}[t_{r+1},\ldots,t_n]^\dagger} G \xrightarrow{\sim} \Gamma(\widetilde{\mathfrak{Y}}, \widetilde{\mathcal{H}}).$$

e) Via a), b), c), d), we conclude thanks to the lemma 17.7.3.10.

8) *The module* $G \in \mathrm{MIC}^\dagger(A^\dagger_K/K)$.

Using the equivalence of categories of 17.5.1.1.(e), we get from the step 6) $\widetilde{\mathcal{G}} := \mathcal{D}_{\widetilde{Y}^\dagger,\mathbb{Q}} \otimes_{D_{\widetilde{Y}^\dagger,K}} G \in \mathrm{MIC}^{\dagger\dagger}(\widetilde{Y}^\dagger/\mathcal{V})$ and from 17.5.1.6, $\mathcal{D}^\dagger_{\widetilde{\mathfrak{Y}},\mathbb{Q}} \otimes_{\mathcal{D}_{\widetilde{Y}^\dagger,K}} \widetilde{\mathcal{G}} \in \mathrm{MIC}^{\dagger\dagger}(\widetilde{\mathfrak{Y}}/\mathcal{V})$. Via the equivalence of categories of 17.5.1.1.(e), the step 7) means that we have the isomorphism: $\mathcal{D}^\dagger_{\widetilde{\mathfrak{Y}},\mathbb{Q}} \otimes_{\mathcal{D}_{\widetilde{Y}^\dagger,K}} \widetilde{\mathcal{G}} \xrightarrow{\sim} \widetilde{\mathcal{H}}$ of $\mathrm{MIC}^{\dagger\dagger}(\widetilde{Y}^\dagger/\mathcal{V})$. As $\widetilde{\mathcal{H}} = w_+(\mathcal{H}) = w_*(\mathcal{H})$, then the restriction of $\widetilde{\mathcal{H}}$ on $\mathfrak{Y}^\flat := \widetilde{\mathfrak{Y}} \setminus \mathfrak{Y}$ is null. Since the functor $\mathcal{D}^\dagger_{\widetilde{\mathfrak{Y}},\mathbb{Q}} \otimes_{\mathcal{D}_{\widetilde{Y}^\dagger,K}} - \colon \mathrm{MIC}^{\dagger\dagger}(\widetilde{Y}^\dagger/\mathcal{V}) \to \mathrm{MIC}^{\dagger\dagger}(\widetilde{\mathfrak{Y}}/\mathcal{V})$ is faithful (see 17.5.1.6 and use the full flatness of $\widetilde{A}^\dagger_K \to O_{\widetilde{\mathfrak{Y}},K}$), this yields $\widetilde{\mathcal{G}}|\mathfrak{Y}^\flat = 0$. As $w^!(\widetilde{\mathcal{G}}) \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathcal{V})$, then we get the second equality: $G = \Gamma(\widetilde{Y}^\dagger, \widetilde{\mathcal{G}}) = \Gamma(Y^\dagger, w^!(\widetilde{\mathcal{G}})) \in \mathrm{MIC}^{\dagger\dagger}(A^\dagger_K/K)$.

II) Construction of the isomorphism $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(G_{Y_0}) \xrightarrow{\sim} \mathcal{E}(^\dagger T_0)$*, where* G_{Y_0} *means the object of* $\mathrm{MIC}^\dagger(Y_0/K)$ *associated with* $G \in \mathrm{MIC}^\dagger(A^\dagger_K/K)$ *via the equivalence of categories 17.5.1.1.(c))*

1) Let $\mathcal{G} := \mathcal{D}_{Y^\dagger,\mathbb{Q}} \otimes_{D_{Y^\dagger,K}} G \in \mathrm{MIC}^{\dagger\dagger}(Y^\dagger/\mathcal{V})$. Since $\Gamma(Y,\mathcal{G}) \xrightarrow{\sim} G$, then with notation 17.6.3.1.1 we get the isomorphism:

$$\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{D_{U^\dagger,K}} v_+(G) \overset{17.6.3.1.1}{\xrightarrow{\sim}} \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{j_*\mathcal{D}_{U^\dagger,\mathbb{Q}}} j_* v_+(\mathcal{G}) = \mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(G_{Y_0}). \qquad (17.7.4.6.10)$$

2) Let us denote by $\widetilde{\mathcal{G}} := w_+(\mathcal{G})$ the direct image of $\mathcal{G}$ by w (beware as $\mathcal{D}$-module and not as $\mathcal{D}^\dagger$-module), $\widetilde{v}_+(G) := \Gamma(U^\dagger, \mathcal{D}_{U^\dagger \leftarrow \widetilde{Y}^\dagger,\mathbb{Q}}) \otimes_{D_{\widetilde{Y}^\dagger,K}} G$. Let $\partial_1, \ldots, \partial_n$ be the derivations corresponding to the coordinates $x_1, \ldots, x_n$. Similarly to 5.2.6.1, as $G = \cap_{i=1}^r \ker(x_i \colon E' \to E')$ we get the canonical $D_{U^\dagger,K}$-linear morphism $\widetilde{v}_+(G) \to E'$. Modulo the isomorphism $\widetilde{v}_+(G) \xrightarrow{\sim} K[\partial_1, \ldots, \partial_r] \otimes_K G$ (same computation as in 5.2.6.1), the map is $\widetilde{v}_+(G) \to E'$ is given by $\partial_i \otimes x \mapsto \partial_i \cdot x$.

By transitivity of the direct image, we obtain $v_+(\mathcal{G}) \xrightarrow{\sim} \widetilde{v}_+(\widetilde{\mathcal{G}})$. As $\widetilde{\mathcal{G}}$ is a coherent $\mathcal{D}_{\widetilde{Y}^\dagger,\mathbb{Q}}$-module such that $\Gamma(\widetilde{Y}^\dagger, \widetilde{\mathcal{G}}) = \Gamma(Y^\dagger, \mathcal{G}) = G$, this yields (thanks to 17.2.5.4): $v_+(G) \xrightarrow{\sim} \widetilde{v}_+(G)$. Hence the $D_{U^\dagger,K}$-linear morphism : $v_+(G) \to E'$. This yields the $D^\dagger_{U^\dagger,K}$-linear morphism :

$$D^\dagger_{U^\dagger,K} \otimes_{D_{U^\dagger,K}} v_+(G) \to E' = D^\dagger_{U^\dagger,K} \otimes_{D^\dagger_K} E. \qquad (17.7.4.6.11)$$

Moreover, we have following 17.7.4.2 the map $D^\dagger_{U^\dagger,\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}}$. By applying the functor $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{D^\dagger_{U^\dagger,K}} -$ to the map 17.7.4.6.11, we obtain: $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{D_{U^\dagger,K}} v_+(G) \to \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} E$. Moreover,

$$\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} E \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger H_0)_{\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger H_0)_{\mathbb{Q}} \otimes_{D^\dagger_K} E \overset{17.7.3.1.1}{\xrightarrow{\sim}} \mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger H_0)_{\mathbb{Q}}} \mathcal{E} = \mathcal{E}(^\dagger T_0),$$

Hence, we get by composition the map:

$$\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}} \otimes_{D_{U^\dagger,K}} v_+(G) \to \mathcal{E}(^\dagger T_0). \qquad (17.7.4.6.12)$$

3) By composing the inverse of 17.7.4.6.10 with 17.7.4.6.12, we obtain therefore the canonical morphism ϕ: $\mathrm{sp}_{Y^\dagger \hookrightarrow U^\dagger, T_0,+}(G_{Y_0}) \to \mathcal{E}(^\dagger T_0)$. Via 17.5.2.5, we check that ϕ is an isomorphism apart from T_0. Following 8.7.6.11, since ϕ is a morphism of coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}}$-modules, this yields that ϕ is an isomorphism. □

Remark 17.7.4.7. In the proof of 17.7.4.6, we have used the theorem of type A of the form 17.7.3.1.1 (see the step II.2). Hence, unless some new idea arises, the hypothesis that the coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger T_0)_{\mathbb{Q}}$-module $\mathcal{E}(^\dagger T_0)$ comes by extension from a coherent $\mathcal{D}^\dagger_{\mathfrak{P}}(^\dagger H_0)_{\mathbb{Q}}$-module is essential (what is important in fact is that H_0 is ample).

Chapter 18

Coefficients stable under Grothendieck's six operations with Frobenius structure

Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. When we work with F-complex, we suppose there exists an automorphism $\sigma \colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining.

18.1 Overholonomicity

18.1.1 Overholonomicity (after any base change) in a smooth $\mathcal{V}$-formal scheme

Definition 18.1.1.1. Let $\mathcal{E}$ be an object of $(F\text{-})D(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. We define by induction on the integer $r \geq 0$, the notion on of *r-overholonomicity in* $\mathfrak{P}$, as follows:

(a) The complex $\mathcal{E}$ is "0-overholonomic in $\mathfrak{P}$" if $\mathcal{E}$ is overcoherent in $\mathfrak{P}$;

(b) for any integer $r \geq 1$, $\mathcal{E}$ is " r-overholonomic in $\mathfrak{P}$" if $\mathcal{E}$ is $r-1$-overholonomic in $\mathfrak{P}$ and for any divisor T of X, the complex $\mathbb{D} \circ ({}^\dagger T)(\mathcal{E})$ is $r-1$-overholonomic in $\mathfrak{P}$.

We say that $\mathcal{E}$ is "∞-overholonomic in $\mathfrak{P}$" or "overholonomic in $\mathfrak{P}$" if $\mathcal{E}$ is r-overholonomic in $\mathfrak{P}$ for any integer $r \geq 0$. Finally, for any $r \in \mathbb{N} \cup \{+\infty\}$, a $(F\text{-})\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module is r-overholonomic in $\mathfrak{P}$ if so is as an object of $(F\text{-})D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.

Definition 18.1.1.2. Let $r \in \mathbb{N} \cup \{+\infty\}$ and $\mathcal{E}$ be an object of $(F\text{-})D(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. We say that $\mathcal{E}$ is "r-overholonomic in $\mathfrak{P}$ after any base change" if, for any morphism $\mathcal{V} \to \mathcal{V}'$ of $\mathrm{DVR}(\mathcal{V})$, denoting by $\mathfrak{S}' := \operatorname{Spf} \mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f \colon \mathfrak{P}' \to \mathfrak{P}$ the projection, the complex $\mathcal{D}^\dagger_{\mathfrak{P}'/\mathfrak{S}',\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}} f^{-1}\mathcal{E}$ is r-overholonomic in $\mathfrak{P}'$, i.e. the base change $f^!(\mathcal{E})$ of $\mathcal{E}$ via $\mathcal{V} \to \mathcal{V}'$ is r-overholonomic in $\mathfrak{P}'$ (see 9.2.7.1). An $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module is r-overholonomic in $\mathfrak{P}$ after any base change if so is as an object of $(F\text{-})D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. We denote by $D^{\mathrm{b}}_{\mathrm{h}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ the full subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ consisting of overholonomic after any base change in $\mathfrak{P}$ complexes.

Proposition 18.1.1.3. *Let $\mathcal{E} \in D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ and $r \in \mathbb{N} \cup \{+\infty\}$. Then, the complex $\mathcal{E}$ is r-overholonomic in $\mathfrak{P}$ after any base change if and only if for any integer $j \in \mathbb{Z}$ the modules $H^j(\mathcal{E})$ are r-overholonomic in $\mathfrak{P}$ after any base change.*

Proof. It comes from 15.3.5.4 that r-overholonomic after any base change complexes in $\mathfrak{P}$ are holonomic. Then we check the corollary by induction on r by using the fact that the dual functor $\mathbb{D}$ (resp. the localisation functor $({}^\dagger T)$ outside a divisor T of P) is exact on the category of holonomic (resp. coherent and then holonomic) $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules. □

18.1.2 Overholonomicity (after any base change) and stability

We denote by $\mathfrak{P}$ an smooth $\mathfrak{S}$-formal scheme.

Definition 18.1.2.1. Let $\mathcal{E}$ be an object of $(F\text{-})D(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. We define by induction on the integer $r \geq -1$, the notion of r-*overholonomicity*, as follows:

(a) $\mathcal{E}$ is 0-*overholonomic* if and only if $\mathcal{E} \in (F\text{-})D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ (see notation 15.3.6.2);

(b) For any integer $r \geq 1$, $\mathcal{E}$ is r-overholonomic if and only if $\mathcal{E}$ is $r-1$-overholonomic and, for any smooth morphism $f \colon \mathfrak{P}' \to \mathfrak{P}$ of $\mathfrak{S}$-formal schemes, for any divisor T' of X', the complex $\mathbb{D}(^\dagger T')f^!(\mathcal{E})$ is $r-1$-overholonomic.

(c) We say that $\mathcal{E}$ is ∞-*overholonomic* or simply *overholonomic* if $\mathcal{E}$ is r-overholonomic for any integer r. We denote by $(F\text{-})D^{\mathrm{b}}_{\mathrm{ovhol}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ the full subcategory of $(F\text{-})D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ consisting of overholonomic complexes.

(d) A $(F\text{-})\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module is r-overholonomic (resp. overholonomic) if so is as an object of $(F\text{-})D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.

Definition 18.1.2.2. Let $r \in \mathbb{N} \cup \{+\infty\}$ and $\mathcal{E}$ be an object of $(F\text{-})D(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. We say that $\mathcal{E}$ is "r-overholonomic after any base change" if, for any morphism $\mathcal{V} \to \mathcal{V}'$ of $\mathrm{DVR}(\mathcal{V})$, denoting by $\mathfrak{S}' := \mathrm{Spf}\,\mathcal{V}'$, $\mathfrak{P}' := \mathfrak{P} \times_{\mathfrak{S}} \mathfrak{S}'$, $f \colon \mathfrak{P}' \to \mathfrak{P}$ the projection, the complex $\mathcal{D}^\dagger_{\mathfrak{P}'/\mathfrak{S}',\mathbb{Q}} \otimes_{f^{-1}\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}} f^{-1}\mathcal{E}$ is r-overholonomic, i.e. the base change $f^!(\mathcal{E})$ of $\mathcal{E}$ via $\mathcal{V} \to \mathcal{V}'$ is r-overholonomic (see 9.2.7.1). An $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module is r-overholonomic after any base change if so is as an object of $(F\text{-})D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. We denote by $D^{\mathrm{b}}_{\mathrm{h}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ the full subcategory of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ consisting of overholonomic after any base change complexes.

Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. We say that $\mathcal{E}^{(\bullet)}$ is r-overholonomic (after any base change) if $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ and if $\underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)})$ is r-overholonomic (after any base change). We denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$) the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ consisting of overholonomic (resp. overholonomic after any base) complexes.

18.1.2.3. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. It follows from 15.3.6.6 that $\mathcal{E}^{(\bullet)}$ is 0-overholonomic if and only if $\mathcal{E}^{(\bullet)}$ is overcoherent in the sense of definition 15.3.6.1. Using the dual functor 9.2.4.21, we could have defined the overholonomicity by copying the definition 18.1.2.1 in the context of categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ (similarly to 15.3.6.1). The stability properties of the overholonomicity of the subsection is still valid replacing categories of the form $D(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ by that of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$.

Remark 18.1.2.4. (a) Let $r' \geq r$ be two nonnegative integers and let $\mathcal{E}$ be an r'-overholonomic complex of $(F\text{-})D(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. Then $\mathcal{E}$ is r-overholonomic. In particular $\mathcal{E} \in (F\text{-})D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.

(b) This is an open question wether the category $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ is stable by dual functors (for any smooth $\mathfrak{S}$-formal scheme $\mathfrak{P}$). If this was true then, for any integer r, the notion of r-overholonomicity would be equivalent to that of overcoherence (i.e. 0-overholonomicity) and then to that of overholonomicity. By 15.3.2.8, then this would also imply that overcoherent complexes are holonomic.

Proposition 18.1.2.5. *Let $\mathcal{E} \in D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ and $r \in \mathbb{N} \cup \{+\infty\}$. Then $\mathcal{E}$ is r-overholonomic if and only if, for any smooth morphism $f \colon \mathfrak{P}' \to \mathfrak{P}$ of $\mathfrak{S}$-formal schemes, $f^!(\mathcal{E})$ is r-overholonomic in $\mathfrak{P}'$.*

Proof. The case concerning the overcoherence results from the commutation of the extraordinary inverse image with the functor of localisation (see 13.2.1.4.1). The case of the r-overholonomic can be checked by induction on r. We proceed in a similar way by using moreover the isomorphism 11.3.5.1.1 checked by Abe. □

Corollary 18.1.2.6. *Let $\mathcal{E} \in D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ and $r \in \mathbb{N} \cup \{+\infty\}$. Then, the complex $\mathcal{E}$ is r-overholonomic after any base change if and only if for any integer $j \in \mathbb{Z}$ the modules $H^j(\mathcal{E})$ are r-overholonomic after any base change.*

Proof. This follows from 18.1.1.3, from the characterization of 18.1.2.5 and from the fact that the functor f^* is acyclic for any smooth morphism $f \colon \mathfrak{P}' \to \mathfrak{P}$ on the category of coherent $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules. □

Remark 18.1.2.7. The isomorphism 11.3.5.1.1 of Abe is necessary in order to check the characterization 18.1.2.5 of the overholonomicity. However, it is possible to check directly the corollary 18.1.2.6 from 15.3.5.4 without using this isomorphism by using the arguments of acyclicity of the dual functor, localisation and extraordinary inverse image by a smooth morphism.

Proposition 18.1.2.8. *The $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$ is overholonomic.*

Proof. By induction on $n \geq 0$, let us prove the following property (P_n): the $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$ is n-overholonomic. The assertion P_0 is exactly 15.3.6.3 . For $n \geq 0$, assuming P_n true, we prove P_{n+1}. As the constant coefficient is stable under extraordinary inverse images and base change, then it is a question of proving that $\mathbb{D} \circ (^{\dagger}T)(\mathcal{O}_{\mathfrak{P},\mathbb{Q}})$ is n-overholonomic. Since this is local in $\mathfrak{P}$, we can suppose $\mathfrak{P}$ is affine.

1) i) First suppose that $T = \emptyset$. Following 11.2.6.3.4, $\mathbb{D}(\mathcal{O}_{\mathfrak{P},\mathbb{Q}}) \xrightarrow{\sim} \mathcal{O}^{\vee}_{\mathfrak{P},\mathbb{Q}} \xrightarrow{\sim} \mathcal{O}_{\mathfrak{P},\mathbb{Q}}$. We then conclude by induction hypothesis.

ii) It follows from i) that $\mathbb{D} \circ (^{\dagger}T)(\mathcal{O}_{\mathfrak{P},\mathbb{Q}})$ is n-overholonomic if and only if $\mathbb{D}^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$ is n-overholonomic.

2) Let us now treat the case where T is a smooth divisor. Since T is affine and smooth, then there exists an affine and smooth $\mathfrak{S}$-formal schemes $i\colon \mathfrak{T} \hookrightarrow \mathfrak{P}$ which is a lifting of the closed immersion $T \hookrightarrow P$. By applying the dual functor $\mathbb{D}^{(\bullet)}$ to the localization triangle of $\mathcal{O}^{(\bullet)}_{\mathfrak{P}}$ with respect to T, we obtain the distinguished triangle

$$\mathbb{D}^{(\bullet)}(^{\dagger}T)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \to \mathbb{D}^{(\bullet)}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \to \mathbb{D}^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \to \mathbb{D}^{(\bullet)}(^{\dagger}T)(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})[1]. \tag{18.1.2.8.1}$$

We have the isomorphism:

$$\mathbb{D}^{(\bullet)}\circ\mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \underset{13.2.1.5.1}{\xrightarrow{\sim}} \mathbb{D}^{(\bullet)}\circ i^{(\bullet)}_{+}\circ i^{(\bullet)!}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \xrightarrow{\sim} \mathbb{D}^{(\bullet)}\circ i^{(\bullet)}_{+}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}}[-1]) \underset{9.4.5.2}{\xrightarrow{\sim}} i^{(\bullet)}_{+}\circ\mathbb{D}^{(\bullet)}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}})[1] \underset{11.2.6.3.4}{\xrightarrow{\sim}} i^{(\bullet)}_{+}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}})[1].$$

Since $\mathcal{O}^{(\bullet)}_{\mathfrak{T}}$ is n-overholonomic by induction hypothesis, then it follows from the theorem 18.1.2.15 that $i^{(\bullet)}_{+}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}})[1]$ is n-overholonomic and therefore that $\mathbb{D}^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$ is n-overholonomic. Hence, thanks to 1)ii), we are done.

3) Now suppose that T is a strict normal crossing divisor (see 4.5.2.5) Denote by $T_1, \dots, T_r$ the irreducible components of T. Let us then proceed with a (second) recurrence on $r \geq 1$. The case where $r = 1$ was treated in ii). Consider the distinguished triangle from Mayer-Vietoris (13.1.4.15.2):

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{T_1}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \oplus \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=1}^{r}T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})[1]. \tag{18.1.2.8.2}$$

Let us choose a lifting $i_1\colon \mathfrak{T}_1 \hookrightarrow \mathfrak{P}$ of the closed immersion $T_1 \hookrightarrow P$. Since $\mathbb{R}\underline{\Gamma}^{\dagger}_{T_1} \xrightarrow{\sim} i^{(\bullet)}_{1+}i^{(\bullet)!}_{1}$ (see 13.2.1.5.1), by ??, we obtain the isomorphism

$$\begin{aligned}\mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) &\underset{9.3.5.13}{\xrightarrow{\sim}} i^{(\bullet)}_{1+}i^{(\bullet)!}_{1}\mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \\ &\underset{13.2.1.4.1}{\xrightarrow{\sim}} i^{(\bullet)}_{1+} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(i^{(\bullet)!}_{1}\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \xrightarrow{\sim} i^{(\bullet)}_{1+} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}_1}[-1]).\end{aligned} \tag{18.1.2.8.3}$$

As $\cup_{i=2}^{r}T_1 \cap T_i$ is a strict normal crossing divisor of T_1, then by using the induction hypothesis on r and 1.ii), we obtain that $\mathbb{D}^{(\bullet)}\circ\mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}_1}[-1])$ is n-overholonomic. It follows from the preservation of n-overholonomy by direct image by a proper morphism (see 18.1.2.15), that

$$\mathbb{D}^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \underset{18.1.2.8.3}{\xrightarrow{\sim}} \mathbb{D}^{(\bullet)} \circ i^{(\bullet)}_{1+} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}_1}[-1]) \underset{9.4.5.2}{\xrightarrow{\sim}} i_{1+} \circ \mathbb{D}^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_1\cap T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{T}_1}[-1]) \tag{18.1.2.8.4}$$

is n-overholonomic. We further obtain by induction hypothesis on r (and again using 1.ii) that $\mathbb{D}^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{T_1}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}}) \oplus \mathbb{D}^{(\bullet)}\circ\mathbb{R}\underline{\Gamma}^{\dagger}_{\cup_{i=2}^{r}T_i}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$ is n-overholonomic. By applying the functor $\mathbb{D}^{(\bullet)}$ to the distinguished triangle 18.1.2.8.2, this implies that the complex $\mathbb{D}^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{T}(\mathcal{O}^{(\bullet)}_{\mathfrak{P}})$ is n-overholonomic. Then, using 1.ii), we are done.

4) Finally, let's move on to the case where T is any divisor but different from the empty set. Using de Jong's desingularization theorem ([dJ96]), there exist a projective smooth morphism $f\colon \mathcal{Q}' \to \mathfrak{P}$, a smooth scheme X' over k, a closed immersion $\iota_0'\colon P' \hookrightarrow \mathcal{Q}'$, a projective, surjective, generically finite and étale morphism $a_0\colon P' \to P$ such that $a_0 = f_0 \circ \iota_0'$ and $T' := a_0^{-1}(T)$ is a strict normal crossing divisor of P'. Since $({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(\mathfrak{P}, T/\mathcal{V})$, then following 16.1.11.2, $({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)})$ is a direct summand of $f_+^{(\bullet)} \mathbb{R}\underline{\Gamma}^\dagger_{P'} f^{(\bullet)!}(({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)}))$. Hence, $\mathbb{D}^{(\bullet)} \circ ({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)})$ is a direct summand of

$$\mathbb{D}^{(\bullet)} \circ f_+^{(\bullet)} \mathbb{R}\underline{\Gamma}^\dagger_{P'} f^{(\bullet)!}(({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)})) \underset{9.4.5.2}{\xrightarrow{\sim}} f_+^{(\bullet)} \circ \mathbb{D}^{(\bullet)} \mathbb{R}\underline{\Gamma}^\dagger_{P'} f^{(\bullet)!}(({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)})).$$

Since the morphism f is proper, then using 18.1.2.15 we reduce therefore to check the n-overholonomicity of $\mathbb{D}^{(\bullet)} \mathbb{R}\underline{\Gamma}^\dagger_{P'} f^{(\bullet)!}(({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)}))$. Since this is local on $\mathcal{Q}'$, then we can suppose that there exists a lifting $\iota'\colon \mathfrak{P}' \hookrightarrow \mathcal{Q}'$ of ι_0'.

$$\begin{aligned} &\mathbb{D}^{(\bullet)} \mathbb{R}\underline{\Gamma}^\dagger_{P'} f^{(\bullet)!}(({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)})) \underset{13.2.1.5.1}{\xrightarrow{\sim}} \mathbb{D}^{(\bullet)} \circ \iota_+'^{(\bullet)} \circ \iota'^{(\bullet)!} f^{(\bullet)!}(({}^\dagger T)(\mathcal{O}_{\mathfrak{P}}^{(\bullet)})) \\ &\underset{13.2.1.4.1}{\xrightarrow{\sim}} \mathbb{D}^{(\bullet)} \circ \iota_+^{(\bullet)} \circ ({}^\dagger T) \circ \iota'^{(\bullet)!} f^{(\bullet)!}(\mathcal{O}_{\mathfrak{P}}^{(\bullet)}) \xrightarrow{\sim} \mathbb{D}^{(\bullet)} \circ \iota_+'^{(\bullet)} \circ ({}^\dagger T')(\mathcal{O}_{\mathfrak{P}'}^{(\bullet)}) \underset{9.4.5.2}{\xrightarrow{\sim}} \iota_+'^{(\bullet)} \circ \mathbb{D}^{(\bullet)} \circ ({}^\dagger T')(\mathcal{O}_{\mathfrak{P}'}^{(\bullet)}). \end{aligned} \tag{18.1.2.8.5}$$

Following the step 3), $\mathbb{D}^{(\bullet)} \circ ({}^\dagger T')(\mathcal{O}_{\mathfrak{P}'}^{(\bullet)})$ is n-overholonomic. Hence, thanks to 18.1.2.8.5 and 18.1.2.15. □

Proposition 18.1.2.9. *Let $r \in \mathbb{N} \cup \{\infty\}$.*

(a) Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ be an $r+1$-overholonomic complex. Then $\mathbb{D}(\mathcal{E})$ is r-overholonomic

(b) For any $r \in \mathbb{N} \cup \{\infty\}$, a direct summand of an r-overholonomic complex is r-overholonomic.

(c) Let $r \in \mathbb{N} \cup \{\infty\}$ and $\mathcal{E}' \to \mathcal{E} \to \mathcal{E}'' \to \mathcal{E}'[1]$ be a distinguished triangle of $D(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. If two of the three complexes are r-overholonomic then so is the third. In particular, $D^{\mathrm{b}}_{\mathrm{ovhol}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ is a triangulated subcategory of $D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.

(d) Let $r \geq 1$ be an integer or $r = \infty$ and $\mathcal{E}$ be an r-overholonomic $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module. Then $\mathcal{E}$ is holonomic.

(e) Let $r \in \mathbb{N} \cup \{\infty\}$ and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ be an r-overholonomic complex. Then, for any subscheme Y of P, the complex $\mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E})$ is r-overholonomic.

(f) For any smooth morphism $f\colon \mathfrak{P}' \to \mathfrak{P}$ of $\mathfrak{S}$-formal schemes, for any r-overholonomic complex $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$, the complex $f^!(\mathcal{E})$ is r-overholonomic.

Proof. The property a) is tautological (with the notations of 18.1.2.1, it is sufficient to take T' empty and f equal to the identity). The properties b) and c) are already known when $r = 0$ (see 15.3.6 when the divisor T is empty). The general case easily follows by induction on $r \in \mathbb{N}$. Now let us deal with d). Following the remark 18.1.2.4.(a), it is sufficient to check it when $r = 1$. Thanks to a), if $\mathcal{E}$ is a 1-overholonomic $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-module then $\mathbb{D}(\mathcal{E})$ is overcoherent and therefore has finite extraordinary fibers (see 15.3.6.12). By 15.3.2.8, this implies that $\mathcal{E}$ is holonomic. Hence d). Now, let's establish e). Since this is local, we can suppose P is integral. The case $r = 0$ has already been treated (see 15.3.6.9). Let $r \geq 1$ be an integer and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ be an r-overholonomic complex.

Let T be a divisor of P. We obtain from the induction hypothesis that $\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E})$ and $({}^\dagger T)(\mathcal{E})$ are $r-1$-overholonomic. Moreover, for any smooth morphism $f\colon \mathfrak{P}' \to \mathfrak{P}$ of $\mathfrak{S}$-formal schemes, for any divisor T' of X', we have the isomorphisms:

$$\mathbb{D}({}^\dagger T') f^! ({}^\dagger T)(\mathcal{E}) \overset{13.2.1.4.1}{\xrightarrow{\sim}} \mathbb{D}({}^\dagger T')({}^\dagger f^{-1}(T)) f^!(\mathcal{E}) \overset{13.1.5.6.1}{\xrightarrow{\sim}} \mathbb{D}({}^\dagger T' \cup f^{-1}(T)) f^!(\mathcal{E}).$$

Since $T' \cup f^{-1}(T)$ is a divisor of P', as $\mathcal{E}$ is r-overholonomic, then by definition $\mathbb{D}({}^\dagger T' \cup f^{-1}(T)) f^!(\mathcal{E})$ is $r-1$-overholonomic (see 18.1.2.1). Hence so is the complex $\mathbb{D}({}^\dagger T') f^! ({}^\dagger T)(\mathcal{E})$. This means that $({}^\dagger T)(\mathcal{E})$ is r-overholonomic. By using the triangle of localisation in T (see 13.1.5.6.3) and via c), this yields that $\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E})$ is r-overholonomic.

Let Z be a closed subscheme of X. Following 13.1.3.6, there exists some divisors $T_1, \ldots, T_n$ of X such that $Z = \cap_{i=1,\ldots,n} T_i$. By setting $Z' := \cap_{i=2,\ldots,n} T_i$, we have the distinguished triangle of Mayer-Vietoris (see 13.1.4.15.1):

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'}(\mathcal{E}) \oplus \mathbb{R}\underline{\Gamma}^{\dagger}_{T_1}(\mathcal{E}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{Z' \cup T_1}(\mathcal{E}) \to \mathbb{R}\underline{\Gamma}^{\dagger}_{Z}(\mathcal{E})[1].$$

Since Z' and $Z' \cup T_1$ are the intersections of $n-1$ divisors, we end the proof thanks to c) and by proceeding by induction on n.

Finally, the statement (f) is obvious by definition. □

Corollary 18.1.2.10. *Let T be a divisor of X and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}})$. Then $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$ if and only if $\mathbb{D}_T(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$.*

Proof. a) Suppose $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$. The canonical morphism $\mathcal{E} \to ({}^{\dagger}T)(\mathcal{E})$ is a morphism of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}T)_{\mathbb{Q}}$-modules which is an isomorphism apart from T. By 8.7.6.11, this implies that $\mathcal{E} \to ({}^{\dagger}T)(\mathcal{E})$ is an isomorphism. However, following 9.2.4.22.3 dual functors commute with localisation, i.e., $\mathbb{D}_T \circ ({}^{\dagger}T)(\mathcal{E}) \xrightarrow{\sim} ({}^{\dagger}T) \circ \mathbb{D}(\mathcal{E})$. We obtain then $\mathbb{D}_T(\mathcal{E}) \xrightarrow{\sim} ({}^{\dagger}T) \circ \mathbb{D}(\mathcal{E})$. Hence, using 18.1.2.9.(a) and 18.1.2.9.(e) this yields $\mathbb{D}_T(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$.

b) The converse comes from the biduality isomorphism $\mathbb{D}_T \circ \mathbb{D}_T(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}$ (see 8.7.7.3) and from the part a). □

Like coherence, we verify that the notion of overholonomicity is local on $\mathfrak{P}$. Moreover, we extend the standard properties of coherent modules to overholonomic modules. For example, we have the following two propositions:

Proposition 18.1.2.11. *Let $\Phi \colon \mathcal{E} \to \mathcal{F}$ be a morphism of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules and $r \in \mathbb{N} \cup \{\infty\}$. If $\mathcal{E}$ and $\mathcal{F}$ are r-overholonomic, then so are* $\operatorname{Ker}\Phi$, $\operatorname{Coker}\Phi$ *and* $\operatorname{Im}\Phi$.

Proof. We proceed by induction on $r \geq 0$. The case $r = 0$ is 15.3.6.4.(a). Suppose now the theorem holds for $r-1 \geq 0$ and let us check it for r. Let $f \colon \mathfrak{P}' \to \mathfrak{P}$ be a smooth morphism of $\mathfrak{S}$-formal schemes, T' be a divisor of P'. Since the functor $({}^{\dagger}T') \circ f^*$ is exact and preserves the r-overholonomic (see 18.1.2.9), then by induction hypothesis we reduce to check that $\mathbb{D}(\ker\Phi)$, $\mathbb{D}(\operatorname{Coker}\Phi)$ and $\mathbb{D}(\operatorname{Im}\Phi)$ are $r-1$-overholonomic. By 18.1.2.9.(d), since $r \geq 1$, then Φ is a morphism of holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules. Hence, it follows from 15.2.4.14 that $\ker\Phi$, $\operatorname{Coker}\Phi$ and $\operatorname{Im}\Phi$ are holonomic. Let us recall that following the homological criterion of holonomicity (see 15.2.4.8), if $\mathcal{G}$ is a holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module, then by setting $\mathcal{G}^* := H^0\mathbb{D}(\mathcal{G})$ we get $\mathcal{G}^* \xrightarrow{\sim} \mathbb{D}(\mathcal{G})$. We get the morphism $\Phi^* := H^0\mathbb{D}(\Phi) \colon \mathcal{F}^* \to \mathcal{E}^*$. Since the functor $H^0\mathbb{D}$ is exact on the category of holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules, then $(\operatorname{Im}(\phi))^* \xrightarrow{\sim} \operatorname{Im}(\phi^*)$, $(\ker\Phi)^* \xrightarrow{\sim} \operatorname{Coker}(\Phi^*)$, $(\operatorname{Coker}\Phi)^* \xrightarrow{\sim} \ker(\Phi^*)$. By definition of the r-overholonomic, Φ^* is a morphism of $r-1$-overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules. By induction hypothesis, this yields that $(\operatorname{Im}(\phi))^*$, $(\ker\Phi)^*$, $(\operatorname{Coker}\Phi)^*$ are $r-1$-overholonomic, q.e.d. □

Proposition 18.1.2.12. *Let $\mathcal{E}_1 \to \mathcal{E}_2 \to \mathcal{E}_3 \to \mathcal{E}_4 \to \mathcal{E}_5$ an exact sequence of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules. For any $r \in \mathbb{N} \cup \{\infty\}$, if $\mathcal{E}_1$, $\mathcal{E}_2$, $\mathcal{E}_4$, $\mathcal{E}_5$ are r-overholonomic, then $\mathcal{E}_3$ is r-overholonomic.*

Proof. The case $r = 0$ is already known (see 15.3.6.4.(b)). Suppose now the proposition holds for $r-1 \geq 0$ and let us prove it for r. Let $f \colon \mathfrak{P}' \to \mathfrak{P}$ be a smooth morphism of $\mathfrak{S}$-formal schemes, T' be a divisor of P'. Since the functor $({}^{\dagger}T') \circ f^*$ is exact and preserves the r-overholonomic (see 18.1.2.9), then by induction hypothesis we reduce to check that $\mathbb{D}(\mathcal{E}_3)$ is $r-1$-overholonomic.

By 18.1.2.9.(d), since $r \geq 1$, then $\mathcal{E}_1$, $\mathcal{E}_2$, $\mathcal{E}_4$, $\mathcal{E}_5$ are holonomic. Denote by $\mathcal{F}_2$ (resp. $\mathcal{F}_3$) the image of $\mathcal{E}_2 \to \mathcal{E}_3$ (resp. $\mathcal{E}_3 \to \mathcal{E}_4$). Using 15.2.4.14, since $\mathcal{E}_2$ (resp. $\mathcal{E}_4$) is holonomic, then so is $\mathcal{F}_2$ (resp. $\mathcal{F}_3$). Since we have the exact sequence $0 \to \mathcal{F}_2 \to \mathcal{E}_3 \to \mathcal{F}_3 \to 0$ with $\mathcal{F}_2$ and $\mathcal{F}_3$ holonomic then so is $\mathcal{E}_3$ (thanks to 15.2.4.14). Hence, $\mathbb{D}(\mathcal{E}_3) \xrightarrow{\sim} \mathcal{E}_3^*$. Since the functor $H^0\mathbb{D}$ is exact on the category of holonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules (see 15.2.4.15), then we get the exact sequence $\mathcal{E}_5^* \to \mathcal{E}_4^* \to \mathcal{E}_3^* \to \mathcal{E}_2^* \to \mathcal{E}_1^*$. By induction hypothesis, $\mathcal{E}_3^*$ is therefore $r-1$-overholonomic. □

Corollary 18.1.2.13. *Let $N \in \mathbb{N}$. For $N \geq p, q \geq 0$, $r_0 \geq 1$, let $\mathcal{E}_{r_0}^{p,q} \Rightarrow \mathcal{E}^n$ be a spectral sequence of coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules. If, for any p, q, the $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules $\mathcal{E}_{r_0}^{p,q}$ are r-overholonomic, then so are the $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules $\mathcal{E}^n$ for any $n \in \mathbb{N}$.*

Proof. It follows from 18.1.2.11 that the $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules $\mathcal{E}^{p,q}_{\infty}$ are r-overholonomic. With 18.1.2.12, this implies that so are $\mathcal{E}^n$. $\square$

Theorem 18.1.2.14. *Let $f\colon \mathfrak{Y} \to \mathfrak{P}$ be a morphism of smooth $\mathfrak{S}$-formal schemes, $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$, $\in \mathbb{N} \cup \{\infty\}$ and $r \in \mathbb{N}$. If $\mathcal{E}$ is r-overholonomic then so is $f^!(\mathcal{E})$.*

Proof. We proceed by induction on $r \geq 0$. For $r = 0$, this is 15.3.6.12. Now let us suppose the theorem holds for $r-1 \geq 0$ and let us prove it for r.

Since f factors as the composition of an immersion (its graph $\mathfrak{Y} \hookrightarrow \mathfrak{Y} \times_{\mathfrak{S}} \mathfrak{P}$) followed by the smooth projection $\mathfrak{Y} \times_{\mathfrak{S}} \mathfrak{P} \to \mathfrak{P}$, then it is sufficient to treat the case where f is smooth and where f is a closed immersion. Since the case where f is smooth is obvious (see 18.1.2.9.(f)) then we reduce to treat the case where f is a closed immersion.

Let $g\colon \mathfrak{Y}' \to \mathfrak{Y}$ be a smooth morphism and Z' be a closed subscheme of Y'. By induction hypothesis on r, it is sufficient to check that $\mathbb{D} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} \circ g^!(f^!(\mathcal{E}))$ is $r-1$-overholonomic. Indeed, taking Z' equal to Y', this implies that $\mathbb{D} \circ g^!(f^!(\mathcal{E}))$ is $r-1$-overholonomic. By applying the dual functor $\mathbb{D}$ to the triangle of localisation of $g^!(f^!(\mathcal{E}))$ in Z' (see 13.1.5.6.3), then it follows from 18.1.2.9.c that $\mathbb{D} \circ ({}^{\dagger}Z') \circ g^!(f^!(\mathcal{E}))$ is $r-1$-overholonomic.

Let us prove now that $\mathbb{D} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} \circ g^!(f^!(\mathcal{E}))$ is $r-1$-overholonomic. Since this is local on $\mathfrak{Y}'$, we can then suppose that g factors in a closed immersion $\mathfrak{Y}' \hookrightarrow \widehat{\mathbb{A}}^n_{\mathfrak{Y}}$ followed by the projection $\widehat{\mathbb{A}}^n_{\mathfrak{Y}} \to \mathfrak{Y}$. Let $p\colon \widehat{\mathbb{A}}^n_{\mathfrak{P}} \to \mathfrak{P}$ be the projection and i the closed immersion $\mathfrak{Y}' \hookrightarrow \widehat{\mathbb{A}}^n_{\mathfrak{P}}$. Since, $f \circ g = p \circ i$, then we get the first isomorphism:

$$\mathbb{D} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} \circ g^!(f^!(\mathcal{E})) \xrightarrow{\sim} \mathbb{D} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} \circ i^! \circ p^!(\mathcal{E}) \underset{13.2.1.4.1}{\xrightarrow{\sim}} \mathbb{D} \circ i^! \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} \circ p^!(\mathcal{E}) \underset{9.3.5.11.1}{\xrightarrow{\sim}} i^! \circ \mathbb{D} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} \circ p^!(\mathcal{E}), \tag{18.1.2.14.1}$$

where the last isomorphism follows from the fact that $\mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} p^!(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Q}',\mathbb{Q}})$ is coherent with support in Y' (because $\mathcal{E}$ is overcoherent). Following 18.1.2.9, since $\mathcal{E}$ is r-overholonomic then the complex $\mathbb{D} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} p^!(\mathcal{E})$ is $r-1$-overholonomic. By induction hypothesis, this yields $i^! \mathbb{D} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z'} p^!(\mathcal{E})$ is also $r-1$-overholonomic. Hence, we are done. $\square$

Theorem 18.1.2.15. *Let $f\colon \mathfrak{Y} \to \mathfrak{P}$ be a realizable (in the sense of 13.2.3.1) morphism of smooth $\mathcal{V}$-formal schemes. For any $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}})$ with proper support over P, for any integer r, if $\mathcal{F}$ is r-overholonomic then $f_+(\mathcal{F})$ is r-overholonomic.*

Proof. We proceed by induction on the integer $r \geq 0$. The case $r = 0$ has been checked in 16.3.3.1 (in fact, the version of 15.3.6.14 is sufficient). Now, let us suppose the theorem holds for $r-1 \geq 0$ and let us check it for r. Let $\mathcal{F}$ be an r-overholonomic complex of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}})$, $g\colon \mathfrak{P}' \to \mathfrak{P}$ be a smooth morphism of $\mathfrak{S}$-formal schemes and T' be a divisor of P'. Denote by $\mathfrak{Y}' := \mathfrak{Y} \times_{\mathfrak{P}} \mathfrak{P}'$, $f'\colon \mathfrak{Y}' \to \mathfrak{P}'$ and $g'\colon \mathfrak{Y}' \to \mathfrak{Y}$ the respective projections. We have to check that $\mathbb{D}({}^{\dagger}T')g^! f_+(\mathcal{F})$ is $r-1$ overholonomic. However, by using the isomorphism of base change of the direct image of a realisable morphism by a smooth morphism $g^! f_+(\mathcal{F}) \xrightarrow{\sim} f'_+ g'^!(\mathcal{F})$ (see 13.2.3.7), the commutation of the direct image with the local cohomological functor (see 13.2.1.4.2) and to the relative duality theorem (see 13.2.4.1), we get the isomorphisms:

$$\mathbb{D}({}^{\dagger}T')g^! f_+(\mathcal{F}) \xrightarrow{\sim} \mathbb{D}({}^{\dagger}T')f'_+ g'^!(\mathcal{F}) \xrightarrow{\sim} \mathbb{D} f'_+({}^{\dagger}f'^{-1}T')g'^!(\mathcal{F}) \xrightarrow{\sim} f'_+ \mathbb{D}({}^{\dagger}f'^{-1}T')g'^!(\mathcal{F}).$$

Following the proposition 18.1.2.9 and the theorem 18.1.2.14, the complex $\mathbb{D}({}^{\dagger}f'^{-1}T')g'^!(\mathcal{F})$ is $r-1$-overholonomic. By induction hypothesis, this yields that the complex $f'_+\mathbb{D}({}^{\dagger}f'^{-1}T')g'^!(\mathcal{F})$ is $r-1$-overholonomic. $\square$

Theorem 18.1.2.16 (Overholonomic version of Berthelot-Kashiwara theorem)**.** *Let $f\colon \mathfrak{Y} \to \mathfrak{P}$ be a closed immersion of smooth $\mathcal{V}$-formal schemes, $r \in \mathbb{N} \cup \{\infty\}$.*

(a) For any r-overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module $\mathcal{E}$ with support in Y, any r-overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}$-module $\mathcal{F}$ and any integer $k \neq 0$, $H^k f_+(\mathcal{F}) = 0$ and $H^k f^!(\mathcal{E}) = 0$.

(b) The functors f_+ and $f^!$ induce canonically quasi-inverse equivalences between the category of r-overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules with support in Y and that of r-overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}$-modules.

Proof. The a) part results from the coherent version of the theorem of Kashiwara due to Berthelot (see 9.3.5.9)) and of the fact that a r-overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}$-module (resp. a r-overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module with support in Y) is a coherent $\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}$-module (resp. a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module with support in Y). The assertion b) comes from of 9.3.5.9) and from the stability of the r-overholonomicity by direct image and extraordinary inverse image by a closed immersion (see 18.1.2.14 and of 18.1.2.15). □

18.2 Acyclicity of u_+ and $u_!$ when the underlying formal scheme morphism is the identity

Let $m \in \mathbb{N} \cup \{\infty\}$, $\mathfrak{S} := \operatorname{Spf} \mathcal{V}$. Let $\mathfrak{X} \to \mathfrak{S}$ be a smooth morphism of formal schemes. Let $\mathfrak{Z} \subset \mathfrak{X}$ be a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor (see definition 4.5.2.7). Let $\mathfrak{Y}$ be the open of $\mathfrak{X}$ complementary to $\mathfrak{Z}$ and $j \colon \mathfrak{Y} \subset \mathfrak{X}$ be the open immersion. Set $\mathfrak{X}^{\sharp} := (\mathfrak{X}, M(\mathfrak{Z}))$. Let $\mathfrak{Z}^{\flat}, \mathfrak{D} \subset \mathfrak{Z}$ be subdivisors of $\mathfrak{Z}$ such that $\mathfrak{Z} = \mathfrak{Z}^{\flat} \cup \mathfrak{D}$ and the irreducible components of $\mathfrak{Z}^{\flat}$ and $\mathfrak{D}$ are disjoint. Set $\mathfrak{X}^{\flat} := (\mathfrak{X}, M(\mathfrak{Z}^{\flat}))$. Let $u \colon \mathfrak{X}^{\sharp} \to \mathfrak{X}^{\flat}$ be the canonical morphism. The underlying morphism of smooth $\mathfrak{S}$-formal schemes is the identity of $\mathfrak{X}$.

The goal of this section is to establish the theorem 18.2.3.13. The first part of the theorem is a consequence of 18.2.3.1 (which follows from 18.2.1.6). The second part of the theorem 18.2.3.13 (or also 18.2.3.11) corresponds in some way (modulo the twist "$(\mathfrak{Z})$") to an isomorphism of (logarithmic) relative duality to the canonical morphism $\mathfrak{X}^{\sharp} \to \mathfrak{X}$. It can be proved similarly to the complex case of [CMNM05, 3.1.2] by using the isomorphism of associativity of 4.5.3.3 (or more precisely the induced isomorphism 4.5.3.8.1).

18.2.1 Finite order case

Let $\mathcal{B}_{\mathfrak{X}}$ be an $\mathcal{O}_X$-algebra endowed with a compatible structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\flat}}$-module. We get a structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}}$-module on $\mathcal{B}_{\mathfrak{X}} = u^*\mathcal{B}_{\mathfrak{X}}$ whose stratification $(\varepsilon_n^{u^*\mathcal{B}_{\mathfrak{X}}})_n$ given by the pullbacks via the algebra homomorphisms $\mathcal{P}^n_{\mathfrak{X}^{\flat}/\mathfrak{S}(m)} \to \mathcal{P}^n_{\mathfrak{X}^{\sharp}/\mathfrak{S}(m)}$ (see 4.4.2). Hence, $\varepsilon_n^{u^*\mathcal{B}_{\mathfrak{X}}}$ are $\mathcal{P}^n_{\mathfrak{X}^{\sharp}/\mathfrak{S}(m)}$-algebra isomorphisms, i.e. the induced structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}}$-module of $\mathcal{B}_{\mathfrak{X}}$ is compatible. Hence, for any $0 \le m' \le m$, we get the $\mathcal{O}_{\mathfrak{S}}$-algebras by setting $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^{\sharp}} := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^{\sharp}}$ and $\widetilde{\mathcal{D}}^{(m')}_{\mathfrak{X}^{\flat}} := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m')}_{\mathfrak{X}^{\flat}}$. Recall, the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/S} \to \widetilde{\mathcal{D}}^{(m)}_{X^{\flat}/S}$ is a ring morphism (use a similar to 4.5.2.18.3 diagram).

18.2.1.1 (Local description)**.** Suppose there exist nice coordinates $t_1, \dots, t_d$ of $\mathfrak{X}^{\sharp}/\mathfrak{S}$ so that $\mathfrak{Z}$ is empty or $\mathfrak{Z}$ is cut out by $\prod_{1 \le j \le r} t_j$ for some $r \ge 1$, and $\mathfrak{Z}^{\flat}$ is either empty of cut out by $\prod_{1 \le j \le s} t_j$ for some $r \ge s \ge 1$ (which is always locally possible following 4.5.2.14). Then the coordinates $t_1, \dots, t_d$ of $\mathfrak{X}^{\sharp}/\mathfrak{S}$ are semi-nice coordinates of $\mathfrak{X}^{\flat}/\mathfrak{S}$ (because when $r > s$, t_r is not invertible). We get the description 4.5.2.18.(b). We get the bases $\{\underline{\partial}^{\underline{k}}_{(r)} : \underline{k} \in \mathbb{N}^d\}$ of $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}$ and $\{\underline{\partial}^{\underline{k}}_{(s)} : \underline{k} \in \mathbb{N}^d\}$ of $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\flat}/\mathfrak{S}}$. According to 4.5.1.9, in the computations of the subsection, when we refer to some logarithmic formulas, we will mean its semi-logarithmic avatar.

We have the commutative canonical diagram

$$\begin{array}{ccc} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\flat}} & \xrightarrow{\sigma} & \operatorname{gr} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\flat}} \\ \uparrow & & \uparrow \\ \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}} & \xrightarrow{\sigma} & \operatorname{gr} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\sharp}} \end{array} \qquad (18.2.1.1.1)$$

where the vertical arrows are injective. For any $i = 1, \dots, d$, we set $\xi_{i,(s)} := \sigma(\partial_{i,(s)})$ and $\xi_{i,(r)} := \sigma(\partial_{i,(r)})$ (this latter can be viewed as an element of $\operatorname{gr} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\flat}}$).

Lemma 18.2.1.2. *We keep hypotheses and notation of 18.2.1.1 and we suppose $t_1, \dots, t_d$ is a regular sequence of $\mathcal{B}_{\mathfrak{X}}$ (e.g. $\mathcal{O}_{\mathfrak{X}}$).*

(a) The sequence $\xi_{1,(r)}, \dots, \xi_{d,(r)}$ of $\operatorname{gr} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^{\flat}}$ is regular.

(b) We have the equality

$$\sigma(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}(\partial_{1,(r)},\ldots,\partial_{d,(r)})) = (\operatorname{gr}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat})(\xi_{1,(r)},\ldots,\xi_{d,(r)}). \tag{18.2.1.2.1}$$

Proof. a) Since $t_1,\ldots,t_d$ nice coordinates of $\mathfrak{X}^\sharp/\mathfrak{S}$, then they are semi-logarithmic coordinates of $\mathfrak{X}^\flat/\mathfrak{S}$ and we get: $\operatorname{gr}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat} = \mathcal{B}_{\mathfrak{X}}[\xi_{1,(s)},\ldots,\xi_{d,(s)}]$. For any integer i such that $1\le i\le s$ and $r+1\le i\le d$, we have $\xi_{i,(r)}=\xi_{i,(s)}$. For any integer i such that $s+1\le i\le r$, we have $\xi_{i,(r)} = t_i\xi_{i,(s)}$. Hence, for any $1\le i\le s$, $\operatorname{gr}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}/(\xi_{1,(r)},\ldots,\xi_{i,(r)}) = \mathcal{B}_{\mathfrak{X}}[\xi_{i+1,(s)},\ldots,\xi_{d,(s)}]$; for any $r+1\le i\le s$, $\operatorname{gr}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}/(\xi_{1,(r)},\ldots,\xi_{i,(r)}) = \big(\mathcal{O}_{\mathfrak{X}}[\xi_{r+1,(s)},\ldots,\xi_{i,(s)}]/(t_{r+1}\xi_{r+1,(s)},\ldots,t_i\xi_{i,(s)})\big)[\xi_{i+1,(s)},\ldots,\xi_{d,(s)}]$. Since the sequence $t_1,\ldots,t_d$ of $\mathcal{B}_{\mathfrak{X}}$ is regular, then $t_{i+1}\xi_{i+1,(s)}$ is a nonzerodivisor of $\operatorname{gr}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}/(\xi_{1,(r)},\ldots,\xi_{i,(r)})$. Hence, we are done.

b) Let us prove now the equality 18.2.1.2.1. To simplify notation, for any integers $1\le i\le d$ and $n\ge 0$, we set $\delta_i := \partial_{i,(r)}$, $\xi_i := \xi_{i,(r)}$, $\mathcal{D} := \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}$, $\mathcal{I} := \mathcal{D}(\delta_1,\ldots,\delta_d)$, $\mathcal{D}_n := \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat,n}$. Let $\mathcal{D}^d\to\mathcal{I}$ be the epimorphism given by $(P_1,\ldots,P_d)\mapsto\sum_i P_i\delta_i$ and let $\mathcal{I}_n$ be the image of $\mathcal{D}^d_{n-1}$ by this map. We get $\sigma(\mathcal{D}(\delta_1,\ldots,\delta_d) = \oplus_{n\ge1}(\mathcal{I}\cap\mathcal{D}_n+\mathcal{D}_{n-1})/\mathcal{D}_{n-1}$ and $\operatorname{gr}\mathcal{D}(\xi_1,\ldots,\xi_d) = \oplus_{n\ge1}\mathcal{I}_n+\mathcal{D}_{n-1}/\mathcal{D}_{n-1}$. Hence, we have to check $\mathcal{I}\cap\mathcal{D}_n+\mathcal{D}_{n-1} = \mathcal{I}_n+\mathcal{D}_{n-1}$ for any $n\ge 1$. Since $\mathcal{I}_n\subset\mathcal{I}\cap\mathcal{D}_n$ then $\mathcal{I}_n+\mathcal{D}_{n-1}\subset\mathcal{I}\cap\mathcal{D}_n+\mathcal{D}_{n-1}$ is obvious. Conversely, let $P\in\mathcal{I}\cap\mathcal{D}_n$. Let $P_1,\ldots,P_d\in\mathcal{D}$ such that $P=\sum_i P_i\delta_i$. We prove $P\in\mathcal{I}_n+\mathcal{D}_{n-1}$ by induction on the maximal order N of the operators P_i $(i=1,\ldots,d)$, i.e. on $N:=\min\{n\ge1$; such that $P_i\in\mathcal{D}_n$ for any $i=1,\ldots,d\}$. If $N\le n-1$, then $P\in\mathcal{I}_n$ and we are done. Suppose now $N\le n$. Let K be the the set of subindices j such that P_j has order N. If $\sum_{i\in K}\sigma(P_i)\xi_i\ne 0$, then $\sigma(P)=\sum_{i\in K}\sigma(P_i)\xi_i\in\mathcal{D}_{N+1}$, which is absurd. Hence, $\sum_{i\in K}\sigma(P_i)\xi_i = 0$. We set $G_i:=\sigma(P_i)$ for any $i\in K$, and $G_i=0$ for any $i\notin K$. This yields $\sum_{i=1}^d G_i\xi_i = 0$. As the sequence $\xi_1,\ldots,\xi_d$ of $\operatorname{gr}\mathcal{D} = \mathcal{B}_{\mathfrak{X}}[\xi_{1,(s)},\ldots,\xi_{d,(s)}]$ is regular (from the part a), then there exists homogeneous polynomials $(G_{ij})_{1\le i<j\le d}$ of $\operatorname{gr}\mathcal{D}$ of order $N-1$ such that

$$(G_1,\ldots,G_d) = \sum_{1\le i<j\le d} G_{ij}(\xi_j\vec{e}_i - \xi_i\vec{e}_j),$$

where $\vec{e}_i = (0,\ldots,0,1,0,\ldots,0)$ is the element of $\mathbb{N}^d$ with 1 at the ith position. We choose for any $1\le i<j\le d$ operators $Q_{ij}\in\mathcal{D}_{N-1}$ such that $\sigma(Q_{ij}) = G_{ij}$. We set $(Q_1,\ldots,Q_n) := (P_1,\ldots,P_n) - \sum_{1\le i<j\le d} Q_{ij}(\delta_j\vec{e}_i-\delta_i\vec{e}_j)$. Let $\sigma_N\colon\mathcal{D}_N\to\operatorname{gr}_N\mathcal{D}$ be the canonical map. For $i=1,\ldots,d$, we compute $\sigma_N(P_i) = G_i$ and $\sigma_N(Q_{ij}) = \sigma(Q_{ij}) = G_{ij}$. Since σ_N is $\mathcal{B}_{\mathfrak{X}}$-linear and multiplicative (with respect to the product of two elements staying in $\mathcal{D}_N$), this yields $(\sigma_N(Q_1),\ldots,\sigma_N(Q_n)) = (Q_1,\ldots,Q_n) - \sum_{1\le i<j\le d} G_{ij}(\xi_j\vec{e}_i-\xi_i\vec{e}_j) = 0$. Hence, $Q_1,\ldots,Q_d\in\mathcal{D}_{N-1}$. Moreover, since the family $(\xi_i)_i$ commutes two by two, we get:

$$\sum_{i=1}^d Q_i\delta_i = \sum_{i=1}^d P_i\delta_i - \sum_{1\le i<j\le d} Q_{ij}(\xi_i\xi_j-\xi_j\xi_i) = 0.$$

By using the induction hypothesis, we get $(Q_1,\ldots,Q_d)$. □

Theorem 18.2.1.3. *We suppose $\mathcal{B}_{\mathfrak{X}}$ is $\mathcal{O}_{\mathfrak{X}}$-flat. Let $\mathcal{E}$ be a left coherent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}$-module which is coherent and flat on $\mathcal{B}_{\mathfrak{X}}$. Then, the complex $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}}\operatorname{Sp}^\bullet_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}}(\mathcal{E})$, where $\operatorname{Sp}^\bullet_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}}(\mathcal{E})$ is the Spencer complex of 4.7.3.7.1 is acyclic.*

Proof. 0) We have to check the exactness of the sequence:

$$0\to\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{B}_{\mathfrak{X}}}\wedge^d\widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E}\xrightarrow{\epsilon}\cdots\xrightarrow{\epsilon}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{B}_{\mathfrak{X}}}\wedge^1\widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E}\xrightarrow{\epsilon}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E}\xrightarrow{\varpi}\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}}\mathcal{E}\to 0, \tag{18.2.1.3.1}$$

where ϖ is the canonical epimorphism and where ϵ is induced by extension from the Spencer complex (see the formula of 4.7.3.4), i.e. is the morphism of left $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}$-modules

$$\epsilon\colon\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{B}_{\mathfrak{X}}}\wedge^i\widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E}\to\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{B}_{\mathfrak{X}}}\wedge^{i-1}\widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{E} \tag{18.2.1.3.2}$$

given by

$$
\begin{aligned}
\epsilon\left(P \otimes (v_1 \wedge \cdots \wedge v_i) \otimes u\right) = & \sum_{a=1}^{i} (-1)^{a-1} P v_a \otimes (v_1 \wedge \cdots \wedge \widehat{v_a} \wedge \cdots \wedge v_i) \otimes u \\
& - \sum_{a=1}^{i} (-1)^{a-1} P \otimes (v_1 \wedge \cdots \wedge \widehat{v_a} \wedge \cdots \wedge v_i) \otimes v_a u \\
& + \sum_{1 \le a < b \le i} (-1)^{a+b} P \otimes ([v_a, v_b] \wedge v_1 \wedge \cdots \wedge \widehat{v_a} \wedge \cdots \wedge \widehat{v_b} \wedge \cdots \wedge v_i) \otimes u
\end{aligned}
$$

1) As $\mathcal{E}$ is flat on $\mathcal{B}_{\mathfrak{X}}$, we get the following filtration of 18.2.1.3.1 for $n \in \mathbb{N}$:

$$
\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n-d} \otimes_{\mathcal{B}_{\mathfrak{X}}} \wedge^d \widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\epsilon} \cdots \xrightarrow{\epsilon} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n-1} \otimes_{\mathcal{B}_{\mathfrak{X}}} \wedge^1 \widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\epsilon} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\varpi} \varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}). \tag{18.2.1.3.3}
$$

The induced morphism by ϵ morphism

$$
\overline{\epsilon}_{n,i} \colon \operatorname{gr}_{n-i}(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \wedge^i \widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E} \to \operatorname{gr}_{n-i+1}(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \wedge^{i-1} \widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E} \tag{18.2.1.3.4}
$$

is given by

$$
\overline{\epsilon}_{n,i}\left(\overline{P} \otimes (v_1 \wedge \cdots \wedge v_i) \otimes u\right) = \sum_{a=1}^{i} (-1)^{a-1} \overline{P v_a} \otimes (v_1 \wedge \cdots \wedge \widehat{v_a} \wedge \cdots \wedge v_i) \otimes u.
$$

Moreover, since $\mathcal{E}$ is flat as $\mathcal{B}_{\mathfrak{X}}$-module, then we get

$$
\varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}) / \varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n-1} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}) \xrightarrow{\sim} \varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n}) / \varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n-1}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}),
$$

where $\varpi \colon \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat} \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}} \mathcal{B}_{\mathfrak{X}}$ is the canonical morphism (i.e. this is ϖ in the case where $\mathcal{E} = \mathcal{B}_{\mathfrak{X}}$). Hence, the graded complex induced by the filtration 18.2.1.3.3 is canonically isomorphic to the graded complex induce by the filtration 18.2.1.3.3 where $\mathcal{E}$ is equal to $\mathcal{B}_{\mathfrak{X}}$ tensored by $\mathcal{E}$ above $\mathcal{B}_{\mathfrak{X}}$. As $\mathcal{E}$ is flat on $\mathcal{B}_{\mathfrak{X}}$, we reduce therefore to the case where $\mathcal{E} = \mathcal{B}_{\mathfrak{X}}$.

2) Let us check the graded complex induced by the filtration 18.2.1.3.3 is acyclic when $\mathcal{E} = \mathcal{B}_{\mathfrak{X}}$. Since this is local, we can suppose the local situation of 18.2.1.1 holds and we use the notation of the proof of 18.2.1.2.1. Since $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp} / \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}(\delta_1, \ldots, \delta_d) \xrightarrow{\sim} \mathcal{B}_{\mathfrak{X}}$, then $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}} \mathcal{B}_{\mathfrak{X}} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat} / \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}(\partial_{1,(r)}, \ldots, \partial_{d,(r)}) = \mathcal{D}/\mathcal{I}$. Hence, $\varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n}) = \mathcal{D}_n + \mathcal{I}/\mathcal{I}$ and therefore $\varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n}) / \varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n-1}) = \mathcal{D}_n + \mathcal{I}/\mathcal{D}_{n-1} + \mathcal{I} = \mathcal{D}_n/(\mathcal{I} \cap \mathcal{D}_n + \mathcal{D}_{n-1})$. Since $\mathcal{B}_{\mathfrak{X}}$ is a flat $\mathcal{O}_{\mathfrak{X}}$-algebra, then we get from 18.2.1.2.1 the equality $\operatorname{gr} \mathcal{D} / \operatorname{gr} \mathcal{D}(\xi_1, \ldots, \xi_d) = \operatorname{gr} \mathcal{D} / \sigma(\mathcal{I})$. As $\sigma(\mathcal{I}) = \oplus_{n \ge 0} (\mathcal{I} \cap \mathcal{D}_n + \mathcal{D}_{n-1}) / \mathcal{D}_{n-1}$, this yields:

$$
\operatorname{gr} \mathcal{D} / \operatorname{gr} \mathcal{D}(\xi_1, \ldots, \xi_d) = \operatorname{gr} \mathcal{D} / \sigma(\mathcal{I}) = \oplus_{n \ge 0} \mathcal{D}_n / (\mathcal{I} \cap \mathcal{D}_n + \mathcal{D}_{n-1}) = \oplus_{n \ge 0} \varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n}) / \varpi(\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat, n-1}). \tag{18.2.1.3.5}
$$

Since $\widetilde{\mathcal{T}}_{\mathfrak{X}^\sharp}$ is a free $\mathcal{B}_{\mathfrak{X}}$-module whose basis is given by $\delta_1, \ldots, \delta_d$, then the map $\oplus_{n \in \mathbb{N}} \overline{\epsilon}_{n,i}$ (where $\overline{\epsilon}_{n,i}$ is defined at 18.2.1.3.4 with $\mathcal{E} = \mathcal{B}_{\mathfrak{X}}$) is the i-th map given by the Koszul complex of the ring $\operatorname{gr} \mathcal{D}$ with respect to the sequence $\xi_1, \ldots, \xi_d$. Since the sequence $\xi_1, \ldots, \xi_d$ of $\operatorname{gr} \mathcal{D}$ is regular (see 18.2.1.2), then the Koszul complex is acyclic. Using 18.2.1.3.5, we are done.

□

Corollary 18.2.1.4. *We suppose $\mathcal{B}_{\mathfrak{X}}$ is $\mathcal{O}_{\mathfrak{X}}$-flat. Let $\mathcal{E}$ be a left coherent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}$-module which is coherent and flat on $\mathcal{B}_{\mathfrak{X}}$. The canonical homomorphism $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}} \mathcal{E} \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat} \otimes_{\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}} \mathcal{E}$ is then an isomorphism.*

Proof. This is a consequence of 4.7.3.6 and 18.2.1.3. □

Remark 18.2.1.5. Following a counter-example of Noot-Huyghe, the extension $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp} \to \widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\flat}$ is not flat. The corollary 18.2.1.4 is then not valid for any left coherent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}$-module.

Example 18.2.1.6. Let T be a divisor of X. Then $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ is $\mathcal{O}_{\mathfrak{X}}$-flat. We have $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} := \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}_{\mathfrak{X}^\sharp} = \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(0)}_{\mathfrak{X}^\sharp}$. Let $\mathcal{E}$ be a left coherent $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is locally projective of finite type as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module. The canonical homomorphism $\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} \to \mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}$ is therefore an isomorphism.

Notation 18.2.1.7. According to 3.4.5.1, the sheaf $\omega_{\mathfrak{X}^\flat}$ (resp. $\omega_{\mathfrak{X}^\flat}$) is endowed with a canonical structure of right $\mathcal{D}_{\mathfrak{X}^\sharp}$-module (resp. right $\mathcal{D}_{\mathfrak{X}^\flat}$-module). Via the homomorphism $\mathcal{D}_{\mathfrak{X}^\sharp} \subset \mathcal{D}_{\mathfrak{X}^\flat}$, $\omega_{\mathfrak{X}^\flat}$ can also be viewed as a right $\mathcal{D}_{\mathfrak{X}^\sharp}$-module. Hence, we get from 4.2.3.5.(c), two left $\mathcal{D}_{\mathfrak{X}^\sharp}$-modules by setting:

$$\mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) := \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^\flat}, \omega_{\mathfrak{X}^\sharp}), \mathcal{O}_{\mathfrak{X}}(-\mathfrak{D}) := \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^\sharp}, \omega_{\mathfrak{X}^\flat}). \tag{18.2.1.7.1}$$

Both sheaves $\mathcal{O}_{\mathfrak{X}}(\mathfrak{D})$ and $\mathcal{O}_{\mathfrak{X}}(-\mathfrak{D})$ are locally free $\mathcal{O}_{\mathfrak{X}}$-modules of rank 1 (buy beware neither $\mathcal{O}_{\mathfrak{X}}(\mathfrak{D})$ nor $\mathcal{O}_{\mathfrak{X}}(-\mathfrak{D})$ are sheaves of rings). Let $\mathfrak{U}$ be an open of $\mathfrak{X}$ such that there exist nice coordinates $t_1, \dots, t_d$ of $\mathfrak{U}^\sharp/\mathfrak{S}$ so that $\mathfrak{Z} \cap \mathfrak{U}$ is empty or $\mathfrak{Z} \cap \mathfrak{U}$ is cut out by $\prod_{1 \le j \le r} t_j$ for some $r \ge 1$, and $\mathfrak{Z}^\flat \cap \mathfrak{U}$ is either empty of cut out by $\prod_{1 \le j \le s} t_j$ for some $r \ge s \ge 1$. By applying $j^* = |\mathfrak{Y}$ to the canonical morphisms $\omega_{\mathfrak{X}} \to \omega_{\mathfrak{X}^\sharp}$ and $\omega_{\mathfrak{X}} \to \omega_{\mathfrak{X}^\sharp}$ we get isomorphisms. Indeed, since this is local in $\mathfrak{X}$, we reduce to check it on $\mathfrak{U} \cap \mathfrak{Y}$. The canonical morphisms $\omega_{\mathfrak{U}} \to \omega_{\mathfrak{U}^\sharp}$ is given by $dt_1 \wedge \cdots \wedge dt_d \to t_1 d\log t_1 \wedge \cdots \wedge t_r d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge t_d$ and the canonical morphisms $\omega_{\mathfrak{U}} \to \omega_{\mathfrak{U}^\flat}$ is given by $dt_1 \wedge \cdots \wedge dt_d \to t_1 d\log t_1 \wedge \cdots \wedge t_s d\log t_s \wedge dt_{s+1} \wedge \cdots \wedge t_d$, which conclude the check. Hence, we get the $\mathcal{D}_{\mathfrak{Y}}$-linear isomorphism: $\mathcal{O}_{\mathfrak{X}}(\mathfrak{D})|\mathfrak{Y} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{Y}}, \omega_{\mathfrak{Y}}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{Y}}$. Hence we get by adjunction the $\mathcal{D}_{\mathfrak{X}^\sharp}$-linear map $\mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) \to j_* \mathcal{O}_{\mathfrak{Y}}$. If $\mathfrak{X} = \mathfrak{U}$, then $V(t_{s+1} \cdots t_r) = \mathfrak{D}$ and we compute that $\mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) \to j_* \mathcal{O}_{\mathfrak{Y}}$ is given by $1 \mapsto \frac{1}{t_{s+1} \cdots t_r}$, which justifies the notation.

Using 4.2.4.11.1, we get the $\mathcal{D}_{\mathfrak{X}^\sharp}$-linearity of 18.2.1.7.2 .

$$\mathrm{ev}\colon \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\sharp},\ \mathrm{ev}\colon \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(-\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\flat}. \tag{18.2.1.7.2}$$

By evaluating twice, we obtain from 18.2.1.7.2 the $\mathcal{D}_{\mathfrak{X}^\sharp}$-linear isomorphism : $\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(-\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\sharp}$. Hence, we get the $\mathcal{D}_{\mathfrak{X}^\sharp}$-linear isomorphism :

$$\mathcal{O}_{\mathfrak{X}}(-\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}. \tag{18.2.1.7.3}$$

Notation 18.2.1.8. For any integer $n \in \mathbb{N}$, this yields of left $\mathcal{D}_{\mathfrak{X}^\sharp}$-modules by setting: $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(\mathfrak{D})^{\otimes n}$ and $\mathcal{O}_{\mathfrak{X}}(-n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(-\mathfrak{D})^{\otimes n}$, where $\otimes n$ means that we tensorise n-times as $\mathcal{O}_{\mathfrak{X}}$-module. For any $n, n' \in \mathbb{Z}$, using 18.2.1.7.3, the canonical isomorphisms $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n'\mathfrak{D}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}((n+n')\mathfrak{D})$ are $\mathcal{D}_{\mathfrak{X}^\sharp}$-linear.

According to 4.3.4.4, we get the left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module $\mathcal{B}_{\mathfrak{X}}(n\mathfrak{D}) := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D})$. Let $\mathcal{E}$ (resp. $\mathcal{M}$) is a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module and $n \in \mathbb{Z}$. Following 4.3.4.12, we define a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module by setting $\mathcal{E}(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\sim} \mathcal{B}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}$ (resp. $\mathcal{M}(n\mathfrak{D}) := \mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \xrightarrow{\sim} \mathcal{M} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})$).

Following 4.2.5.1.1, we have the so called transposition isomorphism of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-bimodule $\gamma_{\mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})}\colon \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{B}_{\mathfrak{X}}(n\mathfrak{D}) \xrightarrow{\sim} \mathcal{B}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$. Following 4.2.5.1.2, then we check the formula

$$\gamma_{\mathcal{B}_{\mathfrak{X}}(nZ)}(\underline{\partial}_\sharp^{\langle \underline{k} \rangle} \otimes e) = \sum_{\underline{h} \le \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h} \rangle} e \otimes \underline{\partial}_\sharp^{\langle \underline{h} \rangle}.$$

We get a $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-bimodule by setting $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$. Using 4.2.4.3, we have the canonical isomorphisms: $\mathcal{E}(n\mathfrak{D}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(n\mathfrak{D}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{E}$ and $\mathcal{M}(n\mathfrak{D}) \xrightarrow{\sim} \mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})) \overset{\gamma_{\mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})}}{\xrightarrow{\sim}} \mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(n\mathfrak{D})$. This yields the isomorphisms:

$$\mathcal{M}(n\mathfrak{D}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{E} \xrightarrow{\sim} \mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(n\mathfrak{D}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{E} \xrightarrow{\sim} \mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{E}(n\mathfrak{D}). \tag{18.2.1.8.1}$$

18.2.1.9. The functor $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} -$ is an equivalence of category between the category from the left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-modules to that of right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-modules, and the functor $- \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat} = \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^\flat}, -)$ is a quasi-inverse. Indeed, for any left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module $\mathcal{E}$, right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module $\mathcal{M}$, using the right part of 4.2.4.11.2 (resp. 4.2.4.11.1), we get the left (resp. right) canonical morphism

$$\mathcal{E} \to \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^\flat}, \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}), \qquad \mathrm{ev}\colon \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_X} \mathcal{H}om_{\mathcal{O}_X}(\omega_{\mathfrak{X}^\flat}, \mathcal{M}) \to \mathcal{M} \tag{18.2.1.9.1}$$

is $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-linear. Since $\omega_{\mathfrak{X}^\flat}$ is locally free of rank one, then these morphisms are isomorphisms and we are done.

Lemma 18.2.1.10. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module and $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module. We have the following canonical isomorphisms of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-modules :*

$$\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}(\mathfrak{D})\xrightarrow{\sim}\omega_{\mathfrak{X}^\sharp}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E},\qquad \omega_{\mathfrak{X}^\sharp}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}(-\mathfrak{D})\xrightarrow{\sim}\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}, \tag{18.2.1.10.1}$$

$$\mathcal{E}(\mathfrak{D})\xrightarrow{\sim}(\omega_{\mathfrak{X}^\sharp}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E})\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat},\qquad \mathcal{E}(-\mathfrak{D})\xrightarrow{\sim}(\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E})\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\sharp}, \tag{18.2.1.10.2}$$

$$\mathcal{M}(\mathfrak{D})\xrightarrow{\sim}\omega_{\mathfrak{X}^\sharp}\otimes_{\mathcal{O}_{\mathfrak{X}}}(\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat}),\qquad \mathcal{M}(-\mathfrak{D})\xrightarrow{\sim}\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}(\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\sharp}). \tag{18.2.1.10.3}$$

Proof. By applying the functor $-_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}$ to the isomorphism 18.2.1.7.2, via the associativity isomorphism of the tensor product of 4.2.4.1, we get the isomorphisms 18.2.1.10.1. Via 4.3.5.4 and 18.2.1.9, this yields the other isomorphisms of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-modules. □

Notation 18.2.1.11. According to 5.1.1.2, we set $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat\leftarrow\mathfrak{X}^\sharp}:=\omega_{\mathfrak{X}^\sharp}\overset{\mathrm{r}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat})$ viewed as $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat},\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$-bimodule, where the symbol "r" means that to compute the tensor product we choose the right structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-module of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat}$. Following 18.2.1.10.3, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat\leftarrow\mathfrak{X}^\sharp}$ is canonically isomorphic to $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{O}_{\mathfrak{X}}(\mathfrak{D})$, which justifies the notation. We can also denote by $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\rightarrow\mathfrak{X}^\flat}:=\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$ considered as a $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp},\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})$-bimodule.

Definition 18.2.1.12. We denote by $\widetilde{\mathfrak{X}}^\sharp$ (resp. $\widetilde{\mathfrak{X}}^\flat$) the ringed $\mathcal{V}$-logarithmic formal scheme $(\mathfrak{X}^\sharp,\mathcal{B}_{\mathfrak{X}})$ (resp. $(\mathfrak{X}^\sharp,\mathcal{B}_{\mathfrak{X}})$), and by $\tilde{u}\colon\widetilde{\mathfrak{X}}^\sharp\to\widetilde{\mathfrak{X}}^\flat$ the induced morphism of ringed $\mathcal{V}$-logarithmic formal schemes by the diagram. Similarly to 5.1.3.1 (we had not considered the "algebraic version" of pushforwards on formal schemes), for any $\mathcal{E}\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M}\in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we define respectively the *direct image* by $\widetilde{u}$ of $\mathcal{E}$ and $\mathcal{M}$ by setting:

$$\widetilde{u}^{(m)}_{+}(\mathcal{E}):=\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat\leftarrow\mathfrak{X}^\sharp}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}}\mathcal{E}\xrightarrow{\sim}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{O}_{\mathfrak{X}}(\mathfrak{D}))\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}}\mathcal{E},$$
$$\widetilde{u}^{(m)}_{+}(\mathcal{M}):=\mathcal{M}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp\rightarrow\mathfrak{X}^\flat}=\mathcal{M}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}. \tag{18.2.1.12.1}$$

18.2.1.13. By reversing the roles of $\mathfrak{D}$ and $\mathfrak{Z}^\flat$, we define similarly to 18.2.1.7.1 and 18.2.1.8 the left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-modules $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)$ for any $n\in\mathbb{Z}$. In fact, by an easy computation, we can check that $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)$ is a left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-submodule of $j_*\mathcal{O}_{\mathfrak{Y}}$. Let $\mathcal{E}^\sharp$ be a left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module.

By applying $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}-$ to the canonical map of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-modules $\mathcal{E}^\sharp\to\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}\mathcal{E}^\sharp$, we get the morphism of of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-modules $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^\sharp\to\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}\mathcal{E}^\sharp)$. This yields by extension the morphism of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-modules

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^\sharp)\to\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}\mathcal{E}^\sharp). \tag{18.2.1.13.1}$$

This morphism is an isomorphism. Indeed, we construct an inverse map as follows. Using 18.2.1.13.1 for $-n$ and with $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^\sharp$ instead of $\mathcal{E}^\sharp$ we get the morphism:

$$\begin{aligned}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}\mathcal{E}^\sharp&\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{O}_{\mathfrak{X}}(-n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^\sharp)\\ &\underset{18.2.1.13.1}{\longrightarrow}\mathcal{O}_{\mathfrak{X}}(-n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\left(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^\sharp)\right).\end{aligned} \tag{18.2.1.13.2}$$

By applying $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}-$ to 18.2.1.13.2 we get the morphism

$$\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}\mathcal{E}^\sharp)\to\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^\sharp). \tag{18.2.1.13.3}$$

The morphism 18.2.1.13.3 is an inverse of 18.2.1.13.1 and we are done.

SImilarly, for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we construct the canonical isomorphisms:

$$\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} (\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\sharp) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{E}^\sharp), \tag{18.2.1.13.4}$$

$$(\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{M}^\sharp) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} (\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}). \tag{18.2.1.13.5}$$

Proposition 18.2.1.14. *For any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have the canonical isomorphisms:*

$$\widetilde{u}^{(m)}_+(\mathcal{M}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat} \xrightarrow{\sim} \widetilde{u}^{(m)}_+(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}), \qquad \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{u}^{(m)}_+(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^{(m)}_+(\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}). \tag{18.2.1.14.1}$$

Moreover, if $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$ (resp. $\mathcal{M} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$) then $\widetilde{u}^{(m)}_+(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})$ (resp. $\widetilde{u}^{(m)}_+(\mathcal{M}) \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})$).

Proof. We construct the left isomorphism of 18.2.1.14.1 as follows:

$$\widetilde{u}^{(m)}_+(\mathcal{M}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat} \underset{4.2.4.3}{\xrightarrow{\sim}} \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}) \underset{4.3.5.6.1}{\xrightarrow{\sim}} (\omega_{\mathfrak{X}^\sharp} \overset{\mathrm{l}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat})) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} (\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp})$$
$$\underset{4.2.5.6.3}{\xrightarrow{\sim}} (\omega_{\mathfrak{X}^\sharp} \overset{\mathrm{r}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat})) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} (\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}) = \widetilde{u}^{(m)}_+(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}),$$

The symbol "l" and "r" meaning respectively that to compute the tensor product we choose the left and right structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-module of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}$. This yields by passage from right to left (i.e., via the equivalences of categories of 4.3.5.5) the right isomorphism of 18.2.1.14.1. Concerning the the preservation of the perfectness, The case of right modules is straightforward. As equivalence of categories between left and right modules of the form 4.3.5.7 are exact and preserve the local projectivity of finite type, then they also preserve perfect complexes. Hence, the left case is then a consequence of 18.2.1.14.1. □

Definition 18.2.1.15. For any $* \in \{\mathrm{l}, \mathrm{r}\}$, we define the dual functors $\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp} \colon D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}) \to D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$ as follows. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$. Similarly to 5.1.4.1 (we are working with formal schemes), we define *the $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-linear duals* of $\mathcal{E}$ and of $\mathcal{M}$ by setting

$$\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\mathcal{E}) = \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{E}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}[d_X], \qquad \mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\mathcal{M}) = \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{M}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})[d_X].$$

We also consider the $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-linear duals: $\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\flat} \colon D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}) \to D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})$.

18.2.1.16. Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$. Similarly to 5.1.4.4, we have the biduality isomorphism: $\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp} \circ \mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}$ (similarly for $\mathcal{M}$). Similarly to 5.1.4.3, we get the isomorphisms: $\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\mathcal{E})$ and $\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}) \xrightarrow{\sim} \mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\mathcal{M}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}$.

18.2.1.17. It follows from 18.2.1.9 that for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}, \mathcal{M}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{E}, \mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}), \tag{18.2.1.17.1}$$

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}, \mathcal{E}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{M}, \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}). \tag{18.2.1.17.2}$$

Definition 18.2.1.18. For any $* \in \{\mathrm{l}, \mathrm{r}\}$, we define the *extraordinary direct image* by $\widetilde{u}$ the functor $\widetilde{u}^{(m)}_! \colon \widetilde{u}^{(m)}_! \colon D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}) \to D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})$ by setting

$$\widetilde{u}^{(m)}_! := \mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\flat} \circ \widetilde{u}^{(m)}_+ \circ \mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}.$$

Proposition 18.2.1.19. *For any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have the canonical isomorphisms*

$$\widetilde{u}^{(m)}_!(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}) \xrightarrow{\sim} \widetilde{u}^{(m)}_!(\mathcal{M}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}, \qquad \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{u}^{(m)}_!(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^{(m)}_!(\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}). \tag{18.2.1.19.1}$$

Proof. This comes by composition from 18.2.1.14 and 18.2.1.16. □

Proposition 18.2.1.20. *For any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have the canonical isomorphisms:*

$$\widetilde{u}^{(m)}_{!}(\mathcal{E}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{E},\ \widetilde{u}^{(m)}_{!}(\mathcal{M}) \xrightarrow{\sim} \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} (\mathcal{O}_{\mathfrak{X}}(-\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}). \tag{18.2.1.20.1}$$

Proof. Set $\mathcal{F} := \mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\sharp}(\mathcal{E})$. By definition, $\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\flat} \circ \widetilde{u}^{(m)}_{+}(\mathcal{F}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}}((\omega_{\mathfrak{X}^\sharp} \overset{\mathrm{r}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat})) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat})[d]$, the symbol "r" meaning that to compute the internal tensor product we choose the right structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-module of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}$. Via the transposition isomorphism $\beta_{\widetilde{\mathfrak{X}}^\flat} : \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}$ (see 4.2.5.6.3), we get the isomorphisms of $(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$-bimodules:

$$\omega_{\mathfrak{X}^\sharp} \overset{\mathrm{r}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}) \underset{\beta_{\widetilde{\mathfrak{X}}^\flat}}{\xrightarrow{\sim}} \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}, \tag{18.2.1.20.2}$$

where the structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-module (resp. left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module) of the right term is the twisted structure induced by the right $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$-module (resp. the left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-module) structure of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$. Hence, we get:

$$\begin{aligned}
&\mathbb{D}^{(m)}_{\widetilde{\mathfrak{X}}^\flat} \circ \widetilde{u}^{(m)}_{+}(\mathcal{F}) \overset{\beta_{\widetilde{\mathfrak{X}}^\flat}}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}}((\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat})[d].\\
&\underset{18.2.1.17.2}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}}((\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}) \overset{\mathrm{l}}{\otimes}{}^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{F}, \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\flat})[d] \underset{4.2.5.6.2}{\xrightarrow{\sim}}\\
&\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}}((\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}) \overset{\mathrm{l}}{\otimes}{}^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})[d] \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}((\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}) \overset{\mathrm{l}}{\otimes}{}^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})[d] \underset{4.2.5.6.1}{\xrightarrow{\sim}}\\
&\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat})[d] \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})[d]\\
&\underset{18.2.3.6.1}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{F}, (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp})_{\mathrm{r}})[d]\\
&\underset{4.2.5.6.1}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{F}, (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp})_{\mathrm{l}})[d] \underset{4.6.6.4}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathbb{D}_{\mathfrak{X}^\sharp}(\mathcal{F}).
\end{aligned} \tag{18.2.1.20.3}$$

where the second isomorphism is 18.2.1.17.2 used in the case where $\sharp = \flat$, where the symbol "r" (resp. "l") means that to compute $\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}$ we choose the right (resp. left) structure of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}$. Since by biduality $\mathbb{D}_{\mathfrak{X}^\sharp}(\mathcal{F}) \xrightarrow{\sim} \mathcal{E}$ (see 18.2.1.16), then we get the first isomorphism of 18.2.1.20.1. In order to establish the second one, we can suppose $\mathcal{M} = \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$. We get:

$$\begin{aligned}
&u_{!}(\mathcal{M}) \underset{18.2.1.19.1}{\xrightarrow{\sim}} \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} u_{!}(\mathcal{E}) \underset{18.2.1.20.1}{\xrightarrow{\sim}} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{E} \underset{\delta}{\xrightarrow{\sim}} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}) \overset{\mathrm{l}}{\otimes}{}^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{E}\\
&\underset{4.3.5.6.1}{\xrightarrow{\sim}} (\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} ((\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}) \overset{\mathrm{l}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \omega^{-1}_{\mathfrak{X}^\sharp}) \underset{18.2.1.10.2}{\xrightarrow{\sim}} \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} (\mathcal{O}_{\mathfrak{X}}(-\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}).
\end{aligned}$$

□

The following proposition means that the relative duality isomorphism of the canonical morphism $\mathfrak{X}^\sharp \to \mathfrak{X}^\flat$ necessity of use a twist (see 18.2.1.21).

Proposition 18.2.1.21. *For any $* \in \{\mathrm{l}, \mathrm{r}\}$, for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have the canonical isomorphism:*

$$\widetilde{u}^{(m)}_{+}(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^{(m)}_{!}(\mathcal{E}(\mathfrak{D})). \tag{18.2.1.21.1}$$

Proof. With 18.2.1.14.1 and 18.2.1.19.1, it is sufficient to treat the left case (i.e. $* = l$). Let $\mathcal{P}^\flat$ be a resolution of $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$ by flat $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-bimodule and $\mathcal{P}^\sharp$ be a resolution of $\mathcal{E}$ by flat left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}$-modules. Hence we have isomorphisms:

$$\begin{aligned}
&(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \xleftarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^\sharp) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{P}^\flat \overset{4.5.3.8.1}{\xrightarrow{\sim}} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^\flat) \overset{\mathrm{l}}{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{P}^\sharp\\
&\xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}) \overset{\mathrm{l}}{\otimes}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{P}^\sharp \underset{4.2.5.6.1}{\xrightarrow{\sim}} \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{P}^\sharp) \xrightarrow{\sim} \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} (\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}} \mathcal{E}).
\end{aligned}$$

With 18.2.1.12.1, 18.2.1.20, we get therefore $\widetilde{u}_{+}^{(m)}(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{u}_{!}^{(m)}(\mathcal{E})$. By applying to it the functor $- \otimes_{\mathcal{O}_{\mathfrak{X}}} \omega_{\mathfrak{X}^\flat}^{-1}$, via 18.2.1.10.2, 18.2.1.14.1 this yields the isomorphism: $\widetilde{u}_{+}^{(m)}(\mathcal{E}(-\mathfrak{D})) \xrightarrow{\sim} \widetilde{u}_{!}^{(m)}(\mathcal{E})$. □

Corollary 18.2.1.22. *For any $* \in \{\mathrm{l}, \mathrm{r}\}$, for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have the canonical isomorphism:*

$$\widetilde{u}_{+}^{(m)}(\mathcal{E}(\mathfrak{Z}^\flat)) \xrightarrow{\sim} (\widetilde{u}_{+}^{(m)}(\mathcal{E}))(\mathfrak{Z}^\flat), \qquad \widetilde{u}_{!}^{(m)}(\mathcal{E}(\mathfrak{Z}^\flat)) \xrightarrow{\sim} (\widetilde{u}_{!}^{(m)}(\mathcal{E}))(\mathfrak{Z}^\flat). \tag{18.2.1.22.1}$$

Proof. This is a consequence of 18.2.1.13.4, 18.2.1.13.5, 18.2.1.20 and 18.2.1.21. □

18.2.1.23. Using 18.2.1.12.1, 18.2.1.20 and 18.2.1.21, for any $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we get the isomorphism

$$(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(\mathfrak{Z})) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \mathcal{E} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} (\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}),$$
$$(\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(-\mathfrak{Z})) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \xrightarrow{\sim} \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} (\mathcal{O}_{\mathfrak{X}}(-\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}).$$

Proposition 18.2.1.24. *We suppose $\mathcal{B}_{\mathfrak{X}}$ is $\mathcal{O}_{\mathfrak{X}}$-flat. Let $\mathcal{E}$ be a left coherent $\widetilde{\mathcal{D}}^{(0)}_{\mathfrak{X}^\sharp}$-module which is coherent and flat on $\mathcal{B}_{\mathfrak{X}}$. For any $l \neq 0$,*

$$H^l(\widetilde{u}_{+}^{(m)}(\mathcal{E})) = 0, \qquad H^l(\widetilde{u}_{!}^{(m)}(\mathcal{E})) = 0. \tag{18.2.1.24.1}$$

Proof. For any $l \neq 0$, the equality $H^l(\widetilde{u}_{!}^{(m)}(\mathcal{E})) = 0$ follows from 18.2.1.20 and 18.2.1.4. Moreover, $\widetilde{u}_{+}^{(m)}(\mathcal{E}) \underset{18.2.1.21.1}{\xrightarrow{\sim}} \widetilde{u}_{!}^{(m)}(\mathcal{E}(\mathfrak{D})) \underset{18.2.1.20}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{\mathfrak{X}^\sharp}} (\mathcal{E}(\mathfrak{D}))$. Since $\mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})$ is a flat $\mathcal{B}_{\mathfrak{X}}$-module, since $\mathcal{E}(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\sim} \mathcal{B}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{E}$, then $\mathcal{E}(n\mathfrak{D})$ is a flat $\mathcal{B}_{\mathfrak{X}}$-module. Hence, we conclude using 18.2.1.4. □

18.2.2 Preliminaries on complete level m context

We keep notation 18.2.1 and we suppose $\mathcal{B}_{\mathfrak{X}}$ be an $\mathcal{O}_{\mathfrak{X}}$-algebra commutative satisfying the hypotheses of 7.5.3. We set $\mathcal{D}_\sharp := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp}$, $\widehat{\mathcal{D}}_\sharp := \mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp}$, $\mathcal{D}_\flat := \mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\flat}$, $\widehat{\mathcal{D}}_\flat := \mathcal{B}_{\mathfrak{X}} \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\flat}$, which are coherent sheaves of rings (see 7.5.1.3). By p-adic completion, we get from the ring homomorphism $\mathcal{D}_\sharp \to \mathcal{D}_\flat$, the ring homomorphism $\widehat{\mathcal{D}}_\sharp \to \widehat{\mathcal{D}}_\flat$.

The purpose of this subsection is mainly to prove 18.2.2.4.2 which will be used to check later 18.2.3.5.2, a key ingredient in the proof of 18.2.3.11.

18.2.2.1. Since $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{D})$ is a coherent $\mathcal{O}_{\mathfrak{X}}$-module then it is p-adically complete and therefore endowed with a structure of $\widehat{\mathcal{D}}_\sharp$-module extending its structure of $\mathcal{D}$-module. Moreover, the canonical morphism $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D} \to \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}_\sharp$ is an isomorphism. Hence, $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}_\sharp$ is endowed with a structure of $\widehat{\mathcal{D}}_\sharp$-bimodule extending canonically its structure of $\mathcal{D}$-bimodule. Similarly, $\widehat{\mathcal{D}}_\sharp \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D})$ is endowed with a canonical structure of $\widehat{\mathcal{D}}_\sharp$-bimodule. By p-adic completion of the transposition isomorphism of 4.2.5.1.1, we get $\widehat{\gamma}_{\mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})} \colon \widehat{\mathcal{D}}_\sharp \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}_\sharp$. This yields a $\widehat{\mathcal{D}}_\sharp$-bimodule by setting $\widehat{\mathcal{D}}_\sharp(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}_\sharp$.

Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\widehat{\mathcal{D}}_\sharp$-module and $n \in \mathbb{Z}$. Using 4.2.4.3, we compute that the canonical isomorphisms $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\sim} \widehat{\mathcal{D}}_\sharp(n\mathfrak{D}) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}$ and $\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \xrightarrow{\sim} \mathcal{M} \otimes_{\widehat{\mathcal{D}}_\sharp} (\widehat{\mathcal{D}}_\sharp \otimes_{\mathcal{B}_{\mathfrak{X}}} \mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})) \overset{\widehat{\gamma}_{\mathcal{B}_{\mathfrak{X}}(n\mathfrak{D})}}{\xrightarrow{\sim}} \mathcal{M} \otimes_{\widehat{\mathcal{D}}_\sharp} \widehat{\mathcal{D}}_\sharp(n\mathfrak{D})$ are $\mathcal{D}$-linear. Hence, $\mathcal{E}(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$ (resp. $\mathcal{M}(n\mathfrak{D}) := \mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D})$) is canonically endowed with a structure of left (resp. right) $\widehat{\mathcal{D}}_\sharp$-module extending its structure of left (resp. right) $\mathcal{D}_\sharp$-module. Similarly to 18.2.1.8.1, we get the isomorphisms:

$$\mathcal{M}(n\mathfrak{D}) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E} \xrightarrow{\sim} \mathcal{M} \otimes_{\widehat{\mathcal{D}}_\sharp} \widehat{\mathcal{D}}_\sharp(n\mathfrak{D}) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E} \xrightarrow{\sim} \mathcal{M} \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}(n\mathfrak{D}). \tag{18.2.2.1.1}$$

18.2.2.2. We keep notation 18.2.2.1.

(a) Since $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp$ is p-adically complete, then they are endowed with a structure of right $\widehat{\mathcal{D}}_\sharp$-bimodule extending there structure of right $\mathcal{D}$-modules.

(b) It follows from 4.2.4.3 that if $\mathcal{E}$ is a left $\widehat{\mathcal{D}}_\sharp$-module, then $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}$ is endowed with a structure of right $\widehat{\mathcal{D}}_\sharp$-module extending canonically its structure of right $\mathcal{D}$-module making $\widehat{\mathcal{D}}_\sharp$-linear the isomorphism:

$$\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E} \xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}. \tag{18.2.2.2.1}$$

(c) Via 4.2.4.4, if $\mathcal{M}$ is a right $\widehat{\mathcal{D}}_\sharp$-module, then $\mathcal{M} \otimes_{\mathcal{O}_\mathfrak{X}} \omega_{\mathfrak{X}^\flat}^{-1} = \mathcal{H}om_{\mathcal{O}_\mathfrak{X}}(\omega_{\mathfrak{X}^\flat}, \mathcal{M})$ is endowed with a structure of right $\widehat{\mathcal{D}}_\sharp$-module extending canonically its structure of left $\mathcal{D}$-module making $\widehat{\mathcal{D}}_\sharp$-linear the isomorphism:

$$\mathcal{H}om_{\mathcal{O}_\mathfrak{X}}(\omega_{\mathfrak{X}^\flat}, \mathcal{M}) \xrightarrow{\sim} \mathcal{H}om_{\widehat{\mathcal{D}}_\sharp}(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp, \mathcal{M}). \tag{18.2.2.2.2}$$

(d) Since $\omega_{\mathfrak{X}^\flat}$ is locally free (of rank one), the canonical $\mathcal{O}_\mathfrak{X}$-linear morphism, then we have the $\widehat{\mathcal{D}}_\sharp$-linear isomorphism

$$\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{H}om_{\mathcal{O}_\mathfrak{X}}(\omega_{\mathfrak{X}^\flat}, \mathcal{M}) \xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{H}om_{\widehat{\mathcal{D}}_\sharp}(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp, \mathcal{M}) \xrightarrow{\sim} \mathcal{M}, \tag{18.2.2.2.3}$$

where the last isomorphism is the evaluation one. We have the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear isomorphism:

$$\mathcal{E} \xrightarrow{\sim} \mathcal{H}om_{\widehat{\mathcal{D}}_\sharp}(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp, \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_\mathfrak{X}}(\omega_{\mathfrak{X}^\flat}, \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}). \tag{18.2.2.2.4}$$

(e) Similarly to 4.3.5.6, this yields that for any left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\mathcal{E}$ (resp. $\mathcal{M}$), we have the following isomorphism of $\mathcal{O}_S$-modules:

$$\mathcal{M} \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E} \xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}) \otimes_{\widehat{\mathcal{D}}_\sharp} (\mathcal{M} \otimes_{\mathcal{O}_\mathfrak{X}} \omega_{\mathfrak{X}^\flat}^{-1}). \tag{18.2.2.2.5}$$

(f) As for 4.3.5.7, using the above results, we can check that the functors $- \otimes_{\mathcal{O}_\mathfrak{X}} \omega_{\mathfrak{X}^\flat}^{-1} = \mathcal{H}om_{\mathcal{O}_\mathfrak{X}}(\omega_{\mathfrak{X}^\flat}, -)$ and $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} -$ induce quasi-inverse equivalences between the category of (resp. coherent, resp. flat, resp. locally projective of finite type) left $\widehat{\mathcal{D}}_\sharp$-modules and that of (resp. coherent, resp. flat, resp. locally projective of finite type) right $\widehat{\mathcal{D}}_\sharp$-modules. These equivalences extends to complexes.

Lemma 18.2.2.3. *Let $\mathcal{E}$ be a left $\widehat{\mathcal{D}}_\sharp$-module and $\mathcal{M}$ be a right $\widehat{\mathcal{D}}_\sharp$-module. Via the structure of $\widehat{\mathcal{D}}_\sharp$-modules defined at 18.2.2.2 and 7.5.1.13, we have the following canonical isomorphisms of $\widehat{\mathcal{D}}_\sharp$-modules:*

$$\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}, \qquad \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}(-\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}, \tag{18.2.2.3.1}$$

$$\mathcal{E}(\mathfrak{D}) \xrightarrow{\sim} (\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}) \otimes_{\mathcal{O}_\mathfrak{X}} \omega_{\mathfrak{X}^\flat}^{-1}, \qquad \mathcal{E}(-\mathfrak{D}) \xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}) \otimes_{\mathcal{O}_\mathfrak{X}} \omega_{\mathfrak{X}^\sharp}^{-1}, \tag{18.2.2.3.2}$$

$$\mathcal{M}(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_\mathfrak{X}} (\mathcal{M} \otimes_{\mathcal{O}_\mathfrak{X}} \omega_{\mathfrak{X}^\flat}^{-1}), \qquad \mathcal{M}(-\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} (\mathcal{M} \otimes_{\mathcal{O}_\mathfrak{X}} \omega_{\mathfrak{X}^\sharp}^{-1}). \tag{18.2.2.3.3}$$

Proof. It follows by functoriality from 18.2.1.10.1, that we have the canonical isomorphism of right $\mathcal{D}$-bimodules $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp$. Since they are p-adically complete, then this is in fact an isomorphism of right $\widehat{\mathcal{D}}_\sharp$-bimodules. Hence, we get the third isomorphism:

$$\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}(\mathfrak{D}) \underset{\sim}{\overset{18.2.2.2.1}{\longrightarrow}} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp) \otimes_{\widehat{\mathcal{D}}_\sharp} (\widehat{\mathcal{D}}_\sharp(\mathfrak{D}) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E})$$
$$\xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp(\mathfrak{D})) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E} \xrightarrow{\sim} (\omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_\mathfrak{X}} \widehat{\mathcal{D}}_\sharp) \otimes_{\widehat{\mathcal{D}}_\sharp} \mathcal{E} \underset{\sim}{\overset{7.5.1.13}{\longrightarrow}} \omega_{\mathfrak{X}^\sharp} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{E}.$$

We get the other isomorphisms by using 18.2.2.2 and 7.5.1.13. □

18.2.2.4. Let $\mathcal{E}^\sharp \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}_\sharp)$ and $\mathcal{F}^\flat \in D({}^{\mathrm{l}}\widehat{\mathcal{D}}_\flat)$. Using 18.2.2.2.(f), by applying $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{B}_\mathfrak{X}} -$ to the morphism $\mathcal{E}^\sharp \to \widehat{\mathcal{D}}_\flat \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}^\sharp$ of $D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\widehat{\mathcal{D}}_\sharp)$, we get the morphism of $D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{r}}\widehat{\mathcal{D}}_\sharp)$: $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{B}_\mathfrak{X}} \mathcal{E}^\sharp \to \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{B}_\mathfrak{X}} (\widehat{\mathcal{D}}_\flat \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}^\sharp)$. This yields by extension the homomorphism of coherent right $\widehat{\mathcal{D}}_\flat$-modules :

$$(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{B}_\mathfrak{X}} \mathcal{E}^\sharp) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_\sharp} \widehat{\mathcal{D}}_\flat \to \omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{B}_\mathfrak{X}} (\widehat{\mathcal{D}}_\flat \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}^\sharp). \tag{18.2.2.4.1}$$

Following 4.5.3.8.2, this map is isomorphism modulo $\mathfrak{m}^{i+1}$. Since the complexes are coherent and therefore quasi-coherent, then 18.2.2.4.1 is an isomorphism. Using 7.5.1.13.7 instead of 4.3.5.10.1, similarly to 4.5.3.8.1 we get from 18.2.2.4.1 the isomorphism:

$$(\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\sharp) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_\sharp} \mathcal{F}^\flat \xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{F}^\flat) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}_\sharp} \mathcal{E}^\sharp. \tag{18.2.2.4.2}$$

18.2.3 Holonomicity and acyclicity of the image by u_+ and $u_!$ of overconvergent log isocrystals

Let T be a divisor of X. Applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ to the ring homomorphism $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T) \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\flat}(T)$ (see 18.2.2), we get the ring homomorphism $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}$.

Theorem 18.2.3.1. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is a locally projective $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module of finite type. The canonical morphism*

$$\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} \to \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} \tag{18.2.3.1.1}$$

is an isomorphism.

Proof. Since $\mathcal{E}$ be a left coherent $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module, then according to 18.2.1.6 the canonical morphism

$$\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}_{\mathfrak{X}^\sharp,\mathbb{Q}}} \mathcal{E} \to \mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp,\mathbb{Q}}} \mathcal{E} \tag{18.2.3.1.2}$$

is an isomorphism. Since the extensions $\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}$, $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$ are flat, this yields that the canonical morphism

$$\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} (\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}) \to \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} (\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}) \tag{18.2.3.1.3}$$

is an isomorphism. We conclude via 11.2.1.9.2. □

18.2.3.2. Tensoring with $\mathbb{Q}$ and passing to the inductive limit on the level, we get from 18.2.2.1 the following properties: $\mathcal{O}_{\mathfrak{X}}(n\mathfrak{D})$ is endowed with a structure of $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module extending its structure of $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module. The transposition isomorphism of 18.2.2.1 induces the isomorphism of $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-bimodule of the form: $\gamma\colon \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$. We get a $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-bimodule by setting $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$.

Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module and $n \in \mathbb{Z}$. The sheaves $\mathcal{E}(n\mathfrak{D}) := \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$ (resp. $\mathcal{M}(n\mathfrak{D}) := \mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{D})$) is canonically endowed with a structure of left (resp. right) $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module extending its structure of left (resp. right) $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module. Similarly to 18.2.1.8.1, we get the isomorphisms:

$$\mathcal{M}(n\mathfrak{D}) \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} \xrightarrow{\sim} \mathcal{M} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}(n\mathfrak{D}) \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} \xrightarrow{\sim} \mathcal{M} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}(n\mathfrak{D}). \tag{18.2.3.2.1}$$

Let $\mathcal{M} \in D^-({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, $\mathcal{F} \in D^-({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$. By taking flat resolutions of $\mathcal{M}$ and $\mathcal{F}$, we construct from 18.2.3.2.1 the canonical isomorphism:

$$\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} (\mathcal{O}_{\mathfrak{X},\mathbb{Q}}(\mathfrak{Z}) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{F}) \xrightarrow{\sim} (\mathcal{M} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{O}_{\mathfrak{X},\mathbb{Q}}(\mathfrak{Z})) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{F}. \tag{18.2.3.2.2}$$

18.2.3.3. We keep notation 18.2.3.2.

(a) Tensoring with $\mathbb{Q}$ and passing to the inductive limit on the level, we get from 18.2.2.2 that $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$ is endowed with a structure of right $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-bimodule extending there structure of right $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules.

(b) It follows from 4.2.4.3 that if $\mathcal{E}$ is a left $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module, then $\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$ is endowed with a structure of right $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module extending canonically its structure of right $\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module making $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-linear the isomorphism:

$$\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}) \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}. \tag{18.2.3.3.1}$$

(c) Via 4.2.4.4, if $\mathcal{M}$ is a right $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-module, then $\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^{\flat}} = \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^{\flat}},\mathcal{M})$ is endowed with a structure of right $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-module extending canonically its structure of left $\mathcal{D}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-module making $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-linear the isomorphism:

$$\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^{\flat}},\mathcal{M}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}(\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}},\mathcal{M}). \tag{18.2.3.3.2}$$

(d) Since $\omega_{\mathfrak{X}^{\flat}}$ is locally free (of rank one), the canonical $\mathcal{O}_{\mathfrak{X}}$-linear morphism, then we have the $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-linear isomorphism

$$\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^{\flat}},\mathcal{M}) \xrightarrow{\sim} (\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}(\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}},\mathcal{M}) \xrightarrow{\sim} \mathcal{M}, \tag{18.2.3.3.3}$$

where the last isomorphism is the evaluation one. We have the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/S^{\sharp}}$-linear isomorphism:

$$\mathcal{E} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}(\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}},\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{E}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^{\flat}},\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}). \tag{18.2.3.3.4}$$

(e) Similarly to 4.3.5.6, this yields that for any left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/S^{\sharp}}$-module $\mathcal{E}$ (resp. $\mathcal{M}$), we have the following isomorphism of $\mathcal{O}_S$-modules:

$$\mathcal{M}\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{E} \xrightarrow{\sim} (\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E})\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}(\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^{\flat}}). \tag{18.2.3.3.5}$$

(f) As for 4.3.5.7, using the above results, we can check that the functors $-\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^{\flat}} = \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(\omega_{\mathfrak{X}^{\flat}},-)$ and $\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_X}-$ induce quasi-inverse equivalences between the category of (resp. coherent, resp. flat, resp. locally projective of finite type) left $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules and that of (resp. coherent, resp. flat, resp. locally projective of finite type) right $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules. These equivalences extends to complexes.

Lemma 18.2.3.4. *Let $\mathcal{E}$ be a left $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-module and $\mathcal{M}$ be a right $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-module. Via the structure of $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules defined at 18.2.3.3 and 8.7.2.2, we have the following canonical isomorphisms of $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-modules:*

$$\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}, \qquad \omega_{\mathfrak{X}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}(-\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}, \tag{18.2.3.4.1}$$

$$\mathcal{E}(\mathfrak{D}) \xrightarrow{\sim} (\omega_{\mathfrak{X}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E})\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^{\flat}}, \qquad \mathcal{E}(-\mathfrak{D}) \xrightarrow{\sim} (\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E})\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^{\sharp}}, \tag{18.2.3.4.2}$$

$$\mathcal{M}(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}(\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^{\flat}}), \qquad \mathcal{M}(-\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}(\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^{\sharp}}). \tag{18.2.3.4.3}$$

Proof. It follows by functoriality from 18.2.1.10.1, that we have the canonical isomorphism of right $\mathcal{D}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-bimodules $\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}(\mathfrak{D}) \xrightarrow{\sim} \omega_{\mathfrak{X}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$. Since they are p-adically complete, then this is in fact an isomorphism of right $\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}$-bimodules. Hence, we get the third isomorphism:

$$\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}(\mathfrak{D}) \overset{18.2.2.2.1}{\xrightarrow{\sim}} (\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}(\mathfrak{D})\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{E})$$

$$\xrightarrow{\sim} (\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}(\mathfrak{D}))\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{E} \xrightarrow{\sim} (\omega_{\mathfrak{X}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})\otimes_{\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}}}\mathcal{E} \overset{7.5.1.13}{\xrightarrow{\sim}} \omega_{\mathfrak{X}^{\sharp}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}.$$

We get the other isomorphisms by using 18.2.2.2 and 7.5.1.13. □

18.2.3.5. Let $\mathcal{E}^{\sharp} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\sharp}}({}^{\dagger}T)_{\mathbb{Q}})$. Let $\lambda_0\colon \mathbb{N}\to\mathbb{N}$ an increasing map such that $p^{\lambda_0(0)} \geq e/(p-1)$ (see 1.2.4.2) and $\lambda_0(m) \geq m$, for any $m\in\mathbb{N}$. Let $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}}(T)$, $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}}(T) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^{\sharp}}$. It follows from the equivalence 8.7.5.4.1, that there exists $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}(T))$ such that $\underrightarrow{l}^{*}_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}$. By definition (see 8.4.1.1), we can suppose there exists $\lambda \in L(\mathbb{N})$ large enough such that $\mathcal{E}^{(\bullet)} \in D^{\mathrm{b}}_{\mathrm{coh}}(\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}(T))$. Let $\mathcal{F}^{(\bullet)} \in D^{\mathrm{b}}({}^{\mathrm{l}}\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\flat}/\mathfrak{S}}(T),{}^{\mathrm{r}}\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\flat}/\mathfrak{S}}(T))$ and $\mathcal{F}^{\flat} := \underrightarrow{l}^{*}_{\mathbb{Q}}({}^{\mathrm{l}}\mathcal{F}^{(\bullet)}) \in D^{\mathrm{b}}(\mathcal{D}^{\dagger}_{\mathfrak{X}^{\flat}}({}^{\dagger}T)_{\mathbb{Q}},{}^{\mathrm{r}}\mathcal{D}^{\dagger}_{\mathfrak{X}^{\flat}}({}^{\dagger}T)_{\mathbb{Q}})$. It follows from 18.2.2.4.2 that we have the canonical isomorphism of $D^{\mathrm{b}}({}^{\mathrm{r}}\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\flat}/\mathfrak{S}}(T))$:

$$(\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)})\otimes^{\mathbb{L}}_{\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}(T)}\mathcal{F}^{(\bullet)} \xrightarrow{\sim} (\omega_{\mathfrak{X}^{\flat}}\otimes_{\mathcal{B}_{\mathfrak{X}}}\mathcal{F}^{(\bullet)})\otimes^{\mathbb{L}}_{\lambda^{*}\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}/\mathfrak{S}}(T)}\mathcal{E}^{(\bullet)}). \tag{18.2.3.5.1}$$

By applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ this yields the isomorphism of $D^{\mathrm{b}}({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}})$:

$$(\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^\sharp)\otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}\mathcal{F}^\flat \xrightarrow{\sim} (\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{F}^\flat)\otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}\mathcal{E}^\sharp). \tag{18.2.3.5.2}$$

18.2.3.6. It follows from 18.2.3.3 that for any $\mathcal{E}\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, $\mathcal{M}\in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E},\mathcal{M}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{E},\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat}), \tag{18.2.3.6.1}$$

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat},\mathcal{E}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}}(\mathcal{M},\omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}). \tag{18.2.3.6.2}$$

Definition 18.2.3.7. Let $*\in\{\mathrm{l},\mathrm{r}\}$. The pushforward by u with coefficients in $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ of finite level (as in 18.2.1.12) is denoted by $u^{\mathrm{alg}}_{T,+}\colon D^-({}^*\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})\to D^-({}^*\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}})$. This later functor do not have to be confound with the usual pushforward $u_{T,+}\colon D^-({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})\to D^-({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}})$ (see 9.2.4.14), which is defined by setting for any $\mathcal{F}\in D^-({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, $\mathcal{M}\in D^-({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$,

$$u_{T,+}(\mathcal{F}) := \mathcal{D}^\dagger_{\mathfrak{X}^\flat\leftarrow\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}\otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}\mathcal{F}, \qquad u_{T,+}(\mathcal{M}) := \mathcal{M}\otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp\to\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}},$$

where $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp\to\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} := \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}$ as $(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}},\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}})$-bimodule and where $\mathcal{D}^\dagger_{\mathfrak{X}^\flat\leftarrow\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$ is the $(\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}},\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$-bimodule

$$\mathcal{D}^\dagger_{\mathfrak{X}^\flat\leftarrow\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}} := \omega_{\mathfrak{X}^\sharp}\overset{\mathrm{r}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat}) \underset{18.2.3.4.3}{\xrightarrow{\sim}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) \underset{18.2.3.2}{\xrightarrow{\sim}} \mathcal{O}_{\mathfrak{X}}(\mathfrak{D})\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}.$$

Concerning the dual functors, we keep notation 9.2.4.22.1 and 9.2.4.22.2.

This yields the extraordinary pushforward by u with coefficients in $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$ of finite level or not: $u^{\mathrm{alg}}_{T,!}\colon D^-({}^*\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})\to D^-({}^*\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}})$ and $u_{T,!}\colon D^-({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})\to D^-({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}})$ by setting $u^{\mathrm{alg}}_{T,!} = \mathbb{D}^{\mathrm{alg}}_{\mathfrak{X}^\flat,T}\circ u^{\mathrm{alg}}_{T,+}\circ\mathbb{D}^{\mathrm{alg}}_{\mathfrak{X}^\sharp,T}$ and $u_{T,!}=\mathbb{D}_{\mathfrak{X}^\flat,T}\circ u_{T,+}\circ\mathbb{D}_{\mathfrak{X}^\sharp,T}$.

These functors preserves perfectness.

Proposition 18.2.3.8. *For any $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, $\mathcal{M}\in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, we have the canonical isomorphisms*

$$u_!(\mathcal{M}\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\sharp}) \xrightarrow{\sim} u_!(\mathcal{M})\otimes_{\mathcal{O}_{\mathfrak{X}}}\omega^{-1}_{\mathfrak{X}^\flat}, \qquad \omega_{\mathfrak{X}^\flat}\otimes_{\mathcal{O}_{\mathfrak{X}}}u_!(\mathcal{E}) \xrightarrow{\sim} u_!(\omega_{\mathfrak{X}^\sharp}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}). \tag{18.2.3.8.1}$$

Proof. Following 9.2.4.8.2 and 9.2.4.17 (resp. 9.2.4.20.3 and 9.2.4.22.(f)), we have such commutation isomorphisms for pushforward (duality). Hence, the proposition follows by composition. □

Proposition 18.2.3.9. *For any $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, $\mathcal{M}\in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, we have the canonical isomorphisms:*

$$u_!(\mathcal{E}) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}\otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}\mathcal{E},\ u_!(\mathcal{M}) \xrightarrow{\sim} \mathcal{M}\otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}(\mathcal{O}_{\mathfrak{X}}(-\mathfrak{D})\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}). \tag{18.2.3.9.1}$$

Proof. Using 8.7.2.4 (resp. 18.2.3.6.2, resp. 18.2.3.4) instead of 4.2.5.6 (resp. 18.2.1.17.2, resp. 18.2.1.10), we can copy the proof of 18.2.1.20. □

Lemma 18.2.3.10. *Let $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$ and $\mathcal{M}\in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$. We have the canonical isomorphisms:*

$$u^{\mathrm{alg}}_{T,+}(\mathcal{M})\otimes_{\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}}\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \xrightarrow{\sim} u_{T,+}(\mathcal{M}\otimes_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}), \tag{18.2.3.10.1}$$

$$\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}\otimes_{\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}}u^{\mathrm{alg}}_{T,+}(\mathcal{E}) \xrightarrow{\sim} u_{T,+}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}\otimes_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}}\mathcal{E}). \tag{18.2.3.10.2}$$

In the same way by replacing the direct image by the extraordinary direct image.

Proof. As the dual functor commutes with scalar extensions (see 4.6.4.4.1), then it is sufficient to treat the case of the direct image. The isomorphism 18.2.3.10.1 is straightforward. Setting $\mathcal{D}^{(m)}_{\mathfrak{X}^\flat}(T) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\flat}$, $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\flat}$, we have the canonical bijection

$$\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T)\otimes_{\mathcal{D}^{(m)}_{\mathfrak{X}^\flat}(T)}((\mathcal{D}^{(m)}_{\mathfrak{X}^\flat}(T)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{O}_{\mathfrak{X}}(\mathfrak{D})) \xrightarrow{\sim} (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T)\otimes_{\mathcal{O}_{\mathfrak{X}}}\mathcal{O}_{\mathfrak{X}}(\mathfrak{D})) \tag{18.2.3.10.3}$$

given by associativity of the tensor product. Since the source and the target are $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T)$-coherent, then they are p-adically complete. Hence, it follows from 4.2.4.3.1 by p-adic completion that 18.2.3.10.3 is an isomorphism of $(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T), \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(T))$-bimodules. Tensoring by $\mathbb{Q}$ and taking inductive limit on the level, this yields the isomorphism of $(\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q}, \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q})$-bimodules:

$$\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q}} ((\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{O}_\mathfrak{X}(\mathfrak{D})) \xrightarrow{\sim} (\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{O}_\mathfrak{X}(\mathfrak{D})) \tag{18.2.3.10.4}$$

The isomorphism 18.2.3.10.2 is built as follows:

$$\begin{aligned}\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q}} u^{\mathrm{alg}}_{T,+}(\mathcal{E}) &\xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q}} ((\mathcal{D}_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{O}_\mathfrak{X}(\mathfrak{D})) \otimes^\mathbb{L}_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E}) \\ &\xrightarrow[18.2.3.10.4]{\sim} (\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{O}_\mathfrak{X}(\mathfrak{D})) \otimes^\mathbb{L}_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E} \xrightarrow{\sim} \\ &\xrightarrow{\sim} (\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{O}_\mathfrak{X}} \mathcal{O}_\mathfrak{X}(\mathfrak{D})) \otimes^\mathbb{L}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q} \otimes^\mathbb{L}_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E} \xrightarrow{\sim} u_{T,+}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{D}_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E}).\end{aligned}$$

□

The following proposition means that the isomorphism of relative duality to the canonical morphism $\mathfrak{X}^\sharp \to \mathfrak{X}^\flat$ necessity of use a twist (see 18.2.3.11).

Proposition 18.2.3.11. *We have, for any $\mathcal{E} \in D^\mathrm{b}_\mathrm{perf}({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q})$, of the canonical isomorphism:*

$$u_+(\mathcal{E}) \xrightarrow{\sim} u_!(\mathcal{E}(\mathfrak{D})). \tag{18.2.3.11.1}$$

Proof. Using 9.2.4.8.2 and 9.2.4.17, 18.2.3.8, it is sufficient to treat the left case (i.e. $* = l$). Replacing 4.5.3.8.1 (resp. 4.2.5.6, 18.2.1.12.1, 18.2.1.20, 18.2.1.10.2) by 18.2.3.5.2 (resp. 8.7.2.4, 18.2.3.7, 18.2.3.9.1, 18.2.3.4), we can copy the proof of 18.2.1.21.1.

□

Corollary 18.2.3.12. *Let $\mathcal{E} \in D^\mathrm{b}_\mathrm{perf}(\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q})$. We have the canonical quasi-isomorphism:*

$$\Omega^\bullet_{\mathfrak{X}^\sharp/\mathfrak{T},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E} \xrightarrow{\sim} \Omega^\bullet_{\mathfrak{X}/\mathfrak{T},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} u_{T+}(\mathcal{E}). \tag{18.2.3.12.1}$$

Proof. It follows from 18.2.3.9 and 18.2.3.11 that we have the isomorphism:

$$u_{T,+}(\mathcal{E}) \xrightarrow{\sim} u_{T,!}(\mathcal{E}(\mathfrak{D})) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes^\mathbb{L}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E}(\mathfrak{D}). \tag{18.2.3.12.2}$$

We have isomorphisms:

$$\begin{aligned}\Omega^\bullet_{\mathfrak{X}^\sharp,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E} &\xrightarrow{\sim} (\Omega^\bullet_{\mathfrak{X}^\sharp,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}) \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E} \\ \xrightarrow[8.7.7.5.a)]{\sim} \omega_{\mathfrak{X}^\sharp,\mathbb{Q}}({}^\dagger T) \otimes^\mathbb{L}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E}[-d] &\xrightarrow[18.2.1.10.1]{\sim} (\omega_{\mathfrak{X},\mathbb{Q}}({}^\dagger T) \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{O}_{\mathfrak{X},\mathbb{Q}}(\mathfrak{Z})) \otimes^\mathbb{L}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E}[-d] \\ \xrightarrow[18.2.3.2.2]{\sim} \omega_{\mathfrak{X},\mathbb{Q}}({}^\dagger T) \otimes^\mathbb{L}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E}(\mathfrak{Z})[-d] &\xrightarrow[18.2.3.12.2]{\sim} \omega_{\mathfrak{X},\mathbb{Q}}({}^\dagger T) \otimes^\mathbb{L}_{\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger T)_\mathbb{Q}} u_{T,+}(\mathcal{E})[-d] \\ &\xrightarrow[8.7.7.5.a)]{\sim} \Omega^\bullet_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} u_{T,+}(\mathcal{E}).\end{aligned} \tag{18.2.3.12.3}$$

□

Theorem 18.2.3.13. *Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}$-module which is a locally projective $\mathcal{O}_\mathfrak{X}({}^\dagger T)_\mathbb{Q}$-module of finite type.*

(a) For any $l \neq 0$,

$$H^l(u_{T,+}(\mathcal{E})) = 0, \qquad H^l(u_{T,!}(\mathcal{E})) = 0. \tag{18.2.3.13.1}$$

(b) We have isomorphisms $u_{T,+}(\mathcal{E}) \xrightarrow{\sim} u_{T,!}(\mathcal{E}(\mathfrak{D})) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_\mathbb{Q} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_\mathbb{Q}} \mathcal{E}(\mathfrak{D})$.

(c) We have the canonical isomorphism:

$$\mathbb{D}_{\mathfrak{X},T} \circ u_{T,+}(\mathcal{E}) \xrightarrow{\sim} u_{T,+}(\mathcal{E}^\vee(-\mathfrak{D})). \tag{18.2.3.13.2}$$

(d) *The sheaves $u_{T,+}(\mathcal{E})$ and $u_{T,!}(\mathcal{E})$ are $\mathcal{D}^\dagger_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-holonomic (see 15.2.4.5).*

Proof. The (a), (b) assertions are a consequence of 18.2.3.1 and 18.2.3.12.2. Let us check (c). By biduality (see 8.7.7.3), it follows from $u_{T,+}(\mathcal{E}) \xrightarrow{\sim} u_{T,!}(\mathcal{E}(\mathfrak{D}))$ the isomorphism $\mathbb{D}_{\mathfrak{X},T} \circ u_{T,+}(\mathcal{E}) \xrightarrow{\sim} u_{T,+} \circ \mathbb{D}_{\mathfrak{X}^\sharp,T}(\mathcal{E}(\mathfrak{D}))$ (see the notation 9.2.4.22). By 11.2.6.3.4, $\mathbb{D}_{\mathfrak{X}^\sharp,T}(\mathcal{E}(\mathfrak{D})) \xrightarrow{\sim} (\mathcal{E}(\mathfrak{D}))^\vee \xrightarrow{\sim} \mathcal{E}^\vee(-\mathfrak{D})$. Hence, we are done. Finally, (d) is a easy consequence of (a) and (c). □

18.2.3.14. Let $n \in \mathbb{Z}$. Similarly to 18.2.1.13.4, 18.2.1.13.5, for any $\mathcal{E}^\sharp \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, $\mathcal{M}^\sharp \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{r}}\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}})$, we construct the canonical isomorphisms:

$$\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} (\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\sharp) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} (\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}^\sharp), \tag{18.2.3.14.1}$$

$$(\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{M}^\sharp) \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^\flat) \otimes_{\mathcal{O}_{\mathfrak{X}}} (\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}). \tag{18.2.3.14.2}$$

Hence, it follows from 18.2.3.9 and 18.2.3.11 that for any $* \in \{\mathrm{l}, \mathrm{r}\}$, for any $\mathcal{G} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp})$, we have the canonical isomorphism:

$$u_{T,+}(\mathcal{E}(n\mathfrak{Z}^\flat)) \xrightarrow{\sim} (u_{T,+}(\mathcal{E}))(n\mathfrak{Z}^\flat), \qquad u_{T,!}(n\mathcal{E}(\mathfrak{Z}^\flat)) \xrightarrow{\sim} (u_{T,!}(\mathcal{E}))(n\mathfrak{Z}^\flat). \tag{18.2.3.14.3}$$

For $\natural \in \{\mathrm{qc}, \mathrm{coh}\}$, we have the functor $(\mathfrak{Z}^\flat)\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T))$ by setting for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T))$:

$$(\mathfrak{Z}^\flat)(\mathcal{E}^{(\bullet)}) = \mathcal{O}^{(\bullet)}_{\mathfrak{X}}(\mathfrak{Z}^\flat) \otimes_{\mathcal{O}^{(\bullet)}_{\mathfrak{X}}} \mathcal{E}^{(\bullet)}, \tag{18.2.3.14.4}$$

where $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}(\mathfrak{Z}^\flat)$ is the constant sheaf given by $\mathcal{O}_{\mathfrak{X}}(\mathfrak{Z}^\flat)$. For any divisor T' of X, we have the canonical isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\natural}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T))$:

$$({}^\dagger T') \circ (\mathfrak{Z}^\flat) \xrightarrow{\sim} (\mathfrak{Z}^\flat) \circ ({}^\dagger T'), \qquad \mathbb{R}\underline{\Gamma}^\dagger_{T'} \circ (\mathfrak{Z}^\flat) \xrightarrow{\sim} (\mathfrak{Z}^\flat) \circ \mathbb{R}\underline{\Gamma}^\dagger_{T'}. \tag{18.2.3.14.5}$$

Indeed, the left isomorphism of 18.2.3.14.5 is a consequence of the isomorphism 9.1.1.5.2. By construction of the local cohomological functor with strict support over a divisor (see 13.1.1.4), using [BBD82, 1.1.9] this yields the right canonical isomorphism of 18.2.3.14.5.

When T is empty, $D^{\mathrm{b}}_{\mathrm{perf}}({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\sharp,\mathbb{Q}} = D^{\mathrm{b}}_{\mathrm{coh}}({}^*\mathcal{D}^\dagger_{\mathfrak{X}^\sharp,\mathbb{Q}})$ (see 8.7.7.7 and 1.4.3.29). Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}({}^*\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$. It follows from 18.2.3.14.3 that we get the isomorphism:

$$u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)}(n\mathfrak{Z}^\flat)) \xrightarrow{\sim} (u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)}))(n\mathfrak{Z}^\flat), \qquad u^{(\bullet)}_{!}(\mathcal{E}^{(\bullet)}(n\mathfrak{Z}^\flat)) \xrightarrow{\sim} (u^{(\bullet)}_{!}(\mathcal{E}^{(\bullet)}))(\mathfrak{Z}^\flat). \tag{18.2.3.14.6}$$

Proposition 18.2.3.15. *The canonical ring homomorphisms $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(T \cup D) \to \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T \cup D)$ and $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T \cup D) \to \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\flat}(T \cup D)$ are injective. Via theses injections, we get the inclusion: $p\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T \cup D) \subset \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp}(T \cup D)$. In particular, the ring homomorphism $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T \cup D) \to \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\flat}(T \cup D)$ is an isomorphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T \cup D))$. The canonical morphism $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T \cup D)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T \cup D)_{\mathbb{Q}}$ is a ring isomorphism.*

Proof. The assertion is local on $\mathfrak{X}$. We can suppose that there exists local coordinates $t_1, \ldots, t_d$ of $\mathfrak{X}$ such that $\mathfrak{Z} = V(t_1 \ldots t_r)$, $\mathfrak{Z}^\flat = V(t_1 \ldots t_s)$ and $\mathfrak{D} = V(t_{s+1} \ldots t_r)$ for some $0 \le s \le r$. Then $t_1, \ldots, t_d$ of $\mathfrak{X}^\sharp/\mathfrak{S}$ are semi-nice coordinates of both $\mathfrak{X}^\sharp/\mathfrak{S}$ and $\mathfrak{X}^\flat/\mathfrak{S}$. We get the description 7.5.1.6. For instance, we get the bases $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{(r)} : \underline{k} \in \mathbb{N}^d\}$ of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T \cup D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}}$ and $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{(s)} : \underline{k} \in \mathbb{N}^d\}$ of $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T \cup D) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\flat/\mathfrak{S}}$. For any integer $m \ge 0$, using the description 7.5.1.6, since $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{(r)} \in \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T \cup D)$ for any $\underline{k} \in \mathbb{N}^d$ (recall 4.5.1.1.1), then we get $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp}(T \cup D) \subset \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T \cup D)$.

For any integer $k \ge 0$, we denote by $q^{(m)}_k$, $q^{(m+1)}_k$, $r^{(m)}_k$, $r^{(m+1)}_k$, $\tilde{r}^{(m)}_k$ the integers satisfying the following conditions: $k = p^m q^{(m)}_k + r^{(m)}_k$, $0 \le r^{(m)}_k < p^m$, $k = p^{m+1} q^{(m+1)}_k + r^{(m+1)}_k$, $0 \le r^{(m+1)}_k < p^{m+1}$, $q^{(m)}_k = p q^{(m+1)}_k + \tilde{r}^{(m)}_k$, $0 \le \tilde{r}^{(m)}_k < p$. We recall that the p-adic valuation of $k!$ is $v_p(k!) = (k - \sigma(k))/(p-1)$, where $\sigma(k) = \sum_i a_i$ if $k = \sum_i a_i p^i$ with $0 \le a_i < p$. We compute: $v_p(q^{(m)}_k!) - v_p(q^{(m+1)}_k!) = (q^{(m)}_k - q^{(m+1)}_k - \tilde{r}^{(m)}_k)/(p-1) = q^{(m+1)}_k$. Let $u_k \in \mathbb{Z}_p^\times$ be a unit such that $q^{(m)}_k!/q^{(m+1)}_k! = u_k p^{q^{(m+1)}_k}$. Let $s+1 \le$

$i \leq r$ be an integer. By 1.4.2.5.2 (and via $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X},\mathbb{Q}} \subset \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X},\mathbb{Q}}$), we have: $\partial_i^{\langle k \rangle_{(m)}} = q_k^{(m)}!/q_k^{(m+1)}!\partial_i^{\langle k \rangle_{(m+1)}}$. Hence, we compute:

$$p\partial_i^{\langle k \rangle_{(m)}} = u_k p^{q_k^{(m+1)}+1} \partial_i^{\langle k \rangle_{(m+1)}} = u_k t_i^{p^{m+1}-r_k^{(m+1)}} \left(\frac{p}{t_i^{p^{m+1}}} \right)^{q_k^{(m+1)}+1} t_i^k \partial_i^{\langle k \rangle_{(m+1)}} \in \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp}(T \cup D).$$

This yields the inclusion $p^d \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T \cup D) \subset \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{X}^\sharp}(T \cup D)$.

Let $\lambda \in L(\mathbb{N})$ given by $m \mapsto m+1$ and $\chi \in M(\mathbb{N})$ given by $m \mapsto m+1$. Then we get the commutative square:

$$\begin{array}{ccc} \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T \cup D) & \longrightarrow & \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\flat}(T \cup D) \\ \downarrow & \swarrow & \downarrow \\ \lambda^* \chi^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T \cup D) & \longrightarrow & \lambda^* \chi^* \widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\flat}(T \cup D) \end{array} \qquad (18.2.3.15.1)$$

Then, by applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ to 18.2.3.15.1, we get the canonical morphism $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T \cup D)_{\mathbb{Q}} \to \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T \cup D)_{\mathbb{Q}}$ is an isomorphism. □

Corollary 18.2.3.16. *Let $\mathfrak{X}$ (resp. $\mathfrak{X}'$) be a smooth $\mathfrak{S}$-formal scheme and $\mathfrak{D} \subset \mathfrak{X}$ (resp. $\mathfrak{D}' \subset \mathfrak{X}'$) be a relative to $\mathfrak{X}/\mathfrak{S}$ (resp. $\mathfrak{X}'/\mathfrak{S}$) strict normal crossing divisor. Set $\mathfrak{X}^\sharp := (\mathfrak{X}, M(\mathfrak{D}))$ and $\mathfrak{X}'^\sharp := (\mathfrak{X}', M(\mathfrak{D}'))$. Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{X}'^\sharp$ be a morphism of log-smooth $\mathfrak{S}$-log formal schemes. Let T, T' be two divisors such that $f_0^{-1}(T) \subset T'$, $Z \subset T$ and $Z' \subset T'$. We have the equalities*

(a) The categories $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp)$ and $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/\mathfrak{S}^\sharp)$ (resp. $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}'^\sharp, T'/\mathfrak{S}^\sharp)$ and $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}', T'/\mathfrak{S}^\sharp)$) are canonically equivalent. Moreover, modulo theses identifications, the functors $f^{\sharp *}_{T',T}\colon \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S}^\sharp) \to \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}'^\sharp, T'/\mathfrak{S})$ and $f^*_{T',T}\colon \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, T/\mathfrak{S}^\sharp) \to \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}', T'/\mathfrak{S})$ of 11.2.3.5 and the functors $\mathbb{L}f^{\sharp *(\bullet)}_{T',T}\colon \mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp, T/\mathfrak{S}) \to \mathrm{MIC}^{(\bullet)}(\mathfrak{X}'^\sharp, T'/\mathfrak{S})$ and $\mathbb{L}f^{*(\bullet)}_{T',T}\colon \mathrm{MIC}^{(\bullet)}(\mathfrak{X}, T/\mathfrak{S}) \to \mathrm{MIC}^{(\bullet)}(\mathfrak{X}', T'/\mathfrak{S})$ of 11.2.3.5.1 are equals.

(b) Let $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}^\sharp/\mathfrak{S})$ and $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q}}\, \mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp/\mathfrak{S})$. We have therefore the isomorphism of coherent $\mathcal{D}^\dagger_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}$-modules, $\mathcal{O}_{\mathfrak{X}'}({}^\dagger T')_{\mathbb{Q}}$-coherent:

$$({}^\dagger T')(f^\sharp(\mathcal{E})) \xrightarrow{\sim} f^*_{T',T}(\mathcal{E}({}^\dagger T)), \qquad ({}^\dagger T')(f^{\sharp(\bullet)}(\mathcal{E}^{(\bullet)})) \xrightarrow{\sim} f^{(\bullet)*}_{T',T}(\mathcal{E}^{(\bullet)}({}^\dagger T)). \qquad (18.2.3.16.1)$$

Proof. The first part is a consequence of 18.2.3.15. Using 13.2.1.4.1, this yields the second part. □

18.2.3.17. Let $\mathcal{E}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module which is a locally projective $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module of finite type. We get the map:

$$\mathcal{E}(\mathfrak{D}) = \mathcal{O}_{\mathfrak{X}}(\mathfrak{D}) \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \to \mathcal{O}_{\mathfrak{X}}({}^\dagger T \cup D)_{\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T \cup D)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} = \mathcal{E}({}^\dagger T \cup D). \qquad (18.2.3.17.1)$$

Since $\mathcal{E}(\mathfrak{D})$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-module, this yields by extension the morphism of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T \cup D)_{\mathbb{Q}}$-module:

$$\mathcal{E}(\mathfrak{D})({}^\dagger T \cup D) = \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T \cup D)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} (\mathcal{E}(\mathfrak{D})) \to \mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T \cup D)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E} = \mathcal{E}({}^\dagger T \cup D). \qquad (18.2.3.17.2)$$

Since the map 18.2.3.17.2 is an isomorphism outside $T \cup D$, then it is an isomorphism. It follows from 18.2.3.15 that $\mathcal{E}({}^\dagger T \cup D)$ is a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T \cup D)_{\mathbb{Q}}$. Hence, we get by extension from 18.2.3.17.1 the last $\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}$-linear morphism:

$$\rho_{\mathcal{E}}\colon u_{T,+}(\mathcal{E}) \underset{18.2.3.13.(b)}{\xrightarrow{\sim}} \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}({}^\dagger T)_{\mathbb{Q}}} \mathcal{E}(\mathfrak{D}) \to \mathcal{E}({}^\dagger T \cup D), \qquad (18.2.3.17.3)$$

$\rho_{\mathcal{E}}$ being by definition the composite morphism. This yields by extension from 18.2.3.17.3 the homomorphism of coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T \cup D)_{\mathbb{Q}}$-modules:

$$({}^\dagger T \cup D)(u_{T,+}(\mathcal{E})) = \mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T \cup D)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\flat}({}^\dagger T)_{\mathbb{Q}}} u_{T,+}(\mathcal{E}) \to \mathcal{E}({}^\dagger T \cup D), \qquad (18.2.3.17.4)$$

Since the map 18.2.3.17.4 is an isomorphism outside $T \cup D$, then it is an isomorphism.

Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T))$ such that $\underrightarrow{l}^*_{\mathbb{Q}}\ \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}$. It follows from 18.2.3.15 that the functor $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\flat}(T \cup D) \otimes^{\mathbb{L}}_{\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T\cup D)} -\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp}(T \cup D)) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\flat}(T \cup D))$ and we can identify them. Then similarly to 18.2.3.17.4 we construct the morphism of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\flat}(T \cup D))$ of the form:

$$({}^\dagger D) \circ u^{(\bullet)}_{T,+}(\mathcal{E}^{(\bullet)}) \to ({}^\dagger D)(\mathcal{E}^{(\bullet)}), \qquad (18.2.3.17.5)$$

which is an isomorphism thanks to 18.2.3.17.4.

18.3 Stability of the (over)holonomicity with a Frobenius structure

18.3.1 A comparison theorem between log-de Rham complexes and de Rham complexes

Let $\mathfrak{X}$ be a separated, quasi-compact and smooth $\mathcal{V}$-formal scheme and $g\colon \mathfrak{X} \to \operatorname{Spf}\mathcal{V}$ be the structural morphism. Let $\mathfrak{Z}$ be a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor, $\mathfrak{Y} := \mathfrak{X} \setminus \mathfrak{Z}$, and let $j\colon \mathfrak{Y} \subset \mathfrak{X}$ be the open immersion. Let $\mathfrak{Z}_1, \dots, \mathfrak{Z}_r$ be the irreducible components of $\mathfrak{Z}$ and $\mathfrak{Z}^\flat := \cup_{i\geq 2} \mathfrak{Z}_i$. We set $\mathfrak{X}^\sharp := (\mathfrak{X}, M(\mathfrak{Z}))$, $\mathfrak{X}^\flat := (\mathfrak{X}, M(\mathfrak{Z}^\flat))$. We get a relative strict normal crossing divisor on $\mathfrak{Z}_1/\mathfrak{S}$ defined by $\mathfrak{D}_1 := i_1^{-1}(\mathfrak{Z}^\flat) := \mathfrak{Z}_1 \cap \mathfrak{Z}^\flat := \bigcup_{i=2}^r (\mathfrak{Z}_1 \cap \mathfrak{Z}_i)$ and we set $\mathfrak{Z}_1^\flat := (\mathfrak{Z}_1, M(\mathfrak{D}_1))$. Let $i_1\colon \mathfrak{Z}_1 \hookrightarrow \mathfrak{X}$ be the corresponding closed immersion and $i_1^\flat\colon \mathfrak{Z}_1^\flat \hookrightarrow \mathfrak{X}^\flat$ be the induced exact closed immersion. We put $u\colon \mathfrak{X}^\sharp \to \mathfrak{X}$, $u_1\colon \mathfrak{X}^\sharp \to \mathfrak{X}^\flat$, $v_1\colon \mathfrak{X}^\flat \to \mathfrak{X}$, $w_1\colon \mathfrak{Z}_1^\flat \to \mathfrak{Z}_1$ be the canonical morphisms.

Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. When we work with F-complex, we suppose there exists an automorphism $\sigma\colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining.

Let T be a divisor of X such that $U := T \cap Z_1$ is a divisor of Z_1. Let $\lambda_0\colon \mathbb{N} \to \mathbb{N}$ an increasing map such that $p^{\lambda_0(0)} \geq e/(p-1)$ (see why at 1.2.4.2) and $\lambda_0(m) \geq m$, for any $m \in \mathbb{N}$. We put then $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{X}}(T)$, $\widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}_1}(U) := \mathcal{B}^{(\lambda_0(m))}_{\mathfrak{Z}_1}(U)$, $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}(T) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{X}}(T) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\flat}$, $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}_1^\flat}(U) := \widetilde{\mathcal{B}}^{(m)}_{\mathfrak{Z}_1}(U) \widehat{\otimes}_{\mathcal{O}_{\mathfrak{Z}_1}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{Z}_1^\flat}$.

Definition 18.3.1.1. We denote by $\mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{X}^\sharp, T/\mathfrak{S})$ the full subcategory of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ consisting of objects which are locally projective of finite type as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module and having nilpotent residues along each irreducible components of D not included in T.

We denote by $\mathrm{MIC}^{\dagger\dagger}_{\mathrm{NL}}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ the full subcategory of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ consisting of objects which are locally projective of finite type as $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-module and such that the following conditions hold:

(a) none of differences of exponents along each irreducible components of D not included in T of $\mathcal{E}$ is a p-adic Liouville number,

(b) none of exponents along each irreducible components of D not included in T of $\mathcal{E}$ is a p-adic Liouville number.

When the divisor is empty, we simply write $\mathrm{MIC}^{\dagger\dagger}_{\natural}(\mathfrak{X}^\sharp/\mathfrak{S})$, with $\natural \in \{\mathrm{NL}, 0\}$.

Proposition 18.3.1.2. *The category* $\mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{X}^\sharp, T/\mathfrak{S})$ *is abelian.*

Proof. When T is empty, this is [Ked07, 3.2.14] (see also the definition [Ked07, 2.3.7]). Let $\mathfrak{U}$ be the open of $\mathfrak{X}$ complementary to T. Let $\mathcal{E} \to \mathcal{F}$ be a morphism $\mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{X}^\sharp, T/\mathfrak{S})$. We have to check that its kernel and cokernel belong to $\mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{X}^\sharp, T/\mathfrak{S})$. Since this is Zariski local on $\mathfrak{X}$, we can suppose $\mathfrak{X}$ and T defined by an equation. This yields $\mathfrak{U}$ is affine. Using theorem of type A concerning coherent $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules, we reduce to check that $\Gamma(\mathfrak{X}, \mathcal{E})$ is a projective $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$-module of finite type.

Following the case where T is empty, we get that $\mathcal{E}$ is a locally projective $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-module of finite type. Since $\mathfrak{U}$ is affine, then via theorem of type A for coherent $\mathcal{O}_{\mathfrak{U},\mathbb{Q}}$-modules we get $\Gamma(\mathfrak{U}, \mathcal{E})$ is a projective $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{U},\mathbb{Q}})$-module of finite type. Theorem of type A concerning coherent $\mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}$-modules implies that the canonical morphism $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \otimes_{\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})} \Gamma(\mathfrak{X}, \mathcal{E}) \to \Gamma(\mathfrak{U}, \mathcal{E})$ is an isomorphism. Since $\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) = \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{U},\mathbb{Q}})$, since $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}}) \to \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{U},\mathbb{Q}})$ is faithfully flat (this is checked in the proof of 8.7.6.8), then this implies that $\Gamma(\mathfrak{X}, \mathcal{E})$ is a projective $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}}({}^\dagger T)_{\mathbb{Q}})$-module of finite type. □

Remark 18.3.1.3. The category $\mathrm{MIC}^{\dagger\dagger}_{\mathrm{NL}}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ is not abelian. For instance, $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ and $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}(\mathfrak{Z}_1)$ are objects of $\mathrm{MIC}^{\dagger\dagger}_{\mathrm{NL}}(\mathfrak{X}^\sharp/\mathfrak{S})$ but not the cokernel of the canonical inclusion $\mathcal{O}_{\mathfrak{X},\mathbb{Q}} \to \mathcal{O}_{\mathfrak{X},\mathbb{Q}}(\mathfrak{Z}_1)$.

18.3.1.4 (Inverse image)**.** Let $\mathcal{V} \to \mathcal{V}'$ be a morphism of mixed characteristic complete discrete valuation rings, $k \to k'$ be the induced morphism of perfect residue fields, $\mathfrak{X}$ be a smooth $\mathcal{V}$-formal scheme, $\mathfrak{X}'$ be a smooth formal $\mathcal{V}'$-scheme and $\mathfrak{Z}$ (resp. $\mathfrak{Z}'$) be a relative to $\mathfrak{X}/\mathfrak{S}$ (resp. relative to $\mathfrak{X}'/\operatorname{Spf}\mathcal{V}'$) strict normal crossing divisor. Let $f_0\colon (X', M(\mathfrak{Z}')) \to (X, M(\mathfrak{Z}))$ be a morphism of log-schemes over $\operatorname{Spec} k$ (see notation 4.5.2.14). We have a canonical inverse image functor under f_0 denoted by f_0^*: $I_{\mathrm{conv,et}}((X, M(\mathfrak{Z}))/\operatorname{Spf}\mathcal{V}) \to I_{\mathrm{conv,et}}((X', M(\mathfrak{Z}'))/\operatorname{Spf}\mathcal{V}')$ (this is obvious from the definition [Shi02, 2.1.5, 2.1.6]). We get from 11.2.1.5.(b) an inverse image functor under f_0, also denoted by f_0^*, from the category of coherent $\mathcal{D}^\dagger_{(\mathfrak{X},M(\mathfrak{Z})),\mathbb{Q}}$-modules, locally projective of finite type over $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ to the category of coherent $\mathcal{D}^\dagger_{(\mathfrak{X}',M(\mathfrak{Z}')),\mathbb{Q}}$-modules, locally projective of finite type over $\mathcal{O}_{\mathfrak{X}',\mathbb{Q}}$. When there exists a lifting $f\colon (\mathfrak{X}', M(\mathfrak{Z}')) \to (\mathfrak{X}, M(\mathfrak{Z}))$ of $(X', M(\mathfrak{Z}')) \to (X, M(\mathfrak{Z}))$ then f_0^* is canonically isomorphic to the usual functor f^*.

18.3.1.5 (Frobenius structure)**.** Suppose now that $\mathcal{V} \to \mathcal{V}'$ is σ (which is a fixed lifting of the ath Frobenius power of k) and f_0 is $F_{(X,Z)}$ (or simply F) the ath power of the absolute Frobenius of (X, Z). A "coherent F-$\mathcal{D}^\dagger_{(\mathfrak{X},M(\mathfrak{Z})),\mathbb{Q}}$-module, locally projective of finite type over $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$" or "coherent $\mathcal{D}^\dagger_{(\mathfrak{X},M(\mathfrak{Z})),\mathbb{Q}}$-module, locally projective of finite type over $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ and endowed with a Frobenius structure" is a coherent $\mathcal{D}^\dagger_{(\mathfrak{X},M(\mathfrak{Z})),\mathbb{Q}}$-module $\mathcal{E}$, locally projective of finite type over $\mathcal{O}_{\mathfrak{X},\mathbb{Q}}$ and endowed with a $\mathcal{D}^\dagger_{(\mathfrak{X},M(\mathfrak{Z})),\mathbb{Q}}$-linear isomorphism $\mathcal{E} \xrightarrow{\sim} F^*(\mathcal{E})$. This notion is compatible (via the equivalence of categories 11.2.1.5.(b)) with Shiho's notion of convergent F-log-isocrystal on (X, Z) (see [Shi02, 2.4.2]). By [Shi02, 2.4.3], an F-log-isocrystal on (X, Z) is strikingly locally free.

We translate 10.3.4.23 (beware we have changed the notation) in the arithmetic $\mathcal{D}$-modules side as follows:

Theorem 18.3.1.6. *We assume that $g : \mathfrak{X} \to \mathfrak{S}$ factors through a smooth morphism $g_1\colon \mathfrak{X} \to \mathfrak{Z}_1$ over $\mathfrak{S}$ such that $g_1 \circ i_1 = \mathrm{id}$ and $\mathfrak{Z}^\flat = g_1^{-1} \circ i_1^{-1}(\mathfrak{Z}^\flat)$. Let $g_1^\sharp\colon \mathfrak{X}^\sharp \to \mathfrak{Z}_1^\flat$ be the morphism induced by g_1. Let $\mathcal{E} \in \mathrm{MIC}^{\dagger\dagger}_{\mathrm{NL}}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ (see notation 11.2.1.4).*

(i) We suppose that none of exponents along Z_1 of $\mathcal{E}$ is a nonnegative integer. Then the canonical morphism $g^\sharp_{1,T+}(\mathcal{E}) \to g^\sharp_{1,T\cup Z_1+}(\mathcal{E}({}^\dagger Z_1))$ is an isomorphism.

(ii) Suppose there exist $n \in \mathbb{Z}$ and $\mathcal{G} \in \mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{X}^\sharp, T/\mathfrak{S})$ such that $\mathcal{E} := \mathcal{G}(n\mathfrak{Z}_1)$. Then

$$\operatorname{Cone}\left(g^\sharp_{1,T+}(\mathcal{E}) \to g^\sharp_{1,T\cup Z_1+}(\mathcal{E}({}^\dagger Z_1))\right) \tag{18.3.1.6.1}$$

is isomorphic to a complex of $D^{\mathrm{b}}(\mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{Z}_1^\flat, T/\mathfrak{S}))$.

Proof. 1) We set $E := \mathrm{sp}^*(\mathcal{E})$, $Y_1 := X \setminus Z_1$, $j_1\colon Y_1 \subset X$ be the open immersion. Since $\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} E \cong j^\dagger\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{j^\dagger\mathcal{O}_{]X[_\mathfrak{X}}} E$, since the functor $\underline{\Gamma}^\dagger_{]Z_1[_\mathfrak{X}}$ is exact, since mapping cones commute with the functor $\mathbb{R}g_{1K*}(\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} -)$ then we obtain the isomorphisms:

$$\begin{aligned}\mathbb{R}g_{1K*}\underline{\Gamma}^\dagger_{]Z_1[_\mathfrak{X}}\left(\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} E\right) &\cong \mathbb{R}g_{1K*}\left(\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} \underline{\Gamma}^\dagger_{]Z_1[_\mathfrak{X}} E\right)\\ &\cong \mathbb{R}g_{1K*}\left(\operatorname{Cone}\left(\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} E \to \Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} j_1^\dagger E\right)[-1]\right)\\ \cong \operatorname{Cone}\left(\mathbb{R}g_{1K*}(\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} E) \right.&\left.\to \mathbb{R}g_{1K*}(\Omega^\bullet_{\mathfrak{X}^\sharp_K/\mathfrak{Z}^\flat_{1K}} \otimes_{\mathcal{O}_{]X[_\mathfrak{X}}} j_1^\dagger E)\right)[-1]\end{aligned} \tag{18.3.1.6.2}$$

2) We have the following commutative diagram:

$$\begin{array}{ccc}
\mathbb{R}\mathrm{sp}_*\mathbb{R}g_{1K*}(\Omega^{\bullet}_{\mathfrak{X}^{\sharp}_K/\mathfrak{Z}^{\flat}_{1K}} \otimes_{\mathcal{O}_{]X[_{\mathfrak{X}}}} E) & \longrightarrow & \mathbb{R}\mathrm{sp}_*\mathbb{R}g_{1K*}(\Omega^{\bullet}_{\mathfrak{X}^{\sharp}_K/\mathfrak{Z}^{\flat}_{1K}} \otimes_{\mathcal{O}_{]X[_{\mathfrak{X}}}} j^{\dagger}_{Y_1} E) \\
\downarrow \sim & & \downarrow \sim \\
\mathbb{R}g_{1*}(\Omega^{\bullet}_{\mathfrak{X}^{\sharp}/\mathfrak{Z}^{\flat}_1,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathrm{sp}_*(E)) & \longrightarrow & \mathbb{R}g_{1*}(\Omega^{\bullet}_{\mathfrak{X}^{\sharp}/\mathfrak{Z}^{\flat}_1,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathrm{sp}_*(j^{\dagger}_{Y_1} E)), \\
\downarrow \sim & & \sim \downarrow 11.2.7.2.1 \\
\mathbb{R}g_{1*}(\Omega^{\bullet}_{\mathfrak{X}^{\sharp}/\mathfrak{Z}^{\flat}_1,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}) & \longrightarrow & \mathbb{R}g_{1*}(\Omega^{\bullet}_{\mathfrak{X}^{\sharp}/\mathfrak{Z}^{\flat}_1,\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}(^{\dagger}Z_1)), \\
\sim \downarrow 9.4.1.6.1 & & \sim \downarrow 9.4.1.6.1 \\
g^{\sharp}_{1,T+}(\mathcal{E})[-1] & \longrightarrow & g^{\sharp}_{1,T\cup Z_1+}(\mathcal{E}(^{\dagger}Z_1))[-1],
\end{array} \qquad (18.3.1.6.3)$$

where both top vertical arrows can be constructed by using the canonical isomorphism $\mathbb{R}\mathrm{sp}_* \circ \mathbb{R}g_{1K*} \xrightarrow{\sim} \mathbb{R}g_{1*} \circ \mathbb{R}\mathrm{sp}_*$ and by using 10.1.2.3.2.

3) By applying the functor $\mathbb{R}\mathrm{sp}_*$ to the left top term of 18.3.1.6.2, following 10.3.4.23 (and via the equivalence of categories 11.2.1.5.(a)) we get either the null complex in the case (i) of the theorem or a complex isomorphic to a complex of coherent $\mathcal{D}^{\dagger}_{\mathfrak{Z}^{\flat}_1}(^{\dagger}U)_{\mathbb{Q}}$-modules belonging to $\mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{Z}^{\flat}_1, U/\mathfrak{S})$ in the second case (see the description of the right part of 10.3.4.23.1, we have two terms with nilpotent residues on $\mathfrak{Z}^{\flat}_1$). Hence, we conclude thanks to the steps 1) and 2). □

18.3.1.7. Since $i^{\flat *}_1(\mathcal{O}_{\mathfrak{X}}(n\mathfrak{Z}^{\flat})) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{Z}^{\flat}_1}(n\mathfrak{D}_1)$, then for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}}(T))$ we obtain the isomorphism:

$$i^{\flat(\bullet)!}_1(\mathcal{E}^{(\bullet)}(n\mathfrak{Z}^{\flat})) \xrightarrow{\sim} i^{\flat(\bullet)!}_1(\mathcal{E}^{(\bullet)})(n\mathfrak{D}_1)). \qquad (18.3.1.7.1)$$

By using Berthelot-Kashiwara theorem of the form 9.3.5.13, for any $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^{\sharp}_1}(U))$ we get from 18.3.1.7.2 the isomorphism:

$$i^{\flat(\bullet)}_{1+}(\mathcal{F}^{(\bullet)})(n\mathfrak{Z}^{\flat}) \xrightarrow{\sim} i^{\flat(\bullet)}_{1+}(\mathcal{F}^{(\bullet)}(n\mathfrak{D}_1)). \qquad (18.3.1.7.2)$$

The following paragraph means that the context of Theorem 18.3.1.6 is Zariski local up to an étale morphism.

18.3.1.8 (Local situation)**.** Suppose $\mathfrak{X} := \mathrm{Spf}\, A$ affine and there exists $\phi\colon \mathfrak{X} \to \widehat{\mathbb{A}}^d_{\mathcal{V}}$ be an étale morphism of $\mathcal{V}$-formal schemes such that, denoting by $t_1, \ldots, t_d \in \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ the coordinates given by ϕ, for any $i = 1, \ldots, r$, we have $\mathfrak{Z}_i = V(t_i)$.

Let $\bar{t}_2, \ldots, \bar{t}_d$ be the global sections of $\mathcal{O}_{\mathfrak{Z}_1}$ induced by $t_2, \ldots, t_d$ and let $\phi_1\colon \mathfrak{Z}_1 \to \widehat{\mathbb{A}}^{d-1}_{\mathcal{V}}$ be the étale morphism induced by the coordinates $\bar{t}_2, \ldots, \bar{t}_d$. We get the morphism of smooth $\mathcal{V}$-formal schemes $\mathrm{id} \times \phi_1\colon \widehat{\mathbb{A}}^1_{\mathcal{V}} \times \mathfrak{Z}_1 \to \widehat{\mathbb{A}}^1_{\mathcal{V}} \times \widehat{\mathbb{A}}^{d-1}_{\mathcal{V}} = \widehat{\mathbb{A}}^d_{\mathcal{V}}$. Let $\iota_0\colon \mathrm{Spf}\, \mathcal{V} \hookrightarrow \widehat{\mathbb{A}}^1_{\mathcal{V}}$ be the closed immersion given by 0 and $\iota_0 := \iota_0 \times \mathrm{id}\colon \mathfrak{Z}_1 = \mathrm{Spf}\, \mathcal{V} \times \mathfrak{Z}_1 \hookrightarrow \widehat{\mathbb{A}}^1_{\mathcal{V}} \times \mathfrak{Z}_1$. By putting $\mathfrak{X}'' := (\widehat{\mathbb{A}}^1 \times \mathfrak{Z}_1) \times_{\widehat{\mathbb{A}}^d} \mathfrak{X}$, we get the closed immersion $i'_1\colon \mathfrak{Z}_1 \hookrightarrow \mathfrak{X}'$ making commutative the left diagram:

$$\begin{array}{ccccc}
\mathfrak{Z}_1 & \overset{i''_1}{\dashrightarrow} & \mathfrak{X}'' & \overset{\phi''}{\longrightarrow} & \widehat{\mathbb{A}}^1 \times \mathfrak{Z}_1 \\
& \underset{i_1}{\searrow} & \downarrow f' & \square & \downarrow \mathrm{id} \times \phi_1 \\
& & \mathfrak{X} & \underset{\phi}{\longrightarrow} & \widehat{\mathbb{A}}^d
\end{array}\ (\mathfrak{Z}_1 \xrightarrow{\iota_0} \widehat{\mathbb{A}}^1 \times \mathfrak{Z}_1), \qquad
\begin{array}{ccccc}
\mathfrak{Z}_1 & \overset{i'_1}{\dashrightarrow} & \mathfrak{X}' & \overset{\phi'}{\longrightarrow} & \widehat{\mathbb{A}}^1 \times \mathfrak{Z}_1 \\
& \underset{i_1}{\searrow} & \downarrow f & & \downarrow \mathrm{id} \times \phi_1 \\
& & \mathfrak{X} & \underset{\phi}{\longrightarrow} & \widehat{\mathbb{A}}^d
\end{array}\ (\mathfrak{Z}_1 \xrightarrow{\iota_0} \widehat{\mathbb{A}}^1 \times \mathfrak{Z}_1) \qquad (18.3.1.8.1)$$

whose square is cartesian and has étale morphisms and where f' and ϕ'' are the canonical projections. Putting $\mathfrak{Z}''_1 := f'^{-1}(\mathfrak{Z}_1) = \mathfrak{Z}_1 \times_{\mathfrak{X}} \mathfrak{X}''$, we get a section $(\mathrm{id}, i''_1)\colon \mathfrak{Z}_1 \hookrightarrow \mathfrak{Z}''_1$ of the étale projection $\mathfrak{Z}''_1 \to \mathfrak{Z}_1$. Hence, by using SGA1 Exp. I Corollary 5.3., there exists a dense open $\mathfrak{X}'$ of $\mathfrak{X}''$ such that $\mathfrak{Z}_1 \xrightarrow{\sim} \mathfrak{Z}_1 \times_{\mathfrak{X}} \mathfrak{X}'$. We get therefore the right diagram of 18.3.1.8.1. Let $g_1\colon \mathfrak{X}' \to \mathfrak{Z}_1$ be the canonical morphism, i.e. the composition of ϕ' and the projection $\widehat{\mathbb{A}}^1 \times \mathfrak{Z}_1 \to \mathfrak{Z}_1$. By construction, i'_1 is a section of g_1.

We put $T' := f^{-1}(T)$, $\mathfrak{Z}' := f^{-1}(\mathfrak{Z})$, $\mathfrak{Z}'^{\flat} := f^{-1}(\mathfrak{Z}^{\flat})$, $\mathfrak{X}'^{\sharp} := (\mathfrak{X}', M(\mathfrak{Z}'))$, $\mathfrak{X}'^{\flat} := (\mathfrak{X}', M(\mathfrak{Z}'^{\flat}))$. We denote by $f^{\flat}\colon \mathfrak{X}'^{\flat} \to \mathfrak{X}^{\flat}$, $f^{\sharp}\colon \mathfrak{X}'^{\sharp} \to \mathfrak{X}^{\sharp}$, $u'_1\colon \mathfrak{X}'^{\sharp} \to \mathfrak{X}'^{\flat}$, $g^{\sharp}_1\colon \mathfrak{X}'^{\sharp} \to \mathfrak{Z}^{\flat}_1$, $g^{\flat}_1\colon \mathfrak{X}'^{\flat} \to \mathfrak{Z}^{\flat}_1$, $i'^{\flat}_1\colon \mathfrak{Z}^{\flat}_1 \to \mathfrak{X}'^{\flat}$,

$v_1' \colon \mathfrak{X}'^{\flat} \to \mathfrak{X}'$ the associated morphisms. We summarize the notation and the above properties in the following commutative diagrams:

$$\begin{array}{ccccccc} \mathfrak{Z}_1 & \overset{i_1'}{\underset{g_1}{\rightleftarrows}} & \mathfrak{X}' & \overset{v_1'}{\longleftarrow} & \mathfrak{X}'^{\flat} & \overset{g_1^{\flat}}{\underset{i_1'^{\flat}}{\rightleftarrows}} & \mathfrak{Z}_1^{\flat} \\ \| & \square & \downarrow f & \square & \downarrow f^{\flat} & \square & \| \\ \mathfrak{Z}_1 & \overset{i_1}{\hookrightarrow} & \mathfrak{X} & \underset{v_1}{\longleftarrow} & \mathfrak{X}^{\flat} & \overset{i_1^{\flat}}{\longleftarrow} & \mathfrak{Z}_1^{\flat}, \end{array} \quad (w_1 \colon \mathfrak{Z}_1^{\flat} \to \mathfrak{Z}_1) \qquad \begin{array}{ccc} \mathfrak{X}'^{\flat} & \overset{u_1'}{\longleftarrow} & \mathfrak{X}'^{\sharp} \\ f^{\flat} \downarrow & \square & \downarrow f^{\sharp} \\ \mathfrak{X}^{\flat} & \underset{u_1}{\longleftarrow} & \mathfrak{X}^{\sharp} \end{array} \tag{18.3.1.8.2}$$

where squares (including the below "square" containing w_1) are cartesian, where the commutativity of the top part means that i_1' is a section of g_1 and $i_1'^{\flat}$ is a section of $g_1^{\flat}$.

We remark that $\mathfrak{Z}'^{\flat} = g_1^{-1}(\mathfrak{Z}_1^{\flat})$. Indeed, since $\mathfrak{Z}^{\flat} = \phi^{-1}(V(x_2 \dots x_r))$, then using the commutativity of the square of the right diagram of 18.3.1.8.1 we get $\mathfrak{Z}'^{\flat} = f^{-1}\phi^{-1}(V(x_2 \dots x_d)) = \phi'^{-1}(id \times \phi_1)^{-1}(V(x_2 \dots x_r)) = \phi'^{-1}(\widehat{\mathbb{A}}^1 \times \mathfrak{Z}_1^{\flat}) = g_1^{-1}(\mathfrak{Z}_1^{\flat})$. Moreover, since $i_1'^{-1}(\mathfrak{Z}'^{\flat}) = i_1^{-1}(\mathfrak{Z}^{\flat}) = \mathfrak{Z}_1^{\flat}$, this implies $\mathfrak{Z}'^{\flat} = g_1^{-1} \circ i_1'^{-1}(\mathfrak{Z}'^{\flat})$.

Remark 18.3.1.9. With the notation 18.3.1.6, let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}^{\mathrm{b}}_{\mathbb{Q},\mathrm{perf}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}}(T))$ an object such that $\underrightarrow{l}^*_{\mathbb{Q}}\, \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}$ (see 8.4.5.6). We have the isomorphism (see 13.1.5.6.3):

$$\underrightarrow{l}^*_{\mathbb{Q}} g_{1+}^{\sharp(\bullet)} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{Z_1}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathrm{Cone}\left(g^{\sharp}_{1T+}(\mathcal{E}) \to g^{\sharp}_{1T\cup Z_1+}(\mathcal{E}({}^{\dagger}T \cup Z_1))\right)[-1]. \tag{18.3.1.9.1}$$

Corollary 18.3.1.10. *Let $\mathcal{G} \in \mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{X}^{\sharp}, T/\mathfrak{S})$ (see notation 18.3.1.1). Let $n \in \mathbb{Z}$ and $\mathcal{E} := \mathcal{G}(n\mathfrak{Z}_1)$. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\sharp}}(T))$ such that $\underrightarrow{l}^*_{\mathbb{Q}}\, \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}$. The following properties are then satisfied:*

(a) We have $i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}_1^{\flat}}(U))$.

(b) If $n \geq 0$, then $i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$ and the canonical morphism $u_{1+}(\mathcal{E}) \to \mathcal{E}({}^{\dagger}Z_1)$ is an isomorphism.

(c) Suppose we are in the situation 18.3.1.8. Then, the complex $i_1^{\flat!} \circ u_{1+}(\mathcal{E})$ is isomorphic to a complex (with two terms) of $D^{\mathrm{b}}(\mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{Z}_1^{\flat}, U/\mathfrak{S}))$.

Proof. 0) Since the proposition is Zariski local on $\mathfrak{X}$, then we can suppose we are in the situation 18.3.1.8 and we take its notation. By using the right cartesian square of 18.3.1.8.2 and thanks to the base change isomorphism of a proper pushforward by a smooth pullback (more precisely, see 13.2.3.7) which gives the isomorphism $f^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}(\bullet)) \xrightarrow{\sim} u_{1+}'^{(\bullet)} \circ f^{\sharp(\bullet)!}(\mathcal{E}(\bullet))$, since $\underrightarrow{l}^*_{\mathbb{Q}} \circ f^{\sharp(\bullet)!}(\mathcal{E}(\bullet)) \xrightarrow{\sim} f^{\sharp!}(\mathcal{E}) \in \mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{X}'^{\sharp}, T'/\mathfrak{S})$, then we reduce to the case where there exists a smooth morphism $g_1 \colon \mathfrak{X} \to \mathfrak{Z}_1$ such that $g_1 \circ i_1 = \mathrm{id}$ and $\mathfrak{Z}^{\flat} = g_1^{-1} \circ i_1^{-1}(\mathfrak{Z}^{\flat})$.

1) Let us check (a) and (c). Since $i_1^{\flat}$ is an exact immersion, then following 13.2.1.5.1 we have $i_{1+}^{\flat(\bullet)} \circ i_1^{\flat(\bullet)!} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Z_1}$. As $({}^{\dagger}Z_1) \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}({}^{\dagger}Z_1)$ (see 18.2.3.17.5), then we get from 13.1.1.5 the distinguished triangle of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\flat}}(T))$:

$$i_{1+}^{\flat(\bullet)} \circ i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \to u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}({}^{\dagger}Z_1) \to i_{1+}^{\flat(\bullet)} \circ i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)})[1]. \tag{18.3.1.10.1}$$

By applying the functor $g_{1+}^{\flat(\bullet)}$ to the triangle 18.3.1.10.1, as $g_{1+}^{\flat(\bullet)} \circ i_{1+}^{\flat(\bullet)} = \mathrm{id}$, since $g_{1+}^{\flat(\bullet)} \circ u_{1+}^{(\bullet)} = g_{1+}^{\sharp(\bullet)}$, we get then the distinguished triangle of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}_1^{\flat}}(U))$:

$$i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \to g_{1+}^{\sharp(\bullet)}(\mathcal{E}^{(\bullet)}) \to g_{1+}^{\sharp(\bullet)}(\mathcal{E}^{(\bullet)}({}^{\dagger}Z_1)) \to i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)})[1]. \tag{18.3.1.10.2}$$

As $u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LM}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^{\flat}}(T))$, then $\underrightarrow{l}^*_{\mathbb{Q}} \circ i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} i_1^{\flat!} \circ u_{1,T+}(\mathcal{E})$. Hence, by applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ to 18.3.1.10.2, we obtain:

$$i_1^{\flat!} \circ u_{1,T+}(\mathcal{E}) \to g^{\sharp}_{1,T+}(\mathcal{E}) \to g^{\sharp}_{1,T\cup Z_1+}(\mathcal{E}({}^{\dagger}Z_1)) \to i_1^{\flat!} \circ u_{1,T+}(\mathcal{E})[1]. \tag{18.3.1.10.3}$$

Using Theorem 18.3.1.6.(ii), we deduce from 18.3.1.10.3 that $i_1^{\flat !} \circ u_{1+}(\mathcal{E})$ is isomorphic to a complex of $D^{\mathrm{b}}(\mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{Z}_1^\flat, T/\mathfrak{S}))$. Using 14.3.3.9, 14.3.3.1 and 18.3.1.2, this yields $i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}_1^\flat}(U))$.

2) It remains to check (b). When $n \geq 0$, then $\mathcal{E}$ satisfies the conditions (a), (b) and (p) of 18.3.1.6.(i), and then the canonical morphism $g^\sharp_{1,T+}(\mathcal{E}) \to g^\sharp_{1,T\cup Z_1+}(\mathcal{E}(^\dagger Z_1))$ is an isomorphism. With 18.3.1.10.3, this implies that $i_1^{\flat !} \circ u_{1,T+}(\mathcal{E}) \xrightarrow{\sim} 0$. Since $i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}_1^\flat}(U))$, since $\underrightarrow{l}^*_{\mathbb{Q}} \circ i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} i_1^{\flat !} \circ u_{1,T+}(\mathcal{E})$, then $i_1^{\flat(\bullet)!} \circ u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} 0$. With 18.3.1.10.1, this yields $u_{1+}^{(\bullet)}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}(^\dagger Z_1)$ is an isomorphism. By applying $\underrightarrow{l}^*_{\mathbb{Q}}$ we are done. □

Corollary 18.3.1.11. *Let $\mathcal{G} \in \mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ (see notation 18.3.1.1). The canonical morphism $u_{T,+}(\mathcal{G}) \to \mathcal{G}(^\dagger Z)$ of 18.2.3.17.3 is an isomorphism.*

Proof. We proceed by induction on r as follows. We have $u_+(\mathcal{G}) \xrightarrow{\sim} v_{1,+}(u_{1,+}(\mathcal{G})) \underset{18.3.1.10.(b)}{\xrightarrow{\sim}} v_{1,+}(\mathcal{G}(^\dagger Z_1)$. By induction hypothesis, since $\mathcal{G}(^\dagger Z_1) \in \mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{X}^\flat, T \cup Z_1/\mathfrak{S})$ (see 18.2.3.17.3), then we get $v_{1,+}(\mathcal{G}(^\dagger Z_1)) \xrightarrow{\sim} \mathcal{G}(^\dagger Z_1)(^\dagger Z^\flat) \xrightarrow{\sim} \mathcal{G}(^\dagger Z)$.

□

Remark 18.3.1.12. Let $\mathcal{G}$ be a coherent $\mathcal{D}^\dagger_{\mathfrak{X}^\sharp}(^\dagger T)_{\mathbb{Q}}$-module which is a locally projective $\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}$-module of finite type. Moreover, if we do not make some assumptions on the exponents, the homomorphism the canonical morphism $u_+(\mathcal{G}) \to \mathcal{G}(^\dagger Z)$ of 18.2.3.17.3 is not always an isomorphism, i.e. the hypothesis $\mathcal{G} \in \mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{X}^\sharp, T/\mathfrak{S})$ in 18.3.1.11 is crucial. Here are two counter-examples:

(a) When $\mathfrak{Z}$ is non-empty, we check that $\rho_{\mathcal{O}_{\mathfrak{X}}(^\dagger T)_{\mathbb{Q}}(-\mathfrak{Z})}$ is not an isomorphism. Indeed, by 8.7.6.11, we reduce to the case where T is empty. Let us suppose $\mathfrak{X}^\sharp/\mathfrak{S}$ that there exist nice local coordinates $t_1, \dots, t_d$ such that $\mathfrak{Z} = V(t_1 \dots t_s)$ (see definition 4.5.2.15). We compute $\mathcal{D}_{\mathfrak{X}^\sharp,\mathbb{Q}}/\mathcal{D}_{\mathfrak{X}^\sharp,\mathbb{Q}}(\partial_{\sharp,1}, \dots, \partial_{\sharp,d}) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X},\mathbb{Q}}$. Following 11.1.1.6.(c), this yields :

$$\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}/\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(t_1\partial_1, \dots, t_d\partial_d) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{X}^\sharp,\mathbb{Q}}} \mathcal{O}_{\mathfrak{X},\mathbb{Q}} \underset{18.2.3.13.(b)}{\xrightarrow{\sim}} u_{T,+}(\mathcal{O}_{\mathfrak{X},\mathbb{Q}}(-\mathfrak{Z})).$$

Moreover, we deduce from 12.1.2.3.1 the first isomorphism:

$$\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}/\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(\partial_1 t_1, \dots, \partial_s t_s, \partial_{s+1}, \dots, \partial_d) \xrightarrow{\sim} \mathcal{O}_{\mathfrak{X}}(^\dagger Z)_{\mathbb{Q}} \xrightarrow{\sim} (\mathcal{O}_{\mathfrak{X},\mathbb{Q}}(-\mathfrak{Z}))(^\dagger Z).$$

When $s \geq 1$, we conclude then noticing $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(t_1\partial_1, \dots, t_d\partial_d) \neq \mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}(\partial_1 t_1, \dots, \partial_s t_s, \partial_{s+1}, \dots, \partial_d)$.

(b) When $\mathfrak{X}$ is proper and T is empty, the fact that $\rho_{\mathcal{G}}$ is an isomorphism implies that the rigid cohomology of the overconvergent isocrystal $\mathcal{G}(^\dagger Z)$ would be of finite dimension. Hence we can consider the overconvergent isocrystal (which comes from a log-isocrystal convergent) described by Berthelot in the last remark of [Ber96c] to notice that this is not always the case.

Corollary 18.3.1.13. *Let $\mathcal{E}$ be an isocrystal on $\mathfrak{X}^\sharp$ overconvergent along T with nilpotent residues. Suppose that there exists a smooth morphism $\mathfrak{X} \to \mathfrak{T}$ of smooth formal schemes over $\mathfrak{S}$ such that $\mathfrak{Z}$ is a relative strict normal crossing divisor of $\mathfrak{X}$ over $\mathfrak{T}$. Then the canonical morphism $\Omega^\bullet_{\mathfrak{X}^\sharp/\mathfrak{T},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E} \to \Omega^\bullet_{\mathfrak{X}/\mathfrak{T},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X},\mathbb{Q}}} \mathcal{E}(^\dagger Z)$ is a quasi-isomorphism.*

Proof. This follows from 18.3.1.11 and 18.2.3.12. □

18.3.2 Overholonomicity of overconvergent F-isocrystals and stability

Theorem 18.3.2.1. *Let $\mathfrak{X}$ be a smooth $\mathcal{V}$-formal scheme, $\mathfrak{Z}$ a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor, Let $\mathfrak{X}^\sharp := (\mathfrak{X}, M(\mathfrak{Z}))$ be the induced log smooth $\mathcal{V}$-log formal scheme and $u\colon \mathfrak{X}^\sharp \to \mathfrak{X}$ the canonical morphism. Let $\mathfrak{Z}_1, \dots, \mathfrak{Z}_l$ be the irreducible components of $\mathfrak{Z}$. Let $\mathcal{G} \in \mathrm{MIC}_0^{\dagger\dagger}(\mathfrak{X}^\sharp/\mathfrak{S})$ (see notation 18.3.1.1). Let $n \in \mathbb{Z}$ and $\mathcal{E} := \mathcal{G}(n\mathfrak{Z})$. Then $u_+(\mathcal{E})$ is overholonomic.*

Proof. For convenience, an object $\mathcal{F}$ of $D(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$ is said to be -1-*overholonomic* if $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$. Let $r \geq -1$, $n \geq 0$ be two integers and let us consider the next properties:

$(P_{n,r})$ If $\dim X \leq n$ then the module $u_+(\mathcal{E})$ is r-overholonomic (see 18.1.2.1).

$(Q_{n,r})$ If $\dim X \leq n$ then the complex $\mathbb{R}\underline{\Gamma}^\dagger_Z u_+(\mathcal{E})$ is r-overholonomic.

$(R_{n,r})$ If $\dim X \leq n$ then the module $\mathcal{E}({}^\dagger Z)$ is r-overholonomic.

(I) *$(P_{n,-1})$, $(Q_{n,-1})$ and $(R_{n,-1})$ are satisfied.*

Since the functor u_+ preserves the coherence, then $(P_{n,-1})$ is satisfied. Following 18.3.1.11, $u_+(\mathcal{G}) \xrightarrow{\sim} \mathcal{G}({}^\dagger Z)$. Since $\mathcal{G}({}^\dagger Z) \xrightarrow{\sim} \mathcal{E}({}^\dagger Z)$ (see 18.2.3.17.2), then $(R_{n,-1})$ is satisfied. By using the exact triangle of localisation with respect to Z, this yields that $(Q_{n,-1})$ is satisfied.

(II) *For any $n \geq 1$, $r \geq 0$, we check the implication $(P_{n-1,r}) \Rightarrow (Q_{n,r})$.*

Let $\mathcal{G}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$ such that $\underrightarrow{l}^*_{\mathbb{Q}}\ \mathcal{G}^{(\bullet)} \xrightarrow{\sim} \mathcal{G}$. We set $\mathcal{E}^{(\bullet)} := \mathcal{G}^{(\bullet)}(n\mathfrak{Z})$. Since this is local, we can suppose we are in the local situation 18.3.1.8 and we use its notation (within notation 18.3.1). and $u_{1+} \circ (l\mathfrak{Z}^\flat) \xrightarrow{\sim} (l\mathfrak{Z}^\flat) \circ u_{1+}$, and since $\mathbb{R}\underline{\Gamma}^\dagger_{Z_1}$ commutes with pushforwards, then we get the isomorphism Since $\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}^\sharp})$, then we get the second isomorphism:

$$\begin{aligned}\mathbb{R}\underline{\Gamma}^\dagger_{Z_1} \circ u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)}) &\xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Z_1} \circ v^{(\bullet)}_{1+} \circ u^{(\bullet)}_{1+} \circ (l\mathfrak{Z}^\flat) \circ (\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1))\\ &\underset{18.2.3.14.6}{\xrightarrow{\sim}} \mathbb{R}\underline{\Gamma}^\dagger_{Z_1} \circ v^{(\bullet)}_{1+} \circ (l\mathfrak{Z}^\flat) \circ u^{(\bullet)}_{1+} \circ (\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1))\\ &\underset{13.2.1.4.2}{\xrightarrow{\sim}} v^{(\bullet)}_{1+} \circ \mathbb{R}\underline{\Gamma}^\dagger_{Z_1} \circ (l\mathfrak{Z}^\flat) \circ u^{(\bullet)}_{1+} \circ (\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1))\\ &\underset{18.2.3.14.5}{\xrightarrow{\sim}} v^{(\bullet)}_{1+} \circ (l\mathfrak{Z}^\flat) \circ \mathbb{R}\underline{\Gamma}^\dagger_{Z_1} \circ u^{(\bullet)}_{1+}(\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1)).\end{aligned} \tag{18.3.2.1.1}$$

Set $\mathcal{F}^{(\bullet)}_1 := i^{\flat(\bullet)!}_1 \circ u^{(\bullet)}_{1+}(\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1))$ and $\mathcal{F}_1 := \underrightarrow{l}^*_{\mathbb{Q}}\ \mathcal{F}^{(\bullet)}_1$. Following 18.3.1.10.(a), $\mathcal{F}^{(\bullet)}_1 \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{Z}^\flat_1})$ and according to 18.3.1.10.c, $\mathcal{F}_1$ is isomorphic to a complex (with two terms) of $D^{\mathrm{b}}(\mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{Z}^\flat_1/\mathfrak{S}))$. Since $i^\flat_1$ is an exact immersion, then following 13.2.1.5.1 we have $i^{\flat(\bullet)}_{1+} \circ i^{\flat(\bullet)!}_1 \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{Z_1}$. Hence, we get the first isomorphism:

$$\begin{aligned} v^{(\bullet)}_{1+} \circ (l\mathfrak{Z}^\flat) \circ \mathbb{R}\underline{\Gamma}^\dagger_{Z_1} \circ u^{(\bullet)}_{1+}(\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1)) &\underset{13.2.1.5.1}{\xrightarrow{\sim}} v^{(\bullet)}_{1+} \circ (l\mathfrak{Z}^\flat) \circ i^{\flat(\bullet)}_{1+} \circ i^{\flat(\bullet)!}_1 \circ u^{(\bullet)}_{1+}(\mathcal{G}^{(\bullet)}(l\mathfrak{Z}_1))\\ = v^{(\bullet)}_{1+} \circ (l\mathfrak{Z}^\flat) \circ i^{\flat(\bullet)}_{1+}(\mathcal{F}^{(\bullet)}_1) &\underset{18.3.1.7.2}{\xrightarrow{\sim}} v^{(\bullet)}_{1+} \circ i^{\flat(\bullet)}_{1+} \circ (l\mathfrak{D}_1)(\mathcal{F}^{(\bullet)}_1) \xrightarrow{\sim} i^{(\bullet)}_{1+} \circ w^{(\bullet)}_{1+} \circ (l\mathfrak{D}_1)(\mathcal{F}^{(\bullet)}_1).\end{aligned} \tag{18.3.2.1.2}$$

Composing 18.3.2.1.1 and 18.3.2.1.2 and applying the functor $\underrightarrow{l}^*_{\mathbb{Q}}$, we get the isomorphism: $\mathbb{R}\underline{\Gamma}^\dagger_{Z_1} u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} i^{(\bullet)}_{1+} \circ w^{(\bullet)}_{1+} \circ (l\mathfrak{D}_1)(\mathcal{F}^{(\bullet)}_1)$. Hence, it follows from 9.4.2.4 that $\mathbb{R}\underline{\Gamma}^\dagger_{Z_1} u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. The hypothesis $(P_{n-1,r})$ implies that $w_{1+} \circ (l\mathfrak{D}_1)(\mathcal{F}_1)$ is r-overholonomic. Hence, so is $\mathbb{R}\underline{\Gamma}^\dagger_{Z_1} u_+(\mathcal{E}) \xrightarrow{\sim} i_{1+} \circ w_{1+} \circ (l\mathfrak{D}_1)(\mathcal{F}_1)$ and therefore $\mathbb{R}\underline{\Gamma}^\dagger_{Z_1} u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)})$. Symmetrically, we obtain for any $i = 1, \ldots, r$ that $\mathbb{R}\underline{\Gamma}^\dagger_{Z_i} u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)})$ is r-overholonomic. Using Mayer-Vietoris exact triangle and the stability of the r-overholonomicity under local cohomological functors, this implies that $\mathbb{R}\underline{\Gamma}^\dagger_{Z} u^{(\bullet)}_{+}(\mathcal{E}^{(\bullet)})$ is r-overholonomic.

(III). *We prove the implication $(P_{n,r-1}) \Rightarrow (R_{n,r})$ for any $n \geq 0$, $r \geq 0$.*

We suppose $\dim X \leq n$. We suppose $r = 0$ (resp. $r \geq 1$). Since $\mathcal{G}({}^\dagger Z) \xrightarrow{\sim} \mathcal{E}({}^\dagger Z)$, then we reduce to the case where $\mathcal{G} = \mathcal{E}$, i.e $l = 0$. Moreover, in the respective case, this implies that $\mathcal{G}({}^\dagger Z)$ is $r-1$-overholonomic (and in particular overcoherent). Let $\alpha\colon \mathfrak{P} \to \mathfrak{X}$ be a smooth morphism. Then $\alpha^{-1}(\mathfrak{Z})$ is a relative to $\mathfrak{P}/\mathfrak{S}$ strict normal crossing divisor. Let $\mathfrak{P}^\sharp := (\mathfrak{P}, M(\alpha^{-1}(\mathfrak{Z})))$ be the induced log smooth $\mathcal{V}$-log formal scheme and $\alpha^\sharp\colon \mathfrak{P}^\sharp \to \mathfrak{X}^\sharp$ be the induced morphism. Then following 18.2.3.16.1, $\alpha^{\sharp!}(\mathcal{G})[-d_{P/X}] \in \mathrm{MIC}^{\dagger\dagger}_0(\mathfrak{P}^\sharp/\mathfrak{S})$ and $({}^\dagger\alpha^{-1}(Z)) \circ \alpha^{\sharp!}(\mathcal{G}) \xrightarrow{\sim} \alpha^! \circ ({}^\dagger(Z))(\mathcal{G})$. Hence, it is sufficient to prove that for any divisor T of X, $\mathcal{G}({}^\dagger Z \cup T)$ is $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-coherent (resp. $\mathbb{D}_{\mathfrak{X}}(\mathcal{G}({}^\dagger Z \cup T))$ is $(r-1)$-overholonomic). Using de Jong's desingularization theorem ([dJ96]), there exist a projective smooth morphism $f\colon \mathfrak{P}' \to \mathfrak{X}$, a smooth scheme X' over k, a closed immersion $\iota'_0\colon X' \hookrightarrow \mathfrak{P}'$, a projective, surjective, generically finite and étale morphism $a_0\colon X' \to X$ such that $a_0 = f_0 \circ \iota'_0$ and $Z'' := a_0^{-1}(Z \cup T)$ is a strict normal crossing divisor of X'. Since $\mathcal{G}({}^\dagger Z \cup T) \in \mathrm{MIC}^{\dagger\dagger}(\mathfrak{X}, Z \cup T/\mathcal{V})$, then following 16.1.11.2 $\mathcal{G}({}^\dagger Z \cup T)$ is a direct summand of $f_+\mathbb{R}\underline{\Gamma}^\dagger_{X'} f^!(\mathcal{G}({}^\dagger Z \cup T))$. By using the stability of the coherence under pushforwards (resp. the stability of the $(r-1)$-overholonomicity under pushforwards and the fact that f_+ commutes with $\mathbb{D}_{\mathfrak{X}}$ because f is proper following 13.2.4.1), it remains to prove that $\mathbb{R}\underline{\Gamma}^\dagger_{X'} f^!(\mathcal{G}({}^\dagger Z \cup T))$ is $\mathcal{D}^\dagger_{\mathfrak{P}',\mathbb{Q}}$-coherent (resp. $\mathbb{D}_{\mathfrak{P}'} \circ \mathbb{R}\underline{\Gamma}^{\dagger}_{X'} \circ f^{!}(\mathcal{G}(^{\dagger}Z \cup T))$ is $(r-1)$-overholonomic. Since this is local on $\mathfrak{P}'$, then we can suppose that there exists a lifting $\iota' \colon \mathfrak{X}' \hookrightarrow \mathfrak{P}'$ of ι'_0 and that Z'' lifts to a relative to $\mathfrak{X}'/\mathfrak{S}$ strict normal crossing divisor $\mathfrak{Z}''$ (see 4.5.2.17). We set $\mathfrak{X}'^{\sharp} := (\mathfrak{X}', M(\mathfrak{Z}''))$. Since this is Zariski local on X', we can suppose the canonical morphism $a_0^{\sharp} \colon X'^{\sharp} \to X^{\sharp}$ (because $Z'' = a_0^{-1}(Z \cup T)$) lifts to a morphism $a^{\sharp} \colon \mathfrak{X}'^{\sharp} \to \mathfrak{X}^{\sharp}$ (see 4.5.2.17). We denote by $a \colon \mathfrak{X}' \to \mathfrak{X}$ the underlying morphism of formal schemes.

We have the isomorphism:

$$\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{(\bullet)!}(\mathcal{G}^{(\bullet)}(^{\dagger}Z \cup T)) \underset{13.2.1.5.1}{\xrightarrow{\sim}} \iota'^{(\bullet)}_{+} \iota'^{(\bullet)!} f^{(\bullet)!}(\mathcal{G}^{(\bullet)}(^{\dagger}Z \cup T)) \xrightarrow{\sim} \iota'^{(\bullet)}_{+} a^{(\bullet)!}(\mathcal{G}^{(\bullet)}(^{\dagger}Z \cup T)).$$

Hence, by using the stability of the coherence (resp. $(r-1)$-overholonomicity) under pushforwards, we come down to prove that $a^{(\bullet)!}(\mathcal{G}^{(\bullet)}(^{\dagger}Z \cup T)) = a^{(\bullet)*}(\mathcal{G}^{(\bullet)}(^{\dagger}Z \cup T)) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}'})$ (resp. $\mathbb{D}_{\mathfrak{X}'} a^{!}_{Z \cup T}(\mathcal{G}(^{\dagger}Z \cup T))$ is $r-1$-overholonomic). Following 11.2.3.5.1, $a^{(\bullet)!}(\mathcal{G}^{(\bullet)}(^{\dagger}Z \cup T)) \in \mathrm{MIC}^{(\bullet)}(\mathfrak{X}', Z \cup T/\mathfrak{S})$. Using 9.1.6.3, we reduce therefore in the non respective case to check that $a^{!}_{Z \cup T}(\mathcal{G}(^{\dagger}Z \cup T)) = a^{*}_{Z \cup T}(\mathcal{G}(^{\dagger}Z \cup T))$ is $\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$-coherent. We get from 18.2.3.16.1 the following isomorphism: $a^{*}_{Z \cup T}(\mathcal{G}(^{\dagger}Z \cup T)) \xrightarrow{\sim} (^{\dagger}Z'')(a^{\sharp *}(\mathcal{G}))$. Thus, it remains to prove that $(^{\dagger}Z'')(a^{\sharp *}(\mathcal{G}))$ is $\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$-coherent (resp. $\mathbb{D}_{\mathfrak{X}'} \circ (^{\dagger}Z'')(a^{\sharp *}(\mathcal{G}))$ is $(r-1)$-overholonomic). We check this separately:

Non-respective case. Since $\mathcal{G} \in \mathrm{MIC}^{\dagger\dagger}_{0}(\mathfrak{X}^{\sharp}/\mathfrak{S})$, then $a^{\sharp *}(\mathcal{G}) \in \mathrm{MIC}^{\dagger\dagger}_{0}(\mathfrak{X}'^{\sharp}/\mathfrak{S})$ (for the nilpotence of the residues, see 10.3.4.4.a). Hence, using 18.3.1.11 this yields $u'_{+}(a^{\sharp *}(\mathcal{G})) \xrightarrow{\sim} (^{\dagger}Z'')(a^{\sharp *}(\mathcal{G}))$. This yields that $(^{\dagger}Z'')(a^{\sharp *}(\mathcal{G}))$ is $\mathcal{D}^{\dagger}_{\mathfrak{X}',\mathbb{Q}}$-coherent.

Respective case. The log-relative duality isomorphism of 18.2.3.13.2 gives: $\mathbb{D}_{\mathfrak{X}'} \circ u'_{+}(a^{\sharp *}(\mathcal{G})) \xrightarrow{\sim} u'_{+}((a^{\sharp *}(\mathcal{G}))^{\vee}(-\mathfrak{Z}''))$. Since $(a^{\sharp *}(\mathcal{G}))^{\vee} \in \mathrm{MIC}^{\dagger\dagger}_{0}(\mathfrak{X}'^{\sharp}/\mathfrak{S})$, then by using $(P_{n,r-1})$ we obtain that $u'_{+}((a^{\sharp *}(\mathcal{G}))^{\vee}(-\mathfrak{Z}''))$ is $(r-1)$-overholonomic. Since $\mathbb{D}_{\mathfrak{X}'} \circ (^{\dagger}Z'')(a^{\sharp *}(\mathcal{G})) \xrightarrow{\sim} \mathbb{D}_{\mathfrak{X}'} \circ u'_{+}(a^{\sharp *}(\mathcal{G}))$, then this yields that $\mathbb{D}_{\mathfrak{X}'} \circ (^{\dagger}Z'')(a^{\sharp *}(\mathcal{G}))$ is $(r-1)$-overholonomic.

(III). *Conclusion.*

For any $n \geq 0$, we know that $(P_{n,-1})$ is true. Also, for any $r \geq -1$, $(P_{0,r})$ is already known (see 18.1.2.8).

We get from the two previous steps that, for any $r \geq 0$ and $n \geq 1$, $(P_{n-1,r}) + (P_{n,r-1}) \Rightarrow (Q_{n,r}) + (R_{n,r})$. Using the exact triangle of localization of $u_{+}(\mathcal{E})$ with respect to Z we get $(Q_{n,r}) + (R_{n,r}) \Rightarrow (P_{n,r})$. Thus, $(P_{n,r-1}) + (P_{n-1,r}) \Rightarrow (P_{n,r})$. This implies that $(P_{n,r})$ is true for any $r \geq -1$ and $n \geq 0$. □

The following is the main result of [CT12]:

Theorem 18.3.2.2 (Caro-Tsuzuki)**.** *Let $(Y, X, \mathfrak{P}, Z)/\mathfrak{S}$ be a smooth c-frame over $\mathfrak{S}$ (see definition 16.2.1.8). Let $E \in F\text{-}\mathrm{MIC}^{\dagger}(X, \mathfrak{P}, Z/K)$. With notation 16.2.1.10.1, $\mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z,+}(E)$ is overholonomic after any base change.*

Proof. Since $\mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z,+}$ commutes with base change, then we reduce to prove the overholonomicity of $\mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z,+}(E)$. Since this is local in $\mathfrak{P}$, we can suppose P is integral. Hence, writing Z as a finite intersection of divisor of P, using 16.2.7.4.1, we reduce to the case where Z is a divisor. Since E admits a semistable reduction (see 10.3.3.3), then there exists a commutative diagram of the form:

$$\begin{array}{ccccc} Y' & \longrightarrow & X' & \xrightarrow{\iota'_0} & \mathfrak{P}' \\ \downarrow b_0 & & \downarrow a_0 & & \downarrow f \\ Y & \longrightarrow & X & \xrightarrow{\iota_0} & \mathfrak{P}, \end{array} \qquad (18.3.2.2.1)$$

such that f is a proper smooth morphism of smooth $\mathcal{V}$-formal schemes, the left square is cartesian, X' is a smooth scheme over k, ι'_0 is a closed immersion, a_0 is a projective, surjective, generically finite and étale morphism, $a_0^{-1}(Z)$ is a strict normal crossing divisor of X' and the F-isocrystal $a_0^{*}(E)$ on Y' overconvergent along $a_0^{-1}(Z)$ is log-extendable on X'. We set $\mathcal{E} := \mathrm{sp}_{X \hookrightarrow \mathfrak{P}, T,+}(E)$. We have $\mathbb{R}\underline{\Gamma}^{\dagger}_{X'} f^{!}_{T}(\mathcal{E}) \xrightarrow{\sim} \mathrm{sp}_{X' \hookrightarrow \mathfrak{P}', f^{-1}(T),+}(a_0^{*}(E))$ (see 16.2.4.3). Then by 16.1.11.2 we check that $\mathcal{E}$ is a direct factor of $f_{T,+}\mathrm{sp}_{X' \hookrightarrow \mathfrak{P}', f^{-1}(T),+}(a_0^{*}(E))$. Since the overholonomicity is stable under direct image by a proper morphism (see 18.1.2.15), it is therefore sufficient to prove that $\mathrm{sp}_{X' \hookrightarrow \mathfrak{P}', f^{-1}(T),+}(a_0^{*}(E))$ is overholonomic. This last statement is local on $\mathfrak{P}'$. Then, we can suppose that there exists a lifting $\iota' \colon \mathfrak{X}' \hookrightarrow \mathfrak{P}'$ of ι'_0 and that $a_0^{-1}(Z)$ lifts to a relative strict normal crossing divisor $\mathfrak{Z}'$ of $\mathfrak{X}'$ over $\mathfrak{S}$.

Then, $\mathrm{sp}_{X' \hookrightarrow \mathfrak{P}', f^{-1}(T),+}(a_0^*(E)) \xrightarrow{\sim} \iota'_+ \mathrm{sp}_*(a_0^*(E))$, where $\mathrm{sp}\colon \mathfrak{X}'_K \to \mathfrak{X}'$ is the specialization morphism of $\mathfrak{X}'$. It remains to check that $\mathrm{sp}_*(a_0^*(E))$ is overholonomic. But since $a_0^*(E)$ is an F-isocrystal on Y' overconvergent along $a_0^{-1}(Z)$ which is log-extendable on X', it follows from 18.3.2.1 that $\mathrm{sp}_*(a_0^*(E))$ is overholonomic. □

Theorem 18.3.2.3. *Let $(Y, X, \mathfrak{P}, Z)$ be a c-frame. Let $\mathcal{E}^{(\bullet)} \in F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ such that $\mathbb{R}\underline{\Gamma}^\dagger_Y \mathcal{E}^{(\bullet)} \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$. Then the following assertions are equivalent:*

(a) The F-complex $\mathcal{E}^{(\bullet)}$ belongs to $F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{povcoh}}(X, \mathfrak{P}, Z/\mathfrak{S})$;

(b) The F-complex $\mathcal{E}^{(\bullet)}$ belongs to $F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$

(c) The F-complex $\mathcal{E}^{(\bullet)}$ belongs to $F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(X, \mathfrak{P}, Z/\mathfrak{S})$

(d) The F-complex $\mathcal{E}^{(\bullet)}$ belongs to $F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y, \mathfrak{P}/\mathfrak{S})$.

Proof. Following 16.3.1.18, we have $(a) \Rightarrow (d)$. By 18.3.2.2, we get by devissage $(d) \Rightarrow (c)$. Finally, the implications $(c) \Rightarrow (b) \Rightarrow (a)$ are tautological. □

Remark 18.3.2.4. The theorem 18.3.2.3 is wrong without Frobenius structure even when $Z = T$ is a divisor. Indeed, by using the counter-example of Berthelot given at the end of [Ber96c], there exists some $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules $\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-coherent which are not $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-coherent. Moreover, following 16.1.1.7, coherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-modules $\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-coherent are $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-overcoherent. This yields that an overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module is not necessarily $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-coherent nor a fortiori $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-overcoherent.

Notation 18.3.2.5. Let $\mathfrak{P}$ be a separated and smooth $\mathfrak{S}$-formal scheme. Let Y be a subvariety of P.

We denote by $(F\text{-})D^{\mathrm{b}}_{\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V})$ (resp. $(F\text{-})D^{\mathrm{b}}_{\mathrm{h}}(Y, X, \mathfrak{P}, Z/\mathcal{V})$) the full subcategory of $(F\text{-})D^{\mathrm{b}}_{\mathrm{h}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ of $(F\text{-})$complexes $\mathcal{E}$ such that there exists an isomorphism of the form $\mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}$.

We denote by $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V})$ the strictly full subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$ of complexes $\mathcal{E}^{(\bullet)}$ such that there exist an isomorphism of the form $\mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$. With notation 16.3.1.15, we get the equality $F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V}) = F\text{-}\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V})$.

Corollary 18.3.2.6. *Let $\mathfrak{P}$ and $\mathfrak{P}'$ be a two separated and smooth $\mathfrak{S}$-formal schemes. Let Y (resp. Y') be a subvariety of $\mathfrak{P}$ (resp. $\mathfrak{P}'$). Set $\mathfrak{P}'' := \mathfrak{P} \times \mathfrak{P}'$ and $Y'' := Y \times Y'$. We have the factorisations*

$$-\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{S}}} -\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y, \mathfrak{P}/\mathcal{V}) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y', \mathfrak{P}'/\mathcal{V}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{dev}}(Y'', \mathfrak{P}''/\mathcal{V}), \tag{18.3.2.6.1}$$

$$-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}^{(\bullet)}_{\mathfrak{P}}} -\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V}) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V}). \tag{18.3.2.6.2}$$

Proof. By using 16.3.1.18 and 18.3.2.3, this is a straightforward consequence of 16.3.2.2.2. □

18.3.3 Berthelot's conjectures on the holonomicity stability on projective and smooth $\mathcal{V}$-formal schemes

The theorem 18.3.3.1 below means that the conjecture [Ber02, 5.3.6.D)] of Berthelot is satisfied when the divisor is ample.

Theorem 18.3.3.1. *Let $\mathfrak{P}$ be a proper and smooth $\mathcal{V}$-formal scheme, H_0 be an ample divisor of P_0, $\mathfrak{A}$ the open of $\mathfrak{P}$ complementary to H_0. Let $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}}({}^\dagger H_0)_{\mathbb{Q}})$ such that $\mathcal{E}|\mathfrak{A} \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{A},\mathbb{Q}})$. Hence $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{h}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.*

Proof. There exists a closed immersion $\alpha_0\colon P_0 \hookrightarrow \mathbb{P}^n_k$ such that $(\mathbb{P}^n_k \setminus \mathbb{A}^n_k) \cap P_0 = H_0$. Following the theorem of Berthelot-Kashiwara $\alpha_0^! \circ \alpha_{0+}(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}$ (see 9.3.5.9). Moreover $\mathcal{E}|\mathfrak{A}$ is holonomic if and only if so is $\alpha_{0+}(\mathcal{E})|\widehat{\mathbb{A}}^n_{\mathcal{V}}$ (for the holonomic version of the theorem of Berthelot-Kashiwara, see 15.2.4.19). As $\alpha_{0+}(\mathcal{E})$ is a coherent $F\text{-}\mathcal{D}^\dagger_{\widehat{\mathbb{P}}^n_{\mathcal{V}}}({}^\dagger\mathbb{P}^n_k \setminus \mathbb{A}^n_k)_{\mathbb{Q}}$-module such that $\alpha_{0+}(\mathcal{E})|\widehat{\mathbb{A}}^n_{\mathcal{V}}$ is a holonomic $F\text{-}\mathcal{D}^\dagger_{\widehat{\mathbb{A}}^n_{\mathcal{V}},\mathbb{Q}}$-module, since the overholonomicity is closed by extraordinary inverse image (see 18.1.2.14), we reduce then to the case where $\mathfrak{P} = \widehat{\mathbb{P}}^n_{\mathcal{V}}$ and $H_0 = \mathbb{P}^n_k \setminus \mathbb{A}^n_k$.

We proceed now by induction on the lexicographical order $(\dim \mathrm{Supp}(\mathcal{E}), N_{\mathrm{cmax}})$, where $\dim \mathrm{Supp}(\mathcal{E})$ is the dimension of the support of $\mathcal{E}$ and N_{cmax} means the number of irreducible components of the support of $\mathcal{E}$ whose dimension is $\dim \mathrm{Supp}(\mathcal{E})$, i.e., its maximal dimension. The case where $\dim \mathrm{Supp}(\mathcal{E}) \leq 1$ is a consequence of 15.3.3.4, 15.3.3.9 and 18.3.2.3. Then let us suppose $\dim \mathrm{Supp}(\mathcal{E}) \geq 1$.

For any integer j, $H^j(\mathcal{E})$ is a coherent $F\text{-}\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-module such that $\mathcal{E}|\mathfrak{A}$ is a holonomic $F\text{-}\mathcal{D}^{\dagger}_{\mathfrak{A},\mathbb{Q}}$-module. Moreover, to establish that $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{ovhol}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$, it is sufficient to check that for any integer j, $H^j(\mathcal{E})$ is an overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. We reduce therefore to the case where the complex $\mathcal{E}$ is in fact a module.

Let us denote by X_0 the support of $\mathcal{E}$. Let $\mathfrak{U}$ be an affine open of $\mathfrak{P}$ included in $\mathfrak{A}$ such that $Y_0 := X_0 \cap U_0$ is integral, smooth and dense in an irreducible component of X of dimension $\dim X$. There exist a lifting $v \colon \mathfrak{Y} \hookrightarrow \mathfrak{U}$ of the closed immersion $Y_0 \hookrightarrow U_0$. Following the theorem of Berthelot-Kashiwara (see 15.2.4.19), as $\mathcal{E}|\mathfrak{U}$ is holonomic and with support in Y_0, then $v^!(\mathcal{E}|\mathfrak{U})$ is a holonomic $F\text{-}\mathcal{D}^{\dagger}_{\mathfrak{Y},\mathbb{Q}}$-module. By 15.3.1.20, shrinking $\mathfrak{U}$ and $\mathfrak{Y}$ if necessary, we can suppose that $v^!(\mathcal{E}|\mathfrak{U})$ is $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent. Let us denote by T_0 the reduced divisor of P_0 complementary to U_0 (see 17.6.1.5). Shrinking $\mathfrak{U}$ if necessary, we can suppose $\mathfrak{U}$ endowed with local coordinates $x_1, \ldots, x_n$ such that $\mathfrak{Y}$ is defined by the ideal generated by $x_1, \ldots, x_r$. Moreover, via [Ked05, Theorem 2] (applied to the point 0 and with the irreducible divisors defined by $x_1 = 0, \ldots, x_r = 0$), shrinking $\mathfrak{U}$ if necessary, we can suppose that there exist a finite etale morphism $g_0 \colon U_0 \to \mathbb{A}^n_k$ such that $g_0(Y_0) \subset \mathbb{A}^{n-r}_k$. Thanks to theorems 17.7.4.6, 17.6.3.3 and 18.3.2.2, this yields that $\mathcal{E}({}^{\dagger}T_0)$ is overholonomic. We conclude the induction by using the triangle of localisation of $\mathcal{E}$ in T_0. □

Remark 18.3.3.2. The theorem 18.3.3.1 is false if the complex $\mathcal{E}$ is not endowed with a Frobenius structure. Indeed, it is about using the example gives every to the end of [Ber96c] by Berthelot where $\mathfrak{P} = \widehat{\mathbb{P}}^1_{\mathcal{V}}$ and $A = \mathbb{G}_{m,k}$. Following this example, there exist a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-module $\mathcal{E}$ such that $\mathcal{E}|\mathfrak{A}$ is $\mathcal{O}_{\mathfrak{A},\mathbb{Q}}$-coherent and then $\mathcal{D}^{\dagger}_{\mathfrak{A},\mathbb{Q}}$-holonomic and $\mathcal{D}^{\dagger}_{\mathfrak{A},\mathbb{Q}}$-overholonomic. But, this module $\mathcal{E}$ is same not $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-coherent.

With this same counter-example, the theorem 18.3.3.4 is false without Frobenius structure.

Corollary 18.3.3.3. *Let $\mathfrak{P}$ be a proper and smooth $\mathcal{V}$-formal scheme, H_0 be an ample divisor of P_0, $\mathfrak{A}$ the open of $\mathfrak{P}$ complementary to H_0, X_0 be a closed smooth subscheme of P_0 and $Y_0 := X_0 \setminus H_0$. Then* $\mathrm{MIC}^{\dagger\dagger}(X_0, \mathfrak{P}, H_0/\mathcal{V})$ *(see notation 12.2.1.4) is equal to the full subcategory of* $\mathrm{Coh}(X_0, \mathfrak{P}, H_0/\mathcal{V})$ *(see notation 9.3.7.4) whose objects $\mathcal{E}$ satisfy the following condition: $\mathcal{E}|\mathfrak{A} \in \mathrm{MIC}^{\dagger\dagger}(Y_0, \mathfrak{A}/\mathcal{V})$.*

Proof. It follows from 15.1.5.4 and from the holonomic version of the Berthelot-Kashiwara theorem of 15.2.4.19 that $\mathcal{E}|\mathfrak{A} \in \mathrm{MIC}^{\dagger\dagger}(Y_0, \mathfrak{A}/\mathcal{V})$ Following 18.3.3.1, this implies that a coherent $F\text{-}\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}}$-module $\mathcal{E}$ tel that $\mathcal{E}|\mathfrak{A}$ is in the essential image of $\mathrm{sp}_{Y_0 \hookrightarrow \mathfrak{A},+}$ is a F-isocrystal overconvergent on Y_0. The converse is straightforward.

□

The theorem 18.3.3.1 remains valid by replacing "holonomic " by "having finite extraordinary fibers" (see the definition 15.3.2.1):

Theorem 18.3.3.4. *Let $\mathfrak{P}$ be a proper and smooth $\mathcal{V}$-formal scheme, H_0 be an ample divisor of P_0, $\mathfrak{A}$ the open of $\mathfrak{P}$ complementary to H_0 and $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{P}}({}^{\dagger}H_0)_{\mathbb{Q}})$. If $\mathcal{E}|\mathfrak{A}$ has finite extraordinary fibers (see 15.3.2.1) then $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{h}}(\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}})$.*

Proof. The proof is similar to that of 18.3.3.1 but with slight changes: we reduce similarly to the case where $P_0 = \mathbb{P}^n_k$ and $H_0 = \mathbb{P}^n_k \setminus \mathbb{A}^n_k$. We still proceed by induction on the lexicographical order of $(\dim \mathrm{Supp}(\mathcal{E}), N_{\mathrm{cmax}})$. The case $\dim \mathrm{Supp}(\mathcal{E}) \leq 1$ is still a consequence of 15.3.3.4, 15.3.3.9 and 18.3.2.3. The difference here is that we can not reduce directly to the case where $\mathcal{E}$ is a module because the property of having finite extraordinary fibers does not "a priori" hold for the cohomological spaces $H^l(\mathcal{E})$, $l \in \mathbb{Z}$. Let us denote by X_0 the support of $\mathcal{E}$. By replacing 15.3.1.20 by 15.3.2.5, we check similarly (to the proof of 18.3.3.1) that there exist an affine open formal subscheme $\mathfrak{U}$ of $\mathfrak{P}$ included in $\mathfrak{A}$ such that $Y_0 := X_0 \cap U_0$ is integral, smooth and dense in a irreducible component of X of dimension $\dim X$ and such that $v^!(\mathcal{E}|\mathfrak{U}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{Y},\mathbb{Q}})$. Moreover, since $\mathcal{E}|\mathfrak{U} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{\dagger}_{\mathfrak{U},\mathbb{Q}})$ and has its support in Y_0, then following the theorem of Berthelot-Kashiwara (see 9.3.5.9), for any integer r, $v^!(H^r(\mathcal{E}|\mathfrak{U})) \xrightarrow{\sim} H^r(v^!(\mathcal{E}|\mathfrak{U}))$, Hence, $v^!(H^r(\mathcal{E})|\mathfrak{U})$ is $\mathcal{O}_{\mathfrak{Y},\mathbb{Q}}$-coherent. Let us denote by T_0 the reduced divisor of P_0 complementary to U_0. By using [Ked05, Theorem 2], shrinking U_0 if necessary, we can suppose that there exist a finite etale morphism $g_0 \colon U_0 \to \mathbb{A}^n_k$ such that $g_0(Y_0) \subset \mathbb{A}^{n-r}_k$. Via the theorems 17.7.4.6, 17.6.3.3 and 18.3.2.2, this yields that $(H^r\mathcal{E})(^\dagger T_0)$ is overholonomic. As $(H^r\mathcal{E})(^\dagger T_0) \xrightarrow{\sim} H^r(\mathcal{E}(^\dagger T_0))$, the complex $\mathcal{E}(^\dagger T_0)$ is then overholonomic. We conclude the induction by using the triangle of localisation of $\mathcal{E}$ with respect to T_0. □

Theorem 18.3.3.5. *Let $\mathfrak{P}$ be a projective and smooth $\mathcal{V}$-formal scheme, $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. The following assertions are equivalent :*

(a) The F-complex $\mathcal{E}$ belongs to $F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.

(b) The F-complex $\mathcal{E}$ has finite extraordinary fibers.

(c) The F-complex $\mathcal{E}$ belongs to $F\text{-}D^{\mathrm{b}}_{\mathrm{ovcoh}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.

(d) The F-complex $\mathcal{E}$ belongs to $F\text{-}D^{\mathrm{b}}_{\mathrm{h}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$.

Proof. Following 18.3.2.3, we already know $(d) \Leftrightarrow (c)$. The implication $(c) \Rightarrow (b)$ is clear. Using 18.1.2.9.(d) and 18.1.2.6, we get the implication $(d) \Rightarrow (a)$. Let us check now $(a) \Rightarrow (d)$. Let us suppose then $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$. Since $\mathfrak{P}$ is projective, using the theorem of Berthelot-Kashiwara, we reduce to the case where $\mathfrak{P} = \widehat{\mathbb{P}}^n_{\mathcal{V}}$. Let $\mathcal{H}$ be the hyperplan of $\widehat{\mathbb{P}}^n_{\mathcal{V}}$ defined by $u_0 = 0$, i.e. $H_0 := \mathbb{P}^n_k \setminus \mathbb{A}^n_k$. Hence, following 18.3.3.1, $\mathcal{E}(^\dagger H_0)$ is overholonomic. Via the triangle of localisation of $\mathcal{E}$ in H_0, this yields that $\mathbb{R}\underline{\Gamma}^\dagger_{H_0}(\mathcal{E})$ is also holonomic. Denoting by $\alpha \colon \mathcal{H} \hookrightarrow \widehat{\mathbb{P}}^n_{\mathcal{V}}$ the canonical closed immersion we get $\alpha^!(\mathcal{E}) \xrightarrow{\sim} \alpha^!(\mathbb{R}\underline{\Gamma}^\dagger_{H_0}(\mathcal{E}))$. Following the holonomic version of the theorem of Berthelot-Kashiwara (see 15.2.4.19) this yields that $\alpha^!(\mathcal{E})$ is holonomic. By proceeding by induction on n, we get then the overholonomicity of $\alpha^!(\mathcal{E})$. Since $\mathbb{R}\underline{\Gamma}^\dagger_{H_0}(\mathcal{E}) \xrightarrow{\sim} \alpha_+\alpha^!(\mathcal{E})$ (see 14.3.3.1), then using 15.2.4.19 we get the overholonomicity of $\mathbb{R}\underline{\Gamma}^\dagger_{H_0}(\mathcal{E})$. Via the localisation triangle of $\mathcal{E}$ with respect to H_0, this yields that $\mathcal{E}$ is also overholonomic. Hence, we have checked $(a) \Rightarrow (d)$. Finally, to establish the implication $(b) \Rightarrow (d)$ we proceed similarly to the proof of $(a) \Rightarrow (d)$ by replacing the use of theorem 18.3.3.1 by 18.3.3.4. □

Via the stability 18.1.2.15 and 18.1.2.14 of the overholonomicity, we obtain the following corollary which answers positively in the projective case to the conjectures [Ber02, 5.3.6.A),B)] of Berthelot.

Corollary 18.3.3.6. *Let $f \colon \mathfrak{P}' \to \mathfrak{P}$ be a morphism of $\mathcal{V}$-formal schemes projective smooth, $\mathcal{E} \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$, $\mathcal{E}' \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P}',\mathbb{Q}})$. Hence $f_+(\mathcal{E}') \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ and $f^!(\mathcal{E}) \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P}',\mathbb{Q}})$.*

This will give the stability under Grothendieck six operations in the context of quasi-projective varieties (see 19.2.4).

Chapter 19

Coefficients stable under Grothendieck's six operations

Suppose the residue field k of $\mathcal{V}$ is a perfect field of characteristic $p > 0$. When we work with F-complex, we suppose there exists an automorphism $\sigma \colon \mathcal{V} \xrightarrow{\sim} \mathcal{V}$ which is a lifting of the sth Frobenius power of k. The data s and σ are fixed in the remaining.

19.1 Data of coefficients

19.1.1 Definitions

Definition 19.1.1.1. A *data of coefficients* $\mathfrak{C}$ *over* $\mathcal{V}$ will be the data for any object $\mathcal{W}$ of DVR$(\mathcal{V})$ (see notation 9.2.6.12), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$ of a strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$, which will be denoted by $\mathfrak{C}(\mathfrak{X}/\mathcal{W})$, or simply $\mathfrak{C}(\mathfrak{X})$ if there is no ambiguity with the base $\mathcal{W}$. If there is no ambiguity with $\mathcal{V}$, we simply say a *data of coefficients*.

Examples 19.1.1.2. We have the following data of coefficients.

(a) We define the data of coefficients $\mathfrak{B}_{\emptyset}$ as follows: for any object $\mathcal{W}$ of DVR$(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\mathfrak{B}_{\emptyset}(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ whose unique object is $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$ (where $\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$ is the constant object $\mathcal{O}^{(m)}_{\mathfrak{X}} = \mathcal{O}_{\mathfrak{X}}$ for any $m \in \mathbb{N}$ with the identity as transition maps).

(b) We will need the larger data of coefficients $\mathfrak{B}_{\mathrm{div}}$ defined as follows: for any object $\mathcal{W}$ of DVR$(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\mathfrak{B}_{\mathrm{div}}(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ whose objects are of the form $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T)$, where T is any divisor of the special fiber of $\mathfrak{X}$. From Corollary 12.2.7.2, we have $\mathcal{B}^{(\bullet)}_{\mathfrak{X}}(T) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$.

(c) We define $\mathfrak{B}_{\mathrm{cst}}$ as follows: for any object $\mathcal{W}$ of DVR$(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\mathfrak{B}_{\mathrm{cst}}(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ whose objects are of the form $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\mathcal{O}^{(\bullet)}_{\mathfrak{X}}$, where Y is a subvariety of the special fiber of $\mathfrak{X}$ and the functor $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}$ is defined in 13.1.5.1. Recall following 13.1.5.5, theses objects are coherent.

(d) We define $\mathfrak{M}_{\emptyset}$ (resp. $\mathfrak{M}_{\mathrm{sncd}}$, resp. $\mathfrak{M}_{\mathrm{div}}$) as follows: for any object $\mathcal{W}$ of DVR$(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\mathfrak{M}_{\emptyset}(\mathfrak{X})$ (resp. $\mathfrak{M}_{\mathrm{sncd}}(\mathfrak{X})$, resp. $\mathfrak{M}_{\mathrm{div}}(\mathfrak{X})$) is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ consisting of objects of the form $({}^{\dagger}T)(\mathcal{E}^{(\bullet)})$, where $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(Z, \mathfrak{X}/K)$ (see notation 12.2.1.6), with Z is a smooth subvariety of the special fiber of $\mathfrak{X}$, and where T is an empty divisor (resp. a strict normal crossing divisor, resp. a divisor) of Z. Recall that following 13.2.2.1, these objects are indeed coherent.

Definition 19.1.1.3. In order to be precise, let us fix some terminology. Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients over $\mathcal{V}$.

(a) We say that the data of coefficients $\mathfrak{C}$ is stable under pushforwards if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any *realizable* (see 13.2.3.1) morphism $g\colon \mathfrak{X}' \to \mathfrak{X}$ of smooth formal schemes over $\mathcal{W}$, for any object $\mathcal{E}'^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{X}')$ with proper support over X via g, the complex $g_+(\mathcal{E}'^{(\bullet)})$ is an object of $\mathfrak{C}(\mathfrak{X})$.

(b) We say that the data of coefficients $\mathfrak{C}$ is stable under extraordinary pullbacks (resp. under *smooth* extraordinary pullbacks) if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any morphism (resp. *smooth* morphism) $f\colon \mathfrak{Y} \to \mathfrak{X}$ of smooth formal schemes over $\mathcal{W}$, for any object $\mathcal{E}^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{X})$, we have $f^!(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y})$.

(c) We still say that the data of coefficients $\mathfrak{C}$ satisfies the first property (resp. the second property) of Berthelot-Kashiwara theorem or satisfies $BK^!$ (resp. BK_+) for short if the following property is satisfied: for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any closed immersion $u\colon \mathfrak{Z} \hookrightarrow \mathfrak{X}$ of smooth formal schemes over $\mathcal{W}$, for any object $\mathcal{E}^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{X})$ with support in $\mathfrak{Z}$, we have $u^!(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Z})$ (resp. for any object $\mathcal{G}^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{Z})$, we have $u_+(\mathcal{G}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{X})$). Remark that $BK^!$ and BK_+ hold if and only if the data of coefficients $\mathfrak{C}$ satisfies (an analogue of) Berthelot-Kashiwara theorem, which justifies the terminology.

(d) We say that the data of coefficients $\mathfrak{C}$ is stable under base change if for any morphism $\mathcal{W} \to \mathcal{W}'$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any object $\mathcal{E}^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{X})$, we have $\mathcal{W}'\widehat{\otimes}^{\mathbb{L}}_{\mathcal{W}}\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X} \times_{\operatorname{Spf}\mathcal{W}} \operatorname{Spf}\mathcal{W}')$.

(e) We say that the data of coefficients $\mathfrak{C}$ is stable under tensor products (resp. duals) if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any objects $\mathcal{E}^{(\bullet)}$ and $\mathcal{F}^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{X})$ we have $\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X})$ (resp. $\mathbb{D}_{\mathfrak{X}}(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{X})$).

(f) We say that the data of coefficients $\mathfrak{C}$ is stable under local cohomological functors (resp. under localizations outside a divisor), if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any object $\mathcal{E}^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{X})$, for any subvariety Y (resp. for any divisor T) of the special fiber of $\mathfrak{X}$, we have $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X})$ (resp. $({}^{\dagger}T)(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{X})$).

(g) We say that the data of coefficients $\mathfrak{C}$ is stable under cohomology if, for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any object $\mathcal{E}^{(\bullet)}$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$, the property $\mathcal{E}^{(\bullet)}$ is an object of $\mathfrak{C}(\mathfrak{X})$ is equivalent to the fact that, for any integer n, $H^n(\mathcal{E}^{(\bullet)})$ is an object of $\mathfrak{C}(\mathfrak{X})$.

(h) We say that the data of coefficients $\mathfrak{C}$ is stable under shifts if, for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any object $\mathcal{E}^{(\bullet)}$ of $\mathfrak{C}(\mathfrak{X})$, for any integer n, $\mathcal{E}^{(\bullet)}[n]$ is an object of $\mathfrak{C}(\mathfrak{X})$.

(i) We say that the data of coefficients $\mathfrak{C}$ is stable by devissages if $\mathfrak{C}$ is stable by shifts and if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any exact triangle $\mathcal{E}_1^{(\bullet)} \to \mathcal{E}_2^{(\bullet)} \to \mathcal{E}_3^{(\bullet)} \to \mathcal{E}_1^{(\bullet)}[1]$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$, if two objects are in $\mathfrak{C}(\mathfrak{X})$, then so is the third one.

(j) We say that the data of coefficients $\mathfrak{C}$ is stable under direct summands if, for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$ we have the following property: any direct summand in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ of an object of $\mathfrak{C}(\mathfrak{X})$ is an object of $\mathfrak{C}(\mathfrak{X})$.

(k) We say that $\mathfrak{C}$ contains $\mathfrak{D}$ (or $\mathfrak{D}$ is contained in $\mathfrak{C}$) if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$ the category $\mathfrak{D}(\mathfrak{X})$ is a full subcategory of $\mathfrak{C}(\mathfrak{X})$.

(l) We say that the data of coefficients $\mathfrak{C}$ is local if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any open covering $(\mathfrak{X}_i)_{i\in I}$ of $\mathfrak{X}$, for any object $\mathcal{E}^{(\bullet)}$ of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$, we have $\mathcal{E}^{(\bullet)} \in \operatorname{Ob}\mathfrak{C}(\mathfrak{X})$ if and only if $\mathcal{E}^{(\bullet)}|\mathfrak{X}_i \in \operatorname{Ob}\mathfrak{C}(\mathfrak{X}_i)$ for any $i \in I$. For instance, it follows from 8.4.5.8.b that the data of coefficients $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$ is local.

(m) We say that the data of coefficients $\mathfrak{C}$ is quasi-local if for any object $\mathcal{W}$ of DVR($\mathcal{V}$), for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, for any open immersion $j\colon \mathfrak{Y} \hookrightarrow \mathfrak{X}$ for any object $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X})$, we have $j^{(\bullet)!}\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{Y})$.

We finish the subsection with some notation.

19.1.1.4 (Duality)**.** Let $\mathfrak{C}$ be a data of coefficients. We define its dual data of coefficients $\mathfrak{C}^\vee$ as follows: for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\mathfrak{C}^\vee(\mathfrak{X})$ is the subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ of objects $\mathcal{E}^{(\bullet)}$ such that $\mathbb{D}_{\mathfrak{X}}(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{X})$.

Notation 19.1.1.5. Let $\mathfrak{C}$ be a data of coefficients. We denote by $\mathfrak{C}^+$ the smallest data of coefficients containing $\mathfrak{C}$ and stable under shifts. We define by induction on $n \in \mathbb{N}$ the data of coefficients $\Delta_n(\mathfrak{C})$ as follows: for $n = 0$, we put $\Delta_0(\mathfrak{C}) = \mathfrak{C}^+$. Suppose $\Delta_n(\mathfrak{C})$ is constructed for $n \in \mathbb{N}$. For any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\Delta_{n+1}(\mathfrak{C})(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ of objects $\mathcal{E}^{(\bullet)}$ such that there exists an exact triangle of the form $\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to \mathcal{E}^{(\bullet)}[1]$ such that $\mathcal{F}^{(\bullet)}$ and $\mathcal{G}^{(\bullet)}$ are objects of $\Delta_n(\mathfrak{C})(\mathfrak{X})$. Finally, we put $\Delta(\mathfrak{C}) := \cup_{n\in\mathbb{N}}\Delta_n(\mathfrak{C})$. The data of coefficients $\Delta(\mathfrak{C})$ is the smallest data of coefficients containing $\mathfrak{C}$ and stable under devissage.

Example 19.1.1.6. Using the isomorphisms 13.1.5.6.2, and Theorem 13.2.1.4, we check that $\mathfrak{B}^+_{\mathrm{cst}}$ satisfies BK_+, and is stable under local cohomological functors, extraordinary pullbacks and tensor products.

The following lemma is obvious.

Lemma 19.1.1.7. *Let $\mathfrak{D}$ be a data of coefficients over $\mathcal{V}$. If $\mathfrak{D}$ is stable under pushforwards (resp. extraordinary pullbacks, resp. smooth extraordinary pullbacks, resp. tensor products, resp. base change, resp. local cohomological functors, resp. localisation outside a divisor) then so is $\Delta(\mathfrak{D})$. If $\mathfrak{D}$ satisfies BK_+ (resp. is quasi-local) then so is $\Delta(\mathfrak{D})$. If $\mathfrak{D}$ satisfies $BK^!$ and is stable under local cohomological functors then so is $\Delta(\mathfrak{D})$.*

19.1.1.8. Beware also that if $\mathfrak{D}$ is local (resp. stable under cohomology, resp. satisfies $BK^!$), then it is not clear that so is $\Delta(\mathfrak{D})$.

Since the converse of 19.1.1.7 is not true, let us introduce the following definition.

Definition 19.1.1.9. Let $\mathfrak{D}$ be a data of coefficients over $\mathcal{V}$. Let P be one of the stability property of 19.1.1.3. We say that $\mathfrak{D}$ is Δ-stable under P if there exists a data of coefficients $\mathfrak{D}'$ over $\mathcal{V}$ such that $\Delta(\mathfrak{D}') = \Delta(\mathfrak{D})$ and $\mathfrak{D}'$ is stable under P.

Lemma 19.1.1.10. *The data of coefficients $\mathfrak{D}$ is Δ-stable under pushforwards (resp. extraordinary pullbacks, resp. smooth extraordinary pullbacks, resp. tensor products, resp. base change, resp. local cohomological functors, resp. localisation outside a divisor) if and only if $\Delta(\mathfrak{D})$ is stable under pushforwards (resp. extraordinary pullbacks, resp. smooth extraordinary pullbacks, resp. tensor products, resp. base change, resp. local cohomological functors, resp. localisation outside a divisor). The data of coefficients $\mathfrak{D}$ satisfies Δ-BK_+ (resp. is Δ-quasi local) if and only if $\Delta(\mathfrak{D})$ satisfies BK_+ (is quasi-local).*

Proof. This is a translation of Lemma 19.1.1.7. □

Beware, it is not clear that if $\mathfrak{D}$ satisfies Δ-$BK^!$ and is Δ-stable under local cohomological functors then $\Delta(\mathfrak{D})$ satisfies $BK^!$.

19.1.2 Overcoherence, (over)holonomicity (after any base change) revisited and complements

Definition 19.1.2.1. Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients.

(a) We denote by $S_0(\mathfrak{D},\mathfrak{C})$ the data of coefficients defined as follows: for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $S_0(\mathfrak{D},\mathfrak{C})(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ of objects $\mathcal{E}^{(\bullet)}$ satisfying the following properties:

   ($\star$) for any smooth morphism $f\colon \mathfrak{Y} \to \mathfrak{X}$ of smooth $\mathcal{W}$-formal schemes, for any object $\mathcal{F}^{(\bullet)} \in \mathfrak{D}(\mathfrak{Y})$, we have $\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^!(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y})$.

(b) We denote by $S(\mathfrak{D},\mathfrak{C})$ the data of coefficients defined as follows: for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $S(\mathfrak{D},\mathfrak{C})(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ of objects $\mathcal{E}^{(\bullet)}$ satisfying the following ($\star\star$) property

(⋆⋆) for any morphism $\mathcal{W} \to \mathcal{W}'$ of $\mathrm{DVR}(\mathcal{V})$, we have $\mathcal{W}'\widehat{\otimes}^{\mathbb{L}}_{\mathcal{W}}\mathcal{E}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X} \times_{\mathrm{Spf}\,\mathcal{W}} \mathrm{Spf}\,\mathcal{W}')$.

(c) Let $\sharp$ be a symbol so that either $S_\sharp = S_0$ or $S_\sharp = S$.

Examples 19.1.2.2. We retrieve previous notions as follows:

(a) We denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}} = S_0(\mathfrak{B}_{\mathrm{div}}, \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}})$ (see the second example of 19.1.1.2). We denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}} = S(\mathfrak{B}_{\mathrm{div}}, \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}})$. These notions correspond to that of the overcoherence (after any base change) as defined in 15.3.6.1. More precisely, for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, we get the equality $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\mathfrak{X}) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$.

(b) We put $\mathfrak{H}_0 := S(\mathfrak{B}_{\mathrm{div}}, \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}})$ and by induction on $i \in \mathbb{N}$, we put $\mathfrak{H}_{i+1} := \mathfrak{H}_i \cap S(\mathfrak{B}_{\mathrm{div}}, \mathfrak{H}_i^{\vee})$ (see Notation 19.1.1.4). The coefficients of $\mathfrak{H}_i$ are called *i-overholonomic after any base change.* We get the data of coefficients $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}} := \mathfrak{H}_\infty := \cap_{i\in\mathbb{N}}\mathfrak{H}_i$ whose objects are called *overholonomic after any base change.* This correspond to that of the overholonomicity as defined in 18.1.2.2, i.e. for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, we get the equality $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}(\mathfrak{X}) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$.

(c) Replacing S by S_0 in the definition of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}$, we get a data of coefficients that we will denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}$. This correspond to that of the overholonomicity after any base change as defined in 18.1.2.2, i.e. for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, we get the equality $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(\mathfrak{X}) = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$.

(d) Finally, we set $\underrightarrow{LM}_{\mathbb{Q},\star} := \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star} \cap \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}$, for $\star \in \{\mathrm{ovcoh}, \mathrm{oc}, \mathrm{h}, \mathrm{ovhol}\}$.

Remark 19.1.2.3. (a) Let $\mathfrak{C}$ be a data of coefficients. The data of coefficients $\mathfrak{C}$ is stable under smooth extraordinary inverse image and localizations outside a divisor (resp. under smooth extraordinary inverse image, localizations outside a divisor, and base change) if and only if $S_0(\mathfrak{B}_{\mathrm{div}}, \mathfrak{C}) = \mathfrak{C}$ (resp. $S(\mathfrak{B}_{\mathrm{div}}, \mathfrak{C}) = \mathfrak{C}$).

(b) By construction, we remark that $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}$ is the biggest data of coefficients which contains $\mathfrak{B}_{\mathrm{div}}$, is stable by devissage, dual functors and the operation $S_0(\mathfrak{B}_{\mathrm{div}}, -)$. Moreover, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}$ is the biggest data of coefficients which contains $\mathfrak{B}_{\mathrm{div}}$, is stable by devissage, dual functors and the operation $S(\mathfrak{B}_{\mathrm{div}}, -)$.

We will need later the following Lemmas.

Lemma 19.1.2.4. *Let $\mathfrak{C}$ be a data of coefficients stable under devissage.*

(a) We have the equality $\Delta(\mathfrak{B}_{\mathrm{div}}) = \Delta(\mathfrak{B}_{\mathrm{cst}})$ (see Notation 19.1.1.2).

(b) The data of coefficients $\mathfrak{C}$ is stable under local cohomological functors if and only if it is stable under localizations outside a divisor (see Definitions 19.1.1.3).

Proof. Both statements are checked by using exact triangles of localisation 13.1.4.3.3 and Mayer-Vietoris exact triangles 13.1.4.15.2. □

Lemma 19.1.2.5. *Let $\mathfrak{C}$ be a data of coefficients stable under local cohomological functors. Then the data of coefficients $\mathfrak{C}$ is stable under smooth extraordinary pullbacks and satisfies $BK^!$ if and only if $\mathfrak{C}$ is stable under extraordinary pullbacks.*

Proof. Since the converse is obvious, let us check that if $\mathfrak{C}$ is stable under smooth extraordinary pullbacks and satisfies $BK^!$ then $\mathfrak{C}$ is stable under extraordinary pullbacks. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $f : \mathfrak{Y} \to \mathfrak{X}$ be a morphism of smooth formal schemes over $\mathcal{W}$, and $\mathcal{E}^{(\bullet)}$ be an object of $\mathfrak{C}(\mathfrak{X})$. Since f is the composition of its graph $\mathfrak{Y} \hookrightarrow \mathfrak{Y}\times\mathfrak{X}$ followed by the projection $\mathfrak{Y}\times\mathfrak{X} \to \mathfrak{X}$ which is smooth, then using the stability under smooth extraordinary pullbacks, we reduce to the case where f is a closed immersion. From the stability under local cohomological functors, $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X})$. Since $\mathfrak{C}$ satisfies $BK^!$, then $f^!\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{Y})$. We conclude using the isomorphism $f^!\mathbb{R}\underline{\Gamma}^{\dagger}_{Y}\mathcal{E}^{(\bullet)} \xrightarrow{\sim} f^!(\mathcal{E}^{(\bullet)})$ (use 13.2.1.4). □

Lemma 19.1.2.6. *Let $\mathfrak{D}$ be a data of coefficients over $\mathcal{V}$. If $\mathfrak{D}$ contains $\mathfrak{B}_{\mathrm{div}}$, and if $\mathfrak{D}$ is stable under tensor products, then $\mathfrak{D}$ is stable under localizations outside a divisor.*

Proof. This is a consequence of the isomorphism 13.1.5.6.2 (we use the case where $\mathcal{E}^{(\bullet)} = \mathcal{O}_{\mathfrak{X}}^{(\bullet)}$). □

Lemma 19.1.2.7. *Let $\mathfrak{C}$ be a data of coefficients. If the data of coefficients $\mathfrak{C}$ is local (resp. is stable under devissages, resp. is stable under direct summands, resp. is stable under pushforwards, resp. is stable under base change, resp. satisfies $BK^!$), then so is $\mathfrak{C}^\vee$ (see Notation 19.1.1.4).*

Proof. The stability under pushforwards is a consequence of the relative duality isomorphism (see 13.2.4.1). It follows from 9.3.5.11.1, that if $\mathfrak{C}$ satisfies $BK^!$, then so is $\mathfrak{C}^\vee$. The other stability properties are straighforward. □

Lemma 19.1.2.8. *Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients.*

(a) If $\mathfrak{D} \subset \mathfrak{C}$ then $\mathfrak{D}^\vee \subset \mathfrak{C}^\vee$.

(b) We have the equality $\Delta(\mathfrak{C})^\vee = \Delta(\mathfrak{C}^\vee)$.

Proof. The first statement is obvious. Moreover, since $\mathfrak{C} \subset \Delta(\mathfrak{C})$ then $\mathfrak{C}^\vee \subset \Delta(\mathfrak{C})^\vee$. From 19.1.2.7, $\Delta(\mathfrak{C})^\vee$ is stable under devissage. Hence $\Delta(\mathfrak{C}^\vee) \subset \Delta(\mathfrak{C})^\vee$. By replacing in the inclusion $\mathfrak{C}$ by $\mathfrak{C}^\vee$, since $(\mathfrak{C}^\vee)^\vee = \mathfrak{C}$, we get $\Delta(\mathfrak{C}) \subset \Delta(\mathfrak{C}^\vee)^\vee$. Hence, $\Delta(\mathfrak{C})^\vee \subset (\Delta(\mathfrak{C}^\vee)^\vee)^\vee = \Delta(\mathfrak{C}^\vee)$.

□

Lemma 19.1.2.9. *Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients. With the notation of 19.1.2.1, we have the following properties.*

1. *If $\mathfrak{D}$ contains $\mathfrak{B}_\emptyset$ (see Notation 19.1.1.2) then $S_\sharp(\mathfrak{D}, \mathfrak{C})$ is contained in $\mathfrak{C}$. If $\mathfrak{D}$ contains $\mathfrak{B}_{\mathrm{div}}$, then $S_0(\mathfrak{D}, \mathfrak{C})$ (resp $S(\mathfrak{D}, \mathfrak{C})$) is included in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}$).*
2. *If $\mathfrak{C} \subset \mathfrak{C}'$ and $\mathfrak{D}' \subset \mathfrak{D}$, then $S_\sharp(\mathfrak{D}, \mathfrak{C}) \subset S_\sharp(\mathfrak{D}', \mathfrak{C}')$.*
3. *If either $\mathfrak{C}$ or $\mathfrak{D}$ is stable under devissages (resp. shifts), then so is $S_\sharp(\mathfrak{D}, \mathfrak{C})$ and we have the equality $S_\sharp(\Delta(\mathfrak{D}), \mathfrak{C}) = S_\sharp(\mathfrak{D}, \mathfrak{C})$ (resp. $S_\sharp(\mathfrak{D}^+, \mathfrak{C}) = S_\sharp(\mathfrak{D}, \mathfrak{C})$).*
4. *Suppose that $\mathfrak{D}$ is stable under smooth extraordinary pullbacks, tensor products (resp. and base change), and that $\mathfrak{C}$ contains $\mathfrak{D}$.*
   (a) The data of coefficients $S_0(\mathfrak{D}, \mathfrak{C})$ contains $\mathfrak{D}$ (resp. $S(\mathfrak{D}, \mathfrak{C})$ contains $\mathfrak{D}$).
   (b) If $\mathfrak{D}$ contains $\mathfrak{B}_\emptyset$, if either $\mathfrak{C}$ or $\mathfrak{D}$ is stable under shifts, then $S_0(\mathfrak{D}, \mathfrak{C}) = S_0(\mathfrak{D}, S_0(\mathfrak{D}, \mathfrak{C}))$ (resp. $S(\mathfrak{D}, \mathfrak{C}) = S(\mathfrak{D}, S(\mathfrak{D}, \mathfrak{C}))$).
   (c) If either $\mathfrak{C}$ or $\mathfrak{D}$ is stable under shifts then $S_0(S_0(\mathfrak{D}, \mathfrak{C}), S_0(\mathfrak{D}, \mathfrak{C}))$ (resp. $S(S(\mathfrak{D}, \mathfrak{C}), S(\mathfrak{D}, \mathfrak{C}))$) contains $\mathfrak{D}$.

Proof. The assertions 1), 2), 3), 4.a) and 4.b) are obvious. Let us prove 4)c). Let us suppose moreover $\mathfrak{C}$ stable under shifts. Since tensor products and extraordinary inverse images commute with base change, to check the second part, we reduce to establish the non-respective case. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$, and $\mathcal{E}^{(\bullet)} \in \mathfrak{D}(\mathfrak{X})$. Let $f \colon \mathfrak{Y} \to \mathfrak{X}$ be a smooth morphism of smooth $\mathcal{W}$-formal schemes. Let $\mathcal{F}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{Y})$. We have to check that $\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^!(\mathcal{E}^{(\bullet)}) \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{Y})$. Let $g \colon \mathfrak{Z} \to \mathfrak{Y}$ be a smooth morphism of smooth $\mathcal{W}$-formal schemes, and $\mathcal{G}^{(\bullet)} \in \mathfrak{D}(\mathfrak{Z})$. We have the isomorphisms

$$\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} g^! \left(\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^!(\mathcal{E}^{(\bullet)}) \right) \underset{9.2.1.27.1}{\xrightarrow{\sim}} \left(\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} g^! \mathcal{F}^{(\bullet)} \right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} (f \circ g)^!(\mathcal{E}^{(\bullet)})[-d_{Z/Y}]$$
$$\xrightarrow{\sim} \left(\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} (f \circ g)^!(\mathcal{E}^{(\bullet)}) \right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} g^! \mathcal{F}^{(\bullet)}[-d_{Z/Y}]. \qquad (\star)$$

Since $\mathfrak{D}$ is stable under smooth extraordinary pullbacks and tensor products, then $\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} (f \circ g)^!(\mathcal{E}^{(\bullet)}) \in \mathfrak{D}(\mathfrak{Z})$. Since $\mathcal{F}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{Y})$, then $\left(\mathcal{G}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} (f \circ g)^!(\mathcal{E}^{(\bullet)}) \right) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Z}}} g^! \mathcal{F}^{(\bullet)}[-d_{Z/Y}] \in \mathfrak{C}(\mathfrak{Z})$. Hence, using $(\star)$ we conclude. The respective case is treated similarly. □

Remark 19.1.2.10. Let $\mathfrak{C}$, $\mathfrak{D}$ be two data of coefficients.

1. If $\mathfrak{C}$ is stable under devissages, then using 19.1.2.9.3 and 19.1.2.4 we get $S_\sharp(\mathfrak{B}_{\mathrm{div}}, \mathfrak{C}) = S_\sharp(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C})$.

2. Let $\mathfrak{D}'$ be a data of coefficients such that $\Delta(\mathfrak{D}') = \Delta(\mathfrak{D})$. If $\mathfrak{C}$ is stable under devissages, then $S_\sharp(\mathfrak{D}', \mathfrak{C}) = S_\sharp(\mathfrak{D}, \mathfrak{C})$. Hence, in the case of stable properties appearing in Lemma 19.1.1.10 and when $\mathfrak{C}$ is stable under devissages, to study $S_\sharp(\mathfrak{D}, \mathfrak{C})$ it is enough to consider Δ-stable properties instead of stable properties satisfied by $\mathfrak{D}$ (e.g. see the beginning of the proof of 19.1.2.12).

3. If $\mathfrak{D}$ is stable under smooth extraordinary pullbacks, tensor products, and that $\mathfrak{D}$ contains $\mathfrak{B}_{\mathrm{div}}$ and is contained in $\mathfrak{C}$, if moreover either $\mathfrak{C}$ or $\mathfrak{D}$ is stable under shifts, then using 19.1.2.9 (1, 2 and 4.b), we get
$$S_0(\mathfrak{D}, \mathfrak{C}) = S_0\left(\mathfrak{D}, S_0(\mathfrak{B}_{\mathrm{div}}, \mathfrak{C})\right) = S_0\left(\mathfrak{D}, S_0(\mathfrak{D}, \mathfrak{C})\right). \qquad (19.1.2.10.1)$$

   If moreover $\mathfrak{D}$ is stable under base change, then
$$S(\mathfrak{D}, \mathfrak{C}) = S\left(\mathfrak{D}, S(\mathfrak{B}_{\mathrm{div}}, \mathfrak{C})\right) = S\left(\mathfrak{D}, S(\mathfrak{D}, \mathfrak{C})\right). \qquad (19.1.2.10.2)$$

Lemma 19.1.2.11. *Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients. We have the following properties.*

1. *If $\mathfrak{C}$ is local and if $\mathfrak{D}$ is quasi-local then $S_\sharp(\mathfrak{D}, \mathfrak{C})$ is local. If $\mathfrak{C}$ is stable under direct summands, then so is $S_\sharp(\mathfrak{D}, \mathfrak{C})$.*

2. *The data of coefficients $S_0(\mathfrak{D}, \mathfrak{C})$ (resp. $S(\mathfrak{D}, \mathfrak{C})$) is stable under smooth extraordinary pullbacks (resp. and under base change).*

3. *If $\mathfrak{D}$ is stable under local cohomological functors (resp. localizations outside a divisor), then so is $S_\sharp(\mathfrak{D}, \mathfrak{C})$.*

4. *Suppose that $\mathfrak{C}$ is stable under pushforwards and shifts. Suppose that $\mathfrak{D}$ is stable under extraordinary pullbacks. Then the data of coefficients $S_\sharp(\mathfrak{D}, \mathfrak{C})$ are stable under pushforwards.*

5. *Suppose that $\mathfrak{C}$ is stable under shifts, and satisfies $BK^!$. Moreover, suppose that $\mathfrak{D}$ satisfies BK_+. Then the data of coefficients $S_\sharp(\mathfrak{D}, \mathfrak{C})$ satisfies $BK^!$.*

Proof. a) Using 8.4.5.8 (beware that tensor products do not preserve coherence), we check that if $\mathfrak{C}$ is local and if $\mathfrak{D}$ is quasi-local then $S_\sharp(\mathfrak{D}, \mathfrak{C})$ is local. The rest of the assertions 1) and 2) are obvious.

b) Let us check 3). From the commutation of the base change with local cohomological functors, we reduce to check that $S_0(\mathfrak{D}, \mathfrak{C})$ is stable under local cohomological functors (resp. localisations outside a divisor). Using 13.1.5.6.2 and the commutation of local cohomological functors with extraordinary inverse images (see 13.2.1.4), we check the desired properties.

c) Let us check 4). From the commutation of base changes with pushforwards (see 9.2.6), we reduce to check the stability of $S_0(\mathfrak{D}, \mathfrak{C})$ under pushforwards. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$. Let $g\colon \mathfrak{X}' \to \mathfrak{X}$ be a realizable morphism of smooth $\mathcal{W}$-formal schemes. Let $\mathcal{E}'^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X}')$ with proper support over X. We have to check that $g_+(\mathcal{E}'^{(\bullet)}) \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$. Let $f\colon \mathfrak{Y} \to \mathfrak{X}$ be a smooth morphism of smooth $\mathcal{W}$-formal schemes. Let $f'\colon \mathfrak{Y} \times_{\mathfrak{X}} \mathfrak{X}' \to \mathfrak{X}'$, and $g'\colon \mathfrak{Y} \times_{\mathfrak{X}} \mathfrak{X}' \to \mathfrak{Y}$ be the structural projections. Let $\mathcal{F}^{(\bullet)} \in \mathfrak{D}(\mathfrak{Y})$. We have to check $\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^! g_+(\mathcal{E}'^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y})$. Using the hypotheses on $\mathfrak{C}$ and $\mathfrak{D}$, via the isomorphisms
$$\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^! g_+(\mathcal{E}'^{(\bullet)}) \underset{13.2.3.7.1}{\xrightarrow{\sim}} \mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} g'_+ f'^!(\mathcal{E}'^{(\bullet)}) \underset{9.4.3.1.1}{\xrightarrow{\sim}} g'_+\left(g'^!(\mathcal{F}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f'^!(\mathcal{E}'^{(\bullet)})\right)[-d_{X'/X}],$$
we check that $\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^! g_+(\mathcal{E}'^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y})$.

d) Let us check 5) (we might remark the similarity with the proof of 15.3.6.12). Since extraordinary pullbacks commute with base change, we reduce to check that $S_0(\mathfrak{D}, \mathfrak{C})$ satisfies $BK^!$. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, and $u\colon \mathfrak{X} \hookrightarrow \mathfrak{P}$ be a closed immersion of smooth formal schemes over $\mathcal{W}$. Let $\mathcal{E}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{P})$ with support in $\mathfrak{X}$. We have to check that $u^!(\mathcal{E}^{(\bullet)}) \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$. We already know that $u^!(\mathcal{E}^{(\bullet)}) \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ (thanks to Berthelot-Kashiwara theorem 9.3.5.13). Let $f\colon \mathfrak{Y} \to \mathfrak{X}$ be a smooth morphism of smooth $\mathcal{W}$-formal schemes, and $\mathcal{F}^{(\bullet)} \in \mathfrak{D}(\mathfrak{Y})$. We have to check $\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^!(u^! \mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y})$.

The morphism f is the composite of its graph $\mathfrak{Y} \hookrightarrow \mathfrak{Y} \times \mathfrak{X}$ with the projection $\mathfrak{Y} \times \mathfrak{X} \to \mathfrak{X}$. We denote by v the composite of $\mathfrak{Y} \hookrightarrow \mathfrak{Y} \times \mathfrak{X}$ with $id \times u \colon \mathfrak{Y} \times \mathfrak{X} \hookrightarrow \mathfrak{Y} \times \mathfrak{P}$. Let $g \colon \mathfrak{Y} \times \mathfrak{P} \to \mathfrak{P}$ be the projection. Set $\mathfrak{U} := \mathfrak{Y} \times \mathfrak{P}$. Since $\mathfrak{D}$ satisfies BK_+, then $v_+(\mathcal{F}^{(\bullet)}) \in \mathfrak{D}(\mathfrak{U})$. Since $\mathcal{E}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{P})$ and g is smooth, this yields $v_+(\mathcal{F}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{U}}} g^!(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{U})$. Since $\mathfrak{C}$ satisfies $BK^!$, this implies $v^! \left(v_+(\mathcal{F}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{U}}} g^!(\mathcal{E}^{(\bullet)}) \right) \in \mathfrak{C}(\mathfrak{Y})$. Since $v^! \left(v_+(\mathcal{F}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{U}}} g^!(\mathcal{E}^{(\bullet)}) \right) \xrightarrow{\sim} v^! v_+(\mathcal{F}^{(\bullet)}) \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} v^! g^!(\mathcal{E}^{(\bullet)})[r]$ with r an integer (see 9.2.1.27.1), since $v^! v_+(\mathcal{F}^{(\bullet)}) \xrightarrow{\sim} \mathcal{F}^{(\bullet)}$ (see Berthelot-Kashiwara theorem 9.3.5.13), since $\mathfrak{C}$ is stable under shifts, since by transitivity $v^! g^! \xrightarrow{\sim} f^! u^!$, then we get $\mathcal{F}^{(\bullet)} \widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^! u^!(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y})$. □

Proposition 19.1.2.12. *Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients. We suppose $\mathfrak{D}$ contains $\mathfrak{B}_{\mathrm{div}}$, satisfies Δ-BK_+, and is Δ-stable under extraordinary pullbacks and tensor products (resp. $\mathfrak{D}$ contains $\mathfrak{B}_{\emptyset}$, satisfies Δ-BK_+, and is Δ-stable under extraordinary pullbacks and local cohomological functors). We suppose $\mathfrak{C}$ is local, satisfies $BK^!$, is stable under devissages, pushforwards, and direct summands.*

In that case, the data of coefficients $S_\sharp(\mathfrak{D}, \mathfrak{C})$ is local, stable under devissages, direct summands, local cohomological functors, extraordinary pullbacks, pushforwards ($S(\mathfrak{D}, \mathfrak{C})$ is moreover stable under base change).

Proof. Let us check the non-respective case. Using 19.1.1.10, $\Delta(\mathfrak{D})$ satisfies the same properties than $\mathfrak{D}$ without the symbol Δ. Following 19.1.2.9.3, since $\mathfrak{C}$ is stable under devissage, then $S_\sharp(\mathfrak{D}, \mathfrak{C}) = S_\sharp(\Delta(\mathfrak{D}), \mathfrak{C})$. Hence, we reduce to the case $\Delta(\mathfrak{D}) = \mathfrak{D}$. Using 19.1.2.11 (except 3), we get $S_\sharp(\mathfrak{D}, \mathfrak{C})$ is local, is stable under devissages, direct summands, smooth extraordinary pullbacks, pushforwards, satisfies $BK^!$ and $S(\mathfrak{D}, \mathfrak{C})$ is moreover stable under base change. Using 19.1.2.6, we check $\mathfrak{D}$ is stable under localizations outside a divisor. This yields by 19.1.2.4.(b) that $\mathfrak{D}$ is stable under under local cohomological functors. Hence, using 19.1.2.11.3 so is $S_\sharp(\mathfrak{D}, \mathfrak{C})$. By applying 19.1.2.5 this yields that $S_\sharp(\mathfrak{D}, \mathfrak{C})$ is stable under extraordinary pullbacks. Similarly, the respective case is a straightforward consequence of 19.1.2.5 and 19.1.2.11. □

Corollary 19.1.2.13. *Let $i \in \mathbb{N} \cup \{\infty\}$. The data of coefficients $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}$, resp. $\mathfrak{H}_i$) contains $\mathfrak{B}_{\mathrm{cst}}$, is local, stable under devissages, direct summands, local cohomological functors, extraordinary pullbacks, pushforwards (resp. and base change). Moreover, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}$ is stable under duality.*

Proof. For any $i \in \mathbb{N}$, since $\mathfrak{H}_{i+1} \subset \mathfrak{H}_i \cap \mathfrak{H}_i^\vee$, we get the stability under duality of $\mathfrak{H}_\infty$. Using 19.1.2.10.1, we get $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}} = S_0(\mathfrak{B}^+_{\mathrm{cst}}, \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}} = S(\mathfrak{B}^+_{\mathrm{cst}}, \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}})$, resp. $S(\mathfrak{B}_{\mathrm{div}}, \mathfrak{H}_i^\vee) = S(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{H}_i^\vee)$). Since $\mathfrak{B}^+_{\mathrm{cst}}$ satisfies BK_+, and is stable under local cohomological functors, extraordinary pullbacks and tensor products (see 19.1.1.6), since $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$ is local, satisfies $BK^!$, is stable under devissages, pushforwards, direct summands then we conclude by applying 19.1.2.7 and 19.1.2.12.

□

Notation 19.1.2.14. Let $\mathfrak{C}$ be a data of coefficients. We denote by $\mathfrak{C}^0$ the data of coefficients defined as follows. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$. Then $\mathfrak{C}^0(\mathfrak{X}) := \mathfrak{C}(\mathfrak{X}) \cap \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$.

Lemma 19.1.2.15. *Let $\mathfrak{C}$ be a data of coefficients.*

(a) If $\mathfrak{C}$ is stable under cohomology, then $\Delta(\mathfrak{C}) = \Delta(\mathfrak{C}^0)$.

(b) If $\mathfrak{C}$ is stable under devissages and cohomology, then for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\mathfrak{C}^0(\mathfrak{X})$ is an abelian strictly full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ which is stable under extensions (i.e. is a weak Serre subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ in the sense of [Sta22, 02MP]).

(c) If for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\mathfrak{C}^0(\mathfrak{X})$ contains the zero objects, is an abelian strictly full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ which is stable under extensions, then $\mathfrak{D} := \Delta(\mathfrak{C}^0)$ is stable under devissages and cohomology and $\mathfrak{D}^0 = \mathfrak{C}^0$.

Proof. a) Since $\Delta(\mathfrak{C}^0) \subset \Delta(\mathfrak{C})$, it remains to check $\mathfrak{C} \subset \Delta(\mathfrak{C}^0)$. Let $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X})$. By using some exact triangles of truncations (for the canonical t-structure on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ as explained in 13.1.4.18), we check $\mathcal{E}^{(\bullet)} \in \Delta_n(\mathfrak{C}^0)(\mathfrak{X})$ where n is the cardinal of $\{j \in \mathbb{Z}\ ;\ H^j(\mathcal{E}^{(\bullet)}) \neq 0\}$.

b) Let $f\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\mathfrak{C}^0(\mathfrak{X})$. By considering the mapping cone of f and by using the stability properties of $\mathfrak{C}$, we check that $\operatorname{Ker} f$ and $\operatorname{Coker} f$ are objects of $\mathfrak{C}^0(\mathfrak{X})$. The stability under extensions is obvious. Hence, we are done.

c) Denote by $\mathfrak{D}(\mathfrak{X})$ the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ consisting of objects $\mathcal{E}^{(\bullet)}$ such that, for any integer n, $H^n(\mathcal{E}^{(\bullet)})$ is an object of $\mathfrak{C}^0(\mathfrak{X})$. By devissage, we get $\Delta(\mathfrak{C}^0) \supset \mathfrak{D}(\mathfrak{X})$. Conversely, since $\mathfrak{C}^0(\mathfrak{X})$ is a weak Serre category (see [Sta22, 0754]), then for any exact triangle of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ whose two objects belong to $\mathfrak{D}(\mathfrak{X})$, using the induced long exact sequence, then we prove that the third object is an object of $\mathfrak{D}(\mathfrak{X})$, i.e. $\mathfrak{D}(\mathfrak{X})$ is stable under devissage. Since $\mathfrak{C}^0 \subset \mathfrak{D}(\mathfrak{X})$, this yields that $\Delta(\mathfrak{C}^0) \subset \mathfrak{D}(\mathfrak{X})$. Hence, we have proved $\mathfrak{D}(\mathfrak{X}) = \Delta(\mathfrak{C}^0)$. This yields that $\Delta(\mathfrak{C}^0)$ is stable under devissage and cohomology. □

Proposition 19.1.2.16. *Let $\mathfrak{X}$ be a smooth $\mathcal{V}$-formal scheme. Let $\mathfrak{A}$ be an abelian strictly full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ containing the zero object. We denote by $\overline{\mathfrak{A}}$ the (strictly) full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ consisting of object $\mathcal{E}^{(\bullet)}$ such that there exists a filtration $0 = \mathcal{E}^{(\bullet)}_0 \subset \mathcal{E}^{(\bullet)}_1 \subset \dots \mathcal{E}^{(\bullet)}_r = \mathcal{E}^{(\bullet)}$ of length $r \geq 1$ of $\mathcal{E}^{(\bullet)}$ by objects $\mathcal{E}^{(\bullet)}_i$ of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ such that $\mathcal{E}^{(\bullet)}_{i+1}/\mathcal{E}^{(\bullet)}_i$ belong to $\mathfrak{A}$ for any $0 \leq i \leq r-1$. Then $\overline{\mathfrak{A}}$ is the smallest weak Serre subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ containing $\mathfrak{A}$ (in the sense of [Sta22, 02MP]).*

Proof. 0) $\overline{\mathfrak{A}}$ contains $\mathfrak{A}$.

1) We easily check that if $0 \to \mathcal{F}^{(\bullet)} \to \mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to 0$ is an exact sequence of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$, if $\mathcal{F}^{(\bullet)} \in \overline{\mathfrak{A}}$ admits a filtration of length r and $\mathcal{G}^{(\bullet)} \in \overline{\mathfrak{A}}$ admits a filtration of length s then $\mathcal{E}^{(\bullet)} \in \overline{\mathfrak{A}}$ admits a filtration of length $r+s$. In particular, $\overline{\mathfrak{A}}$ is closed under extension.

2) Let $\phi\colon \mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}$ be a morphism of $\overline{\mathfrak{A}}$. Let us prove $\ker \phi \in \overline{\mathfrak{A}}$. Set $\mathcal{K}^{(\bullet)} := \ker \phi$.

a) Suppose $\mathcal{F}^{(\bullet)} \in \mathfrak{A}$. Let $0 = \mathcal{E}^{(\bullet)}_0 \subset \mathcal{E}^{(\bullet)}_1 \subset \dots \mathcal{E}^{(\bullet)}_r = \mathcal{E}^{(\bullet)}$ be a filtration of $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}_{i+1}/\mathcal{E}^{(\bullet)}_i \in \mathfrak{A}$ for any $0 \leq i \leq r-1$. We proceed by induction on r. The case $r=1$, i.e. $\mathcal{E}^{(\bullet)} \in \mathfrak{A}$ follows from the abelianity of $\mathfrak{A}$. Suppose $r \geq 2$ and the property checked for $r-1$. Let $\mathcal{K}^{(\bullet)}_1$ be the kernel of the map $\mathcal{E}^{(\bullet)}_1 \to \mathcal{F}^{(\bullet)}$ induced by ϕ. Then $\mathcal{K}^{(\bullet)}_1 = \mathcal{K}^{(\bullet)} \cap \mathcal{E}^{(\bullet)}_1 \in \mathfrak{A}$. By induction hypothesis, $\mathcal{K}^{(\bullet)}/\mathcal{K}^{(\bullet)}_1$, the kernel of the map $\mathcal{E}^{(\bullet)}/\mathcal{E}^{(\bullet)}_1 \to \mathcal{F}^{(\bullet)}/\phi(\mathcal{E}^{(\bullet)}_1)$ induced by ϕ, belongs to $\overline{\mathfrak{A}}$. Hence, using the step 1), this yields $\mathcal{K}^{(\bullet)} \in \overline{\mathfrak{A}}$.

b) Suppose $\mathcal{E}^{(\bullet)} \in \mathfrak{A}$. Let $0 = \mathcal{F}^{(\bullet)}_0 \subset \mathcal{F}^{(\bullet)}_1 \subset \dots \mathcal{F}^{(\bullet)}_s = \mathcal{F}^{(\bullet)}$ be a filtration of $\mathcal{F}^{(\bullet)}$ such that $\mathcal{F}^{(\bullet)}_{j+1}/\mathcal{F}^{(\bullet)}_j \in \mathfrak{A}$ for any $0 \leq j \leq s-1$. We proceed by induction in s. When $s=1$, this follows from the abelianity of $\mathfrak{A}$. Suppose $s \geq 2$. By induction hypothesis, $\mathcal{E}^{(\bullet)}_1 := \ker \left(\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}/\mathcal{F}^{(\bullet)}_1\right) \in \overline{\mathfrak{A}}$. Then $\mathcal{K}^{(\bullet)}$ is equal to the kernel of the map $\mathcal{E}^{(\bullet)}_1 \to \mathcal{F}^{(\bullet)}_1$. Since $\mathcal{F}^{(\bullet)}_1 \in \mathfrak{A}$ and $\mathcal{E}^{(\bullet)}_1 \in \overline{\mathfrak{A}}$, then following a), we get $\mathcal{K}^{(\bullet)} \in \overline{\mathfrak{A}}$.

c) Let us treat now the general case. Let $0 = \mathcal{E}^{(\bullet)}_0 \subset \mathcal{E}^{(\bullet)}_1 \subset \dots \mathcal{E}^{(\bullet)}_r = \mathcal{E}^{(\bullet)}$ be a filtration of $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}_{i+1}/\mathcal{E}^{(\bullet)}_i \in \mathfrak{A}$ for any $0 \leq i \leq r-1$. We proceed by induction on r. The case $r=1$, i.e. $\mathcal{E}^{(\bullet)} \in \mathfrak{A}$, is the step b). Suppose $r \geq 2$ and the property holds for $r-1$. Let $\mathcal{K}^{(\bullet)}_1 = \mathcal{K}^{(\bullet)} \cap \mathcal{E}^{(\bullet)}_1$ be the kernel of the map $\mathcal{E}^{(\bullet)}_1 \to \mathcal{F}^{(\bullet)}$ induced by ϕ. Then following b) we have $\mathcal{K}^{(\bullet)}_1 \in \overline{\mathfrak{A}}$. By induction hypothesis, $\mathcal{K}^{(\bullet)}/\mathcal{K}^{(\bullet)}_1$, the kernel of the map $\mathcal{E}^{(\bullet)}/\mathcal{E}^{(\bullet)}_1 \to \mathcal{F}^{(\bullet)}/\phi(\mathcal{E}^{(\bullet)}_1)$ induced by ϕ, belongs to $\overline{\mathfrak{A}}$. Hence, using the step 1), this yields $\mathcal{K}^{(\bullet)} \in \overline{\mathfrak{A}}$.

3) Let $\mathcal{E}^{(\bullet)} \subset \mathcal{F}^{(\bullet)}$ be a monomorphism of $\overline{\mathfrak{A}}$. Let us check that $\mathcal{F}^{(\bullet)}/\mathcal{E}^{(\bullet)} \in \overline{\mathfrak{A}}$.

a) Suppose $\mathcal{E}^{(\bullet)} \in \mathfrak{A}$. Let $0 = \mathcal{F}^{(\bullet)}_0 \subset \mathcal{F}^{(\bullet)}_1 \subset \dots \mathcal{F}^{(\bullet)}_s = \mathcal{F}^{(\bullet)}$ be a filtration of $\mathcal{F}^{(\bullet)}$ such that $\mathcal{F}^{(\bullet)}_{j+1}/\mathcal{F}^{(\bullet)}_j \in \mathfrak{A}$ for any $0 \leq j \leq s-1$. We proceed by induction in s. Since $\mathcal{E}^{(\bullet)} \cap \mathcal{F}^{(\bullet)}_{s-1}$ is the kernel of the morphism $\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}/\mathcal{F}^{(\bullet)}_{s-1}$ of $\mathfrak{A}$, then $\mathcal{E}^{(\bullet)} \cap \mathcal{F}^{(\bullet)}_{s-1}$ belongs to $\mathfrak{A}$. Hence, $(\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)})/\mathcal{F}^{(\bullet)}_{s-1} \xleftarrow{\sim} \mathcal{E}^{(\bullet)}/\mathcal{E}^{(\bullet)} \cap \mathcal{F}^{(\bullet)}_{s-1} \in \mathfrak{A}$. Using the exact sequence $0 \to (\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)})/\mathcal{F}^{(\bullet)}_{s-1} \to \mathcal{F}^{(\bullet)}/\mathcal{F}^{(\bullet)}_{s-1} \to \mathcal{F}^{(\bullet)}/(\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)}) \to 0$, this yields that $\mathcal{F}^{(\bullet)}/(\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)}) \in \mathfrak{A}$. Via the exact sequence $0 \to (\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)})/\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}/\mathcal{E}^{(\bullet)} \to \mathcal{F}^{(\bullet)}/(\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)}) \to 0$, since $(\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)})/\mathcal{E}^{(\bullet)} \xleftarrow{\sim} \mathcal{F}^{(\bullet)}_{s-1}/(\mathcal{E}^{(\bullet)} \cap \mathcal{F}^{(\bullet)}_{s-1}) \in \overline{\mathfrak{A}}$ (induction hypothesis), since $\mathcal{F}^{(\bullet)}/(\mathcal{F}^{(\bullet)}_{s-1} + \mathcal{E}^{(\bullet)}) \in \mathfrak{A}$, then we get from the step 1) that $\mathcal{F}^{(\bullet)}/\mathcal{E}^{(\bullet)} \in \overline{\mathfrak{A}}$.

b) Let us go back to the general case. Let $0 = \mathcal{E}^{(\bullet)}_0 \subset \mathcal{E}^{(\bullet)}_1 \subset \dots \mathcal{E}^{(\bullet)}_r = \mathcal{E}^{(\bullet)}$ be a filtration of $\mathcal{E}^{(\bullet)}$ such that $\mathcal{E}^{(\bullet)}_{i+1}/\mathcal{E}^{(\bullet)}_i \in \mathfrak{A}$ for any $0 \leq i \leq r-1$. Using the exact sequence $0 \to \mathcal{F}^{(\bullet)}/\mathcal{E}^{(\bullet)}_1 \to \mathcal{F}^{(\bullet)}/\mathcal{E}^{(\bullet)} \to$

$\mathcal{E}^{(\bullet)}/\mathcal{E}_1^{(\bullet)} \to 0$, since $\mathcal{E}^{(\bullet)}/\mathcal{E}_1^{(\bullet)} \in \overline{\mathfrak{A}}$, since following the step a) we have $\mathcal{F}^{(\bullet)}/\mathcal{E}_1^{(\bullet)} \in \overline{\mathfrak{A}}$, then using the step 1) we get $\mathcal{F}^{(\bullet)}/\mathcal{E}^{(\bullet)} \in \overline{\mathfrak{A}}$.

4) It follows from the steps 2) and 3) that for any morphism ϕ of $\overline{\mathfrak{A}}$, $\mathrm{Coker}\,\phi \in \overline{\mathfrak{A}}$. □

Proposition 19.1.2.17. *Let $\mathfrak{A}$ be a data of coefficients over $\mathcal{V}$ such that for any object $\mathcal{W}$ of* $\mathrm{DVR}(\mathcal{V})$ *(see notation 9.2.6.12), for any smooth $\mathcal{W}$-formal scheme $\mathfrak{X}$, $\mathfrak{A}(\mathfrak{X})$ is an abelian strictly full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$. Then, $\Delta(\mathfrak{A})$ is the smallest data of coefficients containing $\mathfrak{A}$ and stable under devissage and cohomology.*

Proof. Let $\overline{\mathfrak{A}}$ be the data of coefficients over $\mathcal{V}$ such that for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$ (see notation 9.2.6.12), for any smooth $\mathcal{W}$-formal scheme $\mathfrak{X}$, $\overline{\mathfrak{A}}(\mathfrak{X})$ is the smallest weak Serre subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$ containing $\mathfrak{A}(\mathfrak{X})$ (see 19.1.2.16). Since $\mathfrak{A} \subset \overline{\mathfrak{A}}$, then $\Delta(\overline{\mathfrak{A}}) \supset \Delta(\mathfrak{A})$. Moreover, since $\overline{\mathfrak{A}} \subset \Delta(\mathfrak{A})$, then $\Delta(\overline{\mathfrak{A}}) \subset \Delta(\mathfrak{A})$. Hence, $\Delta(\overline{\mathfrak{A}}) = \Delta(\mathfrak{A})$. The proposition is therefore an obvious consequence of 19.1.2.16 and 19.1.2.15. □

Proposition 19.1.2.18. *Let $\mathfrak{A}$ be a data of coefficients over $\mathcal{V}$ such that for any object $\mathcal{W}$ of* $\mathrm{DVR}(\mathcal{V})$ *(see notation 9.2.6.12), for any smooth $\mathcal{W}$-formal scheme $\mathfrak{X}$, $\mathfrak{A}(\mathfrak{X})$ is an abelian strictly full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$. We denote by $\overline{\mathfrak{A}}_{\mathrm{loc}}$ the data of coefficients over $\mathcal{V}$ such that for any object $\mathcal{W}$ of* $\mathrm{DVR}(\mathcal{V})$*, for any smooth $\mathcal{W}$-formal scheme $\mathfrak{X}$, $\overline{\mathfrak{A}}_{\mathrm{loc}}(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$ consisting of objects which are locally in $\mathfrak{X}$ in the smallest weak Serre subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$ containing $\mathfrak{A}(\mathfrak{X})$ (see 19.1.2.16). Then, $\Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})$ is the smallest data of coefficients containing $\mathfrak{A}$ which is local and stable under devissage and cohomology.*

Proof. By definition, $\overline{\mathfrak{A}}_{\mathrm{loc}}$ is local. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$ and $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$. Let $0 \to \mathcal{F}^{(\bullet)} \to \mathcal{E}^{(\bullet)} \to \mathcal{G}^{(\bullet)} \to 0$ be an exact sequence of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$ such that $\mathcal{F}^{(\bullet)}, \mathcal{G}^{(\bullet)} \in \overline{\mathfrak{A}}_{\mathrm{loc}}(\mathfrak{X})$. Since the property $\mathcal{E}^{(\bullet)} \in \overline{\mathfrak{A}}_{\mathrm{loc}}(\mathfrak{X})$ is local, we can suppose that $\mathcal{F}^{(\bullet)}, \mathcal{G}^{(\bullet)} \in \overline{\mathfrak{A}}(\mathfrak{X})$ (see notation of the proof of 19.1.2.17). Hence, following 19.1.2.16, $\mathcal{E}^{(\bullet)} \in \overline{\mathfrak{A}}_{\mathrm{loc}}(\mathfrak{X})$. Similarly, we get the remaining properties to check that $\overline{\mathfrak{A}}_{\mathrm{loc}}(\mathfrak{X})$ is a weak Serre subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$. Hence, following 19.1.2.15.(c), $\Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})$ is stable and under devissage and cohomology and $\Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})^0 = \overline{\mathfrak{A}}_{\mathrm{loc}}$. Hence, $\Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})(\mathfrak{X})$ is equal to the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$ consisting of objects $\mathcal{E}^{(\bullet)}$ such that, for any integer n, $H^n(\mathcal{E}^{(\bullet)})$ is an object of $\overline{\mathfrak{A}}_{\mathrm{loc}}(\mathfrak{X})$. Since $\overline{\mathfrak{A}}_{\mathrm{loc}}$ is local, this yields that so is $\Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})$. Hence, $\Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})$ is a data of coefficients containing $\mathfrak{A}$ which is local, stable and under devissage and cohomology. Let $\mathfrak{D}$ is a data of coefficients containing $\mathfrak{A}$ which is local, stable and under devissage and cohomology. Then $\mathfrak{D}$ must contains $\overline{\mathfrak{A}}_{\mathrm{loc}}$ and therefore $\Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})$. Hence, we are done. □

Notation 19.1.2.19. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$ and $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$. Let $F\text{-}\mathrm{H}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$ be the category of overholonomic $\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}}$-modules endowed with a Frobenius structure. We get a data of coefficients $\mathfrak{A}$ over $\mathcal{V}$ by setting $\mathfrak{A}(\mathfrak{X}) := F\text{-}\mathrm{H}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$. Since this is an abelian category then following 19.1.2.18 and according to its notation we get $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{h}} := \Delta(\overline{\mathfrak{A}}_{\mathrm{loc}})$ the smallest data of coefficients over $\mathcal{V}$ which is local and stable under devissage and cohomology and containing $\mathfrak{A}$. Then it follows from 18.3.2 that $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{h}}$ is local, stable by devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change, tensor products, duals, cohomology. Such objects are called of Frobenius type. [1]

Lemma 19.1.2.20. *Let $\mathfrak{C}$ be a data of coefficients stable under devissages and cohomology and which is local. Let $\mathcal{W}$ be an object of* $\mathrm{DVR}(\mathcal{V})$*, $\mathfrak{T} := \mathrm{Spf}\ \mathcal{W}$, $\mathfrak{X}$ and $\mathfrak{Y}$ be two smooth formal schemes over $\mathcal{W}$, $\mathcal{E}^{0(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{X}}^{(\bullet)})$, and $\mathcal{F}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}_{\mathfrak{Y}}^{(\bullet)})$. Recall exterior tensor products is defined in 9.2.5.8.1.*

(a) The following properties are equivalent

(i) for any $n \in \mathbb{Z}$, $\mathcal{E}^{0(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}} H^n(\mathcal{F}^{(\bullet)}) \in \mathfrak{C}^0(\mathfrak{X})$;

(ii) $\mathcal{E}^{0(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}} \mathcal{F}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X})$.

(b) If for any $n \in \mathbb{Z}$ we have $\mathcal{E}^{(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}} H^n(\mathcal{F}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{X})$, then $\mathcal{E}^{(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}} \mathcal{F}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X})$.

[1] This has previously been called 'F-able' in the literature in the context of overconvergent isocrystal.

Proof. Since this is local, we can suppose $\mathfrak{X}$ affine. The first statement is an obvious consequence of 9.2.5.12.(b). Following 8.4.5.11, there exists $\mathcal{G}^{(\bullet)} \in D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{T}}))$ such that $\mathcal{G}^{(\bullet)}$ is isomorphic to $\mathfrak{e}(\mathcal{E}^{(\bullet)})$ (resp. $\mathcal{H}^{(\bullet)} \in D^{\mathrm{b}}(\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{Y}/\mathfrak{T}}))$ such that $\mathcal{H}^{(\bullet)}$ is isomorphic to $\mathfrak{e}(\mathcal{F}^{(\bullet)})$ where $\mathfrak{e}$ is defined at 8.1.5.14.1). Following 9.2.5.12.(a), we get the spectral sequence in $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}\times\mathfrak{Y}/\mathfrak{T}})$ of the form $H^r(\mathcal{G}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}} H^s(\mathcal{H}^{(\bullet)}) =: E_2^{r,s} \Rightarrow E^n := H^n\left(\mathcal{G}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}}\mathcal{H}^{(\bullet)}\right)$. Since $\mathfrak{C}^0(\mathfrak{X}\times\mathfrak{Y})$ is an abelian strictly full subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widetilde{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}\times\mathfrak{Y}/\mathfrak{S}})$ closed under extensions (see 19.1.2.15.b), since $H^r(\mathcal{G}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}} H^s(\mathcal{H}^{(\bullet)}) \in \mathfrak{C}^0(\mathfrak{X}\times\mathfrak{Y})$ (use 8.4.5.7.1 and the part (a) of the Lemma), then $H^n\left(\mathcal{G}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}}\mathcal{H}^{(\bullet)}\right) \in \mathfrak{C}^0(\mathfrak{X}\times\mathfrak{Y})$. Using 9.2.5.11.1 and 8.4.5.7.1, this yields $H^n\left(\mathcal{E}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{T}}}\mathcal{F}^{(\bullet)}\right) \in \mathfrak{C}^0(\mathfrak{X}\times\mathfrak{Y})$.

□

Proposition 19.1.2.21. *Let $\mathfrak{C}$ be a data of coefficients. Suppose that $\mathfrak{C}$ is stable under cohomology, and devissage. Then $S_\sharp(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C})$ is stable under devissages and cohomology.*

Proof. Following 19.1.2.10, $S_\sharp(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C}) = S_\sharp(\mathfrak{B}_{\mathrm{div}}, \mathfrak{C})$. Since localizations outside a divisor and the functor $f^{(\bullet)*}$ when f is any smooth morphism are t-exact (for the canonical t-structure of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$), then this is straightforward. □

Corollary 19.1.2.22. *The data of coefficients $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}$, and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}$ are stable under cohomology.*

Proposition 19.1.2.23. *Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients. Suppose that $\mathfrak{D}$ is stable under cohomology, smooth extraordinary pullbacks, and that $\mathfrak{C}$ is local and stable under cohomology, devissage, extraordinary pullbacks. Then $S_\sharp(\mathfrak{D}, \mathfrak{C})$ is stable under devissages and cohomology.*

Proof. 1) We prove the case where $\sharp = 0$. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. Let $f\colon \mathfrak{Y} \to \mathfrak{X}$ be a smooth morphism of smooth $\mathcal{W}$-formal schemes, $\mathcal{F}^{(\bullet)} \in \mathfrak{D}(\mathfrak{Y})$.

a) Suppose that $\mathcal{E}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$. Since $\mathfrak{D}$ is stable under cohomology and smooth extraordinary pullbacks, then $H^r(\mathcal{F}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{W}} f^!(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y}\times_{\mathrm{Spf}\,\mathcal{W}}\mathfrak{Y})$, for any $r \in \mathbb{Z}$. Since $\mathfrak{C}$ is local and is stable under cohomology and devissage, then using 19.1.2.20.a, we get $H^r(\mathcal{F}^{(\bullet)})\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{W}} H^s(f^{(\bullet)!}(\mathcal{E}^{(\bullet)})) \in \mathfrak{C}^0(\mathfrak{Y}\times_{\mathrm{Spf}\,\mathcal{W}}\mathfrak{Y})$, for any $r, s \in \mathbb{Z}$. Hence, since $H^s(f^{(\bullet)!}(\mathcal{E}^{(\bullet)})) \xrightarrow{\sim} f^{*(\bullet)}H^{s-d_f}(\mathcal{E}^{(\bullet)})$, using 19.1.2.20.a, we get $\mathcal{F}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{W}} f^{*(\bullet)}H^s(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y}\times_{\mathrm{Spf}\,\mathcal{W}}\mathfrak{Y})$, for any $s \in \mathbb{Z}$. Since $\mathfrak{C}$ is stable under extraordinary pullbacks and shifts, this yields $\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^{*(\bullet)}H^s(\mathcal{E}^{(\bullet)})) \xrightarrow{\sim} \mathbb{L}\delta^{*(\bullet)}(\mathcal{F}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{W}} f^{*(\bullet)}H^s(\mathcal{E}^{(\bullet)})) \in \mathfrak{C}(\mathfrak{Y})$, where $\delta\colon \mathfrak{Y} \hookrightarrow \mathfrak{Y}\times_{\mathrm{Spf}\,\mathcal{W}}\mathfrak{Y}$ is the diagonal immersion. Hence, $H^s(\mathcal{E}^{(\bullet)}) \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$, for any $s \in \mathbb{Z}$.

b) Conversely, suppose $H^s(\mathcal{E}^{(\bullet)}) \in S_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$, for any $s \in \mathbb{Z}$. Then $\mathcal{F}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{W}} f^{*(\bullet)}H^s(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y}\times_{\mathrm{Spf}\,\mathcal{W}}\mathfrak{Y})$. Using 19.1.2.20.b, this yields $\mathcal{F}^{(\bullet)}\widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{W}} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y}\times_{\mathrm{Spf}\,\mathcal{W}}\mathfrak{Y})$. Hence, $\mathcal{F}^{(\bullet)}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{Y}}} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{Y})$.

2) For any morphism $\mathcal{W} \to \widetilde{\mathcal{W}}$ of $\mathrm{DVR}(\mathcal{V})$, set $\widetilde{\mathfrak{X}} := \mathfrak{X}\times_{\mathrm{Spf}\,\mathcal{W}} \mathrm{Spf}\,\widetilde{\mathcal{W}}$, and $\widetilde{\mathcal{E}}^{(\bullet)} := \widetilde{\mathcal{W}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{W}}\mathcal{E}^{(\bullet)}$. The property $\mathcal{E}^{(\bullet)} \in S(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$ is equivalent to the property $\widetilde{\mathcal{E}}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\widetilde{\mathfrak{X}})$ (for any such morphism $\mathcal{W} \to \widetilde{\mathcal{W}}$). The property $\widetilde{\mathcal{E}}^{(\bullet)} \in S_0(\mathfrak{D}, \mathfrak{C})(\widetilde{\mathfrak{X}})$ is equivalent from the first part to $H^n(\widetilde{\mathcal{E}}^{(\bullet)}) \in S_0(\mathfrak{D}, \mathfrak{C})(\widetilde{\mathfrak{X}})$ for any $n \in \mathbb{Z}$. Since the functors H^n commute with base change, this latter property is equivalent to $\widetilde{\mathcal{W}}\widehat{\otimes}^{\mathbb{L}}_{\mathcal{W}} H^n(\mathcal{E}^{(\bullet)}) \in S_0(\mathfrak{D}, \mathfrak{C})(\widetilde{\mathfrak{X}})$ for any $n \in \mathbb{Z}$, i.e. $H^n(\mathcal{E}) \in S(\mathfrak{D}, \mathfrak{C})(\widetilde{\mathfrak{X}})$ for any $n \in \mathbb{Z}$.

□

19.1.2.24. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$, $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$. Following 9.2.4.20.1, we have the dual functor $\mathbb{D}^{(\bullet)}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$. Similarly to 15.2.4.8, we say that $\mathcal{E}^{(\bullet)}$ is holonomic if for any $i \neq 0$, $H^i(\mathbb{D}^{(\bullet)}(\mathcal{E}^{(\bullet)})) = 0$. We denote by $\underrightarrow{LM}_{\mathbb{Q},\mathrm{hol}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ the strictly subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ of holonomic $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}$-modules. By copying 15.2.4.14, we check $\underrightarrow{LM}_{\mathbb{Q},\mathrm{hol}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ is in fact a Serre subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$.

We denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{hol}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ the strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ consisting of complexes $\mathcal{E}^{(\bullet)}$ such that $H^n\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{hol}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$ for any $n \in \mathbb{Z}$. This yields the t-exact equivalence of categories $\mathbb{D}^{(\bullet)}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{hol}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}}) \cong \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{hol}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}/\mathfrak{S}})$. It follows from 15.3.5.4 that $\underrightarrow{LM}_{\mathbb{Q},\mathrm{oc}} \subset \underrightarrow{LM}_{\mathbb{Q},\mathrm{hol}}$. This yields

$$\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}} \subset \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{hol}}. \qquad (19.1.2.24.1)$$

Lemma 19.1.2.25. *Let $\mathfrak{C}$ be a data of coefficients stable under cohomology and included in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}$. Then $\mathfrak{C}^\vee$ is stable under cohomology.*

Proof. This is a straightforward consequence of 19.1.2.24.1. □

Corollary 19.1.2.26. *Let $i \in \mathbb{N} \cup \{\infty\}$. The data of coefficients $\mathfrak{H}_i$ is stable under cohomology.*

19.1.2.27. Let $\mathfrak{C}$ be a data of coefficients stable under devissages and cohomology. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$. We get a canonical t-structure on $\mathfrak{C}(\mathfrak{X}/\mathcal{W})$ whose heart is $\mathfrak{C}^0(\mathfrak{X}/\mathcal{W})$ and so that the t-structure of $\mathfrak{C}(\mathfrak{X}/\mathcal{W})$ is induced by that of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ (which is defined at 13.1.4.18), i.e. the truncation functors are the same and $\mathfrak{C}^{\geq n}(\mathfrak{X}/\mathcal{W}) := \underrightarrow{LD}^{\geq n}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}) \cap \mathfrak{C}(\mathfrak{X}/\mathcal{W})$, $\mathfrak{C}^{\leq n}(\mathfrak{X}/\mathcal{W}) := \underrightarrow{LD}^{\leq n}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}}) \cap \mathfrak{C}(\mathfrak{X}/\mathcal{W})$.

For instance, using 19.1.2.22 and 19.1.2.26, we get for $\star \in \{\mathrm{ovcoh}, \mathrm{oc}, \mathrm{h}, \mathrm{hol}\}$ a canonical t-structure on $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}$. The heart of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\star}$ is $\underrightarrow{LM}^{\mathrm{b}}_{\mathbb{Q},\star}$.

Corollary 19.1.2.28. *The data of coefficients $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}$, and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}$ are stable under special descent of the base.*

Definition 19.1.2.29. Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients.

(a) We denote by $\boxtimes_0(\mathfrak{D}, \mathfrak{C})$ the data of coefficients defined as follows: for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\boxtimes_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ consisting of objects $\mathcal{E}^{(\bullet)}$ satisfying the following property:

   ($\star$) for any smooth $\mathcal{W}$-formal scheme $\mathfrak{Y}$, for any object $\mathcal{F}^{(\bullet)} \in \mathfrak{D}(\mathfrak{Y})$, we have $\mathcal{E}^{(\bullet)} \widehat{\boxtimes}^{\mathbb{L}}_{\mathcal{O}_{\mathrm{Spf}\,\mathcal{W}}} \mathcal{F}^{(\bullet)} \in \mathfrak{C}(\mathfrak{X} \times_{\mathrm{Spf}\,\mathcal{W}} \mathfrak{Y})$.

(b) We denote by $\boxtimes(\mathfrak{D}, \mathfrak{C})$ the data of coefficients defined as follows: for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$, for any smooth formal scheme $\mathfrak{X}$ over $\mathcal{W}$, the category $\boxtimes(\mathfrak{D}, \mathfrak{C})(\mathfrak{X})$ is the full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{X}})$ consisting of objects $\mathcal{E}^{(\bullet)}$ satisfying the following property:

   ($\star\star$) for any morphism $\mathcal{W} \to \mathcal{W}'$ of $\mathrm{DVR}(\mathcal{V})$, $\mathcal{W}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{W}} \mathcal{E}^{(\bullet)} \in \boxtimes_0(\mathfrak{D}, \mathfrak{C})(\mathfrak{X} \times_{\mathrm{Spf}\,\mathcal{W}} \mathrm{Spf}\,\mathcal{W}')$.

(c) Let $\sharp$ be a symbol so that either $\boxtimes_\sharp = \boxtimes_0$ or $\boxtimes_\sharp = \boxtimes$.

Lemma 19.1.2.30. *Let $\mathfrak{C}$ and $\mathfrak{D}$ be two data of coefficients.*

(a) If $\mathfrak{D}$ contains $\mathfrak{B}_\emptyset$, then $\boxtimes_\sharp(\mathfrak{D}, \mathfrak{C})$ is contained in $\mathfrak{C}$.

(b) If $\mathfrak{C} \subset \mathfrak{C}'$ and $\mathfrak{D}' \subset \mathfrak{D}$, then $\boxtimes_\sharp(\mathfrak{D}, \mathfrak{C}) \subset \boxtimes_\sharp(\mathfrak{D}', \mathfrak{C}')$.

(c) If $\mathfrak{C}$ is stable under devissage then so is $\boxtimes_\sharp(\mathfrak{D}, \mathfrak{C})$. Moreover, $\boxtimes_\sharp(\mathfrak{D}, \mathfrak{C}) = \boxtimes_\sharp(\Delta(\mathfrak{D}), \mathfrak{C})$.

(d) The data $\boxtimes(\mathfrak{D}, \mathfrak{C})$ is stable under base change.

(e) If $\mathfrak{C}$ is stable under pushforwards (resp. satisfies $BK^!$, resp. is local, resp. is stable under direct summands), then so is $\boxtimes_\sharp(\mathfrak{D}, \mathfrak{C})$.

(f) If $\mathfrak{C}$ is local and is stable under devissages and cohomology, and if $\mathfrak{D}$ is stable under cohomology, then $\boxtimes_\sharp(\mathfrak{D}, \mathfrak{C})$ is stable under cohomology.

Proof. The first forth statements are obvious. The non-respective case and the first respective case of the fifth one is a consequence of 9.4.4.1. The other cases are obvious. It remains to check the sixth one. Following 19.1.2.15.(a), since $\mathfrak{D}$ is stable under cohomology, then $\Delta(\mathfrak{D}) = \Delta(\mathfrak{D}^0)$. Hence, from the third part of our lemma, we get $\boxtimes_\sharp(\mathfrak{D}, \mathfrak{C}) = \boxtimes_\sharp(\mathfrak{D}^0, \mathfrak{C})$. Then, we conclude by using 19.1.2.20.(a). □

19.1.3 Constructions of stable data of coefficients

Following 19.1.2.19, we have already a data of coefficients stable under Grothendieck operations for objects of "Frobenius type". However, we would like such stability for more general coefficients, e.g. containing convergent isocrystals (without Frobenius structure).

Definition 19.1.3.1. Let $\mathfrak{D}$ be a data of coefficients over $\mathcal{V}$. We say that $\mathfrak{D}$ is almost stable under dual functors if the following property holds: for any data of coefficients $\mathfrak{C}$ over $\mathcal{V}$ which is local, stable under devissages, direct summands and pushforwards, if $\mathfrak{D} \subset \mathfrak{C}$ then $\mathfrak{D}^\vee \subset \mathfrak{C}$. Remark from the biduality isomorphism that the inclusion $\mathfrak{D}^\vee \subset \mathfrak{C}$ is equivalent to the following one $\mathfrak{D} \subset \mathfrak{C}^\vee$.

Lemma 19.1.3.2. *Let $\mathfrak{D}$ be a data of coefficients over $\mathcal{V}$. The data $\mathfrak{D}$ is almost stable under dual functors if and only if $\Delta(\mathfrak{D})$ is almost stable under dual functors.*

Proof. This is a consequence of 19.1.2.8. □

Lemma 19.1.3.3. *With notation 19.1.1.2, we have the equalities $\mathfrak{M}_\emptyset^\vee = \mathfrak{M}_\emptyset$, $(\Delta(\mathfrak{M}_\emptyset))^\vee = \Delta(\mathfrak{M}_\emptyset)$ and $\Delta(\mathfrak{M}_{\mathrm{sncd}}) = \Delta(\mathfrak{M}_\emptyset)$.*

Proof. The first equality is a consequence of 12.2.5.6. The second one follows from 19.1.2.8. It remains to check the inclusion $\mathfrak{M}_{\mathrm{sncd}} \subset \Delta(\mathfrak{M}_\emptyset)$. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$, Z be a smooth subvariety of the special fiber of $\mathfrak{X}$, T be a strict normal crossing divisor of Z, and $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(Z, \mathfrak{X}/K)$. We have to prove that $({}^\dagger T)(\mathcal{E}^{(\bullet)}) \in \Delta(\mathfrak{M}_\emptyset)(\mathfrak{X})$. We proceed by induction on the dimension of T and next the number of irreducible components of T. Let T_1 be one irreducible component of T and T' be the union of the other irreducible components. We have the localisation triangle

$$({}^\dagger T' \cap T_1)\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) \to ({}^\dagger T')(\mathcal{E}^{(\bullet)}) \to ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \to +1 \qquad (19.1.3.3.1)$$

Following 12.2.1.9, we have $\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)})[1] \in \mathrm{MIC}^{(\bullet)}(T_1, \mathfrak{X}/K)$. Hence, since $T' \cap T_1$ is a strict normal crossing divisor of T_1, by induction hypothesis we get $({}^\dagger T' \cap T_1)\mathbb{R}\underline{\Gamma}^\dagger_{T_1}(\mathcal{E}^{(\bullet)}) \in \Delta(\mathfrak{M}_\emptyset)(\mathfrak{X})$. By induction hypothesis, we have also $({}^\dagger T')(\mathcal{E}^{(\bullet)}) \in \Delta(\mathfrak{M}_\emptyset)(\mathfrak{X})$. Hence, by devissage, we get $({}^\dagger T)(\mathcal{E}^{(\bullet)}) \in \Delta(\mathfrak{M}_\emptyset)(\mathfrak{X})$. □

Proposition 19.1.3.4. *The data of coefficients $\mathfrak{B}_{\mathrm{div}}$, $\mathfrak{M}_{\mathrm{div}}$, and $\mathfrak{B}_{\mathrm{cst}}$ are almost stable under duality.*

Proof. I) Since $\Delta(\mathfrak{B}_{\mathrm{cst}}) = \Delta(\mathfrak{B}_{\mathrm{div}})$ (see 19.1.2.4.a) and using 19.1.3.2, since the case $\mathfrak{B}_{\mathrm{div}}$ is checked similarly, we reduce to prove the almost dual stability of $\mathfrak{M}_{\mathrm{div}}$.

II) Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{M}_{\mathrm{div}}$, and which is local, stable under devissages, direct summands and pushforwards. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$, $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$, Z be a smooth subvariety of the special fiber of $\mathfrak{X}$, T be a divisor of Z, and $\mathcal{E}^{(\bullet)} \in \mathrm{MIC}^{(\bullet)}(Z, \mathfrak{X}/K)$ such that $({}^\dagger T)(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}^\vee(\mathfrak{X})$. We have to check that $({}^\dagger T)(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}^\vee(\mathfrak{X})$.

0) Let l be the residue field of $\mathcal{W}$. Since this is local in $\mathfrak{X}$, we can suppose Z integral. Following the de Jong 's desingularisation theorem (of the form 10.4.1.2), there exist a smooth integral l-variety Z', a projective generically finite and etale morphism of l-varieties $\phi\colon Z' \to Z$ such that Z' is quasi-projective and $T' := \phi^{-1}(T)$ is a strict normal crossing divisor of Z'. Hence, there exists a closed immersion of the form $u\colon Z' \hookrightarrow \mathbb{P}^n_Z$ whose composition with the projection $\mathbb{P}^n_Z \to Z$ is ϕ. Let $\mathfrak{X}' := \widehat{\mathbb{P}}^n_{\mathfrak{X}}$, $f\colon \mathfrak{X}' \to \mathfrak{X}$ be the projection. Following 16.1.11.2, $\mathcal{E}^{(\bullet)}$ is a direct summand of $f_+^{(\bullet)}\mathbb{R}\underline{\Gamma}^\dagger_{Z'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$. Hence, $({}^\dagger T)(\mathcal{E}^{(\bullet)})$ is a direct summand of $({}^\dagger T) f_+^{(\bullet)}\mathbb{R}\underline{\Gamma}^\dagger_{Z'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$ Using the commutation of localisation functor with pushforwards, this yields $({}^\dagger T)(\mathcal{E}^{(\bullet)})$ is a direct summand of $f_+^{(\bullet)}({}^\dagger T')\mathbb{R}\underline{\Gamma}^\dagger_{Z'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)})$.

1) Since $\mathcal{E}'^{(\bullet)} := \mathbb{R}\underline{\Gamma}^\dagger_{Z'} f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \in \mathrm{MIC}^{(\bullet)}(Z', \mathfrak{X}'/K)$ (use 12.2.1.9), then $({}^\dagger T')(\mathcal{E}'^{(\bullet)}) \in \mathfrak{M}_{\mathrm{sncd}}(\mathfrak{X}')$. Since $\mathfrak{C}$ contains $\mathfrak{M}_{\mathrm{sncd}}$ and is stable under devissages, then using 19.1.3.3 we get $\mathfrak{M}_{\mathrm{sncd}} \subset \mathfrak{C}^\vee$. Hence, $({}^\dagger T')(\mathcal{E}'^{(\bullet)}) \in \mathfrak{C}^\vee(\mathfrak{X}')$. Since $\mathfrak{C}$ is stable under direct summands and pushforwards, we are done. □

Notation 19.1.3.5. Let $\mathfrak{C}, \mathfrak{D}$ be two data of coefficients. We put $T_0(\mathfrak{D}, \mathfrak{C}) := S(\mathfrak{D}, \mathfrak{C})$. By induction on $i \in \mathbb{N}$, we set $U_i(\mathfrak{D}, \mathfrak{C}) := T_i(\mathfrak{D}, \mathfrak{C}) \cap T_i(\mathfrak{D}, \mathfrak{C})^\vee$, $\widetilde{T}_i(\mathfrak{D}, \mathfrak{C}) := S(\mathfrak{D}, U_i(\mathfrak{D}, \mathfrak{C}))$ and $T_{i+1}(\mathfrak{D}, \mathfrak{C}) := S(\widetilde{T}_i(\mathfrak{D}, \mathfrak{C}), \widetilde{T}_i(\mathfrak{D}, \mathfrak{C}))$. We put $T(\mathfrak{D}, \mathfrak{C}) := \cap_{i \in \mathbb{N}} T_i(\mathfrak{D}, \mathfrak{C})$.

Theorem 19.1.3.6. *Let $\mathfrak{B}_{\mathrm{div}} \subset \mathfrak{D} \subset \mathfrak{C}$ be two data of coefficients. We suppose*

1. *The data $\mathfrak{D}$ is stable under cohomology ;*

2. *The data $\Delta(\mathfrak{D})$ satisfies BK_+, is stable under extraordinary pullbacks, base change, tensor products and is almost stable under dual functors ;*

3. *The data $\mathfrak{C}$ satisfies $BK^!$, is local and stable under devissages, direct summands, pushforwards, cohomology.*

Then, the data of coefficients $T(\mathfrak{D}, \mathfrak{C})$ (see Definition 19.1.3.5) is included in $\mathfrak{C}$, contains $\mathfrak{D}$, is local, stable by devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change, tensor products, duals, cohomology.

Proof. I) First, we check by induction on $i \in \mathbb{N}$ that the data of coefficients $T_i(\mathfrak{D}, \mathfrak{C})$ contains $\mathfrak{D}$, is contained in $\mathfrak{C}$, is local, stable under devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change and cohomology (which implies such stability properties for $T(\mathfrak{D}, \mathfrak{C})$).

a) Let us verify that $T_0(\mathfrak{D}, \mathfrak{C})$ satisfies these properties. Using 19.1.2.9.3, we get from 19.1.2.9.1 (resp. 19.1.2.9.4) that $T_0(\mathfrak{D}, \mathfrak{C})$ is included in $\mathfrak{C}$ (resp. contains $\mathfrak{D}$). Using 19.1.1.6 and (the non-respective case of) 19.1.2.12, we check that $S(\mathfrak{D}, \mathfrak{C})$ and $S(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C})$ are both local, stable under devissages, direct summands, local cohomological functors, extraordinary pullbacks, pushforwards and base change. Following 19.1.2.21 $S(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C})$ is also stable under cohomology. Moreover, it follows from 19.1.2.23 that $S\left(\mathfrak{D}, S(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C})\right)$ is also stable under cohomology. Using 19.1.2.10 (specially the left equality of 19.1.2.10.2), we get the equalities $S(\mathfrak{D}, \mathfrak{C}) = S(\Delta(\mathfrak{D}), \mathfrak{C}) = S\left(\Delta(\mathfrak{D}), S(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C})\right) = S\left(\mathfrak{D}, S(\mathfrak{B}^+_{\mathrm{cst}}, \mathfrak{C})\right)$. Hence, we are done.

b) Suppose that the properties hold for $T_i(\mathfrak{D}, \mathfrak{C})$ for some $i \in \mathbb{N}$.

i) Since $\mathfrak{D}$ is almost stable under duals, then $U_i(\mathfrak{D}, \mathfrak{C})$ contains $\mathfrak{D}$. Since $\Delta(\mathfrak{D})$ is stable by tensor products, extraordinary pullbacks, and base change then, using 19.1.2.9.4 (where $\mathfrak{C}$ is replaced by $U_i(\mathfrak{D}, \mathfrak{C})$ which is stable under devissage), this implies that $\mathfrak{D}$ is contained in $\widetilde{T}_i(\mathfrak{D}, \mathfrak{C})$ and $T_{i+1}(\mathfrak{D}, \mathfrak{C})$. Using 19.1.2.9.1, we get that $\widetilde{T}_i(\mathfrak{D}, \mathfrak{C})$ and $T_{i+1}(\mathfrak{D}, \mathfrak{C})$ are included in $\mathfrak{C}$.

ii) From Lemma 19.1.2.7, $U_i(\mathfrak{D}, \mathfrak{C})$ satisfies $BK^!$, is local, stable under pushforwards, under devissages, direct summands, base change/ It follows from 19.1.2.9.1 that $T_i(\mathfrak{D}, \mathfrak{C})$ is included in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}$. Using 19.1.2.25, this yields that $U_i(\mathfrak{D}, \mathfrak{C})$ is stable under cohomology. Hence, by applying the step I)a) in the case where $\mathfrak{C}$ is replaced by $U_i(\mathfrak{D}, \mathfrak{C})$, we get that $\widetilde{T}_i(\mathfrak{D}, \mathfrak{C})$ is local, stable under devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change and cohomology.

Using (the respective case of) 19.1.2.12, this yields that $T_{i+1}(\mathfrak{D}, \mathfrak{C})$ is local, stable under devissages, direct summands, local cohomological functors, extraordinary pullbacks, pushforwards and base change. By applying 19.1.2.23 we check moreover that $T_{i+1}(\mathfrak{D}, \mathfrak{C})$ is stable under cohomology.

II) From 19.1.2.9.1, $T_{i+1}(\mathfrak{D}, \mathfrak{C})$ is contained in $\widetilde{T}_i(\mathfrak{D}, \mathfrak{C})$ and $\widetilde{T}_i(\mathfrak{D}, \mathfrak{C})$ is contained in $T_i(\mathfrak{D}, \mathfrak{C}) \cap T_i(\mathfrak{D}, \mathfrak{C})^\vee$. Hence, by construction, the tensor product of two objects of $T_{i+1}(\mathfrak{D}, \mathfrak{C})$ is an object of $T_i(\mathfrak{D}, \mathfrak{C})$ and the dual of an object of $T_{i+1}(\mathfrak{D}, \mathfrak{C})$ is an object of $T_i(\mathfrak{D}, \mathfrak{C})$. □

Example 19.1.3.7. We can choose $\mathfrak{D} = \mathfrak{B}^+_{\mathrm{div}}$ and $\mathfrak{C} = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$.

Lemma 19.1.3.8. *Let $\mathfrak{C}$ be a data of coefficients which contains $\mathfrak{M}_{\mathrm{div}}$ and is stable under shifts. We have the inclusions:*

(a) The data $\mathfrak{M}^+_{\mathrm{div}}$ is stable under base change, smooth extraordinary pullbacks and tensor products.

(b) $\mathfrak{M}_{\mathrm{div}} \subset S(\mathfrak{B}_{\mathrm{div}}, \mathfrak{C})$.

(c) $\mathfrak{M}_{\mathrm{div}} \subset \boxtimes\left(\boxtimes(\mathfrak{M}_{\mathrm{div}}, \mathfrak{C}), \boxtimes(\mathfrak{M}_{\mathrm{div}}, \mathfrak{C})\right)$.

Proof. The first statement is a consequence of 12.2.1.9 and 12.2.1.13. The other ones are easy consequences of the first statement. □

Notation 19.1.3.9. We put $T_0 := S(\mathfrak{B}_{\mathrm{div}}, \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}})$. By induction on $i \in \mathbb{N}$, we set $U_i := T_i \cap T_i^\vee$, $\widetilde{U}_i := \boxtimes(\boxtimes(\mathfrak{M}_{\mathrm{div}}, U_i), \boxtimes(\mathfrak{M}_{\mathrm{div}}, U_i))$, and $T_{i+1} := S(\mathfrak{B}_{\mathrm{div}}, \widetilde{U}_i)$. We put $T := \cap_{i \in \mathbb{N}} T_i$.

Theorem 19.1.3.10. *The data of coefficients T contains $\mathfrak{M}_{\mathrm{div}}$, is local, stable by devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change, tensor products, duals and cohomology*

Proof. I) We prove by induction on i that T_i contains $\mathfrak{M}_{\mathrm{div}}$, is local, stable under devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change and cohomology.

a) For $T_0 = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}$, this comes from the step I)a) of the proof of 19.1.3.6, and of 19.1.3.8.b.

b) Suppose that this is true for T_i for some $i \in \mathbb{N}$.

i) Since $\mathfrak{M}_{\mathrm{div}}$ is almost stable under duality (see 19.1.3.4), then U_i contains $\mathfrak{M}_{\mathrm{div}}$. Hence, using 19.1.3.8, $\widetilde{U}_i$ contains $\mathfrak{M}_{\mathrm{div}}$.

ii) Similarly to the first part of the step I)b)ii) of the proof of 19.1.3.6, we check that U_i satisfies $BK^!$, is local, stable under pushforwards, under devissages, direct summands, base change and cohomology. Hence, following 19.1.2.30, we check that so is $\boxtimes(\mathfrak{M}_{\mathrm{div}}, U_i)$ and then so is $\widetilde{U}_i$. Hence, using the step I)a) of the proof of 19.1.3.6, we get that T_{i+1} satisfied the desired properties.

II) Using first 19.1.2.9.1, and next 19.1.2.30.a we get the inclusions $T_{i+1} \subset \widetilde{U}_i \subset \boxtimes(\mathfrak{M}_{\mathrm{div}}, U_i) \subset U_i \subset T_i$. Hence, by construction, the exterior tensor product of two objects of T_{i+1} is an object of T_i and the dual of an object of T_{i+1} is an object of T_i.

□

19.2 Grothendieck six operations over realizable pairs

We shall define here Grothendieck six operations for arithmetic $\mathcal{D}$-modules over realizable pairs.

Let $\mathcal{W}$ be an object of DVR($\mathcal{V}$), and l be its residue field.

19.2.1 Data of coefficients over frames

Definition 19.2.1.1. We define the category of frames over $\mathcal{W}$ as follows.

(a) A *frame* $(Y, X, \mathfrak{P})$ over $\mathcal{W}$ means that $\mathfrak{P}$ is a realizable smooth formal scheme over $\mathcal{W}$ (see definition 13.2.3.1), X is a closed subscheme of the special fiber P of $\mathfrak{P}$ and Y is an open subscheme of X. Let $(Y', X', \mathfrak{P}')$ and $(Y, X, \mathfrak{P})$ be two frames over $\mathcal{W}$. A morphism $\theta = (b, a, f): (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$ of frames over $\mathcal{W}$ is the data of a morphism $f: \mathfrak{P}' \to \mathfrak{P}$ of realizable smooth formal schemes over $\mathcal{W}$, a morphism $a: X' \to X$ of l-schemes, and a morphism $b: Y' \to Y$ of l-schemes inducing the commutative diagram

$$\begin{array}{ccccc} Y' & \hookrightarrow & X' & \hookrightarrow & \mathfrak{P}' \\ \downarrow{\scriptstyle b} & & \downarrow{\scriptstyle a} & & \downarrow{\scriptstyle f} \\ Y & \hookrightarrow & X & \hookrightarrow & \mathfrak{P}. \end{array}$$

If there is no ambiguity with $\mathcal{W}$, we simply say frame or morphism of frames.

(b) A morphism $\theta = (b, a, f): (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$ of frames over $\mathcal{W}$ is said to be *complete* (resp. *strictly complete*) if a is proper (resp. f and a are proper).

Remark 19.2.1.2. To avoid confusion with the notion of frames in the context of isocrystals (see 10.1.1.4), one might call a frame $(Y, X, \mathfrak{P})$ as defined in 19.2.1.1 a *realizable* frame. However, hoping that this does not cause any confusion, in order not to overload the notations we prefer not to add the term realizable.

Definition 19.2.1.3. (a) We define the category of *realizable pairs* over $\mathcal{W}$ as follow. A realizable pair (Y, X) over $\mathcal{W}$ means the two first data of a frame over $\mathcal{W}$ of the form $(Y, X, \mathfrak{P})$. A frame of the form $(Y, X, \mathfrak{P})$ is said to be enclosing (Y, X). A morphism of realizable pairs $u = (b, a): (Y', X') \to (Y, X)$ over $\mathcal{W}$ is the data of a morphism of l-schemes of the form $a: X' \to X$ such that $a(Y') \subset Y$ and $b: Y' \to Y$ is the induced morphism.

(b) A morphism of realizable pairs $u = (b, a): (Y', X') \to (Y, X)$ over $\mathcal{W}$ is said to be *complete* if a is proper.

Remark 19.2.1.4. (a) Let $u = (b, a)\colon (Y', X') \to (Y, X)$ be a complete morphism of realizable pairs over $\mathcal{W}$. Then there exists a strictly complete morphism of frames over $\mathcal{W}$ of the form $\theta = (b, a, f)\colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$. Indeed, by definition, there exist some frames over $\mathcal{W}$ of the form $(Y', X', \mathfrak{P}'')$ and $(Y, X, \mathfrak{P})$. There exists an immersion $\mathfrak{P}'' \hookrightarrow \mathfrak{Q}''$ with $\mathfrak{Q}''$ a proper and smooth $\mathcal{W}$-formal scheme. Hence, put $\mathfrak{P}' := \mathfrak{Q}'' \times \mathfrak{P}$ and let $f\colon \mathfrak{P}' \to \mathfrak{P}$ be the projection. Since a is proper, $X \hookrightarrow \mathfrak{P}$ is proper, and f is proper, then the immersion $X' \hookrightarrow \mathfrak{P}'$ is also proper.

(b) Let $u = (b, a)\colon (Y', X') \to (Y, X)$ be a morphism of realizable pairs over $\mathcal{W}$. Similarly, we check that there exists a morphism of frames over $\mathcal{W}$ of the form $\theta = (b, a, f)\colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$.

Notation 19.2.1.5. Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$. Let $(Y, X, \mathfrak{P})$ be a frame over $\mathcal{W}$. We denote by $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ the full subcategory of $\mathfrak{C}(\mathfrak{P})$ of objects $\mathcal{E}$ such that there exists an isomorphism of the form $\mathcal{E} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^{\dagger}_{Y}(\mathcal{E})$. We remark that $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ only depend on the immersion $Y \hookrightarrow \mathfrak{P}$ which explains the notation. We might choose X equal to the closure of Y in P.

Notation 19.2.1.6. Let $\mathfrak{C}$ be a data of coefficients stable under devissages and cohomology. Let $(Y, X, \mathfrak{P})$ be a frame over $\mathcal{W}$. Choose $\mathfrak{U}$ an open set of $\mathfrak{P}$ such that Y is closed in $\mathfrak{U}$.

(a) We define a canonical t-structure on $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ as follows. We denote by $\mathfrak{C}^{\leq n}(Y, \mathfrak{P}/\mathcal{W})$ (resp. $\mathfrak{C}^{\geq n}(Y, \mathfrak{P}/\mathcal{W})$) the full subcategory of $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ of complexes $\mathcal{E}$ such that $\mathcal{E}|\mathfrak{U} \in \mathfrak{C}^{\leq n}(Y, \mathfrak{U}/\mathcal{W}) := \mathfrak{C}(Y, \mathfrak{U}/\mathcal{W}) \cap \mathfrak{C}^{\leq n}(\mathfrak{U}/\mathcal{W})$ (resp. $\mathcal{E}|\mathfrak{U} \in \mathfrak{C}^{\geq n}(Y, \mathfrak{U}/\mathcal{W}) := \mathfrak{C}(Y, \mathfrak{U}/\mathcal{W}) \cap \mathfrak{C}^{\geq n}(\mathfrak{U}/\mathcal{W})$), where the t-structure on $\mathfrak{C}(\mathfrak{U}/\mathcal{W})$ is the canonical one (see 19.1.2.27). Since the restriction on an open formal subscheme is r-acyclic, then we get the independance on the choice of the open $\mathfrak{U}$ such that Y is closed in $\mathfrak{U}$. The heart of this t-structurewill be denoted by $\mathfrak{C}^{0}(Y, \mathfrak{P}/\mathcal{W})$. Finally, we denote by $\mathcal{H}^{i}_{\mathrm{t}}$ the ith space of cohomology with respect to this canonical t-structure.

(b) Suppose Y is smooth. Then, we denote by $\mathfrak{C}_{\mathrm{isoc}}(Y, \mathfrak{P}/\mathcal{W})$ (resp. $\mathfrak{C}^{\geq n}_{\mathrm{isoc}}(Y, \mathfrak{P}/\mathcal{W})$, resp. $\mathfrak{C}^{\leq n}_{\mathrm{isoc}}(Y, \mathfrak{P}/\mathcal{W})$, resp. $\mathfrak{C}^{0}_{\mathrm{isoc}}(Y, \mathfrak{P}/\mathcal{W})$) the full subcategory of (resp. $\mathfrak{C}^{\geq n}(Y, \mathfrak{P}/\mathcal{W})$, resp. $\mathfrak{C}^{\leq n}(Y, \mathfrak{P}/\mathcal{W})$, resp. $\mathfrak{C}^{0}(Y, \mathfrak{P}/\mathcal{W})$) consisting of complexes $\mathcal{E}^{(\bullet)}$ such that $H^{i}(\mathcal{E}^{(\bullet)}|\mathfrak{U}) \in \mathrm{MIC}^{(\bullet)}(Y, \mathfrak{U}/K)$. We refer "isoc" as isocrystals. Remark that when $\mathfrak{C}$ is included in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}$ then $\mathfrak{C}^{0}_{\mathrm{isoc}}(Y, \mathfrak{P}/\mathcal{W}) = \mathfrak{C}^{0}(Y, \mathfrak{P}/\mathcal{W}) \cap \mathrm{MIC}^{(\bullet)}(Y, X, \mathfrak{P}, Z/K)$ is X is the closure of Y in P and $Z = X \setminus Y$ (see 16.2.1.1).

Remark 19.2.1.7. Let $\mathfrak{C}$ be a data of coefficients stable under devissages and cohomology. Let $\mathfrak{P}$ be a smooth $\mathcal{W}$-formal scheme, Y be a subscheme of P, Z be a closed subscheme of Y, and $Y' := Y \setminus Z$.

(a) We get the t-exact functor $({}^{\dagger}Z)\colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y', \mathfrak{P}/\mathcal{W})$. Beware the functor $({}^{\dagger}Z)\colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ is not always t-exact.

(b) We say that Z locally comes from a divisor of P if locally in P, there exists a divisor T of P such that $Z = Y \cap T$ (this is equivalent to saying that locally in P, the ideal defining $Z \hookrightarrow Y$ is generated by one element). In that case, we get the t-exact functor $({}^{\dagger}Z)\colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$. Indeed, by construction of our t-structures, we can suppose Y is closed in $\mathfrak{P}$ (and then we reduce to the case where the t-structure on $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ is induced by the standard t-structure of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$). Since the property is local, we can suppose there exists a divisor T such that $Z = T \cap Y$. Then both functors $({}^{\dagger}Z)$ and $({}^{\dagger}T)$ of $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ are isomorphic. Since $({}^{\dagger}T)$ is t-exact, we are done.

19.2.2 Grothendieck six operations over realizable pairs

Theorem 19.2.2.1 (Independence)**.** *Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, and under local cohomological functors.*

Let $\theta = (b, a, f)\colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$ be a morphism of frames over $\mathcal{W}$ such that a and b are proper.

(a) For any $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$, for any $\mathcal{E}'^{(\bullet)} \in \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$ (recall notation 19.2.1.5, we have

$$\mathrm{Hom}_{\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})}(f^{(\bullet)}_{+}(\mathcal{E}'^{(\bullet)}), \mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathrm{Hom}_{\mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})}(\mathcal{E}'^{(\bullet)}, \mathbb{R}\underline{\Gamma}^{\dagger}_{Y'} f^{!(\bullet)}(\mathcal{E}^{(\bullet)})).$$

(b) Suppose that $Y' = Y$ and b is the identity, and that $\mathfrak{C}$ is stable under cohomology. Then, for any $\mathcal{E}^{(\bullet)} \in \mathfrak{C}^0(Y, \mathfrak{P}/\mathcal{W})$, for any $\mathcal{E}'^{(\bullet)} \in \mathfrak{C}^0(Y, \mathfrak{P}'/\mathcal{W})$, for any $n \in \mathbb{Z} \setminus \{0\}$, we have

$$\mathcal{H}^n_t \mathbb{R}\underline{\Gamma}^\dagger_Y f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) = 0, \qquad \mathcal{H}^n_t f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) = 0.$$

(c) Suppose that $Y' = Y$ and b is the identity. For any $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$, for any $\mathcal{E}'^{(\bullet)} \in \mathfrak{C}(Y, \mathfrak{P}'/\mathcal{W})$, the adjunction morphisms $\mathbb{R}\underline{\Gamma}^\dagger_Y f^{(\bullet)!} f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) \to \mathcal{E}'^{(\bullet)}$ and $f^{(\bullet)}_+ \mathbb{R}\underline{\Gamma}^\dagger_Y f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ are isomorphisms. In particular, the functors $\mathbb{R}\underline{\Gamma}^\dagger_Y f^{(\bullet)!}$ and $f^{(\bullet)}_+$ induce quasi-inverse equivalences of categories between $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ and $\mathfrak{C}(Y, \mathfrak{P}'/\mathcal{W})$.

Proof. I) Let us check the first statement. Replacing X and X' by the closure of Y in P and Y' in P', we can suppose Y is dense in X and Y' is dense in X'. Let $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$, and $\mathcal{E}'^{(\bullet)} \in \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$. Since a is proper, using 13.2.4.2.2, the stability of $\mathfrak{C}$ under extraodinary pullbacks, and the equivalence of categories 8.4.5.6, we get the bijection

$$\mathrm{Hom}_{\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})}(f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}), \mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathrm{Hom}_{\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'})}(\mathcal{E}'^{(\bullet)}, f^{!(\bullet)}(\mathcal{E}^{(\bullet)})).$$

Since a and b are proper, then the open immersion $Y' \subset a^{-1}(Y)$ is proper. Since Y' is dense in X', then $Y' = a^{-1}(Y)$. Hence, the functors $\mathbb{R}\underline{\Gamma}^\dagger_{X'} f^{!(\bullet)}$ and $\mathbb{R}\underline{\Gamma}^\dagger_{Y'} f^{!(\bullet)}$ (resp. $f^{(\bullet)}_+$ and $\mathbb{R}\underline{\Gamma}^\dagger_Y f^{(\bullet)}_+$) are isomorphic over $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ (resp. $\mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$). Hence, the functor $\mathbb{R}\underline{\Gamma}^\dagger_{X'} f^{!(\bullet)}$ (resp. $f^{(\bullet)}_+$) induces $\mathbb{R}\underline{\Gamma}^\dagger_{X'} f^{!(\bullet)} \colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$ (resp. $f^{(\bullet)}_+ \colon \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$). Since $\mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$ is a strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'})$, we conclude using the equality

$$\mathrm{Hom}_{\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}'})}(\mathcal{E}'^{(\bullet)}, f^{!(\bullet)}(\mathcal{E}^{(\bullet)})) = \mathrm{Hom}_{\mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})}(\mathcal{E}'^{(\bullet)}, \mathbb{R}\underline{\Gamma}^\dagger_{X'} f^{!(\bullet)}(\mathcal{E}^{(\bullet)})).$$

II) Now let us check at the same time the last two statements. Using the stability properties that $\mathfrak{C}$ satisfies, we check that the functors $f^{(\bullet)}_+ \colon \mathfrak{C}(Y, \mathfrak{P}'/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ and $\mathbb{R}\underline{\Gamma}^\dagger_Y f^{!(\bullet)} \colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}'/\mathcal{W})$ are well defined. Since $\mathfrak{C}$ is included in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}$, we reduce to check the case where $\mathfrak{C} = \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}$. Choose $\mathfrak{U}$ (resp. $\mathfrak{U}'$) an open set of $\mathfrak{P}$ (resp. $\mathfrak{P}'$) such that Y is closed in $\mathfrak{U}$ (resp. Y is closed in $\mathfrak{U}'$), and such that $f(\mathfrak{U}') \subset \mathfrak{U}$. The functor $|\mathfrak{U} \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}/\mathcal{W}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{U}/\mathcal{W})$ is t-exact, and the same with some primes. Moreover, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}/\mathcal{W})$ (or $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}/\mathcal{W})$), the property $\mathcal{E}^{(\bullet)} = 0$ is equivalent to $\mathcal{E}^{(\bullet)}|\mathfrak{U} = 0$. Hence, we can suppose $\mathfrak{U} = \mathfrak{P}$ and $\mathfrak{U}' = \mathfrak{P}'$, i.e. $Y \hookrightarrow P$ and $Y \hookrightarrow P'$ are closed immersions.

1) In this case we treat the case where Y is smooth. Since the theorem is local, we can suppose there exists a smooth formal scheme $\mathfrak{Y}$ which is a lifting of Y. Hence, this is an obvious consequence of Berthelot-Kashiwara theorem 9.3.5.13.

2) Let us go back to the general case. We proceed by induction on the dimension of Y. When $\dim Y = 0$, then using 15.3.3.3, this is a consequence of the step 1).

Now, suppose $\dim Y \geq 1$ and the theorem valid when Y is replaced by a variety of inferior dimension. Since l is perfect, since the theorem is local on $\mathfrak{P}$, we can suppose $\mathfrak{P}$ integral and affine, and there exists a (reduced) divisor T of P such that, putting $Z := Y \cap T$, we have $Y \setminus Z$ is a smooth l-variety, and $\dim Z < \dim Y$.

3) We check in this step that for any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}'/\mathcal{W})$, for any integer $r \neq 0$, $\mathcal{H}^r f^{(\bullet)}_+(\mathcal{E}'^{(\bullet)}) = 0$.

Since Z locally comes from a divisor of P', then the functor $({}^\dagger Z) \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}'/\mathcal{W}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}'/\mathcal{W})$ is t-exact (see 19.2.1.7.b). Hence, the localisation triangle in Z of $\mathcal{E}'^{(\bullet)}$ induces the exact sequence in $\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}'/\mathcal{W})$:

$$0 \to \mathcal{H}^{\dagger,0}_Z(\mathcal{E}'^{(\bullet)}) \to \mathcal{E}'^{(\bullet)} \to ({}^\dagger Z)(\mathcal{E}'^{(\bullet)}) \to \mathcal{H}^{\dagger,1}_Z(\mathcal{E}'^{(\bullet)}) \to 0. \tag{19.2.2.1.1}$$

Let $\mathcal{F}'^{(\bullet)}$ be the kernel of the epimorphism $({}^\dagger Z)(\mathcal{E}'^{(\bullet)}) \to \mathcal{H}^{\dagger,1}_Z(\mathcal{E}'^{(\bullet)})$. We get the exact sequence in $\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}'/\mathcal{W})$

$$0 \to \mathcal{F}'^{(\bullet)} \to ({}^\dagger Z)(\mathcal{E}'^{(\bullet)}) \to \mathcal{H}^{\dagger,1}_Z(\mathcal{E}'^{(\bullet)}) \to 0.$$

By applying the functor $f_+^{(\bullet)}$ to this latter exact sequence, we get a long exact sequence. We have $({}^\dagger Z)(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y \setminus Z, \mathfrak{P}'/\mathcal{W})$ and $\mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Z, \mathfrak{P}'/\mathcal{W})$. Hence, following the step 1), using the induction hypothesis, using the long exact sequence, we check that for any integer $r \notin \{0,1\}$, we have $\mathcal{H}^r(f_+^{(\bullet)})(\mathcal{F}'^{(\bullet)}) = 0$. Moreover, $\mathcal{H}^1(f_+^{(\bullet)})(\mathcal{F}'^{(\bullet)}) = 0$ if and only if the morphism $s\colon \mathcal{H}^0(f_+^{(\bullet)})(({}^\dagger Z)(\mathcal{E}'^{(\bullet)})) \to \mathcal{H}^0(f_+^{(\bullet)})(\mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)}))$ is an epimorphism. We split the check of this latter property in the following two steps a) and b).

3.a) In this step, we check that the morphism $s' := \mathcal{H}^0(\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!})(s)$ is an epimorphism. Since $({}^\dagger Z)(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y \setminus Z, \mathfrak{P}'/\mathcal{W})$, since the functors $\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!}$ and $\mathbb{R}\underline{\Gamma}_{Y\setminus Z}^\dagger \circ f^{(\bullet)!}$ are canonically isomorphic over $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y \setminus Z, \mathfrak{P}/\mathcal{W})$ then following the step 1), the canonical morphism

$$({}^\dagger Z)(\mathcal{E}'^{(\bullet)}) \to \mathcal{H}^0(\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!}) \circ \mathcal{H}^0(f_+^{(\bullet)})(({}^\dagger Z)(\mathcal{E}'^{(\bullet)}))$$

is an isomorphism. Since $\mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)}) \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Z, \mathfrak{P}'/\mathcal{W})$, since the functors $\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!}$ and $\mathbb{R}\underline{\Gamma}_Z^\dagger \circ f^{(\bullet)!}$ are canonically isomorphic over $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Z, \mathfrak{P}/\mathcal{W})$ then by induction hypothesis the canonical morphism

$$\mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)}) \to \mathcal{H}^0(\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!}) \circ \mathcal{H}^0(f_+^{(\bullet)})(\mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)}))$$

is an isomorphism. Since $({}^\dagger Z)(\mathcal{E}'^{(\bullet)}) \to \mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)})$ is an epimorphism, this yields that so is s'.

3.b) Let us check that s is an epimorphism. Let $\mathcal{F}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}/\mathcal{W})$ be the image of s, and i be the canonical monomorphism $\mathcal{F}^{(\bullet)} \hookrightarrow \mathcal{H}^0(f_+^{(\bullet)})(\mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)}))$. Since $\mathcal{H}^0(f_+^{(\bullet)})(\mathcal{H}_Z^{\dagger,1}(\mathcal{E}'^{(\bullet)}))$ has his support in Z, then i is in fact a monomorphism of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Z, \mathfrak{P}/\mathcal{W})$. Using the induction hypothesis, since the functors $\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!}$ and $\mathbb{R}\underline{\Gamma}_Z^\dagger \circ f^{(\bullet)!}$ are canonically isomorphic over $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Z, \mathfrak{P}/\mathcal{W})$ this yields that $i' := \mathcal{H}^0(\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!})(i)$ is a monomorphism. Since s' is an epimorphism, then so is i'. Hence, the morphism i' is an isomorphism. Using the induction hypothesis, this implies that i is an isomorphism. This yields that s is an epimorphism.

3.c) Hence, we have checked that for any integer $r \neq 0$, we have $\mathcal{H}^r(f_+^{(\bullet)})(\mathcal{F}'^{(\bullet)}) = 0$. From 19.2.2.1.1, we get the exact sequence $0 \to \mathcal{H}_Z^{\dagger,0}(\mathcal{E}'^{(\bullet)}) \to \mathcal{E}'^{(\bullet)} \to \mathcal{F}'^{(\bullet)} \to 0$. By applying the functor $f_+^{(\bullet)}$ to this latter sequence, we get a long exact sequence. Looking at this later one, we remark that the property "for any $r \neq 0$, $\mathcal{H}^r(f_+^{(\bullet)})(\mathcal{F}'^{(\bullet)}) = 0$ and $\mathcal{H}^r(f_+^{(\bullet)})(\mathcal{H}_Z^{\dagger,0}(\mathcal{E}'^{(\bullet)})) = 0$", implies that "for any $r \neq 0$, $\mathcal{H}^r(f_+^{(\bullet)})(\mathcal{E}'^{(\bullet)}) = 0$".

4) Similarly to the step 3), we check that for any $r \neq 0$, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LM}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}/\mathcal{W})$, we have $\mathcal{H}^r(\mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!})(\mathcal{E}^{(\bullet)}) = 0$.

5) It remains to check the last statement of the theorem. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}/\mathcal{W})$. Using the localisation triangle with respect to Z, to check that the morphism $f_+^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!}(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)}$ is an isomorphism, we reduce to check we get an isomorphism after applying $\mathbb{R}\underline{\Gamma}_Z^\dagger$ and $({}^\dagger Z)$. Using 13.2.1.4 and 13.1.5.6.1, after applying $\mathbb{R}\underline{\Gamma}_Z^\dagger$, we get a morphism canonically isomorphic to the canonical morphism $f_+^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}_Z^\dagger \circ f^{(\bullet)!}(\mathbb{R}\underline{\Gamma}_Z^\dagger \mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}_Z^\dagger \mathcal{E}^{(\bullet)}$. By induction hypothesis, this latter is an isomorphism. Moreover, after applying $({}^\dagger Z)$, we get the morphism $f_+^{(\bullet)} \circ \mathbb{R}\underline{\Gamma}_{Y\setminus Z}^\dagger \circ f^{(\bullet)!}(\mathbb{R}\underline{\Gamma}_{Y\setminus Z}^\dagger \mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}_{Y\setminus Z}^\dagger \mathcal{E}^{(\bullet)}$, which is an isomorphism following the step 1).

We proceed similarly to check that the canonical morphism $\mathcal{E}'^{(\bullet)} \to \mathbb{R}\underline{\Gamma}_Y^\dagger \circ f^{(\bullet)!} \circ f_+^{(\bullet)}(\mathcal{E}'^{(\bullet)})$ is an isomorphism for any $\mathcal{E}'^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovcoh}}(Y, \mathfrak{P}'/\mathcal{W})$.

□

Corollary 19.2.2.2. *Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, and local cohomological functors. Let $\mathbb{Y} := (Y, X)$ be a realizable pair over $\mathcal{W}$.*

(a) Choose a frame of the form $(Y, X, \mathfrak{P})$. The category $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ does not depend, up to a canonical equivalence of categories, on the choice of the frame $(Y, X, \mathfrak{P})$ over $\mathcal{W}$ enclosing (Y, X). Hence, we can simply write $\mathfrak{C}(\mathbb{Y}/\mathcal{W})$ instead of $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ without ambiguity (up to canonical equivalence of categories).

(b) If moreover $\mathfrak{C}$ is stable under cohomology, then we get a canonical t-structure on $\mathfrak{C}(\mathbb{Y}/\mathcal{W})$.

Proof. Let $(Y, X, \mathfrak{P})$ and $(Y, X, \mathfrak{P}')$ be two frames over $\mathcal{W}$ enclosing (Y, X). The closed immersions $X \hookrightarrow \mathfrak{P}$ and $X \hookrightarrow \mathfrak{P}'$ induce $X \hookrightarrow \mathfrak{P} \times \mathfrak{P}'$. Denoting by $\pi_1 \colon \mathfrak{P} \times \mathfrak{P}' \to \mathfrak{P}$ and $\pi_2 \colon \mathfrak{P} \times \mathfrak{P}' \to \mathfrak{P}'$ the structural projections, we get two morphisms of frames over $\mathcal{W}$ of the form $(id, id, \pi_1) \colon (Y, X, \mathfrak{P} \times \mathfrak{P}') \to (Y, X, \mathfrak{P})$ and $(id, id, \pi_2) \colon (Y, X, \mathfrak{P} \times \mathfrak{P}') \to (Y, X, \mathfrak{P}')$. From 19.2.2.1, the functors $\pi^{(\bullet)}_{2+} \mathbb{R}\underline{\Gamma}^\dagger_Y \pi_1^{!(\bullet)}$ and $\pi^{(\bullet)}_{1+} \mathbb{R}\underline{\Gamma}^\dagger_Y \pi_2^{(\bullet)!}$ are canonically quasi-inverse equivalences of categories between $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ and $\mathfrak{C}(Y, \mathfrak{P}'/\mathcal{W})$. When $\mathfrak{C}$ is stable under cohomology then these equivalences are t-exact. Hence we are done. □

Lemma 19.2.2.3. *Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, local cohomological functors, and duals. Let $\mathbb{Y} := (Y, X)$ be a realizable pair over $\mathcal{W}$. Choose a frame of the form $(Y, X, \mathfrak{P})$. The functor $\mathbb{R}\underline{\Gamma}^\dagger_Y \mathbb{D}_{\mathfrak{P}} \colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ does not depend, up to canonical isomorphism, of 19.2.2.2 (more precisely, we have the commutative diagram 19.2.2.3.1 up to canonical isomorphism), on the choice of the frame enclosing (Y, X). Hence, we will denote by $\mathbb{D}_{\mathbb{Y}} \colon \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}/\mathcal{W})$ the functor $\mathbb{R}\underline{\Gamma}^\dagger_Y \mathbb{D}_{\mathfrak{P}}$.*

Proof. As in the beginning of the proof, 19.2.2.2, let $(Y, X, \mathfrak{P}_1)$ and $(Y, X, \mathfrak{P}_2)$ be two frames over $\mathcal{W}$ enclosing (Y, X). Let $\pi_1 \colon \mathfrak{P}_1 \times \mathfrak{P}_2 \to \mathfrak{P}_1$ and $\pi_2 \colon \mathfrak{P}_1 \times \mathfrak{P}_2 \to \mathfrak{P}_2$ be the structural projections. We have to check that the diagram

$$\begin{array}{ccccc}
\mathfrak{C}(Y, \mathfrak{P}_1/\mathcal{W}) & \xrightarrow[\mathbb{R}\underline{\Gamma}^\dagger_Y \pi_1^{!(\bullet)}]{\cong} & \mathfrak{C}(Y, \mathfrak{P}_1 \times \mathfrak{P}_2/\mathcal{W}) & \xrightarrow[\pi^{(\bullet)}_{2+}]{\cong} & \mathfrak{C}(Y, \mathfrak{P}_2/\mathcal{W}) \\
\downarrow {\scriptstyle \mathbb{R}\underline{\Gamma}^\dagger_Y \mathbb{D}_{\mathfrak{P}_1}} & & \downarrow {\scriptstyle \mathbb{R}\underline{\Gamma}^\dagger_Y \mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}} & & \downarrow {\scriptstyle \mathbb{R}\underline{\Gamma}^\dagger_Y \mathbb{D}_{\mathfrak{P}_2}} \\
\mathfrak{C}(Y, \mathfrak{P}_1/\mathcal{W}) & \xrightarrow[\cong]{\mathbb{R}\underline{\Gamma}^\dagger_Y \pi_1^{!(\bullet)}} & \mathfrak{C}(Y, \mathfrak{P}_1 \times \mathfrak{P}_2/\mathcal{W}) & \xrightarrow[\cong]{\pi^{(\bullet)}_{2+}} & \mathfrak{C}(Y, \mathfrak{P}_2/\mathcal{W})
\end{array} \qquad (19.2.2.3.1)$$

is commutative, up to canonical isomorphisms. Let $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(Y, \mathfrak{P}_1 \times \mathfrak{P}_2/\mathcal{W})$. From 13.2.4.1, we have the isomorphism $\mathbb{D}_{\mathfrak{P}_2} \pi^{(\bullet)}_{2+}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \pi^{(\bullet)}_{2+} \mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}(\mathcal{E}^{(\bullet)})$. Hence, by applying the functor $\mathbb{R}\underline{\Gamma}^\dagger_Y$ to this isomorphism, we get the first one $\mathbb{R}\underline{\Gamma}^\dagger_Y \mathbb{D}_{\mathfrak{P}_2} \pi^{(\bullet)}_{2+}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_Y \pi^{(\bullet)}_{2+} \mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}(\mathcal{E}^{(\bullet)}) \underset{13.2.1.4}{\xrightarrow{\sim}} \pi^{(\bullet)}_{2+} \mathbb{R}\underline{\Gamma}^\dagger_{\pi_2^{-1}(Y)} \mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}(\mathcal{E}^{(\bullet)})$. The immersion $Y \hookrightarrow \pi_2^{-1}(Y)$ is in fact a closed immersion. This yields $Y = \overline{Y} \cap \pi_2^{-1}(Y)$, where $\overline{Y}$ is the closure of Y in $P_1 \times P_2$. Since $\mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}(\mathcal{E}^{(\bullet)})$ has in support in $\overline{Y}$, then $\mathbb{R}\underline{\Gamma}^\dagger_{\pi_2^{-1}(Y)} \mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{\pi_2^{-1}(Y)} \mathbb{R}\underline{\Gamma}^\dagger_{\overline{Y}} \mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_Y \mathbb{D}_{\mathfrak{P}_1 \times \mathfrak{P}_2}(\mathcal{E}^{(\bullet)})$. Hence, we have checked the commutativity, up to commutative isomorphism, of the right square of 19.2.2.3.1. From 19.2.2.1, $\pi^{(\bullet)}_{1+}$ is canonically a quasi-inverse of the equivalence of categories $\mathbb{R}\underline{\Gamma}^\dagger_Y \pi_1^{!(\bullet)} \colon \mathfrak{C}(Y, \mathfrak{P}_1 \times \mathfrak{P}_2/\mathcal{W}) \cong \mathfrak{C}(Y, \mathfrak{P}_1/\mathcal{W})$ (we means that we have canonical isomorphisms $\pi^{(\bullet)}_{1+} \mathbb{R}\underline{\Gamma}^\dagger_Y \pi_1^{!(\bullet)} \xrightarrow{\sim} \mathrm{id}$ and $id \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_Y \pi_1^{!(\bullet)} \pi^{(\bullet)}_{1+}$). Hence, we get the commutativity, up to canonical isomorphism, of the left square of 19.2.2.3.1. □

Lemma 19.2.2.4. *Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, and local cohomological functors. Let $u = (b, a) \colon (Y', X') \to (Y, X)$ be a morphism of realizable pairs over $\mathcal{W}$. Put $\mathbb{Y} := (Y, X)$ and $\mathbb{Y}' := (Y', X')$. Let us choose a morphism of frames $\theta = (b, a, f) \colon (Y', X', \mathfrak{P}') \to (Y, X, \mathfrak{P})$ over $\mathcal{W}$ enclosing u.*

(a) The functor $\theta^{!(\bullet)} := \mathbb{R}\underline{\Gamma}^\dagger_{Y'} \circ f^{(\bullet)!} \colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$ does not depend on the choice of such θ enclosing u (up to canonical equivalences of categories). Hence, it will be denoted by $u^! \colon \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}'/\mathcal{W})$.

(b) Suppose that u is complete, i.e. that $a \colon X' \to X$ is proper. The functor $\theta_+ := f^{(\bullet)}_+ \colon \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ does not depend on the choice of such θ enclosing u (up to canonical equivalences of categories). Hence, it will be denoted by $u_+ \colon \mathfrak{C}(\mathbb{Y}'/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}/\mathcal{W})$.

Proof. To check the first assertion, we proceed as in the proof of 19.2.2.3 (use also the commutation of local cohomological functors with extraordinary inverse images given in 13.2.1.4). Let us check that the functor $f^{(\bullet)}_+ \colon \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ is well defined. Let $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$. Since a is proper, then $f^{(\bullet)}_+(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(\mathfrak{P})$. We compute $\mathbb{R}\underline{\Gamma}^\dagger_Y f^{(\bullet)}_+(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} f^{(\bullet)}_+ \mathbb{R}\underline{\Gamma}^\dagger_{f^{-1}Y}(\mathcal{E}^{(\bullet)})$. Since Y' is included in $f^{-1}(Y)$ and $\mathcal{E}^{(\bullet)} \in \mathfrak{C}(Y', \mathfrak{P}'/\mathcal{W})$, then $\mathbb{R}\underline{\Gamma}^\dagger_{f^{-1}Y}(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} \mathcal{E}^{(\bullet)}$. Hence, $\mathbb{R}\underline{\Gamma}^\dagger_Y f^{(\bullet)}_+(\mathcal{E}^{(\bullet)}) \xrightarrow{\sim} f^{(\bullet)}_+(\mathcal{E}^{(\bullet)})$, which implies that $f^{(\bullet)}_+(\mathcal{E}^{(\bullet)}) \in \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$. To check that the functor does not depend on the choice of θ enclosing u, we proceed as in the proof of 19.2.2.3. □

Lemma 19.2.2.5. *Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, and tensor products. Let $\mathbb{Y} := (Y, X)$ be a realizable pair over $\mathcal{W}$. Choose a frame of the form $(Y, X, \mathfrak{P})$. The bifunctor $-\widehat{\otimes}^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{P}}} - [-\dim P] \colon \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \times \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W}) \to \mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ does not depend, up to the canonical equivalences of categories of 19.2.2.2, on the choice of the frame enclosing (Y, X). It will be denoted by $\widetilde{\otimes}_{\mathbb{Y}} \colon \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \times \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}/\mathcal{W})$.*

Proof. From Lemmas 19.1.2.4.b and 19.1.2.6, the data of coefficients $\mathfrak{C}$ is also stable under local cohomological functors. From 9.2.1.27.1 (resp. 13.1.5.6.2), extraordinary inverse images (resp. local cohomological functors) commute with tensor products (up to a shift). Proceeding as in the proof of 19.2.2.3 with its notation, $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y} \pi_1^{!(\bullet)}$ and $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y} \pi_2^{!(\bullet)}$ commute with tensor products and then so are $\pi_{1+}^{(\bullet)}$ and $\pi_{2+}^{(\bullet)}$.

□

19.2.2.6 (Grothendieck six operations)**.** Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, duals, and tensor products. To sum-up the above Lemmas we can define Grothendieck six operations on realizable pairs as follows. Let $u = (b, a) \colon (Y', X') \to (Y, X)$ be a morphism of realizable pairs over $\mathcal{W}$. Put $\mathbb{Y} := (Y, X)$ and $\mathbb{Y}' := (Y', X')$.

(a) We have the dual functor $\mathbb{D}_{\mathbb{Y}} \colon \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}/\mathcal{W})$ (see 19.2.2.3).

(b) We have the extraordinary pullback $u^! \colon \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}'/\mathcal{W})$ (see 19.2.2.4). We get the pullbacks $u^+ := \mathbb{D}_{\mathbb{Y}'} \circ u^! \circ \mathbb{D}_{\mathbb{Y}}$.

(c) Suppose that u is complete. Then, we have the functor $u_+ \colon \mathfrak{C}(\mathbb{Y}'/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}/\mathcal{W})$ (see 19.2.2.4). We denote by $u_! := \mathbb{D}_{\mathbb{Y}} \circ u_+ \circ \mathbb{D}_{\mathbb{Y}'}$, the extraordinary pushforward by u.

(d) We have the tensor product $-\widetilde{\otimes}_{\mathbb{Y}} - \colon \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \times \mathfrak{C}(\mathbb{Y}/\mathcal{W}) \to \mathfrak{C}(\mathbb{Y}/\mathcal{W})$ (see 19.2.2.5)

Examples 19.2.2.7. (a) We recall the data of coefficients $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}$ and $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}$ are defined respectively in 19.1.2.2.b and 19.1.2.2.c. Using Lemmas 19.1.2.5 and 19.1.2.11 (and 19.1.2.10), they are stable under local cohomological functors, pushforwards, extraordinary pullbacks, and duals. Hence, with the notation 19.2.2.2, using Lemmas 19.2.2.4, 19.2.2.5, and 19.2.2.3, for any frame $(Y, X, \mathfrak{P})$ over $\mathcal{W}$, we get the categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(Y, \mathfrak{P}/\mathcal{W})$, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{h}}(\mathbb{Y}/\mathcal{W})$, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}(Y, \mathfrak{P}/\mathcal{W})$ or $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{ovhol}}(\mathbb{Y}/\mathcal{W})$ endowed with five of Grothendieck cohomological operations (the tensor product is a priori missing).

(b) With notation 19.1.2.19, the data of coefficients $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{h}}$ is local, stable by devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change, tensor products, duals, cohomology. Hence, $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{h}}$ is endowed with Grothendieck six cohomological operations.

(c) Following theorem 19.1.3.10, there exist a data of coefficients T which contains $\mathfrak{M}_{\mathrm{div}}$, is local, stable by devissages, direct summands, local cohomological functors, pushforwards, extraordinary pullbacks, base change, tensor products, duals, cohomology and special descent of the base. Hence, for any frame $(Y, X, \mathfrak{P})$ over $\mathcal{W}$, we get the triangulated category $T(Y, \mathfrak{P}/\mathcal{W})$ or $T(\mathbb{Y}/\mathcal{W})$, endowed with a t-structure and Grothendieck six operations.

19.2.3 Grothendieck six operations over realizable varieties

Definition 19.2.3.1 (Proper compactification)**.** (a) A frame $(Y, X, \mathfrak{P})$ over $\mathcal{W}$ is said to be *proper* if $\mathfrak{P}$ is proper. The category of proper frames over $\mathcal{W}$ is the full subcategory of the category of frames over $\mathcal{W}$ whose objects are proper frames over $\mathcal{W}$.

(b) The category of *proper realizable pairs* over $\mathcal{W}$ is the full subcategory of the category of realizable pairs over $\mathcal{W}$ whose objects (Y, X) are such that X is proper. We remark that if (Y, X) is a proper realizable pair over $\mathcal{W}$ then there exists a proper frame over $\mathcal{W}$ of the form $(Y, X, \mathfrak{P})$.

(c) A *realizable variety* over $\mathcal{W}$ is a l-scheme Y such that there exists a proper frame over $\mathcal{W}$ of the form $(Y, X, \mathfrak{P})$. For such frame $(Y, X, \mathfrak{P})$, we say that the proper frame $(Y, X, \mathfrak{P})$ encloses Y or that the proper realizable pair (Y, X) encloses Y.

19.2.3.2 (Grothendieck six operations)**.** Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, duals, and tensor products. Similarly to Lemma 19.2.2.2, we check using Theorem 19.2.2.1 that the category $\mathfrak{C}(Y, \mathfrak{P}/\mathcal{W})$ (resp. $\mathfrak{C}(Y, X/\mathcal{W})$) does not depend, up to a canonical equivalence of categories, on the choice of the proper frame $(Y, X, \mathfrak{P})$ (resp. the proper realizable pair (Y, X)) over $\mathcal{W}$ enclosing Y. Hence, we simply denote it by $\mathfrak{C}(Y/\mathcal{W})$. As for 19.2.2.6, we can define Grothendieck six operations on realizable varieties as follows. Let $u\colon Y' \to Y$ be a morphism of realizable varieties over $\mathcal{W}$.

(a) We have the dual functor $\mathbb{D}_Y\colon \mathfrak{C}(Y/\mathcal{W}) \to \mathfrak{C}(Y/\mathcal{W})$ (see 19.2.2.3).

(b) We have the extraordinary pullback $u^!\colon \mathfrak{C}(Y/\mathcal{W}) \to \mathfrak{C}(Y'/\mathcal{W})$ (see 19.2.2.4). We get the pullbacks $u^+ := \mathbb{D}_{Y'} \circ u^! \circ \mathbb{D}_Y$.

(c) We have the functor $u_+\colon \mathfrak{C}(Y'/\mathcal{W}) \to \mathfrak{C}(Y/\mathcal{W})$ (see 19.2.2.4). We denote by $u_! := \mathbb{D}_Y \circ u_+ \circ \mathbb{D}_{Y'}$, the extraordinary pushforward by u.

(d) We have the tensor product $-\widetilde{\otimes}_Y -\colon \mathfrak{C}(Y/\mathcal{W}) \times \mathfrak{C}(Y/\mathcal{W}) \to \mathfrak{C}(Y/\mathcal{W})$ (see 19.2.2.5)

19.2.4 Stability of the holonomicity by Grothendieck's six operations on quasi-projective k-varieties, algebraic stacks, crystallin companion

Let us introduce a projective version of the notion of data of coefficients of 19.1.1.1.

Definition 19.2.4.1. A *projective data of coefficients* $\mathfrak{C}$ *over* $\mathcal{V}$ will be the data for any object $\mathcal{W}$ of $\mathrm{DVR}(\mathcal{V})$ (see notation 9.2.6.12), for any projective smooth formal scheme $\mathfrak{P}$ over $\mathcal{W}$ of a strictly full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$, which will be denoted by $\mathfrak{C}(\mathfrak{P}/\mathcal{W})$, or simply $\mathfrak{C}(\mathfrak{P})$ if there is no ambiguity with the base $\mathcal{W}$. If there is no ambiguity with $\mathcal{V}$, we simply say a *projective data of coefficients*.

Replacing data of coefficients by projective data of coefficients in 19.1.1.3, we get similar stability notions.

Notation 19.2.4.2. Let $\mathcal{W}$ be an object of $\mathrm{DVR}(\mathcal{V})$ and $\mathfrak{X}$ be a smooth formal scheme over $\mathcal{W}$. Let $F\text{-}\mathrm{Hol}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$ be the category of holonomic $\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}}$-modules endowed with a Frobenius structure. We get a data of coefficients $\mathfrak{A}$ over $\mathcal{V}$ by setting $\mathfrak{A}(\mathfrak{X}) := F\text{-}\mathrm{Hol}(\mathcal{D}^\dagger_{\mathfrak{X},\mathbb{Q}})$. Since this is an abelian category then following 19.1.2.17 we get $\Delta(\mathfrak{A})$ the smallest data of coefficients over $\mathcal{V}$ which is stable under devissage and cohomology and containing $\mathfrak{A}$. We denote by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}$ the underlying projective data of coefficients of $\Delta(\mathfrak{A})$.

19.2.4.3 (Complexes of arithmetic $\mathcal{D}$-modules with bounded and F-holonomic cohomology on quasi-projective k-variety)**.** Let Y be a variety quasi-projective on k. Then there exists a projective and smooth $\mathcal{V}$-formal scheme $\mathfrak{P}$, such that Y is a subscheme of the special fiber P of $\mathfrak{P}$. We denote by $F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y, \mathfrak{P}/\mathcal{V})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y, \mathfrak{P}/\mathcal{V})$) the full subcategory of $F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(\mathcal{D}^\dagger_{\mathfrak{P},\mathbb{Q}})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(\mathfrak{P}/\mathcal{V})$) of complexes $\mathcal{E}$ such that there exists an isomorphism of the form $\mathbb{R}\underline{\Gamma}^\dagger_Y(\mathcal{E}) \xrightarrow{\sim} \mathcal{E}$. Similarly to 19.2.2.1, we can check that the category $F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y, \mathfrak{P}/\mathcal{V})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y, \mathfrak{P}/\mathcal{V})$) is independent, up to canonical isomorphism, of the choice of the immersion $Y \hookrightarrow \mathfrak{P}$ into a projective and smooth $\mathcal{V}$-formal scheme. We write it $F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V})$ (resp. $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y/\mathcal{V})$).

19.2.4.4 (Operations cohomological on quasi-projective k-varieties)**.** Let $b\colon Y' \to Y$ be a morphism of quasi-projective varieties on k. Similarly to 19.2.3.2 (use 18.3.3.5 and the stability of the overholonomicity with Frobenius structure), we get the functors $b_+, b_!\colon F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y'/\mathcal{V}) \to F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V})$ called respectively direct image and extraordinary direct image by b ; we have the functors $b^+, b^!\colon F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V}) \to F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y'/\mathcal{V})$ called respectively inverse image and extraordinary inverse image by b, the dual functor $\mathbb{D}_Y\colon F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V}) \to F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V})$ and the tensor product $-\widetilde{\otimes}_{\mathcal{O}_Y} -\colon F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V}) \times F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V}) \to F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V})$.

Similarly to 19.2.3.2, we get the functors $b^+, b^! \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y/\mathcal{V}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y'/\mathcal{V})$ called respectively inverse image and extraordinary inverse image by b, the dual functor $\mathbb{D}_Y \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y/\mathcal{V}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y/\mathcal{V})$ and the tensor product $-\widetilde{\otimes}_{\mathcal{O}_Y} - \colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y/\mathcal{V}) \times \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y/\mathcal{V}) \to \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{hol}}(Y/\mathcal{V})$.

19.2.4.5 (Arithmetic $\mathcal{D}$-modules for algebraic stacks)**.** In [Abe18, 2], T. Abe construct construct a p-adic cohomology theory for algebraic stacks from the quasi-projective case. He first needs to construct a theory for algebraic spaces, and making use of the theory, he may construct that for algebraic stacks.

19.2.4.6 (Crystalline companion)**.** The Weil conjectures were finally proven by P. Deligne in the 1970s, culminating in the theory of weights for l-adic cohomology in his celebrated paper [Del80]. A p-adic analogue of such a theory of weights were proved by K. Kedlaya for overconvergent isocrystals in [Ked06b], and by T. Abe and the author for arithmetic $\mathcal{D}$-modules in [AC18]. Moreover, in his famous paper, Deligne made the following conjecture on the existence of compatible systems :

Conjecture (Deligne [Del80, 1.2.10])**.** Soient X un schéma normal connexe de type fini sur $\mathbb{F}_p$, et $\mathcal{F}$ un faisceau lisse irréducible dont le déterminant est défini par un caract'ere d'ordre fini du groupe fondamental.

(ii) Il existe un corps de nombres $E \subset \overline{\mathbb{Q}}_l$ tel que le polynôme $\det(1 - F_x t, \mathcal{F})$ pour $x \in |X|$, soit à coefficients dans E.

(v) Pour E convenable (peut-être plus grand qu'en (ii)), et chaque place non archimédienne λ première à p, il existe un E_λ-faisceau compatible à $\mathcal{F}$ (mêmes valeurs propres des Frobenius).

(vi) Pour λ divisant p, on espère des petits camarades cristallins.

The part (vi) is written vaguely because a good theory of p-adic cohomology was not available at the time Deligne conjectured it. R. Crew made this conjecture more precise in [Cre92, 4.13] after P. Berthelot's foundational works in p-adic cohomology theory. This conjecture has been one of the driving forces in developing a p-adic cohomology theory over fields of positive characteristic parallel to the l-adic cohomology theory (e.g., see the introduction of [Chi98]). When X is a curve, all parts of the the conjecture except for (vi) are consequences of the Langlands correspondence, which was proven by V. Drinfeld in the rank 2 case and by L. Lafforgue in the higher rank case. Moreover, Deligne and Drinfeld proved all parts of the conjecture except for (vi) for any smooth scheme X as a consequence of the Langlands correspondence. When X is a curve, T. Abe proves a correspondence between irreducible overconvergent F-isocrystals with finite determinant on an open dense subscheme of X and cuspidal automorphic representations of the function field of X with finite central character (see [Abe18, Theorem 4.2.2]). This implies in particular the part (vi) of Deligne's conjecture in the curve case. T. Abe also proves in [Abe18, Theorem 4.4.5] the converse of Deligne's conjecture when X is smooth using the techniques of Deligne and Drinfeld in [EK12] and [Dri12] assuming the Bertini-type conjecture (more precisely, see [Abe18, Theorem 4.4.2]): for any overconvergent F-isocrystal over a smooth scheme, there exists an l-adic companion for any $l \neq p$. His strategy of proof uses similar ingredients to the l-adic case: for instance, he needs the product formula for epsilon factors, which was proven in the p-adic setting by Abe and A. Marmora in [AM].

19.2.5 Constructible t-structure

For completeness, we introduce the notion of constructibility. Let $\mathfrak{C}$ be a data of coefficients over $\mathcal{V}$ which contains $\mathfrak{B}_{\mathrm{div}}$, which is stable under devissages, pushforwards, extraordinary pullbacks, duals, tensor products, and cohomology.

19.2.5.1 (Constructible t-structure)**.** Let $\mathbb{Y} := (Y, X)$ be a realizable pair. Choose a frame $(Y, X, \mathfrak{P})$. If $Y' \to Y$ is an immersion, then we denote by $i_{Y'} \colon (Y', X', \mathfrak{P}) \to (Y, X, \mathfrak{P})$ the induced morphism where X' is the closure of Y' in X. We define on $\mathfrak{C}(\mathbb{Y}/\mathcal{W})$ the constructible t-structure as follows. An object $\mathcal{E} \in \mathfrak{C}(\mathbb{Y}/\mathcal{W})$ belongs to $\mathfrak{C}^{c,\geq 0}(\mathbb{Y}/\mathcal{W})$ (resp. $\mathfrak{C}^{c,\leq 0}(\mathbb{Y}/\mathcal{W})$) if there exists a special morphism $\mathcal{W} \to (\mathcal{W}', \mathcal{W}^\flat)$ such that, denoting by $\mathfrak{P}' := \mathfrak{P} \times_{\mathrm{Spf}\,\mathcal{W}} \mathrm{Spf}\,\mathcal{W}'$, $Y' := (Y \times_{\mathrm{Spf}\,\mathcal{W}} \mathrm{Spf}\,\mathcal{W}')_{\mathrm{red}}$ and $\mathcal{E}'^{(\bullet)} := \mathcal{W}' \widehat{\otimes}^{\mathbb{L}}_{\mathcal{W}} \mathcal{E}^{(\bullet)}$, there exists a smooth stratification (see 16.3.1.2) $(Y'_i)_{i=1,\ldots,r}$ of Y' such that for any i, the complex $i^+_{Y'_i}(\mathcal{E}'^{(\bullet)})[d_{Y'_i}]$ (see notation 19.2.2.6) belongs to $\mathfrak{C}^{\geq 0}_{\mathrm{isoc}}(Y'_i, \mathfrak{P}'/\mathcal{W})$ (resp. $\mathfrak{C}^{\leq 0}_{\mathrm{isoc}}(Y'_i, \mathfrak{P}'/\mathcal{W})$).

Proposition 19.2.5.2. *Let $\mathbb{Y} := (Y, X)$ be a realizable pair.*

(a) Let $\mathcal{E}'^{(\bullet)} \to \mathcal{E} \to \mathcal{E}''^{(\bullet)} \to \mathcal{E}'^{(\bullet)}[1]$ be an exact triangle in $\mathfrak{C}(\mathbb{Y}/\mathcal{W})$. If $\mathcal{E}'^{(\bullet)}$ and $\mathcal{E}''^{(\bullet)}$ are in $\mathfrak{C}^{c,\geq 0}(\mathbb{Y}/\mathcal{W})$ (resp. $\mathfrak{C}^{c,\leq 0}(\mathbb{Y}/\mathcal{W})$) then so is $\mathcal{E}$.

(b) Suppose that Y is smooth. Let $\mathcal{E} \in \mathfrak{C}_{isoc}(\mathbb{Y}/\mathcal{W})$. Then $\mathcal{E} \in \mathfrak{C}^{c,\geq 0}(\mathbb{Y}/\mathcal{W})$ (resp. $\mathcal{E} \in \mathfrak{C}^{c,\leq 0}(\mathbb{Y}/\mathcal{W})$) if and only if $\mathcal{E} \in \mathfrak{C}^{\geq d_X}_{isoc}(\mathbb{Y}/\mathcal{W})$ (resp. $\mathcal{E} \in \mathfrak{C}^{\leq d_X}_{isoc}(\mathbb{Y}/\mathcal{W})$).

Proof. This is left to the reader. □

19.3 Comparison between p-adic de Rham type cohomologies

19.3.1 A comparison between rigid and $\mathcal{D}$-module cohomology for constructible isocrystals of Frobenius type

19.3.1.1. Let $\mathfrak{P}$ be a smooth separated formal scheme over $\mathfrak{S}$. Let Z and X be two closed subschemes of P such that $X \setminus Z$ is smooth over $\operatorname{Spec} k$. Following 16.2.7.11.1, we have constructed the canonical equivalence of categories

$$\mathrm{sp}^{(\bullet)}_{Y,+} = \mathrm{sp}^{(\bullet)}_{X\hookrightarrow\mathfrak{P},Z,+} \colon (F\text{-})\mathrm{MIC}^{\dagger}(X,\mathfrak{P},Z/K) \cong (F\text{-})\mathrm{MIC}^{(\bullet)}(X,\mathfrak{P},Z/\mathcal{V}).$$

Let Y be a realisable smooth k-variety. By embedding Y inside a smooth and proper formal $\mathcal{V}$-scheme $\mathfrak{P}$, it follows from 18.3.2.2 that the above functor sp_+ has the factorisation:

$$\mathrm{sp}_{Y,+} \colon F\text{-}\mathrm{Isoc}^{\dagger}(Y,\mathfrak{P}/\mathcal{V}) \to F\text{-}D^{\mathrm{b}}_{\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V}),$$
$$\mathrm{sp}_{Y,+} \colon \mathrm{Isoc}^{\dagger}_{F}(Y,\mathfrak{P}/\mathcal{V}) \to D^{\mathrm{b}}_{F\text{-}\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V}),$$

where $\mathrm{Isoc}^{\dagger}_{F}(Y,\mathfrak{P}/\mathcal{V})$ is the category of overconvergent isocrystals on Y of Frobenius type, where $F\text{-}D^{\mathrm{b}}_{\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V})$ is the category of complexes of $D^{\mathrm{b}}_{\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V})$ having a Frobenius structure, and $D^{\mathrm{b}}_{F\text{-}\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V})$ is the category of overholonomic complexes after any base change on $Y/\mathcal{V}$ of Frobenius type (i.e. according to notation 19.1.2.19, the functor $\underrightarrow{l}^{*}_{\mathbb{Q}}$ induces the equivalence of categories $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},F\text{-}\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V}) \cong D^{\mathrm{b}}_{F\text{-}\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V})$). It follows from 11.3.5.3 (similarly to the remark of [AL22, 7.1.2]), that for any $E \in F\text{-}\mathrm{MIC}^{\dagger}(Y,\mathfrak{P}/K)$, we have the isomorphism of $F\text{-}D^{\mathrm{b}}_{\mathrm{h}}(Y,\mathfrak{P}/\mathcal{V})$:

$$\mathrm{sp}_{Y+}(E^{\vee}) \xrightarrow{\sim} \mathbb{D}_{Y} \circ \mathrm{sp}_{Y+}(E)(d_Y). \tag{19.3.1.1.1}$$

In fact, thanks to a descent construction of T. Abe [Abe19], the fully faithful functor $\mathrm{sp}_{Y,+}$ can be extended to any (non necessarily smooth) realisable k-variety. In the Rieman-Hilbert's correspondence point of vue, using notation 8.8.3.3, we write

$$\mathrm{sp}^{\mathrm{RH}}_{Y,+} := \mathrm{sp}_{Y,+}[-d_Y](-d_Y)^{2}. \tag{19.3.1.1.2}$$

19.3.1.2 (Constructible isocrystals)**.** In [LS14, LS16], B. Le Stum's introduced a theory of constructible isocrystals. Le Stum's category of constructible isocrystals on $\mathfrak{P}$ corresponds to a rigid cohomological analogue of the category of constructible ℓ-adic sheaves, and consists of convergent ∇-modules on $\mathfrak{P}_K$, which become locally free on the tubes of each stratum in some stratification of $\mathfrak{P}$.

Theorem 19.3.1.3 (Abe-Lazda)**.** *Let $\mathfrak{P}$ be a realisable smooth formal $\mathcal{V}$-scheme, and $\mathcal{F}$ is a constructible isocrystal of Frobenius type. Then $\mathrm{sp}^{\mathrm{RH}}_{!}\mathcal{F}$ is a dual constructible complex of overholonomic $\mathcal{D}^{\dagger}_{\mathfrak{P}\mathbb{Q}}$-modules. If $\mathcal{F}$ is supported on some locally closed subscheme $Y \hookrightarrow P$, then so is $\mathrm{sp}_{!}\mathcal{F}$, where $\mathrm{sp}^{\mathrm{RH}}_{!} := \mathbb{R}\mathrm{sp}_{*}[\dim \mathfrak{P}]$.*

Proof. The strategy is to use de Jong's theory of alterations to reduce to the case of overconvergent isocrystals on completely smooth d-frames. To get the overholonomicity, the fundamental result of 18.3.2.2 is needed. This descent requires also a rather delicate verification of the compatibility of the functor $\mathrm{sp}_{!}$ with the rigid analytic trace map defined in [AL20]. For more details, see [AL22, 6.2.1]. □

[2] Beware in [AL22], $\mathrm{sp}^{\mathrm{RH}}_{Y,+}$ (resp. $\mathrm{sp}_{Y,+}$) is denoted by sp_{+} (resp. $\widetilde{\mathrm{sp}}_{+}$)

Abe and Lazda also prove the compatibility of $\mathrm{sp}_!$ with arbitrary pullback, as well as pushforward along a locally closed immersion. Both functors sp_+ and $\mathrm{sp}_!$ are compatible as follows, which justifies the notation:

Theorem 19.3.1.4 (Abe-Lazda)**.** *Let Y be a realisable smooth k-variety, and E an overconvergent isocrystal of Frobenius type on Y. Then there is a natural isomorphism*

$$\mathrm{sp}_+^{\mathrm{RH}} E \cong \mathbb{D}_Y \mathrm{sp}_!^{\mathrm{RH}} E^\vee$$

in $D^{\mathrm{b}}_{F\text{-}\mathrm{h}}(Y)$.

Proof. Given this descent result, and compatibility with pullbacks, the proof of Theorem 19.3.1.4 is actually relatively straightforward. The point is that the objects involved lie in an abelian category which satisfies h-descent. Thus to construct such an isomorphism locally for the h-topology on Y. Via some de Jong's alterationd, they reduce to the case when Y has a smooth compactification, which then locally lifts to a smooth formal $\mathcal{V}$-scheme. It is then possible to compare $\mathrm{sp}_!^{\mathrm{RH}}$ with $\mathrm{sp}_+^{\mathrm{RH}}$ more or less directly. For more details, see [AL22, 7.1.1]. □

Theorem 19.3.1.5 (Abe-Lazda)**.** *Let Y/k be a realisable k-variety, $f\colon Y \to \operatorname{Spec} k$ its structure morphism. Let E be an overconvergent isocrystal on Y of Frobenius type. We denote by $H^*_{\mathrm{rig}}(Y, E)$ (resp. $H^*_{c,\mathrm{rig}}(Y, E)$) the rigid cohomology (the rigid cohomology with compact support) of E.*

(a) There is a canonical isomorphism

$$H^*_{c,\mathrm{rig}}(Y, E) \cong H^*(f_! \circ \mathrm{sp}^{\mathrm{RH}}_{Y,+}(E))$$

of finite dimensional, graded K-vector spaces. When $E \in F\text{-}\mathrm{Isoc}^\dagger(Y, \mathfrak{P}/\mathcal{V})$, this is compatible with Frobenius.

(b) Suppose Y is either *smooth* or *proper. There is a canonical isomorphism*

$$H^*_{\mathrm{rig}}(Y, E) \cong H^*(Y, f_+ \circ \mathrm{sp}^{\mathrm{RH}}_{Y,+}(E))$$

of finite dimensional, graded K-vector spaces. When $E \in F\text{-}\mathrm{Isoc}^\dagger(Y, \mathfrak{P}/\mathcal{V})$, this is compatible with Frobenius.

Proof. Let us only give few ingredients of Abe-Lazda's proof. Given an embedding of $i_Y : Y \hookrightarrow \mathfrak{P}$ into a smooth and proper formal $\mathcal{V}$-scheme, the proof of the part (a) boils down to computing the de Rham cohomology of the constructible ∇-module $i_{Y!}E$ on $\mathfrak{P}_K$. Using 19.3.1.4, we reduce to check a similar isomorphism with $\mathrm{sp}^{\mathrm{RH}}_{Y,!}$ instead of $\mathrm{sp}^{\mathrm{RH}}_{Y,+}$. The functor $\mathrm{sp}_!^{\mathrm{RH}}$ has a genuinely global definition which make easier to prove this comparison theorem for compactly supported cohomology. A key ingredient in achieving this is the trace morphism in rigid analytic geometry defined in [AL20], which enables to interpret the de Rham cohomology of $i_{Y!}E$ as the rigid Borel–Moore homology of Y with coefficients in E. The part (b) is a consequence of the part (a) and Poincaré duality. See [AL22, 7.2.1 and 7.2.2] for more details. □

19.3.1.6. Kedlaya proved that the rigid cohomology with or without compact support $H^*_{c,\mathrm{rig}}(Y, E)$ and $H^*_{c,\mathrm{rig}}(Y, E)$ of an overconvergent F-isocrystals E, have finite cohomological dimension (see [Ked06a]), which is the culmination of a long series of finiteness results of these rigid cohomologies: We first got the first finiteness result by Crew in the case where Y is an affine and smooth curve (see [Cre98]). When E is equal to the constant coefficient, i.e. $E = j^\dagger \mathcal{O}_{\mathfrak{P}_K}$, the finiteness of $H^*_{\mathrm{rig}}(Y/K)$, the rigid cohomology with or without compact support was first proved Berthelot proved in [Ber97b] in the case where Y/S is smooth. Via a proper cohomological descent and using de Jong's desingularisation theorem, Tsuzuki proved in [Tsu03], the finiteness of $H^*_{c,\mathrm{rig}}(Y/K)$ and $H^*_{c,\mathrm{rig}}(Y/K)$ for any k-scheme of finite type Y. Grosse Könne gave a second proof of this later result in [GK02] via his theory of dagger spaces"dagger spaces".

19.3.2 L-functions associated with arithmetic $\mathcal{D}$-modules

Let $q = p^s$ be a power of a prime number. We assume the residual field k is equal to a field with q elements $\mathcal{F}_q$. Let Y be a variety quasi-projective on k. Choose a projective and smooth $\mathcal{V}$-formal scheme $\mathfrak{P}$, such that Y is a subscheme of the special fiber P of $\mathfrak{P}$. Let X be the closure of Y in P and $j: Y \subset X$ be the open immersion.

19.3.2.1. Let Y^0 be the set of closed points of Y. Let $y \in Y^0$. Then we denote by $i_y\colon \operatorname{Spec} k(y) \hookrightarrow Y$ the induced closed immersion. Choose a morphism (by abuse of notation still denoted by i_y) of smooth $\mathcal{V}$-formal schemes of the form $i_y\colon \operatorname{Sp} \mathcal{V}(y) \hookrightarrow \mathfrak{P}$ which is a lifting of the closed immersion $\operatorname{Spec} k(y) \hookrightarrow Y$ induced by i_y. Let $i_{y,K}\colon \operatorname{Sp} K(y) \hookrightarrow \mathfrak{P}_K$ be the induced morphism of rigid analytic K-spaces.

Definition 19.3.2.2. With notation 19.2.4.3, let $(\mathcal{E},\ \Phi) \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V})$. We define the L-function associated with $(\mathcal{E},\ \Phi)$ [3] by setting:

$$L(Y, \mathcal{E}, t) = \prod_{y\in Y^0}\prod_{r\in\mathbb{Z}} \det{}_K \left(1 - t^{\deg y} F^{\deg y} | H^r(i_y^+(\mathcal{E}))\right)^{(-1)^{r+1}/\deg y}.$$

19.3.2.3 (Link with the L-functions associated with overconvergent F-isocrystals)**.** Let $(E, \Phi) \in F\text{-}\operatorname{Isoc}^\dagger(Y, \mathfrak{P}/K)$. For any closed point y of Y, let $E_y := H^0_{\mathrm{rig}}(\operatorname{Spec} k(y), i^*_{y,K}E)$ the fiber of E in y and $F|E_y$ its Frobenius automorphism.

In [ÉLS93, 2.3], the L-function associated with (E, Φ) is given by

$$L(Y, E, t) := \prod_{y\in Y^0} \det{}_K(1 - t^{\deg y} F^{\deg y} | E_y)^{-1/\deg y}. \tag{19.3.2.3.1}$$

They proved in [ÉLS93] the cohomological formula:

$$L(Y, E, t) := \prod_{i} \det{}_K(1 - t^{\deg y} F | H^i_{c,\mathrm{rig}}(Y, E))^{(-1)^{i+1}}. \tag{19.3.2.3.2}$$

Viewing $H^i_{\text{ét,c}}(X_{\overline{k}}, \mathbb{Q}_p)$ as the kernel of the action of $1-F$ acting on $H^i_{c,\mathrm{rig}}(Y/K)$ they checked in [ÉLS97] Katz's conjecture is valid for the constant coefficient, i.e. the function

$$Z(X, t)/\det(1 - tF | H^i_{\text{ét,c}}(X_{\overline{k}}, \mathbb{Q}_p))^{(-1)^{i+1}}$$

has neither zero nor pole on the unit disk ($\overline{k}$ denotes an algebraic closure of $\mathbb{F}_q$).

Building on work of Crew, Kedlaya proved in [Ked06b] a rigid cohomological analogue of the main result of Deligne's of "Weil II" (i.e. [Del80]), which gives a purely p-adic proof of the Weil conjectures. Ingredients include a p-adic analogue of Laumon's application of the geometric Fourier transform in the l-adic setting or that of Huyghe's one as exposed in 9.4.6. This gives a rigid avatar of Deligne's theory of weights. Such a theory has an arithmetic $\mathcal{D}$-modules analogue (see [AC18]).

The computation of Weil's zeta functions via p-adic methods leads to new algorithms (e.g. see [Ked04c], [Har07]).

Proposition 19.3.2.4. *Suppose Y is smooth. Let $(E, \Phi) \in F\text{-}\operatorname{Isoc}^\dagger(Y, \mathfrak{P}/K)$. Since the functor sp_{Y+} commutes with pullbacks (see 16.2.4.3.1), then we get a Frobenius structure on $\mathrm{sp}_{Y+}E$. We have the equality:*

$$L(Y, E, t) = L(\mathfrak{Y}, \mathrm{sp}^{\mathrm{RH}}_{Y+}(E), t).$$

Proof. Using 19.3.1.1.1 and 19.3.1.1.2, we reduce to check

$$L(Y, E^\vee, t) = L(\mathfrak{Y}, \mathbb{D}_{\mathfrak{X},T}(\mathrm{sp}_{Y+}E)[d_Y], t).$$

Let y be a closed point of Y. By transitivity of the isomorphism 16.2.4.3.1, the canonical functorial in E isomorphism: $\mathrm{sp}_{y+} \circ i^*_{y,K}(E) \xrightarrow{\sim} i^!_{y\,T} \circ \mathrm{sp}_{Y+}(E)[d_{\mathfrak{X}}]$ is therefore compatible with Frobenius, where sp_{y+} is equal to the pushforward sp_{y*} by the specialisation morphism $\mathrm{sp}_y\colon \operatorname{Sp} K(y) \to \operatorname{Spf} \mathcal{V}(y)$. Furthermore, as E is a $j^\dagger\mathcal{O}_{\mathfrak{P}_K}$-locally free module of finite type, we have a $K(y)$-linear isomorphism compatible with Frobenius: $\mathrm{sp}_{y+} \circ i^*_{y,K}(E^\vee) \xrightarrow{\sim} \mathbb{D}_y \circ \mathrm{sp}_{y+} \circ i^*_{y,K}(E)$. Hence: $\mathrm{sp}_{y+} \circ i^*_{y,K}(E^\vee) \xrightarrow{\sim} \mathbb{D}_y \circ i^!_{y,\,T}(\mathrm{sp}_{Y+}E)[d_X]$. Using the isomorphism compatible with Frobenius $i^+_y(\mathbb{D}_Y(\mathrm{sp}_{Y+}E)) \xrightarrow{\sim} \mathbb{D}_y \circ i^!_{y,\,T}(\mathrm{sp}_{Y+}E)$, we then conclude the proof. ☐

[3]Compared to [Car06b, 3.1.1 and 3.1.3], we have multiplied by $(-1)^{d_Y}$ both L-function and cohomological function

Example 19.3.2.5. Let $j^\dagger\mathcal{O}_{]X[_{\mathfrak{P}}}$ be the constant isocrystal on Y/K and let $K_Y := \mathrm{sp}_{Y+}(j^\dagger\mathcal{O}_{]X[_{\mathfrak{P}}})$ be the associated object of $F\text{-}D^{\mathrm{b}}_{\mathrm{h}}(Y, \mathfrak{P}/\mathcal{V})$. Then

$$L(Y, K_Y, t) = L(Y, j^\dagger\mathcal{O}_{]X[_{\mathfrak{P}}}, t) = Z(Y, t),$$

where $Z(Y, t)$ it the Weil zeta function.

Theorem 19.3.2.6. *For any complex $(\mathcal{E},\ \Phi) \in F\text{-}D^{\mathrm{b}}_{\mathrm{hol}}(Y/\mathcal{V})$, we have the equality:*

$$L(Y, \mathcal{E}, t) = \prod_{r\in\mathbb{Z}} \det_K (1 - tF|H^r(f_{T,!}\mathcal{E}))^{(-1)^{r+1}}.$$

Proof. By devissage, we reduce to the case where Y is smooth and $(\mathcal{E},\ \Phi)$ comes from an overconvergent F-isocrystal. In that case, we have the cohomological interpretation of Étesse et Le Stum (see 19.3.2.3.2). Using the comparison between both L-functions (19.3.2.4) and cohomology (see 19.3.1.5.(b)), then we are done. □

19.3.3 Comparison with some other cohomologies

19.3.3.1. E. Grosse-Klönne in [GK00] defines a category of "rigid spaces with overconvergent structures sheaf", which he calls "dagger spaces". He develops a theory of coherent analytic sheaves for his spaces, and shows that it satisfies an analogue of Serre duality. He also defines de Rham cohomology, and de Rham cohomology with compact support, and shows that these satisfy Poincaré duality and the Künneth formula. Finally, he compares this de Rham cohomology theory to Berthelot's rigid cohomology and proved its finiteness (see [GK02]).

19.3.3.2 (Comparison with overconvergent de Rham-Witt cohomology)**.** Let $W = W(k)$ be the ring of Witt vectors over k, and let $K = W[1/p]$. Let X be a smooth variety over k. The rigid cohomology groups $H^i_{\mathrm{rig}}(X/K)$ are finite-dimensional K-vector spaces. One might wonder whether there is an integral cohomology theory with similar finiteness properties. If X is proper over k, then the crystalline cohomology $H^i_{\mathrm{crys}}(X/W)$ is a finitely generated W-module, and its image in $H^i_{\mathrm{rig}}(X/K)$ is a lattice in $H^i_{\mathrm{rig}}(X/K)$. However, without the properness assumption, $H^i_{\mathrm{crys}}(X/W)$ is not always finitely generated. L. Illusie introduced in [Ill79] a canonical sheaf of differential graded algebras $W\Omega^\bullet_{X/k}$ on the Zariski site of X, called the de Rham-Witt complex, whose degree zero component is the ring of Witt vectors $W\mathcal{O}_X$ of the structure sheaf $\mathcal{O}_X$. He proved that its cohomology $H^i(X, W\Omega^\bullet_{X/k})$ is isomorphic to $H^i_{\mathrm{crys}}(X/W)$. Later, A. Langer, and T. Zink generalize Illusie's definition of the de Rham-Witt complex to a relative situation, i.e. more precisely for a proper and smooth morphism (see [LZ04]).

In [DLZ11, DLZ12], C. Davis, A. Langer, and T. Zink introduced a natural differential graded subalgebra $W^\dagger\Omega^\bullet_{X/k} \subset W\Omega^\bullet_{X/k}$, called the overconvergent de Rham-Witt complex, and shows that its cohomology tensored with $\mathbb{Q}$ computes the rigid cohomology of X in case X is quasi-projective, i.e. $H^i(X, W^\dagger\Omega^\bullet_{X/k}) \otimes_W K$ is isomorphic to $H^i_{\mathrm{rig}}(X/W)$. The degree zero term $W^\dagger\mathcal{O}_X$ is called the sheaf of overconvergent Witt vectors, and its main properties were already developed in a previous work by the same authors; it is defined in terms of a growth condition for the components of the Witt vectors that is too technical to reproduce here. These growth conditions are then extended to the whole de Rham-Witt complex, to define the overconvergent subcomplex.

The torsion subgroup of $H^i(X, W^\dagger\Omega^\bullet_{X/k})$ can be infinitely generated (e.g. in the case $X = \mathbb{A}^1_k$ and $i = 1$). However, one might still wonder if the image of $H^i(X, W^\dagger\Omega^\bullet_{X/k})$ in $H^i_{\mathrm{rig}}(X/W)$, the ith space of the integral overconvergent de Rham-Witt cohomology modulo torsion, is a lattice. In [ES20], V. Ertl and A. Shiho show that if X is a smooth affine curve over k whose smooth compactification has genus zero, then the image of $H^i(X, W^\dagger\Omega^\bullet_{X/k})$ in $H^i_{\mathrm{rig}}(X/W)$ is a finitely generated W-module. However, they construct a counter-example if the genus is instead positive. They conjecture that if the genus is positive, then the image is never finitely generated.

Generalizing a definition of Bloch, V. Ertl introduced overconvergent de Rham-Witt connections in [Ert16]. This provides a tool to extend the comparison morphisms of Davis, Langer and Zink between overconvergent de Rham-Witt cohomology and Monsky-Washnitzer respectively rigid cohomology to coefficients. Another step toward an interpretation of F-isocrystals as overconvergent de Rham-Witt connections has been made by R. Muñoz--Bertrand in [MB22] and [MB24].
