Introduction

0.1 Motivations

Let $q = p^s$ be a power of a prime number, $k = \mathbb{F}_q$ be a finite field with q elements and X be an algebraic variety over k of dimension d, i.e. a separated k-scheme of finite type. We want to compute

$$N_r(X) := |X(\mathbb{F}_{q^r})|$$

for all $r \in \mathbb{N}$. André Weil made in 1949 ([Wei49]) few conjectures concerning theses numbers. Weil conjectures are easier to deal with via the Zeta function of X which is the generating function

$$\zeta(X,t) = \exp\left(\sum_{r=1}^{\infty} N_r(X)\frac{t^r}{r}\right) = \prod_{x\in X^0} \frac{1}{1-t^{d(x)}},$$

where x going through the set X^0 of closed points of X, and $d(x)$ denotes the degree of the residual field $k(x)$ of x over k. Three main parts of Weil conjectures can be formulated in the following way:

(a) Rationality: the function $\zeta(X,t)$ can be written of the form

$$\zeta(X,t) = \frac{P_1(t)\dots P_{2d-1}(t)}{P_0(t)\dots P_{2d}(t)},$$

where $P_i(t) \in \mathbb{Q}[t]$ is a polynomial of degree b_i, where b_i coincide with the ith Betti-number of a lifting of X to characteristic zero, is one exists.

(b) Functional equation: if X is proper and smooth, then

$$\zeta(X, \frac{1}{q^d t}) = \pm q^{d\chi(X)/2} t^{\chi(X)} \zeta(X,t)$$

with $\chi(X) = \sum_{i=1}^{2d} (-1)^i b_i$ (Euler characteristic).

(c) Purity: if X is proper and smooth, then the polynomials $P_i(t)$ have integral coefficients. Moreover, if $P_i(t) = \prod_{j_i=1}^{b_i}(1-\omega_{j_i}t)$, the complex numbers ω_{j_i} have archimedean absolute values $q^{i/2}$ (such numbers are called Weil number of weight i).

More concretely, the rationality means that there exists finitely many algebraic integers α_j and β_j such that for all r, we have $N_r(X) = \sum \beta_j^r - \alpha_j^r$ (the β_j are equal to the ω_{j_i} with i odd and α_j are equal to the ω_{j_i} with i even). When X is proper and smooth, the functional equation is translated by the property that the application $\gamma \mapsto q^d/\gamma$ induces a permutation of the α_j's and a permutation of the β_j's. The purity implies that the algebraic integers α_j and β_j are Weil numbers with weight in $[0, 2d]$.

Using p-adic methods, Bernard Dwork in 1960 gave the first proof of the rationality ([Dwo60]). Later, using l-adic methods, where l is a prime number different from p, the characteristic of the algebraic variety, Alexandre Grothendieck proved the rationality. More precisely, let $\overline{k}$ be an algebraic closure of k, $\overline{X} := X \otimes_k \overline{k}$ and F be the Frobenius endomorphism on $\overline{X}$. He obtained the cohomological interpretation of the zeta function (e.g. [SGA4.1, SGA4.2, SGA4.3] or [Mil80, VI.13.1]):

Theorem (Grothendieck). *$Z(X,t)$ is rational and we have the equality:*

$$Z(X,t) = \prod_{i=0}^{2d_X} \det(1 - tF | H^i_{\text{ét,c}}(\overline{X}, \mathbb{Q}_l))^{(-1)^{i+1}}$$

where $H^i_{\text{ét,c}}(\overline{X}, \mathbb{Q}_l)$ designates the spaces of étale cohomology with compact support of the constant sheaf $\mathbb{Q}_l$.

He also proved the functional equation holds in 1965 (see [Gro95]). Using Grothendieck's theory of ℓ-adic étale cohomology of varieties over a field of characteristic $p \neq \ell$, Pierre Deligne in 1974 established the purity which fully completed the Weil conjectures ([Del80]). Moreover, he built a theory of mixedness and weights for constructible ℓ-adic sheaves which is compatible with the "six functors formalism" of the ℓ-adic cohomology, namely the mixedness and weight are stable under the functors $f_!$, $f_*, f^*, f^!, \otimes$ and $\mathcal{H}om$ (see [Del80]). Later, using the theory of perverse sheaves, in [BBD82] Gabber proved the stability of purity and mixedness under intermediate extensions, with which the theory of weights for ℓ-adic cohomology may be regarded as complete.

However, the problem of obtaining a p-adic Weil cohomology, i.e. getting similar results within a p-adic cohomological framework attached to a separated scheme of finite type over a perfect field k of characteristic p remained opened. Inspired by the Dwork's proof of the rationality of the zeta function, Monsky and Washnitzer introduced the notion of p-adic weak completion and constructed the so-called Monsky-Washintzer cohomology (see [MW68, Mon68, Mon71]). The is the first attempt towards a p-adic Weil cohomology (as nice as the l-adic étale cohomology for $l \neq p$) and is well suited for affine and smooth k-varieties. In the continuation of the notion of crystals and infinitesimal site formulated by Grothendieck in the zero characteristic (see [Grot68]), Berthelot constructed the crystalline cohomology over schemes of characteristic p, which is a p-adic Weil cohomology well adapted to proper and smooth k-varieties ([Ber74, Ill76, BO78]). In order to unify both crystalline and Monsky-Washnitzer cohomologies and to get a p-adic Weil cohomology at least well suited for any k-variety X, Berthelot introduced the rigid cohomology (see [LS07] and [Ber96b]). For any k-variety X, the coefficients on X studied in rigid cohomology, are the isocrystals on X, specially those endowed with a Frobenius action which are called F-isocrystals. They constitute a p-adic avatar of the notion of integrable connections (which are of finite type over the structural sheaf of the variety) on a variety of characteristic zero. This cohomology behaves well for the following multiple reasons. For any k-variety X and any F-isocrystal E on X, Kedlaya proved the finiteness of the rigid cohomological spaces with or without compact support denoted respectively by $H^*_{\text{rig}}(Y,E)$ and $H^*_{\text{rig,c}}(Y,E)$ (see [Ked06a]). In addition, Etesse and Le Stum defined (see [ÉLS93]) the L-functions associated with overconvergent F-isocrystals and obtained the following rigid cohomological interpretation of the zeta function:

Theorem (Etesse-Le Stum). *Let E be an overconvergent F-isocrystal on a smooth k-scheme Y of pure dimension d. We then have the equality*

$$L(Y,E,t) = \prod_{r=1}^{2d} \det_K(1 - tF^{-1} | H^r_{\text{rig,c}}(Y,E)).$$

When E is the constant F-isocrystal, we retrieve the Weil zeta function.

Concerning the purity, the first attempt to calculate the weights of some p-adic cohomology was made by Katz and Messing in their famous paper [KM74]. Using Deligne's deep results on weights, especially *"Le théorème du pgcd"*, they showed that, for projective smooth varieties, the weight of crystalline cohomology is the same as that of ℓ-adic one. It was reasonable to hope that the coefficient theory of weights parallel to ℓ-adic cohomology should exist in the spirit of the *petit camarade conjecture* [Del80, 1.2.10], even though there were many obstacles that prevented the construction of such a theory. After the work of Katz-Messing, efforts were made until Kedlaya finally obtained in [Ked06b] the expected estimation of weights of rigid cohomology. We do not go into more details of the history, and recommend the reader to consult the excellent explanation in the introduction of [Ked06b].

The theory of modules over suitable rings of differential operators are generically called theory of "$\mathcal{D}$-modules" and are an essential tool in the study of de Rham cohomology and other theories deriving from it. Overconvergent F-isocrystals can be seen as a p-adic avatar of the notion of smooth constructible

l-adic sheaves. For instance, tensor products, pullbacks, internal homomorphisms of overconvergent F-isocrystals give overconvergent F-isocrystals. However, the property of being stable by direct images by closed immersions are missing for such p-adic coefficients. In order to get a p-adic Weil cohomology stable under six functors on k-varieties, being inspired by the notion of p-adic weak completion appearing in Monsky-Washnitzer cohomology or rigid cohomology, Berthelot constructed a p-adic avatar of a theory of modules over the ring of differential operators. The objects appearing in his theory are called arithmetic $\mathcal{D}$-modules or complexes of arithmetic $\mathcal{D}$-modules. In the framework of Berthelot's theory of arithmetic $\mathcal{D}$-modules, several constructions of p-adic coefficients stable by Grothendieck's six functors satisfying few extra properties, e.g. with finite de Rham cohomology, that we might call six functors formalisms, have been verified. With N. Tsuzuki (see [CT12]), we established such a formalism for overholonomic F-complexes of arithmetic $\mathcal{D}$-modules (i.e. complexes together with a Frobenius structure) over realizable k-varieties (i.e. k-varieties which can be embedded into a proper smooth $W(k)$-formal scheme). Another example was given by holonomic F-complexes of arithmetic $\mathcal{D}$-modules over quasi-projective varieties ([Car11d]). In a wider geometrical context, T. Abe established a six functors formalism for admissible stacks, namely algebraic stacks of finite type with finite diagonal morphism (see [Abe18, 2.3]). The starting point of his work was the case of quasi-projective k-varieties. Again, some Frobenius structures are involved in his construction. Finally, without Frobenius structure, in [Car18], we showed how to build such a p-adic formalism of Grothendieck's six functors, e.g. with quasi-unipotent complexes of arithmetic $\mathcal{D}$-modules (see [Car18]). When the field k is not perfect, such a formalism has been extended in [Car21].

In [AC18], with T. Abe we use systematically Berthelot's arithmetic $\mathcal{D}$-modules to complete the program of establishing a p-adic theory of weights stable under six functors. In many applications, such a theory should play as important roles as suggested by the classical situations; for example, the theory of intersection cohomology and its purity, the theory of Springer representations, Lafforgue's proof of Langlands correspondence, etc.

0.2 Goals

In his introduction to arithmetic $\mathcal{D}$-modules of [Ber02], Berthelot gave an excellent overview of the state of the art of his theory in 2002. However, some proofs were missing there and were still unpublished, specially the most technical and fundamental ones concerning his notion of quasi-coherent or coherent complexes over a projective or inductive system of differential rings. One first main goal of this book is to fill this gap by giving to the reader the details of Berthelot's proofs and therefore to understand the solid foundations of the theory of arithmetic $\mathcal{D}$-modules of Berthelot.

Another main objective is to gather everything needed in the theory of arithmetic $\mathcal{D}$-modules to get in the case where the field k is perfect a six functors formalism for 1) overholonomic complexes with Frobenius structure (or more generally of Frobenius type) on realizable varieties (see here 19.1.2.19), 2) holonomic complexes with Frobenius structures which solves Berthelot's conjecture in this context (see 19.2.4) or 3) more recently some slightly more technical ingredients to construct a stable coefficient without Frobenius structure (see 19.1.3.10). We think this represents a sufficiently interesting mathematical goal to prove the maturity of Berthelot's theory. In this book, we are content to present a valid theory for realisable (e.g. quasi-projective) k-varieties (with or without Frobenius structure). We mention at the end (see 19.2.4.6) the extension (from the case of quasi-projective schemes) to certain algebraic stacks by T. Abe which allowed him to establish a striking proof of the conjecture of Deligne's little crystalline companion.

We have very good foundational papers by P. Berthelot on arithmetic $\mathcal{D}$-modules (e.g. see [Ber96c, Ber00]), but they are mostly written without logarithmic structures. Let us explain why log-structures are mandatory in the theory of arithmetic $\mathcal{D}$-modules. The proof concerning the stability of the overholonomicity with Frobenius structure reduces by devissage to check the overholonomicity of overconvergent F-isocrystals on smooth k-varieties (see 18.3.2.2 for a proof of this later result). The main ingredient is the semistable reduction of Kedlaya which is one of the most profound structure results concerning overconvergent F-isocrystals. This allows us to reduce to the case of log extendable isocrystals, which requires a log version of arithmetic $\mathcal{D}$-modules. Hence, another objective of the book is to properly rewrite all of Berthelot's constructions within this framework as general as possible and check the log version of theorems when they are valid. We tried to have complete proofs and to be as self-contained as possible. However, we have sometimes omitted some proofs by simply giving a few references or the main ingredients of the checks. Let us cite in particular Berthelot's Frobenius descent of the level (see [Ber00]), the finite homological dimension of the sheaf of differential operators of finite level when the log structure comes from a strict normal crossing divisor proved by C. Montagnon (see 6.1.4.2), with overconvergent singularities and with trivial log structure established by C. Huyghe (see 8.7.7.9) or the commutation of the extraordinary pullbacks of a smooth morphism to duality proved by T. Abe (see 11.3.5.1.1).

0.3 Overview

Let $X \to S$ be a smooth morphism of schemes. We recall in the first chapter Grothendieck's construction of the usual sheaf of differential operators $\mathcal{D}_{X/S}$ of X/S, which (in contract with Berthelot construction) can be clarified by adding "of infinite level and finite order" and denoted by $\mathcal{D}^{(\infty)}_{X/S}$. Then we introduce the sheaf of differential operators $\mathcal{D}^{(m)}_{X/S}$ of finite order and of finite level m for some integer $m \in \mathbb{N}$ as defined in ([Ber96c] §2, [Ber02] §1.2.2, [Ber90] §1.2) by Berthelot. In order to obtain coherent sheaf of rings, the idea is to replace in Grothendieck's construction the diagonal immersion by its m-PD envelope whose notion is explained here in details. For instance, in the level 0 case, the sheaf $\mathcal{D}^{(0)}_{X/S}$ is locally generated by $\mathcal{O}_X$ and the derivations. Next, we study the notion of left and right $\mathcal{D}^{(m)}_{X/S}$-modules (for m finite or not) via respectively m-PD-stratifications and m-PD-costratifications. Beware that contrary to the infinite level case, $\mathcal{D}^{(m)}_{X/S}$ is not a subring $\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{O}_X)$ but we have ring homomorphisms $\mathcal{D}^{(m)}_{X/S} \to \mathcal{D}^{(m+1)}_{X/S} \to \mathcal{D}_{X/S}$ which gives for instance a canonical structure of left $\mathcal{D}^{(m)}_{X/S}$-modules on $\mathcal{O}_X$. We pay particular attention to the case of level zero, which had already been studied in [Ber74]. For instance, we give a detailed proof of the equivalence for an $\mathcal{O}_X$-module $\mathcal{E}$ between the data of an integrable connection relative to X/S on $\mathcal{E}$ and a structure of left $\mathcal{D}^{(0)}_{X/S}$-module on $\mathcal{E}$ extending its structure of $\mathcal{O}_X$-module (see 2.3.2.6).

We then move on to the logarithmic context. To make things easier, we introduce the notion of nice fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ for some integer i and we exclusively works in this context: a fine log scheme $S^\sharp$ over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ is nice if there exists a scheme Z such that $S^\sharp$ is a log flat Z-log-scheme (see the definition [Ogu18, IV.4.1.1] of log-flatness, which we can also simply be called flatness). The useful point which simplify the comparison between logarithmic and non logarithmic derivations is that when $S^\sharp$ is a nice fine log scheme then, denoting by $U := (S^\sharp)^*$ the open in $S^\sharp$ subscheme with trivial log-structure and $j\colon U \to S^\sharp$ the canonical inclusion, the canonical morphism $\mathcal{O}_{S^\sharp} \to j_*\mathcal{O}_U$ is injective (see 3.1.1.3). Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0, p)$, with perfect residue field k and field of fraction K. We also benefit from a notion of nice fine log $\mathcal{V}$-formal scheme. Let $X^\sharp \to S^\sharp$ be a log smooth morphism of nice fine log schemes (or log $\mathcal{V}$-formal schemes). We construct similarly the sheaf of differential operators $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ of finite order and of finite level m for some integer $m \in \mathbb{N}$. Again, the notion of left and right $\mathcal{D}^{(m)}_{X/S}$-modules can be translated in terms of m-PD-stratifications and m-PD-costratifications. In order to describe the right structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module of the sheaf $\omega_{X^\sharp/S^\sharp}$, we introduce the notion of logarithmic transposition (see 3.4.1). We have treated separately the non logarithmic case because for instance in the case where the log structure is trivial, the correspondance between logarithmic and non-logarithmic properties or formulas are not always obvious (e.g. the logarithmic inverse formula of the Taylor formula of 3.4.5.3.2 or the logarithmic transposition version describing the tensor product formula of 3.4.2.7.2), or because logarithmic formulas are much more complicated than the non logarithmic ones (e.g. see 1.4.2.7 vs 3.2.3.13.1).

Next, we explain in the forth chapter how to obtain "coefficients" of differential operators more general than the constant coefficient $\mathcal{O}_X$. More precisely, let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra which is endowed with a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure on $\mathcal{B}_X$ which is "compatible" with its $\mathcal{O}_X$-algebra structure. This compatibility makes it possible to obtain a canonical ring structure on the sheaf $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. In this context, $\mathcal{B}_X$ play in $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ the role of the constant coefficient $\mathcal{O}_X$ in $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. We can view $\mathcal{B}_X$ as the coefficients of the differential operators of $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. We will mainly need later such a generalization in order to construct the sheaf of differential operators with overconvergent singularities along a divisor. Beware that this notion of compatibility requires the full understanding of the constant case (i.e. $\mathcal{B}_X = \mathcal{O}_X$), so the reading of the first chapters are mandatory before going to the general case of log $\mathcal{D}$-modules with coefficients and we had to treat the constant case separately.

Once the differential operators *of finite order* are well defined in their full generality, we then define the cohomological functors in the case of differential operators *of finite orders*: the pushforwards f_+ and extraordinary pullbacks $f^!$ by a morphism f, dual functor $\mathbb{D}$, external tensor product $\boxtimes$, internal tensor product $\otimes$. In the case where log structures are trivial, we then give the Frobenius descent of Berthelot whose reader can find complete proofs in [Ber00]. The main application of such a Frobenius descent is the finiteness of the homological dimension of the sheaf of differential operators of level m: Berthelot reduces by descent to the level 0 case which is checked using the same computations as in the characteristic zero case.

Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme. Moreover, let $\mathfrak{P}^\sharp \to \mathfrak{S}^\sharp$ be a log smooth morphism of log formal schemes (the underlying formal schemes are denoted by $\mathfrak{S}$ and $\mathfrak{P}$). Let π be a uniformizer of $\mathcal{V}$ and $P^\sharp \to S^\sharp$ be the induced modulo π morphism of log schemes over $\operatorname{Spec} k$. For any integer $i \geq 0$, set $P_i^\sharp := \mathfrak{P}^\sharp \times_{\operatorname{Spf} \mathcal{V}} \operatorname{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$, $P^\sharp := P_0^\sharp$. For simplicity, suppose $\mathfrak{P}$ is p-torsion free, noetherian of finite Krull dimension and P is regular.

Taking the p-adic completion of $\mathcal{D}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$, we get the sheaf $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$ of differential operators of level m and *infinite* order (roughly speaking locally we get p-adically converging power series on the derivations), which remains a coherent sheaf of rings with Noetherian sections. When one wants to extend cohomological operations to complexes of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$-modules, technical difficulties related to completions appear. To obtain the desired transitivity formulas when composing several functors that do not necessarily preserve coherence (in particular the transitivity of inverse and direct images), we have to integrate completion into the definition of these functors, and thus also to impose a completion condition on the complexes with which we are working. We call quasi-coherent in the sense of Berthelot the complexes $\mathcal{E}$ of $D^-(\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$ such that $\mathcal{O}_P \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{P}}} \mathcal{E}$ has quasi-coherent cohomology, and that the adjunction morphism $\mathcal{E} \to \mathbb{R}\varprojlim_i \mathcal{O}_{P_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{P}}} \mathcal{E}$ is an isomorphism. These conditions are verified by bounded complexes with coherent cohomology. We can then extend the cohomological operations studied (the finite order case) above to these complexes, and deduce from them by completion the expected properties or theorems. This is written in detail in chapter 7 and is mostly based on the unpublished notes of Berthelot.

Taking the inductive limit on the level of the inductive system $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp} = (\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})_{m\in\mathbb{N}}$, we get the sheaf of differential operators of finite level and infinite order $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$, which is a subsheaf of the p-adic completion of the sheaf of usual differential operators $\mathcal{D}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$. Let $\mathfrak{U}^\sharp$ be an affine open of $\mathfrak{P}^\sharp$ endowed with logarithmic coordinates. Let $P \in \Gamma(\mathfrak{U}, \widehat{\mathcal{D}}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$. We can uniquely write

$$P = \sum_{\underline{k}\in\mathbb{N}^d} a_{\underline{k}} \underline{\partial}_\sharp^{[\underline{k}]},$$

with $a_{\underline{k}} \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P}})$ a sequence converging to 0 for the p-adic topology when $|\underline{k}|$ goes to infinity. For any $i \in \mathbb{N}$, let $P_i \in \Gamma(U, \mathcal{D}_{P_i^\sharp/S_i^\sharp})$ be the image of P, where $P_i^\sharp/S_i^\sharp$ is the reduction modulo π^{i+1} of $\mathfrak{P}^\sharp/\mathfrak{S}^\sharp$. The following conditions are equivalent (see 8.7.1.8):

(a) $P \in \Gamma(\mathfrak{U}, \mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$;

(b) $\exists \alpha, \beta \in \mathbb{R}$ such that $\operatorname{ord}(P_i) \leq \alpha i + \beta$ for any $i \in \mathbb{N}$;

(c) $\exists c, \eta \in \mathbb{R}_+$ such that $\eta < 1$ and $\|b_{\underline{k}}\| \leq c\eta^{|\underline{k}|}$, for any $\underline{k} \in \mathbb{N}^d$.

This can be interpreted by saying that $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$ is the weak completion of $\mathcal{D}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$ as $\mathcal{O}_{\mathfrak{P}}$-ring, the dagger symbole meaning "p-adic completion". The sheaf $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$, its tensorisation with $\mathbb{Q}$, is not any more noetherian but is at least coherent, thanks to a theorem of flatness of the transition homomorphisms $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}} \to \widehat{\mathcal{D}}^{(m+1)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}$. Montagnon proved that it is also of finite homological dimension when $\mathfrak{P}$ is a smooth $\mathcal{V}$-formal scheme and log structure comes from a relative to $\mathfrak{P}/\mathfrak{S}$ normal crossing divisor (see [Mon02]).

A key fundamental idea of Berthelot's theory is the need to work with more evolved categories which we might be called "LD-type" category. Let us first recall what these categories introduced by Berthelot consist of. Consider first the derived category of $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$-modules, i.e. of inductive systems of $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$-modules. By tensorizing by $\mathbb{Q}$ and taking the inductive limit on the level, we obtain the functor denoted by $\underrightarrow{l}^*_{\mathbb{Q}}\colon D^{\mathrm{b}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}) \to D^{\mathrm{b}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp,\mathbb{Q}})$. In order to obtain a fully faithful functor which factorises this functor $\underrightarrow{l}^*_{\mathbb{Q}}$, Berthelot has introduced the category $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$ which is an appropriate localization (by ind-isogenies and lim-isomorphisms) of $D^{\mathrm{b}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$. He has also defined a full subcategory of "coherent" (in the sense of Berthelot) complexes of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$ that he denotes by $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$. Then he has established that the functor $\underrightarrow{l}^*_{\mathbb{Q}}$ induces the equivalence of categories

$$(*)\qquad \underrightarrow{l}^*_{\mathbb{Q}}\colon \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp}) \cong D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp,\mathbb{Q}}).$$

This Berthelot theorem is at the heart of the foundations of the theory of arithmetic $\mathcal{D}$-modules. Such theorem and related to the categories of the form $\underrightarrow{LD}_{\mathbb{Q}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$ results were announced in [Ber02]. In this book, the reader will found complete and detailed proofs of theses unpublished Berthelot's foundational theorems.

Berthelot also defines the full subcategory $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$ formed by "quasi-coherent" complexes. The pushforwards and extraordinary pullbacks can be defined for both categories of the form $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$ and $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ and coincide for coherent complexes via the above equivalence of categories $(*)$ induced by $\underrightarrow{l}^*_{\mathbb{Q}}$. However, even if LD-type categories are technically more involved, the LD-type categories were constructed so that the verification of the expected properties can be formally reduced to the case of schemes (i.e. to the context of finite order operators, without completion or passage to the inductive limit on the level). For instance, we get without further effort that pushforwards and extraordinary pullbacks preserve the quasi-coherence in the sense of Berthelot and are transitive with respect to the composition. Another huge advantage to work with LD-type categories is the possibility of properly and canonically defining the internal tensor product, which is translated for categories of the form $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ by a sort of derived p-adic weak completion of the usual tensor product (such derived p-adic weak completions need a priori the choice of a model in $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$, i.e. we have to choose an inverse of the equivalence $\underrightarrow{l}^*_{\mathbb{Q}}$ which do not seem canonical). More comprehensively, in the chapter 9 we give the following cohomological operations for quasi-coherent inductive systems of arithmetic $\mathcal{D}$-modules: pushforwards, extraordinary pullbacks, base changes, dual functors, exterior or internal tensor products.

Using internal tensor products, we define next localisation outside a divisor as follows. Let T be a divisor of P. Let $\mathfrak{Y}^\sharp$ be the open of $\mathfrak{P}^\sharp$ complementary to T and $j\colon \mathfrak{Y}^\sharp \subset \mathfrak{P}^\sharp$ be the inclusion. Let $m \in \mathbb{N}$ be an integer such that $p^m \geq e/(p-1)$. We get a p-adically complete $\mathcal{O}_{\mathbb{P}}$-algebra $\mathcal{B}^{(m)}_{\mathfrak{P}}(T)$ which is endowed with compatible canonical structure of left $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$-module together with a canonical $\widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}$-linear inclusion $\mathcal{B}^{(m)}_{\mathfrak{P}}(T) \to j_*\mathcal{O}_{\mathfrak{Y}}$. We define respectively the sheaf of "functions on $\mathfrak{P}$ with overconvergent singularities along the divisor T" and the sheaf of "differential operators of finite level on $\mathfrak{P}^\sharp/\mathfrak{S}^\sharp$ with overconvergent singularities along of T" by setting

$$\mathcal{O}_{\mathfrak{P}}({}^\dagger T) := \varinjlim_m \mathcal{B}^{(m)}_{\mathfrak{P}}(T),$$
$$\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T) = \varinjlim_m \mathcal{B}^{(m)}_{\mathfrak{P}}(T)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{P}}} \widehat{\mathcal{D}}^{(m)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}.$$

Locally, if $\mathfrak{U} = \operatorname{Spf} A$ is some open of $\mathfrak{P}$ such that there exist a lifting $f \in \Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P}})$ of an equation of $T \subset P$, then $\mathcal{B}^{(m)}_{\mathfrak{U}}(T\cap U)$ is the p-adic completion of $\mathcal{O}_{\mathfrak{U}}[T]/(f^{p^{m+1}}T - \pi)$. A version with π replaced by p is available in the litterature (see [Ber96c]), but by default we prefer to use Huyghe's version. This is harmless since the ring inductive systems $\mathcal{B}^{(\bullet)}_{\mathfrak{P}}(T)$ are isomorphic (up to a canonical lim-isomorphism). After tensorising by $\mathbb{Q}$ the sheaf $\mathcal{O}_{\mathfrak{P}}({}^\dagger T)$ (indicated by the index $\mathbb{Q}$), we have the following nice description:

$$\Gamma(\mathfrak{U}, \mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}) \xrightarrow{\sim} \left\{ \sum_{n=0}^{\infty} \frac{a_n}{f^n} : a_n \in A_K,\ \exists\, c, \eta \in \mathbb{R}, \eta < 1 \text{ such that } \|a_n\| \leq c\eta^n \right\},$$

where A_K is endowed with the topology induced by the p-adic topology of A which induces a p-adic norm on A_K (see 8.7.1.6).

The localisation outside T is by definition the functor $({}^\dagger T) := \mathcal{B}^{(\bullet)}_{\mathfrak{P}}(T)\widehat{\otimes}_{\mathcal{O}_{\mathfrak{P}}} -$ which preserves the quasi-coherence in the sense of Berthelot. This functor can simply be described for coherent complexes: if $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{coh}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$ and $\mathcal{E} := \underrightarrow{l}^*_{\mathbb{Q}}(\mathcal{E}^{(\bullet)}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}})$ is the associated complex via the equivalence $\underrightarrow{l}^*_{\mathbb{Q}}$, then $\underrightarrow{l}^*_{\mathbb{Q}}\left(({}^\dagger T)(\mathcal{E}^{(\bullet)})\right) \xrightarrow{\sim} \mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}} \otimes_{\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp,\mathbb{Q}}} \mathcal{E}$.

The local cohomological functor with strict support over T is the functor $\mathbb{R}\underline{\Gamma}^\dagger_T$ so that the triangle

$$\mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)}) \to \mathcal{E}^{(\bullet)} \to ({}^\dagger T)(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_T(\mathcal{E}^{(\bullet)})[1].$$

is exact for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp})$ (see 13.1.1.5.1).

More generally, both functors can uniquely up to canonical isomorphism be extended by a local functor $\mathbb{R}\underline{\Gamma}^\dagger_U$ over any subscheme U of P as follows: if U is the complementary of a divisor T of P then $\mathbb{R}\underline{\Gamma}^\dagger_Y = ({}^\dagger T)$, for any subschemes U and U' of P we have the natural isomorphism $\mathbb{R}\underline{\Gamma}^\dagger_U \circ \mathbb{R}\underline{\Gamma}^\dagger_{U'} \xrightarrow{\sim} \mathbb{R}\underline{\Gamma}^\dagger_{U\cap U'}$ and for any closed subscheme U' of a subscheme U of P, for any $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$ we have the exact triangle of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp})$:

$$\mathbb{R}\underline{\Gamma}^\dagger_{U'}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_U(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{U\setminus U'}(\mathcal{E}^{(\bullet)}) \to \mathbb{R}\underline{\Gamma}^\dagger_{U}(\mathcal{E}^{(\bullet)})[1].$$

Let us now explain the link between overconvergent isocrystals and arithmetic $\mathcal{D}$-modules in the following lifted case, which is the starting point of building a bridge between the rigid cohomology world with arithmetic $\mathcal{D}$-modules one. Suppose $\mathfrak{S}$ is a smooth $\mathcal{V}$-formal scheme, $\mathfrak{P}/\mathfrak{S}$ is smooth and there exists a relative strict normal crossing divisor $\mathfrak{Z}$ of $\mathfrak{P}/\mathfrak{S}$ such that $\mathfrak{P}^\sharp = (\mathfrak{P}, M_{\mathfrak{Z}})$ is the logarithmic $\mathcal{V}$-formal scheme whose underlying logarithmic structure $M_{\mathfrak{Z}}$ is the one associated with $\mathfrak{Z}$. We have the morphism of ringed spaces $\mathrm{sp}\colon (\mathfrak{P}_K, \mathcal{O}_{\mathfrak{P}_K}) \to (\mathfrak{P}, \mathcal{O}_{\mathfrak{P},\mathbb{Q}})$ induced by the specialization morphism. We get the inverse image functor sp^* by setting $\mathrm{sp}^*(\mathcal{E}) := \mathcal{O}_{\mathfrak{P}_K} \otimes_{\mathrm{sp}^{-1}\mathcal{O}_{\mathfrak{P},\mathbb{Q}}} \mathrm{sp}^{-1}(\mathcal{E})$, for any $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-modules $\mathcal{E}$.

The functors sp_* and sp^* induce quasi-inverse equivalences between the category of (resp. locally free of finite type) coherent $\mathcal{O}_{\mathfrak{P}_K}$-modules together with a convergent (i.e. satisfying a convergent condition: see 10.3.2.3.1) logarithmic connection relative to $\mathfrak{P}^\sharp_K/\mathfrak{S}_K$ and that of left $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S},\mathbb{Q}}$-modules which are (resp. locally projective of finite type) coherent as $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-module (see 11.1.1.2). When $\mathfrak{S} = \mathrm{Spf}\,\mathcal{V}$, the category consisting of left $\mathcal{D}^\dagger_{\mathfrak{P}^\sharp/\mathfrak{S},\mathbb{Q}}$-modules which are locally projective of finite type as $\mathcal{O}_{\mathfrak{P},\mathbb{Q}}$-module is equivalent to the full subcategory of $I_{\mathrm{conv}}(P^\sharp/\mathrm{Spf}\,\mathcal{V})$ consisting of locally free isocrystals on the log convergent site $((P, M)/\mathrm{Spf}\,\mathcal{V})_{\mathrm{conv}}$ defined by Shiho at [Shi02, Definition 2.1.5] (see here 10.3.1.1).

Let T be a divisor of P and $\mathrm{MIC}^\dagger(\mathfrak{P}^\sharp_K, T/\mathfrak{S}^\sharp_K)$ be the category of overconvergent along T log-isocrystal on $\mathfrak{P}^\sharp/\mathfrak{S}^\sharp$ (see the chapter 10 and 11). We denote by $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$ the category of $\mathcal{D}_{\mathfrak{P}^\sharp/\mathfrak{S}^\sharp}({}^\dagger T)_{\mathbb{Q}}$-modules which are coherent as $\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module and such that the underlying connection is overconvergent along T. We get almost by definition that the functors sp_* and sp^* induce quasi-inverse equivalences of categories between $\mathrm{MIC}^\dagger(\mathfrak{P}^\sharp_K, T/\mathfrak{S}^\sharp_K)$ and $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}^\sharp, T/\mathfrak{S}^\sharp)$.

From now let $\mathfrak{S} := \mathrm{Spf}\,\mathcal{V}$ and let $\mathfrak{P}$ is a separated and smooth $\mathfrak{S}$-formal scheme. In that case, the category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$ is equal to the full category of that of coherent $\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-modules consisting of objects which are coherent as $\mathcal{O}_{\mathfrak{P}}({}^\dagger T)_{\mathbb{Q}}$-module (see 11.2.1.14). In fact, we can check that the objects of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$ are overcoherent $\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger T)_{\mathbb{Q}}$-modules, i.e., for any smooth morphism of the form $f\colon \mathfrak{P}' \to \mathfrak{P}$, for any divisor T' containing $f^{-1}(T)$ we have $({}^\dagger T') \circ f^!(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^\dagger_{\mathfrak{P}'}({}^\dagger f^{-1}(T))_{\mathbb{Q}})$. For instance, when T is empty, this means that the localisation functor outside a divisor preserves the $\mathcal{D}^\dagger$-coherence and this latter property is stable under pullbacks by smooth morphisms.

We would like to extend the category $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$ with T is replaced by a closed subscheme Z of P. When T is not empty, an object of $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, T/\mathcal{V})$ is not (in general) a coherent $\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S},\mathbb{Q}}$-module. Moreover, the sheaf $\mathcal{D}^\dagger_{\mathfrak{P}/\mathfrak{S}}({}^\dagger Z)_{\mathbb{Q}}$ has a priori no meaning because Z is not a divisor. So, in order to well define $\mathrm{MIC}^{\dagger\dagger}(\mathfrak{P}, Z/\mathcal{V})$, it seems unavoidable to work with quasi-coherence complexes in the sense of Berthelot and to build it as a full subcategory of $\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}(\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$. For this purpose, we construct a strictly full subcategory $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}})$ consisting of objects $\mathcal{E}^{(\bullet)}$ satisfying certain overconvergent condition which is required to be stable by base change (see 15.3.7.1). The objects of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)))$ are called $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)$-overcoherent $(F\text{-})$complexes after any base change (this is an abuse of notation since $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z)$ do not a priori exists). When Z is the support of a divisor T, we retrieve the above notion of $\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(T)$-overcoherence. It has a canonical t-structure, its heart is written $(F\text{-})$ $\underrightarrow{LM}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$. If $U = P \setminus Z$, we get an equivalence between $\mathrm{MIC}^{\dagger}(Y, P/K)$ and $\mathrm{MIC}^{(\bullet)}(\mathfrak{P}, Z/\mathcal{V})$, where $\mathrm{MIC}^{(\bullet)}(\mathfrak{P}, Z/\mathcal{V})$ is the subcategory of $\underrightarrow{LM}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ of objects which are roughly speaking $\mathcal{O}_{\mathfrak{P}}$-coherent outside Z.

More generally, let Z and X be two closed subschemes of P such that $Y = X \setminus Z$ is smooth. We construct $(F\text{-})\mathrm{MIC}^{(\bullet)}(Y, X, \mathfrak{P}, Z/\mathfrak{S})$ (see 16.2.1.1), a strictly full abelian subcategory of $(F\text{-})\underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{oc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}/\mathfrak{S}}(Z))$ consisting of objects with support in X and which can be seen as $\mathcal{O}$-coherent on Y, together with the canonical equivalence of categories (see 16.2.1.10.1):

$$\mathrm{sp}^{(\bullet)}_{X \hookrightarrow \mathfrak{P}, Z, +} \colon \mathrm{MIC}^{\dagger}(Y, X/K) \cong \mathrm{MIC}^{(\bullet)}(X, \mathfrak{P}, Z/\mathcal{V}).$$

The category $\mathrm{MIC}^{(\bullet)}(Y, X, \mathfrak{P}, Z/\mathfrak{S})$ can be written $\mathrm{MIC}^{(\bullet)}(Y, \mathfrak{P}/\mathfrak{S})$ since this only depends on $Y \subset \mathfrak{P}$.

Let Y be a subvariety of P. Let $\mathcal{E}^{(\bullet)} \in \underrightarrow{LD}^{\mathrm{b}}_{\mathbb{Q},\mathrm{qc}}({}^{\mathrm{l}}\widehat{\mathcal{D}}^{(\bullet)}_{\mathfrak{P}})$. Via the above equivalence of categories of the form $\mathrm{sp}^{(\bullet)}_{+}$, we get a notion of devissability into overconvergent isocrystals as follows: The complex $\mathcal{E}^{(\bullet)}$ "splits into overconvergent isocrystals" if there exists a smooth stratification of P of the form $P = \sqcup_{i=1,\ldots,r} Y_i$ such that, for any $i = 1, \ldots, r$, the cohomological spaces of $\mathbb{R}\underline{\Gamma}^{\dagger}_{Y_i}(\mathcal{E}^{(\bullet)})$ belong to $\mathrm{MIC}^{(\bullet)}(Y_i, \mathfrak{P}/\mathcal{V})$.

We then focus on the construction of stable properties by the 6 Grothendieck functors with a Frobenius structure. Let us now explain further notions stable by Grothendieck's six functors with a Frobenius structure. Suppose from now that k is perfect and $\mathfrak{P}$ is a smooth $\mathcal{V}$-formal scheme. We give Berthelot's construction of the characteristic variety associated with a coherent F-$\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module. This characteristic variety satisfies Bernstein's inequality which yields as usual to the notion of holonomicity. In fact, without Frobenius structure, even if the notion of characteristic variety associated with a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module is problematic because we canot reduce canonically to the level 0 case, we can still define a notion of dimension of a coherent $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-module so that Bernstein's inequality holds, which extends the notion of holonomicity (see chapter 15). Beware that without Frobenius structure, we do not know if the holonomicity is stable under pullbacks by a closed immersion for instance. In order to get a notion stable by duality and stronger (a priori) to the overcoherence (in the strong sense: as complexes of $\mathcal{D}^{\dagger}_{\mathfrak{P},\mathbb{Q}}$-modules, i.e. without overconvergent singularities added in $\mathcal{D}^{\dagger}$), we introduce the notion of overholonomicity (see [Car09b]) and that of overholonomicity after any base change to get a notion stable by base change (see 18.1). This notion of overholonmicity is stable by duality, (extraordinary) pushforwards and (extraordinary) pullbacks. Without Frobenius structure, the stability of the overholonomicity under tensor products is an open question. However, with Tsuzuki, we proved that for any smooth subvariety Y of $\mathfrak{P}$ the following theorem (see [CT12] or 18.3.2.2 for a slight simplication of the proof):

Theorem (C.-Tsuzuki)**.** *Let Y be a smooth subvariety of $\mathfrak{P}$. The objects of F-$\mathrm{MIC}^{(\bullet)}(Y, \mathfrak{P}/\mathcal{V})$ are overholonomic after any base change.*

This yields that for F-complexes the notion of overcoherent, overholonomicity after any base change, devissability into overconvergent isocrystals are equal (see 18.3.2.3). Since the tensor product of isocrystals gives isocrystals, this implies that the notion of overholonomicity (after any base change) for F-complexes is stable by tensor products. These notions are then stable under Grothendieck's six functors.

When $\mathfrak{P}$ is projective (which is possible when Y is quasi-projective), we prove furthermore that in the case of F-complexes these notions are equal to that of holonomic F-complexes. The proof relies on a construction by hand (using affine $\mathcal{V}$-weak formal schemes) for certain affine and smooth k-schemes Y of a functor sp_{Y+} from the category of overconvergent isocrystal on Y to that of arithmetic $\mathcal{D}$-modules, studying specially the case where Y has a finite étale map over an affine space (see chapter 17).

Finally, in the last chapter we explain how to build a formalism of Grothendieck six functors for (without Frobenius structure) arithmetic $\mathcal{D}$-modules associated to realisable k-varieties. The rough idea is the same but more technical than for the overholonmicity since we have to define stable by six functors (including tensor products) categories, the stability being formal "by construction".

Notation

Without further mentioning, all occuring modules will be left modules. We let $\mathbb{N} = \{0, 1, 2, ...\}$ be the set of non-negative integers.

We fix $\mathcal{V}$ a complete discrete valuation ring of mixed characteristics $(0, p)$, e its absolute ramification, k its residual field, K its field of fractions and π a uniformizer.

Logarithmic formal schemes (resp. $\mathcal{V}$-weak formal schemes, resp. schemes) will be denoted by gothic letters (resp. roman letters with the exponent † or without if no confusion is possible, resp. roman letters). The special fibers of $\mathcal{V}$-formal schemes will be denoted by the corresponding straight letters with or without 0 as index. The $\mathcal{V}$-formal scheme induced by p-adic completion of a $\mathcal{V}$-weak formal scheme will be denoted by the gothic corresponding letter, e.g., if $P^\dagger$ a $\mathcal{V}$-weak formal schemes, we set $\mathfrak{P} := \widehat{P^\dagger}$ and $P := \mathfrak{P} \otimes_{\mathcal{V}} k$ or $P_0 := \mathfrak{P} \otimes_{\mathcal{V}} k$. Moreover, if u is a morphism of logarithmic $\mathcal{V}$-formal schemes, the induced modulo π morphism between special fibers will be denoted by u_0 or simply u.

If $\mathcal{E}$ is a sheaf of $\mathcal{V}$-modules, we set $\mathcal{E}_{\mathbb{Q}} := \mathcal{E} \otimes_{\mathbb{Z}} \mathbb{Q} \xrightarrow{\sim} \mathcal{E} \otimes_{\mathcal{V}} K$ and $\widehat{\mathcal{E}}$ is the p-adic completion of $\mathcal{E}$.

For any $\underline{k} \in (k_1, \dots, k_d) \in \mathbb{N}^d$, we set $|\underline{k}| = k_1 + \cdots + k_d$.

If D, D' are two rings, we say that E is a (D, D')-bimodule (resp. left bimodule, resp. right bimodule) if E is endowed with two compatible structures of left (resp. left, resp. right) D -module and right (resp. left, resp. right) D'-module. If $D = D'$, we simply say (resp. left, resp. right) D-bimodule.

If $\phi \colon \mathcal{A} \to \mathcal{B}$ is a homomorphism of sheaves of rings, for any $\mathcal{A}$-module $\mathcal{M}$ (resp. $\mathcal{B}$-module $\mathcal{N}$), we will denote by $\phi^\flat(\mathcal{M}) := \mathcal{H}om_{\mathcal{A}}(\mathcal{B}, \mathcal{M})$ (resp. $\phi_*(\mathcal{N})$ is $\mathcal{N}$ viewed as $\mathcal{A}$-module). The convention is to work in the derived categories but the functors of the form $\phi^\flat$ that we will use will be exact.

Let $\mathfrak{A}$ be an abelian category. We denote by $C(\mathfrak{A})$ the category of complexes of $\mathfrak{A}$. We say that a complex $X^\bullet \in C(\mathfrak{A})$ is bounded from below (resp. bounded from above) if there exists $n_0 \in \mathbb{Z}$ such that $X^n = 0$ for $n < n_0$ (resp. $X^n = 0$ for $n > n_0$). The complex $X^\bullet$ is bounded if it is bounded from above and below. We denote by $C^+(\mathfrak{A})$ (resp. $C^-(\mathfrak{A})$, resp. $C^{\mathrm{b}}(\mathfrak{A})$) the full subcategory of $C(\mathfrak{A})$ consisting of bounded below complexes (resp. bounded above complexes, resp. bounded complexes). Let $*$ be one of the symbol $\emptyset$, $+$, $-$, or b. We denote by $K^*(\mathfrak{A})$ the homotopic category of complexes of $C^*(\mathfrak{A})$, i.e., $K^*(\mathfrak{A})$ is a triangulated category with the same objects as $C^*(A)$ and classes of homotopic morphisms as morphisms. The class S of all quasi-isomorphisms in $K^*(\mathfrak{A})$ is a localizing class compatible with the triangulation. Localize by this class S, we get triangulated category $D^*(\mathfrak{A}) := K^*(\mathfrak{A})[S^{-1}]$ together with a triangulated functor $Q \colon K^*(\mathfrak{A}) \to D^*(\mathfrak{A})$.

Let $\mathcal{A}$ be a sheaf of rings on a topological space X (or a topos). If $*$ is one of the symbol $\emptyset$, $+$, $-$, or b, we denote by $D^*({}^{\mathrm{l}}\mathcal{A})$ (resp. $D^*({}^{\mathrm{r}}\mathcal{A})$) the derived category of complexes of left (resp. right) $\mathcal{A}$-modules satisfying the corresponding vanishing conditions. If $*$ is one of the symbol $-$, or b, we write $D^*_{\mathrm{coh}}(\mathcal{A})$ (resp. $D^*_{\mathrm{tdf}}(\mathcal{A})$, resp. $D^*_{\mathrm{perf}}(\mathcal{A})$) for the full subcategory of $D^*(\mathcal{A})$ consisting of pseudo-coherent (resp. finite tor dimension, resp. perfect) complexes

If X is a scheme and $\mathcal{A}$ is an $\mathcal{O}_X$-algebra, then for $\star \in \{\emptyset, +, -, b\}$, we denote by $D^\star_{\mathrm{qc}}(\mathcal{A})$ the full subcategory of $D^\star(\mathcal{A})$ consisting of complexes whose cohomology sheaves are $\mathcal{O}_X$-quasi-coherent.

Chapter 1

Sheaves of differential operators of finite order

1.1 Sheaves of differential operators of infinite level and finite order

1.1.1 nth infinitesimal neighborhood

Let S be a scheme.

Definition 1.1.1.1. (a) We denote by $\mathscr{C}$ the category whose objects are S-immersions of schemes and whose morphisms $u' \to u$ are commutative diagrams of the form

$$\begin{array}{ccc} X' & \xrightarrow{f} & X \\ {\scriptstyle u'}\uparrow & & \uparrow{\scriptstyle u} \\ Z' & \longrightarrow & Z. \end{array} \qquad (1.1.1.1.1)$$

We say that $u' \to u$ is flat (resp. cartesian) if f is flat (resp. the square 1.1.1.1.1 is cartesian).

(b) Let $n \in \mathbb{N}$. We denote by $\mathscr{C}_n$ the full subcategory of $\mathscr{C}$ whose objects are nilpotent closed immersions of order n.

(c) Let u be an object of $\mathscr{C}$. A "nilpotent closed immersion of order n induced by u" is an object u' of $\mathscr{C}_n$ endowed with a morphism $u' \to u$ of $\mathscr{C}$ satisfying the following universal property: for any object u'' of $\mathscr{C}_n$ endowed with a morphism $f : u'' \to u$ of $\mathscr{C}$ there exists a unique morphism $u'' \to u'$ in $\mathscr{C}_n$ whose composition with $u' \to u$ is f. The existence and the uniqueness up to canonical isomorphism of the nilpotent closed immersion of order n induced by u are obvious. We will denote by $P^n(u)$ the nilpotent closed immersion of order n induced by u. We also say that $P^n(u)$ is the "nth infinitesimal neighbourhood of u"

Proposition 1.1.1.2. *Let $n \geq 0$ be an integer.*

(a) The inclusion functor $For_n : \mathscr{C}_n \to \mathscr{C}$ has a right adjoint functor which we will denote by $P^n : \mathscr{C} \to \mathscr{C}_n$.

(b) Let $u : Z \hookrightarrow X$ be an object of $\mathscr{C}$. By abuse of notation we can also write $P^n(u)$ for the target of the arrow $P^n(u)$.

(i) Then Z is also the source of $P^n(u)$.

(ii) If $U \subset X$ is an open subset containing Z such that $v : Z \hookrightarrow U$ is a closed immersion then $P^n(u) = P^n(v)$ and the morphism $P^n(u) \to U$ is affine. In that case, we denote by $\mathcal{P}^n(u)$ the quasi-coherent $\mathcal{O}_U$-algebra so that $P^n(u) = \mathrm{Spec}(\mathcal{P}^n(u))$. The sheaf $\mathcal{P}^n(u)$ has his support in Z and we can simply denote $v^{-1}\mathcal{P}^n(u)$ by $\mathcal{P}^n(u)$. If X is noetherian, then so is $P^n(u)$.

Proof. Let U be an open subset of X containing $u(Z)$ such that the induced morphism $v\colon Z \to U$ is a closed immersion. Let $\mathcal{I}$ be the ideal of $\mathcal{O}_X$ given by v and $U_n := \mathrm{Spec}(\mathcal{O}_X/\mathcal{I}^{n+1})$. Then the closed immersion $Z \hookrightarrow U_n$ satisfies the universal property of $P^n(u) \to u$ (and hence do not depend on the choice of U). □

Let us recall the following standard definitions.

Definition 1.1.1.3. Let $f\colon X \to Y$ be an S-morphism.

(a) We say that f is "formally étale" (resp. "formally unramified") if it satisfies the following property: for any commutative diagram of schemes of the form

$$\begin{array}{ccc} U & \xrightarrow{u_0} & X \\ {\scriptstyle\iota}\big\downarrow & & \big\downarrow{\scriptstyle f} \\ T & \xrightarrow{v} & Y \end{array} \tag{1.1.1.3.1}$$

such that ι is an object of $\mathscr{C}_1$, there exists a unique morphism (resp. there exists at most one morphism) $u\colon T \to X$ such that $u \circ \iota = u_0$ and $f \circ u = v$.

(b) We say that f is "étale" if f is formally étale and Zariski locally of finite presentation.

Definition 1.1.1.4. Let $f\colon X \to Y$ be a morphism of S-schemes.

(a) We say that a finite set $t_1, \ldots, t_d$ of elements of $\Gamma(X, \mathcal{O}_X)$ are "formal coordinates of f" if the corresponding Y-morphism $X \to \mathbb{A}^d_Y$ is formally étale.

(b) We say that a finite set $t_1, \ldots, t_d$ of elements of $\Gamma(X, \mathcal{O}_X)$ are "coordinates of f" if the corresponding Y-morphism $X \to \mathbb{A}^d_Y$ is étale.

(c) We say that f is "weakly smooth" if, étale locally on X, f has formal coordinates. Notice that this notion of weak smoothness is étale local on Y.

Recall that f is "smooth" if, étale locally on X, f has coordinates. Notice that this notion of smoothness is étale local on Y.

Lemma 1.1.1.5. *Let $n \in \mathbb{N}$, $f\colon X \to Y$ be a formally étale morphism of S-schemes, $u\colon Z \hookrightarrow X$ and $v\colon Z \hookrightarrow Y$ be two S-immersions such that $v = f \circ u$. Then we have $P^n(u) = P^n(v)$.*

Proof. By using the universal property of the formal etaleness, we get a unique Y-morphism $P^n(v) \to u$ (see 1.1.1.3). It is sufficient to prove that $P^n(v) \to v$ satisfies the universal property corresponding to $P^n(u) \to u$, which is easy. □

Lemma 1.1.1.6. *Let $u \to v$ be a morphism of $\mathscr{C}$. Let $w := P^n(v) \times_v u$ (this is the product in $\mathscr{C}$). Then $P^n(w) = P^n(u)$.*

Proof. We can easily check that the composition $P^n(w) \to w \to u$ satisfies the universal property of $P^n(u) \to u$. Hence, we are done.

□

Proposition 1.1.1.7. *Let $f\colon X \to Y$ be an S-morphism of schemes, $(t_\lambda)_{\lambda=1,\ldots,r}$ be formal coordinates of f. Let $u\colon Z \hookrightarrow X$ and $v\colon Z \hookrightarrow Y$ be two S-immersions of schemes such that $v = f \circ u$. Suppose that there exist $y_\lambda \in \Gamma(Y, \mathcal{O}_Y)$ whose images in $\Gamma(Z, \mathcal{O}_Z)$ coincide with the images of t_λ. Then we have the following isomorphism of $\mathcal{O}_{P^n(v)}$-algebras*

$$\mathcal{O}_{P^n(v)}[T_1, \ldots, T_r]_n \xrightarrow{\sim} \mathcal{O}_{P^n(u)}$$
$$T_\lambda \mapsto t_\lambda - f^*(y_\lambda), \tag{1.1.1.7.1}$$

with $\mathcal{O}_{P^n(v)}[T_1, \ldots, T_r]_n := \mathcal{O}_{P^n(v)}[T_1, \ldots, T_r]/\left(I_n + (T_1, \ldots, T_r)\right)^{n+1}$, where I_n is the ideal defined by the closed immersion $P^n(v)$.

Proof. 1) Using Lemma 1.1.1.5 (and [Gro60, 5.3.13]), we may assume that $X = Y \times_S \mathbb{A}^r_S$, $f : X \to Y$ is the first projection, and that the family $(t_\lambda)_{\lambda=1,\ldots,r}$ are the elements of $\Gamma(X, \mathcal{O}_X)$ corresponding to the coordinates of $\mathbb{A}^r$. Using Lemma 1.1.1.6, we may furthermore assume that $P^n(v) = v$.

Let $\phi : Y \times_S \mathbb{A}^r_S \to Y \times_S \mathbb{A}^r_S$ be the Y-morphism given by $t_1 - f^*(y_1), \ldots, t_r - f^*(y_r)$. Let $i : Y \hookrightarrow Y \times_S \mathbb{A}^r_S$ be the closed immersion defined by $t_\lambda \mapsto 0$. Since ϕ is etale, as $\phi \circ u = i \circ v$, using Lemma 1.1.1.5, we reduce to the case where u is equal to $i \circ v$, and $(y_\lambda)_{\lambda=1,\ldots,r}$ are equal to 0. Then 1.1.1.7.1 is obvious. □

1.1.2 Sheaf of principal parts relative to weakly smooth morphisms

Let S be a scheme.

Notation 1.1.2.1. Let X be an S-scheme. Let $\Delta_{X/S}(r) : X \hookrightarrow X^{r+1}_{/S}$ denote the diagonal immersion. With notation 1.1.1.2, we set

$$\Delta^n_{X/S}(r) := P^n(\Delta_{X/S}(r)).$$

Let us write $\mathcal{P}^n_{X/S}(r)$ for the nth infinitesimal neighborhood $\mathcal{P}^n(\Delta_{X/S}(r))$ (see 1.1.1.2). Let U be an open of $X^{r+1}_{/S}$ containing the image of $\Delta_{X/S}(r)$ such that the induced immersion $v : X \to U$ is closed. Let $\mathcal{I}(r)$ be the ideal given by v. Recall, by definition, we have $v_* \mathcal{P}^n_{X/S}(r) = \mathcal{P}^n(\mathcal{I}(r))$. For $i = 0, \ldots, r$, let $p_i : X \hookrightarrow X^{r+1}_{/S} \to X$ be the morphisms induced by the projections. Let $p^U_i : U \to X$ be the morphism induced by the projection p_i. We get the $\mathcal{O}_X$-algebra $p^U_{i*}\mathcal{P}^n(\mathcal{I}(r))$. Since $p^U_i \circ v = \mathrm{id}$ then as a sheaf of sets $\mathcal{P}^n_{X/S}(r) = p^U_{i*}\mathcal{P}^n(\mathcal{I}(r))$. This yields $r+1$-structures of $\mathcal{O}_X$-algebras on $\mathcal{P}^n_{X/S}(r)$. To clarify which $\mathcal{O}_X$-algebra structure we consider, we set $p_{i*}\mathcal{P}^n_{X/S}(r) := p^U_{i*}\mathcal{P}^n(\mathcal{I}(r))$. By composing p^U_i with the canonical morphism $\Delta^n_{X/S} \to U$, we get the projection $p^n_i : \Delta^n_{X/S}(r) \to X$, for $i = 0, \ldots, r$. We get the ring homomorphisms $p^n_i : \mathcal{O}_X \to \mathcal{P}^n_{X/S}$.

When $r = 1$, we simply write $\mathcal{I}$, $\Delta^n_{X/S}$, $\Delta_{X/S}$, $\mathcal{P}^n_{X/S}$, $\mathcal{P}_{X/S}$. The left (resp. right) structure of $\mathcal{O}_X$-module on $\mathcal{P}^n_{X/S}$ is by definition the one given by $p_{0*}\mathcal{P}^n_{X/S}$ (resp. $p_{1*}\mathcal{P}^n_{X/S}$).

Definition 1.1.2.2. We say that $\mathcal{P}^n_{X/S}$ is the *sheaf of principal parts of order n of X/S.*

Proposition 1.1.2.3 (Local description of $\mathcal{P}^n_{X/S}$)**.** Suppose f has formal coordinates $(t_\lambda)_{\lambda=1,\ldots,d}$. Let $\tau_{\lambda,n}$ be the image of $1 \otimes t_\lambda - t_\lambda \otimes 1$ in $\mathcal{P}^n_{X/S}$. For any $i = 0, 1$, we have the following isomorphism of $\mathcal{O}_X$-algebras:

$$\begin{aligned} \mathcal{O}_X[T_1, \ldots, T_d]_n &\xrightarrow{\sim} p_{i*}\mathcal{P}^n_{X/S} \\ T_\lambda &\mapsto \tau_{\lambda,n}, \end{aligned} \tag{1.1.2.3.1}$$

with $\mathcal{O}_X[T_1, \ldots, T_d]_n := \mathcal{O}_X[T_1, \ldots, T_d] / (T_1, \ldots, T_d)^{n+1}$.

Proof. Since the case of where $i = 1$ is checked symmetrically, let us compute the case where $i = 0$. Consider the commutative diagram

$$\begin{array}{ccccc} \mathbb{A}^d_S & \xleftarrow{p_1} & X \times_S \mathbb{A}^d_S & & \\ \uparrow t & \square & \uparrow \mathrm{id} \times t & \searrow q & \\ X & \xleftarrow{p_1} & X \times_S X & \xrightarrow{p_0} & X, \end{array} \tag{1.1.2.3.2}$$

where p_0, p_1 means respectively the left and right projection, where q is the canonical projection, where t is the S-morphism induced by $t_1, \ldots, t_d$, where $id \times t$ is the X-morphism induced by $p_1^*(t_1), \ldots, p_1^*(t_d)$. Since $(p_1^*(t_\lambda))_{\lambda=1,\ldots,d}$ are formal coordinates of p_0 (because the square of the diagram 1.1.2.3.2 is cartesian), we can apply Proposition 1.1.1.7 in the case where f is p_0, u is $\Delta_{X/S}$, v is the identity, t_λ is $t_\lambda \otimes 1$ and y_λ is t_λ. □

Remark 1.1.2.4. From the local description of 1.1.2.3, we get that the morphisms $p^n_1 : \Delta^n_{X/S}(r) \to X$ and $p^n_0 : \Delta^n_{X/S}(r) \to X$ are finite when X/S is weakly smooth.

1.1.2.5. The closed immersions $\Delta^n_{X/S}$ and $\Delta^{n'}_{X/S}$ induce $\Delta^{n,n'}_{X/S} := (\Delta^n_{X/S}, \Delta^{n'}_{X/S})\colon X \hookrightarrow \Delta^n_{X/S} \times_X \Delta^{n'}_{X/S}$. We get $\Delta^{n,n'}_{X/S} \in \mathscr{C}_{n+n'}$. Using the universal property of the $n+n'$ infinitesimal neighborhood of $\Delta_{X/S}$, we get a unique morphism $\Delta^n_{X/S} \times_X \Delta^{n'}_{X/S} \to \Delta^{n+n'}_{X/S}$ of $\mathscr{C}_{n+n'}$ inducing the commutative diagram

$$\begin{array}{ccccc} X & \hookrightarrow & \Delta^n_{X/S} \times_X \Delta^{n'}_{X/S} & \longrightarrow & X \times_S X \times_S X \\ \| & & \downarrow & & \downarrow{\scriptstyle p_{02}} \\ X & \hookrightarrow & \Delta^{n+n'}_{X/S} & \longrightarrow & X \times_S X. \end{array} \tag{1.1.2.5.1}$$

We denote by $\delta^{n,n'}\colon \mathcal{P}^{n+n'}_{X/S} \to \mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S}$ the corresponding morphism, where $\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S} := p_{1*}\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} p_{0*}\mathcal{P}^{n'}_{X/S}$. We compute $\delta^{n,n'}(a \otimes b) = (a \otimes 1) \otimes (1 \otimes b)$ and we have the commutative diagram:

$$\begin{array}{ccc} \mathcal{O}_X & \xrightarrow{p^n_1} & \mathcal{P}^n_{X/S} \\ {\scriptstyle p^{n+n'}_1}\downarrow & & \downarrow{\scriptstyle 1\otimes p^{n'}_1} \\ \mathcal{P}^{n+n'}_{X/S} & \xrightarrow{\delta^{n,n'}} & \mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S}. \end{array} \tag{1.1.2.5.2}$$

By replacing p_{02} by p_{01} (resp. p_{12}), we get a unique morphism $\Delta^n_{X/S} \times_X \Delta^{n'}_{X/S} \to \Delta^{n+n'}_{X/S}$ making commutative the diagram 1.1.2.5.1. We denote by $q^{n,n'}_0\colon \mathcal{P}^{n+n'}_{X/S} \to \mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S}$ (resp. $q^{n,n'}_1\colon \mathcal{P}^{n+n'}_{X/S} \to \mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S}$) the corresponding morphism (or simply $q^{n,n'}_0$ or q_0). We notice that $q^{n,n'}_0 = \pi^{n+n',n}_{X/S} \otimes 1$ and $q^{n,n'}_1 = 1 \otimes \psi^{n+n',n'}_{X/S}$, where $\psi^{n_1,n_2}_{X/S}$ is the projection $\mathcal{P}^{n_1}_{X/S} \to \mathcal{P}^{n_2}_{X/S}$ for any integers $n_1 \geq n_2$.

1.1.2.6. We have the following proprieties making some links between the sheaf of relative differentials and the sheaf of principal parts of order ≤ 1 of X/S.

(a) We denote by $\mathcal{I}^1_{X/S}$ the ideal of the closed immersion $\Delta^1_{X/S}$ and by $\Omega^1_{X/S} := (\Delta^1_{X/S})^{-1}(\mathcal{I}^1_{X/S})$ the corresponding $\mathcal{O}_X$-module (recall $\Delta^1_{X/S*}$ is an homeomorphism). In other words, $\Omega^1_{X/S}$ is the kernel of the canonical morphism of $\mathcal{O}_X$-algebras (for both structures) $\psi^{1,0}_{X/S}\colon \mathcal{P}^1_{X/S} \to \mathcal{P}^0_{X/S} = \mathcal{O}_X$. The sheaf $\Omega^1_{X/S}$ is the "sheaf of relative differentials of X/S". Since $\Omega^1_{X/S}$ is an ideal of $\mathcal{P}^1_{X/S}$ of order 2 then the left and right structure of $\mathcal{O}_X$-module of $\Omega^1_{X/S}$ (recall $\psi^{1,0}_{X/S}$ is $\mathcal{O}_X$-linear for both structures) are in fact identical.

(b) We have the exact sequence of $\mathcal{O}_X$-modules

$$0 \to \Omega^1_{X/S} \xrightarrow{j} p_{0*}\mathcal{P}^1_{X/S} \xrightarrow{\psi^{1,0}_{X/S}} \mathcal{O}_X \to 0, \tag{1.1.2.6.1}$$

where j is the canonical inclusion (recall p_{0*} means that $\mathcal{P}^1_{X/S}$ is considered as an $\mathcal{O}_X$-algebra for its left structure). The exact sequence 1.1.2.6.1 splits via the section $p^1_0\colon \mathcal{O}_X \to p_{0*}\mathcal{P}^1_{X/S}$, which yields the isomorphism of $\mathcal{O}_X$-modules

$$(p^1_0, j)\colon \mathcal{O}_X \oplus \Omega^1_{X/S} \xrightarrow{\sim} p_{0*}\mathcal{P}^1_{X/S}. \tag{1.1.2.6.2}$$

(c) Via the isomorphism 1.1.2.6.2, we get the $\mathcal{O}_X$-linear homomorphism

$$\varpi_{X/S}\colon p_{0*}\mathcal{P}^1_{X/S} \twoheadrightarrow \Omega^1_{X/S} \tag{1.1.2.6.3}$$

which is a left inverse of the inclusion $\Omega^1_{X/S} \subset p_{0*}\mathcal{P}^1_{X/S}$. We compute $\varpi_{X/S} = \mathrm{id} - p^1_0 \circ \psi^{1,0}_{X/S}$.

(d) We denote by $d_{X/S}\colon \mathcal{O}_X \to \Omega^1_{X/S}$ (or simply d) the constant $\mathcal{O}_S$-derivation which is given by $a \mapsto p^1_1(a) - p^1_0(a)$ for any local section a of $\mathcal{O}_X$ (see notation 1.1.2). The composition of $\varpi_{X/S}$ with $p^1_1\colon \mathcal{O}_X \to \mathcal{P}^1_{X/S}$ is the constant $\mathcal{O}_S$-derivation $d_{X/S}$. (Indeed, since $\psi^{1,0}_{X/S} \circ p^1_1 = \mathrm{id}$, then $\varpi_{X/S} \circ p^1_1 = p^1_1 - p^1_0 = d_{X/S}$.) Since $\varpi_{X/S}$ is $\mathcal{O}_X$-linear, this means that $d_{X/S}$ is a differential operator of order ≤ 1 relatively to X/S (see definition 1.1.3.2).

(e) We have the exact sequence of $\mathcal{O}_X$-modules

$$0 \xrightarrow{j} \Omega^1_{X/S} \to p_{1*}\mathcal{P}^1_{X/S} \xrightarrow{\psi^{1,0}_{X/S}} \mathcal{O}_X \to 0. \tag{1.1.2.6.4}$$

The exact sequence 1.1.2.6.4 splits via the section $p^1_1 \colon \mathcal{O}_X \to p_{1*}\mathcal{P}^1_{X/S}$, which yields the isomorphism of $\mathcal{O}_X$-modules

$$(p^1_1, j) \colon \mathcal{O}_X \oplus \Omega^1_{X/S} \xrightarrow{\sim} p_{1*}\mathcal{P}^1_{X/S}. \tag{1.1.2.6.5}$$

(f) Suppose X/S has coordinates $(t_\lambda)_{\lambda=1,\dots,d}$. According to notation 1.1.2.3, let $\tau_{\lambda,1}$ be the image of $1 \otimes t_\lambda - t_\lambda \otimes 1$ in $\mathcal{P}^1_{X/S}$ for $\lambda = 1,\dots,d$. Then $\varpi_{X/S}(\tau_{\lambda,1}) = \tau_{\lambda,1} = dt_\lambda$. Moreover, $\varpi_{X/S}(1) = 0$. Hence, $\ker \varpi_{X/S} = \mathcal{O}_X$.

1.1.3 Differential operators

We remind few elements on the concept of differential operators (see the section [Gro67, IV.16.8]). We only collect information to understand the construction of the de Rham complex (see the paragraph below 2.3.2.1). The reader may find further properties that we will not need in [Gro67, IV.16.8]. Let $X \to S$ be a morphism of schemes. Let $\mathcal{E}, \mathcal{F}$ be two $\mathcal{O}_X$-modules, $n \geq 0$ be an integer.

Notation 1.1.3.1. By convention, $\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$ means $p_{1*}(\mathcal{P}^n_{X/S}) \otimes_{\mathcal{O}_X} \mathcal{E}$ and $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S}$ means $\mathcal{E} \otimes_{\mathcal{O}_X} p_{0*}(\mathcal{P}^n_{X/S})$. For instance, $\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S}$ is $p_{1*}(\mathcal{P}^n_{X/S}) \otimes_{\mathcal{O}_X} p_{0*}(\mathcal{P}^{n'}_{X/S})$.

We have two structures of $\mathcal{O}_X$-module on the sheaf $\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$: the "left structure" given by functoriality from the left structure of $\mathcal{P}^n_{X/S}$ and the "right structure" given by the internal tensor product. We denote by $p_{0*}(\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E})$ (resp. $p_{1*}(\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E})$) to clarify we are considering the left structure (resp. right structure).

Similarly, we denote by $p_{0*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S})$ (resp. $p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S})$) the $\mathcal{O}_X$-module given by the internal tensor product (resp. by functoriality from the right $\mathcal{O}_X$-module structure of $\mathcal{P}^n_{X/S}$) which is called the left (resp. right) structure.

We denote by $p^n_{0,\mathcal{E}} \colon \mathcal{E} \to p_{0*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S})$ the canonical $\mathcal{O}_X$-linear map given by $x \mapsto x \otimes \mathbb{1}$, i.e. is the composition of $\mathrm{id}_{\mathcal{E}} \otimes p^n_0$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^0_{X/S}$. We denote by $p^n_{1,\mathcal{E}} \colon \mathcal{E} \to p_{1*}(\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E})$ the canonical $\mathcal{O}_X$-linear map given by $x \mapsto \mathbb{1} \otimes x$, i.e. is the composition of $p^n_1 \otimes \mathrm{id}_{\mathcal{E}}$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{P}^0_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$.

Definition 1.1.3.2. We say that a $f^{-1}\mathcal{O}_S$-linear homomorphism $D \colon \mathcal{E} \to \mathcal{F}$ is a "differential operator of order $\leq n$ (relatively to X/S)" if there exists a homomorphism of $\mathcal{O}_X$-modules $u \colon p^n_{0*}(\mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}) \to \mathcal{F}$ such that $D = u \circ p^n_{1,\mathcal{E}}$ (see notation 1.1.3.1).

1.1.3.3 (Local description)**.** Let $D \colon \mathcal{E} \to \mathcal{F}$ be a $f^{-1}\mathcal{O}_S$-linear homomorphism. The property that D is a differential operator of order $\leq n$ is better understood locally. Let us describe it below. Suppose $S = \operatorname{Spec} R$, $X = \operatorname{Spec} A$. Then $\Gamma(X, \mathcal{P}^n_{X/S}) = (A \otimes_R A)/I^{n+1}$ where I is the kernel of the multiplication $A \otimes_R A \to A$. Set $E := \Gamma(X, \mathcal{E})$, $F := \Gamma(X, \mathcal{F})$. Then $\Gamma(X, p^n_{0,\mathcal{E}})$ is the canonical map $E \to (A \otimes_R A)/I^{n+1} \otimes_A E$ given by $x \mapsto \mathbb{1} \otimes x$. Let us denote by $p_{0,E} \colon E \to (A \otimes_R A) \otimes_A E$ the canonical map given by $x \mapsto \mathbb{1} \otimes x$. We have the A-linear isomorphism $(A \otimes_R A) \otimes_A E \xrightarrow{\sim} A \otimes_R E$ (for the left structure of $A \otimes_R A$ by default). Since D is R-linear, this yields by extension a unique A-linear map $u \colon (A \otimes_R A) \otimes_A E \to F$ such that $D = \widetilde{D} \circ p_{0,E}$. Then D is a differential operator of order $\leq n$ is equivalent to saying that $u(I^{n+1}) = 0$. Remark also that the A-linear map u such that $D = u \circ p^n_{0,\mathcal{E}}$ is therefore unique if it exists.

Proposition 1.1.3.4. *Let $D \colon \mathcal{E} \to \mathcal{F}$ be a $f^{-1}\mathcal{O}_S$-linear homomorphism. The following conditions are equivalent:*

(a) D is a differential operator of order $\leq n$.

(b) For any section a of $\mathcal{O}_X$ above an open subset U, the homomorphism $D_a \colon \mathcal{E}|U \to \mathcal{F}|U$ such that, for any section t of $\mathcal{E}$ above a open subset $V \subset U$, we have

$$D_a(t) = D(at) - aD(t) \tag{1.1.3.4.1}$$

is is a differential operator of order $\leq n - 1$.

(c) *For any open subset U of X, for any family $(a_i)_{1\le i\le n+1}$ of $n+1$ sections of $\mathcal{O}_X$ above U and any section t of $\mathcal{E}$ above U, we have the identity*

$$\sum_{H\subset\{1,\dots,n+1\}}(-1)^{\mathrm{Card}\,H}(\prod_{i\in H}a_i)D\left((\prod_{i\notin H}a_i)t\right)=0. \tag{1.1.3.4.2}$$

Proof. Let us sketch the proof (see [Gro67, IV16.8.8)] for a complete one). These properties are local. Hence, we can use the local description of 1.1.3.3 of a differential operator of order $\le n$. With notation 1.1.3.3, the ideal I^{n+1} is generated by the elements of the form

$$\prod_{i=1}^{n+1}(a_i\otimes 1-1\otimes a_i)=\sum_{H\subset\{1,\dots,n+1\}}(-1)^{\mathrm{Card}\,H}(\prod_{i\in H}a_i)\otimes(\prod_{i\notin H}a_i).$$

Hence, we easily check via some computation the equivalence between the three statements. □

1.1.4 Sheaf of differential operators relative to weakly smooth morphisms

Let $f\colon X\to S$ be a weakly smooth morphism (see 1.1.1.4).

Definition 1.1.4.1. In the case where $\mathcal{E}$ and $\mathcal{F}$ are equal to $\mathcal{O}_X$ in the definition (1.1.3.2), we get the sheaf of differential operators of order $\le n$ of f (of infinite level) is defined by putting $\mathcal{D}_{X/S,n}:=\mathcal{H}om_{\mathcal{O}_X}(p^n_{0*}\mathcal{P}^n_{X/S},\mathcal{O}_X)$. The sheaf of differential operators of f is defined by putting $\mathcal{D}_{X/S}:=\cup_{n\in\mathbb{N}}\mathcal{D}_{X/S,n}$. The tautological structure of $\mathcal{O}_X$-module on $\mathcal{D}_{X/S,n}$ is said to be the left one. For any $a\in\mathcal{O}_X$, we have the map $\mathcal{D}_{X/S,n}\to\mathcal{D}_{X/S,n}$ induced by the $\mathcal{O}_X$-linear map $p^n_1(a)\colon p^n_{0*}\mathcal{P}^n_{X/S}\to p^n_{0*}\mathcal{P}^n_{X/S}$. This yields another structure of $\mathcal{O}_X$-module on $\mathcal{D}_{X/S,n}$ which is called the right structure of $\mathcal{O}_X$-module. For any $n'\ge n$, the homomorphisms $\mathcal{D}_{X/S,n}\to\mathcal{D}_{X/S,n'}$ are $\mathcal{O}_X$-linear for both structures. This yields two structures of $\mathcal{O}_X$-modules on $\mathcal{D}_{X/S}$, the left one and the right one.

Since the image of $p^n_1\colon\mathcal{O}_X\to\mathcal{P}^n_{X/S}$ generates $p^n_{0*}\mathcal{P}^n_{X/S}$ as $\mathcal{O}_X$-module, then the morphism

$$\mathcal{D}_{X/S,n}=\mathcal{H}om_{\mathcal{O}_X}(p^n_{0*}\mathcal{P}^n_{X/S},\mathcal{O}_X)\xrightarrow{p^n_1}\mathcal{H}om_{\mathcal{O}_S}(\mathcal{O}_X,\mathcal{O}_X)=\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{O}_X)$$

is injective. We get the injection $\mathcal{D}_{X/S}\hookrightarrow\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{O}_X)$. The sheaf $\mathcal{D}_{X/S}$ is in fact a subring of $\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{O}_X)$. Indeed, let $P\in\mathcal{D}_{X/S,n}$, $P'\in\mathcal{D}_{X/S,n'}$. Then it follows from the commutativity of 1.1.2.5.2 that the product PP' in $\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{O}_X)$ corresponds to the element of $\mathcal{D}_{X/S,n+n'}$ defines by the composition:

$$PP'\colon\mathcal{P}^{n+n'}_{X/S}\xrightarrow{\delta^{n,n'}}\mathcal{P}^n_{X/S}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'}_{X/S}\xrightarrow{\mathrm{id}\otimes P'}\mathcal{P}^n_{X/S}\xrightarrow{P}\mathcal{O}_X. \tag{1.1.4.1.1}$$

Since $\mathcal{D}_{X/S}$ is a subring of $\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{O}_X)$, this yields a canonical structure of left $\mathcal{D}_{X/S}$-module on $\mathcal{O}_X$. By definition, the action of $P\in\mathcal{D}_{X/S,n}$ on $f\in\mathcal{O}_X$ is denoted by $P(f)$ or $P\cdot f$ and is given by the formula

$$P(f)=P\circ p^n_1(f). \tag{1.1.4.1.2}$$

Remark 1.1.4.2. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. We can set $\mathcal{D}iff_{X/S}(\mathcal{E},\mathcal{E}):=\cup_{n\in\mathbb{N}}\mathcal{H}om_{\mathcal{O}_X}(p^n_{0*}(\mathcal{P}^n_{X/S}\otimes_{\mathcal{O}_X}\mathcal{E}),\mathcal{E})$. Then we get the injection $\mathcal{D}iff_{X/S}(\mathcal{E},\mathcal{E})\hookrightarrow\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{E})$ via the map

$$\mathcal{H}om_{\mathcal{O}_X}(p^n_{0*}(\mathcal{P}^n_{X/S}\otimes_{\mathcal{O}_X}\mathcal{E}),\mathcal{E})\xrightarrow{p^n_1}\mathcal{H}om_{\mathcal{O}_S}(\mathcal{E},\mathcal{E})=\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{E}).$$

We check similarly that the sheaf $\mathcal{D}iff_{X/S}(\mathcal{E},\mathcal{E})$ is in fact a subring of $\mathcal{E}nd_{\mathcal{O}_S}(\mathcal{E})$ (see [Gro67, IV.16.8.9]).

Notation 1.1.4.3. Let $d\ge 1$ be an integer. By convention, an element $\underline{k}\in\mathbb{N}^d$ is of the form $\underline{k}=(k_1,\dots,k_d)$. We consider $(\mathbb{N}^d,+)$ as a monoid and we put $|\underline{k}|:=k_1+\cdots+k_d$. We endow $\mathbb{N}^d$ with the partial order as follows. For any $\underline{k},\underline{k}'\in\mathbb{N}^d$, by definition the inequality $\underline{k}'\le\underline{k}$ means that we have $k'_i\le k_i$, for any $i=1,\dots,d$. For any $\underline{k},\underline{l}\in\mathbb{N}^d$, we remark that $\sup\{\underline{k},\underline{l}\}$ exists and $\underline{n}:=\sup\{\underline{k},\underline{l}\}$ is given by $n_i=\max\{k_i,l_i\}$ for any $i=1,\dots d$ (see 3.2.3.13 to get an example of formula involving such computation). Moreover, for any $\underline{k}'\le\underline{k}'$ in $\mathbb{N}^d$, we write

$$\underline{k}!:=\prod_{i=1}^d k_i!,\qquad\binom{\underline{k}}{\underline{k}'}:=\prod_{i=1}^d\binom{k_i}{k'_i}. \tag{1.1.4.3.1}$$

1.1.4.4 (Local formulas)**.** Suppose f has the formal coordinates $(t_\lambda)_{\lambda=1,\ldots,r}$. Put $\tau_\lambda := 1 \otimes t_\lambda - t_\lambda \otimes 1$. Following 1.1.2.3, the elements $\{\underline{\tau}^{\underline{k}}\}_{|\underline{k}|\leq n}$ form a basis of $\mathcal{P}^n_{X/S}$. The corresponding dual basis of $\mathcal{D}_{X/S,n}$ will be denoted by $\{\underline{\partial}^{[\underline{k}]},\ |\underline{k}| \leq n\}$. Hence, $\mathcal{D}_{X/S}$ is a free $\mathcal{O}_X$-module (for both structures) with the basis $\{\underline{\partial}^{[\underline{k}]},\ \underline{k} \in \mathbb{N}^r\}$. We have the formulas:

$$\underline{\partial}^{[\underline{k}']}\underline{\partial}^{[\underline{k}'']} = \binom{\underline{k}'+\underline{k}''}{\underline{k}'}\underline{\partial}^{[\underline{k}'+\underline{k}'']}, \qquad \text{product rule,} \tag{1.1.4.4.1}$$

$$\underline{\partial}^{[\underline{k}]}f = \sum_{\underline{k}'+\underline{k}''=\underline{k}} \underline{\partial}^{[\underline{k}']}(f)\underline{\partial}^{[\underline{k}'']}, \qquad \text{Leibniz rule} \tag{1.1.4.4.2}$$

for $\underline{k}, \underline{k}', \underline{k}'' \in \mathbb{N}^d$ and any $f \in \Gamma(U, \mathcal{O}_U)$. The product formula says the operators $\underline{\partial}^{[\underline{k}]}$ commute.

For any $i = 1, \ldots, d$, let $\underline{\epsilon}_i = (0, \ldots, 0, 1, 0, \ldots, 0)$ where 1 is at the ith place. We set $\partial_i := \underline{\partial}^{[\underline{\epsilon}_i]}$. Write $\underline{\partial}^{\underline{k}} = \underbrace{\partial_1 \cdots \partial_1}_{k_1} \cdots \underbrace{\partial_d \cdots \partial_d}_{k_d}$. Then we get $\underline{k}!\underline{\partial}^{[\underline{k}]} = \underline{\partial}^{\underline{k}}$.

Proposition 1.1.4.5. *Let X be a smooth scheme over $S := \operatorname{Spec} k$, with k a perfect field. Any $\mathcal{D}_{X/S}$-module which is coherent over $\mathcal{O}_X$ is a locally free $\mathcal{O}_X$-module.*

Proof. Let $\mathcal{M}$ be a $\mathcal{D}_{X/S}$-module coherent over $\mathcal{O}_X$. Let x be a closed point of X. We have to check that the stalk $\mathcal{M}_x$ is free (or projective) over $\mathcal{O}_{X,x}$. There exists an open neighborhood U of x, such that $U/\operatorname{Spec} k$ has coordinates $t_1, \ldots, t_d$. Since $k(x)/k$ is separable, then $t_{1x}, \ldots, t_{dx}$ generate $\mathcal{O}_{X,x}$ which number is the minimal (see [Gro67, IV.17.12.2]) i.e. $t_{1x}, \ldots, t_{dx}$ is a regular system of parameter of $\mathfrak{m}_{X,x}$. Then it follows from Nakayama's lemma that there exist $s_1, s_2, \ldots, s_m \in \mathcal{M}_x$ such that $\mathcal{M}_x m \sum_{i=1}^m \mathcal{O}_{X,x}s_i$ and $\overline{s}_1, \ldots, \overline{s}_m \in \mathcal{M}_x/\mathfrak{m}_{X,x}\mathcal{M}_x$ are free generators of the vector space $\mathcal{M}_x/\mathfrak{m}_{X,x}\mathcal{M}_x$ over $k = \mathcal{O}_{X,x}/\mathfrak{m}_{X,x}$. We will show that $\{s_1, s_2, \ldots, s_m\}$ is a free generator of the $\mathcal{O}_{X,x}$ -module $\mathcal{M}_x$. Now we define the order of each $f \in \mathcal{O}_{X,x}$ at $x \in X$ by $\operatorname{ord}(f) := \max\{l \in \mathbb{N} \parallel f \in \mathfrak{m}_{X,x}\}$ if $f \neq 0$ and $\operatorname{ord}(f) = \infty$ otherwise. Let ν be the minimum of the order of $f_1, \ldots, f_m \in \mathcal{O}_{X,x}$ such that

$$\sum_{i=1}^m f_i s_i = 0.$$

To arrive to a contradiction, suppose $\nu \in \mathbb{N}$. Reordoring if necessarily, let $f_1, \ldots, f_m\mathcal{O}_{X,x}$ such that $\sum_{i=1}^m f_i s_i = 0$ and $\operatorname{ord}(f_1) = \nu$. There exists $\underline{k} \in \mathbb{N}^d$ such that $|\underline{k}| = \nu$ and $\underline{\partial}^{[\underline{k}]}(f_1) \in \mathcal{O}^*_{X,x}$. Using 1.1.4.4.2, we get $\underline{\partial}^{[\underline{k}]}f_i - \underline{\partial}^{[\underline{k}]}(f_i) \in \mathfrak{m}_{X,x}$. This yields $0 = \underline{\partial}^{[\underline{k}]} \cdot (\sum_{i=1}^m f_i s_i) = \sum_{i=1}^m (\underline{\partial}^{[\underline{k}]} f_i) \cdot s_i \equiv \sum_{i=1}^m \underline{\partial}^{[\underline{k}]}(f_i) \cdot s_i \mod \mathfrak{m}_{X,x}\mathcal{M}_x$. Since $\underline{\partial}^{[\underline{k}]}(f_1) \in \mathcal{O}^*_{X,x}$, then this is a contradiction with the fact that $\overline{s}_1, \ldots, \overline{s}_m \in \mathcal{M}_x/\mathfrak{m}_{X,x}\mathcal{M}_x$ are free generators of the k-vector space $\mathcal{M}_x/\mathfrak{m}_{X,x}\mathcal{M}_x$. □

1.2 Partial divided power

1.2.1 Modified binomial coefficients

Let $m \in \mathbb{N}$.

1.2.1.1. For any integer $k \geq 0$, we recall the formula

$$v_p(k!) = (k - \sigma(k))/(p-1), \tag{1.2.1.1.1}$$

where we set $k = \sum_{i=0}^{n_k} a_i p^i$, with $1 \leq a_i \leq p-1$, and $\sigma(k) = \sum_{i=0}^{n_k} a_i$. Since $n_k < \log_p(k+1) \leq n_k + 1$, we have the estimate

$$(p-1)\log_p(k+1) \leq \sigma(k) < (p-1)(\log_p(k+1)+1). \tag{1.2.1.1.2}$$

For $k = k' + k''$ with $k', k'' \in \mathbb{N}$, from 1.2.1.1.1 we get

$$v_p\left(\binom{k}{k'}\right) = (\sigma(k') + \sigma(k'') - \sigma(k))/(p-1). \tag{1.2.1.1.3}$$

Notation 1.2.1.2. Let $k \in \mathbb{N}$.

(a) We denote by $q_k^{(m)}$ and $r_k^{(m)}$ the nonnegative integers such that $k = p^m q_k^{(m)} + r_k^{(m)}$ and $r_k^{(m)} < p^m$.

(b) Let $k' \in \mathbb{N}$ such that $k' \leq k$. We set

$$\left\{ \begin{matrix} k \\ k' \end{matrix} \right\}_{(m)} = \frac{q_k^{(m)}!}{q_{k'}^{(m)}! q_{k-k'}^{(m)}!}, \quad \left\langle \begin{matrix} k \\ k' \end{matrix} \right\rangle_{(m)} = \binom{k}{k'} \left\{ \begin{matrix} k \\ k' \end{matrix} \right\}_{(m)}^{-1}. \tag{1.2.1.2.1}$$

Notation 1.2.1.3. Let $d \geq 1$ be an integer. We complete the notation 1.1.4.3 as follows. For any $\underline{k'} \leq \underline{k}'$ in $\mathbb{N}^d$, we write

$$\underline{q}_{\underline{k}}^{(m)} := (q_{k_1}^{(m)}, \ldots, q_{k_d}^{(m)}), \qquad \left\{ \begin{matrix} \underline{k} \\ \underline{k'} \end{matrix} \right\}_{(m)} := \prod_{i=1}^{d} \left\{ \begin{matrix} k_i \\ k'_i \end{matrix} \right\}_{(m)}, \qquad \left\langle \begin{matrix} \underline{k} \\ \underline{k'} \end{matrix} \right\rangle_{(m)} := \prod_{i=1}^{d} \left\langle \begin{matrix} k_i \\ k'_i \end{matrix} \right\rangle_{(m)}. \tag{1.2.1.3.1}$$

1.2.1.4. Let $0 \leq k' \leq k$ be two integers. From 1.2.1.1.3, we compute

$$v_p \left(\left\langle \begin{matrix} k \\ k' \end{matrix} \right\rangle_{(m)} \right) = (q_{k'}^{(m)} + q_{k-k'}^{(m)} - q_k^{(m)} - \sigma(r_k^{(m)}) + \sigma(r_{k'}^{(m)}) + \sigma(r_{k-k'}^{(m)}))/(p-1). \tag{1.2.1.4.1}$$

Lemma 1.2.1.5. *We have the following properties.*

(a) For any integers $m, k, k' \geq 0$, we have

$$\left\{ \begin{matrix} k \\ k' \end{matrix} \right\}_{(m)} \in \mathbb{N}, \qquad \left\langle \begin{matrix} k \\ k' \end{matrix} \right\rangle_{(m)} \in \mathbb{Z}_{(p)}.$$

(b) Let $0 \leq j$, and $0 \leq q' \leq q$ be three integers. If $j \geq m$, or if $q < p$, we have

$$\left\langle \begin{matrix} p^j q \\ p^j q' \end{matrix} \right\rangle_{(m)} \in \mathbb{Z}_{(p)}^*.$$

(c) For any nonnegative integers j, r and q such that $r < p^j$ we have

$$\left\langle \begin{matrix} p^j q + r \\ p^j q \end{matrix} \right\rangle_{(m)} \in \mathbb{Z}_{(p)}^*.$$

(d) For any $k \geq p^m$, we have

$$\left\langle \begin{matrix} k \\ p^m \end{matrix} \right\rangle_{(m)} \in \mathbb{Z}_{(p)}^*. \tag{1.2.1.5.1}$$

Proof. The Lemma is an easy consequence of the formula 1.2.1.4.1. □

Notation 1.2.1.6. Let $k', k'' \in \mathbb{N}$. We set

$$C_{k'',k'}^{(m)} := q_{k'k''}^{(m)}!/((q_{k'}^{(m)}!)^{k''} q_{k''}^{(m)}!). \tag{1.2.1.6.1}$$

It follows from [Ber96c, 1.1.5] that $C_{k'',k'}^{(m)} \in \mathbb{N}$.

1.2.2 Divided power

We begin with a summary on divided power envelope which we need to construct differential operators of finite level. Details of proofs can be found in [Ber96c] §1, [Ber74], [BO78].

Definition 1.2.2.1. Let A be a commutative ring with identity and $I \subset A$ an ideal. By a *divided power structure* on I we mean a family $\gamma = (\gamma_i)$ of maps from I to A indexed by integers $i \geq 0$ satisfying the following conditions for $x, y \in I$ and $a \in A$

(1) $\gamma_0(x) = 1$, $\gamma_1(x) = x$ and $\gamma_i(x) \in I$ for all $i \geq 2$.

(2) $\gamma_k(x + y) = \sum_{i+j=k} \gamma_i(x)\gamma_j(y)$ for all $k \geq 0$.

(3) $\gamma_k(ax) = a^k \gamma_k(x)$ for all $k \geq 0$.

(4) $\gamma_i(x)\gamma_j(x) = \binom{i+j}{j}\gamma_{i+j}(x)$ for all $i, j \geq 0$.

(5) $\gamma_i(\gamma_j(x)) = \frac{(ij)!}{i!(j!)^i}\gamma_{ij}(x)$ for all $i, j \geq 0$.

We say that (I, γ) is a PD ideal, and (A, I, γ) is a PD ring. If there is no ambiguity on γ, we write n-th *divided power* $\gamma_n(x)$ of x as $x^{[n]}$.

Examples 1.2.2.2. (a) 0 is a PD-ideal with $\gamma_i(0) = 0$ for any integer $i \geq 1$.

(b) If A is a $\mathbb{Q}$-algebra, every ideal has a unique PD structure, given by $\gamma_i(x) = x^i/i!$.

(c) If $\mathcal{V}$ is a discrete valuation ring of unequal characteristic $(0, p)$ and uniformizing parameter π, write $p = u\pi p^e$, with u a unit. Then $\pi^k\mathcal{V}$ has a PD-structure if and only if $e/(p-1) \leq k$. In particular, $\pi\mathcal{V}$ has a PD-structure if and only if $e \leq p - 1$.

Definition 1.2.2.3. Given PD rings (A, I, γ) and (A', I', γ') we call a ring homomorphism $f : A \to A'$ a *PD homomorphism*, if $f(I) \subset I'$ and $\gamma'_n \circ f = f \circ \gamma_n$ $(\forall n)$.

Definition 1.2.2.4. Let (A, I, γ) be a PD ring. We say an ideal $J \subseteq I$ is a *sub PD ideal* if and only if $\gamma_k(x) \in J$ for any $x \in J$, $k \geq 1$.

Definition 1.2.2.5. Let (A, I, γ) be a PD ring. For any positive integer n, let us set $I^{[n]} \subset A$ to be the ideal generated by the set of elements $\gamma_{i_1}(x_1)\gamma_{i_2}(x_2)\cdots\gamma_{i_k}(x_k)$ with $x_i \in I$ and $i_1 + \cdots i_k \geq n$. Clearly $I^{[n]}$ is a PD ideal, and $I^{[n]}I^{[m]} \subset I^{[n+m]}$. If for some positive integer n we have $I^{[n]} = 0$, then say I is *PD nilpotent*.

Definition 1.2.2.6. Let (A, I, γ) be a PD ring and B be an A-algebra. We say that "γ extends to B" iff there is a (a necessarily unique) PD structure $\overline{\gamma}$ on IB such that $(A, I, \gamma) \to (B, IB, \overline{\gamma})$ is a PD-morphism.

Example 1.2.2.7. Let (A, I, γ) be a PD ring and B be an A-algebra. When I is principal, then γ extends to B.

Proposition 1.2.2.8. *Let (A, I, γ) be a PD ring. Let B be an A-algebra. (J, δ) be a PD ideal in B. Then the following are equivalent:*

(1) γ extends to B and $\overline{\gamma} = \delta$ on $IB \cap J$.

(2) The ideal $IB + J$ has (a necessarily unique) structure $\overline{\delta}$ such that $(A, I, \gamma) \to (B, IB + J, \overline{\delta})$ and $(B, J, \delta) \to (B, IB + J, \overline{\delta})$ are PD-morphisms.

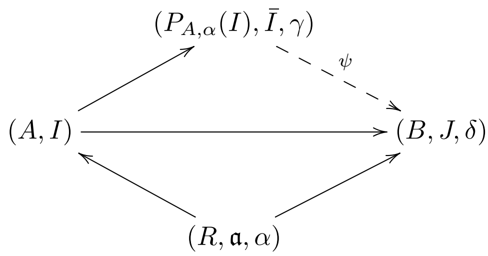
Definition 1.2.2.9. If the equivalent conditions of the proposition 1.2.2.8 are fulfilled, we say that γ and δ are compatible.

Proposition 1.2.2.10. *If $(R, \mathfrak{a}, \alpha)$ is a PD-ring, A is a R-algebra and I is an ideal of A, then there exists an A algebra $P_{A,\alpha}(I)$ with a PD ideal $(\bar{I}, \gamma)$ such that*

(a) $IP_{A,\alpha}(I) \subseteq \bar{I}$,

(b) γ is compatible with α

(c) and the following universal property holds: if (B, J, δ) is any PD A-algebra with $IB \subseteq J$ and δ is compatible with α, then there is a unique PD homomorphism $\tilde{\psi} : (P_{A,\alpha}(I), \bar{I}, \gamma) \to (B, J, \delta)$ such that the following commutes



Definition 1.2.2.11. Under the hypotheses of the proposition, we say (A, I) has *PD envelope* $(P_{A,\alpha}(I), \bar{I}, \gamma)$ compatible with α. We also write $P_\alpha(I)$ or $P_A(I)$ for $P_{A,\alpha}(I)$ ([BO78] Theorem 3.19;[Ber74] 2.4.2).

Examples 1.2.2.12. Take any ring R, put $A = R[T_1, \ldots, T_d]$, let $I = (T_1, \ldots, T_d)$. Then PD envelope $P_A(I)$ is the free R-module with basis consists of products of divided powers $T_1^{[k_1]} \cdots T_d^{[k_d]}$ (in the notation for divided powers above).

If R is a $\mathbb{Q}$-algebra, it follows from the uniqueness of PD-structure in an ideal in a $\mathbb{Q}$-algebra that $A \cong P_A(I)$. If R is not a $\mathbb{Q}$-algebra then $P_A(I)$ is not finitely generated as an R-algebra and is not noetherian.

1.2.3 Divided power compatible with (p)

Let $\mathbb{Z}_{(p)}$ denote the ring of integers localized at the ideal generated by p.

Definition 1.2.3.1. If A is a $\mathbb{Z}_{(p)}$-algebra, the canonical PD-structure of the ideal $(p) \subset \mathbb{Z}_{(p)}$ extends to A ; we will denote by $p^{[n]} = p^n/n!$. If $(I, \gamma) \subset A$ is a PD-ideal, we say that γ is **compatible with (p)** if γ is compatible with the canonical PD-structure of (p) (see 1.2.2.9).

The following Lemma will be applied in the case where the ideal $\mathfrak{a}$ is (p).

Lemma 1.2.3.2. *Let A be a $\mathbb{Z}_{(p)}$-algebra, $(I, \gamma) \subset A$, $(I', \gamma') \subset A$ be two ideals endowed with a PD-structure compatible with (p). We denote by $I_1 := I + pA$, $I_1' := I' + pA$. Let α be the canonical PD-structure on pA. Let δ (resp. δ') be the PD-structure on I_1 (resp. I_1') extending γ (resp. γ') and α. The following conditions are equivalent:*

(a) The PD-structure δ and δ' coincide on $I_1 \cap I_1'$.

(b) The PD-structure δ and γ' coincide on $I_1 \cap I'$.

(c) The PD-structure δ and δ' coincide on $I_1 \cap I_1'$.

(d) There exists on $I + I' + pA$ a PD structure inducing γ, γ' and α.

(e) There exists on $I + I'$ a PD structure which is compatible with (p) and inducing γ and γ'.

In that case we say that γ and γ' are "strictly compatible" (see below 1.2.3.3 for an extension of this notion).

Definition 1.2.3.3. Let $A \to A'$ be a morphism of commutative $\mathbb{Z}_{(p)}$-algebras.

1. Let $(I, \gamma) \subset A$ be an ideal endowed with a PD-structure compatible with (p). We say that γ "strictly extends" to A' if γ extends to A' and if $\overline{\gamma}$ is compatible with (p), where $\overline{\gamma}$ is the PD-structure on IA' which is induced by γ. Beware that γ can extend to A' but not strictly.
2. Let $(I, \gamma) \subset A$ be an ideal endowed with a PD-structure compatible with (p). Let $(I', \gamma') \subset A'$ be an ideal endowed with a PD-structure compatible with (p). We say that γ and γ' are "strictly compatible" if γ strictly extends to A' and if $\overline{\gamma}$ and γ' are strictly compatible (see 1.2.3.2), where $\overline{\gamma}$ is the PD-structure on IA' which is induced by γ. Beware that γ and γ' can be compatible but not strictly compatible.

Lemma 1.2.3.4. *Let A be a $\mathbb{Z}_{(p)}$-algebra and I be an ideal of A.*

(a) The ideal $pA \cap I$ is a sub-PD ideal of pA.

(b) If $(J, \gamma) \subset I$ is a PD-ideal compatible with (p) then $(J + pA) \cap I$ is a sub-PD-ideal of $J + pA$.

Proof. a) If $a \in A$ is such that $pa \in I$, then for any integer $n \geq 1$ we have $p^{[n]}a \in pA \cap I$ and then $(pa)^{[n]} = p^{[n]}a^n \in pA \cap I$.

b) The second statement is a consequence of the first one and of $(J + pA) \cap I = J + pA \cap I$. □

1.2.4 Divided powers of level m

The definition of divided powers is modified by Berthelot to give partial divided powers. More details can be found in [Ber96c] §1.3, 1.4. In the rest of this book, a PD-structure of an ideal of a commutative $\mathbb{Z}_{(p)}$-algebra will always be supposed compatible with (p). Fix an integer m.

Definition 1.2.4.1. We have the following notions.

(a) Let A be a $\mathbb{Z}_{(p)}$-algebra and I be an ideal of A. A "partial PD structure of level m on I" or a "m-PD structure on I" is the data of a PD-ideal (J, γ) such that

$$I^{(p^m)} + pI \subset J \subset I \tag{1.2.4.1.1}$$

where $I^{(p^m)}$ denotes the ideal generated by x^{p^m} for $x \in I$. We say (I, J, γ) is an "m-PD ideal of A" and that (A, I, J, γ) is an m-PD-$\mathbb{Z}_{(p)}$-algebra.

(b) Let (A, I, J, γ) and (A', I', J', γ') be two m-PD-$\mathbb{Z}_{(p)}$-algebras. An "m-PD morphism" or "morphism of m-PD-$\mathbb{Z}_{(p)}$-algebras" of the form $(A, I, J, \gamma) \to (A', I', J', \gamma')$ is a homomorphism of $\mathbb{Z}_{(p)}$-algebras $\phi\colon A \to A'$ such that $\phi(I) \subset I'$, and $(A, J, \gamma) \to (A', J', \gamma')$ is a PD-morphism. When ϕ is the identity, we say that (I, J, γ) is a "sub-m-PD-ideal" of (I', J', γ') ; if moreover $I' = I$, we say that (J, γ) is a "sub-m-PD-structure" of (J', γ').

Remark that a 0-PD-structure (resp. 0-PD-ideal, 0-PD morphism) is the same than a PD-structure (resp. PD-ideal, PD morphism) since when $m = 0$ the equality 1.2.4.1.1 implies $J = I$. Moreover, for any $m' \geq m$, if (I, J, γ) is an m-PD ideal of A then it is also an m'-PD ideal of A. In other words, an m-PD-$\mathbb{Z}_{(p)}$-algebra can be viewed as an m'-PD-$\mathbb{Z}_{(p)}$-algebra.

Examples 1.2.4.2. We have the following m-PD structures.

(a) Let $\mathcal{V}$ be a discrete valuation ring of unequal characteristic $(0, p)$ and uniformizing parameter π, write $p = u\pi p^e$, with u a unit. Let $\mathfrak{a} := \pi^h \mathcal{V}$ and $\mathfrak{b} := \pi^k \mathcal{V}$. Following 1.2.2.2.c, $\mathfrak{b}$ has a canonical PD-structure if and only if $e/(p-1) \leq k$. It follows from the inclusions 1.2.4.1.1, that $(\mathfrak{a}, \mathfrak{b}, \square)$ is an m-ideal if and only if $e/(p-1) \leq k$, $e + h \geq k$, $hp^m \geq k$ and $k \geq h$. In particular, $\mathfrak{a}$ has an m-PD-structure if and only if $hp^m \geq e/(p-1)$.

(b) Let A be a $\mathbb{Z}_{(p)}$-algebra and I be an ideal of A. Let (J_0, γ) be a PD-ideal such that $J_0 \cap I$ is a sub PD-ideal of J_0 and such that $I^{(p^m)} \subset J_0$. We denote by $(J_0 + pA, \overline{\gamma})$ the PD-ideal induced by the PD-ideal (J_0, γ) (compatible with (p)). Then $J := (J_0 + pA) \cap I$ is a sub PD-ideal of $(J_0 + pA, \overline{\gamma})$ (see 1.2.3.4). We get the m-PD ideal $(I, J, \overline{\gamma})$.

For instance, if $I^{(p^m)} \subset pA$ then by taking $J_0 = J = pA \cap I$ endowed with the PD-structure $\square$ induced by the canonical one of pA (see 1.2.3.4), we get the m-PD ideal $(I, pA \cap I, \square)$. We say that $(pA \cap I, \square)$ is the "trivial" m-PD structure of I.

(c) If (J, γ) is an m-PD structure of an ideal I then it is also an m'-PD structure for any $m' \geq m$.

Definition 1.2.4.3. We introduce the notion of *compatible* m-PD structures as follows.

(i) Let $(R, \mathfrak{a}, \mathfrak{b}, \alpha)$ be an m-PD-$\mathbb{Z}_{(p)}$-algebra. Let A be a commutative R-algebra. We say that the "m-PD structure $(\mathfrak{b}, \gamma)$ extends to A" if α is extends strictly to A. If we denote by $\overline{\alpha}$ the PD structure on $\mathfrak{b}A$ extending α, then $(A, \mathfrak{a}A, \mathfrak{b}A, \overline{\alpha})$ is an m-PD-$\mathbb{Z}_{(p)}$-algebra.

(ii) Let $(R, \mathfrak{a}, \mathfrak{b}, \alpha)$ and (A, I, J, γ) be two m-PD-$\mathbb{Z}_{(p)}$-algebras such that A is an R-algebra. We say that "the m-PD structures $(\mathfrak{b}, \alpha)$ and (J, γ) are compatible" if the following conditions are satisfied

  (a) the PD-structures α and γ are strictly compatible,

  (b) $(\mathfrak{b}A + pA) \cap I$ is a sub PD ideal of $\mathfrak{b}A + pA$.

Remark 1.2.4.4. Let $(R, \mathfrak{a}, \mathfrak{b}, \alpha)$ and (A, I, J, γ) be two m-PD-$\mathbb{Z}_{(p)}$-algebras such that A is an R-algebra and such that the m-PD structures $(\mathfrak{b}, \alpha)$ and (J, γ) are compatible. Then $J + \mathfrak{b}A$ endowed with the PD structure extending γ and α is an m-PD-structure on $I + \mathfrak{a}A$ which is also compatible with $(\mathfrak{b}, \alpha)$. For more details, see [Ber96c, 1.3.2.(ii)].

1.2.4.5. Let (A, I, J, γ) be an m-PD-$\mathbb{Z}_{(p)}$-algebra. For $x \in I$ and $k \in \mathbb{N}$, the k-th *partial divided power* of x is

$$x^{\{k\}} = \gamma_{q_k^{(m)}}(x^{p^m})x^{r_k^{(m)}}.$$

We can simply write $x^{\{k\}}$. The map $x \mapsto x^{\{k\}_{(m)}}$ satisfies properties similar to that of $x \mapsto x^{[k]}$. We list some of these properties:

(a) For any $m' \geq m$ and $k \in \mathbb{N}$, we have

$$q_k^{(m)}!x^{\{k\}} = x^k, \qquad x^{\{k\}_{(m')}} = \frac{q_k^{(m)}!}{q_k^{(m')}!}x^{\{k\}_{(m)}}. \tag{1.2.4.5.1}$$

(b) $\forall x \in I$, $x^{\{0\}_{(m)}} = 1$, $x^{\{1\}_{(m)}} = x$; $\forall k \geq 1$, $x^{\{k\}_{(m)}} \in I$; $\forall k \geq p^m$, $x^{\{k\}_{(m)}} \in J$.

(c) $\forall x \in I$, $\forall k \in \mathbb{N}$, $\forall a \in A$, $(ax)^{\{k\}_{(m)}} = a^k x^{\{k\}_{(m)}}$.

(d) $\forall\, x, y \in I$ we have binomial expansion

$$(x+y)^{\{k\}_{(m)}} = \sum_{k'+k''=k} \left\langle {k \atop k'} \right\rangle_{(m)} x^{\{k'\}_{(m)}} y^{\{k''\}_{(m)}}. \tag{1.2.4.5.2}$$

(e) For any $k, k' \in \mathbb{N}$,

$$x^{\{k'\}_{(m)}} x^{\{k''\}_{(m)}} = \left\{ {k'+k'' \atop k'} \right\}_{(m)} x^{\{k'+k''\}_{(m)}}. \tag{1.2.4.5.3}$$

(f) For any $k', k'' \in \mathbb{N}$, with notation 1.2.1.6.1, we have

$$(x^{\{k'\}_{(m)}})^{\{k''\}_{(m)}} = C^{(m)}_{k'',k'} x^{\{k'k''\}_{(m)}}.$$

1.3 m-PD envelopes

1.3.1 m-PD adic filtration

We give the definition of an m-PD adic filtration following [Ber00] Appendice.

Proposition 1.3.1.1. *Let $(R, \mathfrak{a}, \mathfrak{b}, \alpha)$ and (A, I, J, γ) be two m-PD-$\mathbb{Z}_{(p)}$-algebras such that A is an R-algebra and the m-PD structures $(\mathfrak{b}, \alpha)$ and (J, γ) are compatible. Consider the set $\mathcal{F}$ of decreasing filtrations $(F^n A)_{n \geq 0}$ of A by ideals satisfying the following conditions:*

(a) $F^0 A = A$, $F^1 A = I$ and for $n, n' \geq 0$, we have $F^n A \cdot F^{n'} A \subseteq F^{n+n'} A$;

(b) for any $n \geq 1$, $x \in F^n A$ and $k \geq 0$, $x^{\{k\}} \in F^{kn} A$;

(c) for all $n \geq 0$, $(J + pA) \cap F^n A$ is a sub PD ideal in $(J + pA)$.

Then there exists a finer filtration $(I^{\{n\}_{(m)}})_{n \in \mathbb{N}}$ of $\mathcal{F}$, i.e. for any $(F^n A)_{n \in \mathbb{N}} \in \mathcal{F}$ then $I^{\{n\}_{(m)}} \subseteq F^n A$ for all n.

Definition 1.3.1.2. Under the hypotheses of 1.3.1.1, the m-PD filtration of (A, I, J, γ) is $(I^{\{n\}_{(m)}})_{n \in \mathbb{N}}$. Say I is *m-PD nilpotent* if there exists n such that $I^{\{n\}_{(m)}} = 0$. Say I is *topologically (for the p-adic topology) m-PD nilpotent* if the filtration given by the m-PD-filtration is finer than the p-adic topology on A.

We give some example.

Proposition 1.3.1.3. *Let $\mathcal{V}$ be a discrete valuation ring of characteristic $(0, p)$ with maximal ideal $\mathfrak{m}$ and ramification index e. Let $k, h \in \mathbb{N}$, $\mathfrak{a} := \mathfrak{m}^h$, $\mathfrak{b} := \mathfrak{m}^k$ such that $(\mathfrak{a}, \mathfrak{b}, {}^{[]})$ is canonically an m-PD ideal (see 1.2.4.2.a).*

(a) *The m-PD filtration of* $\mathfrak{a}$ *is given by*

$$\mathfrak{a}^{\{n\}} = ((\pi^h)^{\{n'\}})_{n'\geq n}.$$

This is independent of $\mathfrak{b}$*, and is topologically m-PD nilpotent if and only if* $hp^m > \frac{e}{p-1}$.

(b) *Let* A *be a* $\mathcal{V}$*-algebra,* $I = \mathfrak{a}A$*,* $J = \mathfrak{b}A$*. Then the m-PD adic filtration of* $(I, J, ^{[]})$ *is given by* $I^n = \mathfrak{a}^{\{n\}}I$.

Proposition 1.3.1.4. *With the notation and hypotheses of 1.3.1.2, the m-PD adic filtration satisfies the following properties:*

(a) *Let* $n \geq 1$*,* $\overline{A} := A/I^{\{n\}}$*,* $\varpi\colon A \to \overline{A}$ *be the canonical homomorphism,* $\overline{I} := I\overline{A}$*,* $\overline{J} := J\overline{A}$*,* $\overline{\gamma}$ *be the quotient PD-structure on* $\overline{J}$*. Then* $(\overline{J}, \overline{\gamma})$ *defines on* $\overline{\gamma}$ *an m-PD structure compatible with* $(\mathfrak{b}, \alpha)$*,* ϖ *is a strict morphism for the m-PD-adic filtrations, and* ϖ *is universal for m-PD-morphism* $(A, I, J, \gamma) \to (A', I', J', \gamma')$ *such that* (J', γ') *is compatible with* $(\mathfrak{b}, \alpha)$ *and* $I'^{\{n\}_{(m)}} = 0$.

(b) *For any flat morphism* $A \to A'$*, the ideal* $I' := IA$ *can be endowed with an m-PD structure* $(J' = JA', \gamma')$ *extending* (J, γ) *to* A' *and compatible with* $(\mathfrak{b}, \alpha)$*. Moreover, the m-PD adic filtration of* (I', J', γ') *is given by* $I'^{\{n\}_{(m)}} = I^{\{n\}_{(m)}}A'$.

Proof. See [Ber00, A.5]. □

1.3.2 m-PD envelopes of an ideal

Proposition 1.3.2.1. *Let* R *be a* $\mathbb{Z}_{(p)}$*-algebra,* $(\mathfrak{a}, \mathfrak{b}, \alpha)$ *an m-PD ideal of* R*,* A *a* R*-algebra,* I *an ideal of* A*. Then there exists a ring homomorphism*

$$\varphi : A \to A_1$$

an ideal I_1 *of* A_1 *such that* $\varphi(I) \subset I_1$*, and a m-PD structure* $(J_1, ^{[\,]})$ *of* I_1 *which is compatible with* $(\mathfrak{b}, \alpha)$ *such that for any R-homomorphism*

$$f\colon A \to A'$$

satisfying $f(I) \subset I'$ *and for any m-PD structure* (J', γ') *in* A' *which is compatible with* $(\mathfrak{b}, \alpha)$*, there exists a unique m-PD morphism*

$$g : (A_1, I_1, J_1, ^{[]}) \to (A', I', J', \gamma')$$

such that $g \circ \varphi = f$.

Proof. A proof of the existence is given in [Ber96c, 1.4.1]. □

Definition 1.3.2.2. With notation 1.3.2.1, A_1 is denoted by $P_{A,(m),\alpha}(I)$ or simply by $P_{(m),\alpha}(I)$ and is called the *level m partial divided power envelope* of (A, I) (compatible with $(\mathfrak{b}, \alpha)$). The m-PD ideal of $P_{(m),\alpha}(I)$ will be denoted by $(I_{(m)\alpha}, \widetilde{I}_{(m)\alpha}, ^{[\,]})$.

Corollary 1.3.2.3. *Under the hypotheses of 1.3.2.1, for any integer* $n \geq 0$*, the R-algebra* $P^n_{A,(m),\alpha}(I) := P_{A,(m),\alpha}(I)/I^{\{n+1\}}_{(m)\alpha}$ *is endowed with the m-PD-ideal* $(I^n_{(m)\alpha}, \widetilde{I}^n_{(m)\alpha}, ^{[\,]}) := (I_{(m)\alpha}P^n_{A,(m),\alpha}(I), \widetilde{I}_{(m)\alpha}P^n_{A,(m),\alpha}(I), ^{[\,]})$ *which is compatible with* $(\mathfrak{b}, \alpha)$ *and satisfies* $(I^n_{(m)\alpha})^{\{n+1\}_{(m)}} = 0$*, and is endowed with an R-homomorphism* $\phi_n\colon A \to P^n_{A,(m),\alpha}(I)$ *such that* $\phi_n(I) \subset I^n_{(m)\alpha}$ *and which is universal for R-homomorphisms* $R \to (A', I', J', \gamma')$ *sending* I *into an m-PD ideal* I' *compatible with* $(\mathfrak{b}, \alpha)$ *and such that* $I'^{\{n+1\}_{(m)}} = 0$.

Proof. This is a consequence of 1.3.2.1 and 1.3.1.4. □

1.3.2.4. With notation 1.3.2.2, followgin the proof of 1.3.2.1 of Berthelot, we have the equality

$$P_{(m),\alpha}(I) = P_{(0),\alpha}(I^{(m)}). \tag{1.3.2.4.1}$$

The construction of the m-PD ideal $(I_{(m)\alpha}, \widetilde{I}_{(m)\alpha}, ^{[\,]})$ reduce to the level 0 case (but this is too technical to be described here in the general case in few words). For the detailed descriptions, see the proof of [Ber96c, 1.4.1].

Examples 1.3.2.5. With notation 1.3.2.1, the obvious extreme examples are $P_{A,(m),\alpha}(A) = 0$ and $P_{A,(m),\alpha}(0) = A$, $(I_{(m)\alpha}, \widetilde{I}_{(m)\alpha}, {}^{[\,]}) = (0, 0, {}^{[\,]})$.

We have the following fundamental example.

Proposition 1.3.2.6. *Let $m \geq 0$ be an integer, let R be a $\mathbb{Z}_{(p}$-algebra, $(\mathfrak{a}, \mathfrak{b}, \alpha)$ an m-PD ideal of R, $A = R[t_1, \ldots, t_d]$ be a polynomial algebra with coefficients in R, $I = (t_1, \ldots, t_d)$.*

(a) The m-PD-envelope $P_{A,(m),\alpha}(I)$ is independent of α. The canonical morphism $A \to P_{A,(m),\alpha}(I)$ is injective and $P_{A,(m),\alpha}(I)$ is a free R-module having the basis $t^{\{\underline{k}\}} := t_1^{\{k_1\}} \cdots t_d^{\{k_d\}}$, $(k_1, \ldots, k_d) \in \mathbb{N}^d$.

(b) The m-PD-ideal $I_{(m)\alpha}$ is the free R-submodule having the basis $t_1^{\{k_1\}} \cdots t_d^{\{k_d\}}$, with $\sum_{i=1}^d k_i \geq 1$.

(c) The PD-ideal $\widetilde{I}_{(m)\alpha}$ is the R-submodule generated by the elements $pt_1^{\{k_1\}} \cdots t_d^{\{k_d\}}$ with $\sum_{i=1}^d k_i \geq 1$ and by the elements $t_1^{\{k_1\}} \cdots t_d^{\{k_d\}}$, such that there exists i satisfying $k_i \geq p^m$.

(d) The nth term $I_{(m)\alpha}^{\{n\}}$ of the m-PD-filtration of $P_{A,(m),\alpha}(I)$ is the free R-submodule having the basis $t_1^{\{k_1\}} \cdots t_d^{\{k_d\}}$, with $\sum_{i=1}^d k_i \geq n$.

(e) The m-PD-envelope $P^n_{A,(m),\alpha}(I)$ is independent of α. The canonical morphism $A \to P^n_{A,(m),\alpha}(I)$ is injective and $P^n_{A,(m),\alpha}(I)$ is a free R-module having the basis $t^{\{\underline{k}\}} := t_1^{\{k_1\}} \cdots t_d^{\{k_d\}}$, $(k_1, \ldots, k_d) \in \mathbb{N}^d$ with $\sum_{i=1}^d k_i \geq n$.

Proof. See [Ber96c, 1.5.1]. □

Definition 1.3.2.7. Let $m \geq 0$ be an integer, let R be a $\mathbb{Z}_{(p}$-algebra, $(\mathfrak{a}, \mathfrak{b}, \alpha)$ an m-PD ideal of R. Let $A = R[t_1, \ldots, t_d]$ and $I = (t_1, \ldots, t_d)$. We say that $P_{A,(m),\alpha}(I)$ $(P^n_{A,(m),\alpha}(I))$ is the m-PD polynomial algebra with coefficients in R (resp. the m-PD polynomial algebra with coefficients in R of order n) in d variables given by $t_1, \ldots, t_d$, and is denoted by $R\langle t_1, \ldots, t_d\rangle_{(m)}$ (resp. $R\langle t_1, \ldots, t_d\rangle_{(m),n}$).

1.3.2.8. We keep Notation 1.3.2.1. Let K be an ideal of A. By using the universal property of the m-PD envelope, we have the canonical homomorphism

$$P_{A,(m),\alpha}(I) \to P_{A/K,(m),\alpha}(I/I \cap K), (\text{resp. } P^n_{A,(m),\alpha}(I) \to P^n_{A/K,(m),\alpha}(I/I \cap K)). \tag{1.3.2.8.1}$$

Suppose now the image of K in $P_{A,(m),\alpha}(I)$ (resp. $P^n_{(m),\alpha}(I)$) is null. Then, by using the universal property of the m-PD envelope, we construct an m-PD morphism which is an inverse of 1.3.2.8.1. Hence, 1.3.2.8.1 is an m-PD-isomorphism. In particular, taking $K = I^{n+1}$, we get the canonical m-PD-isomorphism:

$$P^n_{A,(m),\alpha}(I) \xrightarrow{\sim} P^n_{A/I^{n+1},(m),\alpha}(I/I^{n+1}). \tag{1.3.2.8.2}$$

1.3.2.9. We keep Notation 1.3.2.1. By using the universal property of the m-PD envelope, we get the m-PD homomorphism $P_{A,(m),\alpha}(I) \to P_{A,(m),\alpha}(I + \mathfrak{a}A)$. It follows from 1.2.4.4, $I_{(m)\alpha} + \mathfrak{a}P_{A,(m),\alpha}(I)$ is endowed with the m-PD-structure $\widetilde{I}_{(m)\alpha} + \mathfrak{b}P_{A,(m),\alpha}(I)$ compatible with $(\mathfrak{b}, \alpha)$. Hence, this yields the m-PD morphism

$$(P_{A,(m),\alpha}(I), I_{(m)\alpha} + \mathfrak{a}P_{A,(m),\alpha}(I), \widetilde{I}_{(m)\alpha} + \mathfrak{b}P_{A,(m),\alpha}(I)) \to P_{A,(m),\alpha}(I + \mathfrak{a}A). \tag{1.3.2.9.1}$$

On the other hand, by using again the universal property of the m-PD envelope, we get the m-PD-morphism

$$P_{A,(m),\alpha}(I + \mathfrak{a}A) \to (P_{A,(m),\alpha}(I), I_{(m)\alpha} + \mathfrak{a}P_{A,(m),\alpha}(I), \widetilde{I}_{(m)\alpha} + \mathfrak{b}P_{A,(m),\alpha}(I)). \tag{1.3.2.9.2}$$

By composing 1.3.2.9.1 with 1.3.2.9.2 or 1.3.2.9.2 with 1.3.2.9.1 we get the identity. Hence 1.3.2.9.1 and 1.3.2.9.2 are m-PD isomorphism.

1.3.2.10. For any $m' \geq m$, since an m-PD-$\mathbb{Z}_{(p)}$-algebra can be viewed as an m'-PD-$\mathbb{Z}_{(p)}$-algebra, then from the universal property we get the homomorphisms of m'-PD-$\mathbb{Z}_{(p)}$-algebra and of A-algebras of the form

$$\psi_{m,m'} \colon P_{(m'),\alpha}(I) \to P_{(m),\alpha}(I), \qquad \psi^n_{m,m'} \colon P^n_{(m'),\alpha}(I) \to P^n_{(m),\alpha}(I). \tag{1.3.2.10.1}$$

From 1.2.4.5.1, we get for any $x \in I_{(m)\alpha}$ and $k \in \mathbb{N}$

$$\psi_{m,m'}(x^{\{k\}_{(m')}}) = \frac{q_k^{(m)}!}{q_k^{(m')}!} x^{\{k\}_{(m)}}. \tag{1.3.2.10.2}$$

For any $m'' \geq m'$, from the universal property, we get the transitive formula $\psi_{m,m'} \circ \psi_{m',m''} = \psi_{m,m''}$ and $\psi^n_{m,m'} \circ \psi^n_{m',m''} = \psi^n_{m,m''}$.

Proposition 1.3.2.11. *Under the hypotheses of 1.3.2.1, suppose the m-PD structure $(\mathfrak{b}, \alpha)$ extends to A/I. Then the canonical homomorphisms*

$$A/I \to P_{A,(m),\alpha}(I)/I_{(m)\alpha} \to P^n_{A,(m),\alpha}(I)/I_{(m)\alpha} \tag{1.3.2.11.1}$$

are isomorphisms for any $n \in \mathbb{N}$.

Proof. See [Ber96c, 1.4.5]. □

Proposition 1.3.2.12. *Under the hypotheses of 1.3.2.1, let A' be flat commutative A-algebra. Then the homomorphisms*

$$P_{A,(m),\alpha}(I) \otimes_A A' \to P_{A',(m),\alpha}(IA'), \tag{1.3.2.12.1}$$

$$P^n_{A,(m),\alpha}(I) \otimes_A A' \to P^n_{A',(m),\alpha}(IA') \tag{1.3.2.12.2}$$

are m-PD-isomorphisms, compatibles with the m-PD filtrations.

Proof. See [Ber96c, 1.4.6]. □

1.3.2.13. Let S be a $\operatorname{Spec} \mathbb{Z}_{(p)}$-scheme. Let $(\mathfrak{a}, \mathfrak{b}, \alpha)$ be a quasi-coherent m-PD-ideal of $\mathcal{O}_S$. Let X be an S-scheme and $\mathcal{I}$ be a quasi-coherent ideal and Z be the closed subscheme of X induced by $\mathcal{I}$. It follows from 1.3.2.12 that the presheaves on X given by $U \mapsto P_{\Gamma(U,\mathcal{O}),(m),\alpha}(\Gamma(U,\mathcal{I}))$, $U \mapsto I_{\Gamma(U,\mathcal{O}),(m),\alpha}(\Gamma(U,\mathcal{I}))$, $U \mapsto J_{\Gamma(U,\mathcal{O}),(m),\alpha}(\Gamma(U,\mathcal{I}))$, are $\mathcal{O}_X$-quasi-coherent. We denote theses sheaves by $\mathcal{P}_{(m),\alpha}(\mathcal{I})$, $\mathscr{I}_{(m),\alpha}(\mathcal{I})$, $\mathscr{J}_{(m),\alpha}(\mathcal{I})$. Similarly, we get the $\mathcal{O}_X$-quasi-coherent sheaves $\mathcal{P}^n_{(m),\alpha}(\mathcal{I})$, $\mathscr{I}^n_{(m),\alpha}(\mathcal{I})$, $\mathscr{J}^n_{(m),\alpha}(\mathcal{I})$.

It follows from the first example of 1.3.2.5 and of Proposition 1.3.2.12 that $\mathcal{P}_{(m),\alpha}(\mathcal{I})$ has its support in Z.

1.3.3 m-PD envelopes of an immersion

Let S be a $\operatorname{Spec} \mathbb{Z}_{(p)}$-scheme. Let $(\mathfrak{a}, \mathfrak{b}, \alpha)$ be a quasi-coherent m-PD-ideal of $\mathcal{O}_S$.

Definition 1.3.3.1. Let $n \geq 1$ be an integer. Let $\mathscr{C}^{(m)}_\alpha$ (resp. $\mathscr{C}^{(m)}_{\alpha,n}$) be the category whose objects are pairs (u, δ) where u is a closed S-immersion $Z \hookrightarrow X$ of schemes and δ is an m-PD-structure on the ideal $\mathcal{I}$ of $\mathcal{O}_X$ given by u which is compatible (see definition 1.2.4.3) with α (resp. and such that $\mathcal{I}^{\{n+1\}_{(m)}} = 0$), where $\mathcal{I}^{\{n+1\}_{(m)}}$ is defined in proposition 1.3.1.1; whose morphisms $(u', \delta') \to (u, \delta)$ are commutative diagrams of the form

$$\begin{array}{ccc} X' & \xrightarrow{f} & X \\ \uparrow{\scriptstyle u'} & & \uparrow{\scriptstyle u} \\ Z' & \longrightarrow & Z \end{array} \tag{1.3.3.1.1}$$

such that f is an m-PD-morphism with respect to the m-PD-structures δ and δ' (i.e., denoting by $\mathcal{I}'$ the sheaf of ideals of $\mathcal{O}_{X'}$ defined by u', for any affine opens U' of X' and U of X such that $f(U') \subset U$, the morphism f induces the m-PD-morphism $(\mathcal{O}_X(U), \mathcal{I}(U), \delta) \to (\mathcal{O}_{X'}(U'), \mathcal{I}'(U'), \delta')$). Beware that theses categories depend on S and also on the quasi-coherent m-PD-ideal (I_S, J_S, α). The objects of $\mathscr{C}^{(m)}_\alpha$ (resp. $\mathscr{C}^{(m)}_{\alpha,n}$) are called m-PD-S-immersions compatible with α (resp. m-PD-S-immersions of order n

compatible with α). We remark that we have the inclusions $\mathscr{C}_{\alpha}^{(m)} \subset \mathscr{C}_{\alpha}^{(m')}$ for any integer $m' \geq m$ (recall an m-PD-structure is also an m'-PD-structure).

We say that a morphism $(u', \delta') \to (u, \delta)$ of $\mathscr{C}_{\alpha}^{(m)}$ (resp. $\mathscr{C}_{\alpha,n}^{(m)}$) is flat (resp. cartesian) if f is flat (resp. the square 1.3.3.1.1 is cartesian).

Notation 1.3.3.2. In this paragraph, suppose $\mathfrak{b} = p\mathcal{O}_S$. Then, there is a unique PD-structure on J_S which we will denote by $\alpha_{\emptyset}$. Let $u\colon Z \hookrightarrow X$ be a closed immersion of S-schemes and δ be an m-PD-structure on the ideal $\mathcal{I}$ of $\mathcal{O}_X$ defined by u. It follows from Lemma 1.2.3.4 that the m-PD-structure δ of $\mathcal{I}$ is always compatible with $\alpha_{\emptyset}$. Hence, in the description of $\mathscr{C}_{\alpha_{\emptyset}}^{(m)}$ (resp. $\mathscr{C}_{\alpha_{\emptyset},n}^{(m)}$) we can remove "compatible with $\alpha_{\emptyset}$" without changing the respective categories. For this reason, we put $\mathscr{C}^{(m)} := \mathscr{C}_{\alpha_{\emptyset}}^{(m)}$ (resp. $\mathscr{C}_{n}^{(m)} := \mathscr{C}_{\alpha_{\emptyset},n}^{(m)}$). But, recall these categories depend on S even if this is not written in the notation. Finally, for any quasi-coherent m-PD-ideal (I_S, J_S, α) of $\mathcal{O}_S$, we have the inclusions

$$\mathscr{C}_{\alpha}^{(m)} \subset \mathscr{C}^{(m)} \text{ and } \mathscr{C}_{\alpha,n}^{(m)} \subset \mathscr{C}_{n}^{(m)}. \tag{1.3.3.2.1}$$

Lemma 1.3.3.3. *The inclusion functor $For_n\colon \mathscr{C}_{\alpha,n}^{(m)} \to \mathscr{C}_{\alpha}^{(m)}$ has a right adjoint. We denote by $Q^n_{(m),\alpha}\colon \mathscr{C}_{\alpha}^{(m)} \to \mathscr{C}_{\alpha,n}^{(m)}$ this right adjoint functor. The functor $Q^n_{(m),\alpha}$ preserves the sources.*

Proof. Let (u, δ) be an object of $\mathscr{C}_{\alpha}^{(m)}$ and $\mathcal{I}$ be the ideal defined by the closed immersion $u\colon Z \hookrightarrow X$. Let $Q^n \hookrightarrow X$ be the closed immersion which is defined by $\mathcal{I}^{\{n+1\}_{(m)}}$. It follows from 1.3.1.4 that $Q^n_{(m),\alpha}(u)$ exists and is equal to the closed immersion $Z \hookrightarrow Q^n$. □

Proposition 1.3.3.4. *Let $u\colon Z \hookrightarrow X$ be an object of $\mathscr{C}$.*

(a) The canonical functor $For^{(m)}\colon \mathscr{C}_{\alpha}^{(m)} \to \mathscr{C}$ has a right adjoint. We denote this right adjoint functor by $P_{(m),\alpha}\colon \mathscr{C} \to \mathscr{C}_{\alpha}^{(m)}$. We say that $P_{(m),\alpha}(u)$ is the m-PD-envelope compatible with α of u.

Similarly, we have the right adjoint functor $P^n_{(m),\alpha}\colon \mathscr{C} \to \mathscr{C}_{\alpha,n}^{(m)}$ of the canonical functor $For_n^{(m)}\colon \mathscr{C}_{\alpha,n}^{(m)} \to \mathscr{C}$. We say that $P^n_{(m),\alpha}(u)$ is the m-PD-envelope of order n compatible with α of u. We have the relation $P^n_{(m),\alpha} = Q^n_{(m),\alpha} \circ P_{(m),\alpha}$.

(b) By an abuse of notation we let $P_{(m),\alpha}(u)$ (resp. $P^n_{(m),\alpha}(u)$) denote the target of the arrow $P_{(m),\alpha}(u)$ (resp. $P^n_{(m),\alpha}(u)$). Let U be an open of X containing Z such that the induced immersion $v\colon Z \hookrightarrow U$ is closed. Then the morphism of schemes of $P_{(m),\alpha}(u) \to U$ (resp. $P^n_{(m),\alpha}(u) \to U$) is affine. Let $\mathcal{I}$ be the ideal of $\mathcal{O}_U$ given by v. Then $P_{(m),\alpha}(u) = \mathrm{Spec}(\mathcal{P}_{(m),\alpha}(\mathcal{I}), (\mathscr{I}_{(m),\alpha}(\mathcal{I}), \mathscr{J}_{(m),\alpha}(\mathcal{I}), ^{[\,]}))$ (see notation 1.3.2.13).

(c) If α extends to Z then the source of $P_{(m),\alpha}(u)$ is Z.

(d) Suppose that $J_S + p\mathcal{O}_S$ is locally principal and that X is noetherian. Then $P^n_{(m),\alpha}(u)$ is a noetherian scheme.

Proof. Let U be an open of X containing Z such that $v\colon Z \hookrightarrow U$ is a closed immersion. Let $\mathcal{I}$ be the ideal of $\mathcal{O}_U$ induced by v. Then we check that $\mathrm{Spec}(\mathcal{P}_{(m),\alpha}(\mathcal{I}), (\mathscr{I}_{(m),\alpha}(\mathcal{I}), \mathscr{J}_{(m),\alpha}(\mathcal{I}), ^{[\,]}))$ satisfies the corresponding universal property. Moreover, $P^n_{(m),\alpha} = Q^n_{(m),\alpha} \circ P_{(m),\alpha}$ satisfies the desired universal property. The other properties are easy. □

Notation 1.3.3.5. Let $u\colon Z \hookrightarrow X$ be an S-immersions of schemes. Let U be an open set of X containing Z such that the induced immersion $v\colon Z \hookrightarrow U$ is closed. Let $\mathcal{I}$ be the ideal given by v. Let $\mathcal{P}_{(m),\alpha}(u) := v^{-1}\mathcal{P}_{(m),\alpha}(\mathcal{I})$ and $\mathcal{P}^n_{(m),\alpha}(u) := v^{-1}\mathcal{P}^n_{(m),\alpha}(\mathcal{I})$. Since $\mathcal{P}_{(m),\alpha}(\mathcal{I})$ and $\mathcal{P}^n_{(m),\alpha}(\mathcal{I})$ have their support in Z (see 1.3.2.13), then $\mathcal{P}_{(m),\alpha}(u)$ and $\mathcal{P}^n_{(m),\alpha}(u)$ do not depend on the choice of U. Beware that even if $\mathcal{P}_{(m),\alpha}(\mathcal{I})$ is quasi-coherent with support in Z, we do not expect that $\mathcal{P}_{(m),\alpha}(u)$ is a quasi-coherent $\mathcal{O}_Z$-module. The sheaf $\mathcal{P}_{(m),\alpha}(u)$ is endowed with the m-PD ideal of $(\mathscr{I}_{(m),\alpha}(u), \mathscr{J}_{(m),\alpha}(u), ^{[\,]})$, where $\mathscr{I}_{(m),\alpha}(u) := v^{-1}\mathscr{I}_{(m),\alpha}(\mathcal{I})$ and $\mathscr{J}_{(m),\alpha}(u) := v^{-1}\mathscr{J}_{(m),\alpha}(\mathcal{I})$.

For any $m' \geq m$, from the universal property

Example 1.3.3.6. From 1.3.2.6, we get the following straightforward example. Let D be an S-scheme such that α extends to Z. Let $u\colon D \hookrightarrow \mathbb{A}^r_D$ be the closed immersion induced by $T_1 = 0, \ldots, T_r = 0$, where $T_1, \ldots, T_r$ are the coordinates of $\mathbb{A}^r_D$. Let $\varpi\colon \mathbb{A}^r_D \to D$ be the projection, which yields the quasi-coherent $\mathcal{O}_D$-algebra $\varpi_* \mathcal{P}_{(m),\alpha}(u)$. Then we get the m-PD polynomial $\mathcal{O}_D$-algebra in the variables $T_1, \ldots, T_r$ by setting:

$$\varpi_* \mathcal{P}_{(m),\alpha}(u) = \mathcal{O}_D\langle T_1, \ldots, T_r\rangle_{(m)},$$

where $\mathcal{O}_D\langle T_1, \ldots, T_r\rangle_{(m)}$ is the sheafification of 1.3.2.7. In particular, this does not depend on the compatibility with α. This is a free $\mathcal{O}_D$-module with basis $T^{\{\underline{k}\}} = T_1^{\{k_1\}} \cdots T_d^{\{k_d\}}$ such that

$$T^{\{\underline{k}'\}} T^{\{\underline{k}''\}} = \left\{ \begin{matrix} \underline{k}' + \underline{k}'' \\ \underline{k}' \end{matrix} \right\} T^{\{\underline{k}' + \underline{k}''\}}.$$

We denote by $(\mathcal{I}_{D,(m),r}, \mathcal{J}_{D,(m),r}, {}^{[\,]})$ the canonical m-PD-structure of $\mathcal{P}_{(m),\alpha}(u)$. We have

$$\varpi_* \mathcal{I}_{D,(m),r} = \oplus_{\underline{k} \neq 0} \mathcal{O}_D T^{\{\underline{k}\}}, \quad \varpi_* \mathcal{I}^{\{n\}}_{D,(m),r} = \oplus_{\underline{k} \geq n} R T^{\{\underline{k}\}},$$

$$\varpi_* \mathcal{J}_{D,(m),r} = \left\{ \sum_{\underline{k}} a_{\underline{k}} T^{\{\underline{k}\}} : a_{\underline{k}} \in p\mathcal{O}_D \text{ if } k_i < p^m \ \forall\, i \right\}$$

Similarly $\varpi_* \mathcal{P}^n_{(m),\alpha}(u) = \mathcal{O}_D\langle T_1, \ldots, T_r\rangle_{(m),n}$.

The purpose of the following Lemma is to introduce the notation 1.3.3.8.

Lemma 1.3.3.7. *Let $r \geq 0$ be an integer, $(v, \delta) \in \mathscr{C}^{(m)}_\alpha$ where $v\colon T \hookrightarrow D$ is a closed S-immersion and $(\widetilde{\mathcal{K}}, \delta)$ is an m-PD-structure compatible with α on the ideal $\mathcal{K}$ of $\mathcal{O}_D$ given by v. Let $(t_\lambda)_{\lambda=1\ldots r}$ be the canonical coordinates of $\mathbb{A}^r_S/S$. Let $i\colon D \to D \times_S \mathbb{A}^r_S$ be the closed D-immersion defined by $t_\lambda \mapsto 0$. Let $\varpi\colon \mathbb{A}^r_D \to D$ be the projection, which yields the quasi-coherent $\mathcal{O}_D$-algebra $\varpi_* \mathcal{P}_{(m),\delta}(i \circ v)$.*

With notation 1.3.3.4 and 1.3.3.6, we have the following properties.

(a) We have the isomorphism of $\mathcal{O}_D$-m-PD-algebras

$$\mathcal{O}_D\langle T_1, \ldots, T_r\rangle_{(m)} \to \varpi_* \mathcal{P}_{(m),\delta}(i \circ v)$$

given by $T_\lambda \mapsto t_\lambda$.

(b) The structural m-PD ideal $(\mathcal{I}_{(m),\alpha}(i \circ v), \mathcal{J}_{(m),\alpha}(i \circ v), {}^{[\,]})$ of $\mathcal{P}_{(m),\delta}(i \circ v)$ is given by

$$\mathcal{I}_{(m),\alpha}(i \circ v) = \mathcal{I}_{D,(m),r} + \mathcal{K}\mathcal{P}_{(m),\delta}(i \circ v),$$
$$\mathcal{J}_{(m),\alpha}(i \circ v) = \mathcal{J}_{D,(m),r} + \widetilde{\mathcal{K}}\mathcal{P}_{(m),\delta}(i \circ v).$$

Proof. By using the remark 1.3.2.9, we can suppose that $v = \mathrm{id}$. Then, this is a consequence of 1.3.2.6. □

Notation 1.3.3.8. With notation 1.3.3.7, we set $\mathcal{O}_{(v,\delta)}\langle T_1, \ldots, T_r\rangle_{(m)} := \varpi_* \mathcal{P}_{(m),\delta}(i \circ v)$ and $\mathcal{O}_{(v,\delta)}\langle T_1, \ldots, T_r\rangle_{(m),n} := \varpi_* \mathcal{P}^n_{(m),\delta}(i \circ v)$.

Lemma 1.3.3.9. *Let $f\colon X \to Y$ be an étale S-morphism, $u\colon Z \hookrightarrow X$ and $v\colon Z \hookrightarrow Y$ be two S-immersions such that $v = f \circ u$.*

(a) $P^n_{(m),\alpha}(u) = P^n_{(m),\alpha}(v)$.

(b) Suppose p is locally nilpotent. Then we have the equality $P_{(m),\alpha}(u) = P_{(m),\alpha}(v)$.

Proof. Let us prove the first (resp. second) assertion. Let $(P(u), \delta)$ be the m-PD envelope (resp. of order n) of u. Let us check that the composition of the canonical morphism $P(u) \to u$ with the morphism $u \to v$ (induced by f) satisfies the universal property of the m-PD envelope (resp. of order n). Let (v', δ') be an object of $\mathscr{C}^{(m)}_\alpha$ (resp. $\mathscr{C}^{(m)}_{\alpha,n}$) and $g\colon v' \to v$ be a morphism of $\mathscr{C}$. Using the universal property of étaleness, since v' is a nil-immersion, then we get a unique morphism $h\colon v' \to u$ of $\mathscr{C}$ whose composition with $u \to v$ gives g. Using the universal property of the m-PD-envelope of u compatible with α that there exists a unique morphism $(v', \delta') \to (P(u), \delta)$ of $\mathscr{C}^{(m)}_\alpha$ (resp. $\mathscr{C}^{(m)}_{\alpha,n}$) such that the composition of $v' \to P(u)$ with $P(u) \to u$ is h. □

Lemma 1.3.3.10. *Let $u \to v$ be a morphism of $\mathscr{C}$. Let δ be the m-PD-structure of $P_{(m),\alpha}(v)$ and $w := P_{(m),\alpha}(v) \times_v u$ (this is the product in $\mathscr{C}$). We denote by $P_{(m),\delta}(w)$ the m-PD-envelope of w compatible with δ. Then $P_{(m),\delta}(w)$ and $P_{(m),\alpha}(u)$ are isomorphic in $\mathscr{C}_\alpha^{(m)}$. Moreover, $P^n_{(m),\delta}(w)$ and $P^n_{(m),\alpha}(u)$ are isomorphic in $\mathscr{C}^{(m)}_{\alpha,n}$.*

Proof. Since the second assertion is checked in the same way, let us prove the first one. Let us check that the composition $P_{(m),\delta}(w) \to w \to u$ satisfies the universal property of $P_{(m),\alpha}(u) \to u$. Let $(u', \delta') \in \mathscr{C}_\alpha^{(m)}$ and $f: u' \to u$ be a morphism of $\mathscr{C}$. First let us check the existence. Composing f with $u \to v$ we get a morphism $g: u' \to v$. Using the universal property of the m-PD envelope, there exists a morphism $\phi: (u', \delta') \to (P_{(m),\alpha}(v), \delta)$ of $\mathscr{C}_\alpha^{(m)}$ such that the composition $u' \to P_{(m),\alpha}(v) \to v$ is g. Hence, we get the morphism $(\phi, f): u' \to w$. Using the universal property of $P_{(m),\delta}(w)$, we get a morphism $u' \to P_{(m),\delta}(w)$ of $\mathscr{C}_\delta^{(m)}$ (and then of $\mathscr{C}_\alpha^{(m)}$) whose composition with $P_{(m),\delta}(w) \to w \to u$ is f. Let us check the unicity. Let $\alpha: u' \to P_{(m),\delta}(w)$ be a morphism of $\mathscr{C}_\alpha^{(m)}$ whose composition with $P_{(m),\delta}(w) \to w \to u$ is f. This implies that the composition of α with $P_{(m),\delta}(w) \to w \to P_{(m),\alpha}(v) \to v$ is g. Since the composition $P_{(m),\delta}(w) \to w \to P_{(m),\alpha}(v)$ is a morphism of $\mathscr{C}_\delta^{(m)}$, then so is the composition of α with $P_{(m),\delta}(w) \to w \to P_{(m),\alpha}(v)$ (in particular, this implies that $\alpha \in \mathscr{C}_\delta^{(m)}$). Using the universal property of $P_{(m),\alpha}(v)$, this latter composition morphism is uniquely determined by g. Hence, the composition of α with $P_{(m),\delta}(w) \to w$ is a morphism of $\mathscr{C}$ uniquely determined by f. Since α is a morphism of $\mathscr{C}_\delta^{(m)}$, we conclude using the universal property of $P_{(m),\delta}(w)$. □

Proposition 1.3.3.11. *Let $f: X \to Y$ be an S-morphism of schemes. Suppose f is endowed with the coordinates $(t_\lambda)_{\lambda=1,\ldots,r}$. Let $u: Z \hookrightarrow X$ and $v: Z \hookrightarrow Y$ be two S-immersions of schemes such that $v = f \circ u$. Suppose that there exist $y_\lambda \in \Gamma(Y, \mathcal{O}_Y)$ whose images in $\Gamma(Z, \mathcal{O}_Z)$ coincide with the images of t_λ. Let $\varpi: P_{(m),\alpha}(u) \to P_{(m),\alpha}(v)$ and $\varpi_n: P^n_{(m),\alpha}(u) \to P^n_{(m),\alpha}(v)$ be the canonical morphisms.*

(a) Suppose p is locally nilpotent. We have the following isomorphism of m-PD-$\mathcal{O}_{P_{(m),\alpha}(v)}$-algebras (see notation 1.3.3.8):

$$\mathcal{O}_{P_{(m),\alpha}(v)}\langle T_1, \ldots, T_r\rangle_{(m)} \xrightarrow{\sim} \varpi_* \mathcal{O}_{P_{(m),\alpha}(u)}$$
$$T_\lambda \mapsto t_\lambda - f^*(y_\lambda), \tag{1.3.3.11.1}$$

where by abuse of notation we denote by t_λ and $f^*(y_\lambda)$ the canonical image in $\mathcal{O}_{P_{(m),\alpha}(u)}$.

(b) We have the following isomorphism of m-PD-$\mathcal{O}_{P^n_{(m),\alpha}(v)}$-algebras (see notation 1.3.3.8):

$$\mathcal{O}_{P^n_{(m),\alpha}(v)}\langle T_1, \ldots, T_r\rangle_{(m),n} \xrightarrow{\sim} \varpi_{n*} \mathcal{O}_{P^n_{(m),\alpha}(u)}$$
$$T_\lambda \mapsto t_\lambda - f^*(y_\lambda), \tag{1.3.3.11.2}$$

where on the left side $P^n_{(m),\alpha}(v)$ means the object of $\mathscr{C}_\alpha^{(m)}$ (and not the target of the closed immersion), where by abuse of notation we denote by t_λ and $f^*(y_\lambda)$ the canonical image in $\mathcal{O}_{P^n_{(m),\alpha}(u)}$.

Proof. Since 1.3.3.11.2 is checked similarly, let us prove 1.3.3.11.1. Using Lemma 1.3.3.9 (and [Gro60, 5.3.13]), we may assume that $X = Y \times_S \mathbb{A}^r_S$, $f: X \to Y$ is the first projection, and that the family $(t_\lambda)_{\lambda=1,\ldots,r}$ are the elements of $\Gamma(X, \mathcal{O}_X)$ corresponding to the coordinates of $\mathbb{A}^r$. Using Lemma 1.3.3.10, we may furthermore assume that $P_{(m),\alpha}(v) = v$ and that the target of $P_{(m),\alpha}(v)$ is $(S, \mathfrak{a}, \mathfrak{b}, \alpha)$. By using Lemma 1.3.3.7, we can suppose that $v = \mathrm{id}$.

Let $\phi: Y \times_S \mathbb{A}^r_S \to Y \times_S \mathbb{A}^r_S$ be the Y-morphism given by $t_1 - f^*(y_1), \ldots, t_r - f^*(y_r)$. Let $i: Y \hookrightarrow Y \times_S \mathbb{A}^r_S$ be the closed immersion defined by $t_\lambda \mapsto 0$. Since ϕ is etale, since $\phi \circ u = i$, using Lemma 1.3.3.9, we reduce to the case where u is equal to i, and $y_\lambda = 0$ for any $\lambda = 1, \ldots, r$. Using 1.3.2.6 this yields that the morphism $\mathcal{O}_Y\langle T_1, \ldots, T_r\rangle_{(m)} \to \mathcal{O}_{P_{(m),\alpha}(\iota)} = \mathcal{O}_{P_{(m),\alpha}(i)}$ given by $T_\lambda \mapsto t_\lambda$ is an isomorphism.

□

Lemma 1.3.3.12. *We have the equality $P^n_{(m),\gamma} \circ For_n \circ P^n = P^n_{(m),\gamma}$, where $For_n: \mathscr{C}_n \to \mathscr{C}$ is the canonical functor and $P^n: \mathscr{C} \to \mathscr{C}_n$ is its right adjoint (see 1.1.1.2).*

Proof. Let $u: Z \hookrightarrow X$ be an object of $\mathscr{C}$. Looking at the construction of P^n and $P^n_{(m),\gamma}$ (see the proof of 1.1.1.2 and 1.3.3.4), the Lemma is a reformulation of 1.3.2.8.2. □

1.4 Sheaves of differential operators of finite level m and finite order

Let S be a $\operatorname{Spec}\mathbb{Z}_{(p)}$-scheme. Let $m \in \mathbb{N}$. Let $(\mathfrak{a}, \mathfrak{b}, \alpha)$ be a quasi-coherent m-PD-ideal of $\mathcal{O}_S$.

1.4.1 Sheaf of principal parts of level m

Let $f\colon X \to S$ be a smooth morphism.

Remark 1.4.1.1. Since α extends to X, then the m-PD envelope compatible with α (of order n) of the identity of X is the identity of X. Indeed, using the arguments given in the proof of 3.2.1.3, we can check that the ideal 0 of $\mathcal{O}_X$ is endowed with a (unique) m-PD structure compatible with α.

Notation 1.4.1.2. Suppose X is a S-scheme. Let $\Delta_{X/S}(r)\colon X \hookrightarrow X^{r+1}_{/S}$ denote the diagonal immersion. With notation 1.3.3.5, we set

$$\Delta^n_{X/S,(m),\alpha}(r) := P^n_{(m),\alpha}(\Delta_{X/S}(r)), \qquad \Delta_{X/S,(m),\alpha}(r) := P_{(m),\alpha}(\Delta_{X/S}(r)).$$

Let us write $\mathcal{P}^n_{X/S,(m),\alpha}(r)$ for the m-PD envelope $\mathcal{P}^n_{(m),\alpha}(\Delta_{X/S}(r))$ of order n of $\Delta_{X/S}(r)$ (see 1.3.3.5). Let U be an open of $X^{r+1}_{/S}$ containing the image of $\Delta_{X/S}(r)$ such that the induced immersion $v\colon X \to U$ is closed. Let $\mathcal{I}(r)$ be the ideal given by v. Recall, by definition, we have $v_*\mathcal{P}^n_{X/S,(m),\alpha}(r) = \mathcal{P}^n_{(m),\alpha}(\mathcal{I}(r))$. For $i = 0, \ldots, r$, let $p_i\colon X^{r+1}_{/S} \to X$ be the projections. Let $p^U_i : U \hookrightarrow X^{r+1}_{/S} \to X$ be the morphism induced by the projection p_i. We get the $\mathcal{O}_X$-algebra $p_{i*}\mathcal{P}^n_{(m),\alpha}(\mathcal{I}(r))$. Since $p^U_i \circ v = \mathrm{id}$ then as a sheaf of sets $\mathcal{P}^n_{X/S,(m),\alpha}(r) = p^U_{i*}\mathcal{P}^n_{(m),\alpha}(\mathcal{I}(r))$. This yields $r+1$-structures of $\mathcal{O}_X$-algebras on $\mathcal{P}^n_{X/S,(m),\alpha}(r)$. To clarify which $\mathcal{O}_X$-algebra structure we consider, we set $p_{i*}\mathcal{P}^n_{X/S,(m),\alpha}(r) := p^U_{i*}\mathcal{P}^n_{(m),\alpha}(\mathcal{I}(r))$. By composing p^U_i with the canonical morphism $\Delta^n_{X/S,(m)}(r) \to U$, we get the projection $p^n_{i(m)}\colon \Delta^n_{X/S,(m),\alpha}(r) \to X$ and $p_{i(m)}\colon \Delta_{X/S,(m),\alpha}(r) \to X$, for $i = 0, \ldots, r$. We get the ring homomorphisms $p^n_{i(m)}\colon \mathcal{O}_X \to \mathcal{P}^n_{X/S,(m)}(r)$ and $p_{i(m)}\colon \mathcal{O}_X \to \mathcal{P}_{X/S,(m)}(r)$. We can simply denote $p^n_{i(m)}$ by p^n_i and $p_{i(m)}$ by p_i. The m-PD-ideal of $\mathcal{P}^n_{X/S,(m)}(r)$ will be denoted by $(\mathcal{I}^n_{X/S,(m)}(r), \mathcal{J}^n_{X/S,(m)}(r), ^{[\,]})$.

When $r = 1$, we simply write $\mathcal{I}$, $\Delta^n_{X/S,(m),\alpha}$, $\Delta_{X/S,(m),\alpha}$, $\mathcal{P}^n_{X/S,(m),\alpha}$, $\mathcal{P}_{X/S,(m),\alpha}$. The left (resp. right) structure of $\mathcal{O}_X$-algebra on $\mathcal{P}^n_{X/S,(m),\alpha}$ is by definition the one given by $p_{0*}\mathcal{P}^n_{X/S,(m),\alpha}$ (resp. $p_{1*}\mathcal{P}^n_{X/S,(m),\alpha}$).

Definition 1.4.1.3. We say that $\mathcal{P}^n_{X/S,(m)}$ is the *sheaf of principal parts of level m of order n of X/S.*

Proposition 1.4.1.4 (Local description)**.** *Let $g\colon X \to \mathbb{A}^d_S$ be an étale morphism. Let $t_1, \ldots, t_d$ be the elements of $\Gamma(X, \mathcal{O}_X)$ defining g. Set $\tau_\lambda := 1\otimes t_\lambda - t_\lambda \otimes 1 \in \mathcal{I}(1)$. For any $\mu = 0, \ldots, r$, let $p_\mu\colon X^{r+1}_{/S} \to X$ be the index μ projection. For any $1 \le \lambda \le d$, $1 \le \mu \le r$, set $\tau_{\lambda\mu} = p^*_\mu(t_\lambda) - p^*_{\mu-1}(t_\lambda) = 1\otimes\cdots\otimes\tau_\lambda\otimes\cdots\otimes 1$. Let $\tau_{\lambda\mu(m),\alpha}$ (resp. $\tau_{\lambda\mu(m),n,\alpha}$) be the image of $\tau_{\lambda\mu}$ in $\mathcal{P}_{X/S,(m),\alpha}(r)$ (resp. $\mathcal{P}^n_{X/S,(m),\alpha}(r)$).*

(a) For any $i = 0, \ldots r$, we have the following isomorphism of $\mathcal{O}_X$-m-PD-algebras

$$\begin{aligned} \mathcal{O}_X\langle T_{\lambda\mu},\, 1 \le \lambda \le d,\, 1 \le \mu \le r\rangle_{(m),n} &\xrightarrow{\sim} p_{i*}\mathcal{P}^n_{X/S,(m),\alpha}(r),\\ T_{\lambda\mu} &\mapsto \tau_{\lambda\mu,(m),n,\alpha}, \end{aligned} \tag{1.4.1.4.1}$$

(b) Suppose p is nilpotent in S. For any $i = 0, \ldots r$, we have the following isomorphism of $\mathcal{O}_X$-m-PD-algebras

$$\begin{aligned} \mathcal{O}_X\langle T_{\lambda\mu},\, 1 \le \lambda \le d,\, 1 \le \mu \le r\rangle_{(m)} &\xrightarrow{\sim} p_{i*}\mathcal{P}_{X/S,(m),\alpha}(r),\\ T_{\lambda\mu} &\mapsto \tau_{\lambda\mu,(m),\alpha}, \end{aligned} \tag{1.4.1.4.2}$$

Proof. By symmetry, we can focus on the case where the structure of $\mathcal{O}_X$-algebra of $\mathcal{P}^n_{X/S,(m),\alpha}(r)$ (resp. $\mathcal{P}_{X/S,(m),\alpha}(r)$) is given by p^n_0 (resp. p_0). Consider the commutative diagram

$$\begin{array}{ccccc} \mathbb{A}^{dr}_S & \xleftarrow{\;q_1\;} & X \times_S \mathbb{A}^{dr}_S & \searrow^{q} & \\ \uparrow{\scriptstyle g^r_{/S}} & \square & \uparrow{\scriptstyle \mathrm{id}\times g^r_{/S}} & & \\ X^r_{/S} & \xleftarrow{\;q_1\;} & X \times_S X^r_{/S} & \xrightarrow{\;p_0\;} & X, \end{array} \tag{1.4.1.4.3}$$

where p_0, q_1 means respectively the left and right projection, where q is the canonical projection, where $g^r_{/S}$ is the S-morphism induced by g, where $id \times g^r_{/S}$ is the X-morphism induced by $(p^*_\mu(t_\lambda))_{\lambda=1,\dots,d,\mu=1,\dots,r}$. Since étaleness is stable under base change, then $(p^*_\mu(t_\lambda))_{\lambda=1,\dots,d,\mu=1,\dots,r}$ are coordinates of p_0. Since the m-PD envelope compatible with α of order n (resp. m-PD envelope compatible with α) of the identity of X is X (see remark 1.4.1.1), we can apply in the first assertion (resp. the second one), we are in the situation to use formula 1.3.3.11.2 (resp. 1.3.3.11.1) in the case where $u = \Delta$ and f is the left projection $p_0 \colon X \times_S X^r_{/S} \to X$. Hence, we get an isomorphism of the form 1.4.1.4.2 where $\tau_{\lambda\mu,(m),\alpha}$ is replaced by the image of $p^*_\beta(t_\lambda) - p^*_0(t_\lambda)$ in $\mathcal{P}_{X/S,(m),\alpha}(r)$ (resp. $\mathcal{P}^n_{X/S,(m),\alpha}(r)$) for $\lambda = 1, \dots, d, \mu = 1, \dots, r$. Since $p^*_\mu(t_\lambda) - p^*_0(t_\lambda) = \tau_{\lambda 0} + \tau_{\lambda 1} + \cdots + \tau_{\lambda\mu}$, we are done. □

In particular, we get the following local description.

Proposition 1.4.1.5 (Local description of $\mathcal{P}_{X/S,(m),\alpha}$). *Let $(t_\lambda)_{\lambda=1,\dots,r}$ be coordinates of f. Let $\tau_{\lambda(m),\alpha}$ (resp. $\tau_{\lambda(m),n,\alpha}$) be the image of $1 \otimes t_\lambda - t_\lambda \otimes 1$ in $\mathcal{P}_{X/S,(m),\alpha}$ (resp. $\mathcal{P}^n_{X/S,(m),\alpha}$).*

(a) For any $i = 0, 1$, we have the following $\mathcal{O}_X$-m-PD isomorphism

$$\begin{aligned} \mathcal{O}_X\langle T_1, \dots, T_r\rangle_{(m),n} &\xrightarrow{\sim} p_{i*}\mathcal{P}^n_{X/S,(m),\alpha} \\ T_\lambda &\mapsto \tau_{\lambda,(m),n,\alpha}. \end{aligned} \tag{1.4.1.5.1}$$

(b) Suppose p is nilpotent in S. For any $i = 0, 1$, we have the following $\mathcal{O}_X$-m-PD isomorphism

$$\begin{aligned} \mathcal{O}_X\langle T_1, \dots, T_r\rangle_{(m)} &\xrightarrow{\sim} p_{i*}\mathcal{P}_{X/S,(m),\alpha} \\ T_\lambda &\mapsto \tau_{\lambda,(m),\alpha}. \end{aligned} \tag{1.4.1.5.2}$$

Corollary 1.4.1.6. *Suppose p is nilpotent in S. Let $f \colon X \to Y$ be an étale morphism of smooth S-schemes. Then the canonical homomorphism $f^*\mathcal{P}_{Y/S,(m)}(r) \to \mathcal{P}_{X/S,(m)}(r)$ is an isomorphism.*

Proof. Since this is local then we can suppose there exists an étale morphism of S-schemes the form $Y \to \mathbb{A}^d_S$. Hence, this follows from 1.4.1.4. □

Remark 1.4.1.7. (a) From the local description 1.4.1.4.1, we get that $\mathcal{P}^n_{X/S,(m),\alpha}(r)$ does not depend on the m-PD-structure (satisfying the conditions of the subsection). Hence, from now, we reduce to the case where $\alpha = \alpha_\emptyset$ (see Notation 1.3.3.2) and we remove α in the notation: we simply write $\mathcal{P}^n_{X/S,(m)}(r)$, $\Delta^n_{X/S,(m)}(r)$, $\tau_{\lambda\beta(m),n}$, $\tau_{\lambda(m),n}$.

(b) Suppose p is nilpotent in S. From 1.4.1.4.2, $\mathcal{P}_{X/S,(m),\alpha}(r)$ does not depend on the m-PD-structure (satisfying the conditions of the subsection). Hence, we can remove α in the corresponding notation.

Remark 1.4.1.8. From the local description of 1.4.1.5, we get that the morphisms p^n_i are finite.

Notation 1.4.1.9. For any integer $m' \geq m$ and $n' \geq n$, we remark that the canonical map $\mathcal{P}^n_{X/S,(m')}(r) \to \mathcal{P}^n_{X/S,(m)}(r)$ (resp. $\mathcal{P}^{n'}_{X/S,(m)}(r) \to \mathcal{P}^n_{X/S,(m)}(r)$) sends $\tau_{\lambda\mu(m'),n}$ to $\tau_{\lambda\mu(m),n}$ (resp. $\tau_{\lambda\mu(m),n'}$ to $\tau_{\lambda\mu(m),n}$). Hence, this will be harmless to denote abusively $\tau_{\lambda\mu(m),n}$ by $\tau_{\lambda\mu}$. Similarly, we can simply denote abusively $\tau_{\lambda(m),n}$ by τ_λ.

1.4.1.10. Suppose p is nilpotent in S. Let $g \colon S' \to S$ be a morphism of schemes, let $(\mathfrak{a}', \mathfrak{b}', \alpha')$ be a quasi-coherent m-PD-ideal of $\mathcal{O}_{S'}$ such that g becomes an m-PD-morphism. Put $X' := X \times_S S'$. Then, the m-PD-morphism $\Delta_{X'/S',(m)} \to \Delta_{X/S,(m)}$ induces the isomorphism $\Delta_{X'/S',(m)} \xrightarrow{\sim} \Delta_{X/S,(m)} \times_S S'$. Indeed, this is equivalent to check that the morphism $g^*\mathcal{P}_{X/S,(m)} \to \mathcal{P}_{X'/S',(m)}$ is an isomorphism. This can be checked by using the local description of 1.4.1.4.1.

1.4.1.11. Let $m' \geq m$ be two integers. Since $\mathscr{C}'^{(m)}_n \subset \mathscr{C}'^{(m')}_n$, then by using the universal property defining $\Delta^n_{X/S,(m')}$ we get a morphism $\psi^n_{m,m'} \colon \Delta^n_{X/S,(m)} \to \Delta^n_{X/S,(m')}$ and then the homomorphism $\psi^n_{m,m'} \colon \mathcal{P}^n_{X/S,(m')} \to \mathcal{P}^n_{X/S,(m)}$. We also get the equalities

$$p^n_{i(m)} \circ \psi^n_{m,m'} = p^n_{i(m')} \text{ and } p^n_i \circ \psi^n_m = p^n_{i(m)}. \tag{1.4.1.11.1}$$

From 1.3.3.12, we get $P^n_{(m)}(P^n(\Delta_{X/S})) = P^n_{(m)}(\Delta_{X/S})$. By using the universal property of the m-PD envelopes we can check that $\psi^n_{m,m'} \circ \psi^n_{m',m''} = \psi^n_{m,m''}$ for $m \le m' \le m''$. Hence, we get a canonical map $\psi^n_m \colon \Delta^n_{X/S,(m)} \to \Delta^n_{X/S}$ and then the homomorphism $\psi^n_m \colon \mathcal{P}^n_{X/S} \to \mathcal{P}^n_{X/S,(m)}$.

Now, suppose that $X \to S$ is endowed with coordinates $(t_\lambda)_{\lambda=1,\dots,r}$. With the notation of 1.4.1.5 and 1.4.1.9, following 1.3.2.10 we have

$$\psi^n_{m,m'}(\underline{\tau}^{\{\underline{k}\}_{(m')}}) = \frac{q^{(m)}_{\underline{k}}!}{q^{(m')}_{\underline{k}}!}\underline{\tau}^{\{\underline{k}\}_{(m)}}, \tag{1.4.1.11.2}$$

where $\underline{\tau}^{\{\underline{k}\}_{(m)}} := \prod_{\lambda=1}^r \tau_\lambda^{\{k_\lambda\}_{(m)}}$, $q^{(m)}_{\underline{k}}! := \prod_{\lambda=1}^r q^{(m)}_{k_\lambda}!$ and similarly with some primes. Moreover, we compute $\psi^n_m(\underline{\tau}^{\underline{k}}) = q^{(m)}_{\underline{k}}!\underline{\tau}^{\{\underline{k}\}_{(m)}}$.

1.4.1.12. By composing the canonical morphism $\Delta_{X/S,(m)}(r) \to X^{\sharp r+1}_{/S}$ and $\Delta^n_{X/S,(m)}(r) \to X^{\sharp r+1}_{/S}$ with the ith projection $p_i \colon X^{\sharp r+1}_{/S} \to X$ for $i = 0, \dots, r$, we get

$$p_{i,(m)}(r) \colon \Delta^n_{X/S,(m)}(r) \to X, \qquad p^n_{i,(m)}(r) \colon \Delta^n_{X/S,(m)}(r) \to X. \tag{1.4.1.12.1}$$

If there are no risk of confusion, we can simply write p_i. We denote by $\Delta_{X/S,(m)}(r) \times_{p_i,X,p_{i'}} \Delta_{X/S,(m)}(r')$ the base change of $p_{i,(m)} \colon \Delta_{X/S,(m)}(r) \to X$ by $p_{i',(m)} \colon \Delta_{X/S,(m)}(r') \to X$. The immersion $X \hookrightarrow \Delta_{X/S,(m)}(r) \times_{p_i,X,p_{i'}} \Delta_{X/S,(m)}(r')$ induced by $X \hookrightarrow \Delta_{X/S,(m)}(r)$ and $X \hookrightarrow \Delta_{X/S,(m)}(r')$ is an closed immersion endowed with a canonical m-PD structure. Indeed, this is an easy consequence of 1.4.1.5 (for more details, see [Ber96c, 2.1.3.(i)]). Moreover, by using the universal property of m-PD-envelopes, we get the m-PD-morphism $q_{(m)}(r, r')$ making commutative the diagram:

$$\begin{array}{ccccccc}
X & \hookrightarrow & \Delta_{X/S,(m)}(r) \times_{p_i,X,p_{i'}} \Delta_{X/S,(m)}(r') & \longrightarrow & X^{r+1}_{/S} \times_{p_i,X,p_{i'}} X^{r'+1}_{/S} & \xrightarrow{p_i \times p_{i'}} & X \times_X X \\
\| & & \downarrow{\scriptstyle q_{(m)}(r,r')} & & \downarrow\wr & & \downarrow\wr \\
X & \hookrightarrow & \Delta_{X/S,(m)}(r+r') & \longrightarrow & X^{r+r'+1}_{/S} & \xrightarrow{p_i} & X.
\end{array} \tag{1.4.1.12.2}$$

By using again 1.4.1.5, we check that this arrow $q_{(m)}(r, r')$ is in fact an m-PD-isomorphism. Similarly, the immersion $X \hookrightarrow \Delta^n_{X/S,(m)}(r) \times_X \Delta^{n'}_{X/S,(m)}(r')$ induced by $X \hookrightarrow \Delta^n_{X/S,(m)}(r)$ and $X \hookrightarrow \Delta^{n'}_{X/S,(m)}(r')$ is a closed immersion endowed with a canonical m-PD structure of order $n + n'$ and we have the m-PD-morphism $q^{n,n'}_{(m)}(r, r')$ making commutative the diagram

$$\begin{array}{ccccccc}
X & \hookrightarrow & \Delta^n_{X/S,(m)}(r) \times_{p_i,X,p_{i'}} \Delta^{n'}_{X/S,(m)}(r') & \longrightarrow & X^{r+1}_{/S} \times_{p_i,X,p_{i'}} X^{r'+1}_{/S} & \xrightarrow{p_i \times p_{i'}} & X \times_X X \\
\| & & \downarrow{\scriptstyle q^{n,n'}_{(m)}(r,r')} & & \downarrow\wr & & \downarrow\wr \\
X & \hookrightarrow & \Delta^{n+n'}_{X/S,(m)}(r+r') & \longrightarrow & X^{r+r'+1}_{/S} & \xrightarrow{p_i} & X.
\end{array} \tag{1.4.1.12.3}$$

When $r = r' = 1$, we simply write $q_{(m)}$ and $q^{n,n'}_{(m)}$.

Notation 1.4.1.13. For any integer n and any integers $0 \le i < j \le 2$, it follows from the universal property of m-PD-envelopes of order n that we get a unique m-PD-morphism $q^n_{ij,(m)} \colon \Delta^n_{X/S,(m)}(2) \to \Delta^n_{X/S,(m)}$ making commutative the diagram

$$\begin{array}{ccccccc}
X & \hookrightarrow & \Delta^n_{X/S,(m)}(2) & \longrightarrow & X \times_S X \times_S X & \overset{p_i}{\underset{p_j}{\rightrightarrows}} & X \\
\| & & \downarrow{\scriptstyle q^n_{ij,(m)}} & & \downarrow{\scriptstyle p_{ij}} & & \| \\
X & \hookrightarrow & \Delta^n_{X/S,(m)} & \longrightarrow & X \times_S X & \overset{p_0}{\underset{p_1}{\rightrightarrows}} & X
\end{array} \tag{1.4.1.13.1}$$

We still denote by $q^n_{ij,(m)} \colon p_{0*}\mathcal{P}^n_{X/S,(m)} \to p_{i*}\mathcal{P}^n_{X/S,(m)}(2)$ or $q^n_{ij,(m)} \colon p_{1*}\mathcal{P}^n_{X/S,(m)} \to p_{j*}\mathcal{P}^n_{X/S,(m)}(2)$ the corresponding homomorphism of m-PD-$\mathcal{O}_X$-algebras. We can simply write the m-PD-morphism $q^n_{ij,(m)} \colon \mathcal{P}^n_{X/S,(m)} \to \mathcal{P}^n_{X/S,(m)}(2)$ and recall that this homomorphism is also a homomorphism of m-PD-$\mathcal{O}_X$-algebras for two structures. Similarly we denote by $q_{ij,(m)} \colon \Delta_{X/S,(m)}(2) \to \Delta_{X/S,(m)}$ making commutative the diagram 1.4.1.13.1 without the order n condition.

Notation 1.4.1.14. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. By convention, $\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$ means $p^n_{1*}(\mathcal{P}^n_{X/S,(m)}) \otimes_{\mathcal{O}_X} \mathcal{E}$ and $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)}$ means $\mathcal{E} \otimes_{\mathcal{O}_X} p^n_{0*}(\mathcal{P}^n_{X/S,(m)})$. For instance, $\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$ is $p^n_{1*}(\mathcal{P}^n_{X/S,(m)}) \otimes_{\mathcal{O}_X} p^{n'}_{0*}(\mathcal{P}^{n'}_{X/S,(m)})$.

We have two structures of $\mathcal{O}_X$-module on the sheaf $\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$: the "left structure" given by functoriality from the left structure of $\mathcal{P}^n_{X/S,(m)}$ and the "right structure" given by the internal tensor product. We denote by $p_{0*}(\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E})$ (resp. $p_{1*}(\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E})$) to clarify we are considering the left structure (resp. right structure).

Similarly, we denote by $p_{0*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)})$ (resp. $p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)})$) the $\mathcal{O}_X$-module given by the internal tensor product (resp. by functoriality from the right $\mathcal{O}_X$-module structure of $\mathcal{P}^n_{X/S,(m)}$) which is called the left (resp. right) structure.

We denote by $p^n_{0,\mathcal{E}} \colon \mathcal{E} \to p_{0*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)})$ the canonical $\mathcal{O}_X$-linear map given by $x \mapsto x \otimes \mathbb{1}$, i.e. is the composition of $\mathrm{id}_{\mathcal{E}} \otimes p^n_0$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^0_{X/S,(m)}$. We denote by $p^n_{1,\mathcal{E}} \colon \mathcal{E} \to p_{1*}(\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E})$ the canonical map given by $x \mapsto \mathbb{1} \otimes x$, i.e. is the composition of $p^n_1 \otimes \mathrm{id}_{\mathcal{E}}$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{P}^0_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$.

Notation 1.4.1.15. We simply denote by $\Delta^n_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)}$ the base change of $p^{n'}_{0,(m)} \colon \Delta^{n'}_{X/S,(m)} \to X$ by $p^n_{1,(m)} \colon \Delta^n_{X/S,(m)} \to X$. Similarly, $X^2_{/S} \times_{p_1,X,p_0} X^2_{/S}$ is simply denoted by $X^2_{/S} \times_X X^2_{/S}$. By composition of 1.4.1.12.3 and 1.4.1.13.1, we get

$$\begin{array}{ccccccccc}
X & \hookrightarrow & \Delta^n_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} & \longrightarrow & X^2_{/S} \times_X X^2_{/S} & \xrightarrow{\sim} & X \times_S X \times_S X & & \\
\| & & \downarrow{\scriptstyle q^{n,n'}_{(m)}} & & & & \| & & \\
X & \hookrightarrow & \Delta^{n+n'}_{X/S,(m)}(2) & \longrightarrow & & & X \times_S X \times_S X & \overset{p_i}{\underset{p_j}{\rightrightarrows}} & X \\
\| & & \downarrow{\scriptstyle q^{n+n'}_{ij,(m)}} & & & & \downarrow{\scriptstyle p_{ij}} & & \| \\
X & \hookrightarrow & \Delta^{n+n'}_{X/S,(m)} & \longrightarrow & & & X \times_S X & \overset{p_0}{\underset{p_1}{\rightrightarrows}} & X.
\end{array} \tag{1.4.1.15.1}$$

We get the morphism $p^{n,n'}_{ij,(m)} := q^{n+n'}_{ij,(m)} \circ q^{n,n'}_{(m)} \colon \Delta^n_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \to \Delta^{n+n'}_{X/S,(m)}$ (which satisfies also a universal property). The morphism $p^{n,n'}_{01,(m)}$ is the composition

$$p^{n,n'}_{01,(m)} \colon \Delta^n_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \to \Delta^n_{X/S,(m)} \overset{\psi^{n+n',n}_{X/S,(m)}}{\hookrightarrow} \Delta^{n+n'}_{X/S,(m)},$$

where the first morphism is given by the left projection. Similarly, $p^{n,n'}_{12,(m)}$ is the composition $\Delta^n_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \to \Delta^{n'}_{X/S,(m)} \to \Delta^{n+n'}_{X/S,(m)}$, where the first morphism is given by the right projection.

By composing the canonical morphism $\Delta^n_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \to X \times_S X \times_S X$ with the ith projection $p_i \colon X \times_S X \times_S X \to X$ for $i = 0, 1, 2$, we get

$$p^{n,n'}_{i,(m)} \colon \Delta^n_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \to X. \tag{1.4.1.15.2}$$

This yields three ring homomorphisms $p^{n,n'}_{i,(m)} \colon \mathcal{O}_X \to \mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X,(m)}$. When $i = 0$ (resp. $i = 1$, resp. $i = 2$), this is said to be the left (resp. middle, resp right) $\mathcal{O}_X$-algebra structure of $\mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X,(m)}$ and this is equal to the $\mathcal{O}_X$-algebra structure given by the left structure of $\mathcal{P}^n_{X/S,(m)}$ (resp. the tensor product, resp. the right structure of $\mathcal{P}^{n'}_{X/S,(m)}$). Using the associated universal properties, we have the equalities $p^{n,n'}_{i,(m)} = p^{n+n'}_{i,(m)}(2) \circ p^{n,n'}_{ij,(m)}$ for any $i, j = 0, 1, 2$.

We denote by $\delta^{n,n'}_{(m)} \colon \mathcal{P}^{n+n'}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$ (resp. $q^{n,n'}_{0(m)} \colon \mathcal{P}^{n+n'}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$, resp. $q^{n,n'}_{1(m)} \colon \mathcal{P}^{n+n'}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$) the morphism of m-PD-algebras associated to the morphism $p^{n,n'}_{02,(m)}$ (resp. $p^{n,n'}_{01,(m)}$, resp. $p^{n,n'}_{12,(m)}$). If there is no doubt on the level, we can also simply write $\delta^{n,n'}$, $q^{n,n'}_0$, $q^{n,n'}_1$.

The morphism $q^{n,n'}_{0(m)}$ is equal to the composition $q^{n,n'}_{0(m)} \colon \mathcal{P}^{n+n'}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$ (the last morphism is $\tau \mapsto \tau \otimes 1$). Moreover, $q^{n,n'}_{1(m)}$ is equal to the composition $q^{n,n'}_{1(m)} \colon \mathcal{P}^{n+n'}_{X/S,(m)} \to \mathcal{P}^{n'}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$ (the last morphism is $\tau \mapsto 1 \otimes \tau$). In order words, we have the relation $q^{n,n'}_{0(m)} = \varpi^{n,n'}_{i(m)} \circ \psi^{n+n',n}_{X/S,(m)}$ and $q^{n,n'}_{1(m)} = \varpi^{n,n'}_{i(m)} \circ \psi^{n+n',n'}_{X/S,(m)}$, where $\varpi^{n,n'}_{0(m)} \colon \mathcal{P}^{n}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$ and $\varpi^{n,n'}_{1(m)} \colon \mathcal{P}^{n'}_{X/S,(m)} \to \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}$ are the homomorphisms associated with the projections. The morphism $q^{n,n'}_{0(m)}$ is $\mathcal{O}_X$-linear for the left (resp. right) structure of $\mathcal{P}^{n+n'}_{X/S(m)}$ and the left structure (resp. of the center) of $\mathcal{P}^{n}_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S(m)}$. Finally, the morphism $q^{n,n'}_{0(m)}$ is $\mathcal{O}_X$-linear for the left (resp. right) structure of $\mathcal{P}^{n+n'}_{X/S(m)}$ and the structure of the center (resp. right) of $\mathcal{P}^{n}_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S(m)}$.

Using the commutativity of the diagram 1.4.1.15.1, we see that $\delta^{n,n'}_{(m)}$ is also an $\mathcal{O}_X$-algebra homomorphism for the respective left structures and for the respective right structures, i.e., $\delta^{n,n'}_{(m)} \circ p^{n+n'}_{0,(m)} = p^{n,n'}_{0,(m)}$ and $\delta^{n,n'}_{(m)} \circ p^{n+n'}_{1,(m)} = p^{n,n'}_{2,(m)}$. Using the commutativity of the diagram 1.4.1.15.1, we see that the morphism $q^{n,n'}_{0(m)}$ is $\mathcal{O}_X$-linear for the left (resp. right) structure of $\mathcal{P}^{n+n'}_{X/S(m)}$ and the left (resp. middle) structure of $\mathcal{P}^{n}_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S(m)}$.

By using 1.4.1.11 and the universal property of the m-PD envelopes, these morphisms are compatible with the change of level and we have the commutative diagram:

$$\begin{array}{ccccc} \mathcal{P}^{n+n'}_{X/S} & \longrightarrow & \mathcal{P}^{n+n'}_{X/S,(m')} & \xrightarrow{\psi^{n+n'}_{m,m'}} & \mathcal{P}^{n+n'}_{X/S,(m)} \\ \downarrow{\scriptstyle \delta^{n,n'}} & & \downarrow{\scriptstyle \delta^{n,n'}_{(m')}} & & \downarrow{\scriptstyle \delta^{n,n'}_{(m)}} \\ \mathcal{P}^{n}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S} & \longrightarrow & \mathcal{P}^{n}_{X/S,(m')} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m')} & \xrightarrow{\psi^{n}_{m,m'} \otimes \psi^{n'}_{m,m'}} & \mathcal{P}^{n}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}. \end{array} \tag{1.4.1.15.3}$$

Remark 1.4.1.16. The canonical m-PD structure on $\Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)}$ is characterized by the following property: the projections $q^{n,n'}_{0(m)} \colon \Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \to \Delta^{n}_{X/S,(m)}$ and $q^{n,n'}_{1(m)} \colon \Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \to \Delta^{n'}_{X/S,(m)}$ are morphisms of $\mathscr{C}^{(m)}_{n+n'}$.

1.4.1.17. Suppose that f has coordinates $(t_\lambda)_{\lambda=1,\dots,r}$. With the notation of 1.4.1.5 and 1.4.1.9, since $\delta^{n,n'}(a \otimes b) = (a \otimes 1) \otimes (1 \otimes b)$ for any $a, b, \in \mathcal{O}_X$, then

$$\delta^{n,n'}_{(m)}(\tau_i) = \tau_i \otimes 1 + 1 \otimes \tau_i. \tag{1.4.1.17.1}$$

The following Lemma will be useful to check the associativity of the product law of the sheaf of differential operator:

Lemma 1.4.1.18. *We denote by $\Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)}$ the base change of $p^{n'}_0 \circ q^{n',n''}_0 \colon \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)} \to X$ by $p^n_1 \colon \Delta^{n}_{X/S,(m)} \to X$. The closed immersion $X \hookrightarrow \Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)}$ induced by $X \hookrightarrow \Delta^{n}_{X/S,(m)}$, $X \hookrightarrow \Delta^{n'}_{X/S,(m)}$ and $X \hookrightarrow \Delta^{n''}_{X/S,(m)}$ is endowed with a canonical m-PD structure. By abuse of notation, we denote by $\Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)}$ this object of $\mathscr{C}^{(m)}_{n+n'+n''}$. This m-PD structure on $\Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)}$ is characterized by the following property: the projections $\Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)} \to \Delta^{n}_{X/S,(m)}$, $\Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)} \to \Delta^{n'}_{X/S,(m)}$, and $\Delta^{n}_{X/S,(m)} \times_X \Delta^{n'}_{X/S,(m)} \times_X \Delta^{n''}_{X/S,(m)} \to \Delta^{n''}_{X/S,(m)}$ are morphisms of $\mathscr{C}^{(m)}_{n+n'+n''}$.*

Proof. This is checked similarly to 1.4.1.12. □

1.4.2 Differential operators of level m

Let $f\colon X \to S$ be a smooth morphism.

Definition 1.4.2.1. (a) The *sheaf of differential operators on X/S of level m and order n* is

$$\mathcal{D}^{(m)}_{X/S,n} := \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^n_{X/S,(m)}, \mathcal{O}_X). \tag{1.4.2.1.1}$$

(b) For any $n' \geq n$, the surjections $\psi^{n',n*}_{X/S,(m)}\colon \mathcal{P}^{n'}_{X/S,(m)} \hookrightarrow \mathcal{P}^n_{X/S,(m)}$ induces the injections

$$\rho^{(m)}_{n',n}\colon \mathcal{D}^{(m)}_{X/S,n} \hookrightarrow \mathcal{D}^{(m)}_{X/S,n'}. \tag{1.4.2.1.2}$$

The *sheaf of differential operators on X/S of level m* is

$$\mathcal{D}^{(m)}_{X/S} := \bigcup_{n\geq 0} \mathcal{D}^{(m)}_{X/S,n}.$$

(c) The tautological structure of $\mathcal{O}_X$-module on $\mathcal{D}^{(m)}_{X/S,n}$ is said to be the left one. For any $a \in \mathcal{O}_X$, we have the map $\mathcal{D}^{(m)}_{X/S,n} \to \mathcal{D}^{(m)}_{X/S,n}$ induced by the $\mathcal{O}_X$-linear map $p^n_{1(m)}(a)\colon p^n_{0(m)*}\mathcal{P}^n_{X/S,(m)} \to p^n_{0(m)*}\mathcal{P}^n_{X/S,(m)}$. This yields another structure of $\mathcal{O}_X$-module on $\mathcal{D}^{(m)}_{X/S,n}$ which is called the right structure of $\mathcal{O}_X$-module. For any $n' \geq n$, the homomorphisms $\mathcal{D}^{(m)}_{X/S,n} \to \mathcal{D}^{(m)}_{X/S,n}$ are $\mathcal{O}_X$-linear for both structures. This yields two structures of $\mathcal{O}_X$-modules on $\mathcal{D}^{(m)}_{X/S}$, the left one and the right one. We write $p_{0*}\mathcal{D}^{(m)}_{X/S,n}$ (resp. $p_{1*}\mathcal{D}^{(m)}_{X/S,n}$) when we consider the left structure (resp. the right one).

(d) Let $P \in \mathcal{D}^{(m)}_{X/S,n}$, $P' \in \mathcal{D}^{(m)}_{X/S,n'}$. We define the product $PP' \in \mathcal{D}^{(m)}_{X/S,n+n'}$ to be the composition

$$PP'\colon \mathcal{P}^{n+n'}_{X/S,(m)} \xrightarrow{\delta^{n,n'}_{(m)}} \mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)} \xrightarrow{\mathrm{id}\otimes P'} \mathcal{P}^n_{X/S,(m)} \xrightarrow{P} \mathcal{O}_X. \tag{1.4.2.1.3}$$

Proposition 1.4.2.2. *The sheaf $\mathcal{D}^{(m)}_{X/S}$ is a sheaf of rings with the product as defined in 1.4.2.1.3.*

Proof. We have to check the product as defined in 1.4.2.1.3 is associative. To simplify notation, let us denote $\mathcal{P}_{X/S,(m)}$ (resp. $\mathcal{O}_X$) by $\mathcal{P}$ (resp. $\mathcal{O}$), i.e. we remove the index in the notation. One checks the commutativity of the diagram

$$\begin{array}{ccccccc}
\mathcal{P}^{n+n'+n''} & = & \mathcal{P}^{n+n'+n''} & \xrightarrow{\delta^{n,n'+n''}_{(m)}} & \mathcal{P}^n\otimes_{\mathcal{O}}\mathcal{P}^{n'+n''} & = & \mathcal{P}^n\otimes_{\mathcal{O}}\mathcal{P}^{n'+n''} \\
 & & \downarrow{\scriptstyle \delta^{n+n',n''}_{(m)}} & & \downarrow{\scriptstyle \mathrm{id}\otimes\delta^{n',n''}_{(m)}} & & \\
 & & \mathcal{P}^{n+n'}\otimes_{\mathcal{O}}\mathcal{P}^{n''} & \xrightarrow{\delta^{n,n'}_{(m)}\otimes\mathrm{id}} & \mathcal{P}^n\otimes_{\mathcal{O}}\mathcal{P}^{n'}\otimes_{\mathcal{O}}\mathcal{P}^{n''} & & \\
\downarrow{\scriptstyle (PP')P''} & & \downarrow{\scriptstyle \mathrm{id}\otimes P''} & & \downarrow{\scriptstyle \mathrm{id}\otimes\mathrm{id}\otimes P''} & & \downarrow{\scriptstyle \mathrm{id}\otimes P'P''} \\
 & & \mathcal{P}^{n+n'} & \xrightarrow{\delta^{n,n'}_{(m)}} & \mathcal{P}^n\otimes_{\mathcal{O}}\mathcal{P}^{n'} & & \\
 & & \downarrow{\scriptstyle PP'} & & \downarrow{\scriptstyle \mathrm{id}\otimes P'} & & \\
\mathcal{O} & = & \mathcal{O} & \xleftarrow[P]{} & \mathcal{P}^n & = & \mathcal{P}^n.
\end{array} \tag{1.4.2.2.1}$$

Indeed, let us check the commutativity of the top square of the middle. Since this is local, we can suppose that f has coordinates $(t_\lambda)_{\lambda=1,\dots,r}$. With the notation of 1.4.1.5 and 1.4.1.9, by using 1.4.1.17.1, we compute that the images of $\tau_1, \dots, \tau_r$ by both maps $\mathcal{P}^{n+n'+n''}_{X/S,(m)} \to \mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n''}_{X/S,(m)}$ are the same. Since both maps are m-PD-morphisms (see 1.4.1.18 for the m-PD-structure), then by using 1.4.1.5 we get the desired commutativity. Since the commutativity of the other squares are obvious, we conclude the proof.

□

Notation 1.4.2.3 (Local description)**.** Let X/S is equipped with coordinates $t_1, \dots, t_d$. The $\mathcal{P}^n_{X/S,(m)}$ is isomorphic to an m-PD polynomial algebra with coefficients in $\mathcal{O}_X$ of order n in d variables given by $\tau_1, \dots, \tau_d$ (see 1.4.1.5 and 1.4.1.9). In particular, $\mathcal{P}^n_{X/S,(m)}$ is a free $\mathcal{O}_X$-module with basis $\{\underline{\tau}^{\{\underline{k}\}_{(m)}}$:

$|\underline{k}| \leq n\}$. Let $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}} : |\underline{k}| \leq n\}$ be the dual basis for $\mathcal{D}^{(m)}_{X/S,n} = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^n_{X/S,(m)}, \mathcal{O}_X)$. Remark that the notation $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$ does not depends on n, since the monomorphisms $\mathcal{D}^{(m)}_{X/S,n} \to \mathcal{D}^{(m)}_{X/S,n+1}$ sends $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$ to $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$. We get the basis $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}} : \underline{k} \in \mathbb{N}^d\}$ of $\mathcal{D}^{(m)}_{X/S}$.

1.4.2.4. We have $\mathcal{O}_X = \mathcal{P}^0_{X/S,(m)}$ and by duality $\mathcal{O}_X = \mathcal{D}^{(m)}_{X/S,0}$. This yields the inclusion $\mathcal{O}_X \hookrightarrow \mathcal{D}^{(m)}_{X/S}$. From 1.4.2.1.3, we remark that $\mathcal{O}_X$ is in fact a subring of $\mathcal{D}^{(m)}_{X/S}$. Moreover, since $\mathcal{D}^{(m)}_{X/S}$ is a $\mathcal{D}^{(m)}_{X/S}$-bimodule, this yields that $\mathcal{D}^{(m)}_{X/S}$ is a $\mathcal{O}_X$-bimodule. We compute that $\mathcal{D}^{(m)}_{X/S,n}$ is a sub $\mathcal{O}_X$-bimodule of $\mathcal{D}^{(m)}_{X/S}$. Moreover, the structure of $\mathcal{O}_X$-module on $\mathcal{D}^{(m)}_{X/S,n}$ coming from the multiplication on the left (resp. the right) is equal to the left structure (resp. right structure) which was defined in 1.4.2.1.1.c.

1.4.2.5. For any $m' \geq m$, from the homomorphisms $\psi^n_{m,m'} \colon \mathcal{P}^n_{X/S,(m')} \to \mathcal{P}^n_{X/S,(m)}$ and $\psi^n_m \colon \mathcal{P}^n_{X/S} \to \mathcal{P}^n_{X/S,(m)}$ of 1.4.1.11, we get by duality, the maps

$$\mathcal{D}^{(m)}_{X/S} \xrightarrow{\rho_{m',m}} \mathcal{D}^{(m')}_{X/S} \xrightarrow{\rho_{m'}} \mathcal{D}_{X/S}. \tag{1.4.2.5.1}$$

It follows from 1.1.4.1.1, 1.4.2.1.3 and 1.4.1.15.3 that the maps of 1.4.2.5.1 are homomorphisms of filtered rings.

When X/S is equipped with coordinates $t_1, \ldots, t_d$, we obtain by duality from 1.4.1.11.2 the formula

$$\rho_{m',m}(\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}) = \frac{q^{(m)}_{\underline{k}}!}{q^{(m')}_{\underline{k}}!} \underline{\partial}^{\langle \underline{k} \rangle_{(m')}} \text{ and } \rho_m(\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}) = \underline{q}^{(m)}_{\underline{k}}! \underline{\partial}^{[\underline{k}]}. \tag{1.4.2.5.2}$$

By taking the inductive limit of ρ_m, we get the filtered ring morphism

$$\rho \colon \varinjlim_m \mathcal{D}^{(m)}_{X/S} \xrightarrow{\sim} \mathcal{D}_{X/S}, \tag{1.4.2.5.3}$$

which is an isomorphism (since this is local, this is an easy consequence of the formula 1.4.2.5.2). However, beware that the homomorphisms 1.4.2.5.1 are not necessarily injective.

Since $\mathcal{O}_X$ is endowed with a canonical structure of left $\mathcal{D}_{X/S}$-module, this induces a structure of left $\mathcal{D}^{(m)}_{X/S}$-module on $\mathcal{O}_X$. It follows from 1.1.4.1.2 and 1.4.2.5.1 that the structure of $\mathcal{D}^{(m)}_{X/S}$-module of $\mathcal{O}_X$ is given via the formula

$$P(f) := P \circ p^n_{1(m)}(f). \tag{1.4.2.5.4}$$

Notation 1.4.2.6 (Infinite level)**.** When $f \colon X \to S$ be a weakly smooth morphism, we write $\mathcal{D}^{(\infty)}_{X/S} := \mathcal{D}_{X/S}$, $\mathcal{P}^n_{X/S,(\infty)} = \mathcal{P}^n_{X/S,(m)}$. The notation is justified by the isomorphism 1.4.2.5.3, i.e. we can viewed the usual sheaf of differential operators as the sheaf of differential operators of infinite level.

Proposition 1.4.2.7. *With notation 1.4.2.3, the following rules hold in* $\mathcal{D}^{(m)}_{X/S}$.

(a) For any $x \in \Gamma(X, \mathcal{O}_X)$, $p^n_{1,(m)}(x) = \sum_{|\underline{k}| \leq n} p^n_{0,(m)}(\underline{\partial}^{\langle \underline{k} \rangle}(x)) \underline{\tau}^{\{\underline{k}\}} \in \mathcal{P}^n_{X,(m)}$ *(Taylor formula).*

(b) For any $x \in \Gamma(X, \mathcal{O}_X)$ *and* $\underline{k} \in \mathbb{N}^r$, *we have in* $\Gamma(X, \mathcal{D}^{(m)}_{X/S})$

$$\underline{\partial}^{\langle \underline{k} \rangle_{(m)}} x = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{k} - \underline{i} \rangle_{(m)}}(x) \underline{\partial}^{\langle \underline{i} \rangle_{(m)}}. \tag{1.4.2.7.1}$$

(c) $\forall\ \underline{k}', \underline{k}'' \in \mathbb{N}^d$, $\underline{\partial}^{\langle \underline{k}' \rangle} \underline{\partial}^{\langle \underline{k}'' \rangle} = \left\langle \begin{smallmatrix} \underline{k}' + \underline{k}'' \\ \underline{k}' \end{smallmatrix} \right\rangle \underline{\partial}^{\langle \underline{k}' + \underline{k}'' \rangle}$,

(d) $\forall\ \underline{k}, \underline{i} \in \mathbb{N}^d$, *if* $\underline{i} \geq \underline{k}$, $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}(\underline{t}^{\underline{i}}) = q^{(m)}_{\underline{k}}! \left(\begin{smallmatrix} \underline{i} \\ \underline{k} \end{smallmatrix} \right) t^{\underline{i} - \underline{k}}$.

Proof. a) Taylor formula 3.2.3.7.1 comes from the fact that $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}, |\underline{k}| \leq n\}$ is the dual basis of $\{\underline{\tau}^{\{\underline{k}\}_{(m)}}, |\underline{k}| \leq n\}$.

b) Let $\underline{k} \in \mathbb{N}^r$ and $n = |\underline{k}|$. Since $\delta_{(m)}^{n,0} = \mathrm{id}$, then by definition of the multiplication (see 1.4.2.1.3), we get

$$\underline{\partial}^{\langle \underline{k} \rangle_{(m)}} x(\underline{\tau}^{\{\underline{i}\}_{(m)}}) = \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} (p_{1,(m)}^{n*}(x)\underline{\tau}^{\{\underline{i}\}_{(m)}}) = \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} \left(\sum_{|\underline{j}| \leq n} \underline{\partial}^{\langle \underline{j} \rangle}(x) \underline{\tau}^{\{\underline{j}\}} \underline{\tau}^{\{\underline{i}\}_{(m)}} \right) \quad (1.4.2.7.2)$$

$$\underset{1.2.4.5.3}{=} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} \left(\sum_{|\underline{j}| \leq n} \left\{ \begin{matrix} \underline{i} + \underline{j} \\ \underline{j} \end{matrix} \right\}_{(m)} \underline{\partial}^{\langle \underline{j} \rangle}(x) \underline{\tau}^{\{\underline{j}+\underline{i}\}} \right) = \left\{ \begin{matrix} \underline{k} \\ \underline{i} \end{matrix} \right\}_{(m)} \underline{\partial}^{\langle \underline{k}-\underline{i} \rangle_{(m)}}(x) \underline{\tau}^{\{\underline{j}+\underline{i}\}}. \quad (1.4.2.7.3)$$

c) Since $\delta_{(m)}^{n,n'}(\tau_i) = \tau_i \otimes 1 + 1 \otimes \tau_i$ (see 1.4.1.17.1), then $\forall\ \underline{k}', \underline{k}'' \in \mathbb{N}^d$, setting $n = |\underline{k}|$ and $n' = |\underline{k}'|$, we get

$$\underline{\partial}^{\langle \underline{k}' \rangle} \underline{\partial}^{\langle \underline{k}'' \rangle}(\underline{\tau}^{\{\underline{i}\}}) = \underline{\partial}^{\langle \underline{k}' \rangle} \circ (\mathrm{id} \otimes \underline{\partial}^{\langle \underline{k}'' \rangle}) \circ \delta_{(m)}^{n,n'}(\underline{\tau}^{\{\underline{i}\}}) = \underline{\partial}^{\langle \underline{k}' \rangle} \circ (\mathrm{id} \otimes \underline{\partial}^{\langle \underline{k}'' \rangle})(\underline{\tau} \otimes 1 + 1 \otimes \underline{\tau})^{\{\underline{i}\}})$$

$$\underset{1.2.4.5.2}{=} \underline{\partial}^{\langle \underline{k}' \rangle} \circ (\mathrm{id} \otimes \underline{\partial}^{\langle \underline{k}'' \rangle}) \left(\sum_{\underline{i}' + \underline{i}'' = \underline{i}} \left\langle \begin{matrix} \underline{i} \\ \underline{i}' \end{matrix} \right\rangle_{(m)} (\underline{\tau}^{\{\underline{i}'\}_{(m)}} \otimes \underline{\tau}^{\{\underline{i}''\}_{(m)}}) \right). \quad (1.4.2.7.4)$$

Hence, if $\underline{i} = \underline{k}' + \underline{k}''$, then $\underline{\partial}^{\langle \underline{k}' \rangle} \underline{\partial}^{\langle \underline{k}'' \rangle}(\underline{\tau}^{\{\underline{i}\}}) = \left\langle \begin{smallmatrix} \underline{k}' + \underline{k}'' \\ \underline{k}' \end{smallmatrix} \right\rangle$, otherwise this is null.

d) The last computation follows from the Tayor formula and the computation

$$p_{1,(m)}^{n*}(\underline{t}^{\underline{i}}) = \left(p_{1,(m)}^{n*}(\underline{t})\right)^{\underline{i}} = \left(p_{0,(m)}^{n*}(\underline{t}) + \underline{\tau}\right)^{\underline{i}} \underset{1.2.4.5.1}{=} \sum_{\underline{k} \leq \underline{i}} q_{\underline{k}}^{(m)}! \begin{pmatrix} \underline{i} \\ \underline{k} \end{pmatrix} \underline{t}^{\underline{i}-\underline{k}} \underline{\tau}^{\{\underline{k}\}}.$$

□

1.4.2.8. We have the following properties.

(a) For any integer k, we denote by $(k)_i \in \mathbb{N}^d$ the element $(k)_i = (0, \ldots, k, \ldots, 0)$, where k is at the ith place. We set $\partial_i^{\langle k \rangle} := \underline{\partial}^{\langle (k)_i \rangle}$.

(b) It follows from 1.4.2.7.c that $\forall\ \underline{k}', \underline{k}'' \in \mathbb{N}^d$, we have $\underline{\partial}^{\langle \underline{k}' \rangle} \underline{\partial}^{\langle \underline{k}'' \rangle} = \underline{\partial}^{\langle \underline{k}'' \rangle} \underline{\partial}^{\langle \underline{k}' \rangle}$. Hence, for any $\underline{k}$ we have

$$\underline{\partial}^{\langle \underline{k} \rangle} = \prod_{i=1}^{d} \partial_i^{\langle k_i \rangle}. \quad (1.4.2.8.1)$$

For $k \in \mathbb{N}$, $k = \sum_{j=0}^{m-1} a_j p^j + a p^m$, with $0 \leq a_j < p$ for all j. It follows from 1.2.1.5 and 1.4.2.7.c that

$$\partial_i^{\langle k \rangle} = u \left(\prod_{j=0}^{m-1} (\partial_i^{\langle p^j \rangle})^{a_j} \right) (\partial_i^{\langle p^m \rangle})^a \quad (1.4.2.8.2)$$

for some invertible elements u in $\mathbb{Z}_{(p)}$ ($u = 1$ if $m = 0$).

(c) If $\underline{k} = p^m \underline{q} + \underline{r}$ with $0 \leq r_i < p^m$ If $r_i = \sum_{j=0}^{m-1} a_{i,j} p^j$ with $0 \leq a_{i,j} < p$, then

$$\underline{\partial}^{\langle \underline{k} \rangle} = u_{\underline{k}} \prod_{i=1}^{p} \left(\prod_{j=0}^{m-1} (\partial_i^{\langle p^j \rangle})^{a_{i,j}} \right) (\partial_i^{[p^m]})^{q_i} \quad (1.4.2.8.3)$$

for some invertible elements $u_{\underline{k}}$ in $\mathbb{Z}_{(p)}^*$.

We have the well known and easy result (e.g. see [LvO96, II.1.2 Proposition 3] or [BGK⁺87, II.5.2]) that we recall for the reader.

Lemma 1.4.2.9. *Let $D = \cup_{n \in \mathbb{N}} D_n$ be a filtered ring (i.e. D_n are abelian groups such that $D_n \cdot D_{n'} \subset D_{n+n'}$) such that $\mathrm{gr}\, D = D_0 \oplus \oplus_{n \geq 1} D_n / D_{n-1}$ is noetherian. Then D is noetherian.*

Proposition 1.4.2.10. *Under the hypotheses 1.4.2.3, the sheaf $\mathcal{D}^{(m)}_{X/S}$ is generated as $\mathcal{O}_S$-algebra by $\mathcal{O}_X$ and the two by two commuting operators $\partial_i, \partial_i^{\langle p \rangle}, \cdots, \partial_i^{\langle p^m \rangle}$, $1 \leq i \leq r$.*

More precisely, fix $1 \leq i \leq r$. Then, for any $0 \leq j \leq m$, for any $0 \leq k < p^j$, the operator $\partial_i^{\langle k \rangle}$ belongs to the sub $\mathbb{Z}_{(p)}$-algebra of $\mathcal{D}^{(m)}_{X/S}$ generated by $\partial_i, \partial_i^{\langle p \rangle}, \cdots, \partial_i^{\langle p^{j-1} \rangle}$. Moreover, for any $k \in \mathbb{N}$, $\partial_i^{\langle k \rangle}$ belongs to the sub $\mathbb{Z}_{(p)}$-algebra of $\mathcal{D}^{(m)}_{X/S}$ generated by $\partial_i, \partial_i^{\langle p \rangle} \cdots, \partial_i^{\langle p^m \rangle}$.

Proof. This is a straightforward consequence of the formula 1.4.2.8.3. □

Proposition 1.4.2.11. *We have the following properties.*

(a) The graded ring gr $\mathcal{D}^{(m)}_{X/S}$ associated to the order filtration $(\mathcal{D}^{(m)}_{X/S,n})_{n \in \mathbb{N}}$ is a commutative ring.

(b) Suppose S be a locally noetherian scheme. Let U be an affine open of X (resp. $x \in X$). Then $\Gamma(U, \mathrm{gr}\ \mathcal{D}^{(m)}_{X/S})$ (resp. $D^{(m)}_U := \Gamma(U, \mathcal{D}^{(m)}_{X/S})$, resp. $\mathrm{gr}\ \mathcal{D}^{(m)}_{X/S,x}$, resp. $\mathcal{D}^{(m)}_{X/S,x}$) is left and right noetherian.

Proof. Let us check (a). Since this is local, we can suppose Let X/S is equipped with coordinates $t_1, \ldots, t_d$. Then this follows from the formulas 1.4.2.7.c and 1.4.2.7.b.

Let us prove (b). As U is affine, it is a coherent topological space, so that the functor $\Gamma(U, -)$ commutes with filtered inductive limits (see [SGA4.2] VI, 5.2). Thus the ring $D^{(m)}_U$ has filtration by order and its associated graded ring is commutative and is noetherian because it is generated as $\Gamma(U, \mathcal{O}_X)$-algebra by the finitely generated $\Gamma(U, \mathcal{O}_X)$-modules $\mathrm{gr}_i\, D^{(m)}_U = \Gamma(U, \mathrm{gr}_i\, \mathcal{D}^{(m)}_{X/S})$ for $i < p^m$ (use 1.4.2.10). This implies that the filtered ring $D^{(m)}_U$ is left and right noetherian (see 1.4.2.9). We proceed similarly for the two remaining cases. □

Remark 1.4.2.12. Beware that the proposition 1.1.4.5 is false in the case of finite level. For instance, $\mathcal{E} = \mathcal{O}_X / t^p \mathcal{O}_X$ is a $\mathcal{D}^{(0)}_X$-module which is $\mathcal{O}_X$-coherent but it is not a locally free $\mathcal{O}_X$-module.

1.4.3 Tor dimension, Cartan's theorems A and B, perfection

Let us recall some facts on tor dimension and perfection which will be useful later.

Definition 1.4.3.1. Let $\mathcal{D}$ be a sheaf of rings on a topological space. Let $\mathcal{E}^\bullet \in C({}^{\mathrm{l}}\mathcal{D})$.

1. Let $a, b \in \mathbb{Z}$ with $a \leq b$. We say $\mathcal{E}^\bullet$ has tor-amplitude in $[a, b]$ if $H^i(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet) = 0$ for all right $\mathcal{D}$-modules $\mathcal{M}$ and all $i \notin [a, b]$.
2. We say $\mathcal{E}^\bullet$ has finite tor dimension if it has tor-amplitude in $[a, b]$ for some integer $a \leq b$. We denote by $D_{\mathrm{tdf}}(\mathcal{D})$ the strictly full subcategory of $D(\mathcal{D})$ consisting of complexes having finite tor dimension on $\mathcal{D}$.
3. We say $\mathcal{E}^\bullet$ *locally has finite tor dimension* if there exists an open covering $\{U_\lambda\}_{\lambda \in \Lambda}$ of X such that $\mathcal{E}^\bullet|_{U_\lambda}$ has finite tor dimension and for each $\lambda \in \Lambda$.

1.4.3.2. Let $\mathcal{D}$ be a sheaf of rings on a topological space X. Let $\mathcal{E}^\bullet \in C({}^{\mathrm{l}}\mathcal{D})$. Let $a, b \in \mathbb{Z}$ with $a \leq b$. The following properties are equivalent.

(a) The complex $\mathcal{E}^\bullet$ has tor-amplitude in $[a, b]$.

(b) There exists a complex $\mathcal{P}^\bullet$ of flat left $\mathcal{D}$-modules with $\mathcal{P}^i = 0$ for $i \notin [a, b]$ together with a quasi-isomorphism of $K({}^{\mathrm{l}}\mathcal{D})$ of the form $\mathcal{P}^\bullet \to \mathcal{E}^\bullet$.

(c) For any $x \in X$, the complex $\mathcal{E}^\bullet_x$ has tor-amplitude in $[a, b]$.

Indeed, for the equivalence between (a) and (b) (resp. (a) and (c)), we can follow the proof of [Sta22, 08CI] (resp. [Sta22, 09U9]).

We will need later (see 5.3.2.12) the following lemma.

Lemma 1.4.3.3. *Let X be a scheme and $\mathcal{D}$ be a sheaf of rings on X endowed with a morphism of rings $\mathcal{O}_X \to \mathcal{D}$. Let $\mathcal{E}^\bullet \in K({}^1\mathcal{D})$. Let $a, b \in \mathbb{Z}$ with $a \leq b$. The following properties are equivalent.*

(a) The complex $\mathcal{E}^\bullet$ has tor-amplitude in $[a, b]$.

(b) We have $H^n(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet) = 0$ for all right $\mathcal{D}$-modules $\mathcal{M}$ which are quasi-coherent as $\mathcal{O}_X$-modules, and all $n \notin [a, b]$.

Proof. The implication $(a) \Rightarrow (b)$ is obvious by definition. Let us prove that the property (b) implies the property 1.4.3.2.(c). Suppose $\mathcal{E}^\bullet$ satisfies the condition (b). Let M be a right $\mathcal{D}_x$-modules and let $n \notin [a, b]$ be an integer. Let $i_x \colon \operatorname{Spec} k(x) \to X$ be the morphism induced by x. Since $i_{x*}M$ is a quasi-coherent right $\mathcal{D}$-module, then $H^n(i_{x*}M \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet) = 0$. Since i_x^{-1} is exact and since $i_x^{-1}(i_{x*}M \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet) \xrightarrow{\sim} M \otimes^{\mathbb{L}}_{\mathcal{D}_x} \mathcal{E}^\bullet_x$, then $H^n(M \otimes^{\mathbb{L}}_{\mathcal{D}_x} \mathcal{E}^\bullet_x) = 0$. □

Lemma 1.4.3.4. *Let $\rho \colon \mathcal{D} \to \mathcal{D}'$ be an homomorphism of sheaf of rings on a topological space. We get the functors $\rho_* \colon D({}^1\mathcal{D}') \to D({}^1\mathcal{D})$ and $\mathbb{L}\rho^* = \mathcal{D}' \otimes^{\mathbb{L}}_{\mathcal{D}} - \colon D({}^1\mathcal{D}) \to D({}^1\mathcal{D}')$. Let $a, b \in \mathbb{Z}$ with $a \leq b$.*

(a) If $\mathcal{E}^\bullet \in D({}^1\mathcal{D})$ has tor amplitude in $[a, b]$ then $\mathbb{L}\rho^*(\mathcal{E}^\bullet)$ has tor-amplitude in $[a, b]$.

(b) Suppose that $\mathcal{D}'$ has tor-amplitude in $[-d, 0]$ for some $d \in \mathbb{N}$ as a complex of $K({}^{\mathrm{r}}\mathcal{D})$. If $\mathcal{E}'^\bullet \in D({}^1\mathcal{D}')$ has tor amplitude in $[a, b]$ then $\rho_*(\mathcal{E}'^\bullet)$ has tor-amplitude in $[a - d, b]$.

Proof. Let $\mathcal{M}'$ be a right $\mathcal{D}'$-module. The part (a) is a consequence of the isomorphism $\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{D}'} (\mathcal{D}' \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet) \xrightarrow{\sim} \mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}^\bullet$. Let $\mathcal{M}$ be a right $\mathcal{D}$-module. The part (b) of lemma follows from the isomorphism $\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}'^\bullet \xrightarrow{\sim} (\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{D}') \otimes^{\mathbb{L}}_{\mathcal{D}'} \mathcal{E}'^\bullet$. □

Definition 1.4.3.5 (tor-dimension of a ring)**.** Let $\mathcal{D}$ be a sheaf of rings on a topological space X. We define the "tor-dimension of the sheaf of ring $\mathcal{D}$" to be the following number (possibly ∞):

$$\operatorname{tor.dim}(\mathcal{D}) := \sup\{n \in \mathbb{N} \ : \ \operatorname{Tor}^{\mathcal{D}}_n(\mathcal{M}, \mathcal{E}) \neq 0 \text{ for some left (resp. right) } \mathcal{D}\text{-module } \mathcal{E} \text{ (resp. } \mathcal{M})\}.$$

We say that $\mathcal{D}$ has *finite tor dimension* if $\operatorname{tor.dim}(\mathcal{D}) \in \mathbb{N}$. We say that $\mathcal{D}$ has *locally finite tor dimension* if there exists an open covering $\{U_\lambda \to X\}_{\lambda \in \Lambda}$ such that $\mathcal{D}|U_\lambda$ has finite tor dimension for any $\lambda \in \Lambda$.

1.4.3.6. Let $\mathcal{D}$ be a sheaf of rings on a topological space X. Let $n \in \mathbb{N}$. By definition, the following conditions are equivalent:

(a) $\operatorname{tor.dim}(\mathcal{D}) \leq n$;

(b) We have $\operatorname{Tor}^{\mathcal{D}}_i(\mathcal{M}, \mathcal{E}) = 0$ for any integer $i > n$ and any left (resp. right) $\mathcal{D}$-module $\mathcal{E}$ (resp. $\mathcal{M}$).

(c) Any left (resp. right) $\mathcal{D}$-module $\mathcal{E}$ (resp. $\mathcal{M}$) has tor-amplitude in $[-n, 0]$.

Remark 1.4.3.7. With notation 1.4.3.4, suppose ρ is flat. Then the functors ρ_* and ρ^* preserve the tor-amplitude. However, since they are not essentially surjective, we cannot compare a priori the tor dimensions of $\mathcal{D}$ and $\mathcal{D}'$ (however, sometimes this might happen: see 1.4.3.24).

Remark 1.4.3.8. Let $\mathcal{D}$ be a sheaf of rings on a topological space X. If $\mathcal{D}$ has locally finite tor dimension, then any complex of $C^{\mathrm{b}}(\mathcal{D})$ has locally finite tor-dimension.

1.4.3.9 (Point case)**.** Let D be a ring. Let $d \in \mathbb{N}$. The following assertions are equivalent.

(a) $\operatorname{tor.dim}(D) \leq d$;

(b) Any left D-module E has tor-amplitude in $[-d, 0]$;

(c) Any left D-module E of finite presentation has tor-amplitude in $[-d, 0]$;

(d) For any left D-module E of finite presentation, for any right D-module M of finite presentation, for any $n > d$, we have $\operatorname{Tor}^D_n(M, E) = 0$.

Indeed, the equivalence between (a) and (b) is tautological. The implications $(b) \Rightarrow (c) \Rightarrow (d)$ are obvious. The converse implications follow from the fact that any left (right) D-module is a small filtered inductive limit of modules of finite presentation (e.g. see [Bou61b, I.§2.Exercice 10]), from the fact that tensor products commute with inductive limits and that small filtered inductive limits are exact in the category of abelian groups.

Consider the assertions.

(i) There exists a left D-module E of finite presentation, a right D-module M of finite presentation, such that $\mathrm{Tor}_d^D(M,E) \neq 0$;

(ii) There exists a left D-module E of finite presentation, a right D-module M of finite presentation, there exists $n \geq d$ such that $\mathrm{Tor}_n^D(M,E) \neq 0$.

(iii) $\mathrm{tor}\,.\dim(D) \geq d$.

It follows from the equivalence between (a) and (d) we have the last relation $(i) \Rightarrow (ii) \Leftrightarrow (iii)$. We have moreover:

$$\mathrm{tor}\,.\dim(D) = \sup\{n \in \mathbb{N}, \exists \text{ a left (right) } D\text{-module } E\ (M) \text{ of f.p. such that } \mathrm{Tor}_n^D(M,E) \neq 0\}.$$

Lemma 1.4.3.10. *Let $\mathcal{D}$ be a sheaf of rings on a topological space X. We have the equality* $\mathrm{tor}\,.\dim(\mathcal{D}) = \sup_{x\in X} \mathrm{tor}\,.\dim(\mathcal{D}_x)$.

Proof. To check $\mathrm{tor}\,.\dim(\mathcal{D}) \leq \sup_{x\in X} \mathrm{tor}\,.\dim(\mathcal{D}_x)$, we can suppose $\sup_{x\in X} \mathrm{tor}\,.\dim(\mathcal{D}_x)$ is an integer denoted by n. Let $\mathcal{E}$ be a left $\mathcal{D}$-module. Then for any $x \in X$, the left $\mathcal{D}_x$-module $\mathcal{E}_x$ has tor-amplitude in $[-n,0]$. Hence, following 1.4.3.2, this implies that the left $\mathcal{D}$-module $\mathcal{E}$ has tor-amplitude in $[-n,0]$. With 1.4.3.6, this yields $\mathrm{tor}\,.\dim(\mathcal{D}) \leq n$.

Let $x \in X$. It remains to check $\mathrm{tor}\,.\dim(\mathcal{D}) \geq \mathrm{tor}\,.\dim(\mathcal{D}_x)$. We reduce to the case where $\mathrm{tor}\,.\dim(\mathcal{D})$ is an integer denoted by n. Let E be a left $\mathcal{D}_x$-module. Then the left $\mathcal{D}$-module $i_{x*}E$ has tor-amplitude in $[-n,0]$. Hence, so is $E = i_x^{-1} i_{x*}E$. □

Lemma 1.4.3.11. *Let $(D_i)_{i\in I}$ be a filtered inductive system of rings. Set $D := \varinjlim_{i\in I} D_i$. Suppose that $D_i \to D$ is right flat for any $i \in I$. Then* $\mathrm{tor}\,.\dim(D) \leq \sup\{\mathrm{tor}\,.\dim(D_i)\ ;\ i \in I\}$.

Proof. Set $n := \sup\{\mathrm{tor}\,.\dim(D_i)\colon\ i \in I\}$ that we can suppose finite. Let E be a left D-module of finite presentation. Then there exist $i_0 \in I$ and a left D_{i_0}-module E_{i_0} of finite presentation together with an isomorphism of left D-modules $D \otimes_{D_{i_0}} E_{i_0} \xrightarrow{\sim} E$. Since $\mathrm{tor}\,.\dim(D_{i_0}) \leq n$ then E_{i_0} has tor amplitude in $[-n,0]$. Since $D_{i_0} \to D$ is right flat this yields that $D \otimes_{D_{i_0}} E_{i_0}$ has tor amplitude in $[-n,0]$ (use 1.4.3.4.(a)). We conclude by using 1.4.3.9. □

Lemma 1.4.3.12. *Let $\mathcal{D}$ be a sheaf of rings on a topological space X. Let $x \in X$ and $\mathfrak{B}$ be a basis of open neighborhoods of x in X such that for any $U \in \mathfrak{B}$ the ring homomorphism $\mathcal{D}(U) \to \mathcal{D}_x$ is right flat. We have* $\mathrm{tor}\,.\dim(\mathcal{D}_x) \leq \sup\{\mathrm{tor}\,.\dim(\mathcal{D}(U))\ ;\ U \in \mathfrak{B}\}$.

Proof. This is a consequence of 1.4.3.11. □

Notation 1.4.3.13. By abuse of notation, for any set A we still denote by A the sheaf on a topological space Y associated with the constant preasheaf with value A.

Definition 1.4.3.14. Let $\mathcal{D}$ be a sheaf of rings on a scheme or a formal scheme X. We say that $\mathcal{D}$ satisfies "theorem A for coherent left modules" if the following conditions hold.

(i) The sheaf of rings $\mathcal{D}$ is left coherent ;

(ii) For any affine opens U, V of X such that $V \subset U$, the extension $\Gamma(U,\mathcal{D}) \to \Gamma(V,\mathcal{D})$ is right flat ;

(iii) For any affine open U of X, the functors $\Gamma(U,-)$ and $\mathcal{D}|_U \otimes_{\Gamma(U,\mathcal{D})} -$ induces canonically quasi-inverse equivalences between the category of coherent left $\mathcal{D}|_U$-modules and that of coherent left $\Gamma(U,\mathcal{D})$-modules ;

We say that $\mathcal{D}$ satisfies "theorem B for coherent left modules" if the following conditions hold.

(i) The sheaf of rings $\mathcal{D}$ is left coherent ;

(iv) For any affine open U of X, for any coherent left $\mathcal{D}|_U$-module $\mathcal{E}$, for any $i \geq 1$, we have $H^i(U, \mathcal{E}) = 0$.

We define similarly the notion of "theorems A and B for coherent right modules" and of "theorems A and B for coherent modules" when both left and right versions are satisfied.

1.4.3.15. By convention in this book, when we add "for coherent modules", it is understood that the ring $\mathcal{D}$ is coherent and for convenience we have added the flatness condition 1.4.3.14.(ii) to get the exactness of the functor $\mathcal{D}_U \otimes_{\Gamma(U,\mathcal{D})} -$. But we do not require affine sections to be noetherian (remark this latter condition together with 1.4.3.14.ii implies the coherence of $\mathcal{D}$: see 1.4.5.2). Such generality is needed in Theorem 8.7.5.5.

The word "canonically" in the condition (iii) of 1.4.3.14 means that the canonical morphisms $M \to \Gamma(U, \mathcal{D}|_U \otimes_{\Gamma(U,\mathcal{D})} M)$ and $\mathcal{D}|_U \otimes_{\Gamma(U,\mathcal{D})} \Gamma(U, \mathcal{M}) \to \mathcal{M}$ are isomorphisms for any affine open set U of X, any coherent $\Gamma(U, \mathcal{D})$-module M and any coherent $\mathcal{D}|_U$-module $\mathcal{M}$.

Remark 1.4.3.16. Let $\mathcal{D}$ be a sheaf of rings on a affine scheme or an affine formal scheme X. Put $D := \Gamma(X, \mathcal{D})$. We have the following properties (and its right version).

i) If $\mathcal{D}$ satisfies theorem A for coherent left modules then D is also left coherent from the property 1.4.3.14.(iii).

ii) Suppose $\mathcal{D}$ satisfies theorem B for coherent left modules. Since X is quasi-compact and quasi-separated, then it follows from [SGA4.2, VI.5.2] that the functors $H^i(X, -)$ for any $i \geq 0$ commute with filtered inductive limits of abelian groups. Since any left D-module is a filtered inductive limits of coherent left D-modules (see [Bou61b, I.§2.Exercice 10]), since the functor $\mathcal{D} \otimes_D -$ commutes also with filtered inductive limits of abelian groups, then for any left D-module E, $H^i(X, \mathcal{D} \otimes_D E) = 0$ for any $i \geq 1$.

iii) Suppose $\mathcal{D}$ satisfies theorems A and B for coherent left modules. Then, using the same arguments as above in ii), we get that the canonical map $E \to \Gamma(X, \mathcal{D} \otimes_D E)$ is an isomorphism for any left D-module E.

Proposition 1.4.3.17. *Let X be a noetherian affine (formal) scheme of finite Krull dimension. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorems A and B for left coherent modules (see 1.4.3.14). Set $D = \mathcal{D}(X)$. Let E be a coherent left D-module E, and $n \in \mathbb{N}$. The following conditions are equivalent.*

(a) The left D-module E has tor-amplitude in $[-n, 0]$ *;*

(b) The left $\mathcal{D}$-module $\mathcal{D} \otimes_D E$ has tor-amplitude in $[-n, 0]$.

In particular, we get the inequality $\operatorname{tor.dim} D \leq \operatorname{tor.dim} \mathcal{D}$.

Proof. I) Let us prove the equivalence $(a) \Leftrightarrow (b)$.

0) By right flatness of $D \to \mathcal{D}$, we get $(a) \to (b)$ (see 1.4.3.4.(a)). Conversely, suppose the left $\mathcal{D}$-module $\mathcal{D} \otimes_D E$ has tor-amplitude in $[-n, 0]$. Let $L^\bullet$ be a complex of free left D-modules of finite type such that $L^i = 0$ for $i > 0$ together with a quasi-isomorphism of $K({}^l D)$ of the form $L^\bullet \to E$.

1) Let us prove the case where $n = 0$, i.e. suppose $\mathcal{D} \otimes_D E$ is $\mathcal{D}$-flat. Let M be a left D-module. Set $\mathcal{E} := \mathcal{D} \otimes_D E$, $\mathcal{M} := M \otimes_D \mathcal{D}$, $\mathcal{L}^\bullet := \mathcal{D} \otimes_D L^\bullet$; $G^\bullet := M \otimes_D L^\bullet$ and $\mathcal{G}^\bullet := \mathcal{M} \otimes_{\mathcal{D}} \mathcal{L}^\bullet$. Following [Gro57, 3.6.5], since X is noetherian of finite Krull dimension then the functor $\Gamma(X, -)$ has bounded cohomology (see definition 4.6.1.4). Hence, it follows from 4.6.1.6.3 that we get the spectral sequence

$$E_1^{r,s} = R^s\Gamma(X, \mathcal{G}^r) \Rightarrow H^{r+s}\mathbb{R}\Gamma(X, \mathcal{G}^\bullet). \qquad (1.4.3.17.1)$$

Since $\mathcal{D}$ satisfies theorem B, since $\mathcal{G}^r$ is of the form $\mathcal{M}^{n_r}$ for some integer n_r, then if follows from 1.4.3.16.ii) that we get $E_1^{r,s} = 0$ if $s \neq 0$. It follows from 1.4.3.16.iii) that the canonical map $G^r \to \Gamma(X, \mathcal{G}^r)$ is an isomorphism. Hence, $E_1^{r,0}$ is canonically isomorphic to G^r and we get $H^n(G^\bullet) \xrightarrow{\sim} H^n\mathbb{R}\Gamma(X, \mathcal{G}^\bullet)$. Since $\mathcal{E}$ is flat, then $\mathcal{G}^\bullet \xrightarrow{\sim} \mathcal{M} \otimes_{\mathcal{D}} \mathcal{E}$ and therefore $H^n\mathbb{R}\Gamma(X, \mathcal{G}^\bullet) = 0$ for any $n \leq -1$. Since $H^n(G^\bullet) = Tor^D_{-n}(M, E)$, then we are done (use [Bou61b, I.§4. Proposition 1]).

2) Let us return to the general case. Let Q be the image of $L^{-n} \to L^{-n+1}$. By flatness of $D \to \mathcal{D}$, we get the flat left resolution $\mathcal{L}^\bullet := \mathcal{D} \otimes_D L^\bullet$ of $\mathcal{E} := \mathcal{D} \otimes_D E$ and the flat left resolution $\mathcal{Q}^\bullet := \mathcal{L}^{\bullet - n}$ of $\mathcal{Q} := \mathcal{D} \otimes_D Q$. For any right $\mathcal{D}$-module $\mathcal{M}$, this yields $\operatorname{Tor}_1^{\mathcal{D}}(\mathcal{M}, \mathcal{Q}) = H^{-1}(\mathcal{M} \otimes_{\mathcal{D}} \mathcal{Q}^\bullet) = H^{-n-1}(\mathcal{M} \otimes_{\mathcal{D}} \mathcal{L}^\bullet) = H^{-n-1}(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}} \mathcal{E}) = 0$. Hence $\mathcal{Q}$ is flat. This yields that Q is flat from the step 1). Hence we get

the exact sequence $0 \to Q \to L^{-n+1} \to L^{-n+2} \cdots \to L^0 \to E \to 0$ with flat left D-modules except E and we are done.

II) By choosing $n = \mathrm{tor.dim}\,\mathcal{D}$, the inequality $\mathrm{tor.dim}\, D \leq \mathrm{tor.dim}\,\mathcal{D}$ follows from the part I) and from 1.4.3.9.(c). □

By removing the hypothesis "satisfies theorem B", we can get closed to 1.4.3.17 results below (see 1.4.3.20). However, beware that 1.4.3.19 and 1.4.3.20 below are not enough to get a theorem A version of the inequality $\mathrm{tor.dim}\, D \leq \mathrm{tor.dim}\,\mathcal{D}$. Indeed, a priori we cannot descent the projectivity of finite presentation because D is not commutative.

Lemma 1.4.3.18. *Let $D \to D'$ be a right flat ring homomorphism such that D is a coherent ring. Then the following assertions are equivalent.*

(a) The map $D \to D'$ be a right faithfully flat ;

(b) For any coherent left D-module E such that $D' \otimes_D E = 0$, we have necessarily $E = 0$;

(c) Any sequence of coherent left D-modules $E \to F \to G$ such $D' \otimes_D E \to D' \otimes_D F \to D' \otimes_D G$ is exact is necessarily exact.

Proof. The equivalence between (b) and (c) is easy. The implication $(a) \Rightarrow (b)$ is tautological. Conversely, suppose (c). Let E be a left D-module such that $D' \otimes_D E = 0$. We have to prove that $E = 0$. Then $E \xrightarrow{\sim} \varinjlim_{i \in I} E_i$ with I a small filtered set and where E_i are coherent left D-modules (e.g. see [Bou61b, I.§2.Exercice 10] and recall that D is coherent). Hence, $\varinjlim_{i \in I} D' \otimes_D E_i = 0$. Let $i_0 \in I$. Since E_i is a left D-module of finite type, then there exists $i \geq i_0$ such that $D' \otimes_D E_{i_0} \to D' \otimes_D E_i$ is the null morphism, i.e. the sequence $D' \otimes_D E_{i_0} \to D' \otimes_D E_{i_0} \to D' \otimes_D E_i$ is exact. By using the property (c), we get that $E_{i_0} \to E_{i_0} \to E_i$ is exact, i.e. $E_{i_0} \to E_i$ is the null morphism. Hence, $\varinjlim_{i \in I} E_i = 0$. □

Lemma 1.4.3.19. *Let X be a scheme or a formal scheme. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorem A for left coherent modules (see 1.4.3.14). For any affine open U of X, for any finite covering $(U_i)_{i \in I}$ of U by affine opens, the extension $\mathcal{D}(U) \to \prod_{i \in I} \mathcal{D}(U_i)$ is left faithfully flat.*

Proof. Let E be a coherent left $\mathcal{D}(U)$-module such that $(\prod_{i \in I} \mathcal{D}(U_i)) \otimes_{\mathcal{D}(U)} E = 0$. Following 1.4.3.18, we reduce to prove that $E = 0$. Since I is finite, $\prod_{i \in I} \mathcal{D}(U_i) = \oplus_{i \in I} \mathcal{D}(U_i)$ and then for any $i \in I$ we get $\mathcal{D}(U_i) \otimes_{\mathcal{D}(U)} E = 0$. Set $\mathcal{E} := \mathcal{D}|U \otimes_{\mathcal{D}(U)} E$. For any $i \in I$, we get $\mathcal{E}|U_i = \mathcal{D}|U_i \otimes_{\mathcal{D}(U)} E \xrightarrow{\sim} \mathcal{D}|U_i \otimes_{\mathcal{D}(U_i)} \mathcal{D}(U_i) \otimes_{\mathcal{D}(U)} E = 0$. Hence $\mathcal{E} = 0$. By using the property 1.4.3.14.(iii), this yields $E = 0$. □

Proposition 1.4.3.20. *Let X be an affine scheme or an affine formal scheme. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorem A for left coherent modules (see 1.4.3.14). Set $D = \mathcal{D}(X)$. Let E be a coherent left D-module E, and $n \in \mathbb{N}$. The following conditions are equivalent.*

(a) There exists a finite covering $(U_i)_{i \in I}$ of X by affine opens such that the left $\mathcal{D}(U_i)$-module $\mathcal{D}(U_i) \otimes_D E$ has tor-amplitude in $[-n, 0]$ for any $i \in I$;

(b) The left $\mathcal{D}$-module $\mathcal{D} \otimes_D E$ has tor-amplitude in $[-n, 0]$.

Proof. 0) By right flatness of $\mathcal{D}(U_i) \to \mathcal{D}$, we get $(a) \to (b)$ (see 1.4.3.4.(a)). Conversely, suppose the left $\mathcal{D}$-module $\mathcal{D} \otimes_D E$ has tor-amplitude in $[-n, 0]$.

1) Let us prove the case where $n = 0$, i.e. suppose $\mathcal{D} \otimes_D E$ is $\mathcal{D}$-flat. Let $x \in X$. By hypothesis, $E_x := \mathcal{D}_x \otimes_D E$ is $\mathcal{D}_x$-flat. Since E_x is a flat left $\mathcal{D}_x$-module of finite presentation, then it is also a projective left $\mathcal{D}_x$-modules (e.g. see [Laz69, 1.4]). We have an exact sequence of coherent left D-module of the form $0 \to K \xrightarrow{a} L \xrightarrow{b} E \to 0$, where L is a free left D-module of finite type. By applying the exact functor $\mathcal{D}_x \otimes_D -$, we get the exact sequence $0 \to K_x \xrightarrow{a_x} L_x \xrightarrow{b_x} E_x \to 0$. Since E_x is projective then we get the section $\gamma \colon E_x \to L_x$. Since this is a morphism of left $\mathcal{D}_x$-module of finite presentation then for an open of X containing x small enough, the map γ is (up to canonical isomorphism) the image by $\mathcal{D} \otimes_{\mathcal{D}(U)} -$ of a morphism of left $\mathcal{D}(U)$-module of the form $c \colon \mathcal{D}(U) \otimes_D E \to \mathcal{D}(U) \otimes_D L$. Shrinking U is necessary, we can suppose c is a section of $\mathcal{D}(U) \otimes_D L \xrightarrow{\mathrm{id} \otimes b} \mathcal{D}(U) \otimes_D E$. Hence, $\mathcal{D}(U) \otimes_D E$ is projective. Since X is quasi-compact, we get a finite covering $(U_i)_{i \in I}$ of X by affine opens such that $\mathcal{D}(U_i) \otimes_D E$ is projective of finite presentation and we are done.

2) We deduce from 1) the general case by copying the part I.2) of the proof of 1.4.3.17. □

1.4.3.21. Let X be an affine scheme or an affine formal scheme. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorem A for left coherent modules (see 1.4.3.14). Set $D = \mathcal{D}(X)$. Let E be a coherent left D-module E.

1. In fact, we have proved in 1.4.3.20 that the following conditions are equivalent.
   (a) There exists a finite covering $(U_i)_{i\in I}$ of X by affine opens such that the left $\mathcal{D}(U_i)$-module $\mathcal{D}(U_i) \otimes_D E$ is projective of finite finite type for any $i \in I$;
   (b) The left $\mathcal{D}$-module $\mathcal{D} \otimes_D E$ is flat.
2. Suppose now that for any $x \in X$, the sheaf $\mathcal{D}_x$ is a local (non-commutative) ring. We have therefore the equivalent conditions:
   (a) There exists a finite covering $(U_i)_{i\in I}$ of X by affine opens such that the left $\mathcal{D}(U_i)$-module $\mathcal{D}(U_i) \otimes_D E$ is free of finite finite type for any $i \in I$;
   (b) The left $\mathcal{D}$-module $\mathcal{D} \otimes_D E$ is flat.

   Indeed, suppose $\mathcal{D}$-module $\mathcal{E} := \mathcal{D} \otimes_D E$ is flat. Then $\mathcal{E}_x = \mathcal{D}_x \otimes_D E$ is a projective, finitely presented $\mathcal{D}_x$-module (e.g. see [Laz69, 1.4]). Hence, following [Rot09, Theorem 4.44], $\mathcal{E}_x$ is a free $\mathcal{D}_x$-module of finite type. We get an isomorphism of the $\mathcal{D}_x^n \xrightarrow{\sim} \mathcal{E}_x$. Since $\mathcal{D}^n$ and $\mathcal{E}$ are coherent, then (e.g. use 8.4.1.11) there exists an open U containing x such that $\mathcal{D}_x^n \xrightarrow{\sim} \mathcal{E}_x$ comes from an isomorphism of the form $\mathcal{D}^n(U) \xrightarrow{\sim} \mathcal{E}(U)$. Hence, via theorem A for coherent $\mathcal{D}$-modules, we are done.

Proposition 1.4.3.22. *Let X be a noetherian affine (formal) scheme of finite Krull dimension. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorems A and B for left coherent modules (see 1.4.3.14). Let $\mathfrak{B}$ be an open basis of X consisting of affine opens. We have the formula*

$$\operatorname{tor.dim} \mathcal{D} = \sup\{\operatorname{tor.dim}(\mathcal{D}(U)) \ ; \ U \in \mathfrak{B}\}.$$

Proof. It follows from 1.4.3.17 (resp. 1.4.3.10) that we have the first (resp. second) inequality $\operatorname{tor.dim}(\mathcal{D}(U)) \leq \operatorname{tor.dim} \mathcal{D}|U \leq \operatorname{tor.dim} \mathcal{D}$ for any $U \in \mathfrak{B}$. Hence, $\sup\{\operatorname{tor.dim}(\mathcal{D}(U)) \ ; \ U \in \mathfrak{B}\} \leq \operatorname{tor.dim} \mathcal{D}$. Conversely, let $x \in X$ such that $\operatorname{tor dim}(\mathcal{D}) = \operatorname{tor dim}(\mathcal{D}_x)$ (recall 1.4.3.10). By using 1.4.3.12, since $\{U \in \mathfrak{B}; x \in U\}$ is a basis of open neighborhoods of x in X, since the ring homomorphisms $\mathcal{D}(U) \to \mathcal{D}_x$ are right flat, then we get $\operatorname{tor dim}(\mathcal{D}_x) \leq \sup\{\operatorname{tor.dim}(\mathcal{D}(U)) \ ; \ U \in \mathfrak{B}\}$. Hence, we are done. □

1.4.3.23. Let X be a scheme and $\mathcal{D}$ be a sheaf of rings on X endowed with a morphism of rings $\mathcal{O}_X \to \mathcal{D}$ such that $\mathcal{D}$ is quasi-coherent for the *left* multiplication. For any $U \subset V$ affine opens, since $\mathcal{O}(V) \to \mathcal{O}(U)$ is flat then $\mathcal{D}(V) \to \mathcal{D}(U)$ is *right* flat. Hence, for any affine open U, the map $\mathcal{D}(U) \to \mathcal{D}|U$ is right flat. This yields the exact functor $E \mapsto \mathcal{D}|U \otimes_{\mathcal{D}(U)} E$ from the category of left $\mathcal{D}(U)$-modules to the category of left $\mathcal{D}|U$-modules.

Proposition 1.4.3.24. *With the notation 1.4.3.23, let Y be a principal open subscheme of X. We get* $\operatorname{tor dim}(\mathcal{D}(Y)) \leq \operatorname{tor dim}(D)$.

Proof. We have $X = \operatorname{Spec} A$, $Y = \operatorname{Spec} A_f$ for some $f \in A$. Set $D_f := \Gamma(Y, \mathcal{D})$. Since $D \to D_f$ is right flat, then it follows from 1.4.3.4.(a) that we reduce to check the functor $D_f \otimes_D -$ from the category of left D-modules to that of left D_f-modules is essentially surjective.

By quasi-coherence hypothesis, the canonical morphism $A_f \otimes_A D \to D_f$ is an isomorphism of (A_f, D)-bimodule. Hence, for any left D-module E, the canonical homomorphism $A_f \otimes_A E \to D_f \otimes_D E$ is an isomorphism (in particular $D \to D_f$ is right flat). Since the canonical homomorphism $A_f \otimes_A D_f \to D_f$ is an isomorphism, this yield that so is the canonical morphism $D_f \otimes_D D_f \to D_f$. Hence, for any left D_f-module E, we get the isomorphisms $D_f \otimes_D E \xrightarrow{\sim} (D_f \otimes_D D_f) \otimes_{D_f} E) \xrightarrow{\sim} D_f \otimes_{D_f} E \xrightarrow{\sim} E$, and we are done. □

Corollary 1.4.3.25. *Let X be a noetherian scheme of finite Krull dimension. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorems A and B for left coherent modules (see 1.4.3.14). Suppose moreover $\mathcal{D}$ is endowed with a ring morphism $\mathcal{O}_X \to \mathcal{D}$ such that $\mathcal{D}$ is quasi-coherent for the left multiplication. Then for any affine open U of X we get* $\operatorname{tor dim}(\mathcal{D}(U)) = \operatorname{tor dim}(\mathcal{D}|U)$.

Proof. Let U be an affine open of X. By using 1.4.3.17, we get $\operatorname{tor}\dim(\mathcal{D}(U)) \leq \operatorname{tor}\dim(\mathcal{D}|U)$. Let $x \in U$ such that $\operatorname{tor}\dim(\mathcal{D}|U) = \operatorname{tor}\dim(\mathcal{D}_x)$ (recall 1.4.3.10). Let $\mathfrak{B}$ be the basis of open neighborhoods of x in X consisting in affine opens V including in U and containing x. By using 1.4.3.12 and 1.4.3.24, we get $\operatorname{tor}\dim(\mathcal{D}_x) \leq \operatorname{tor}\dim(\mathcal{D}(U))$. Hence, we are done. □

The following corollary improves 1.4.3.22 (which only gives $(b) \to (a)$) when X is a scheme and $\mathcal{D}$ is left quasi-coherent:

Corollary 1.4.3.26. *We keep notation and hypotheses of 1.4.3.25. Let U be an affine open of X and $n \in \mathbb{N}$. The following conditions are equivalent:*

(a) We have $\operatorname{tor}.\dim(\mathcal{D}(U)) = n$ *;*

(b) There exists an open basis $\mathfrak{B}$ of U consisting of affine opens such that $\operatorname{tor}.\dim(\mathcal{D}(V)) = n$*, for any $V \in \mathfrak{B}$.*

Proof. This is a consequence of 1.4.3.25. □

Definition 1.4.3.27. Let $\mathcal{D}$ be a sheaf of rings on a topological space X. Let $\mathcal{E}^\bullet \in C(\mathcal{D})$.

1. We say $\mathcal{E}^\bullet$ is "strictly perfect" if $\mathcal{E}^i$ is zero for all but finitely many i and $\mathcal{E}^i$ is a direct summand of a finite free $\mathcal{D}$-module for all i.
2. Let $n \in \mathbb{Z}$. According to [Sta22, 08FT], we say $\mathcal{E}^\bullet$ is n-pseudo-coherent if there exists an open covering $\{(U_\lambda \to X)\}_{\lambda\in\Lambda}$, and for each $\lambda \in \Lambda$ there exist a strictly perfect complex of $\mathcal{D}|_{U_\lambda}$-modules $\mathcal{E}^\bullet_\lambda$ and a morphism $\alpha_\lambda\colon \mathcal{E}^\bullet_\lambda \to \mathcal{E}^\bullet|_{U_\lambda}$ of $C(\mathcal{D}|_{U_\lambda})$ such that $H^j(\alpha_\lambda)$ is an isomorphism for $j > n$ and $H^n(\alpha_\lambda)$ is surjective.
3. We say $\mathcal{E}^\bullet$ is "pseudo-coherent" if it is n-pseudo-coherent for all $n \in \mathbb{Z}$.
4. Let $a, b \in \mathbb{Z}$ with $a \leq b$. We say $\mathcal{E}^\bullet$ is "has perfect amplitude in $[a, b]$" if there exists an open covering $\{U_\lambda \to X\}_{\lambda\in\Lambda}$ and for each $\lambda \in \Lambda$ a morphism of complexes $\alpha_\lambda\colon \mathcal{E}^\bullet_\lambda \to \mathcal{E}^\bullet|_{U_\lambda}$ which is a quasi-isomorphism with $\mathcal{E}^\bullet_\lambda$ strictly perfect and such that $\mathcal{E}^i_\lambda$ for any $i \notin [a, b]$ (see [SGA6, I.4.8]).
5. We say $\mathcal{E}^\bullet$ is "perfect" if there exists an open covering $\{U_\lambda \to X\}_{\lambda\in\Lambda}$ and for each $\lambda \in \Lambda$ a morphism of complexes $\alpha_\lambda\colon \mathcal{E}^\bullet_\lambda \to \mathcal{E}^\bullet|_{U_\lambda}$ which is a quasi-isomorphism with $\mathcal{E}^\bullet_\lambda$ strictly perfect (see [Sta22, 08CM]).
6. Let $n \in \mathbb{Z}$. We say an object of $D(\mathcal{D})$ is n-pseudo-coherent (resp. pseudo-coherent, resp. perfect) if and only if it can be represented by a n-pseudo-coherent (resp. pseudo-coherent, resp. perfect) complex of $\mathcal{D}$-modules. We denote by $D_{n-\mathrm{coh}}(\mathcal{D})$ (resp. $D_{\mathrm{coh}}(\mathcal{D})$, resp. $D_{\mathrm{perf}}(\mathcal{D})$) the full subcategory of $D(\mathcal{D})$ consisting of n-pseudo-coherent (resp. pseudo-coherent, resp. perfect) complexes.

Remark 1.4.3.28. Let $\mathcal{D}$ be a sheaf of rings on a *quasi-compact* topological space X. With the quasi-compactness hypothesis, a complex $\mathcal{E}^\bullet$ of $C(\mathcal{D})$ is perfect if and only if there exists integers $a \leq b$ such that $\mathcal{E}^\bullet$ has perfect amplitude in $[a, b]$.

1.4.3.29. Let $\mathcal{D}$ a sheaf of rings on a topological space. Suppose $\mathcal{D}$ is left coherent. Let $n \in \mathbb{N}$. Let $\mathcal{E}$ be a coherent left $\mathcal{D}$-module. By using [SGA6, I.4.14 and I.5.8.1], the following assertions are therefore equivalent:

a) The left $\mathcal{D}$-module $\mathcal{E}$ has tor-amplitude in $[-n, 0]$;

b) The left $\mathcal{D}$-module $\mathcal{E}$ has perfect amplitude in $[-n, 0]$;

c) There exists an open covering $\{U_\lambda \to X\}_{\lambda\in\Lambda}$ and for each $\lambda \in \Lambda$ there exists a complex $\mathcal{P}^\bullet_\alpha$ of projective left $\mathcal{D}|_{U_\lambda}$-modules of finite type with $\mathcal{P}^i = 0$ for $i \notin [a, b]$ together with a quasi-isomorphism of $K({}^l\mathcal{D}|_{U_\lambda})$ of the form $\mathcal{P}^\bullet \to \mathcal{E}|_{U_\lambda}$.

Let $\mathcal{E}^\bullet$ be an object of $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D})$ (see 4.6.1.3.(b)). This yields (by devissage) that $\mathcal{E}^\bullet$ is a perfect if and only if $\mathcal{E}$ has locally finite tor dimension.

Suppose $\mathcal{D}$ has locally finite tor dimension (and $\mathcal{D}$ is still coherent). Then, it follows from 1.4.3.8 that we get the equality $D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}) = D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D})$.

Lemma 1.4.3.30. *Let D be a left coherent ring. Let $d \in \mathbb{N}$. We get that the following assertions are equivalent.*

(a) $\mathrm{tor}\,.\dim(D) \leq d$ *;*

(b) Any left D-module E has tor-amplitude in $[-d, 0]$;

(c) Any left coherent D-module E has tor-amplitude in $[-d, 0]$;

(d) Any left coherent D-module E has perfect amplitude in $[-d, 0]$;

(e) For any left coherent D-module E, there exists a complex $P^\bullet$ of projective left D-modules of finite type with $P^i = 0$ for $i \notin [-d, 0]$ together with a quasi-isomorphism of $K({}^1D)$ of the form $P^\bullet \to E$.

(f) We have $\mathrm{Ext}^i_D(E, F) = 0$ *for any integer $i > d$, any left coherent D-module E and any left D-module F.*

(g) D has finite tor dimension and we have have $\mathrm{Ext}^i_D(E, D) = 0$ *for any integer $i > d$, any left coherent D-module E.*

Proof. By using 1.4.3.9 and 1.4.3.29, we get the equivalence between (a), (b), (c), (d), (e). The equivalence between (e) and (f) is easy. It remains to check the implication $(g) \Rightarrow (f)$. Let E be a left coherent D-module and F be a left D-module. Since D is left coherent and has finite tor dimension, then $E \in D^{\mathrm{b}}_{\mathrm{perf}}(D)$. Hence, it follows from 4.6.3.6.1 that the canonical morphism

$$\mathbb{R}\mathcal{H}om_D(E, D) \otimes^{\mathbb{L}}_D F \to \mathbb{R}\mathcal{H}om_D(E, D \otimes^{\mathbb{L}}_D F) = \mathbb{R}\mathcal{H}om_D(E, F)$$

is an isomorphism. By hypothesis $\mathbb{R}\mathcal{H}om_D(E, D) \in D^{\leq q}(D)$. Hence, we are done. □

The check of the following proposition is contained in the proofs of [Ber00, 4.4.4–5].

Proposition 1.4.3.31 (Berthelot)**.** *Let D be a p-torsion free π-adically complete noetherian $\mathcal{V}$-algebra. We get the k-algebra $\overline{D} := D/\mathfrak{m}D$ and we set $d :=$* $\mathrm{tor}\,.\dim(\overline{D})$*. We have the following properties.*

(a) We have $\mathrm{tor}\,.\dim D \leq d + 1$

(b) Let E be a p-torsion free left D-module of finite type. Then E admits a resolution by projective of finite type left D-modules of length $\leq d$.

(c) Let E be a left $D_{\mathbb{Q}}$-module of finite type. Then E admits a resolution by projective of finite type left $D_{\mathbb{Q}}$-modules of length $\leq d$.

(d) We have the inequality $\mathrm{tor}\,.\dim(D_{\mathbb{Q}}) \leq d$.

Proof. a) First remark that since the rings are noetherian, then left global dimension is equal to the right global dimension and to the tor dimension (see 2.3.4.2). Since the ring D is a π-adically complete noetherian ring, then by using the $\mathfrak{m}$-adic filtration it follows from [LvO96, I.7.2 Corollary 2] that we get the inequality

$$\mathrm{gl}\,.\dim D \leq \mathrm{gl}\,.\dim \mathrm{gr}\, D.$$

Since π is a regular sequence of D, then we get the canonical isomorphism of graded rings

$$\overline{D} \otimes_k k[t] \xrightarrow{\sim} \mathrm{gr}\, D$$

given by $t \to \pi \mod \mathfrak{m}^2 D$.

b) Remark that if N is a p-torsion free left D-module N of finite type such that $N/\pi N$ is a projective $\overline{D}$-module then N is a projective D-module (exercice or see the end of the proof of [Ber00, 4.4.5]). Hence, by truncating a resolution of E by p-torsion free left D-module of finite type, we get the part (b).

c) Since a left $D_{\mathbb{Q}}$-module of finite type comes from by extension a left D-module (see 7.4.5.3 and recall the noetherianity of D), since $D \to D_{\mathbb{Q}}$ is flat, then get (c) from (b).

d) The inequality $\mathrm{tor}\,.\dim D_{\mathbb{Q}} \leq d$ follows from 1.4.3.30 and the fact that D is noetherian. □

Proposition 1.4.3.32. *Let $(D^{(i)})_{i\in I}$ be an inductive system indexed by a filtered set I of left (resp. right) coherent rings such that the ring homomorphisms $D^{(i)} \to D^{(j)}$ are left (resp. right) flat. Set $D^\dagger := \varinjlim_i D_i$. Suppose there exists $d \in \mathbb{N}$ such that* $\operatorname{tor.dim} D^{(m)} \leq d$ *for m large enough. Then have the inequality* $\operatorname{tor.dim} D^\dagger \leq d$.

Proof. Since the proof is the same, let us consider the non-respective case. It follows from 1.4.3.30 that $D^\dagger$ is a left coherent ring. Let E be a coherent left $\mathcal{D}^\dagger$-module. Using 8.4.1.13, there exist $i \in I$ and a coherent left $D^{(i)}$-module $E^{(i)}$ such that $E \xrightarrow{\sim} D^\dagger \otimes_{D^{(i)}} E^{(i)}$. Since $D^{(i)}$ is a left coherent ring, then following 1.4.3.30 there exists a complex $P^\bullet$ of projective left $D^{(n)}$-modules of finite type with $P^n = 0$ for $n \notin [-d, 0]$ together with a quasi-isomorphism of $K({}^l D^{(i)})$ of the form $P^\bullet \to E^{(i)}$. Since E is quasi-isomorphic to $D^\dagger \otimes_{D^{(i)}} P^\bullet$, then we are done using loc. cit. □

1.4.4 Increasing the level: finiteness of the tor-dimension

Let $f: X \to S$ be a smooth morphism.

Proposition 1.4.4.1. Suppose S is of characteristic $p > 0$. Suppose that X/S have coordinates $t_1, \dots, t_d$.

(a) We have $\partial_i^{\langle p^{m+1}\rangle_{(m)}} = u_m \left(\partial_i^{[p^m]}\right)^p$, for $i = 1, \dots, d$, with $u_m = p!(p^m!)^p/p^{m+1}! \in \mathbb{Z}_{(p)}^*$. For any integer q, we have $\left(\partial_i^{\langle p^{m+1}\rangle_{(m)}}\right)^q = v_{m,q}\partial_i^{\langle p^{m+1}q\rangle_{(m)}}$, with $v_{m,q} \in \mathbb{Z}_{(p)}^*$.

(b) For any integer $q \geq 0$, $0 \leq r \leq p^{m+1} - 1$, by setting $k := p^{m+1}q + r$, we have $\partial_i^{\langle k\rangle_{(m)}} = u_{m,k}\left(\partial_i^{\langle p^{m+1}\rangle_{(m)}}\right)^q \partial_i^{\langle r\rangle_{(m)}}$, for $i = 1, \dots, d$, with $u_{m,k} \in \mathbb{Z}_{(p)}^*$.

(c) Let $\mathcal{K}^{(m)}$ be the set whose elements are the finite sums of the form $\sum_{\underline{k} \not< p^{m+1}} a_{\underline{k}} \underline{\partial}^{\langle \underline{k}\rangle_{(m)}}$, with $a_{\underline{k}} \in \mathcal{O}_X$ and $\underline{k} \not< p^{m+1}$ meaning that $k_i \geq p^{m+1}$ for at least one $1 \leq i \leq d$. Then $\mathcal{K}^{(m)}$ is the two-sided ideal of $\mathcal{D}_{X/S}^{(m)}$ generated by the operators $\partial_i^{\langle p^{m+1}\rangle_{(m)}}$, for $i = 1, \dots, d$.

(d) The center of $\mathcal{D}_{X/S}^{(m)}$ is equal to the polynomial algebra with coefficients in $\mathcal{O}_{X^{(m+1)}}$ in the operators $\partial_i^{\langle p^{m+1}\rangle_{(m)}}$.

Proof. The formula $\partial_i^{\langle p^{m+1}\rangle_{(m)}} = u_m \left(\partial_i^{[p^m]}\right)^p$ is a consequence of 1.4.2.7.c. The fact that u_m is invertible follows from 1.2.1.4.1. Let $n \geq p^{m+1}$. Then $n = p^m q + r$ with $q \geq p$ and $0 \leq r < p^m$, $n - p^{m+1} = p^m(q-p) + r$ and $p^{m+1} = p^m p + 0$. By using 1.2.1.4.1, this yields

$$v_p\left(\left\langle \begin{matrix} n \\ p^{m+1} \end{matrix} \right\rangle_{(m)}\right) = ((q-p) + p - q - \sigma(r) + \sigma(r) + \sigma(0))/(p-1) = 0. \tag{1.4.4.1.1}$$

By using 1.4.2.7.c , this yields

$$\partial_i^{\langle n\rangle_{(m)}} = \alpha_{m,n}\partial_i^{\langle p^{m+1}\rangle_{(m)}}\partial_i^{\langle n-p^{m+1}\rangle_{(m)}},$$

with $\alpha_{m,n} \in \mathbb{Z}_{(p)}^*$. Hence, by iterating this decomposition, we get the second part of a and b. By using 1.4.2.7.c, we get c. Finally, the property d is checked in [Ber96c, 2.2.6]. □

Proposition 1.4.4.2. *If S has characteristic p. Suppose that X/S have local coordinates $t_1, \dots, t_d$. Let $m' \geq m+1$ be an integer.*

(a) The homomorphisms $\mathcal{D}_{X/S}^{(m)} \to \mathcal{D}_{X/S}^{(m')}$, and $\mathcal{D}_{X/S}^{(m)} \to \mathcal{D}_{X/S}$ have the same kernel equal to $\mathcal{K}^{(m)}$.

(b) Moreover, $\mathcal{D}_{X/S}^{(m')}$ is free on the image of $\rho_{m',m}$, with the operators of the form $\underline{\partial}^{\langle p^{m+1}\underline{n}\rangle_{(m')}}$, $\underline{n} \in \mathbb{N}^d$ as a basis.

Proof. By using 1.2.1.1.1, since $q_{\underline{k}}^{(m)} = pq_{\underline{k}}^{(m+1)} + \underline{s}$ with $0 \leq s_i \leq p-1$, then we compute

$$v_p(q_{\underline{k}}^{(m)}!/q_{\underline{k}}^{(m+1)}!) = \sum_{i=1}^{d}(q_{k_i}^{(m)} - \sigma(q_{k_i}^{(m)}) - q_{k_i}^{(m+1)} + \sigma(q_{k_i}^{(m+1)}))/(p-1) = \sum_{i=1}^{d} q_{k_i}^{(m+1)}.$$

This yields that $v_p(q_{\underline{k}}^{(m)}!/q_{\underline{k}}^{(m+1)}!) = 0$ if and only if for any integer i we have $k_i \geq p^{m+1}$, which is denoted by $\underline{k} < p^{m+1}$. This implies that $v_p(q_{\underline{k}}^{(m)}!/q_{\underline{k}}^{(m')}!) = 0$ if and only if for for any integer i we have $k_i \geq p^{m+1}$, which is simply denoted by $\underline{k} < p^{m+1}$. Hence $\rho_{m,m'}(\mathcal{K}^{(m)}) = 0$. Conversely, let $P = \sum_{\underline{k}} a_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} \in \mathcal{D}_X^{(m)}$ be an operator such that $\rho_{m',m}(P) = 0$. From 1.4.2.5.2 this yields $\rho_{m',m}(P) = \sum_{\underline{k}<p^{m+1}} \frac{q_{\underline{k}}^{(m)}!}{q_{\underline{k}}^{(m+1)}!} a_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m')}}$, with $\frac{q_{\underline{k}}^{(m)}!}{q_{\underline{k}}^{(m')}!} \in \mathbb{Z}_{(p)}^*$ for any $\underline{k} < p^{m+1}$.This implies, for any $\underline{k} < p^{m+1}$, we have $a_{\underline{k}} = 0$. Hence, $P \in \mathcal{K}^{(m)}$. Then we have checked $\mathcal{K}^{(m)}$ is the kernel of $\rho_{m,m'}$ for any m'. By passing m' to the limit, this yields that $\mathcal{K}^{(m)}$ is also the kernel of ρ_m.

The image of $\rho_{m,m'}$ consists of elements of the form $\sum_{\underline{k}<p^{m+1}} a_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m')}}$. Hence, it follows from 1.4.4.1.a and 1.4.4.1.c the last statement. □

Remark 1.4.4.3. Suppose that X/S have local coordinates $t_1, \ldots, t_d$ with $d \geq 1$. Then similarly to 1.4.4.2, we check that the homomorphisms $\mathcal{D}_{X/S}^{(m)} \to \mathcal{D}_{X/S}^{(m+1)}$, $\mathcal{D}_{X/S}^{(m)} \to \mathcal{D}_{X/S}$ are injective if and only if S is flat over $\mathbb{Z}$.

Proposition 1.4.4.4. *Suppose p is locally nilpotent on S. For any m, $\mathcal{D}_{X/S}^{(m+1)}$ has left and right tor-dimension d over $\mathcal{D}_{X/S}^{(m)}$.*

Proof. Since this is local, we can suppose that X/S has local coordinates $t_1, \ldots, t_d$.

1) Suppose S has characteristic $p > 0$. Denote by $\overline{\mathcal{D}}_{X/S}^{(m)} := \mathcal{D}_{X/S}^{(m)}/\mathcal{K}^{(m)}$. Since $\overline{\mathcal{D}}_{X/S}^{(m)}$ is isomorphic to the image of $\rho_{m',m}$, it follows from 1.4.4.2.b that we reduce to check that $\overline{\mathcal{D}}_{X/S}^{(m)}$ has left and right tor-dimension d over $\mathcal{D}_{X/S}^{(m)}$.

Let $\mathcal{K}_0^{(m)}$ be the zero ideal of $\mathcal{D}_{X/S}^{(m)}$. Set $E_0 := \mathbb{N}^d$. For any integer $1 \leq r \leq d$, denote by $\mathcal{K}_r^{(m)}$ the is the two-sided ideal of $\mathcal{D}_{X/S}^{(m)}$ generated by the operators $\partial_i^{\langle p^{m+1} \rangle_{(m)}}$, for $i = 1, \ldots, r$; and let E_r be the subset of $\mathbb{N}^d$ of elements $\underline{k}$ such that $k_1, \ldots, k_r < p^{m+1}$. For any $0 \leq r \leq d$, let $\mathcal{J}_r^{(m)}$ be the subset of $\mathcal{D}_{X/S}^{(m)}$ consisting of the elements which can (uniquely) be written of the form $\sum_{\underline{k} \in E_r} a_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$, with $a_{\underline{k}} \in \mathcal{O}_X$. If follows from 1.4.4.1.b that the composition morphism $\mathcal{J}_r^{(m)} \to \mathcal{D}_{X/S}^{(m)} \to \mathcal{D}_{X/S}^{(m)}/\mathcal{K}_r^{(m)}$ is an isomorphism and we can identify them. Moreover, for any $0 \leq r \leq d-1$, by using 1.4.4.1.1, we can easily check that the homomorphism $\partial_{r+1}^{\langle p^{m+1} \rangle_{(m)}} : \mathcal{D}_{X/S}^{(m)}/\mathcal{K}_r^{(m)} \to \mathcal{D}_{X/S}^{(m)}/\mathcal{K}_r^{(m)}$ is injective. Since $\mathcal{K}^{(m)} = \mathcal{K}_d^{(m)}$, we are done.

2) Let us go back to the general case. Suppose S is affine and p^{n+1} vanishes in S. We proceed by induction on $n \in \mathbb{N}$. For any integer $0 \leq i \leq n-1$, set $S_i := S \times_{\mathbb{Z}} \mathbb{Z}/p^{i+1}\mathbb{Z}$, $X_i = X \times_S S_i$. Let $\mathcal{E}$ be a left $\mathcal{D}_{X/S}^{(m)}$-module. We have to prove that $H^j(\mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} \mathcal{E}) = 0$ for any $j \notin [-d, 0]$. For any $0 \leq i \leq n-1$, we have the isomorphisms

$$\mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} \mathcal{D}_{X_i/S_i}^{(m)} \xrightarrow{\sim} \mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} \left(\mathcal{D}_{X/S}^{(m)} \otimes^{\mathbb{L}}_{\mathcal{O}_S} \mathcal{O}_{S_i}\right) \xrightarrow{\sim} \mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{O}_S} \mathcal{O}_{S_i} \xrightarrow{\sim} \mathcal{D}_{X_i/S_i}^{(m+1)}.$$

Hence, if $\mathcal{G}_i$ is a left $\mathcal{D}_{X_i/S_i}^{(m)}$-module, we get the isomorphisms

$$\mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} \mathcal{G}_i \xrightarrow{\sim} \left(\mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} \mathcal{D}_{X_i/S_i}^{(m)}\right) \otimes^{\mathbb{L}}_{\mathcal{D}_{X_i/S_i}^{(m)}} \mathcal{G}_i \xrightarrow{\sim} \mathcal{D}_{X_i/S_i}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X_i/S_i}^{(m)}} \mathcal{G}_i.$$

We have the exact sequence $0 \to p\mathcal{E} \to \mathcal{E} \to \mathcal{E}/p\mathcal{E} \to 0$, which yields the exact triangle

$$\mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} p\mathcal{E} \to \mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} \mathcal{E} \to \mathcal{D}_{X/S}^{(m+1)} \otimes^{\mathbb{L}}_{\mathcal{D}_{X/S}^{(m)}} \mathcal{E}/p\mathcal{E} \to +1$$

Since $p\mathcal{E}$ is a left $\mathcal{D}^{(m)}_{X_{n-1}/S_{n-1}}$-module and $\mathcal{E}/p\mathcal{E}$ is a left $\mathcal{D}^{(m)}_{X_0/S_0}$-module, we are done.

□

1.4.4.5. The sheaf $\mathcal{D}^{(m)}_{X/S}$ admits a natural filtration $F_\bullet\mathcal{D}^{(m)}_{X/S}$ of sheaf of rings which we call the *filtration by order*. If P is a section of $\mathcal{D}^{(m)}_{X/S}$ on a neighborhood of a point $x \in X$,we denote by $\mathrm{ord}_x(P)$ the smallest integer n such that $P_x \in \mathcal{D}^{(m)}_{X/S,n,x}$. For any open set $U \subset X$ and any $P \in \Gamma(U, \mathcal{D}^{(m)}_{X/S})$, put

$$\mathrm{ord}_U(P) := \sup_{x\in U} \mathrm{ord}_x(P).$$

Set $F_k\mathcal{D}^{(m)}_{X/S}(U) = \{P \in \Gamma(U, \mathcal{D}^{(m)}_{X/S}) : \mathrm{ord}_U(P) \leq k\}$.

1.4.5 Coherence of the sheaf of differential operators

First, let us recall the notion of coherence.

Definition 1.4.5.1. Let T be a topological space, $\mathcal{D}$ a sheaf of rings on T. Let $\mathcal{E}$ be a left (resp. right) $\mathcal{D}$-module.

(i) We say that $\mathcal{E}$ is of finite type if for any $x \in T$, there exists an open neighborhood U of x such that is generated by finitely many sections, i.e. there exist a positive integer r and an exact sequence in the category of (sheaves of) left (resp. right) $\mathcal{D}$-modules of the form $\mathcal{D}^r_{|U} \to \mathcal{E}_{|U}$.

(ii) We say that $\mathcal{E}$ is of finite presentation if for any $x \in T$, there exists an open neighborhood U of x such that $\mathcal{E}_{|U}$ is the cokernel of a morphism of left (resp. right) $\mathcal{D}$-modules of the form $\mathcal{D}^a_{|U} \to \mathcal{D}^{\mathrm{b}}_{|U}$.

(iii) We say $\mathcal{E}$ is a coherent left (resp. right) $\mathcal{D}$-module if the following conditions are satisfied

  (a) $\mathcal{E}$ is of finite type ;

  (b) for any open sets $U \subset T$, for any morphism of left (resp. right) $\mathcal{D}$-modules $\alpha\colon \mathcal{D}^a_{|U} \to \mathcal{E}_{|U}$, the kernel $\ker\alpha$ is of finite type.

  In fact, we can check that the property (b) is equivalent to the following one

  (c) for any open sets $U \subset T$, any submodule $\mathcal{F}$ of $\mathcal{E}|U$ of finite type is of finite presentation.

(iv) We say that $\mathcal{D}$ is a left (resp. right) coherent sheaf of rings if $\mathcal{D}$ is coherent as a left (resp. right) $\mathcal{D}$-module.

Proposition 1.4.5.2. *Let T be a topological space, $\mathcal{D}$ a sheaf of rings on T and $\mathfrak{B}$ a basis of open subsets of T satisfying the following conditions:*

(a) For any $U \in \mathfrak{B}$, the ring $\Gamma(U, \mathcal{D})$ is left (resp. right) noetherian.

(b) For any $U, V \in \mathfrak{B}$ with $V \subset U$, the homomorphism $\Gamma(U, \mathcal{D}) \to \Gamma(V, \mathcal{D})$ is right (resp. left) flat.

Then $\mathcal{D}$ is a left (resp. right) coherent sheaf of rings.

Proof. It suffices to show that for all $U \in \mathfrak{B}$ and all $u\colon (\mathcal{D}|_U)^n \to \mathcal{D}|_U$, $\mathcal{N} = \mathrm{Ker}(u)$ is a left $\mathcal{D}|_U$-module of finite type. Write $D = \Gamma(U, \mathcal{D})$, $N = \Gamma(U, \mathcal{N})$. From the condition b), we can check the functor which associates from a left D-module M the left $\mathcal{D}|_U$-module $\mathcal{D}|_U \otimes_D M$ is exact. Since N is of finite type by a), this yields that $\mathcal{N} \xrightarrow{\sim} \mathcal{D}|_U \otimes_D N$ is of finite type. □

Corollary 1.4.5.3. *Let $f\colon X \to S$ be a smooth morphism.*

(a) Then for any inclusion of affine opens of X of the form $V \subset U$, the canonical morphism $\Gamma(U, \mathcal{D}^{(m)}_{X/S}) \to \Gamma(V, \mathcal{D}^{(m)}_{X/S})$ is flat.

(b) Suppose S is locally noetherian. The sheaf $\mathcal{D}^{(m)}_{X/S}$ is coherent.

Proof. Since $\mathcal{D}^{(m)}_{X/S}$ is a quasi-coherent $\mathcal{O}_X$-module, for any inclusion of affine opens of X of the form $V \subset U$, the canonical morphism

$$\Gamma(V, \mathcal{O}_X) \otimes_{\Gamma(U,\mathcal{O}_X)} \Gamma(U, \mathcal{D}^{(m)}_{X/S}) \to \Gamma(V, \mathcal{D}^{(m)}_{X/S})$$

is an isomorphism. Hence, $\Gamma(U, \mathcal{D}^{(m)}_{X/S}) \to \Gamma(V, \mathcal{D}^{(m)}_{X/S})$ is flat. By using 1.4.2.11, we can apply proposition 1.4.5.2 to conclude. □

Chapter 2

$\mathcal{D}$-modules

Let $m \in \mathbb{N} \cup \{+\infty\}$.

(a) First case: $m \in \mathbb{N}$, S is a $\operatorname{Spec} \mathbb{Z}_{(p)}$-scheme and $m \in \mathbb{N}$, $(\mathfrak{a}, \mathfrak{b}, \alpha)$ is a quasi-coherent m-PD-ideal of $\mathcal{O}_S$ and $f\colon X \to S$ be a smooth morphism.

(b) Second case: $m = \infty$ and $f\colon X \to S$ is a weakly smooth morphism and we use notation 1.4.2.6.

2.1 Stratifications and costratifications

2.1.1 PD-stratifications of level m

The formula (1.4.2.8.3) shows that the data of a left $\mathcal{D}_X^{(m)}$-module structure extending an $\mathcal{O}_X$-module structure is determined by the action of the operators $\partial_i^{\langle p^j \rangle}$ for $0 \leq j \leq m$. When $m \geq 1$ it is not always easy to give explicitly this action. For this reason when we want to show an $\mathcal{O}_X$-module $\mathcal{M}$ has the structure of a left $\mathcal{D}_X$-module, we often construct on $\mathcal{M}$ stratifications which are just the data of infinitesimal descent. This coordinate-free method of using the crystalline interpretation of a $\mathcal{D}_X$-module in terms of stratifications was due to Grothendieck.

Definition 2.1.1.1. With notations 1.4.1.2 and 1.4.1.14, an m-PD *stratification relative to X/S* on an $\mathcal{O}_X$-module $\mathcal{E}$ is the data of a family (as n varies) of $\mathcal{P}^n_{X,(m)}$-linear homomorphisms

$$\varepsilon_n \colon \mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} = p^{n*}_{1(m)}(\mathcal{E}) \to p^{n*}_{0(m)}(\mathcal{E}) = \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X,(m)}, \tag{2.1.1.1.1}$$

which satisfy the following conditions:

(a) $\varepsilon_0 = \mathrm{id}_{\mathcal{E}}$ and for any $n' \geq n$ in $\mathbb{N}$, ε_n and $\mathcal{P}^n_{X,(m)} \otimes_{\mathcal{P}^{n'}_{X,(m)}} \varepsilon_{n'}$ are canonically isomorphic, i.e. the following diagram

$$\begin{array}{ccc} \psi^{n',n*}_{X/S,(m)}(\mathcal{P}^{n'}_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}) & \xrightarrow{\psi^{n',n*}_{X/S,(m)}(\varepsilon^{\mathcal{E}}_{n'})} & \psi^{n',n*}_{X/S,(m)}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S,(m)}) \\ \downarrow\wr & & \downarrow\wr \\ \mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\varepsilon^{\mathcal{E}}_n} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)} \end{array} \tag{2.1.1.1.2}$$

whose vertical isomorphisms are the canonical ones, is commutative.

(b) (Cocycle condition) For all integers n, n' in $\mathbb{N}$, with notation 1.4.1.15, we have commutative diagrams of $\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}$-modules:

$$\begin{array}{ccc} \mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)} \otimes \mathcal{E} & \xrightarrow{\delta^{n,n',*}_{(m)}(\varepsilon_{n+n'})} & \mathcal{E} \otimes \mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}. \\ & {\scriptstyle q^{n,n',*}_{1,(m)}(\varepsilon_{n+n'})} \searrow \quad \nearrow {\scriptstyle q^{n,n',*}_{0,(m)}(\varepsilon_{n+n'})} & \\ & \mathcal{P}^n_{X,(m)} \otimes \mathcal{E} \otimes \mathcal{P}^{n'}_{X,(m)} & \end{array} \tag{2.1.1.1.3}$$

Say an $\mathcal{O}_X$-linear homomorphism $\varphi : \mathcal{E} \to \mathcal{F}$ between modules equipped with m-PD stratifications relative to X/S is *horizontal* if it commutes with all ε_n.

Remark 2.1.1.2. Following 1.4.1.15, we have three ring homomorphisms $p^{n,n'}_{i,(m)} \colon \mathcal{O}_X \to \mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X,(m)}$. The diagram 2.1.1.1.3 can be reinterpreted with the following commutative diagram

$$\begin{array}{ccc} p^{n,n'*}_{2,(m)}(\mathcal{E}) & \xrightarrow{\delta^{n,n',*}_{(m)}(\varepsilon_{n+n'})} & p^{n,n'*}_{0,(m)}(\mathcal{E}) \\ & {\scriptstyle q^{n,n',*}_{1,(m)}(\varepsilon_{n+n'})}\searrow \qquad \nearrow{\scriptstyle q^{n,n',*}_{0,(m)}(\varepsilon_{n+n'})} & \\ & p^{n,n'*}_{1,(m)}(\mathcal{E}). & \end{array} \qquad (2.1.1.2.1)$$

It follows from 1.4.1.12.3 and 1.4.1.13.1 that we have the commutative diagram

$$\begin{array}{ccccccc} X & \hookrightarrow & \Delta^n_{X/S,(m)} \times_{p_1,X,p_0} \Delta^{n'}_{X/S,(m)} & \longrightarrow & X^2_{/S} \times_{p_1,X,p_0} X^2_{/S} & \xrightarrow{p_1 \times p_0} & X \times_X X \\ \| & & \downarrow & & \downarrow \wr & & \downarrow \wr \\ X & \hookrightarrow & \Delta^{n+n'}_{X/S,(m)}(2) & \longrightarrow & X^3_{/S} & \xrightarrow{p_1} & X \\ \| & & \downarrow {\scriptstyle (q^{n+n'}_{01,(m)}, q^{n+n'}_{12,(m)})} & & {\scriptstyle (p_{01},p_{12})} \downarrow \wr & & \downarrow \wr \\ X & \hookrightarrow & \Delta^{n+n'}_{X/S,(m)} \times_{p_1,X,p_0} \Delta^{n+n'}_{X/S,(m)} & \longrightarrow & X^2_{/S} \times_{p_1,X,p_0} X^2_{/S} & \xrightarrow{p_1 \times p_0} & X \times_X X. \end{array} \qquad (2.1.1.2.2)$$

With notation 1.4.1.13, this yields that the above condition 2.1.1.1.b is equivalent to

$$\forall\, n \in \mathbb{N}, \qquad q^{n*}_{02,(m)}(\varepsilon_n) = q^{n*}_{01,(m)}(\varepsilon_n) \circ q^{n*}_{12,(m)}(\varepsilon_n). \qquad (2.1.1.2.3)$$

Proposition 2.1.1.3. *Let $\mathcal{E}$ be an $\mathcal{O}_X$-module together with an m-PD stratification $(\varepsilon^{\mathcal{E}}_n)$ relative to X/S. Then the homomorphisms $\varepsilon^{\mathcal{E}}_n$ are $\mathcal{P}^n_{X/S,(m)}$-linear isomorphisms.*

Proof. Let $\iota^n_{(m)} \colon \mathcal{P}^n_{X/S,(m)}(2) \to \mathcal{P}^n_{X/S,(m)}$ be the m-PD-homomorphism corresponding to the closed immersion $\iota \colon X^2_{/S} \to X^3_{/S}$ given by $(x,y) \mapsto (x,y,x)$. Let σ be the canonical involution of $X^2_{/S}$, i.e. $\sigma(x,y) = (y,x)$. This yields the m-PD-isomorphism $\sigma^n_{(m)} \colon \mathcal{P}^n_{X/S,(m)} \xrightarrow{\sim} \mathcal{P}^n_{X/S,(m)}$. Since $p_{01} \circ \iota = \mathrm{id}$, then by unicity of the m-PD-factorisation we get $q^n_{01,(m)} \circ \iota^n_{(m)} = \mathrm{id}$. Moreover, since $p_{12} \circ \iota = \sigma$ then $q^n_{12,(m)} \circ \iota^n_{(m)} = \sigma^n_{(m)}$. Since $p_{02} \circ \iota = \Delta_{X/S} \circ p_0$, then $q^n_{02,(m)} \circ \iota^n_{(m)}$ is equal to the composition $\mathcal{P}^n_{X/S,(m)} \twoheadrightarrow \mathcal{O}_X \xrightarrow{p^n_{1,(m)}} \mathcal{P}^n_{X/S,(m)}$. Hence, $\iota^{n*}_{(m)} \circ q^{n*}_{02,(m)}(\varepsilon_n) = p^{n*}_{1,(m)}(\mathrm{id}) = \mathrm{id}$. By applying $\iota^{n*}_{(m)}$ to the equality 2.1.1.2.3 we get $\mathrm{id} = \sigma^{n*}_{(m)}(\varepsilon_n) \circ \varepsilon_n$. Since $\sigma^{n*}_{(m)}$ is an involution, by applying $\sigma^{n*}_{(m)}$ to this equality we get $\mathrm{id} = \varepsilon_n \circ \sigma^{n*}_{(m)}(\varepsilon_n)$ and then $\sigma^{n*}_{(m)}(\varepsilon_n)$ is the inverse of ε_n. □

Notation 2.1.1.4. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. For any $n \in \mathbb{N}$, since $\mathcal{P}^n_{X,(m)}$ has two structures of $\mathcal{O}_X$-modules, then so is $\mathcal{D}^{(m)}_{X,n}$, which we call the left one and the right one. When we want to clarify which $\mathcal{O}_X$-module structure we choose, we write p_{0*} for the left one and p_{1*} for the right one. For instance, we write $\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n}, \mathcal{E})$ to clarify that we take the left structure of $\mathcal{O}_X$-module to compute the internal homomorphism sheaf. The sheaf $\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n}, \mathcal{E})$ has also by functoriality two structures of $\mathcal{O}_X$-modules: the left (resp. right) one denoted by p_{0*} (resp. p_{1*}) equal to that coming from the left (resp. right) structure of $\mathcal{D}^{(m)}_{X,n}$.

We denote by $\mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{E}$ where to compute the tensor product we have chosen the right structure of $\mathcal{O}_X$-module of $\mathcal{D}^{(m)}_{X,n}$. By functoriality, $\mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{E}$ is also an $(\mathcal{O}_X, \mathcal{O}_X)$-module i.e. has a left structure of $\mathcal{O}_X$-module denoted by p_{0*} coming from the left structure of $\mathcal{D}^{(m)}_{X,n}$, and the internal one (i.e. given by the tensor product) denoted by p_{1*}. Similarly, $\mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'}$ where the $\mathcal{O}_X$-module structure of the tensor product comes from the right (resp. left) structure of $\mathcal{D}^{(m)}_{X,n}$ (resp. $\mathcal{D}^{(m)}_{X,n'}$) is an $(\mathcal{O}_X, \mathcal{O}_X, \mathcal{O}_X)$-module:

its left structure comes from the left one of $\mathcal{D}^{(m)}_{X,n}$, its middle structure is the internal one coming from the tensor product, its right structure comes from the right one of $\mathcal{D}^{(m)}_{X,n'}$. When we want to clarify which $\mathcal{O}_X$-module structure we choose, we write p_{i*} with $i = 0, 1, 2$ for the left, middle, right ones.

We have the Cartan isomorphism (see 4.6.3.9.1):

$$\mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}\mathcal{D}^{(m)}_{X,n'}, p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n}, \mathcal{E})\right) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}(\mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'}), \mathcal{E}\right). \qquad (2.1.1.4.1)$$

The right term of 2.1.1.4.1 can be endowed with three structures of $\mathcal{O}_X$-module: that coming from the internal structure denoted by p_0, that coming from the middle and right structures of $\mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'}$ denoted respectively by p_{i*} for $i = 1, 2$. Via the isomorphism 2.1.1.4.1, this yields three structures of $\mathcal{O}_X$-module for left term that we still denote by p_{i*} for $i = 0, 1, 2$.

It follows from 1.4.2.1.3 that we get the homomorphism

$$\mu_{n,n'} \colon \mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'} \to \mathcal{D}^{(m)}_{X,n+n'}, \qquad (2.1.1.4.2)$$

where the $\mathcal{O}_X$-module structure of the tensor product comes from the right (resp. left) structure of $\mathcal{D}^{(m)}_{X,n}$ (resp. $\mathcal{D}^{(m)}_{X,n'}$). Since $\mu_{n,n'}$ is $\mathcal{O}_X$-linear for the left (and the right) structure, we get the morphism

$$\mathcal{H}om_{\mathcal{O}_X}(\mu_{n,n'}, \mathcal{E}) \colon p_{1*}\mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}(\mathcal{D}^{(m)}_{X,n+n'}), \mathcal{E}\right) \to p_{2*}\mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}(\mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'}), \mathcal{E}\right). \qquad (2.1.1.4.3)$$

Proposition 2.1.1.5. *We have the following properties.*

(I) Given an $\mathcal{O}_X$-module $\mathcal{E}$. The following are equivalent.

(a) A left $\mathcal{D}^{(m)}_X$-module structure on $\mathcal{E}$ extending its $\mathcal{O}_X$-module structure.

(b) A family of $\mathcal{O}_X$-linear homomorphisms $\theta_n \colon \mathcal{E} \to p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X,(m)})$ (the $\mathcal{O}_X$-module structure of this latter is induced by the right structure of $\mathcal{P}^n_{X,(m)}$) satisfying

(i) $\theta_0 = \mathrm{id}_{\mathcal{E}}$ (modulo the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{E} \otimes \mathcal{P}^0_{X,(m)}$) and for any $n, n' \in \mathbb{N}$, the diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\theta_n} & \mathcal{E} \otimes \mathcal{P}^n_{X,(m)} \\ \| & & \uparrow{\scriptstyle \mathrm{id} \otimes \psi^{n+n',n}_{X/S,(m)}} \\ \mathcal{E} & \xrightarrow[\theta_{n+n'}]{} & \mathcal{E} \otimes \mathcal{P}^{n+n'}_{X,(m)} \end{array} \qquad (2.1.1.5.1)$$

is commutative.

(ii) for all n, n' we have commutative diagrams (cocycle condition)

$$\begin{array}{ccc} \mathcal{E} \otimes \mathcal{P}^{n+n'}_{X,(m)} & \xrightarrow{\mathrm{id} \otimes \delta^{n,n'}_{(m)}} & \mathcal{E} \otimes \mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)} \\ {\scriptstyle \theta_{n+n'}}\uparrow & & \uparrow{\scriptstyle \theta_n \otimes \mathrm{id}} \\ \mathcal{E} & \xrightarrow{\theta'_n} & \mathcal{E} \otimes \mathcal{P}^{n'}_{X,(m)}. \end{array} \qquad (2.1.1.5.2)$$

(c) An m-PD stratification $\varepsilon = (\varepsilon^{\mathcal{E}}_n)$ on $\mathcal{E}$.

(II) Let $\mathcal{E}$ be left $\mathcal{D}^{(m)}_X$-module and let $\theta^{\mathcal{E}} = (\theta^{\mathcal{E}}_n)$, $\varepsilon^{\mathcal{E}} = (\varepsilon^{\mathcal{E}}_n)$ be the associated family or m-PD stratification.

(a) We retrieve from $\theta^{\mathcal{E}}$ (resp. $\varepsilon^{\mathcal{E}}$) the action by a section P of $\mathcal{D}^{(m)}_X$ on $\mathcal{E}$ via the following composition of the bottom (resp. top) horizontal morphisms of the commutative diagram:

$$\begin{array}{ccccccc} \mathcal{E} & \xrightarrow[1.4.1.14]{p^n_{1,(m),\mathcal{E}}} & \mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\varepsilon^{\mathcal{E}}_n} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X,(m)} & \xrightarrow{\mathrm{id} \otimes P} & \mathcal{E} \\ \| & & & & \| & & \| \\ \mathcal{E} & & \xrightarrow{\theta^{\mathcal{E}}_n} & & p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X,(m)}) & \xrightarrow{\mathrm{id} \otimes P} & \mathcal{E}. \end{array} \qquad (2.1.1.5.3)$$

For instance, when $\mathcal{E} = \mathcal{O}_X$ is endowed with the canonical m-PD-stratification (see 3.4.2.4), we retrieve its usual action of left $\mathcal{D}_X^{(m)}$-module (see 1.4.2.5.4).

(b) Suppose X/S is equipped with coordinates $t_1, \ldots, t_d$. Conversely, with notation 1.4.2.3, for any $x \in \mathcal{E}$, we have the Taylor expansion formula

$$\theta_n(x) = \sum_{|k| \leq n} \underline{\partial}^{\langle k \rangle} x \otimes \underline{\tau}^{\{k\}}, \qquad \varepsilon_n^{\mathcal{E}}(1 \otimes x) = \sum_{|\underline{k}| \leq n} \underline{\partial}^{\langle \underline{k} \rangle} x \otimes \underline{\tau}^{\{\underline{k}\}}. \tag{2.1.1.5.4}$$

The inverse is given by

$$(\varepsilon_n^{\mathcal{E}})^{-1}(x \otimes 1) = \sum_{|\underline{k}| \leq n} (-1)^{|\underline{k}|} \underline{\tau}^{\{\underline{k}\}} \otimes \underline{\partial}^{\langle \underline{k} \rangle} x. \tag{2.1.1.5.5}$$

(III) An $\mathcal{O}_X$-linear morphism $\phi \colon \mathcal{E} \to \mathcal{F}$ between two left $\mathcal{D}_{X/S}^{(m)}$-modules is $\mathcal{D}_{X/S}^{(m)}$-linear if and only if ϕ is horizontal.

Proof. I) 1) The idea of the proof is standard and comes from Grothendieck: Let us prove the equivalence between (a) and (b). Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. A left $\mathcal{D}_X^{(m)}$-module structure on $\mathcal{E}$ extending its $\mathcal{O}_X$-module structure is equivalent to the data a family $(\mu_n^{\mathcal{E}})_{n \in \mathbb{N}}$ of $\mathcal{O}_X$-linear homomorphisms $\mu_n^{\mathcal{E}} \colon p_{0*}(\mathcal{D}_{X,n}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E}) \to \mathcal{E}$ such that $\mu_0^{\mathcal{E}} = \mathrm{id}_{\mathcal{E}}$ (modulo some canonical identification) and for any $n, n' \in \mathbb{N}$ the following diagrams in the category of $\mathcal{O}_X$-modules

$$\begin{array}{ccc} \mathcal{D}_{X,n}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\mu_n^{\mathcal{E}}} & \mathcal{E} \\ \downarrow{\scriptstyle \rho_{n+n',n}^{(m)} \otimes \mathrm{id}} & & \| \\ \mathcal{D}_{X,n+n'}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\mu_{n+n'}^{\mathcal{E}}} & \mathcal{E} \end{array} \qquad \begin{array}{ccc} \mathcal{D}_{X,n}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{D}_{X,n'}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\mathrm{id} \otimes \mu_{n'}^{\mathcal{E}}} & \mathcal{D}_{X,n}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E} \\ \downarrow{\scriptstyle \mu_{n,n'} \otimes \mathrm{id}} & & \downarrow{\scriptstyle \mu_n^{\mathcal{E}}} \\ \mathcal{D}_{X,n+n'}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\mu_{n+n'}^{\mathcal{E}}} & \mathcal{E} \end{array} \tag{2.1.1.5.6}$$

are commutative (see notation 1.4.2.1.2).

By using Cartan isomorphism (see 4.6.3.9.1 in the case where $\mathcal{A} = \mathcal{O}_X$ and correspond to the left structure on $\mathcal{D}_{X,n}^{(m)}$, $\mathcal{A}' = \mathcal{O}_X$ and correspond to the right structure on $\mathcal{D}_{X,n}^{(m)}$, $\mathcal{C} = \mathcal{O}_X$) the data of the family $(\mu_n)_{n \in \mathbb{N}}$ is equivalent to the data of a family $(\nu_n)_{n \in \mathbb{N}}$ where ν_n is of the form

$$\nu_n \colon \mathcal{E} \to p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}_{X,n}^{(m)}, \mathcal{E}). \tag{2.1.1.5.7}$$

The commutativity of the following diagram in the category of $\mathcal{O}_X$-modules

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\nu_{n+n'}} & p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}_{X,n+n'}^{(m)}, \mathcal{E}) \\ \downarrow{\scriptstyle \nu_{n'}} & & \\ p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}_{X,n'}^{(m)}, \mathcal{E}) & & \downarrow{\scriptstyle 2.1.1.4.3} \\ \downarrow{\scriptstyle \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}_{X,n'}^{(m)}, \nu_n)} & & \\ p_{2*}\mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}\mathcal{D}_{X,n'}^{(m)}, p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}_{X,n}^{(m)}, \mathcal{E})\right) & \underset{\sim}{\xrightarrow{2.1.1.4.1}} & p_{2*}\mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}(\mathcal{D}_{X,n}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{D}_{X,n'}^{(m)}), \mathcal{E}\right) \end{array} \tag{2.1.1.5.8}$$

is equivalent to that of the left one of 2.1.1.5.6. Indeed, the map $\mathcal{E} \to p_{2*}\mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}(\mathcal{D}_{X,n}^{(m)} \otimes_{\mathcal{O}_X} \mathcal{D}_{X,n'}^{(m)}), \mathcal{E}\right)$ from the left and bottom path (resp. top and right path) sends $e \in \mathcal{E}$ to $P \otimes P' \mapsto \mu_n^{\mathcal{E}}(P \otimes \mu_{n'}^{\mathcal{E}}(P' \otimes e))$ (resp. to $P \otimes P' \mapsto \mu_{n+n'}^{\mathcal{E}}(PP' \otimes e)$) for any $P \in \mathcal{D}_{X,n}^{(m)}$, $P' \in \mathcal{D}_{X,n'}^{(m)}$ and $e \in \mathcal{E}$.

We have the canonical isomorphism

$$\iota_n \colon p_{1*}\left(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}_{X,(m)}^n\right) \xrightarrow{\sim} p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}_{X,n}^{(m)}, \mathcal{E}) \tag{2.1.1.5.9}$$

given by $e \otimes \tau \mapsto (P \mapsto P(\tau)e)$, where the $\mathcal{O}_X$-module structure on $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}_{X,(m)}^n$ is given by the right structure of $\mathcal{P}_{X,(m)}^n$. Set $\theta_n := (\iota_n)^{-1} \circ \nu_n$. Hence, by definition and functoriality, we get the commutative diagram:

$$\begin{array}{ccccc}
 & & & & \mathcal{E} \\
 & & \swarrow^{\theta_{n'}} & & \big\downarrow{\scriptstyle \sim\ \nu_{n'}} \\
 & \mathcal{E}\otimes\mathcal{P}^{n'}_{X,(m)} & \xrightarrow[\sim]{\iota_{n'}} & & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n'},\mathcal{E}) \\
 \swarrow^{\theta_n\otimes\mathrm{id}} & \big\downarrow{\scriptstyle \nu_n\otimes\mathrm{id}} & & & \big\downarrow{\scriptstyle \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n'},\nu_n)} \\
 \mathcal{E}\otimes\mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)} \xrightarrow[\sim]{\iota_n\otimes\mathrm{id}} & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n},\mathcal{E})\otimes\mathcal{P}^{n'}_{X,(m)} & \xrightarrow[\sim]{\iota_{n'}} & & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n'},p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n},\mathcal{E}))
\end{array}$$

(2.1.1.5.10)

By composing the bottom arrows of the diagrams 2.1.1.5.10 and 2.1.1.5.8 we get the canonical isomorphism

$$\mathcal{E}\otimes\mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}(\mathcal{D}^{(m)}_{X,n}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n'}),\mathcal{E}\right), \tag{2.1.1.5.11}$$

which is $\mathcal{O}_X$-linear for the right structures and is given by $e\otimes x\mapsto (P\otimes P'\mapsto P\circ(\mathrm{id}\otimes P')(x)\cdot e)$ for any $P\in\mathcal{D}^{(m)}_{X,n}$ and $P'\in\mathcal{D}^{(m)}_{X,n'}$, $e\in\mathcal{E}$ and $x\in\mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}$ (indeed, if $x=\tau\otimes\tau'$, then we compute $(PP'(\tau'))(\tau)=P(\tau p_1^*(P'(\tau'))=P\circ(\mathrm{id}\otimes P')(\tau\otimes\tau'))$. Hence, by construction of the product (see 1.4.2.1.3), we compute that the diagram

$$\begin{array}{ccc}
p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n+n'},\mathcal{E}) & \xleftarrow[\iota_{n+n'}]{\sim} & \mathcal{E}\otimes\mathcal{P}^{n+n'}_{X,(m)} \\
\big\downarrow{\scriptstyle 2.1.1.4.3} & & \big\downarrow{\scriptstyle \mathrm{id}\otimes\delta^{n,n'}_{(m)}} \\
p_{2*}\mathcal{H}om_{\mathcal{O}_X}\left(p_{0*}(\mathcal{D}^{(m)}_{X,n}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n'}),\mathcal{E}\right) & \xleftarrow[\sim]{2.1.1.5.11} & \mathcal{E}\otimes\mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}
\end{array} \tag{2.1.1.5.12}$$

is commutative. By composing (horizontally from left to right) the diagrams 2.1.1.5.10, 2.1.1.5.8 and 2.1.1.5.12, we get the diagram 2.1.1.5.2. Since the maps ι_n are isomorphisms, then the commutativity of 2.1.1.5.2 is equivalent to that of 2.1.1.5.8. Since the commutativity of 2.1.1.5.1 is equivalent to that of the left square of 2.1.1.5.6, then we get the equivalence between the assertions (a) and (b) of the proposition.

2) Now, let us prove the equivalence between (b) and (c). We have the morphism $p^{n*}_{1(m)}\otimes\mathrm{id}_{\mathcal{E}}\colon\mathcal{E}\to\mathcal{P}^{n}_{X,(m)}\otimes_{\mathcal{O}_X}\mathcal{E}$ given by $e\mapsto 1\otimes e$. By adjunction involving the ring morphism $p^{n*}_{1(m)}\colon\mathcal{O}_X\to\mathcal{P}^{n}_{X,(m)}$, a family of $\mathcal{O}_X$-linear homomorphisms $\theta_n\colon\mathcal{E}\to p_{1*}(\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{P}^{n}_{X,(m)})$ is equivalent to a family of $\mathcal{P}^{n}_{X,(m)}$-linear homomorphisms $\epsilon_n\colon\mathcal{P}^{n}_{X,(m)}\otimes_{\mathcal{O}_X}\mathcal{E}\to\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{P}^{n}_{X,(m)}$, the relation being $\epsilon_n\circ(p^{n*}_{1(m)}\otimes\mathrm{id}_{\mathcal{E}})=\theta_n$.

Moreover, $\varepsilon_0=\mathrm{id}_{\mathcal{E}}$ if and only if $\theta_0=\mathrm{id}_{\mathcal{E}}$ and for any $n'\geq n$, ε_n the diagram 2.1.1.1.2 is and only if so is 2.1.1.5.1. Suppose now $\theta_0=\mathrm{id}_{\mathcal{E}}$ and 2.1.1.5.1 is commutative. The morphism $\delta^{n,n'*}_{(m)}(\epsilon_{n+n'})$ is the unique $\mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}$-linear morphism making commutative the contour of the diagram

$$\begin{array}{ccccc}
\mathcal{E} & \xrightarrow{p^{n+n'*}_{1(m)}\otimes\mathrm{id}_{\mathcal{E}}} & \mathcal{P}^{n+n'}_{X,(m)}\otimes\mathcal{E} & \xrightarrow{\delta^{n,n'}_{(m)}\otimes\mathrm{id}} & \mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}\otimes\mathcal{E} \\
\| & & \big\downarrow{\scriptstyle\epsilon_{n+n'}} & & \big\downarrow{\scriptstyle\delta^{n,n'*}_{(m)}(\epsilon_{n+n'})} \\
\mathcal{E} & \xrightarrow{\theta_{n+n'}} & \mathcal{P}^{n+n'}_{X,(m)}\otimes\mathcal{E} & \xrightarrow{\mathrm{id}\otimes\delta^{n,n'}_{(m)}} & \mathcal{E}\otimes\mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}.
\end{array} \tag{2.1.1.5.13}$$

The morphism $(\epsilon_n\otimes\mathrm{id})\circ(\mathrm{id}\otimes\epsilon_{n'})$ is the unique $\mathcal{P}^{n}_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}$-linear morphism making commutative the contour of the diagram

$$\begin{array}{ccccc}
\mathcal{E} & \xrightarrow{p^{n'*}_{1(m)}\otimes \mathrm{id}_{\mathcal{E}}} & \mathcal{P}^{n'}_{X,(m)} \otimes \mathcal{E} & \xrightarrow{p^{n*}_{1(m)}\otimes \mathrm{id}_{\mathcal{P}^{n'}_{X,(m)}\otimes\mathcal{E}}} & \mathcal{P}^{n}_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)} \otimes \mathcal{E} \\
\| & & \downarrow{\scriptstyle \epsilon_{n+n'}} & & \downarrow{\scriptstyle \mathrm{id}\otimes\epsilon_{n'}} \\
\mathcal{E} & \xrightarrow{\theta^{\mathcal{E}}_{n'}} & \mathcal{E}\otimes\mathcal{P}^{n'}_{X,(m)} & \xrightarrow{p^{n*}_{1(m)}\otimes \mathrm{id}_{\mathcal{E}}\otimes \mathrm{id}} & \mathcal{P}^{n}_{X,(m)} \otimes \mathcal{E} \otimes \mathcal{P}^{n'}_{X,(m)} \\
 & & & \searrow^{\theta^{\mathcal{E}}_{n}\otimes \mathrm{id}} & \downarrow{\scriptstyle \epsilon_{n}\otimes \mathrm{id}} \\
 & & & & \mathcal{E}\otimes\mathcal{P}^{n}_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}.
\end{array} \tag{2.1.1.5.14}$$

Since $\epsilon_n \otimes \mathrm{id} = q^{n,n',*}_{1,(m)}(\varepsilon_{n+n'})$ and $\mathrm{id}\otimes\epsilon_{n'} = q^{n,n',*}_{0,(m)}(\varepsilon_{n+n'})$ (remark we need the compatibility given by the commutativity of 2.1.1.1.2), since both composition of the top morphisms of 2.1.1.5.13 and 2.1.1.5.14 are equal (to $e \mapsto 1 \otimes 1 \otimes e$), then by unicity of the factorisation, we get that the diagram 2.1.1.5.2 is commutative if and only if the diagram 2.1.1.1.3 is commutative.

II) Let $\mathcal{E}$ be left $\mathcal{D}^{(m)}_X$-module and let $\varepsilon = (\varepsilon^{\mathcal{E}}_n)$ be the associated m-PD stratification. For any $P \in \mathcal{D}^{(m)}_{X,n}$, by construction the action of P on $\mathcal{E}$ is given by the composition of the bottom arrows of the diagram:

$$\begin{array}{ccccc}
\mathcal{P}^{n}_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\varepsilon^{\mathcal{E}}_n} & \mathcal{E}\otimes_{\mathcal{O}_X} \mathcal{P}^{n}_{X,(m)} & \xrightarrow{\mathrm{id}\otimes P} & \mathcal{E} \\
\uparrow{\scriptstyle p^{n*}_{1(m)}} & \nearrow^{\theta^{\mathcal{E}}_n} & {\scriptstyle 2.1.1.5.9}\downarrow{\scriptstyle \iota_n} & & \| \\
\mathcal{E} & \xrightarrow[\nu_n]{2.1.1.5.7} & p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{D}^{(m)}_{X,n}, \mathcal{E}) & \xrightarrow{\mathrm{ev}_P} & \mathcal{E}.
\end{array} \tag{2.1.1.5.15}$$

Since the diagram 2.1.1.5.15 is commutative, then we get the assertion II)a). When X/S is equipped with coordinates $t_1, \ldots, t_d$, then by using IIa) in the case where $P = \underline{\partial}^{\langle \underline{k}\rangle}$, we get that $(\mathrm{id}\otimes\underline{\partial}^{\langle \underline{k}\rangle})\circ\theta_n(x) = \underline{\partial}^{\langle \underline{k}\rangle}x$. This yields the formulas 2.1.1.5.4.

Let us check that the morphism $\zeta^{\mathcal{E}}_n$ defined by the formula 2.1.1.5.5 is the inverse of the morphism $\varepsilon^{\mathcal{E}}_n$. We compute

$$\begin{aligned}
\zeta^{\mathcal{E}}_n \circ \varepsilon^{\mathcal{E}}_n(1\otimes x) &= \zeta^{\mathcal{E}}_n\Big(\sum_{|\underline{i}|\le n} \underline{\partial}^{\langle \underline{i}\rangle}x \otimes \underline{\tau}^{\{\underline{i}\}}\Big) = \sum_{|\underline{i}|\le n}\sum_{|\underline{j}|\le n} (-1)^{|\underline{j}|}\underline{\tau}^{\{\underline{j}\}}\underline{\tau}^{\{\underline{i}\}} \otimes \underline{\partial}^{\langle \underline{j}\rangle}\underline{\partial}^{\langle \underline{i}\rangle}x \\
&\overset{1.2.4.5.3+1.4.2.7.c}{=} \sum_{|\underline{k}|\le n}\sum_{\underline{j}\le \underline{k}} (-1)^{|\underline{j}|}\left(\begin{matrix}\underline{k}\\ \underline{j}\end{matrix}\right)\underline{\tau}^{\{\underline{k}\}} \otimes \underline{\partial}^{\langle \underline{k}\rangle}x = 1\otimes x.
\end{aligned}$$

Similarly, we check $\varepsilon^{\mathcal{E}}_n \circ \zeta^{\mathcal{E}}_n(x\otimes 1)$. Hence, we are done.

III) To check the last assertion we can either use the functoriality in $\mathcal{E}$ of the diagrams appearing in the equivalences of (I) or make some local computations using (II). □

Remark 2.1.1.6. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module endowed with a family (as n varies) of $\mathcal{P}^n_{X,(m)}$-linear isomorphisms

$$\varepsilon_n \colon \mathcal{P}^{n}_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} = p^{n*}_{1(m)}(\mathcal{E}) \xrightarrow{\sim} p^{n*}_{0(m)}(\mathcal{E}) = \mathcal{E}\otimes_{\mathcal{O}_X} \mathcal{P}^{n}_{X,(m)},$$

satisfying the condition (a) of 2.1.1.1. We remark that the cocycle condition is local. Let us give a local description of this condition. Suppose X/S is equipped with coordinates $t_1, \ldots, t_d$. For any x of $\mathcal{E}$, for any $\underline{k} \in \mathbb{N}^d$, for any $n \ge |\underline{k}|$, let us denote by $\underline{\partial}^{\langle \underline{k}\rangle}(x)$ the section of $\mathcal{E}$ such that we get

$$\varepsilon^{\mathcal{E}}_n(1\otimes x) = \sum_{|\underline{k}|\le n} \underline{\partial}^{\langle \underline{k}\rangle}(x) \otimes \underline{\tau}^{\{\underline{k}\}}.$$

First remark that these elements do not depend on the choice of n which justifies the notation. Moreover, the cocycle condition is equivalent to the condition that the formula

$$\left\langle \begin{matrix}\underline{i}+\underline{j}\\ \underline{i}\end{matrix}\right\rangle \underline{\partial}^{\langle \underline{i}+\underline{j}\rangle}(x) = \underline{\partial}^{\langle \underline{i}\rangle}(\underline{\partial}^{\langle \underline{j}\rangle}(x)) \tag{2.1.1.6.1}$$

holds for any section x of $\mathcal{E}$, for any $\underline{i}, \underline{j} \in \mathbb{N}^d$ (to understand this formula, see 1.4.2.7.c). Indeed, this is an easy computation using $\delta^{n,n'}_{(m)}(\tau_i) = \tau_i \otimes 1 + 1 \otimes \tau_i$ (see 1.4.1.17.1) and the formula 1.2.4.5.2.

Example 2.1.1.7. Let Z be a closed subscheme of X/S defined by an ideal $\mathcal{K}$ of $\mathcal{O}_X$. With notation 1.3.2.13, 1.4.1.2, put

$$\mathcal{K}' = \mathcal{K} \cdot \mathcal{P}^n_{X/S,(m)} + \mathcal{I}^n_{X/S,(m)} = \mathrm{Ker}(\mathcal{P}^n_{X/S,(m)} \to \mathcal{O}_X/\mathcal{K}) = \mathcal{P}^n_{X/S,(m)} \cdot \mathcal{K} + \mathcal{I}^n_{X/S,(m)}. \tag{2.1.1.7.1}$$

Then the canonical map

$$\mathcal{P}_{(m),\alpha}(\mathcal{K}) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)} \to \mathcal{P}_{(m),\alpha}(\mathcal{K}') \tag{2.1.1.7.2}$$

is an isomorphism. Indeed, since this is local, we can suppose X/S is equipped with coordinates $t_1, \ldots, t_d$. First, we remark that this is sufficient to check that $\mathscr{I}_{(m),\alpha}(\mathcal{K}) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)} + \mathcal{P}_{(m),\alpha}(\mathcal{K}) \otimes_{\mathcal{O}_X} \mathcal{I}^n_{X/S,(m)}$ has an m-PD structure extending that of $\mathscr{I}_{(m),\alpha}(\mathcal{K})$ and of $\mathcal{I}^n_{X/S,(m)}$ (indeed, this would yield an inverse of 2.1.1.7.2 by using the universal property of the m-PD envelope). By flatness of $p^n_{1,(m)} \colon \mathcal{O}_X \to \mathcal{P}^n_{X/S,(m)}$, the ideal $\mathscr{I}_{(m),\alpha}(\mathcal{K}) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)}$ is endowed with an m-PD structure extending $\mathscr{I}_{(m),\alpha}(\mathcal{K})$

From the description 1.4.2.3, $\mathcal{P}^n_{X/S,(m)}$ is isomorphic to an m-PD polynomial algebra with coefficients in $\mathcal{O}_X$ of order n in d variables given by $\tau_1, \ldots, \tau_d$. Hence, $\mathcal{P}_{(m),\alpha}(\mathcal{K}) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)}$ is isomorphic to an m-PD polynomial algebra with coefficients in $\mathcal{P}_{(m),\alpha}(\mathcal{K})$ of order n in d variables. Following 1.3.2.6, the m-PD structure of $\mathcal{P}_{(m),\alpha}(\mathcal{K}) \otimes_{\mathcal{O}_X} \mathcal{I}^n_{X/S,(m)}$ is compatible with any m-PD-structure on $\mathscr{I}_{(m),\alpha}(\mathcal{K})$. Hence, we get the m-PD structure.

For the same reason we have the canonical isomorphism

$$\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}_{(m),\alpha}(\mathcal{K}) \to \mathcal{P}_{(m),\alpha}(\mathcal{K}'). \tag{2.1.1.7.3}$$

By composing 2.1.1.7.2 and 2.1.1.7.3, we get the isomorphisms

$$\varepsilon_n : \mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}_{(m),\alpha}(\mathcal{K}) \xrightarrow{\sim} \mathcal{P}_{(m),\alpha}(\mathcal{K}) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)}$$

which gives an m-PD stratification on $\mathcal{P}_{(m),\alpha}(\mathcal{K})$.

2.1.2 PD-costratifications of level m

Conventions on notations for derived categories are given at the beginning of Chapter 5.

2.1.2.1. We will use the following notation (for the second one, see 4.2.2).

(a) Let $\phi \colon \mathcal{A} \to \mathcal{B}$ be a homomorphism of sheaves of commutative rings. We denote by $\phi_* \colon : D(\mathcal{B}) \to D(\mathcal{A})$ the canonical exact forgetful functor. Recall that following the Cartan isomorphisms (see the general version 4.6.3.9) for any $\mathcal{B}$-module $\mathcal{N}$ and any $\mathcal{A}$-module $\mathcal{M}$ we have the bifunctorial in $\mathcal{M}$ and $\mathcal{N}$ canonical isomorphism

$$\mathcal{H}om_{\mathcal{A}}(\phi_*\mathcal{N}, \mathcal{M}) \cong \mathcal{H}om_{\mathcal{B}}(\mathcal{N}, \mathcal{H}om_{\mathcal{A}}(\mathcal{B}, \mathcal{M})). \tag{2.1.2.1.1}$$

In other words, the forgetful functor ϕ_* has the right adjoint $? \mapsto \mathcal{H}om_{\mathcal{A}}(\mathcal{B}, ?)$. We denote by $\phi^\flat \colon D(\mathcal{A}) \to D(\mathcal{B})$ the functor defined by setting $\phi^\flat(\mathcal{M}) := \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{B}, \mathcal{M})$ for any $\mathcal{M} \in D(\mathcal{A})$. The convention here is to work in the derived categories but our functors of the form $\phi^\flat$ will often be exact.

(b) More generally, if $f \colon (X, \mathcal{B}_X) \to (Y, \mathcal{B}_Y)$ is a morphism of ringed spaces, then we define the functor $f^\flat \colon D(\mathcal{B}_Y) \to D(\mathcal{B}_X)$ by setting

$$f^\flat \mathcal{M} = \bar{f}^* \mathbb{R}\mathcal{H}om_{\mathcal{B}_Y}(f_*\mathcal{B}_X, \mathcal{M})$$

where $\bar{f}$ denotes the morphism $(X, \mathcal{B}_X) \to (Y, f_*\mathcal{B}_X)$.

2.1.2.2. Let $f \colon X \to Y$ be a finite morphism between two locally noetherian schemes. $\mathrm{Mod}(\mathcal{O}_X)$ denotes the category of $\mathcal{O}_X$-modules. Since $\bar{f}$ is flat, $\bar{f}^* : \mathrm{Mod}(f_*\mathcal{O}_X) \to \mathrm{Mod}(\mathcal{O}_X)$ is exact and take quasi-coherent (resp. coherent) sheaves to quasi-coherent (resp. coherent), we get that $f^\flat$ takes $D^+_{\mathrm{qc}}(Y)$ (resp. $D^+_{\mathrm{coh}}(Y)$) to $D^+_{\mathrm{qc}}(X)$ (resp. $D^+_{\mathrm{coh}}(X)$). If f is a locally free finite homeomorphism then $f^\flat \mathcal{M} = \mathcal{H}om_{\mathcal{O}_Y}(f_*\mathcal{O}_X, \mathcal{M})$ and $f^\flat$ takes $D_{\mathrm{qc}}(Y)$ (resp. $D_{\mathrm{coh}}(Y)$) to $D_{\mathrm{qc}}(X)$ (resp. $D_{\mathrm{coh}}(X)$).

Definition 2.1.2.3. An m-PD-*costratification on* $\mathcal{M}$ *relatively to* S on an $\mathcal{O}_X$-module $\mathcal{M}$ is the data of a family of $\mathcal{P}^n_{X/S(m)}$-linear homomorphisms

$$\varepsilon_n \colon \mathcal{H}om_{\mathcal{O}_X}(p^n_{0,(m)*}\mathcal{P}^n_{X/S(m)},\, \mathcal{M}) = p^{n\flat}_{0,(m)}(\mathcal{M}) \to p^{n\flat}_{1,(m)}(\mathcal{M}) = \mathcal{H}om_{\mathcal{O}_X}(p^n_{1,(m)*}\mathcal{P}^n_{X/S(m)},\, \mathcal{M}),$$

this ones satisfying the following conditions :

(a) $\varepsilon_0 = \mathrm{id}_{\mathcal{M}}$ and for any $n' \geq n$ in $\mathbb{N}$, ε_n and $\psi^{n',n\flat}_{X/S,(m)}(\varepsilon_{n'})$ are canonically isomorphic, i.e. the following diagram

$$\begin{array}{ccc}
\psi^{n',n\flat}_{X/S,(m)}(p^{n'\flat}_{0,(m)}(\mathcal{M})) & \xrightarrow{\psi^{n',n\flat}_{X/S,(m)}(\varepsilon_{n'})} & \psi^{n',n\flat}_{X/S,(m)}(p^{n'\flat}_{1,(m)}(\mathcal{M})) \\
\downarrow \wr & & \downarrow \wr \\
p^{n\flat}_{0,(m)}(\mathcal{M}) & \xrightarrow{\varepsilon_n} & p^{n\flat}_{1,(m)}(\mathcal{M})
\end{array}, \tag{2.1.2.3.1}$$

whose vertical isomorphisms are the canonical ones, is commutative.

(b) For any n, n', the diagram

$$\begin{array}{ccc}
p^{n,n'\flat}_{0,(m)}(\mathcal{M}) & \xrightarrow{\delta^{n,n',\flat}_{(m)}(\varepsilon_{n+n'})} & p^{n,n'\flat}_{2,(m)}(\mathcal{M}) \\
{\scriptstyle q^{n,n',\flat}_{0,(m)}(\varepsilon_{n+n'})} \searrow & & \nearrow {\scriptstyle q^{n,n',\flat}_{0,(m)}(\varepsilon_{n+n'})} \\
& p^{n,n'\flat}_{1,(m)}(\mathcal{M}) &
\end{array} \tag{2.1.2.3.2}$$

is commutative.

Say an $\mathcal{O}_X$-linear homomorphism $\varphi\colon \mathcal{M} \to \mathcal{N}$ between modules equipped with m-PD costratifications relative to S is *horizontal* if it commutes with all ε_n.

2.1.2.4. With notation 1.4.1.13, similarly to 2.1.1.2, we check that the above condition 2.1.2.3.2 is equivalent to

$$\forall\, n, \qquad q^{n\flat}_{02,(m)}(\varepsilon_n) = q^{n\flat}_{01,(m)}(\varepsilon_n) \circ q^{n\flat}_{12,(m)}(\varepsilon_n). \tag{2.1.2.4.1}$$

Proposition 2.1.2.5. *Let $\mathcal{M}$ be an $\mathcal{O}_X$-module together with an m-PD costratification $(\varepsilon^{\mathcal{M}}_n)$ relative to X/S. Then the homomorphisms $\varepsilon^{\mathcal{M}}_n$ are $\mathcal{P}^n_{X/S,(m)}$-linear isomorphisms.*

Proof. Copy the proof of 2.1.1.3. □

Notation 2.1.2.6. Let $\mathcal{M}$ be an $\mathcal{O}_X$-module. Since $p_{i*}\mathcal{P}^n_{X,(m)}$ is locally free as $\mathcal{O}_X$-modules, then the canonical homomorphism

$$\iota^{\mathcal{M}}_n \colon \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n} = \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X) \to \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^n_{X,(m)}, \mathcal{M}) = p^{n\flat}_{0,(m)}(\mathcal{M}) \tag{2.1.2.6.1}$$

given by $x \otimes P \mapsto (\tau \mapsto xP(\tau))$ is an isomorphism. Similarly, we have the canonical isomorphism

$$\mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X) \otimes_{\mathcal{O}_X} \mathcal{M} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^n_{X,(m)}, \mathcal{M}) = p^{n\flat}_{1,(m)}(\mathcal{M}). \tag{2.1.2.6.2}$$

2.1.2.7. Let $\alpha\colon \mathcal{A} \to \mathcal{B}$ and $\beta\colon \mathcal{B} \to \mathcal{C}$ be two homomorphisms of sheaves of commutative algebras. For any $\mathcal{A}$-module $\mathcal{M}$, we get the commutative triangle

$$\begin{array}{ccc}
\mathcal{H}om_{\mathcal{B}}(\mathcal{C}, \mathcal{H}om_{\mathcal{A}}(\mathcal{B}, \mathcal{M})) & \xrightarrow{\sim} & \mathcal{H}om_{\mathcal{A}}(\mathcal{C}, \mathcal{M}) \\
{\scriptstyle \mathrm{ev}_1} \searrow & & \swarrow {\scriptstyle -\circ\beta} \\
& \mathcal{H}om_{\mathcal{A}}(\mathcal{B}, \mathcal{M}) &
\end{array} \tag{2.1.2.7.1}$$

where the horizontal map is the Cartan isomorphism, ev_1 is the evalutation at 1 morphism and $- \circ \beta$ is the morphism induced by composition with β.

Proposition 2.1.2.8. *Given an $\mathcal{O}_X$-module $\mathcal{M}$. The following are equivalent.*

(a) A right $\mathcal{D}^{(m)}_X$ module structure on $\mathcal{M}$ extending its $\mathcal{O}_X$-module structure.

(b) A family $\theta_n \colon p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^n_{X,(m)}, \mathcal{M}) \to \mathcal{M}$ which are $\mathcal{O}_X$-linear homomorphisms (for the $\mathcal{O}_X$ structure on $\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^n_{X,(m)}, \mathcal{M})$ induced by the right $\mathcal{O}_X$-algebra structure on $\mathcal{P}^n_{X,(m)}$) satisfying

(i) $\theta_0 = \mathrm{id}_{\mathcal{M}}$, and for any $n' \geq n$ in $\mathbb{N}$, θ_n and $\theta_{n'}$ are compatible i.e. the following diagram

$$\begin{array}{ccc} p^{n'\flat}_{0,(m)}(\mathcal{M}) & \xrightarrow{\theta_{n'}} & \mathcal{M} \\ \uparrow{\scriptstyle \psi^{n',n}} & & \| \\ p^{n\flat}_{0,(m)}(\mathcal{M}) & \xrightarrow{\theta_n} & \mathcal{M} \end{array} \quad (2.1.2.8.1)$$

whose the vertical morphism is given by adjunction of $(\psi^{n',n}_{X/S,(m)*} \dashv \psi^{n',n\flat}_{X/S,(m)})$, is commutative.

(ii) for all n, n' we have commutative diagrams

$$\begin{array}{ccc} \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^{n'}_{X,(m)}, \mathcal{M}) & \xrightarrow{\theta_{n'}} & \mathcal{M} \\ \uparrow{\scriptstyle \tilde{\theta}_n} & & \uparrow{\scriptstyle \theta_{n+n'}} \\ \mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) & \xrightarrow{\delta^{n,n'}_{(m)}} & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^{n+n'}_{X,(m)}, \mathcal{M}) \end{array} \quad (2.1.2.8.2)$$

where $\tilde{\theta}_n$ is the $\mathcal{P}^{n'}_{X,(m)}$-linear homomorphism corresponding by adjointness to the composed morphism

$$\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) \to \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^n_{X,(m)}, \mathcal{M}) \xrightarrow{\theta_n} \mathcal{M}, \quad (2.1.2.8.3)$$

where the fist map is induced by functoriality by $q^{n,n'}_{0(m)}$ (which is $\mathcal{O}_X$-linear for the structure defined by p_1 on $\mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X,(m)}$).

(c) An m-PD costratification (ε_n) relatively to X/S on $\mathcal{M}$.

An $\mathcal{O}_X$-linear morphism $\phi \colon \mathcal{M} \to \mathcal{N}$ between two right $\mathcal{D}^{(m)}_{X/S}$-modules is $\mathcal{D}^{(m)}_{X/S}$-linear if and only if ϕ is horizontal or if it commutes to the homomorphisms θ_n.

Proof. Let $\mathcal{M}$ be an $\mathcal{O}_X$-module. A right $\mathcal{D}^{(m)}_X$-module structure on $\mathcal{M}$ extending its $\mathcal{O}_X$-module structure is equivalent to the data a family $(\mu^{\mathcal{M}}_n)_{n\in\mathbb{N}}$ of $\mathcal{O}_X$-linear homomorphisms $\mu^{\mathcal{M}}_n \colon p_{1*}(\mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n}) \to \mathcal{M}$ such that $\mu^{\mathcal{M}}_0 = \mathrm{id}_{\mathcal{M}}$ (modulo some canonical identification) and for any $n, n' \in \mathbb{N}$ the following diagrams in the category of $\mathcal{O}_X$-modules

$$\begin{array}{ccc} \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n} & \xrightarrow{\mu^{\mathcal{M}}_n} & \mathcal{M} \\ \downarrow{\scriptstyle \rho^{(m)}_{n+n',n} \otimes \mathrm{id}} & & \| \\ \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n+n'} & \xrightarrow{\mu^{\mathcal{M}}_{n+n'}} & \mathcal{M}, \end{array} \qquad \begin{array}{ccc} \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'} & \xrightarrow{\mu^{\mathcal{M}}_n \otimes \mathrm{id}} & \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'} \\ \downarrow{\scriptstyle \mathrm{id} \otimes \mu_{n,n'}} & & \downarrow{\scriptstyle \mu^{\mathcal{M}}_{n'}} \\ \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n+n'} & \xrightarrow{\mu^{\mathcal{M}}_{n+n'}} & \mathcal{M} \end{array} \quad (2.1.2.8.4)$$

are commutative (see notation 1.4.2.1.2). With notation 2.1.2.6.1, we denote by $\theta^{\mathcal{M}}_n$ the morphism

$p_{1*}(\mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^n_{X,(m)},\mathcal{M})) \to \mathcal{M}$ so that by setting $\mu_n = \iota_n \circ \theta^{\mathcal{M}}_n$. With notation 1.4.1.15

$$\begin{array}{ccccc}
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}),\mathcal{M}) & \xrightarrow{\varpi^{n,n'}_{0(m)}} & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)}),\mathcal{M}) & & \\
\star\downarrow\wr & \nearrow_{\mathrm{ev}_1} & & \searrow^{\theta^{\mathcal{M}}_n} & \\
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^{n'}_{X,(m)}),p_{1*}\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^n_{X,(m)},\mathcal{M})) & & & & \mathcal{M} \\
\wr\uparrow\iota_n & \searrow^{\theta^{\mathcal{M}}_n} & & \nearrow_{\mathrm{ev}_1} & \\
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^{n'}_{X,(m)}),p_{1*}(\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n})) & \xrightarrow{\mu^{\mathcal{M}}_n} & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^{n'}_{X,(m)}),\mathcal{M}) & & \\
\wr\uparrow\iota_{n'} & & \wr\uparrow\iota_{n'} & \searrow^{\theta^{\mathcal{M}}_{n'}} & \\
\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n'} & \xrightarrow{\mu^{\mathcal{M}}_n\otimes\mathrm{id}} & \mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n'} & \xrightarrow{\mu^{\mathcal{M}}_{n'}} & \mathcal{M}
\end{array} \tag{2.1.2.8.5}$$

where the $\star$ isomorphism is the Cartan isomorphism and the top left triangle is commutative following 2.1.2.7.1. By unicity of the factorisation, we get that $\theta^{\mathcal{M}}_n \circ \star = \tilde{\theta}_n$. By composing the left arrows of the diagrams 2.1.2.8.5, we get the canonical isomorphism

$$\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n'} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}),\mathcal{M}), \tag{2.1.2.8.6}$$

which is $\mathcal{O}_X$-linear for the right structures and is given by $m\otimes P\otimes P' \mapsto (\tau\otimes\tau' \mapsto mP(\tau p_1^*(P'(\tau')) = mP\circ(\mathrm{id}\otimes P')(\tau\otimes\tau')$ for any $P\in\mathcal{D}^{(m)}_{X,n}$, $P'\in\mathcal{D}^{(m)}_{X,n'}$, $m\in\mathcal{M}$. Hence, by construction of the product (see 1.4.2.1.3), we compute that the square of the diagram

$$\begin{array}{ccccc}
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}),\mathcal{M}) & \xrightarrow{\delta^{n,n'}_{(m)}} & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^{n+n'}_{X,(m)}),\mathcal{M}) & & \\
\wr\uparrow 2.1.2.8.6 & & \iota_{n+n'}\uparrow\wr & \searrow^{\theta^{\mathcal{M}}_{n+n'}} & \\
\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n'} & \xrightarrow{\mathrm{id}\otimes\mu_{n,n'}} & \mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n+n'} & \xrightarrow{\mu^{\mathcal{M}}_{n+n'}} & \mathcal{M}
\end{array} \tag{2.1.2.8.7}$$

is commutative. Since its triangle is commutative by definition, then so is the diagram 2.1.2.8.7. Since the map 2.1.2.8.6 is an isomorphism, then using the commutative diagram 2.1.2.8.5 and 2.1.2.8.7 the right square of 2.1.2.8.4 is commutative if and only if the diagram 2.1.2.8.2 is commutative.

We go from μ_n to ϵ_n by adjointness (use 2.1.2.1.1 in the case of $p^n_{1,(m)}\colon \mathcal{O}_X \to p_{1*}\mathcal{P}^n_{X,(m)}$), i.e. ϵ_n is the unique $\mathcal{P}_{X/S(m)}$-linear morphism such that the composition map

$$\mu_n\colon \mathcal{H}om_{\mathcal{O}_X}(p^n_{0,(m)*}\mathcal{P}_{X/S(m)},\,\mathcal{M}) \xrightarrow{\varepsilon_n} \mathcal{H}om_{\mathcal{O}_X}(p^n_{1,(m)*}\mathcal{P}_{X/S(m)},\,\mathcal{M}) \xrightarrow{\mathrm{ev}_1} \mathcal{M} \tag{2.1.2.8.8}$$

is μ_n. Via this correspondance, by using some universal property, we can check that the commutativity of 2.1.2.8.1 is equivalent to that of 2.1.2.3.1. Now let us suppose the square 2.1.2.8.1 is commutative. Via this correspondance, it remains to check that the commutativity of 2.1.2.8.2 is equivalent to that of 2.1.2.3.2. Using our hypothesis, the commutativity of 2.1.2.8.2 is equivalent to saying that $\theta_{n+n'}\circ\delta^{n,n'}_{(m)} = \theta_{n+n'}\circ\psi^{n+n',n}\circ\tilde{\theta}_n$.

$$\begin{array}{ccccc}
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}),\mathcal{M}) & & \xrightarrow[\sim]{q^{n,n',\flat}_{0,(m)}(\varepsilon_{n+n'})} & & \mathcal{H}om_{\mathcal{O}_X}(p_{1*}(\mathcal{P}^n_{X,(m)}\otimes\mathcal{P}^{n'}_{X,(m)}),\mathcal{M}) \\
\downarrow q^{n,n'}_{0,(m)} & & & \swarrow_{q^{n,n'}_{0,(m)}} & \downarrow q^{n,n'}_{1,(m)} \\
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^{n+n'}_{X,(m)},\mathcal{M}) & \xrightarrow[\sim]{\varepsilon_{n+n'}} & \mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^{n+n'}_{X,(m)},\mathcal{M}) & & \mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^{n+n'}_{X,(m)},\mathcal{M}) \\
& \searrow_{\theta_{n+n'}} & \downarrow\mathrm{ev}_1 & \swarrow_{\mathrm{ev}_1} & \\
& & \mathcal{M} & &
\end{array} \tag{2.1.2.8.9}$$

Since $\theta_{n+n'} \circ q^{n,n'}_{0,(m)}$ is equal to the composition morphism 2.1.2.8.3 (use again the commutativity of 2.1.2.8.1), then by uniqueness of the factorization through ev_1, this yields $q^{n,n'}_{1,(m)} \circ q^{n,n',\flat}_{0,(m)}(\varepsilon_{n+n'}) = \psi^{n+n',n} \circ \tilde{\theta}_n$. Hence, by composition 2.1.2.8.9 with the commutative diagram

$$\begin{array}{ccc}
\mathcal{H}om_{\mathcal{O}_X}(p_{1*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) & \xrightarrow[\sim]{q^{n,n',\flat}_{1,(m)}(\varepsilon_{n+n'})} & \mathcal{H}om_{\mathcal{O}_X}(p_{2*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) \\
\downarrow q^{n,n'}_{1,(m)} & & \downarrow q^{n,n'}_{1,(m)} \\
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}\mathcal{P}^{n+n'}_{X,(m)}, \mathcal{M}) & \xrightarrow[\sim]{\varepsilon_{n+n'}} & \mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^{n+n'}_{X,(m)}, \mathcal{M}) \\
& \searrow^{\theta_{n+n'}} & \downarrow \mathrm{ev}_1 \\
& & \mathcal{M}
\end{array} \tag{2.1.2.8.10}$$

we get the commutative triangle:

$$\begin{array}{ccc}
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) & \xrightarrow[\sim]{q^{n,n',\flat}_{1,(m)} \circ q^{n,n',\flat}_{0,(m)}(\varepsilon_{n+n'})} & \mathcal{H}om_{\mathcal{O}_X}(p_{2*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) \\
& \searrow^{\theta_{n+n'} \circ \psi^{n+n',n} \circ \tilde{\theta}_n} & \downarrow \mathrm{ev}_1 \\
& & \mathcal{M}.
\end{array} \tag{2.1.2.8.11}$$

Similarly to 2.1.2.8.10 (replace $q^{n,n'}_{1,(m)}$ by $\delta^{n,n'}_{(m)}$), we get the commutative diagram:

$$\begin{array}{ccc}
\mathcal{H}om_{\mathcal{O}_X}(p_{0*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) & \xrightarrow[\sim]{\delta^{n,n',\flat}_{(m)}(\varepsilon_{n+n'})} & \mathcal{H}om_{\mathcal{O}_X}(p_{2*}(\mathcal{P}^n_{X,(m)} \otimes \mathcal{P}^{n'}_{X,(m)}), \mathcal{M}) \\
& \searrow^{\theta_{n+n'} \circ \delta^{n,n'}_{(m)}} & \downarrow \mathrm{ev}_1 \\
& & \mathcal{M}
\end{array} \tag{2.1.2.8.12}$$

Using 2.1.2.8.11 and 2.1.2.8.12, by unicity of the factorisation through ev_1, this yields the equality $\theta_{n+n'} \circ \delta^{n,n'}_{(m)} = \theta_{n+n'} \circ \psi^{n+n',n} \circ \tilde{\theta}_n$ is equivalent to $q^{n,n',\flat}_{1,(m)} \circ q^{n,n',\flat}_{0,(m)}(\varepsilon_{n+n'}) = \delta^{n,n',\flat}_{(m)}(\varepsilon_{n+n'})$.

□

Lemma 2.1.2.9. *Let $\mathcal{M}$ be a right $\mathcal{D}^{(m)}_X$-module. Let $(\varepsilon^{\mathcal{M}}_n)$ be the m-PD-costratification associated with $\mathcal{M}$.*

(a) With notation 2.1.2.6.1, the action of $P \in \mathcal{D}^{(m)}_{X,n}$ on $x \in \mathcal{M}$ is given from the costratification by the formula

$$xP = \mathrm{ev}_1 \circ \epsilon_n \circ \iota^{\mathcal{M}}_n(x \otimes P). \tag{2.1.2.9.1}$$

(b) Suppose $t_1, \ldots, t_d$ are coordinates of X/S. Let $\{\underline{\partial}^{\star\langle \underline{k}\rangle}, \|\underline{k}| \leq n\}$ be the dual basis to $\{\underline{\tau}^{\{\underline{k}\}}, \|\underline{k}| \leq n\}$ of $\mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X)$. Conversely, via the identification 2.1.2.6.1 and 2.1.2.6.2, the costratification ε_n of $\mathcal{M}$ satisfies the following formula for any $x \in \mathcal{M}$ and any $\underline{k} \in \mathbb{N}^d$:

$$\varepsilon_n(x \otimes \underline{\partial}^{\langle \underline{k}\rangle}) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}^{\star\langle \underline{h}\rangle} \otimes x \underline{\partial}^{\langle \underline{k}-\underline{h}\rangle}. \tag{2.1.2.9.2}$$

We have the following formula for the inverse

$$\varepsilon_n^{-1}(\underline{\partial}^{\star\langle \underline{k}\rangle} \otimes x) = \sum_{\underline{h} \leq \underline{k}} (-1)^{|\underline{k}-\underline{h}|} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} x \underline{\partial}^{\langle \underline{k}-\underline{h}\rangle} \otimes \underline{\partial}^{\langle \underline{h}\rangle}. \tag{2.1.2.9.3}$$

Proof. a) The formula 2.1.2.9.1 is straightforward by construction of the $\epsilon^{\mathcal{M}}_n$ from the right $\mathcal{D}^{(m)}_X$-module action (see 2.1.2.8.8).

b) Set $\delta_{\underline{k},x} := \iota_n^{\mathcal{M}}(x \otimes \underline{\partial}^{\langle \underline{k} \rangle})$. It follows from 1.2.4.5.3 that $\underline{\tau}^{\{\underline{h}\}}\delta_{\underline{k},x} = \left\{\begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix}\right\}_{(m)} \delta_{\underline{k}-\underline{h},x}$. We compute

$$\varepsilon_n(\delta_{\underline{k},x})(\underline{\tau}^{\{\underline{h}\}}) = \left(\underline{\tau}^{\{\underline{h}\}}\varepsilon_n(\delta_{\underline{k},x})\right)(1) = \varepsilon_n(\underline{\tau}^{\{\underline{h}\}}\delta_{\underline{k},x})(1) = \left\{\begin{matrix} \underline{k} \\ \underline{h} \end{matrix}\right\}_{(m)} \varepsilon_n(\delta_{\underline{k}-\underline{h},x})(1) = \left\{\begin{matrix} \underline{k} \\ \underline{h} \end{matrix}\right\}_{(m)} x\underline{\partial}^{\langle \underline{k}-\underline{h} \rangle}. \tag{2.1.2.9.4}$$

From 2.1.2.9.4, we get the formula 2.1.2.9.2. Finally, via an easy computation, we can check that the formula given by 2.1.2.9.3 do is the inverse. □

Remark 2.1.2.10. Let $\mathcal{M}$ be an $\mathcal{O}_X$-module endowed with a family (as n varies) of $\mathcal{P}^n_{X,(m)}$-linear isomorphisms

$$\varepsilon_n \colon p_{0,(m)}^{n\flat}(\mathcal{M}) \to p_{1,(m)}^{n\flat}(\mathcal{M}),$$

satisfying the condition (a) of 2.1.2.3. We remark that the cocycle condition is local. Let us give a local description of this condition. Suppose X/S is equipped with coordinates $t_1, \ldots, t_d$. For any x of $\mathcal{M}$, for any $\underline{k} \in \mathbb{N}^d$, for any $n \geq |\underline{k}|$, we set

$$x \cdot \underline{\partial}^{\langle \underline{k} \rangle} := \mathrm{ev}_1 \circ \varepsilon_n(x \otimes \underline{\partial}^{\langle \underline{k} \rangle}). \tag{2.1.2.10.1}$$

First remark that these elements do not depend on the choice of n which justifies the notation. Moreover, the cocycle condition is equivalent to the condition that the formula

$$\left\langle \begin{matrix} \underline{i} + \underline{j} \\ \underline{i} \end{matrix} \right\rangle x \cdot \underline{\partial}^{\langle \underline{i}+\underline{j} \rangle} = (x \cdot \underline{\partial}^{\langle \underline{i} \rangle}) \cdot \underline{\partial}^{\langle \underline{j} \rangle} \tag{2.1.2.10.2}$$

holds for any section x of $\mathcal{E}$, for any $\underline{i}, \underline{j} \in \mathbb{N}^d$. Indeed, we have checked in the proof of 2.1.2.8 that the family (ε_n) is equivalent to the family of $\mathcal{O}_X$-linear homomorphisms of the form $\mu_n^{\mathcal{M}} \colon p_{1*}(\mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n}) \to \mathcal{M}$ such that $\mu_0^{\mathcal{M}} = \mathrm{id}_{\mathcal{M}}$ and the left square of 2.1.2.8.4 is commutative. Moreover, we have checked the cocycle condition is equivalent to the commutativity of the right square of 2.1.2.8.4, i.e. of the associativity of the definition 2.1.2.10.1. By $\mathcal{O}_X$-linearity of $\mu_n^{\mathcal{M}}$, we reduce to the case where the operators are of the form $\underline{\partial}^{\langle \underline{i} \rangle}$ and we are done thanks to 1.4.2.7.c.

2.1.3 Internal tensor product of $\mathcal{D}$-modules of level m

We give a summary of the local formulas calculating the $\otimes$ of $\mathcal{D}^{(m)}_X$-modules. These will be used throughout the book implicitly. We give some details here as an illustration of calculations with left and right modules.

Proposition 2.1.3.1. *Let $\mathcal{E}$, $\mathcal{F}$ be two left $\mathcal{D}^{(m)}_X$-modules and let $\mathcal{M}$ be a right $\mathcal{D}^{(m)}_X$-module.*

(a) There exists on $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}$ a unique structure of left $\mathcal{D}^{(m)}_X$-module (extending its structure of $\mathcal{O}_X$-module) such that for any open set $U \subset X$ such that U/S has coordinates, for any sections $x \in \Gamma(U, \mathcal{E})$ and $y \in \Gamma(U, \mathcal{F})$ the formula holds

$$\underline{\partial}^{\langle \underline{k} \rangle} \cdot (x \otimes y) = \sum_{\underline{i} \leq \underline{k}} \left\{\begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix}\right\} \underline{\partial}^{\langle \underline{i} \rangle} x \otimes \underline{\partial}^{\langle \underline{k}-\underline{i} \rangle} y. \tag{2.1.3.1.1}$$

(b) There exists on $\mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{E}$ a unique structure of right $\mathcal{D}^{(m)}_X$-module such that such that for any open set $U \subset X$ such that U/S has coordinates, $x \in \Gamma(U, \mathcal{E})$, $y \in \Gamma(U, \mathcal{M})$ the formula holds

$$(y \otimes x)\underline{\partial}^{\langle \underline{k} \rangle} = \sum_{\underline{h} \leq \underline{k}} (-1)^{|\underline{h}|} \left\{\begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix}\right\} y\underline{\partial}^{\langle \underline{k}-\underline{h} \rangle} \otimes \underline{\partial}^{\langle \underline{h} \rangle} x. \tag{2.1.3.1.2}$$

(c) Let $\mathcal{D}$ be a sheaf of rings on X. If the structure of left $\mathcal{D}^{(m)}_{X/S}$-module of $\mathcal{E}$ (resp. $\mathcal{E}$) extends to a structure of $(\mathcal{D}^{(m)}_{X/S}, \mathcal{D})$-bimodule then then the structure of left $\mathcal{D}^{(m)}_{X/S}$-module of $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}$ extends to a structure of $(\mathcal{D}^{(m)}_{X/S}, \mathcal{D})$-bimodule, where the structure of left $\mathcal{D}^{(m)}_{X/S}$-module is the tensor product structure. Moreover, if the structure of left (resp. right) $\mathcal{D}^{(m)}_{X/S}$-module of $\mathcal{E}$ (resp. $\mathcal{M}$) extends to a

structure of $(\mathcal{D}^{(m)}_{X/S}, \mathcal{D})$-bimodule (resp. $(\mathcal{D}, \mathcal{D}^{(m)}_{X/S})$-bimodule) then the structure of right $\mathcal{D}^{(m)}_{X/S}$-module of $\mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{E}$ extends to a structure of right $(\mathcal{D}, \mathcal{D}^{(m)}_{X/S})$-bimodule (resp. $(\mathcal{D}, \mathcal{D}^{(m)}_{X/S})$-bimodule). In the same way, these structures of $\mathcal{D}^{(m)}_{X/S}$-module do not depend on the level m.

Proof. (a) Modulo the canonical isomorphisms of $\mathcal{P}^n_{X/S(m)}$-modules

$$p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)}\otimes_{\mathcal{O}_X}(\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{F}) \xrightarrow{\sim} (p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)}\otimes_{\mathcal{O}_X}\mathcal{E})\otimes_{\mathcal{P}^n_{X/S(m)}}(p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)}\otimes_{\mathcal{O}_X}\mathcal{F}), \quad (2.1.3.1.3)$$

we get the isomorphisms of $\mathcal{P}^n_{X/S(m)}$-modules

$$\epsilon^{\mathcal{E}\otimes\mathcal{F}}_n := \varepsilon^{\mathcal{E}}_n \otimes \varepsilon^{\mathcal{F}}_n \colon \mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} (\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}) \xrightarrow{\sim} (\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S(m)}.$$

By using the formulas 1.2.4.5.3 and 2.1.1.5.4, with the above identification 4.2.3.1.5 we get

$$\varepsilon^{\mathcal{E}\otimes\mathcal{F}}_n(1\otimes(x\otimes y)) = \left(\sum_{|\underline{i}|\leq n} \underline{\partial}^{\langle \underline{i}\rangle} x \otimes \underline{\tau}^{\{\underline{i}\}}\right)\otimes\left(\sum_{|\underline{j}|\leq n} \underline{\partial}^{\langle \underline{j}\rangle} y \otimes \underline{\tau}^{\{\underline{j}\}}\right) = \sum_{|\underline{k}|\leq n}\left(\sum_{\underline{i}\leq\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{i}\end{smallmatrix}\right\} \underline{\partial}^{\langle \underline{i}\rangle} x \otimes \underline{\partial}^{\langle \underline{k}-\underline{i}\rangle} y\right)\otimes\underline{\tau}^{\{\underline{k}\}},$$

which yields 2.1.3.1.1. Using the remark 2.1.1.6, we easily compute that the cocycle condition holds. Hence, $(\epsilon^{\mathcal{E}\otimes\mathcal{F}}_n)$ is an m-PD-stratification relative to X/S.

(b) Set $\mathcal{H} := \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{E}$. Since $\mathcal{P}^n_{X,(m)}$ is locally free of finite rank, so for $i = 0, 1$, we have canonical isomorphisms

$$\begin{aligned} &(p^n_{i,(m)})^\flat(\mathcal{H}) = \mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{E}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{M}) \otimes_{\mathcal{O}_X} \mathcal{E} \\ &\xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{M}) \otimes_{\mathcal{P}^n_{X,(m)}} (p_{i*}\mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}) = (p^n_{i,(m)})^\flat(\mathcal{M}) \otimes_{\mathcal{P}^n_{X/S,(m)}} (p^n_{i,(m)})^*(\mathcal{E}) \end{aligned}$$

Via these identifications, we get the isomorphisms of $\mathcal{P}^n_{X/S(m)}$-modules

$$\epsilon^{\mathcal{H}}_n := \epsilon^{\mathcal{M}}_n \otimes (\epsilon^{\mathcal{E}}_n)^{-1}.$$

By using the formulas 2.1.2.9.2 and 2.1.1.5.5, for any open set $U \subset X$ such that U/S has coordinates, $x \in \Gamma(U, \mathcal{E})$, $y \in \Gamma(U, \mathcal{M})$, we compute

$$\begin{aligned} \varepsilon^{\mathcal{H}}_n(y \otimes x \otimes \underline{\partial}^{\langle \underline{k}\rangle}) &= \varepsilon^{\mathcal{M}}_n(y \otimes \underline{\partial}^{\langle \underline{k}\rangle}) \otimes_{\mathcal{P}^n_{X,(m)}} (\varepsilon^{\mathcal{E}}_n)^{-1}(x \otimes 1) \\ &= \left(\sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} \underline{\partial}^{\star\langle \underline{h}\rangle} \otimes y\underline{\partial}^{\langle \underline{k}-\underline{h}\rangle}\right) \otimes \left(\sum_{|\underline{i}|\leq n} (-1)^{|\underline{i}|}\underline{\tau}^{\{\underline{i}\}} \otimes \underline{\partial}^{\langle \underline{i}\rangle} x\right) \\ &= \sum_{\underline{h}\leq\underline{k}}\sum_{|\underline{i}|\leq n} (-1)^{|\underline{i}|} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} \underline{\tau}^{\{\underline{i}\}}\underline{\partial}^{\star\langle \underline{h}\rangle} \otimes y\underline{\partial}^{\langle \underline{k}-\underline{h}\rangle} \otimes \underline{\partial}^{\langle \underline{i}\rangle} x. \end{aligned} \quad (2.1.3.1.4)$$

Since $\underline{\tau}^{\{\underline{i}\}}\underline{\partial}^{\star\langle \underline{h}\rangle}(1) = 0$ for $\underline{h} \neq \underline{i}$ and $\underline{\tau}^{\{\underline{h}\}}\underline{\partial}^{\star\langle \underline{h}\rangle}(1) = 1$, then we compute

$$(y \otimes x)\underline{\partial}^{\langle \underline{k}\rangle} \overset{2.1.2.9.1}{=} \varepsilon^{\mathcal{M}\otimes\mathcal{E}}_n(y \otimes x \otimes \underline{\partial}^{\langle \underline{k}\rangle})(1) \overset{2.1.3.1.4}{=} \sum_{\underline{h}\leq\underline{k}} (-1)^{|\underline{h}|} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} y\underline{\partial}^{\langle \underline{k}-\underline{h}\rangle} \otimes \underline{\partial}^{\langle \underline{h}\rangle} x.$$

which gives the formula 2.1.3.1.2. Using the remark 2.1.1.6, we easily compute that the cocycle condition holds. Hence, $(\epsilon^{\mathcal{H}}_n)$ is an m-PD-stratification relative to X/S.

(c) The functoriality in $\mathcal{E}$, $\mathcal{F}$ and $\mathcal{M}$ of these structures of $\mathcal{D}^{(m)}_{X/S}$-modules is a consequence for instance of the formulas 2.1.3.1.2 and 2.1.3.1.1. It follows from this functoriality that the part (c) holds (this can also be proves directly via the formula 2.1.3.1.1).

□

2.1.4 Internal homorphism bifunctor of $\mathcal{D}$-modules of level m

We give the local formulas calculating Hom.

Proposition 2.1.4.1. *Let $\mathcal{E}$, $\mathcal{F}$ be two left $\mathcal{D}_X^{(m)}$-modules. Let $\mathcal{M}$, $\mathcal{N}$ be two right $\mathcal{D}_X^{(m)}$-modules.*

(a) There exists on the sheaf $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F})$ a unique structure of left $\mathcal{D}_X^{(m)}$-module such that for any open set $U \subset X$ such that U/S has coordinates, for any $\varphi \in \Gamma(U, \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}))$ and $x \in \Gamma(U,\mathcal{E})$

$$(\underline{\partial}^{\langle \underline{k} \rangle}\varphi)(x) = \sum_{\underline{i}\leq \underline{k}} (-1)^{|\underline{i}|} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{k}-\underline{i} \rangle}(\varphi(\underline{\partial}^{\langle \underline{i} \rangle} x)). \tag{2.1.4.1.1}$$

(b) There exists on $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{M})$ a unique structure of right $\mathcal{D}_X^{(m)}$-module such that for any open set $U \subset X$ such that U/S has coordinates, $x \in \Gamma(U,\mathcal{E})$, $\varphi \colon \mathcal{E}|_U \to \mathcal{M}|_U$ we have

$$(\varphi\underline{\partial}^{\langle \underline{k} \rangle})(x) = \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \varphi(\underline{\partial}^{\langle \underline{h} \rangle} x)\underline{\partial}^{\langle \underline{k}-\underline{h} \rangle}. \tag{2.1.4.1.2}$$

(c) There exists on $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})$ a unique structure of left $\mathcal{D}_X^{(m)}$-module such that for any open set $U \subset X$ such that U/S has coordinates, $z \in \Gamma(U,\mathcal{N})$, $\psi \colon \mathcal{N}|_U \to \mathcal{M}|_U$ we have

$$(\underline{\partial}^{\langle \underline{k} \rangle}\psi)(z) = \sum_{\underline{h}\leq \underline{k}} (-1)^{|\underline{k}-\underline{h}|} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \psi(z\underline{\partial}^{\langle \underline{h} \rangle})\underline{\partial}^{\langle \underline{k}-\underline{h} \rangle}. \tag{2.1.4.1.3}$$

(d) Let $\mathcal{D}$ be a sheaf of rings on X. If the structure of left $\mathcal{D}_{X/S}^{(m)}$-module of $\mathcal{F}$ (resp. $\mathcal{E}$) extends to a structure of $(\mathcal{D}_{X/S}^{(m)},\mathcal{D})$-bimodule then the structure of left $\mathcal{D}_{X/S}^{(m)}$-module of $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F})$ extends to a structure of (resp. left) $(\mathcal{D}_{X/S}^{(m)},\mathcal{D})$-bimodule. The left structure is the internal homomorphism structure. Moreover, if the structure of left (resp. right) $\mathcal{D}_{X/S}^{(m)}$-module of $\mathcal{E}$ (resp. $\mathcal{M}$) extends to a structure of $(\mathcal{D}_{X/S}^{(m)},\mathcal{D})$-bimodule (resp. $(\mathcal{D},\mathcal{D}_{X/S}^{(m)})$-bimodule), then the structure of right $\mathcal{D}_{X/S}^{(m)}$-module of $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{M})$ extends to a structure of right $(\mathcal{D},\mathcal{D}_{X/S}^{(m)})$-bimodule (resp. $(\mathcal{D},\mathcal{D}_{X/S}^{(m)})$-bimodule). Moreover, if the structure of right $\mathcal{D}_{X/S}^{(m)}$-module of $\mathcal{N}$ (resp. of $\mathcal{M}$) extends to a structure of $(\mathcal{D},\mathcal{D}_{X/S}^{(m)})$-bimodule, then the structure of left $\mathcal{D}_{X/S}^{(m)}$-module of $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})$ extends to a structure of (resp. left) $(\mathcal{D}_{X/S}^{(m)},\mathcal{D})$-bimodule.

In the same way, these structures of $\mathcal{D}_{X/S}^{(m)}$-module do not depend on the level m.

Proof. (a) i) We construct the isomorphisms $\varepsilon_n^{\mathcal{G}}$. Since $p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)}$ is a locally free $\mathcal{O}_X$-module, then the canonical morphism

$$p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}) \to \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{F})$$

is an isomorphism. This yields that the canonical morphism of $\mathcal{P}^n_{X/S(m)}$-modules

$$\alpha_i \colon p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F}) \to \mathcal{H}om_{\mathcal{P}^n_{X/S(m)}}(p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{E}, p^n_{i,(m)*}\mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{F}) \tag{2.1.4.1.4}$$

given by $\tau \otimes \varphi \mapsto (\tau' \otimes x \mapsto \tau\tau' \otimes \varphi(x))$, is an isomorphism. Setting $\mathcal{G} := \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{F})$, we denote by $\varepsilon_n^{\mathcal{G}}$ the isomorphism of $\mathcal{P}^n_{X/S(m)}$-modules making commutative the diagram

$$\begin{array}{ccc} \mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{G} & \xrightarrow[\sim]{\alpha_1} & \mathcal{H}om_{\mathcal{P}^n_{X/S(m)}}(\mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{E}, \mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{F}) \\ \downarrow{\scriptstyle \varepsilon_n^{\mathcal{G}}} & & \downarrow{\scriptstyle \mathcal{H}om_{\mathcal{P}^n_{X/S(m)}}((\varepsilon_n^{\mathcal{E}})^{-1}, \epsilon_n^{\mathcal{F}})} \\ \mathcal{G} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S(m)} & \xrightarrow[\sim]{\alpha_0} & \mathcal{H}om_{\mathcal{P}^n_{X/S(m)}}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S(m)}, \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S(m)}). \end{array} \tag{2.1.4.1.5}$$

ii) Let us check the formula 2.1.4.1.1. Suppose X/S has coordinates. Let $\varphi \colon \mathcal{E} \to \mathcal{F}$ be a section of $\mathcal{G}$ and $\psi := \alpha_1(1 \otimes \varphi) \colon \mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{E} \to \mathcal{P}^n_{X/S(m)} \otimes_{\mathcal{O}_X} \mathcal{F}$ be the image of $1 \otimes \varphi$ by the canonical isomorphism

α_1 of 2.1.4.1.4. For any $\underline{k} \in \mathbb{N}^d$, for any $n \geq |\underline{k}|$, let us denote by $\underline{\partial}^{\langle \underline{k} \rangle}\varphi$ or by $\underline{\partial}^{\langle \underline{k} \rangle}(\varphi)$ the section of $\mathcal{G}$ such that we get

$$\varepsilon_n^{\mathcal{G}}(1 \otimes \varphi) = \sum_{|\underline{k}| \leq n} \underline{\partial}^{\langle \underline{k} \rangle}\varphi \otimes \underline{\tau}^{\{\underline{k}\}}.$$

The map $\alpha_0(\epsilon_n^{\mathcal{G}}(1 \otimes \varphi))$ is the unique $\mathcal{P}^n_{X/S(m)}$-linear morphism $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S(m)} \to \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S(m)}$ given by

$$x \otimes 1 \mapsto \sum_{|\underline{k}| \leq n} \underline{\partial}^{\langle \underline{k} \rangle}\varphi \otimes \underline{\tau}^{\{\underline{k}\}},$$

for any section x of $\mathcal{E}$. On the other hand, $\alpha_0(\epsilon_n^{\mathcal{G}}(1 \otimes \varphi)) = \epsilon_n^{\mathcal{F}} \circ \psi \circ (\epsilon_n^{\mathcal{E}})^{-1}$ by definition (see 2.1.4.1.5). We compute

$$\epsilon_n^{\mathcal{F}} \circ \psi \circ (\varepsilon_n^{\mathcal{E}})^{-1}(x \otimes 1) \overset{2.1.\underline{1}.5.5}{=} \epsilon_n^{\mathcal{F}} \circ \psi \left(\sum_{|\underline{i}| \leq n} (-1)^{|\underline{i}|} \underline{\tau}^{\{\underline{i}\}} \otimes \underline{\partial}^{\langle \underline{i} \rangle} x \right) = \epsilon_n^{\mathcal{F}} \left(\sum_{|\underline{i}| \leq n} (-1)^{|\underline{i}|} \underline{\tau}^{\{\underline{i}\}} \otimes \varphi(\underline{\partial}^{\langle \underline{i} \rangle} x) \right)$$

$$\overset{2.1.\underline{1}.5.4}{=} \sum_{|\underline{i}| \leq n} \sum_{|\underline{j}| \leq n} (-1)^{|\underline{i}|} \underline{\partial}^{\langle \underline{j} \rangle}(\varphi(\underline{\partial}^{\langle \underline{i} \rangle} x)) \otimes \underline{\tau}^{\{\underline{j}\}} \underline{\tau}^{\{\underline{i}\}} = \sum_{|\underline{k}| \leq n} \left(\sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} (-1)^{|\underline{i}|} \underline{\partial}^{\langle \underline{k} - \underline{i} \rangle}(\varphi(\underline{\partial}^{\langle \underline{i} \rangle} x)) \right) \otimes \underline{\tau}^{\{\underline{k}\}}$$

Hence, we get the formula 2.1.4.1.1.

iii) Finally the fact that the cocycle condition holds for the family $(\varepsilon_n^{\mathcal{G}})$ (an then is an m-PD-stratification relative to X/S) is ether a consequence by construction of that of the families $(\varepsilon_n^{\mathcal{E}})$ and $(\varepsilon_n^{\mathcal{F}})$ or since this is local is an easy computation using the formula 2.1.4.1.1 and the remark 2.1.1.6.

(b) i) We have the canonical isomorphisms

$$\beta_i \colon (p_i^n)^\flat(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{M})) \overset{4.6.3.9}{\xrightarrow{\sim}} \mathcal{H}om_{\mathcal{O}_X}((p_i^n)^*(\mathcal{E}), \mathcal{M}) \overset{2.1.2.1.1}{\xrightarrow{\sim}} \mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_i^n)^*(\mathcal{E}), (p_i^n)^\flat(\mathcal{M})\right). \tag{2.1.4.1.6}$$

We set $\mathcal{H} := \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{M})$ and we denote by $\epsilon_n^{\mathcal{H}}$ the $\mathcal{P}^n_{X/S,(m)}$-linear isomorphism making commutative the following diagram

$$\begin{array}{ccc} (p_0^n)^\flat(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{M})) & \underset{\beta_0}{\xrightarrow{\sim}} & \mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_0^n)^*(\mathcal{E}), (p_0^n)^\flat(\mathcal{M})\right) \\ \downarrow{\scriptstyle \epsilon_n^{\mathcal{H}}} & & \downarrow{\scriptstyle \mathcal{H}om(\epsilon_n^{\mathcal{E}}, \epsilon_n^{\mathcal{M}})} \\ (p_1^n)^\flat(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E}, \mathcal{M})) & \underset{\beta_1}{\xrightarrow{\sim}} & \mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_1^n)^*(\mathcal{E}), (p_1^n)^\flat(\mathcal{M})\right). \end{array} \tag{2.1.4.1.7}$$

ii) Let us check the formula 2.1.4.1.2. Let $\varphi \colon \mathcal{E} \to \mathcal{M}$ be a section of $\mathcal{H}$, $\underline{k} \in \mathbb{N}^r$ and $\underline{\partial}^{\langle \underline{k} \rangle} \otimes \varphi$ be the section of $(p_0^n)^\flat(\mathcal{H})$ (via its identification with $\mathcal{H} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X/S,n}$). We compute the morphism $\beta_0(\varphi \otimes \underline{\partial}^{\langle \underline{k} \rangle}) \colon (p_0^n)^*(\mathcal{E}) \to (p_0^n)^\flat(\mathcal{M})$ is the morphism given by

$$x \otimes \underline{\tau}^{\{\underline{i}\}} \mapsto (\underline{\tau}^{\{\underline{j}\}} \mapsto \underline{\partial}^{\langle \underline{k} \rangle}(\underline{\tau}^{\{\underline{i}\}} \underline{\tau}^{\{\underline{j}\}})\varphi(x)). \tag{2.1.4.1.8}$$

Hence, modulo the identification $(p_0^n)^\flat(\mathcal{M}) = \mathcal{M} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X/S,n}$, we get

$$\beta_0(\varphi \otimes \underline{\partial}^{\langle \underline{k} \rangle})(x \otimes \underline{\tau}^{\{\underline{i}\}}) = \begin{cases} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \varphi(x) \otimes \underline{\partial}^{\langle \underline{k} - \underline{i} \rangle} & \text{if } \underline{i} \leq \underline{k} \\ 0 & \text{otherwise.} \end{cases} \tag{2.1.4.1.9}$$

Hence, we compute

$$\epsilon_n^{\mathcal{M}} \circ \beta_0(\varphi \otimes \underline{\partial}^{\langle \underline{k}\rangle}) \circ \epsilon_n^{\mathcal{E}}(\underline{\tau}^{\{\underline{i}\}} \otimes x) \overset{2.1.\underline{1}.5.4}{=} \epsilon_n^{\mathcal{M}} \circ \beta_0(\varphi \otimes \underline{\partial}^{\langle \underline{k}\rangle}) \left(\sum_{|\underline{h}|\leq n} \underline{\partial}^{\langle \underline{h}\rangle} x \otimes \underline{\tau}^{\{\underline{h}\}}\underline{\tau}^{\{\underline{i}\}} \right)$$

$$\overset{2.1.\underline{4}.1.13}{=} \epsilon_n^{\mathcal{M}} \left(\sum_{\underline{h}\leq \underline{k}-\underline{i}} \left\{ \begin{matrix} \underline{i}+\underline{h} \\ \underline{i} \end{matrix} \right\} \left\{ \begin{matrix} \underline{k} \\ \underline{i} \end{matrix} + \underline{h} \right\} \varphi(\underline{\partial}^{\langle \underline{h}\rangle} x) \otimes \underline{\partial}^{\langle \underline{k}-\underline{i}-\underline{h}\rangle} \right)$$

$$\overset{2.1.\underline{2}.9.2}{=} \sum_{\underline{h}\leq \underline{k}-\underline{i}} \sum_{\underline{j}\leq \underline{k}-\underline{i}-\underline{h}} \left\{ \begin{matrix} \underline{i}+\underline{h} \\ \underline{i} \end{matrix} \right\} \left\{ \begin{matrix} \underline{k} \\ \underline{i} \end{matrix} + \underline{h} \right\} \left\{ \begin{matrix} \underline{k}-\underline{i}-\underline{h} \\ \underline{j} \end{matrix} \right\} \underline{\partial}^{\star\langle \underline{j}\rangle} \otimes \varphi(\underline{\partial}^{\langle \underline{h}\rangle} x) \underline{\partial}^{\langle \underline{k}-\underline{i}-\underline{h}-\underline{j}\rangle}.$$

We have $\epsilon_n^{\mathcal{H}}(\varphi \otimes \underline{\partial}^{\langle \underline{k}\rangle}) = \beta_1^{-1}(\epsilon_n^{\mathcal{M}} \circ \beta_0(\varphi \otimes \underline{\partial}^{\langle \underline{k}\rangle}) \circ \epsilon_n^{\mathcal{E}})$ by definition (see 2.1.4.1.12). Moreover, we have the commutative diagram

$$\begin{array}{ccc} (p_1^n)^\flat(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{M})) & \xrightarrow[\beta_1]{\sim} & \mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_1^n)^*(\mathcal{E}), (p_1^n)^\flat(\mathcal{M})\right) \\ \downarrow{\scriptstyle \mathrm{ev}_1} & & \downarrow{\scriptstyle \sim} \\ \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},\mathcal{M}) & \xleftarrow[\mathrm{ev}_1]{} & \mathcal{H}om_{\mathcal{O}_X}(\mathcal{E},(p_1^n)^\flat(\mathcal{M})) \end{array} \tag{2.1.4.1.10}$$

where the right isomorphism is the canonical one. Hence, via the commutativity of 2.1.4.1.13, we get

$$x \cdot \underline{\partial}^{\langle \underline{k}\rangle} := \mathrm{ev}_1 \circ \varepsilon_n^{\mathcal{H}}(x \otimes \underline{\partial}^{\langle \underline{k}\rangle}) = \mathrm{ev}_1 \left(\epsilon_n^{\mathcal{M}} \circ \beta_0(\varphi \otimes \underline{\partial}^{\langle \underline{k}\rangle}) \circ \epsilon_n^{\mathcal{E}}(1 \otimes x) \right)$$

$$= \mathrm{ev}_1 \left(\sum_{\underline{h}\leq \underline{k}} \sum_{\underline{j}\leq \underline{k}-\underline{h}} \left\{ \begin{matrix} \underline{k} \\ \underline{h} \end{matrix} \right\} \left\{ \begin{matrix} \underline{k}-\underline{h} \\ \underline{j} \end{matrix} \right\} \underline{\partial}^{\star\langle \underline{j}\rangle} \otimes \varphi(\underline{\partial}^{\langle \underline{h}\rangle} x) \underline{\partial}^{\langle \underline{k}-\underline{h}-\underline{j}\rangle} \right) = \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{matrix} \underline{k} \\ \underline{h} \end{matrix} \right\} \varphi(\underline{\partial}^{\langle \underline{h}\rangle} x) \underline{\partial}^{\langle \underline{k}-\underline{h}\rangle}.$$

iii) Finally the fact that the cocycle condition holds for the family $(\varepsilon_n^{\mathcal{H}})$ (an then is an m-PD-stratification relative to X/S) is ether a consequence by construction of that of the families $(\varepsilon_n^{\mathcal{E}})$ and $(\varepsilon_n^{\mathcal{M}})$ or since this is local is an easy computation using the formula 2.1.4.1.2 and the remark 2.1.2.10.

(c) i) Set $\mathcal{K} := \mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})$. By functoriality and extension, we get the canonical $\mathcal{P}^n_{X/S,(m)}$-linear homomorphisms

$$\gamma_i \colon (p_i^n)^*(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})) \to \mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_i^n)^\flat(\mathcal{N}), (p_i^n)^\flat(\mathcal{M})\right), \tag{2.1.4.1.11}$$

given by $\phi \otimes \tau \mapsto (u \mapsto (\tau' \mapsto \phi \circ u(\tau\tau')))$ with u a section of $(p_i^n)^\flat(\mathcal{N})$, τ and τ' of $\mathcal{P}^n_{X/S,(m)}$. By compositing 2.1.4.1.11 with the isomorphisms

$$\mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_i^n)^\flat(\mathcal{N}), (p_i^n)^\flat(\mathcal{M})\right) \overset{2.1.2.1.1}{\xrightarrow{\sim}} \mathcal{H}om_{\mathcal{O}_X}\left((p_i^n)^\flat(\mathcal{N}), \mathcal{M}\right)$$
$$\overset{2.1.2.6}{\xrightarrow{\sim}} \mathcal{H}om_{\mathcal{O}_X}\left(\mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X) \otimes_{\mathcal{O}_X} \mathcal{N}, \mathcal{M}\right)$$

we get the map given by $\phi \otimes \tau \mapsto ((P \otimes x) \mapsto \phi(P(\tau)x))$. This composition is equal to the composition of the isomorphisms

$$p_{i*}^n\mathcal{P}^n_{X,(m)} \otimes_{\mathcal{O}_X} (\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}\left(\mathcal{N}, \mathcal{H}om_{\mathcal{O}_X}\left(\mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X), \mathcal{M}\right)\right)$$
$$\overset{4.6.3.9}{\xrightarrow{\sim}} \mathcal{H}om_{\mathcal{O}_X}\left(\mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X) \otimes_{\mathcal{O}_X} \mathcal{N}, \mathcal{M}\right)$$

where first map is given by $\phi \otimes \tau \mapsto (x \mapsto (P \mapsto P(\tau)\phi(x)))$, for any $\tau \in \mathcal{P}^n_{X,(m)}$, $\phi \in \mathcal{H}$, $x \in \mathcal{N}$, $P \in \mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X)$ and is an isomorphism because the homomorphism $p_{i*}\mathcal{P}^n_{X,(m)} \to \mathcal{H}om_{\mathcal{O}_X}\left(\mathcal{H}om_{\mathcal{O}_X}(p_{i*}\mathcal{P}^n_{X,(m)}, \mathcal{O}_X), \mathcal{O}_X\right)$ is an isomorphism, we get that the canonical map 2.1.4.1.11 is an isomorphism.

We denote by $\epsilon_n^{\mathcal{K}}$ the $\mathcal{P}^n_{X/S,(m)}$-linear isomorphism making commutative the following diagram

$$\begin{array}{ccc} (p_1^n)^*(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})) & \xrightarrow[\sim]{2.1.4.1.12} & \mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_1^n)^\flat(\mathcal{N}),(p_1^n)^\flat(\mathcal{M})\right) \\ \Big\downarrow \epsilon_n^{\mathcal{K}} & & \Big\downarrow \mathcal{H}om(\epsilon_n^{\mathcal{N}},(\epsilon_n^{\mathcal{M}})^{-1}) \\ (p_0^n)^*(\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})) & \xrightarrow[\sim]{2.1.4.1.12} & \mathcal{H}om_{\mathcal{P}^n_{X/S,(m)}}\left((p_0^n)^\flat(\mathcal{N}),(p_0^n)^\flat(\mathcal{M})\right) \end{array} \tag{2.1.4.1.12}$$

ii) As above in (a) or (b), it is sufficient to check the formula 2.1.4.1.3. Suppose X/S has coordinates.

1) Let $\underline{k}\in\mathbb{N}^r$ and let $\psi_{\underline{k}}$ be a section of $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})$). Modulo the canonical isomorphism $\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n}\xrightarrow{\sim}p^{n\flat}_{0,(m)}(\mathcal{M})$ of 2.1.2.6.1, with notation 2.1.4.1.11 the map $\gamma_0(\psi_{\underline{k}}\otimes\underline{\tau}^{\{\underline{k}\}})$ is the $\mathcal{P}^n_{X/S,(m)}$-linear homomorphism of the form $\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n}\to p^{n\flat}_{0,(m)}(\mathcal{N})$ defined by the formula

$$z\otimes\underline{\partial}^{\langle\underline{i}\rangle}\mapsto(\underline{\tau}^{\{\underline{k}\}}\mapsto\psi_{\underline{k}}(z)\otimes\underline{\partial}^{\langle\underline{i}\rangle}(\underline{\tau}^{\{\underline{j}\}}\underline{\tau}^{\{\underline{k}\}})).$$

Hence, modulo the canonical isomorphism $\mathcal{N}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X,n}\xrightarrow{\sim}p^{n\flat}_{0,(m)}(\mathcal{N})$, with 1.2.4.5.3 we compute

$$\gamma_0(\psi_{\underline{k}}\otimes\underline{\tau}^{\{\underline{k}\}})(z\otimes\underline{\partial}^{\langle\underline{i}\rangle})=\begin{cases}\left\{\begin{matrix}\underline{i}\\ \underline{k}\end{matrix}\right\}\psi_{\underline{k}}(z)\otimes\underline{\partial}^{\langle\underline{i}-\underline{k}\rangle} & \text{if } \underline{i}\geq\underline{k}\\ 0 & \text{otherwise.}\end{cases} \tag{2.1.4.1.13}$$

2) Let ψ be a section of $\mathcal{H}om_{\mathcal{O}_X}(\mathcal{N},\mathcal{M})$). We have the formula

$$\gamma_0(\varepsilon_n^{\mathcal{K}}(1\otimes\psi))(z\otimes\underline{\partial}^{\langle\underline{i}\rangle})\overset{2.1.1.5.4}{=}\sum_{|\underline{k}|\leq n}\gamma_0(\underline{\partial}^{\langle\underline{k}\rangle}\psi\otimes\underline{\tau}^{\{\underline{k}\}})(z\otimes\underline{\partial}^{\langle\underline{i}\rangle})\overset{2.1.4.1.13}{=}\sum_{\underline{k}\leq\underline{i}}\left\{\begin{matrix}\underline{i}\\ \underline{k}\end{matrix}\right\}(\underline{\partial}^{\langle\underline{k}\rangle}\psi)(z)\otimes\underline{\partial}^{\langle\underline{i}-\underline{k}\rangle}. \tag{2.1.4.1.14}$$

Modulo the identifications of 2.1.2.6.2, we compute

$$\gamma_1(1\otimes\psi)=id\otimes\psi\colon\mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^n_{X,(m)},\mathcal{O}_X)\otimes_{\mathcal{O}_X}\mathcal{M}\to\mathcal{H}om_{\mathcal{O}_X}(p_{1*}\mathcal{P}^n_{X,(m)},\mathcal{O}_X)\otimes_{\mathcal{O}_X}\mathcal{N}.$$

Via the commutative diagram 2.1.4.1.12, $\gamma_0(\varepsilon_n^{\mathcal{K}}(1\otimes\psi))=(\epsilon_n^{\mathcal{M}})^{-1}\circ(id\otimes\psi)\circ\epsilon_n^{\mathcal{N}}$. We compute

$$(\epsilon_n^{\mathcal{M}})^{-1}\circ(id\otimes\psi)\circ\epsilon_n^{\mathcal{N}}(z\otimes\underline{\partial}^{\langle\underline{i}\rangle})\overset{2.1.2.9.2}{=}(\epsilon_n^{\mathcal{M}})^{-1}\circ(id\otimes\psi)(z\otimes\underline{\partial}^{\langle\underline{i}\rangle})=(\epsilon_n^{\mathcal{M}})^{-1}\circ(id\otimes\psi)(\sum_{\underline{h}\leq\underline{i}}\left\{\begin{matrix}\underline{i}\\ \underline{h}\end{matrix}\right\}\underline{\partial}^{\star\langle\underline{i}-\underline{h}\rangle}\otimes z\underline{\partial}^{\langle\underline{h}\rangle})$$

$$=\sum_{\underline{h}\leq\underline{i}}\left\{\begin{matrix}\underline{i}\\ \underline{h}\end{matrix}\right\}(\epsilon_n^{\mathcal{M}})^{-1}(\underline{\partial}^{\star\langle\underline{i}-\underline{h}\rangle}\otimes\psi(z\underline{\partial}^{\langle\underline{h}\rangle}))\overset{2.1.2.9.3}{=}\sum_{\underline{h}\leq\underline{i}}\sum_{0\leq\underline{i}-\underline{k}\leq\underline{i}-\underline{h}}(-1)^{|\underline{k}-\underline{h}|}\left\{\begin{matrix}\underline{i}\\ \underline{h}\end{matrix}\right\}\left\{\begin{matrix}\underline{i}-\underline{h}\\ \underline{i}-\underline{k}\end{matrix}\right\}(\psi(z\underline{\partial}^{\langle\underline{h}\rangle}))\underline{\partial}^{\langle\underline{k}-\underline{h}\rangle}\otimes\underline{\partial}^{\langle\underline{i}-\underline{k}\rangle}$$

$$=\sum_{\underline{k}\leq\underline{i}}\left\{\begin{matrix}\underline{i}\\ \underline{k}\end{matrix}\right\}\left(\sum_{\underline{h}\leq\underline{k}}(-1)^{|\underline{k}-\underline{h}|}\left\{\begin{matrix}\underline{k}\\ \underline{h}\end{matrix}\right\}(\psi(z\underline{\partial}^{\langle\underline{h}\rangle}))\underline{\partial}^{\langle\underline{k}-\underline{h}\rangle}\right)\otimes\underline{\partial}^{\langle\underline{i}-\underline{k}\rangle}. \tag{2.1.4.1.15}$$

It follows from 2.1.4.1.13 and 2.1.4.1.15 the equality 2.1.4.1.3.

(d) The functoriality in $\mathcal{E}$, $\mathcal{F}$, $\mathcal{M}$ or $\mathcal{N}$ can be checked by using these formulas. It comes from this functoriality (or again thanks to 2.1.4.1.1, 2.1.4.1.2 and 2.1.4.1.3) the part (d) of the proposition holds.

□

2.2 Exchanging right and left $\mathcal{D}$-modules

2.2.1 Structure of right $\mathcal{D}$-modules on ω_X

Let d be the relative dimension of the smooth morphism $f\colon X\to S$. We set $\omega_{X/S}:=\Omega^d_{X/S}$, which is often written as ω_X when S is understood. The sheaf ω_X plays an important role in $\mathcal{D}$-module theory - it is used to switch left and right modules, and therefore to define $\mathcal{D}$-linear duality.

2.2.1.1 (ω_X is a right $\mathcal{D}_X$-module: first case)**.** First, in order to be able to use the extraordinary inverse functor $g^!$ by an embeddable morphism g in the context of complexes with quasi-coherent cohomology (see [Har66, III Thm 8.7]), suppose S is locally noetherian. Beware, that this functor $g^!$ has not to be confused with the extraordinary inverse functor as complexes of $\mathcal{D}$-modules that we will define later. Since $f\colon X \to S$ is smooth, by construction of the functor $f^! = f^\sharp$, we get $\omega_{X/S} = f^!(\mathcal{O}_S[-d])$. Since $f \circ p^n_{0,(m)} = f \circ p^n_{1,(m)}$, by transitivity of the extraordinary inverse functor (as defined in [Har66, III Thm 8.7]), we get the canonical isomorphisms

$$\varepsilon_n \colon p^{n\flat}_{0,(m)}(\omega_X) \xrightarrow{\sim} p^{n!}_{0,(m)}(\omega_X) \xrightarrow{\sim} p^{n!}_{0,(m)}(f^!(\mathcal{O}_S[-d])) \xrightarrow{\sim} p^{n!}_{1,(m)}(f^!(\mathcal{O}_S[-d])) \xrightarrow{\sim} p^{n!}_{1,(m)}(\omega_X) = p^{n\flat}_{1,(m)}(\omega_X).$$

By using again the transitivity of the functor $f^!$, we check that the cocycle conditions are satisfied and therefore that the isomorphisms ε_n is a costratification. From Proposition 2.1.2.8, this gives ω_X the structure of a right $\mathcal{D}^{(m)}_X$-module.

Definition 2.2.1.2 (Adjoint operator)**.** Suppose X/S has coordinates $t_1, \dots, t_d$. For $P = \sum_{\underline{k}} a_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle} \in \Gamma(X, \mathcal{D}^{(m)}_X)$ with $a_{\underline{k}} \in \Gamma(X, \mathcal{O}_X)$, the *adjoint* of P is defined to be

$${}^t P = \sum_{\underline{k}} (-1)^{|\underline{k}|} \underline{\partial}^{\langle \underline{k} \rangle} a_{\underline{k}}.$$

Lemma 2.2.1.3. *Suppose X/S has coordinates $t_1, \dots, t_d$. Let P, Q be two differential operators of $\Gamma(X, \mathcal{D}^{(m)}_X)$. With notation 2.2.1.2, the following equalities hold: ${}^{\mathrm{t}}({}^{\mathrm{t}}P) = P$, ${}^{\mathrm{t}}(PQ) = {}^{\mathrm{t}}Q {}^{\mathrm{t}}P$.*

Proof. 1) Let us check ${}^{\mathrm{t}}({}^{\mathrm{t}}P) = P$. By additivity of $P \mapsto {}^{\mathrm{t}}P$, we reduce to the case where $P = a\underline{\partial}^{\langle \underline{k} \rangle}$ with $a \in \Gamma(X, \mathcal{O}_X)$ and $\underline{k} \in \mathbb{N}^d$. We compute:

$$\begin{aligned}
{}^{\mathrm{t}}({}^{\mathrm{t}}P) &\overset{1.4.2.7.1}{=} {}^{\mathrm{t}}\left((-1)^{|\underline{k}|} \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{k}-\underline{i} \rangle}(a) \underline{\partial}^{\langle \underline{i} \rangle} \right) = \sum_{\underline{i} \leq \underline{k}} (-1)^{|\underline{i}|+|\underline{k}|} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{i} \rangle} \cdot (\underline{\partial}^{\langle \underline{k}-\underline{i} \rangle}(a)) \\
&\overset{1.4.2.7.1}{=} \sum_{\underline{i} \leq \underline{k}} \sum_{\underline{j} \leq \underline{i}} (-1)^{|\underline{i}|+|\underline{k}|} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{i} \\ \underline{j} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{i}-\underline{j} \rangle}(\underline{\partial}^{\langle \underline{k}-\underline{i} \rangle}(a)) \underline{\partial}^{\langle \underline{j} \rangle} \\
&\overset{1.4.2.7.c}{=} \sum_{\underline{j} \leq \underline{k}} \sum_{\underline{j} \leq \underline{i} \leq \underline{k}} (-1)^{|\underline{i}|+|\underline{k}|} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{i} \\ \underline{j} \end{smallmatrix} \right\} \left\langle \begin{matrix} \underline{k}-\underline{j} \\ \underline{k}-\underline{i} \end{matrix} \right\rangle \underline{\partial}^{\langle \underline{k}-\underline{j} \rangle}(a) \underline{\partial}^{\langle \underline{j} \rangle} \\
&= \sum_{\underline{j} \leq \underline{k}} n_{\underline{k},\underline{j}} \underline{\partial}^{\langle \underline{k}-\underline{j} \rangle}(a) \underline{\partial}^{\langle \underline{j} \rangle} \sum_{\underline{j} \leq \underline{i} \leq \underline{k}} (-1)^{|\underline{k}|-|\underline{i}|} \binom{\underline{k}-\underline{j}}{\underline{k}-\underline{i}} = a\underline{\partial}^{\langle \underline{k} \rangle}. \qquad (2.2.1.3.1)
\end{aligned}$$

where $n_{\underline{k},\underline{j}}$ is a constant only depending on $\underline{k}$ and $\underline{j}$ such that $n_{\underline{k},\underline{k}} = 1$.

2) Let us check ${}^{\mathrm{t}}(PQ) = {}^{\mathrm{t}}Q {}^{\mathrm{t}}P$. i) When $P \in \Gamma(X, \mathcal{O}_X)$ the formula is obvious. Moreover, if follows from the involution of the transposition that we have

$${}^t\left(\sum_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle} a_{\underline{k}} \right) = \sum_{\underline{k}} (-1)^{|\underline{k}|} a_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle}.$$

Hence, the formula ${}^{\mathrm{t}}(PQ) = {}^{\mathrm{t}}Q {}^{\mathrm{t}}P$ is clear when $Q \in \Gamma(X, \mathcal{O}_X)$. ii) By additivity, we reduce to the case where $P = a\underline{\partial}^{\langle \underline{k} \rangle}$ and $Q = \underline{\partial}^{\langle \underline{l} \rangle} b$ with $a, b \in \Gamma(X, \mathcal{O}_X)$ and $\underline{k}, \underline{l} \in \mathbb{N}^d$. From the step i), we can suppose moreover $a = 1$ and $b = 1$. Then we can conclude thanks to 1.4.2.7.c.

□

Theorem 2.2.1.4. *Suppose S is locally noetherian. Suppose X/S has coordinates $t_1, \dots, t_d$. For the structure of right $\mathcal{D}_X$-module on ω_X as defined in 2.2.1.1, for any $a \in \Gamma(U, \mathcal{O}_X)$, $P \in \Gamma(U, \mathcal{D}_X)$ we have therefore*

$$(adt_1 \wedge \cdots \wedge dt_d) \cdot P = ({}^t P \cdot a) dt_1 \wedge \cdots \wedge dt_d.$$

Proof. This is proved by Berthelot at [Ber00, 1.2.3]. □

Corollary 2.2.1.5. *There exists a unique structure of right $\mathcal{D}_X$-module on ω_X such that for any open set U of X such that U/S has coordinates $t_1, \dots, t_d$, for any $a \in \Gamma(U, \mathcal{O}_X)$, $P \in \Gamma(U, \mathcal{D}_X)$ we have*

$$(adt_1 \wedge \cdots \wedge dt_d) \cdot P = ({}^tP \cdot a)dt_1 \wedge \cdots \wedge dt_d. \tag{2.2.1.5.1}$$

Proof. By uniqueness, the corollary is local and we can suppose X and S affine. Let $S' \to S$ be a morphism of schemes and $X' := X \times_S S'$ and $\varpi \colon X' \to X$ be the projection. Since $\varpi^* \mathcal{D}_{X/S} = \mathcal{D}_{X'/S'}$, then if $\omega_{X/S}$ has a structure of right $\mathcal{D}_{X/S}$-module satisfying the formula 2.2.1.5.1, then $\omega_{X'/S'}$ has also a structure of right $\mathcal{D}_{X'/S'}$-module satisfying the formula 2.2.1.5.1. Hence, by passing to the limits we reduce to the case where S is noetherian, which was already checked in 2.2.1.4. □

2.2.1.6 (Left and right $\mathcal{D}$-modules.)**.** We describe here how to switch between right and left $\mathcal{D}_X^{(m)}$-modules. Let $\mathcal{E}$ be a left $\mathcal{D}_X^{(m)}$-module and $\mathcal{M}$ be a right $\mathcal{D}_X^{(m)}$-module.

(a) Since ω_X is a right $\mathcal{D}_X^{(m)}$-module and $\mathcal{E}$ is a left $\mathcal{D}_X^{(m)}$-module then $\omega_X \otimes_{\mathcal{O}_X} \mathcal{E}$ is endowed with a canonical structure of right $\mathcal{D}_X^{(m)}$-module extending its structure of $\mathcal{O}_X$-module (see 2.1.3.1.b).

Let U be an open subset of X such that U/S has coordinates $t_1, \dots, t_d$. It follows from the formulas 2.1.3.1.2 and 2.2.1.5 that for any $P \in \Gamma(U, \mathcal{D}_X^{(m)})$, $x \in \Gamma(U, \mathcal{E})$, denoting by $\omega_0 := dt_1 \wedge \cdots \wedge dt_d$ a basis of the free $\mathcal{O}_U$-module of rank one $\omega_{U/S}$, the right action of P on $\omega_0 \otimes x \in \Gamma(U, \omega_X \otimes_{\mathcal{O}_X} \mathcal{E})$ is given by

$$(\omega_0 \otimes x) \cdot P = \omega_0 \otimes ({}^tP \cdot x).$$

In other words, by making the (non-canonical) identification of $\omega_X \otimes_{\mathcal{O}_X} \mathcal{E}$ with $\mathcal{E}$ via the ω_0, the action of right $\mathcal{D}_X^{(m)}$-module on $\omega_X \otimes_{\mathcal{O}_X} \mathcal{E}$ is given by the transposition (which definition depends on the choice of coordinates). We say that this structure of right $\mathcal{D}_X^{(m)}$-module of $\omega_X \otimes_{\mathcal{O}_X} \mathcal{E}$ is its "twisted structure".

(b) Via the canonical isomorphism of $\mathcal{O}_X$-modules $\mathcal{M} \otimes_{\mathcal{O}_X} \omega_X^{-1} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}(\omega_X, \mathcal{M})$, since the right term as a canonical structure of left $\mathcal{D}_X^{(m)}$-module (see 2.1.4.1.c), we get on $\mathcal{M} \otimes_{\mathcal{O}_X} \omega_X^{-1}$ a canonical structure of left $\mathcal{D}_X^{(m)}$-module.

Let U be an open subset of X such that U/S has coordinates $t_1, \dots, t_d$. Let $\omega_0^\vee = (dt_1 \wedge \cdots \wedge dt_d)^\vee$ be a basis of the free $\mathcal{O}_U$-module of rank one $\omega_{U/S}^{-1}$. It follows from the formulas 2.1.4.1.3 and 2.2.1.5 that for any $P \in \Gamma(U, \mathcal{D}_X^{(m)})$, $x \in \Gamma(U, \mathcal{M})$,

$$P \cdot (x \otimes \omega_0^\vee) = (x \cdot {}^tP) \otimes \omega_0^\vee.$$

In other words, by making the (non-canonical) identification $\mathcal{M} \otimes_{\mathcal{O}_X} \omega_X^{-1}$ with $\mathcal{M}$ via the $\omega_0^\vee$, the action of let $\mathcal{D}_X^{(m)}$-module on $\mathcal{M} \otimes_{\mathcal{O}_X} \omega_X^{-1}$ is given by the transposition (which definition depends on the choice of coordinates). We say that this structure of left $\mathcal{D}_X^{(m)}$-module of $\mathcal{M} \otimes_{\mathcal{O}_X} \omega_X^{-1}$ is its "twisted structure".

(c) From the local description, since the transposition is an involution, we compute that the canonical isomorphism of $\mathcal{O}_X$-modules

$$(\omega_X \otimes_{\mathcal{O}_X} \mathcal{E}) \otimes_{\mathcal{O}_X} \omega_X^{-1} \xrightarrow{\sim} \mathcal{E}, \tag{2.2.1.6.1}$$

$$\omega_X \otimes_{\mathcal{O}_X} (\mathcal{M} \otimes_{\mathcal{O}_X} \omega_X^{-1}) \xrightarrow{\sim} \mathcal{M} \tag{2.2.1.6.2}$$

are $\mathcal{D}_X^{(m)}$-linear. This implies that the functor $\omega_X \otimes_{\mathcal{O}_X} -$ from the category of left $\mathcal{D}_X^{(m)}$-modules to the category of right $\mathcal{D}_X^{(m)}$-modules is an equivalence of categories with quasi-inverse $- \otimes_{\mathcal{O}_X} \omega_X^{-1}$. We refer to this as the side-changing operation.

2.2.2 Transposition isomorphisms

Proposition 2.2.2.1. *Let $\mathcal{E}$ be a left $\mathcal{D}_X^{(m)}$-module. Since $\mathcal{D}_X^{(m)}$ is a $\mathcal{D}_X^{(m)}$-bimodule, then it follows from 2.1.3.1.c that we get a structure of $\mathcal{D}_X^{(m)}$-bimodule on $\mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$ (resp. $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{D}_X^{(m)}$), where the tensor product is computed with the structure of right $\mathcal{D}_X^{(m)}$-module (resp. left $\mathcal{D}_X^{(m)}$-module) of $\mathcal{D}_X^{(m)}$.*

Let $\mathcal{M}$ be a right $\mathcal{D}_X^{(m)}$-module. It follows from 2.1.3.1.c that we get a structure of right $\mathcal{D}_X^{(m)}$-bimodule on $\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}$, where the tensor product is computed with the structure of left $\mathcal{D}_X^{(m)}$-module of $\mathcal{D}_X^{(m)}$. The structure of right $\mathcal{D}_X^{(m)}$-module on $\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}$ given by the tensor product is said to be the right one, the other one is the left structure.

(a) There is a unique $\mathcal{D}_X^{(m)}$-bimodule isomorphism

$$\gamma_{\mathcal{E}}\colon \mathcal{D}_X^{(m)}\otimes_{\mathcal{O}_X}\mathcal{E}\xrightarrow{\sim}\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)} \tag{2.2.2.1.1}$$

such that $\gamma_{\mathcal{E}}(1\otimes e)=e\otimes 1$ for any section e of $\mathcal{E}$. In local coordinates we have

$$\gamma_{\mathcal{E}}(\underline{\partial}^{\langle\underline{k}\rangle}\otimes e)=\sum_{\underline{h}\le\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} y\underline{\partial}^{\langle\underline{k}-\underline{h}\rangle}e\otimes\underline{\partial}^{\langle\underline{h}\rangle}.$$

(b) There exists a unique involution

$$\delta_{\mathcal{M}}\colon \mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}\to\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}$$

exchanging both structures of right $\mathcal{D}_X^{(m)}$-modules such that $\delta_{\mathcal{M}}(x\otimes 1)=x\otimes 1$ for any section x of $\mathcal{M}$. In local coordinates we have

$$\delta_{\mathcal{M}}(x\otimes\underline{\partial}^{\langle\underline{k}\rangle})=\sum_{\underline{h}\le\underline{k}}(-1)^{|\underline{h}|}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} x\underline{\partial}^{\langle\underline{k}-\underline{h}\rangle}\otimes\underline{\partial}^{\langle\underline{h}\rangle}.$$

The map $\gamma_{\mathcal{E}}$ (resp. $\delta_{\mathcal{M}}$) is said to be the transposition isomorphism of $\mathcal{E}$ (resp. $\mathcal{M}$).

Proof. (a) The canonical $\mathcal{O}_X$-linear homomorphism $\mathcal{E}\to\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}$ given by $e\mapsto e\otimes 1$ induces by extension $\gamma_{\mathcal{E}}$ which is a homomorphism of left $\mathcal{D}_X^{(m)}$-modules. Next we need to see that $\gamma_{\mathcal{E}}$ is right $\mathcal{D}_X^{(m)}$-linear, i.e. $\gamma_{\mathcal{E}}((1\otimes e)Q)=\gamma_{\mathcal{E}}(1\otimes e)Q$ for any section Q of $\mathcal{D}_X^{(m)}$. Since this is clear by $\mathcal{O}_X$-linearity of $\gamma_{\mathcal{E}}$ when $Q\in\mathcal{O}_X$, then we reduce to the case where $Q=\underline{\partial}^{\langle\underline{k}\rangle}$. We do a calculation:

$$\begin{aligned}
&\gamma_{\mathcal{E}}((1\otimes e)\underline{\partial}^{\langle\underline{k}\rangle})\\
&=\gamma_{\mathcal{E}}\left(\sum_{\underline{h}\le\underline{k}}(-1)^{|\underline{k}-\underline{h}|}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\underline{\partial}^{\langle\underline{h}\rangle}\otimes\underline{\partial}^{\langle\underline{k}-\underline{h}\rangle}e\right)\ \text{by (2.1.3.1.2)}\\
&=\sum_{\underline{h}\le\underline{k}}(-1)^{|\underline{k}-\underline{h}|}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\underline{\partial}^{\langle\underline{h}\rangle}(\underline{\partial}^{\langle\underline{k}-\underline{h}\rangle}e\otimes 1)\ \text{by left } \mathcal{D}_X^{(m)} \text{ linearity of } \gamma_{\mathcal{E}}\\
&=\sum_{\underline{h}\le\underline{k}}(-1)^{|\underline{k}-\underline{h}|}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\left(\sum_{\underline{i}\le\underline{h}}\left\{\begin{matrix}\underline{h}\\ \underline{i}\end{matrix}\right\}\underline{\partial}^{\langle\underline{h}-\underline{i}\rangle}\underline{\partial}^{\langle\underline{k}-\underline{h}\rangle}e\otimes\underline{\partial}^{\langle\underline{i}\rangle}\right)\ \text{by (2.1.3.1.1)}\\
&=\sum_{\underline{i}\le\underline{k}}\left(\sum_{\underline{i}\le\underline{h}\le\underline{k}}(-1)^{|\underline{k}-\underline{h}|}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\left\{\begin{matrix}\underline{h}\\ \underline{i}\end{matrix}\right\}\left\langle\begin{matrix}\underline{k}-\underline{i}\\ \underline{h}-\underline{i}\end{matrix}\right\rangle\right)\underline{\partial}^{\langle\underline{k}-\underline{i}\rangle}e\otimes\underline{\partial}^{\langle\underline{i}\rangle}\ \text{by proposition 1.4.2.7}\\
&=e\otimes\underline{\partial}^{\langle\underline{k}\rangle}\ \text{similarly to the computation 2.2.1.3.1.}
\end{aligned}$$

By extension from the $\mathcal{O}_X$-linear homomorphism $\mathcal{E}\to\mathcal{D}_X^{(m)}\otimes_{\mathcal{O}_X}\mathcal{E}$ given by $e\mapsto 1\otimes e$ the homomorphism of right $\mathcal{D}_X^{(m)}$-modules $\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}\to\mathcal{D}_X^{(m)}\otimes_{\mathcal{O}_X}\mathcal{E}$ given by $e\otimes P\mapsto(1\otimes e)P$. This map gives an inverse of $\gamma_{\mathcal{E}}$, in particular this is an isomorphism.

(b) Similarly, the canonical $\mathcal{O}_X$-linear (with the $\mathcal{O}_X$-module structure on the target coming from the left structure of right $\mathcal{D}_X^{(m)}$-module) homomorphism $\mathcal{M}\to\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}$ given by $x\mapsto x\otimes 1$ induces the right $\mathcal{D}_X^{(m)}$-linear homomorphism $\delta_{\mathcal{M}}\colon\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}\to\mathcal{M}\otimes_{\mathcal{O}_X}\mathcal{D}_X^{(m)}$ (for the right structure for the source and the left structure for the target). By doing a similar computation, we check the second right $\mathcal{D}_X^{(m)}$-linearity (i.e. for the left structure for the source and the right structure for the target) and the local formula. □

Example 2.2.2.2. From proposition 2.2.2.1.b we have the canonical isomorphism of right $\mathcal{D}_X^{(m)}$-bimodules

$$\delta_X : \omega_X \otimes_{\mathcal{O}_X} \mathcal{D}_X^{(m)} \xrightarrow{\sim} \omega_X \otimes_{\mathcal{O}_X} \mathcal{D}_X^{(m)} \tag{2.2.2.2.1}$$

which is an involution exchanging the two right $\mathcal{D}_X^{(m)}$-module structures. By tensoring with $\otimes_{\mathcal{O}_X} \omega_X^{-1}$ for the right (resp. left) structure of right $\mathcal{D}_X^{(m)}$ of the source (resp. target) of δ_X, we get the isomorphism of $\mathcal{D}_X^{(m)}$-bimodules

$$\alpha_X : \omega_X \otimes_{\mathcal{O}_X} \mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \omega_X^{-1} \xrightarrow{\sim} \mathcal{D}_X^{(m)}. \tag{2.2.2.2.2}$$

By tensoring α_X with $\otimes_{\mathcal{O}_X} \omega_X^{-1}$, this yields the isomorphism of left $\mathcal{D}_X^{(m)}$-bimodules

$$\beta_X : \mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \omega_X^{-1} \xrightarrow{\sim} \mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_X} \omega_X^{-1}$$

which is an involution exchanging the two left $\mathcal{D}_X^{(m)}$-module structures.

2.3 Level 0 case

2.3.1 Stratifications of order ≤ 1 and connections

Definition 2.3.1.1. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. With notations 1.4.1.2 and 1.4.1.14, an *m-PD stratification relative to X/S of order ≤ 1* is the data of a $\mathcal{P}^1_{X/S,(m)}$-linear isomorphism $\varepsilon_1 \colon \mathcal{P}^1_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S,(m)}$ such that the following diagram

$$\begin{array}{ccccc}
\psi^{1,0*}_{X/S,(m)}(\mathcal{P}^1_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}) & \xrightarrow{\sim} & \mathcal{P}^0_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\sim} & \mathcal{E}\ , \\
\downarrow{\scriptstyle \psi^{1,0*}_{X/S,(m)}(\varepsilon_1)} & & \downarrow{\scriptstyle \sim} & & \| \\
\psi^{n',n*}_{X/S,(m)}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S,(m)}) & \xrightarrow{\sim} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^0_{X/S,(m)} & \xrightarrow{\sim} & \mathcal{E}
\end{array} \tag{2.3.1.1.1}$$

whose horizontal isomorphisms are the canonical ones, is commutative. When $m = \infty$, we simply say *stratification relative to X/S of order ≤ 1*.

Remark 2.3.1.2. We have a canonical map from the set of m-PD stratifications relative to X/S of $\mathcal{E}$ (see 2.1.1.1) to that of m-PD stratifications relative to X/S of order ≤ 1 given by $(\varepsilon_n)_{n\in\mathbb{N}} \mapsto \varepsilon_1$.

Proposition 2.3.1.3. *Given an $\mathcal{O}_X$-module $\mathcal{E}$. The following are equivalent.*

(a) An $\mathcal{O}_X$-linear homomorphism $\theta_1 \colon \mathcal{E} \to p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X,(m)})$ (the $\mathcal{O}_X$-module structure of this latter is induced by the right structure of $\mathcal{P}^1_{X,(m)}$) making commutative the diagram

$$\begin{array}{ccc}
\mathcal{E} & \xrightarrow{\sim} & \mathcal{E} \otimes \mathcal{P}^0_{X/S,(m)} \\
& {\scriptstyle \theta_1} \searrow & \uparrow{\scriptstyle \mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S,(m)}} \\
& & \mathcal{E} \otimes \mathcal{P}^1_{X/S,(m)}
\end{array} \tag{2.3.1.3.1}$$

whose top isomorphism is the canonical one (recall $\mathcal{P}^0_{X/S,(m)} = \mathcal{O}_X$).

(b) An m-PD stratification $\varepsilon = (\varepsilon_n^{\mathcal{E}})$ of order ≤ 1 on $\mathcal{E}$.

The bijection between both data is given by $\epsilon_1 \mapsto \epsilon_1 \circ p^1_{1,\mathcal{E}} = \theta_1$.

Proof. This comes from the proof of 2.1.1.5. □

2.3.1.4. When m is an integer, it follows from the local description of 1.1.2.3 and 1.4.1.5 that the canonical homomorphism $\psi^1_m \colon \mathcal{P}^1_{X/S,(m)} \to \mathcal{P}^1_{X/S}$ of 1.4.1.11 is an isomorphism. Hence, the data of a stratification relative to X/S of order ≤ 1 on $\mathcal{E}$ is equivalent to that of an m-PD stratification relative to X/S of order ≤ 1 on $\mathcal{E}$. In other words, the integer m has no importance and by default we simply consider stratifications relative to X/S of order ≤ 1.

Definition 2.3.1.5. A *connection relative to X/S* on an $\mathcal{O}_X$-module $\mathcal{E}$ is an additive map $\nabla\colon \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^1_{X/S}$ such that for any open $U \subseteq X$, for any $x \in \mathcal{E}(U)$, $a \in \mathcal{O}_X(U)$ we have

$$\nabla(ax) = a\nabla x + x \otimes da$$

where $d\colon \mathcal{O}_X \to \Omega^1_{X/S}$ is the constant $\mathcal{O}_S$-derivation.

Proposition 2.3.1.6. *Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. The map $\epsilon_1 \mapsto (\mathrm{id} \otimes \varpi) \circ \epsilon_1 \circ p^1_{1,\mathcal{E}}$, where $p^1_{1,\mathcal{E}}$ is defined at 1.1.3.1, gives a bijection between the set of connections relative to X/S on $\mathcal{E}$ to that of stratifications relative to X/S of order ≤ 1 on $\mathcal{E}$.*

Proof. 1) Let ϵ_1 be a stratification relative to X/S of order ≤ 1 on $\mathcal{E}$. Following 2.3.1.3, it corresponds to ε_1 a homomorphism $\theta_1 := \epsilon_1 \circ p^1_{1,\mathcal{E}} \colon \mathcal{E} \to p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S})$ (the $\mathcal{O}_X$-module structure of this latter is induced by the right structure of $\mathcal{P}^1_{X/S}$) making commutative the diagram 2.3.1.3.1.

2) To simplify notation, we do not write the canonical isomorphisms of the form $\mathcal{E} \xrightarrow{\sim} \mathcal{P}^0_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$ or $\mathcal{E} \xrightarrow{\sim} \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^0_{X/S,(m)}$. i) Let $\theta_1 \colon \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S,(m)}$ be an additive map making commutative the diagram 2.3.1.3.1. We get the additive map $\nabla := (\mathrm{id}_{\mathcal{E}} \otimes \varpi) \circ \theta_1$. Since $\varpi = \mathrm{id} - p^1_0 \circ \psi^{1,0}_{X/S}$, then we compute $\nabla = \theta_1 - (\mathrm{id}_{\mathcal{E}} \otimes p^1_0 \circ \psi^{1,0}_{X/S}) \circ \theta_1 \overset{2.3.1.3.1}{=} \theta_1 - \mathrm{id}_{\mathcal{E}} \otimes p^1_0$. Hence

$$(\mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S}) \circ \nabla = (\mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S}) \circ \theta_1 - (\mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S}) \circ (\mathrm{id}_{\mathcal{E}} \otimes p^1_0) \overset{2.3.1.3.1}{=} \mathrm{id}_{\mathcal{E}} - (\mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S} \circ p^1_0) = \mathrm{id}_{\mathcal{E}} - \mathrm{id}_{\mathcal{E}} = 0.$$

Hence, ∇ factors through $\nabla\colon \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^1_{X/S} \subset \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S}$.

ii) Conversely let $\nabla\colon \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^1_{X/S}$ be an additive map. Set $\theta_1 := \nabla + \mathrm{id}_{\mathcal{E}} \otimes p^1_0$. Since $\Omega^1_{X/S} = \ker \psi^{1,0}_{X/S}$, then we compute

$$(\mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S}) \circ \theta_1 = (\mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S}) \circ (\mathrm{id}_{\mathcal{E}} \otimes p^1_0) = (\mathrm{id}_{\mathcal{E}} \otimes \psi^{1,0}_{X/S} \circ p^1_0) = \mathrm{id}_{\mathcal{E}},$$

which means that the diagram 2.3.1.3.1 is commutative.

iii) Hence we get a bijection between the set of additive maps $\theta_1 \colon \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S,(m)}$ making commutative the diagram 2.3.1.3.1 and that of additive maps $\nabla\colon \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^1_{X/S}$. It remains to check that θ_1 is $\mathcal{O}_X$-linear (the $\mathcal{O}_X$-module structure of this latter is induced by the right structure of $\mathcal{P}^1_{X/S}$) if and only if ∇ is a connection, which is checked in the following last step.

3) Let a be a section of $\mathcal{O}_X$ and x of $\mathcal{E}$. Denoting by $\mathbb{1}$ the unit element of $\mathcal{P}^1_{X/S}$, we compute in $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S}$:

$$\nabla(ax) = \theta_1(ax) - ax \otimes \mathbb{1}. \tag{2.3.1.6.1}$$

On the other hand, we get two sections of $\mathcal{P}^1_{X/S}$ by setting $a \otimes 1 := p^1_0(a)$ and $1 \otimes a := p^1_1(a)$. Since $\nabla(x) \in \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^1_{X/S}$, then $a\nabla(x) = (1 \otimes a)\nabla(x)$. Hence, we compute in $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S}$:

$$a\nabla(x) + x \otimes da = (1 \otimes a)\,(\theta_1(x) - x \otimes \mathbb{1}) + x \otimes (1 \otimes a - a \otimes 1) = (1 \otimes a)\theta_1(x) - ax \otimes \mathbb{1}. \tag{2.3.1.6.2}$$

Hence, with 2.3.1.6.1 and 2.3.1.6.2, we get that ∇ is a connection if and only if θ_1 is $\mathcal{O}_X$-linear (for the right structure of $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S,(m)}$).

□

2.3.2 Integrable connections and $\mathcal{D}$-modules of level 0

2.3.2.1. Let $\Omega^i_{X/S} = \wedge^i_{\mathcal{O}_X} \Omega_{X/S}$ for $i \geq 0$ be the ith exterior power. For any integers i, j, denote by $c_{i,j} \colon \Omega^i_{X/S} \otimes_{\mathcal{O}_X} \Omega^j_{X/S} \to \Omega^{i+j}_{X/S}$ the canonical projection. Recall the constant $\mathcal{O}_S$-derivation $d\colon \mathcal{O}_X \to \Omega^1_{X/S}$ (see 1.1.2.6). Moreover, (e.g. see [Gro67, IV.16.6.2]), for any $i \geq 1$, there is a unique homomorphism of $f^{-1}\mathcal{O}_S$-modules $d^i \colon \Omega^i_{X/S} \to \Omega^{i+1}_{X/S}$ such that $d^i(a_0 da_1 \wedge \cdots \wedge da_i) = da_0 \wedge da_1 \wedge \cdots \wedge da_i$ where $a_0, \ldots, a_i$ are local sections of $\mathcal{O}_X$. In degree 0, remark $d^0 = d$, i.e. we retrieve the constant $\mathcal{O}_S$-derivation $d\colon \mathcal{O}_X \to \Omega^1_{X/S}$. We get the complex of sheaves of $f^{-1}\mathcal{O}_S$-modules

$$0 \to \Omega^0_{X/S} \to \Omega^1_{X/S} \to \Omega^2_{X/S} \to \ldots$$

which is called the de Rham complex of X/S.

We compute $d^i(aw) - ad^i(\omega) = da \wedge \omega$ for any section a of $\mathcal{O}_X$ and section $\omega = a_0 da_1 \wedge \cdots \wedge da_i$ of $\Omega^i_{X/S}$. Hence, $\omega \mapsto d^i(aw) - ad^i(\omega)$ is linear, i.e. the map d^i is a differential operator of order 1 (see 1.1.3.4.1). By definition, there exists a unique $\mathcal{O}_X$-linear homomorphism $\varpi^i \colon \mathcal{P}^1_{X/S} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} \to \Omega^{i+1}_{X/S}$ whose composition with $p^1_{1,\Omega^i_{X/S}} \colon \Omega^i_{X/S} \to \mathcal{P}^1_{X/S} \otimes_{\mathcal{O}_X} \Omega^i_{X/S}$ is equal to d^i. We compute

$$\varpi^i(da \otimes \omega) = \varpi^i(\mathbb{1} \otimes a\omega) - a\varpi^i(\mathbb{1} \otimes \omega) = d^i(aw) - ad^i(\omega) = da \wedge \omega, \qquad (2.3.2.1.1)$$

for any section a of $\mathcal{O}_X$ and section ω of $\Omega^i_{X/S}$. The formula 2.3.2.1.1 means that the restriction of ϖ^i on $\Omega^1_{X/S} \otimes_{\mathcal{O}_X} \Omega^i_{X/S}$ is the canonical map $c_{i,i+1}$.

Notation 2.3.2.2. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module and $i, j \geq 0$ be two integers. Let y (resp. z) be a section of $\mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S}$ (resp. $\Omega^i_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$) and ω be a section of $\Omega^j_{X/S}$. Then we denote by $y \wedge \omega$ (resp. $\omega \wedge z$) the image of $y \otimes \omega$ (resp. $\omega \otimes z$) via $\mathrm{id}_{\mathcal{E}} \otimes c_{i,j}$ (resp. $c_{i,j} \otimes \mathrm{id}_{\mathcal{E}}$). Denote by $y \mapsto {}^t y$ the canonical isomorphism $\mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} \xrightarrow{\sim} \Omega^i_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$. Beware ${}^t(y \wedge \omega) = (-1)^{ij} \omega \wedge {}^t y$.

2.3.2.3 (Integrable connection, de Rham complex)**.** Let $\mathcal{E}$ be an $\mathcal{O}_X$-module endowed with a connection. Denote by ϵ_1 the associated relative to X/S stratification of order ≤ 1 on $\mathcal{E}$ (see 2.3.1.6). Following 2.3.1.3, let $\theta_1 \colon \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_X$ be the corresponding $\mathcal{O}_X$-linear homomorphism making commutative the diagram 2.3.1.3.1. We get the map $\nabla^i \colon \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^{i+1}_{X/S}$ from θ_1 and d^i by composition as follows

$$\begin{array}{ccccc}
\mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} & \xrightarrow{\theta_1 \otimes \mathrm{id}_{\Omega^i_{X/S}}} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} & \xrightarrow{\mathrm{id}_{\mathcal{E}} \otimes \varpi^i} & \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^{i+1}_{X/S}, \\
& \searrow^{p^1_{1,\mathcal{E}\otimes\Omega^i}} & \uparrow{\scriptstyle \epsilon_1 \otimes \mathrm{id}} & & \\
& & \mathcal{P}^1_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} & &
\end{array} \qquad (2.3.2.3.1)$$

where the triangle is commutative. Beware that the terms $\mathcal{P}^1_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S}$ and $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^1_{X/S} \otimes_{\mathcal{O}_X} \Omega^i_{X/S}$ have two structures of $\mathcal{O}_X$-modules: the left one and the right one. The morphisms $p^1_{1,\mathcal{E}\otimes\Omega^i}$ and $\theta_1 \otimes \mathrm{id}_{\Omega^i_{X/S}}$ are $\mathcal{O}_X$-linear for the right one, whereas $\mathrm{id}_{\mathcal{E}} \otimes \varpi^i$ is $\mathcal{O}_X$-linear for the left one. The composition ∇^i is not $\mathcal{O}_X$-linear but since $\epsilon_1 \otimes \mathrm{id}$ is $\mathcal{O}_X$-linear for both structure (and in particular for the left structure), then $\nabla^i \colon \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^{i+1}_{X/S}$ is a differential operator of order 1.

For any sections y of $\mathcal{E} \otimes_{\mathcal{O}_X} \Omega^1_{X/S}$ and ω of $\Omega^i_{X/S}$, it follows from the computation of 2.3.2.1 and the notation 2.3.2.2 that we have $\mathrm{id}_{\mathcal{E}} \otimes \varpi^i(y \otimes \omega) = y \wedge \omega$. Since $\theta_1(x) = \nabla(x) + x \otimes \mathbb{1}$ for any section x of $\mathcal{E}$ and ω of $\Omega^i_{X/S}$, then we compute

$$\nabla^i(x \otimes \omega) = \mathrm{id}_{\mathcal{E}} \otimes \varpi^i(\theta_1(x) \otimes \omega) = \mathrm{id}_{\mathcal{E}} \otimes \varpi^i(\nabla(x) \otimes \omega) + \mathrm{id}_{\mathcal{E}} \otimes \varpi^i(x \otimes \mathbb{1} \otimes \omega) = \nabla(x) \wedge \omega + x \otimes d^i(\omega). \qquad (2.3.2.3.2)$$

More generally, for any sections y_i of $\mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S}$ and ω_j of $\Omega^j_{X/S}$, with notation 2.3.2.2, it follows from 2.3.2.3.2 the formula:

$$\nabla^{i+j}(y_i \wedge \omega_j) = \nabla^i(y_i) \wedge \omega_j + (-1)^i y_i \wedge d^j(\omega_j). \qquad (2.3.2.3.3)$$

Indeed, by additivity, we can suppose y_i is of the form $y_i = x \otimes \omega_i$, where x is a section of $\mathcal{O}_X$ and ω_i is a section of $\Omega^i_{X/S}$. We compute

$$\nabla^{i+j}(y_i \wedge \omega_j) = \nabla^{i+j}(x \otimes (\omega_i \wedge \omega_j)) \overset{2.3.2.3.2}{=} \nabla(x) \wedge (\omega_i \wedge \omega_j) + x \otimes d^{i+j}(\omega_i \wedge \omega_j)$$
$$= (\nabla(x) \wedge \omega_i) \wedge \omega_j + x \otimes (d^i(\omega_i) \wedge \omega_j + (-1)^i \omega_i \wedge d^j(\omega_j)) \overset{2.3.2.3.2}{=} \nabla^i(y_i) \wedge \omega_j + (-1)^i y_i \wedge d^j(\omega_j).$$

We say that the connection ∇ of $\mathcal{E}$ is integrable if $\nabla^1 \circ \nabla = 0$. In that case $\nabla^{i+1} \circ \nabla^i = 0$ for any i and we get the complex

$$0 \to \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^1_{X/S} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^2_{X/S} \to \cdots \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^d_{X/S} \to 0, \qquad (2.3.2.3.4)$$

which is called the de Rham complex.

2.3.2.4 (de Rham complex: exchanging the position)**.** Let $\mathcal{E}$ be an $\mathcal{O}_X$-module endowed with a connection. To define the map $\nabla^i : \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} \to \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^{i+1}_{X/S}$ (see 2.3.2.3.1), it was more natural to put $\mathcal{E}$ on the left. However, when $\mathcal{E} = \mathcal{D}^{(0)}_{X/S}$ for instance, it is much better (to avoid confusion with the right structure of $\mathcal{O}_X$-module of $\mathcal{D}^{(0)}_{X/S}$) to put $\mathcal{E}$ on the right (see 2.3.3.10.2). Moreover, when the connection is integral, since $\mathcal{E}$ can be viewed as a left $\mathcal{D}^{(0)}_{X/S}$-module (see later 2.3.2.6), one might prefer to put $\mathcal{E}$ on the right. In other words, we define $\nabla^i : \Omega^i_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E} \to \Omega^{i+1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$ to be the $\mathcal{O}_S$-linear map making commutative the diagram

$$\begin{array}{ccc} \Omega^i_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\nabla^i} & \Omega^{i+1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E} \\ \downarrow \wr & & \downarrow \wr \\ \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^i_{X/S} & \xrightarrow[2.3.2.3.1]{\nabla^i} & \mathcal{E} \otimes_{\mathcal{O}_X} \Omega^{i+1}_{X/S}, \end{array} \tag{2.3.2.4.1}$$

where the vertical isomorphism are the canonical ones. Via the formulas given at 2.3.2.2 and 2.3.2.3.3, for any sections z_i of $\Omega^i_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$ and ω_j of $\Omega^j_{X/S}$, with notation 2.3.2.2, we get

$$\nabla^{i+j}(\omega_j \wedge z_i) = (-1)^j \omega_j \wedge \nabla^i(z_i) + d^j(\omega_j) \wedge z_i. \tag{2.3.2.4.2}$$

When the connection is integrable, by convention we denote by $\mathrm{DR}(\mathcal{E})$ the de Rham complex of $\mathcal{E}$, with $\mathcal{E}$ on the right side.

2.3.2.5. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module endowed with a connection. Suppose X/S has coordinates $t_1, \dots, t_d$. For any section x of $\mathcal{E}$, we denote by $\partial_1(x), \dots, \partial_d(x)$ the elements of $\mathcal{E}$ such that

$$\nabla(x) = \sum_{i=1}^d \partial_i(x) \otimes dt_i. \tag{2.3.2.5.1}$$

Using 2.3.2.3.2, we compute:

$$\nabla^1 \circ \nabla(x) = \nabla^1 (\sum_{i=1}^d \partial_i(x) \otimes dt_i) = \sum_{j=1}^d \sum_{i=1}^d \partial_j(\partial_i(x)) \otimes dt_j \wedge dt_i.$$

Hence, the connection is integral is equivalent to saying that the maps $\partial_i \in \mathrm{End}_{\mathcal{O}_S}(\mathcal{E})$ commute two by two, i.e., for any $i, j \in \{1, \dots, d\}$, for any section x of $\mathcal{E}$ we have the equality:

$$\partial_j(\partial_i(x)) = \partial_i(\partial_j(x)).$$

For any $\underline{k} \in \mathbb{N}^d$, we get the $\mathcal{O}_S$-linear map $\underline{\partial}^{\underline{k}} : \mathcal{E} \to \mathcal{E}$ by setting $\underline{\partial}^{\underline{k}} = \partial_1^{k_1} \circ \cdots \circ \partial_d^{k_d}$. When, the connection is integrable, for any $\underline{k}, \underline{l} \in \mathbb{N}^d$, we get the equality

$$\underline{\partial}^{\underline{l}} \circ \underline{\partial}^{\underline{k}} = \underline{\partial}^{\underline{k}} \circ \underline{\partial}^{\underline{l}} = \underline{\partial}^{\underline{k}+\underline{l}}. \tag{2.3.2.5.2}$$

Theorem 2.3.2.6. *Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. The following are equivalent.*

(a) An integrable connection relative to X/S on $\mathcal{E}$.

(b) A structure of left $\mathcal{D}^{(0)}_{X/S}$-module on $\mathcal{E}$ extending its structure of $\mathcal{O}_X$-module.

Proof. 0) Recall the data of a structure of left $\mathcal{D}^{(0)}_{X/S}$-module on $\mathcal{E}$ extending its structure of $\mathcal{O}_X$-module is equivalent to that of a 0-PD-stratification relative to X/S on $\mathcal{E}$.

1) Let $(\epsilon_n)_{n \in \mathbb{N}}$ be a 0-PD-stratification relative to X/S on $\mathcal{E}$. We check that the connection $\nabla := (\mathrm{id} \otimes \varpi) \circ \epsilon_1 \circ p^1_{1,\mathcal{E}}$ where $p^1_{1,\mathcal{E}}$ is defined at 2.3.1.3 is integrable as follows. Since this is local, we can suppose X/S has coordinates $t_1, \dots, t_d$. Let $\theta_1 := \epsilon_1 \circ p^1_{1,\mathcal{E}}$. Following the proof of 2.3.1.6, we have $\nabla = \theta_1 - \mathrm{id}_{\mathcal{E}} \otimes p^1_0$. Following 2.1.1.5.4, we get $\theta_1(x) = \sum_{i=1}^d \partial_i(x) \otimes \tau_i + x \otimes \mathbb{1}$. Since $\tau_i = dt_i$ in $\mathcal{P}^1_{X/S}$, then we get $\nabla(x) = \sum_{i=1}^d \partial_i(x) \otimes dt_i$, which justifies the notation of 2.3.2.5.1 concerning the definition of

$\partial_i(x)$ from the connection. Following 2.3.2.5, ∇ is integrable if and only if $\partial_j(\partial_i(x)) = \partial_i(\partial_j(x))$, which is obvious since $\partial_i\partial_j = \partial_j\partial_i$ in $\mathcal{D}^{(0)}_{X/S}$.

2) From the step 1), we get the map ψ sending a integrable connection relative to X/S on $\mathcal{E}$ to a 0-PD-stratification relative to X/S on $\mathcal{E}$ given by $\psi((\epsilon_n)_{n\in\mathbb{N}}) = (\mathrm{id}\otimes\varpi)\circ\epsilon_1\circ p^1_{1,\mathcal{E}}$. It remain check that ψ is bijective. Since this is local, then we can suppose X/S has coordinates $t_1,\dots,t_d$. Since the connection determines the action of $\partial_1,\dots,\partial_d$, since the ring $\mathcal{D}^{(0)}_{X/S}$ is generated as $\mathcal{O}_S$-algebra by $\mathcal{O}_X$ and by $\partial_1,\dots,\partial_d$, then we get the injectivity of ψ. Let us now check the surjectivity. Let ∇ be an integrable connection. With notation 2.3.2.5, for any $\underline{k}\in\mathbb{N}^d$, we get the $\mathcal{O}_S$-linear map $\underline{\partial}^{\underline{k}}\colon\mathcal{E}\to\mathcal{E}$. For any $P\in\mathcal{D}^{(0)}_{X/S}$, we define the $\mathcal{O}_S$-linear map $P\colon\mathcal{E}\to\mathcal{E}$ as follows. We can uniquely write P as a finite sum of the form $P=\sum_{\underline{k}} a_{\underline{k}}\underline{\partial}^{\underline{k}}$, where $a_{\underline{k}}$ is a section of $\mathcal{O}_X$. Hence, we set $P(x) := \sum_{\underline{k}} a_{\underline{k}}(\underline{\partial}^{\underline{k}}(x))$.

Let $P,Q\in\mathcal{D}^{(0)}_{X/S}$. We have to check that $P(Q(x)) = PQ(x)$ for any section x of $\mathcal{E}$. By additivity, we reduce to the case where $P = a\underline{\partial}^{\underline{k}}$ and $Q = b\underline{\partial}^{\underline{l}}$ where a and b are sections of $\mathcal{O}_X$ and $\underline{k},\underline{l}\in\mathbb{N}^d$. By construction of the maps of the form $P\colon\mathcal{E}\to\mathcal{E}$, we can suppose $a=1$.

For any global section y of $\mathcal{E}$, by using the formula 2.3.2.5.1, the equality $\nabla(by) = b\nabla y + y\otimes db$ is translated by the formulas

$$\partial_i(by) = b\partial_i(y) + \partial_i(b)y, \qquad (2.3.2.6.1)$$

for any $i=1,\dots,d$. Let x be a section of $\mathcal{E}$. Using 2.3.2.6.1 in the case where $y=\underline{\partial}^{\underline{l}}(x)$, we get

$$\partial_i(Q(x)) \overset{2.3.2.6.1}{=} b\partial_i(\underline{\partial}^{\underline{l}}(x)) + \partial_i(b)(\underline{\partial}^{\underline{l}}(x)) \overset{2.3.2.5.2}{=} b\partial_i\underline{\partial}^{\underline{l}}(x) + \partial_i(b)\underline{\partial}^{\underline{l}}(x) = (b\partial_i\underline{\partial}^{\underline{l}} + \partial_i(b)\underline{\partial}^{\underline{l}})(x) = (\partial_i Q)(x)$$

the last equality coming from $\partial_i b = b\partial_i + \partial_i(b)$ (see 1.4.2.7.1). This yields by induction on $|\underline{k}|$ the formula $\underline{\partial}^{\underline{k}}(Q(x)) = (\underline{\partial}^{\underline{k}}Q)(x)$ and we are done.

□

The following proposition states that the equivalence of Theorem 2.3.2.6 is in fact an equivalence of categories.

Proposition 2.3.2.7. *Let $\mathcal{E},\mathcal{F}$ be two left $\mathcal{D}^{(0)}_{X/S}$-modules and $f\colon\mathcal{E}\to\mathcal{F}$ be an $\mathcal{O}_X$-linear homomorphism. The following are equivalent.*

(a) The morphism f is $\mathcal{D}^{(0)}_{X/S}$-linear.

(b) The square below is commutative:

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\nabla} & \mathcal{E}\otimes_{\mathcal{O}_X}\Omega^1_{X/S} \\ \downarrow{\scriptstyle f} & & \downarrow{\scriptstyle f\otimes\mathrm{id}} \\ \mathcal{F} & \xrightarrow{\nabla} & \mathcal{F}\otimes_{\mathcal{O}_X}\Omega^1_{X/S}, \end{array} \qquad (2.3.2.7.1)$$

where the connections are the ones associated via 2.3.2.6 with the left $\mathcal{D}^{(0)}_{X/S}$-module structures.

Proof. Since the proposition is local, then we can suppose X/S has coordinates $t_1,\dots,t_d$. By using the formula 2.3.2.5.1, we compute that the square 2.3.2.7.1 is commutative if and only if $\partial_i(f(x)) = f(\partial_i(x))$ for any $i=1,\dots,r$. Since the ring $\mathcal{D}^{(0)}_{X/S}$ is generated as $\mathcal{O}_S$-algebra by $\mathcal{O}_X$ and by $\partial_1,\dots,\partial_d$, then we are done. □

2.3.2.8. Let $f\colon\mathcal{E}\to\mathcal{F}$ be a homomorphism of left $\mathcal{D}^{(0)}_{X/S}$-modules. It follows from 2.3.2.4.2 that the commutativity of 2.3.2.7.1 implies that of

$$\begin{array}{ccc} \mathcal{E}\otimes_{\mathcal{O}_X}\Omega^i_{X/S} & \xrightarrow{\nabla^i} & \mathcal{E}\otimes_{\mathcal{O}_X}\Omega^{i+1}_{X/S} \\ \downarrow{\scriptstyle f\otimes\mathrm{id}} & & \downarrow{\scriptstyle f\otimes\mathrm{id}} \\ \mathcal{F}\otimes_{\mathcal{O}_X}\Omega^i_{X/S} & \xrightarrow{\nabla^i} & \mathcal{F}\otimes_{\mathcal{O}_X}\Omega^{i+1}_{X/S}. \end{array} \qquad (2.3.2.8.1)$$

Hence, we get the morphism of $C(\mathcal{O}_S)$ of the form $\mathrm{DR}(\mathcal{E})\to\mathrm{DR}(\mathcal{F})$ (see notation 2.3.2.4).

2.3.2.9. Let $\mathcal{E}$ be a left $\mathcal{D}^{(0)}_{X/S}$-module. We get the integrable connection $\nabla\colon \mathcal{E} \to \Omega^1_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}$ (see 2.3.2.6 and 2.3.2.4). This yields (see the construction of 2.3.2.3 and 2.3.2.4) the $\mathcal{O}_S$-linear map

$$\nabla^{n-1}\colon \Omega^{n-1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E} \to \Omega^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}. \tag{2.3.2.9.1}$$

Suppose now X/S has coordinates $t_1, \ldots, t_d$. Let $\{i_1, \ldots, i_{n-1}\}$ be $n-1$ elements of $\{1, \ldots, d\}$. Let $\{j_1, \ldots, j_{d-n+1}\}$ be the complementary. For any section x of $\mathcal{E}$, the formula 2.3.2.4.2 yields

$$\begin{aligned}\nabla^{n-1}((dt_{i_1} \wedge \cdots \wedge dt_{i_{n-1}}) \otimes x) &= (-1)^{n-1} dt_{i_1} \wedge \cdots \wedge dt_{i_{n-1}} \wedge \nabla(x)\\ &= (-1)^{n-1} \sum_{a=1}^{d-n+1} (dt_{i_1} \wedge \cdots \wedge dt_{i_{n-1}} \wedge dt_{j_a}) \otimes \partial_{j_a}(x). \end{aligned}\tag{2.3.2.9.2}$$

2.3.2.10. Viewing $\mathcal{D}^{(0)}_{X/S}$ as a left $\mathcal{D}^{(0)}_{X/S}$-module, we get from 2.3.2.9.1 the $\mathcal{O}_S$-linear map:

$$\nabla^{n-1}\colon \Omega^{n-1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S} \to \Omega^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S}. \tag{2.3.2.10.1}$$

In fact, since $\mathcal{D}^{(0)}_{X/S}$ as a $\mathcal{D}^{(0)}_{X/S}$-bimodule then we get by functoriality (see 2.3.2.7) that 2.3.2.10.1 is a homomorphism of right $\mathcal{D}^{(0)}_{X/S}$-modules. When X/S has coordinates $t_1, \ldots, t_d$, following 2.3.2.9.2 and with its notation we have

$$\nabla^{n-1}((dt_{i_1} \wedge \cdots \wedge dt_{i_{n-1}}) \otimes 1) = (-1)^{n-1} \sum_{a=1}^{d-n+1} (dt_{i_1} \wedge \cdots \wedge dt_{i_{n-1}} \wedge dt_{j_a}) \otimes \partial_{j_a}. \tag{2.3.2.10.2}$$

Let $\mathcal{E}$ be a left $\mathcal{D}^{(0)}_{X/S}$-module. Using the formulas 2.3.2.9.2 and 2.3.2.10.2, we get the commutative diagram:

$$\begin{array}{ccc} (\Omega^{n-1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S}) \otimes_{\mathcal{D}^{(0)}_{X/S}} \mathcal{E} & \xrightarrow{\nabla^{n-1}\otimes \mathrm{id}} & (\Omega^{n-1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S}) \otimes_{\mathcal{D}^{(0)}_{X/S}} \mathcal{E} \\ \downarrow\wr & & \downarrow\wr \\ \Omega^{n-1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\nabla^{n-1}} & \Omega^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{E}, \end{array}\tag{2.3.2.10.3}$$

where the vertical isomorphisms are the canonical ones. Hence we have the canonical isomorphism of $C({}^{\mathrm{r}}\mathcal{D}^{(0)}_{X/S})$ of the form $\mathrm{DR}(\mathcal{E}) \xrightarrow{\sim} \mathrm{DR}(\mathcal{D}^{(0)}_{X/S}) \otimes_{\mathcal{D}^{(0)}_{X/S}} \mathcal{E}$.

2.3.3 Tangent sheaf, homological dimension, Spencer resolutions

2.3.3.1 (Tangent sheaf)**.** We set $\mathcal{T}_{X/S} := \mathcal{H}om_{\mathcal{B}_X}(\Omega^1_{X/S}, \mathcal{B}_X)$, the tangent sheaf relative to X/S. From $\Omega^1_{X/S} \hookrightarrow \mathcal{P}^1_{X/S}$, we obtain by duality the canonical epimorphism $\mathcal{D}_{X/S,1} \twoheadrightarrow \mathcal{T}_{X/S}$ whose kernel is $\mathcal{D}_{X/S,0} = \mathcal{O}_X$. From the canonical epimorphism morphism $\varpi\colon p_{0*}\mathcal{P}^1_{X/S} \twoheadrightarrow \Omega^1_{X/S}$ (see 1.1.2.6.3), we get by duality the $\mathcal{O}_X$-linear monomorphism $\varpi^\vee\colon \mathcal{T}_{X/S} \hookrightarrow \mathcal{D}_{X/S,1}$ (for the left structure of $\mathcal{D}_{X/S,1}$).

The morphisms $\mathcal{P}^1_{X/S} \to \mathcal{P}^1_{X/S,(m)}$ and $\mathcal{D}^{(m)}_{X/S,1} \to \mathcal{D}_{X/S,1}$ are isomorphisms for any $m \in \mathbb{N}$. This yields $\mathrm{gr}_1\, \mathcal{D}^{(m)}_{X/S} \xrightarrow{\sim} \mathcal{T}_{X/S}$. Moreover, we get the $\mathcal{O}_X$-linear monomorphism

$$\iota^{(m)}\colon \mathcal{T}_{X/S} \overset{\varpi^\vee}{\hookrightarrow} \mathcal{D}_{X/S,1} \xleftarrow{\sim} \mathcal{D}^{(m)}_{X/S,1} \hookrightarrow \mathcal{D}^{(m)}_{X/S}. \tag{2.3.3.1.1}$$

Suppose X/S has coordinates $(t_\lambda)_{\lambda=1,\ldots,d}$. Following the local description given at 1.1.2.6, $\iota^{(m)}(\mathcal{T}_{X/S})$ is equal to the free $\mathcal{O}_X$-submodule (for the left or the right structure) of $\mathcal{D}^{(m)}_{X/S}$ generated by elements $\partial_1, \ldots, \partial_d$.

Proposition 2.3.3.2. *The canonical homomorphism $\iota^{(0)}\colon \mathcal{T}_{X/S} \to \mathcal{D}^{(0)}_{X/S}$ induces an isomorphism*

$$\mathbb{S}(\mathcal{T}_{X/S}) \xrightarrow{\sim} \mathrm{gr}\, \mathcal{D}^{(0)}_{X/S}.$$

Proof. Since this is local, we can suppose X/S has coordinates $(t_\lambda)_{\lambda=1,\dots,d}$. Following 2.3.3.1, $\iota^{(0)}$ identifies $\mathcal{T}_{X/S}$ with the free $\mathcal{O}_X$-submodule of $\mathcal{D}^{(0)}_{X/S}$ generated by elements $\partial_1,\dots,\partial_d$. Denote by ξ_i the image of ∂_i in $\mathrm{gr}_1\,\mathcal{D}^{(0)}_{X/S}$. Then it follows from 1.4.2.7.1 that $\mathrm{gr}\,\mathcal{D}^{(0)}_{X/S}$ is equal to the commutative polynomial $\mathcal{O}_X$-algebra with the variable $\xi_1,\dots,\xi_d$.

□

We suppose from now $f\colon X\to S$ has pure relative dimension d.

Notation 2.3.3.3. We sometimes remove the canonical inclusion $\iota^{(0)}$ in the notation, i.e. we might canonically identify $\mathcal{T}_{X/S}$ with a sub-$\mathcal{O}_X$-module of $\mathcal{D}^{(0)}_{X/S}$. For any sections v_1,v_2 of $\mathcal{T}_{X/S}$, we denote by $[v_1,v_2]$ the section of $\mathcal{T}_{X/S}$ which corresponds to the section $v_1v_2-v_2v_1$ (we use the ring structure of $\mathcal{D}^{(0)}_{X/S}$ and we remark $v_1v_2-v_2v_1\in\mathcal{T}_{X/S}$). The $f^{-1}\mathcal{O}_S$-bilinear map $[-,-]\colon\mathcal{T}_{X/S}\times\mathcal{T}_{X/S}\to\mathcal{T}_{X/S}$ satisfies the Jacobi identity, i.e. we get a Lie bracket on the tangent space.

Definition 2.3.3.4. Let $\mathcal{E}=(\mathcal{E}_n)_{n\in\mathbb{N}}$ be a filtered left $\mathcal{D}^{(0)}_{X/S}$-module, i.e a left $\mathcal{D}^{(0)}_{X/S}$-module $\mathcal{E}$ endowed with an increasing exhaustive filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ by $\mathcal{O}_X$-submodules so that $\mathcal{D}^{(0)}_{X/S,n'}\cdot\mathcal{E}_n\subset\mathcal{E}_{n+n'}$.

For any sections v_1,v_2 of $\mathcal{T}_{X/S}$ and b of $\mathcal{O}_X$, we compute $v_1b-bv_1=v_1(b)$ in $\mathcal{D}^{(0)}_{X/S}$ and $[bv_1,v_2]=b[v_1,v_2]-v_2(b)v_1$ in $\mathcal{T}_{X/S}$. Hence, similarly to [Kas95, 1.6], we can check that the morphism of left $\mathcal{D}^{(0)}_{X/S}$-modules

$$\delta\colon\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^i\mathcal{T}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{E}_{j-1}\to\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^{i-1}\mathcal{T}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{E}_j \tag{2.3.3.4.1}$$

given by

$$\begin{aligned}\delta\left(P\otimes(v_1\wedge\cdots\wedge v_i)\otimes u\right)=&\sum_{a=1}^{i}(-1)^{a-1}Pv_a\otimes(v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge v_i)\otimes u\\&-\sum_{a=1}^{i}(-1)^{a-1}P\otimes(v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge v_i)\otimes v_au\\&+\sum_{1\le a<b\le i}(-1)^{a+b}P\otimes([v_a,v_b]\wedge v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge\widehat{v_b}\wedge\cdots\wedge v_i)\otimes u\end{aligned}$$

is well defined. Moreover, we compute that we get the following complex of left $\mathcal{D}^{(0)}_{X/S}$-modules

$$0\to\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^d\mathcal{T}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{E}_{n-d}\cdots\xrightarrow[\delta]{}\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge\mathcal{T}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{E}_{n-1}\xrightarrow[\delta]{}\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{E}_n\to\mathcal{E}\to 0. \tag{2.3.3.4.2}$$

We call 2.3.3.4.2 the first Spencer sequence of degree n of $\mathcal{E}$ and denote it by $\mathrm{Sp}_{n,\mathcal{D}^{(0)}_{X/S}}(\mathcal{E})$ or $\mathrm{Sp}_n(\mathcal{E})$.

Theorem 2.3.3.5. *With the notations of 2.3.3.4, let us suppose moreover that the filtration of $\mathcal{E}$ is good. Hence, for s large enough, $\mathrm{Sp}^\bullet_{s,\mathcal{D}^{(0)}_{X/S}}(\mathcal{E})$ is exact.*

Proof. This is checked similarly to [Kas95, 1.6.1] (see also the similar proof of 4.7.3.6). □

2.3.3.6. In particular, taking the trivial filtration of $\mathcal{O}_X$, we get the exact sequence of left $\mathcal{D}^{(0)}_{X/S}$-modules

$$0\to\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^d\mathcal{T}_{X/S}\cdots\xrightarrow[\delta_d]{}\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge\mathcal{T}_{X/S}\xrightarrow[\delta_1]{}\mathcal{D}^{(0)}_{X/S}\to\mathcal{O}_X\to 0 \tag{2.3.3.6.1}$$

where the map

$$\delta_i\colon\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^i\mathcal{T}_{X/S}\to\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^{i-1}\mathcal{T}_{X/S} \tag{2.3.3.6.2}$$

is given by the formula

$$\begin{aligned}\delta_i\left(P\otimes(v_1\wedge\cdots\wedge v_i)\right)=&\sum_{a=1}^{i}(-1)^{a-1}Pv_a\otimes(v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge v_i)\\&+\sum_{1\le a<b\le i}(-1)^{a+b}P\otimes([v_a,v_b]\wedge v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge\widehat{v_b}\wedge\cdots\wedge v_i).\end{aligned} \tag{2.3.3.6.3}$$

2.3.3.7. Let $\mathcal{A}$ be a commutative algebra on a topological space X. Let $\mathcal{E}$ be a $\mathcal{A}$-module. We denote by $\mathcal{E}^\vee := \mathcal{H}om_{\mathcal{A}}(\mathcal{E},\mathcal{A})$ the $\mathcal{A}$-linear dual. For any integer $n \geq 0$, we have a canonical $\mathcal{A}$-linear morphism

$$\wedge^n (\mathcal{E}^\vee) \to (\wedge^n(\mathcal{E}))^\vee. \tag{2.3.3.7.1}$$

The morphism is constructed as follows. By composing the morphisms

$$(\mathcal{E}^\vee)^n = \mathcal{H}om_{\mathcal{A}}(\mathcal{E},\mathcal{A}^n) \xrightarrow{\wedge^n} \mathcal{H}om_{\mathcal{A}}(\wedge^n(\mathcal{E}),\wedge^n(\mathcal{A}^n)) \underset{\sim}{\overset{\det}{\longrightarrow}} (\wedge^n(\mathcal{E}))^\vee \tag{2.3.3.7.2}$$

we get an alternating n-linear mapping. By universal property, this yields the $\mathcal{A}$-linear map 2.3.3.7.1 given by $\phi_1 \wedge \cdots \wedge \phi_n \mapsto ((x_1 \wedge \cdots \wedge x_n) \mapsto \det(\phi_i(x_j)))$.

From now, suppose $\mathcal{E}$ is locally free of rank N. Then 2.3.3.7.1 is an isomorphism. More precisely, suppose $\mathcal{E}$ has the basis $e_1,\dots,e_N$. We denote by $e_1^*,\dots,e_N^*$ the dual basis of $\mathcal{E}^\vee$ and by $(e_{i_1}\wedge\cdots\wedge e_{i_n})^*$ the dual basis of $(\wedge^n(\mathcal{E}))^\vee$ associated with the basis given by the elements $e_{i_1}\wedge\cdots\wedge e_{i_n}$. Then, the map 2.3.3.7.1 sends $e_{i_1}^*\wedge\cdots\wedge e_n^*$ to $(e_{i_1}\wedge\cdots\wedge e_{i_n})^*$.

Moreover, we have the canonical morphism

$$\wedge^{N-n}\mathcal{E} \to \mathcal{H}om_{\mathcal{A}}(\wedge^n\mathcal{E},\wedge^N\mathcal{E}), \tag{2.3.3.7.3}$$

given by $\omega \mapsto (\omega' \mapsto \omega\wedge\omega')$. Reducing to the case where $\mathcal{E}$ is free, we compute that this is an isomorphism. Since $\wedge^N\mathcal{E}$ is locally free, by using the isomorphism 2.3.3.7.1 then the canonical morphisms

$$\wedge^n (\mathcal{E}^\vee)\otimes_{\mathcal{A}}\wedge^N\mathcal{E} \to (\wedge^n\mathcal{E})^\vee\otimes_{\mathcal{A}}\wedge^N\mathcal{E} \to \mathcal{H}om_{\mathcal{A}}(\wedge^n\mathcal{E},\wedge^N\mathcal{E}) \tag{2.3.3.7.4}$$

are both isomorphisms. Hence, by composing 2.3.3.7.3 and the inverse of 2.3.3.7.4, we get the canonical isomorphism

$$\wedge^{N-n}\mathcal{E} \xrightarrow{\sim} \wedge^n(\mathcal{E}^\vee)\otimes_{\mathcal{A}}\wedge^N\mathcal{E}. \tag{2.3.3.7.5}$$

2.3.3.8. We can construct the map 2.3.2.10.1 in a second way by duality from the Spencer morphisms as follows. Since $\mathcal{D}^{(0)}_{X/S}$ is a locally free $\mathcal{O}_X$-module for its left structure (in particular), since $\Omega^i_{X/S}$ is locally free of finite type for any integer $0\leq i\leq d$, then we get the canonical isomorphism of $(\mathcal{O}_X,\mathcal{D}^{(0)}_{X/S})$-bimodules:

$$\begin{aligned}\Omega^i_{X/S}\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S} &\xrightarrow{\sim} \wedge^i(\mathcal{T}^\vee_{X/S})\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S} \underset{2.3.3.7.1}{\xrightarrow{\sim}} \wedge^i(\mathcal{T}_{X/S})^\vee\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S} \xrightarrow{\sim} \\ &\xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}\left(\wedge^i\mathcal{T}_{X/S},\mathcal{D}^{(0)}_{X/S}\right) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{D}^{(0)}_{X/S}}\left(\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^i\mathcal{T}_{X/S},\mathcal{D}^{(0)}_{X/S}\right).\end{aligned} \tag{2.3.3.8.1}$$

Hence, for any integer $0\leq n\leq d$, we get the morphism of right $\mathcal{D}^{(0)}_{X/S}$-modules $\delta^\star_n$ making commutative the diagram

$$\begin{array}{ccc} \Omega^{n-1}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S} & \xrightarrow{\delta^\star_n} & \Omega^n_{X/S}\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S} \\ \sim\downarrow 2.3.3.8.1 & & \sim\downarrow 2.3.3.8.1 \\ \mathcal{H}om_{\mathcal{D}^{(0)}_{X/S}}\left(\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^{n-1}\mathcal{T}_{X/S},\mathcal{D}^{(0)}_{X/S}\right) & \xrightarrow{\delta^\vee_n} & \mathcal{H}om_{\mathcal{D}^{(0)}_{X/S}}\left(\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^{n}\mathcal{T}_{X/S},\mathcal{D}^{(0)}_{X/S}\right), \end{array} \tag{2.3.3.8.2}$$

where $\delta^\vee_n$ is the image under the functor $\mathcal{H}om_{\mathcal{D}^{(0)}_{X/S}}(-,\mathcal{D}^{(0)}_{X/S})$ of the Spencer morphism of left $\mathcal{D}^{(0)}_{X/S}$-modules 2.3.3.6.2.

Lemma 2.3.3.9. *Both maps 2.3.2.10.1 and 2.3.3.8.2 are equal, i.e.* $\delta^\star_n = \nabla^{n-1}$.

Proof. Since this is local, we can suppose X/S has coordinates $t_1,\dots,t_d$. Let $\{i_1,\dots,i_{n-1}\}$ be $n-1$ elements of $\{1,\dots,d\}$. Let $\{j_1,\dots,j_{d-n+1}\}$ be the complementary.

0) For any $1\leq i\leq d$, let us denote by α_i the isomorphism 2.3.3.8.1. For any i elements $\{l_1,\dots,l_i\}$ of $\{1,\dots,d\}$, we compute $\alpha_i((dt_{l_1}\wedge\cdots\wedge dt_{l_i})\otimes 1) = (1\otimes(\partial_{l_1}\wedge\cdots\wedge\partial_{l_i}))^*$ where the elements $1\otimes(\partial_{l_1}\wedge\cdots\wedge\partial_{l_i})$ form a basis of $\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^i\mathcal{T}_{X/S}$ as left $\mathcal{D}^{(0)}_{X/S}$-module and where the star symbol means

the dual basis as right $\mathcal{D}^{(0)}_{X/S}$-module. By right $\mathcal{D}^{(0)}_{X/S}$-linearity of α_i, for any section P of $\mathcal{D}^{(0)}_{X/S}$, we get $\alpha_i((dt_{l_1}\wedge\cdots\wedge dt_{l_i})\otimes P)=(1\otimes(\partial_{l_1}\wedge\cdots\wedge\partial_{l_i}))^*P$.

1) For any integers $1\leq k_1,\ldots,k_n\leq d$, since $\delta_n(1\otimes(\partial_{k_1}\wedge\cdots\wedge\partial_{k_n}))=\sum_{a=1}^{i}(-1)^{a-1}\partial_{k_a}\otimes(\partial_{k_1}\wedge\cdots\wedge\widehat{\partial_{k_a}}\wedge\cdots\wedge\partial_{k_n})$ (see 2.3.3.6.3), then we compute

$$\delta_n^\vee\left((1\otimes(\partial_{i_1}\wedge\cdots\wedge\partial_{i_{n-1}}))^*\right)(1\otimes(\partial_{k_1}\wedge\cdots\wedge\partial_{k_n}))$$
$$=\sum_{a=1}^{i}(-1)^{a-1}\partial_{k_a}(\partial_{i_1}\wedge\cdots\wedge\partial_{i_{n-1}})^*(\partial_{k_1}\wedge\cdots\wedge\widehat{\partial_{k_a}}\wedge\cdots\wedge\partial_{k_n}). \tag{2.3.3.9.1}$$

Hence, if $\{i_1,\ldots,i_{n-1}\}\not\subset\{k_1,\ldots,k_n\}$, then $\delta_n^\vee(1\otimes(\partial_{i_1}\wedge\cdots\wedge\partial_{i_{n-1}}))^*(1\otimes(\partial_{k_1}\wedge\cdots\wedge\partial_{k_n}))=0$. Moreover, for any integer $1\leq a\leq d-n+1$, we get $\delta_n^\vee((1\otimes(\partial_{i_1}\wedge\cdots\wedge\partial_{i_{n-1}}))^*)(1\otimes(\partial_{i_1}\wedge\cdots\wedge\partial_{i_{n-1}}\wedge\partial_{j_a}))=(-1)^{n-1}\partial_{j_a}$. With the step 0), this yields

$$\delta_n^\vee\circ\alpha_{n-1}\left((dt_{i_1}\wedge\cdots\wedge dt_{i_{n-1}})\otimes 1\right)=\delta_n^\vee\left((1\otimes(\partial_{i_1}\wedge\cdots\wedge\partial_{i_{n-1}}))^*\right)$$
$$=(-1)^{n-1}\sum_{a=1}^{d-n+1}(1\otimes(\partial_{i_1}\wedge\cdots\wedge\partial_{i_{n-1}}\wedge\partial_{j_a}))^*\partial_{j_a}$$
$$=\alpha_n\left((-1)^{n-1}\sum_{a=1}^{d-n+1}(dt_{i_1}\wedge\cdots\wedge dt_{i_{n-1}}\wedge dt_{j_a})\otimes\partial_{j_a}\right)\overset{2.3.2.10.2}{=}\alpha_n\circ\nabla^{n-1}\left((dt_{i_1}\wedge\cdots\wedge dt_{i_{n-1}})\otimes 1\right).$$

□

2.3.3.10. By applying the functor $\mathcal{H}om_{\mathcal{D}^{(0)}_{X/S}}(-,\mathcal{D}^{(0)}_{X/S})$ to the complex of left $\mathcal{D}^{(0)}_{X/S}$-modules

$$\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^d\mathcal{T}_{X/S}\underset{\delta_d}{\longrightarrow}\cdots\underset{\delta}{\longrightarrow}\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge\mathcal{T}_{X/S}\underset{\delta_1}{\longrightarrow}\mathcal{D}^{(0)}_{X/S} \tag{2.3.3.10.1}$$

via the canonical isomorphisms 2.3.3.8.1, we get the complex of right $\mathcal{D}^{(0)}_{X/S}$-modules

$$\mathcal{D}^{(0)}_{X/S}\underset{\nabla^0}{\longrightarrow}\Omega^1_{X/S}\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S}\underset{\nabla^1}{\longrightarrow}\cdots\underset{\nabla}{\longrightarrow}\Omega^{d-1}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S}\underset{\nabla^{d-1}}{\longrightarrow}\omega_{X/S}\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S}. \tag{2.3.3.10.2}$$

It follows from 2.3.3.9 that the complex of $C({}^{\mathrm{r}}\mathcal{D}^{(0)}_{X/S})$ defined at 2.3.3.10.2 is the de Rham complex of $\mathcal{D}^{(0)}_{X/S}$ and is denoted by $\mathrm{DR}(\mathcal{D}^{(0)}_{X/S})$ (see 2.3.2.3).

If $\mathcal{E}\in D({}^{\mathrm{l}}\mathcal{D}^{(0)}_{X/S})$, we define the de Rham complex of $\mathcal{E}$ to be the complex

$$\mathrm{DR}(\mathcal{E}):=\mathrm{DR}(\mathcal{D}^{(0)}_{X/S})\otimes_{\mathcal{D}^{(0)}_{X/S}}\mathcal{E}.$$

Remark, when $\mathcal{E}$ is a left $\mathcal{D}^{(0)}_{X/S}$-module, following 2.3.2.10 we retrieve the usual de Rham complex (up to canonical isomorphisms) as defined at 2.3.2.3.

2.3.3.11. By applying the functor $\omega_{X/S}\otimes_{\mathcal{O}_X}-$ to the morphism of left $\mathcal{D}^{(0)}_{X/S}$-modules 2.3.3.6.2, we get the morphism of right $\mathcal{D}^{(0)}_{X/S}$-modules:

$$\omega_{X/S}\otimes_{\mathcal{O}_X}(\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^n\mathcal{T}_{X/S})\to\omega_{X/S}\otimes_{\mathcal{O}_X}(\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^{n-1}\mathcal{T}_{X/S}). \tag{2.3.3.11.1}$$

We have moreover the isomorphism of right $\mathcal{D}^{(0)}_{X/S}$-modules

$$\Omega^{d-n}_{X/S}\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S}\underset{2.3.3.7.5}{\overset{\sim}{\longrightarrow}}(\wedge^n\mathcal{T}_{X/S}\otimes_{\mathcal{O}_X}\omega_{X/S})\otimes_{\mathcal{O}_X}\mathcal{D}^{(0)}_{X/S}$$
$$\underset{\delta_X\otimes\mathrm{id}_{\wedge^n\mathcal{T}_{X/S}}}{\overset{\sim}{\longrightarrow}}\omega_{X/S}\otimes_{\mathcal{O}_X}(\mathcal{D}^{(0)}_{X/S}\otimes_{\mathcal{O}_X}\wedge^n\mathcal{T}_{X/S}), \tag{2.3.3.11.2}$$

where δ_X is the transposition isomorphism (see 2.2.2.2.1).

Lemma 2.3.3.12. *For any integer $0 \leq n \leq d$, the following square of right $\mathcal{D}^{(0)}_{X/S}$-modules*

$$\begin{array}{ccc} \Omega^{d-n}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S} & \xrightarrow[2.3.3.11.2]{\sim} & \omega_{X/S} \otimes_{\mathcal{O}_X} (\mathcal{D}^{(0)}_{X/S} \otimes_{\mathcal{O}_X} \wedge^n \mathcal{T}_{X/S}) \\ {\scriptstyle (-1)^{d-n+1}\nabla^{d-n}} \downarrow {\scriptstyle 2.3.2.10.1} & & {\scriptstyle 2.3.3.11.1} \downarrow {\scriptstyle \mathrm{id} \otimes \delta_n} \\ \Omega^{d-n+1}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S} & \xrightarrow[2.3.3.11.2]{\sim} & \omega_{X/S} \otimes_{\mathcal{O}_X} (\mathcal{D}^{(0)}_{X/S} \otimes_{\mathcal{O}_X} \wedge^{n-1} \mathcal{T}_{X/S}), \end{array} \tag{2.3.3.12.1}$$

is commutative.

Proof. Since this is local, we can suppose X/S has coordinates $t_1, \ldots, t_d$. Choose a subset $\{i_1, \ldots, i_{d-n}\}$ of $d-n$ elements of $\{1, \ldots, d\}$. Let $\{j_1, \ldots, j_n\}$ be the complementary. Set $\omega_{d-n} := dt_{i_1} \wedge \cdots \wedge dt_{i_{d-n}}$, $\omega_n := dt_{j_1} \wedge \cdots \wedge dt_{j_n}$, $\omega_n^* := \partial_{j_1} \wedge \cdots \wedge \partial_{j_n}$ and $\omega_d := \omega_{d-n} \wedge \omega_n$. We compute the isomorphism $\Omega^{d-n}_{X/S} \xrightarrow{\sim} \wedge^n \mathcal{T}_{X/S} \otimes_{\mathcal{O}_X} \omega_{X/S}$ of 2.3.3.7.5 sends ω_{d-n} to $\omega_n^* \otimes \omega_d$. Hence, the top isomorphism of the diagram 2.3.3.12 sends $\omega_{d-n} \otimes 1$ to $\delta_X \otimes \mathrm{id}(\omega_n^* \otimes \omega_d \otimes 1) = \delta_X(\omega_d \otimes 1) \otimes \omega_n^* = \omega_d \otimes 1 \otimes \omega_n^*$ (see the formulas of 2.2.2.1 satisfied by the transposition isomorphism).

For any $a \in \{j_1, \ldots, j_n\}$, set $\omega_{n,\widehat{a}} := dt_{j_1} \wedge \cdots \wedge \widehat{dt_{j_a}} \wedge \cdots \wedge dt_{j_n}$ and $\omega^*_{n,\widehat{a}} := \partial_{j_1} \wedge \cdots \wedge \widehat{\partial_{j_a}} \wedge \cdots \wedge \partial_{j_n}$. Following 2.3.3.6.3, we compute $\delta_n(1 \otimes \omega_n^*) = \sum_{a=1}^n (-1)^{a-1} \partial_{j_a} \otimes \omega^*_{n,\widehat{a}}$. Hence, the right morphism of the diagram 2.3.3.12 sends $\omega_d \otimes 1 \otimes \omega_n^*$ to $\sum_{a=1}^i (-1)^{a-1} \omega_d \otimes \partial_{j_a} \otimes \omega^*_{n,\widehat{a}}$.

On the other hand, the left morphism of the diagram 2.3.3.12 sends $\omega_{d-n} \otimes 1$ to $-\sum_{a=1}^n (\omega_{d-n} \wedge dt_a) \otimes \partial_{j_a}$ (see the formula 2.3.2.10.2). Set $\omega_{d-n,a} := \omega_{d-n} \wedge dt_{j_a}$. We compute $\omega_{d-n,a} \wedge \omega_{n,\widehat{a}} = (-1)^{a-1} \omega_d$. Hence, the isomorphism $\Omega^{d-n+1}_{X/S} \xrightarrow{\sim} \wedge^{n-1} \mathcal{T}_{X/S} \otimes_{\mathcal{O}_X} \omega_{X/S}$ of 2.3.3.7.5 sends $\omega_{d-n,a}$ to $(-1)^{a-1} \omega^*_{n,\widehat{a}} \otimes \omega_d$. Hence, the bottom isomorphism of 2.3.3.12 sends $-\sum_{a=1}^n \omega_{d-n,a} \otimes \partial_{j_a}$ to $-\sum_{a=1}^n \delta_X \otimes \mathrm{id}((-1)^{a-1} \omega^*_{n,\widehat{a}} \otimes \omega_d \otimes \partial_{j_a}) = \sum_{a=1}^n (-1)^{a-1} \omega_d \otimes \partial_{j_a} \otimes \omega^*_{n,\widehat{a}}$ (see the formulas of 2.2.2.1 satisfied by the transposition isomorphism). □

Proposition 2.3.3.13. *We have the following assertions.*

(i) The map $\omega_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S} \xrightarrow{\beta} \omega_{X/S}$ given by the structure of a right $\mathcal{D}^{(0)}_{X/S}$-module on $\omega_{X/S}$ induces a $\mathcal{D}^{(0)}_{X/S}$-linear resolution $\mathrm{DR}(\mathcal{D}^{(0)}_{X/S})[d] \xrightarrow{\sim} \omega_{X/S}$ of $\omega_{X/S}$.

(ii) $\mathcal{E}xt^i_{\mathcal{D}^{(0)}_{X/S}}(\mathcal{O}_X, \mathcal{D}^{(0)}_{X/S}) = 0$ for $i \neq d$. There is a canonical isomorphism of right $\mathcal{D}^{(0)}_{X/S}$-modules

$$\mathcal{E}xt^d_{\mathcal{D}^{(0)}_{X/S}}(\mathcal{O}_X, \mathcal{D}^{(0)}_{X/S}) \xrightarrow{\sim} \omega_{X/S}.$$

Proof. By applying the functor $\omega_{X/S} \otimes_{\mathcal{O}_X} -$ to the exact sequence 2.3.3.6.1, with 2.3.3.12, we get that $\mathrm{DR}(\mathcal{D}^{(0)}_{X/S})[d]$ is a resolution of $\omega_{X/S}$. Moreover, we compute that the map $\omega_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(0)}_{X/S} \xrightarrow{\beta} \omega_{X/S}$ of the resolution $\mathrm{DR}(\mathcal{D}^{(0)}_{X/S})[d] \xrightarrow{\sim} \omega_{X/S}$ is given by the structure of a right $\mathcal{D}^{(0)}_{X/S}$-module on $\omega_{X/S}$. □

2.3.4 Homological global dimension

2.3.4.1 (Left and right global Dimension)**.** Let D be a ring. We recall few facts on the definition of the homological/global dimension (see [BouAlgX] §8; [Wei94] Ch 4). We denote by $i.\dim(E)$ (resp. $p.\dim(E)$, resp. $f.\dim(E)$) the injective dimension (resp. projective dimension, resp. flat dimension) of a left or right D-module E. The following numbers are the same:

i) $\sup\{i.\dim(F)$: F is a left D-module$\}$;

ii) $\sup\{p.\dim(E)$: E is a left D-module$\}$;

ii') $\sup\{p.\dim(E)$: E is a monogeneous left D-module$\}$;

iii) $\sup\{n$: $\mathrm{Ext}^n_D(E, F) \neq 0$ for some left D-modules $E, F\}$;

iii') $\sup\{n\colon \operatorname{Ext}^n_D(E,F)\neq 0$ for some monogeneous left D-module E and left D-module $F\}$.

This common number (possibly ∞) is called the *left global dimension of* D and is denoted by $\mathrm{l.gl.dim}(D)$. Bourbaki [BX] calls it the *homological dimension of* D. One might sometimes say homological global dimension of D. One may define the right global dimension $\mathrm{r.gl.dim}(D)$ similarly.

When $\mathrm{r.gl.dim}(D) = \mathrm{l.gl.dim}(D)$, we simply write them $\mathrm{gl.dim}(D)$ and it is called the global dimension of D, or the homological global dimension of D.

When D is coherent, this notion is very similar to the tor dimension (see 1.4.3.30) but not equal a priori (beware in the condition iii') that the monogeneous left D-module is not coherent).

2.3.4.2 (Comparison with the tor-dimension)**.** We have obviously $\mathrm{tor.dim}(D) \leq r.\mathrm{gl.dim}(D)$ and $\mathrm{tor.dim}(D) \leq \mathrm{l.gl.dim}(D)$. If moreover D is left (resp. right) noetherian, then $\mathrm{tor.dim}(D) = r.\mathrm{gl.dim}(D)$ (resp. $\mathrm{tor.dim}(D) = \mathrm{l.gl.dim}(D)$ (see [Wei94, 4.1.5]). Hence, if D is both left and right noetherian, then $r.\mathrm{gl.dim}(D) = \mathrm{l.gl.dim}(D)$. We have almost the equality by considering inductive limits of noetherings rings : see below 2.3.4.3.

Proposition 2.3.4.3. *Let $(D^{(m)})_{m\in\mathbb{N}}$ be an inductive system indexed by $\mathbb{N}$ of noetherian rings such that the ring homomorphisms $D^{(m)}\to D^{(m+1)}$ are injective and left (resp. right) flat. Set $D^\dagger := \varinjlim_m D_m$. We have the inequality*

$$\mathrm{tor.dim}\, D^\dagger \leq \mathrm{l.gl.dim}\, D^\dagger \leq \mathrm{tor.dim}\, D^\dagger + 1 \qquad \textit{(resp. } \mathrm{tor.dim}\, D^\dagger \leq \mathrm{r.gl.dim}\, D^\dagger \leq \mathrm{tor.dim}\, D^\dagger + 1\textit{)}.$$

Proof. We have nothing to prove if the tor dimension is infinite. Suppose $\mathrm{tor.dim}\, D^\dagger$ is an integer d. We have to prove the vanishing

$$\operatorname{Ext}^i_{D^\dagger}(E,M)=0$$

for all cyclic $D^\dagger$-module E, all $D^\dagger$-module M and all $i > d+1$ (see 2.3.4.1). Let $E \simeq D^\dagger/I$ be a presentation of E and for any $m\in\mathbb{N}$ put

$$I_m = D^\dagger(I\cap D^{(m)}), \qquad E_m = D^\dagger/I_m.$$

Then $I=\cup_m I_m$, $E\simeq \varinjlim_m E_m$, and for any M,

$$\operatorname{Hom}_{D^\dagger}(E,M) \xrightarrow{\sim} \varprojlim_m \operatorname{Hom}_{D^\dagger}(E_m,M),$$

from which a spectral sequence follows

$$E_2^{i,j} = R^i\varprojlim_m \operatorname{Ext}^j_{D^\dagger}(E_m,M) \Rightarrow E^n = \operatorname{Ext}^n_{D^\dagger}(E,M).$$

Now for all m, since $D^{(m)}$ is noetherian then I_m is left ideal of finite type of $D^\dagger$. Thus E_m is coherent on $D^\dagger$. By using 1.4.3.32, this yields $\operatorname{Ext}^j_{D^\dagger}(E_m,M)$ are zero for $j>d$ and all m. As $R^i\varprojlim_m$ are zero for $i>1$, the assertion follows. □

Remark 2.3.4.4. Let $\mathcal{D}$ be a left coherent sheaf of rings on a topological space X. Suppose there exist an integer n and an open basis $\mathfrak{B}$ of X such that for any $U\in\mathfrak{B}$, $\mathrm{l.gl.dim}(\mathcal{D}(U))\leq n$ (one might define this property by saying that $\mathrm{l.gl.dim}(\mathcal{D})\leq n$). Then $\mathcal{D}$ has finite tor-dimension $\leq n$ (use 1.4.3.12). This yields the equality $D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}) = D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D})$ (see 1.4.3.29).

Proposition 2.3.4.5 (Homological global dimension)**.** *Suppose X is affine, S is affine and regular. Let $r := \sup_{s\in f(X)} \dim \mathcal{O}_{S,s}$ which is suppose to be finite. Then the ring $D^{(0)}_{X/S} := \Gamma(X,\mathcal{D}^{(0)}_{X/S})$ has homological global dimension equal to $2d+r$.*

Proof. Since $D^{(0)}_{X/S}$ is noetherian, then $\mathrm{tor.dim}(D^{(0)}_{X/S}) = \mathrm{gl.dim}(D^{(0)}_{X/S})$ (see 2.3.4.2). This yields that the corollary is local in X (see 1.4.3.26) and we can therefore suppose that $X\to S$ has coordinates $t_1,\dots,t_d$. Following 2.3.3.2, $\mathrm{gr}\, D^{(0)}_{X/S}$ is a polynomial ring over $\Gamma(X,\mathcal{O}_X)$ with d variables. Hence, $\dim\mathrm{gr}\, D^{(0)}_{X/S} = 2d+r$. Since we have the inequality $\mathrm{gl.dim}\, D^{(0)}_{X/S} \leq \mathrm{gl.dim}\,\mathrm{gr}\, D^{(0)}_{X/S}$ (see [LvO96, I.7.2 Corollary 2]), this yields $\mathrm{gl.dim}\, D^{(0)}_{X/S}\leq 2d+r$. It remains to exhibit a left $D^{(0)}_{X/S}$-module E

such that $\mathrm{Ext}^{2d+r}_{D^{(0)}_{X/S}}(E, D^{(0)}_{X/S}) \neq 0$. Let $s \in f(X)$ such that $\dim \mathcal{O}_{S,s} = r$, $s_1, \ldots, s_r \in \mathfrak{m}_{S,x} \subset \mathcal{O}_{S,s}$ be a regular sequence of generators. Since $s_1, \ldots, s_r, t_1^p, \ldots, t_d^p$ are in the center of $\mathcal{D}^{(0)}_{X/S}$ then the sub-$\mathcal{O}_X$-module of $\mathcal{O}_X$ generated by $(s_1, \ldots, s_r, t_1^p, \ldots, t_d^p)$ is a sub-$\mathcal{D}^{(0)}_{X/S}$-module of $\mathcal{O}_X$. Hence, we get a left $\mathcal{D}^{(0)}_{X/S}$-module (resp. a left $D^{(0)}_{X/S}$-module) by setting $\mathcal{E} := \mathcal{O}_X/(s_1, \ldots, s_r, t_1^p, \ldots, t_d^p)$ (resp. $E = \Gamma(X, \mathcal{E})$). Let $K_\bullet := K_\bullet(s_1, \ldots, s_r, t_1^p, \ldots, t_d^p)$ be the Koszul complex of $\Gamma(X, \mathcal{O}_X)$-free modules given by the sequence of global sections $s_1, \ldots, s_r, t_1^p, \ldots, t_d^p$ of $\Gamma(X, \mathcal{O}_X)$ (e.g. see the description in 5.2.5.4). Since $s_1, \ldots, s_r, t_1^p, \ldots, t_d^p$ are in the center of $\mathcal{D}^{(0)}_{X/S}$ then $K_\bullet$ is also a complex of left $\mathcal{D}^{(0)}_{X/S}$-modules (where $\mathcal{O}_X$ is endowed with its constant structure of left $\mathcal{D}^{(0)}_{X/S}$-module). By using the spectral sequence $E_1^{i,j} = \mathrm{Ext}^j_{D^{(0)}_{X/S}}(K_i, D^{(0)}_{X/S}) \Rightarrow \mathrm{Ext}^n_{D^{(0)}_{X/S}}(E, D^{(0)}_{X/S})$, since $E_1^{i,j} = 0$ if $j \neq d$ (see 2.3.3.13), then $\mathrm{Ext}^{2d+r}_{D^{(0)}_{X/S}}(E, D^{(0)}_{X/S})$ is the cokernel of the map $E_1^{d+r-1,d} \to E_1^{d+r,d}$ which is isomorphic to the map $\Gamma(X, \omega_{X/S})^{d+r} \to \Gamma(X, \omega_{X/S})$ whose jth component is the multiplication by $(-1)^j u_j$ where u_j is the jth component of $(s_1, \ldots, s_r, t_1^p, \ldots, t_d^p)$. Hence, $\mathrm{Ext}^{2d+r}_{D^{(0)}_{X/S}}(E, D^{(0)}_{X/S}) \neq 0$. □

Chapter 3

Logarithmic differential modules

We refer the readers to [Ogu18], for more details on log schemes.

3.1 Sheaf of differential operators of infinite level and finite order on logarithmic schemes

We will keep the following notation. If $X^\sharp$ is a log scheme, we denote by $\alpha_{X^\sharp}: M_{X^\sharp} \to \mathcal{O}_X$ the underlying log structure of $X^\sharp$. If $f: X^\sharp \to Y^\sharp$ is a morphism of fine log schemes, then we denote by X and Y the underlying schemes, by $\underline{f}: X \to Y$ the underlying morphism of schemes, by $f^\sharp: \mathcal{O}_Y \to f_*\mathcal{O}_X$ (or sometimes $f^\sharp: f^{-1}\mathcal{O}_Y \to \mathcal{O}_X$) and $f^\flat: M_{Y^\sharp} \to f_* M_{X^\sharp}$ (or sometimes $f^\flat: f^{-1}M_{Y^\sharp} \to M_{X^\sharp}$). By abuse of notation, we might sometimes still denote by f instead of $\underline{f}$ or of $f^\sharp$. We work in the category of fine log schemes or p-adic fine log formal schemes. Hence, fiber products are computed in these categories.

3.1.1 nth infinitesimal neighborhood

Let i be an integer and $S^\sharp$ be a fine log scheme over the scheme $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$. First, let us introduce the notion of nice log-schemes that we will need only from 3.4.

Definition 3.1.1.1. We say that $S^\sharp$ is a "nice" fine log scheme if there exists a scheme Z over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ such that $S^\sharp$ is a log flat Z-log-scheme (see the definition [Ogu18, IV.4.1.1] of log-flatness, which we can also simply be called flatness). Following Lemma [Ogu18, IV.4.1.3] (i.e. we can use the zero monoid for Z), this means that fppf locally on $S^\sharp$ and Z, there exists a flat and strict morphism of Z-log-schemes of the form $\alpha: S^\sharp \to Z \times A_P$ where P is an integral monoid and the product is computed in the category of log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$.

Remark 3.1.1.2. Remark that it follows from [Ogu18, IV.4.1.2.4] that if $Y^\sharp$ is nice and $X^\sharp \to Y^\sharp$ is log flat (e.g log smooth), then $X^\sharp$ is also nice.

Lemma 3.1.1.3. *Let $U := (S^\sharp)^*$ be the open in $S^\sharp$ subscheme with trivial log-structure (see [Ogu18, III.1.2.8]) and $j: U \to S^\sharp$ be the canonical inclusion. If $S^\sharp$ is a nice fine log scheme (see definition 3.1.1.1), then the canonical morphism $\mathcal{O}_{S^\sharp} \to j_*\mathcal{O}_U$ is injective.*

Proof. Let Z be a scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ such that $S^\sharp$ is a log flat Z-log-scheme. Since the lemma is fppf local, we can suppose there exists a flat and strict morphism of Z-log-schemes $\alpha: S^\sharp \to Z \times A_P$ with P an integral monoid. Since α and the projection $Z \times A_P \to A_P$ are strict, then it follows from [Ogu18, III.1.2.11] that we have $U = \alpha^{-1}((Z \times A_P)^*)$ and $(Z \times A_P)^* = Z \times A_P^*$. Since $A_P^* = A_{P^{\mathrm{gr}}}$ (see [Ogu18, III.1.2.10]), then $U = \alpha^{-1}(Z \times A_{P^{\mathrm{gr}}})$. Let $\iota: Z \times A_{P^{\mathrm{gr}}} \to Z \times A_P$ be the canonical open immersion. Since $\mathcal{O}_{Z \times A_P} \to \iota_*\mathcal{O}_{Z \times A_{P^{\mathrm{gr}}}}$ is injective and α is flat, then we can conclude. □

Remark 3.1.1.4. With the notation of 3.1.1.3, it is not clear that the canonical morphism $j_*\mathcal{O}_U \to \mathcal{O}_{S^\sharp}$ is injective in general. Let $X^\sharp$ is a log smooth $S^\sharp$-log scheme. When $S^\sharp$ is a nice fine log scheme, we will check (by using this injectivity) that $\omega_{X^\sharp/S^\sharp}$ has a canonical right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure (see Lemma 3.4.5.1). There exist some extensions of this latter result (when $m = 0$ or when the log scheme is the reduction modulo π^{i+1} of some log formal scheme: see [CV17, Section 3.6]). Since the context of nice log schemes is largely sufficient for us, this justifies why we only consider the case of nice log schemes from the subsection 3.4.

Definition 3.1.1.5. Let $f\colon X^\sharp \to Y^\sharp$ be a morphism of log schemes and $\mathcal{B}_X$ be an $\mathcal{O}_X$-algebra. We have the following quasi-flatness notions which will be useful to define derived duality or derived tensor products over the ring of differential operators (see the example 4.6.3.3).

1. We say that f is quasi-flat if there exists a morphism of schemes $g\colon Y \to Z$ such that the morphism of schemes $g \circ f\colon X \to Z$ is flat.
2. We say that $\mathcal{B}_X$ is a quasi-flat $f^{-1}\mathcal{O}_Y$-algebra if there exists a morphism of schemes $g\colon Y \to Z$ such that the (induced by $g \circ f$) morphism of ringed spaces $(X, \mathcal{B}_X) \to Z$ is flat.

Remark 3.1.1.6. We will give later a notion of quasi-flatness in the context of "ringed logarithmic schemes" (see 4.4.1.3). With the notation of the last statement of Definition 3.1.1.5, $(X^\sharp, \mathcal{B}_X) \to Y^\sharp$ is a quasi-flat morphism of ringed logarithmic schemes means that $\mathcal{B}_X$ is a quasi-flat $f^{-1}\mathcal{O}_Y$-algebra (see 4.4.1.3.a). We will moreover gives a notion of quasi-flatness for morphism of relative ringed logarithmic schemes (see 4.4.1.3).c).

Remark 3.1.1.7. Let $f\colon X^\sharp \to Y^\sharp$ be log smooth (e.g log flat) morphism of fine log schemes (resp. of locally noetherian fine log schemes). We suppose that for any $y \in Y$, the monoid $(M_{Y^\sharp}/\mathcal{O}_Y^*)_y$ is generated by one element. Then $X^\sharp \to Y^\sharp$ is integral (see [Kat89, 4.4] or [Ogu18, III.2.5.3.3]). Hence, it follows from [Kat89, 4.5] (resp. [Ogu18, IV.4.3.5.1]) that the underlying morphism of schemes $X \to Y$ is flat.

Definition 3.1.1.8. Let $u\colon Z^\sharp \to X^\sharp$ be a morphism of log-schemes.

(a) According to [Ogu18, II.1.1.12], we say that u is an immersion (resp. closed immersion) if $\underline{u}$ is an immersion (resp. a closed immersion) of schemes and if $u^*M_{X^\sharp} \to M_{Z^\sharp}$ is surjective (here u^* means the pullback of log structures [Kat89, 1.4]). An immersion (resp. a closed immersion) is exact if and only if $u^*M_{X^\sharp} \to M_{Z^\sharp}$ is an isomorphism.

(b) We say that u is an open immersion if u is an exact immersion such that $\underline{u}$ is an open immersion of schemes.

(c) Let n be an integer. A "log thickening of order (n)" (resp. "log thickening of order n") is an *exact* closed immersion $u\colon U^\sharp \hookrightarrow T^\sharp$ such that $\mathcal{I}^{(n)} = 0$ (resp. such that $\mathcal{I}^{n+1} = 0$), where $\mathcal{I}$ is the ideal associated with the closed immersion $\underline{u}$. The convention of the respective case is that of [Ogu18, IV.2.1.1] and is convenient when we are dealing with n-infinitesimal neighborhood.

(d) Let $a \in \mathbb{N}$. A "(p)-nilpotent log thickening of order a" is a log thickening of order (p^{a+1}). A "(p)-nilpotent log thickening" is a (p)-nilpotent log thickening of order a for some $a \in \mathbb{N}$ large enough.

An $S^\sharp$-immersion (resp. $S^\sharp$-log-thickening) is an immersion (resp. log thickening) which is an $S^\sharp$-morphism.

Remark 3.1.1.9. (a) If $u\colon Z^\sharp \to X^\sharp$ and $f\colon X^\sharp \to Y^\sharp$ are two $S^\sharp$-morphisms of log schemes such that $f \circ u$ is an $S^\sharp$-immersion, then so is u (use [Gro60, 5.3.13]).

(b) If $u\colon Z^\sharp \to X^\sharp$ and $f\colon X^\sharp \to Y^\sharp$ are two $S^\sharp$-morphisms of log schemes such that $f \circ u$ is a closed $S^\sharp$-immersion and $\underline{f}$ is separated, then u is a closed immersion (use [Gro60, 5.4.4]).

(c) We can decompose a (strict) $S^\sharp$-immersion u into $u = u_1 \circ u_2$, where u_1 is an open $S^\sharp$-immersion and u_2 is a (strict) closed $S^\sharp$-immersion.

(d) Let $u\colon U^\sharp \hookrightarrow T^\sharp$ be an $S^\sharp$-log-thickening of order (p^a) for some integer a. Since p is nilpotent in $\mathcal{O}_T$, by applying finitely many times the functor $\mathcal{I} \mapsto \mathcal{I}^{(p)}$ to the ideal defined by $\underline{u}$ we obtain the zero ideal, which justifies the definition of "(p)-nilpotent log thickening". This also implies that u is the composition of several $S^\sharp$-log-thickenings of order (p).

Definition 3.1.1.10. (a) We denote by $\mathscr{C}_\sharp$ the category whose objects are $S^\sharp$-immersions of fine log-schemes and whose morphisms $u' \to u$ are commutative diagrams of the form

$$\begin{array}{ccc} X'^\sharp & \xrightarrow{f} & X^\sharp \\ {\scriptstyle u'}\uparrow & & \uparrow{\scriptstyle u} \\ Z'^\sharp & \longrightarrow & Z^\sharp . \end{array} \qquad (3.1.1.10.1)$$

We say that $u' \to u$ is strict (resp. flat, resp. cartesian) if f is strict (resp. $\underline{f}$ is flat, resp. the square 3.1.1.10.1 is cartesian).

(b) Let $n \in \mathbb{N}$. We denote by $\mathscr{C}_{\sharp n}$ (resp. $\mathscr{T}hick_{(p)}$) the full subcategory of $\mathscr{C}_\sharp$ whose objects are $S^\sharp$-log-thickening of order n (resp. (p)-nilpotent $S^\sharp$-log-thickenings).

(c) Let u be an object of $\mathscr{C}_\sharp$. A "log thickening of order n induced by u" is an object u' of $\mathscr{C}_{\sharp n}$ endowed with a morphism $u' \to u$ of $\mathscr{C}_\sharp$ satisfying the following universal property: for any object u'' of $\mathscr{C}_{\sharp n}$ endowed with a morphism $f : u'' \to u$ of $\mathscr{C}_\sharp$ there exists a unique morphism $u'' \to u'$ of $\mathscr{C}_{\sharp n}$ whose composition with $u' \to u$ is f. The unicity up to canonical isomorphism of the log thickening of order n induced by u is obvious. We will denote by $P^{\sharp n}(u)$ the log thickening of order n induced by u. We also say that $P^{\sharp n}(u)$ is the "nth infinitesimal neighbourhood of u" (see [Kat89, 5.8]). The existence is checked below (see 3.1.1.17).

Remark 3.1.1.11. (a) If $u' \to u$ is a strict cartesian morphism of $\mathscr{C}_\sharp$ with $u \in \mathscr{C}_{\sharp n}$ (resp. $u \in \mathscr{T}hick_{(p)}$), then $u' \in \mathscr{C}_{\sharp n}$ (resp. $u' \in \mathscr{T}hick_{(p)}$). Indeed, the corresponding square of the form 3.1.1.10.1 of $u' \to u$ remains cartesian after applying the forgetful functor from the category of fine log schemes to the category of schemes (to check this fact, we need a priori the strictness of $u' \to u$).

(b) The category $\mathscr{C}_\sharp$ has fibered products. More precisely, let $u : Z^\sharp \hookrightarrow X^\sharp$, $u' : Z'^\sharp \hookrightarrow X'^\sharp$, $u'' : Z^{\sharp\prime\prime} \hookrightarrow X^{\sharp\prime\prime}$ be some objects of $\mathscr{C}_\sharp$; let $u' \to u$ and $u'' \to u$ be two morphisms of $\mathscr{C}_\sharp$. Then $u' \times_u u''$ is the immersion $Z'^\sharp \times_{Z^\sharp} Z^{\sharp\prime\prime} \hookrightarrow X'^\sharp \times_{X^\sharp} X^{\sharp\prime\prime}$. If $u' \to u$ is moreover cartesian, then so is the projection $u' \times_u u'' \to u''$.

In order to be precise, let us clarify the standard definitions.

Definition 3.1.1.12. Let $f : X^\sharp \to Y^\sharp$ be an $S^\sharp$-morphism of fine log schemes.

(a) We say that f is "fine formally log étale" (resp. "fine formally log unramified") if it satisfies the following property: for any commutative diagram of fine log schemes of the form

$$\begin{array}{ccc} U^\sharp & \xrightarrow{u_0} & X^\sharp \\ {\scriptstyle \iota}\downarrow & & \downarrow{\scriptstyle f} \\ T^\sharp & \xrightarrow{v} & Y^\sharp \end{array} \qquad (3.1.1.12.1)$$

such that ι is an object of $\mathscr{C}_{\sharp 1}$, there exists a unique morphism (resp. there exists at most one morphism) $u : T^\sharp \to X^\sharp$ such that $u \circ \iota = u_0$ and $f \circ u = v$.

(b) We say that f is "log étale" if f is fine formally log étale and if $\underline{f}$ is of finite presentation.

(c) We say that f is "étale" if f is log étale and strict (which is equivalent to saying that $\underline{f}$ is étale and f is strict).

Remark 3.1.1.13. (a) The definitions appearing in 3.1.1.12 do not depend on the choice of the fine log scheme $S^\sharp$.

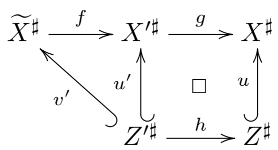
(b) Let $f : X^\sharp \to Y^\sharp$ be an $S^\sharp$-morphism of fine log schemes. The notion of etaleness of Kato appearing in [Kat89, 3.3] is what we have defined as "log etaleness". We distinguish by definition "log etale" from "etale" morphisms in order to avoid confusion when we say for instance "etale locally".

(c) There exists in the literature a notion of etale morphism of log schemes with coherent log structures (see in Ogus's book at [Ogu18, IV.3.1.1]). This notion is compatible with Kato's notion of etale morphism of fine log schemes. Indeed, both notions have the same characterization when we focus on morphisms of fine log schemes (see respectively Theorem [Kat89, 3.5] and Theorem [Ogu18, IV.3.3.1]).

To avoid confusion with the etale notion in the classical sense, we will call such a morphism a "log etale" morphism of log schemes with coherent log structures (instead of "etale morphism").

Moreover, let $f\colon X^\sharp \to Y^\sharp$ be a morphism of log schemes with coherent log structures. From [Ogu18, IV.3.1.11], $X^{\sharp\mathrm{int}} \to X^\sharp$ and $Y^{\sharp\mathrm{int}} \to Y^\sharp$ are log etale (see [Ogu18, III.2.1.5.1] concerning the functor $X^\sharp \mapsto X^{\sharp\mathrm{int}}$). Hence, using Remark [Ogu18, IV.3.1.2], we can check that f is log etale if and only if f^{int} is log etale.

3.1.1.14. We recall in the paragraph how we can exactify an immersion. Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ be an $S^\sharp$-immersion of fine log-schemes. Let $\overline{z}$ be a geometric point of $Z^\sharp$. Using the proof of [Kat89, 4.10.1] and Proposition [Gro67, IV.18.1.1], we can check that there exists a commutative diagram of the form



such that the square is cartesian, f is log étale, $\underline{f}$ is affine, g is étale, v' is an exact closed $S^\sharp$-immersion and h is an étale neighborhood of $\overline{z}$ in $Z^\sharp$.

Lemma 3.1.1.15. *Let $u' \to u$ be a strict cartesian morphism of $\mathscr{C}_\sharp$. Suppose that $P^{\sharp n}(u)$, the log thickening of order n induced by u, exists. Then the log thickening of order n induced by u' exists and we have $P^{\sharp n}(u') = P^{\sharp n}(u) \times_u u'$.*

Proof. Using the remarks of 3.1.1.11, since $u' \to u$ is strict and cartesian, then so is the projection $P^{\sharp n}(u) \times_u u' \to P^{\sharp n}(u)$ and then $P^{\sharp n}(u) \times_u u' \in \mathscr{C}_{\sharp n}$. Hence, we can check easily that $P^{\sharp n}(u) \times_u u'$ endowed with the projection $P^{\sharp n}(u) \times_u u' \to u'$ satisfies the corresponding universal property of $P^{\sharp n}(u')$. We can check similarly the respective case. □

Lemma 3.1.1.16. *Let $n \in \mathbb{N}$, $f\colon X^\sharp \to Y^\sharp$ be a fine formally log étale morphism of fine log $S^\sharp$-schemes, $u\colon Z^\sharp \hookrightarrow X^\sharp$ and $v\colon Z^\sharp \hookrightarrow Y^\sharp$ be two $S^\sharp$-immersions of fine log schemes such that $v = f \circ u$. If $P^{\sharp n}(u)$ exists, then $P^{\sharp n}(v)$ exists and we have $P^{\sharp n}(u) = P^{\sharp n}(v)$.*

Proof. Abstract nonsense. □

Proposition 3.1.1.17. *We have the following properties.*

(a) For any integer n, the inclusion functor $For_{\sharp n}\colon \mathscr{C}_{\sharp n} \to \mathscr{C}_\sharp$ has a right adjoint functor which we will denote by $P^{\sharp n}\colon \mathscr{C}_\sharp \to \mathscr{C}_{\sharp n}$. Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ be an object of $\mathscr{C}_\sharp$. Then $Z^\sharp$ is also the source of $P^{\sharp n}(u)$.

(b) Moreover, let $U^\sharp$ be an open of $X^\sharp$ containing $Z^\sharp$ such that the induced immersion $v\colon Z^\sharp \hookrightarrow U^\sharp$ is closed. Denoting abusively by $P^{\sharp n}(u)$ the target of the arrow $P^{\sharp n}(u)$, the underlying morphism of schemes of $P^{\sharp n}(u) \to U^\sharp$ is affine. We denote by $\mathcal{P}^n(u)$ the quasi-coherent $\mathcal{O}_U$-algebra so that $P^n(u) = \mathrm{Spec}(\mathcal{P}^n(u))$ where $P^n(u)$ is the underline scheme of $P^{\sharp n}(u)$. The sheaf $\mathcal{P}^n(u)$ has his support in Z and we also denote by $\mathcal{P}^n(u)$ the sheaf $v^{-1}\mathcal{P}^n(u)$ which is independent on the choice of U.

(c) If X is noetherian, then so is $P^n(u)$.

Proof. Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ be an $S^\sharp$-immersion of fine log-schemes. If u is an open immersion, then $P^{\sharp n}(u)$ is the identity of $Z^\sharp$. Similarly, we reduce to the case where u is a closed immersion.

Using 3.1.1.15, the existence of $P^{\sharp n}(u)$ (and then the whole proposition) is étale local on $X^\sharp$ (i.e. following our convention, this is local for the Zariski topology and we can proceed by descent of a finite covering with étale quasi-compact morphisms). Hence, by 3.1.1.14, we may thus assume that there exists a commutative diagram of the form

$$\begin{array}{ccc} \widetilde{X}^\sharp & \xrightarrow{f} & X^\sharp \\ & \nwarrow^{\widetilde{u}} & \uparrow{\scriptstyle u} \\ & & Z^\sharp \end{array}$$

such that f is log étale, $\underline{f}$ is affine and $\widetilde{u}$ is an exact closed $S^\sharp$-immersion. Let $\mathcal{I}$ be the ideal given by $\widetilde{u}$. Let $P^{\sharp n} \hookrightarrow \widetilde{X}^\sharp$ be the exact closed immersion which is induced by $\mathcal{I}^{n+1}$. Using 3.1.1.16, we can check that $P^{\sharp n}(u)$ is the exact closed immersion $Z^\sharp \hookrightarrow P^{\sharp n}$. When X is noetherian, then so are $\widetilde{X}^\sharp$ and P^n. □

Lemma 3.1.1.18. *Let $u \to v$ be a morphism of $\mathscr{C}_\sharp$. Let $w := P^{\sharp n}(v) \times_v u$ (this is the product in $\mathscr{C}_\sharp$). Then $P^{\sharp n}(w)$ and $P^{\sharp n}(u)$ are isomorphic in $\mathscr{C}_{\sharp n}$.*

Proof. We can easily check that the composition $P^{\sharp n}(w) \to w \to u$ satisfies the universal property of $P^{\sharp n}(u) \to u$. Hence, we are done. □

Notation 3.1.1.19. Let P be a monoid. We denote by $A_P := (\mathrm{Spec}(\mathbb{Z}[P]), M_P)$ the log formal scheme whose underlying scheme is $\mathrm{Spec}(\mathbb{Z}[P])$ and whose log structure is the log structure associated with the pre-log structure induced canonically by $P \to \mathbb{Z}[P]$.

Definition 3.1.1.20. Let $f : X^\sharp \to Y^\sharp$ be a morphism of fine $S^\sharp$-log schemes.

(a) We say that a finite set $u_1, \ldots, u_d$ of elements of $\Gamma(X, M_{X^\sharp})$ are "formal logarithmic coordinates of f" if the corresponding $Y^\sharp$-morphism $X^\sharp \to Y^\sharp \times_{\mathrm{Spec}\,\mathbb{Z}} A_{\mathbb{N}^d}$ is formally log étale (see notation 3.1.1.19).

(b) We say that a finite set $u_1, \ldots, u_d$ of elements of $\Gamma(X, M_{X^\sharp})$ are "logarithmic coordinates of f" if the corresponding $Y^\sharp$-morphism $X^\sharp \to Y^\sharp \times_{\mathrm{Spec}\,\mathbb{Z}} A_{\mathbb{N}^d}$ is log étale (see notation 3.1.1.19).

(c) We say that f is "weakly log smooth" if, étale locally on $X^\sharp$, f has formal logarithmic coordinates. Notice that this notion of weak log smoothness is étale local on Y.

Recall that f is "log smooth" if, étale locally on $X^\sharp$, f has logarithmic coordinates. Notice that this notion of weak log smoothness is étale local on $Y^\sharp$.

Definition 3.1.1.21. Let $f : X^\sharp \to Y^\sharp$ be a *strict* morphism of fine $S^\sharp$-log schemes.

(a) We say that a finite set $t_1, \ldots, t_d$ of elements of $\Gamma(X, \mathcal{O}_X)$ are "formal coordinates of f" if the corresponding $Y^\sharp$-morphism $X^\sharp \to Y^\sharp \times_{\mathrm{Spec}\,\mathbb{Z}} A_{\mathbb{N}^d}$ is (formally) log étale.

(b) We say that a finite set $t_1, \ldots, t_d$ of elements of $\Gamma(X, \mathcal{O}_X)$ are "coordinates of f" if the corresponding $Y^\sharp$-morphism $X^\sharp \to Y^\sharp \times_{\mathrm{Spec}\,\mathbb{Z}} A_{\mathbb{N}^d}$ is (log) étale.

(c) We say that f is "weakly smooth" if f is weakly log smooth morphism.

Remark, this is compatible with Definition 1.1.1.4.

Remark 3.1.1.22. To simplify the terminology here, the definitions 3.1.1.20 and 3.1.1.21 are different from that of [CV17] where we had distinguished in the terminology both cases where the morphism $X^\sharp \to Y^\sharp \times_{\mathrm{Spec}\,\mathbb{Z}} A_{\mathbb{N}^d}$ is strict or not (what is called log coordinates was called log basis).

Notation 3.1.1.23. Let $P^\sharp = (P, M_{P^\sharp})$ be a log scheme. We denote by $\alpha_P : (M_{P^\sharp}, \cdot) \to (\mathcal{O}_P, \times)$ or simply α the underlying monoid morphism and we can identity $M^*_{P^\sharp}$ and $\mathcal{O}^*_P$ via α.

Lemma 3.1.1.24. *Let $i : X^\sharp \hookrightarrow P^\sharp$ be an exact closed $S^\sharp$-immersion of fine log schemes.*

(a) We have the equality $\ker(i^{-1}\mathcal{O}^*_P \to \mathcal{O}^*_X) = \ker(i^{-1}M^{\mathrm{gr}}_{P^\sharp} \to M^{\mathrm{gr}}_{X^\sharp})$. In particular, $\ker(\mathcal{O}^*_{P,\overline{x}} \to \mathcal{O}^*_{X,\overline{x}}) = \ker(M^{\mathrm{gr}}_{P^\sharp,\overline{x}} \to M^{\mathrm{gr}}_{X^\sharp,\overline{x}})$ for any geometric point $\overline{x}$ of $X^\sharp$.

(b) When the ideal $\mathcal{I}$ of $\mathcal{O}_P$ given by i is moreover an nil ideal then $\ker(i^{-1}M^{\mathrm{gr}}_{P^\sharp} \to M^{\mathrm{gr}}_{X^\sharp}) = 1 + i^{-1}\mathcal{I}$.

Proof. The last statement is [Ogu18, IV.2.1.2]. Let us now check (a). Let $\overline{x}$ be a geometric point of $X^\sharp$. Since i is an exact closed immersion, we have $(M_{P^\sharp}/\mathcal{O}_P^*)_{\overline{x}} = (M_{X^\sharp}/\mathcal{O}_X^*)_{\overline{x}}$ (use [Kat89, 1.4.1]) and thus $(M_{P^\sharp}^{\mathrm{gp}}/\mathcal{O}_P^*)_{\overline{x}} = (M_{X^\sharp}^{\mathrm{gp}}/\mathcal{O}_X^*)_{\overline{x}}$ (because the functor $M \mapsto M^{\mathrm{gr}}$ commutes with inductive limits). Hence, the inclusion $\ker(\mathcal{O}_{P,\overline{x}}^* \to \mathcal{O}_{X,\overline{x}}^*) \subset \ker(M_{P^\sharp,\overline{x}}^{\mathrm{gr}} \to M_{X^\sharp,\overline{x}}^{\mathrm{gr}})$ is in fact an equality. Since we have the canonical inclusion $\ker(i^{-1}\mathcal{O}_P^* \to \mathcal{O}_X^*) \subset \ker(i^{-1}M_{P^\sharp}^{\mathrm{gr}} \to M_{X^\sharp}^{\mathrm{gr}})$, this yields that this latter inclusion is an equality. □

Proposition 3.1.1.25. *Let $f\colon X^\sharp \to Y^\sharp$ be an $S^\sharp$-morphism of fine log-schemes endowed with formal logarithmic coordinates $(b_\lambda)_{\lambda=1,\dots,r}$ (see definition 3.1.1.20). Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ and $v\colon Z^\sharp \hookrightarrow Y^\sharp$ be two $S^\sharp$-immersions of fine log schemes such that $v = f \circ u$. Suppose given $y_\lambda \in \Gamma(Y, M_{Y^\sharp})$ whose images in $\Gamma(Z, M_{Z^\sharp})$ coincide with the images of b_λ. Let $Z^\sharp \hookrightarrow D'_n$ and $Z^\sharp \hookrightarrow D_n$ be the nth infinitesimal neighborhood of order n of u and v respectively (see Definition 3.1.1.10.c and recall following Proposition 3.1.1.17, the source is indeed $Z^\sharp$). Let $\alpha\colon D'_n \to X^\sharp$ be the canonical morphism. Using multiplicative notation, put $u_\lambda := \frac{\alpha^*(b_\lambda)}{\alpha^*(f^*(y_\lambda))} \in \ker(\Gamma(D'_n, M^{\mathrm{gr}}_{D'_n}) \to \Gamma(Z, M^{\mathrm{gr}}_{Z^\sharp})) = \ker(\Gamma(D'_n, \mathcal{O}^*_{D'_n}) \to \Gamma(Z, \mathcal{O}^*_Z))$ (see 3.1.1.24). We set $\mathcal{O}_{D_n}[T_1,\dots,T_r]_n := \mathcal{O}_{D_n}[T_1,\dots,T_r]/\left(I_{D_n} + (T_1,\dots,T_r)\right)^{n+1}$, where I_{D_n} is the ideal defined by the closed immersion $Z^\sharp \hookrightarrow D_n$. Then, we have the isomorphism of $\mathcal{O}_{D_n}$-algebras*

$$\begin{aligned} \mathcal{O}_{D_n}[T_1,\dots,T_r]_n &\xrightarrow{\sim} \mathcal{O}_{D'_n} \\ T_\lambda &\mapsto u_\lambda - 1. \end{aligned} \tag{3.1.1.25.1}$$

Proof. By using Lemma 3.1.1.16, we reduce to the case where $X^\sharp = Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{N}^r}$, $f\colon X^\sharp \to Y^\sharp$ is the first projection, and that the family $(b_\lambda)_{\lambda=1,\dots,r}$ of elements of $\Gamma(X, M_{X^\sharp})$ is given by the canonical basis $(e_\lambda)_{\lambda=1\dots r}$ of $\mathbb{N}^r$. Using lemma 3.1.1.18, we may furthermore assume that $Y^\sharp = S^\sharp$, $Z^\sharp \hookrightarrow Y^\sharp$ is an exact closed immersion of order n. In particular, we get $D_n = Y^\sharp$.

Let $i\colon Y^\sharp \to Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{Z}^r}$ be the exact closed $Y^\sharp$-immersion defined by $e_\lambda \mapsto 1 \in \Gamma(Y, M_{Y^\sharp})$. By copying the parts 1), 2) and 3) of the proof of 3.2.1.17 (we replace the use of Lemma 3.2.1.7 by the use of Lemma 3.1.1.16), we reduce to the case where $u = i \circ v$, $X^\sharp = Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{Z}^r}$, $(b_\lambda)_{\lambda=1,\dots,r}$ are the elements of $\Gamma(X, M_{X^\sharp})$ corresponding to the canonical basis of $\mathbb{Z}^r$, and $(y_\lambda)_{\lambda=1,\dots,r}$ are equal to 1. This case is obvious.

□

Remark 3.1.1.26. Suppose we are in the situation of 3.2.1.17: let $f\colon X^\sharp \to Y^\sharp$ be an $S^\sharp$-morphism of fine log-schemes, $(b_\lambda)_{\lambda=1,\dots,r}$ be some elements of $\Gamma(X, M_{X^\sharp})$. Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ and $v\colon Z^\sharp \hookrightarrow Y^\sharp$ be two $S^\sharp$-immersions of fine log schemes such that $v = f \circ u$. Then, since $v^* M_{Y^\sharp} \to M_{Z^\sharp}$ is surjective (for the étale topology), then étale locally on $Y^\sharp$, there exist $y_\lambda \in \Gamma(Y, M_{Y^\sharp})$ whose images in $\Gamma(Z, M_{Z^\sharp})$ coincide with the images of b_λ.

3.1.2 Sheaf of principal parts relative to a weakly log smooth morphism

Let i be an integer and $S^\sharp$ be a fine log scheme over the scheme $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$. Let $f\colon X^\sharp \to S^\sharp$ be a weakly log smooth morphism of fine log-schemes. We write $X^\sharp = (X, M_{X^\sharp})$.

Notation 3.1.2.1. Let $\Delta_{X^\sharp/S^\sharp}(r)\colon X^\sharp \hookrightarrow X^{\sharp r+1}_{/S^\sharp}$ denote the diagonal immersion. With notation 3.1.1.17, we set

$$\Delta^n_{X^\sharp/S^\sharp}(r) := P^{\sharp n}(\Delta_{X^\sharp/S^\sharp}(r)).$$

Recall the source of $\Delta^n_{X^\sharp/S^\sharp}$ is $X^\sharp$. For any $n' \geq n$, we denote by

$$\psi^{n',n}_{X^\sharp/S^\sharp}(r)\colon \Delta^n_{X^\sharp/S^\sharp}(r) \hookrightarrow \Delta^{n'}_{X^\sharp/S^\sharp}(r) \tag{3.1.2.1.1}$$

the canonical exact closed immersion. Moreover, we can denote abusively the underlying scheme of the target of $\Delta^n_{X^\sharp/S^\sharp}$ by $\Delta^n_{X^\sharp/S^\sharp}$.

Let us write $\mathcal{P}^n_{X^\sharp/S^\sharp}(r) := \mathcal{P}^n(\Delta_{X^\sharp/S^\sharp}(r))$ (see Notation 3.1.1.17). By default $\mathcal{P}^n_{X^\sharp/S^\sharp}(r)$ is viewed as a sheaf of rings on X: let $U^\sharp$ be an open of $X^{\sharp r+1}_{/S^\sharp}$ containing the image of $\Delta_{X^\sharp/S^\sharp}(r)$ such that the immersion $v\colon X^\sharp \to U^\sharp$ induced by $\Delta^n_{X^\sharp/S^\sharp}(r)$ is closed. Recall, by definition, $\mathcal{P}^n_{X^\sharp/S^\sharp}(r)$ is a sheaf on X

such that $v_*\mathcal{P}^n_{X^\sharp/S^\sharp}(r)$ is a quasi-coherent $\mathcal{O}_U$-algebra and $\mathrm{Spec}(v_*\mathcal{P}^n_{X^\sharp/S^\sharp}(r)) = \Delta^n_{X^\sharp/S^\sharp}(r)$ (see Notation 3.1.1.17).

For $i = 0, \ldots, r$, let $p_i \colon X^{\sharp r+1}_{/S^\sharp} \to X^\sharp$ be the projections. Let $p_i^{U^\sharp} \colon U^\sharp \hookrightarrow X^{\sharp r+1}_{/S^\sharp} \to X^\sharp$ be the morphism induced by the projection p_i. Since $p_i^{U^\sharp} \circ v = \mathrm{id}$ then $\mathcal{P}^n_{X^\sharp/S^\sharp}(r) = p^{U^\sharp}_{i*}(v_*\mathcal{P}^n_{X^\sharp/S^\sharp}(r))$. Since $v_*\mathcal{P}^n_{X^\sharp/S^\sharp}(r)$ is endowed with a structure of quasi-coherent $\mathcal{O}_U$-algebra, we get $r+1$-structures of quasi-coherent $\mathcal{O}_{X^\sharp}$-algebras on $\mathcal{P}^n_{X^\sharp/S^\sharp}(r)$.

To clarify which $\mathcal{O}_{X^\sharp}$-algebra structure we consider, we set $p_{i*}\mathcal{P}^n_{X^\sharp/S^\sharp}(r) := p^{U^\sharp}_{i*}\mathcal{P}^n(\mathcal{I}(r))$. By composing $p_i^{U^\sharp}$ with the canonical morphism $\Delta^n_{X^\sharp/S^\sharp}(r) \to U^\sharp$, we get the projection $p_i^n \colon \Delta^n_{X^\sharp/S^\sharp}(r) \to X^\sharp$. This yields the ring homomorphisms $p_i^n(r) \colon \mathcal{O}_{X^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp}(r)$ and the monoid homomorphisms $p_i^n(r) \colon M_{X^\sharp} \to M_{\Delta^n_{X^\sharp/S^\sharp}(r)}$.

When $r = 1$, we simply write $\mathcal{I}$, $\Delta^n_{X^\sharp/S^\sharp}$, $\Delta_{X^\sharp/S^\sharp}$, $\mathcal{P}^n_{X^\sharp/S^\sharp}$, $\mathcal{P}_{X^\sharp/S^\sharp}$, p_i^n. The left (resp. right) structure of $\mathcal{O}_{X^\sharp}$-algebra on $\mathcal{P}^n_{X^\sharp/S^\sharp}$ is by definition the one given by $p_{0*}\mathcal{P}^n_{X^\sharp/S^\sharp}$ (resp. $p_{1*}\mathcal{P}^n_{X^\sharp/S^\sharp}$).

We denote by $M^n_{X^\sharp/S^\sharp}$ the log structure of $\Delta^n_{X^\sharp/S^\sharp}$. If $a \in M_{X^\sharp}$, we denote by $\mu^n(a)$ the unique section (see 3.1.1.24) of $\ker(\mathcal{P}^{n*}_{X^\sharp/S^\sharp} \to \mathcal{O}^*_X)$ such that we get in $M^n_{X^\sharp/S^\sharp}$ the equality

$$p_1^n(a) = p_0^n(a)\mu^n(a). \tag{3.1.2.1.2}$$

We get the monoid morphism $\mu^n \colon M_{X^\sharp} \to \ker(\mathcal{P}^{n*}_{X^\sharp/S^\sharp} \to \mathcal{O}^*_X)$ given by $a \mapsto \mu^n(a)$.

Lemma 3.1.2.2. *The morphisms p_1^n and p_0^n are strict.*

Proof. Let $\iota^n \colon X^\sharp \hookrightarrow \Delta^n_{X^\sharp/S^\sharp}$ be the structural morphism. Since $\iota^{-1} = \mathrm{id}$, then from [Kat89, 1.4.1] we get the isomorphisms $p_i^{n*}(M_{X^\sharp})/\mathcal{P}^{n*}_{X^\sharp/S^\sharp} \xrightarrow{\sim} M_{X^\sharp}/\mathcal{O}^*_X$ and $M^n_{X^\sharp/S^\sharp}/\mathcal{P}^{n*}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \iota^{n*}(M^n_{X^\sharp/S^\sharp})/\mathcal{O}^*_X \xrightarrow{\sim} M_{X^\sharp}/\mathcal{O}^*_X$ (the last isomorphism is a consequence of the exactness of ι^n). Hence, $p_i^{n*}(M_{X^\sharp})/\mathcal{P}^{n*}_{X^\sharp/S^\sharp} \xrightarrow{\sim} M^n_{X^\sharp/S^\sharp}/\mathcal{P}^{n*}_{X^\sharp/S^\sharp}$. This implies that the canonical morphism $p_i^{n*}(M_{X^\sharp}) \to M^n_{X^\sharp/S^\sharp}$ is an isomorphism. □

Proposition 3.1.2.3 (Local description of $\mathcal{P}^n_{X^\sharp/S^\sharp}$)**.** *Let $(u_\lambda)_{\lambda=1,\ldots,r}$ be logarithmic coordinates of f. Put $\tau_{\sharp\lambda,n} := \mu^n(u_\lambda) - 1$. We have the following isomorphism of $\mathcal{O}_X$-algebras:*

$$\begin{aligned} \mathcal{O}_X[T_1, \ldots, T_r]_n &\xrightarrow{\sim} \mathcal{P}^n_{X^\sharp/S^\sharp} \\ T_\lambda &\mapsto \tau_{\sharp\lambda,n}, \end{aligned} \tag{3.1.2.3.1}$$

where the structure of $\mathcal{O}_X$-module of $\mathcal{P}^n_{X^\sharp/S^\sharp}$ is given by p_1^n or p_0^n.

Proof. Since the case of p_1^n is checked symmetrically, let us compute the case where the $\mathcal{O}_X$-module of $\mathcal{P}^n_{X^\sharp/S^\sharp}$ is given by p_0^n. Consider the commutative diagram

$$\begin{array}{ccccc} A_{\mathbb{N}^r} & \xleftarrow{p_1} & X^\sharp \times_{S^\sharp} A_{\mathbb{N}^r} & & \\ \uparrow u & \Box & \uparrow u\times\mathrm{id} & \searrow q & \\ X^\sharp & \xleftarrow{p_1} & X^\sharp \times_{S^\sharp} X^\sharp & \xrightarrow{p_0} & X^\sharp, \end{array} \tag{3.1.2.3.2}$$

where p_0, p_1 means respectively the left and right projection, where q is the projection, where u is the $S^\sharp$-morphism induced by $u_1, \ldots, u_r$, where $u \times \mathrm{id}$ is the $X^\sharp$-morphism induced by $p_1^*(u_1), \ldots, p_1^*(u_r)$. Since $(p_1^*(u_\lambda))_{\lambda=1,\ldots,r}$ are logarithmic coordinates of p_0 (because the square of the diagram 3.1.2.3.2 is cartesian), we can apply Proposition 3.1.1.25 in the case where f is p_0, u is $\Delta_{X^\sharp/S^\sharp}$, b_λ is $p_1^*(u_\lambda)$, and y_λ is u_λ. □

Remark 3.1.2.4. From the local description of 3.1.2.3, we get that the morphisms p_1^n and p_0^n are finite (i.e. the underlying morphism of schemes is finite).

3.1.3 Sheaf of relative logarithmic differentials

We keep notation 3.1.2.

Definition 3.1.3.1. Let $Y^\sharp \to T^\sharp$ be a morphism of log schemes.

(a) A log derivation of $Y^\sharp/T^\sharp$ with values in a sheaf of $\mathcal{O}_Y$-modules $\mathcal{E}$ is a pair (d, δ), where $d\colon \mathcal{O}_Y \to \mathcal{E}$ is a homomorphism of abelian sheaves and $\delta\colon M_{Y^\sharp} \to \mathcal{E}$ is a homomorphism of sheaves of monoids such that the following conditions holds:

   (i) $d(\alpha_{Y^\sharp}(m)) = \alpha_{Y^\sharp}(m)\delta(m)$ for every local section m of $M_{Y^\sharp}$;

   (ii) $\delta(f^\flat(n)) = 0$ for every local section n of $f^{-1}(M_{T^\sharp})$;

   (iii) $d(ab) = ad(b) + bd(a)$ for every pari of local sections a, b of $\mathcal{O}_Y$;

   (iv) $d(f^\sharp(c)) = 0$ for every local section c of $f^{-1}(\mathcal{O}_T)$.

   We denote by $\mathrm{Der}_{Y^\sharp/T^\sharp}(\mathcal{E})$ the set of all such derivations.

(b) We denote by $(d_{Y^\sharp/T^\sharp}, d\log_{Y^\sharp/T^\sharp})\colon \mathcal{O}_Y \to \Omega^1_{Y^\sharp/T^\sharp}$ the log derivation which is a universal object representing the functor $\mathcal{E} \mapsto \mathrm{Der}_{Y^\sharp/T^\sharp}(\mathcal{E})$ from the category of $\mathcal{O}_Y$-modules (see [Ogu18, Theorem IV.1.2.4]). We can also simply write $(d, d\log)$. The map $(d_{Y^\sharp/T^\sharp}, d\log_{Y^\sharp/T^\sharp})$ is called the constant logarithmic derivation relative to $Y^\sharp/T^\sharp$ and $\Omega^1_{Y^\sharp/T^\sharp}$ is called the "sheaf of relative logarithmic differentials relative to $Y^\sharp/T^\sharp$".

3.1.3.2. We have the following proprieties making some links between the sheaf of relative differentials and the sheaf of principal parts of order ≤ 1 of $X^\sharp/S^\sharp$.

(a) We denote by $\mathcal{I}^1_{X^\sharp/S^\sharp}$ the ideal of the closed immersion $\Delta^1_{X^\sharp/S^\sharp}$. Then, following [Ogu18, IV.3.4.5], we have $\Omega^1_{X^\sharp/S^\sharp} = (\Delta^1_{X^\sharp/S^\sharp})^{-1}(\mathcal{I}^1_{X^\sharp/S^\sharp})$. In other words, $\Omega^1_{X^\sharp/S^\sharp}$ is the kernel of the canonical morphism $\psi^{1,0}_{X^\sharp/S^\sharp}\colon \mathcal{P}^1_{X^\sharp/S^\sharp} \to \mathcal{P}^0_{X^\sharp/S^\sharp} = \mathcal{O}_X$. Since $\Omega^1_{X^\sharp/S^\sharp}$ is an ideal of $\mathcal{P}^1_{X/S}$ of order 2 then the left and right structure of $\mathcal{O}_X$-module of $\Omega^1_{X^\sharp/S^\sharp}$ (recall $\psi^{1,0}_{X^\sharp/S^\sharp}$ is $\mathcal{O}_X$-linear for both structures) are in fact identical.

(b) We have the exact sequence of $\mathcal{O}_X$-modules

$$0 \to \Omega^1_{X^\sharp/S^\sharp} \xrightarrow{j} p_{0*}\mathcal{P}^1_{X^\sharp/S^\sharp} \xrightarrow{\psi^{1,0}_{X^\sharp/S^\sharp}} \mathcal{O}_X \to 0, \tag{3.1.3.2.1}$$

where j is the canonical inclusion (recall p_{0*} means that $\mathcal{P}^1_{X^\sharp/S^\sharp}$ is considered as an $\mathcal{O}_X$-algebra for its left structure). The exact sequence 3.1.3.2.1 splits via the section $p^1_0\colon \mathcal{O}_X \to p_{0*}\mathcal{P}^1_{X^\sharp/S^\sharp}$, which yields the isomorphism of $\mathcal{O}_X$-modules

$$(p^1_0, j)\colon \mathcal{O}_X \oplus \Omega^1_{X^\sharp/S^\sharp} \xrightarrow{\sim} p_{0*}\mathcal{P}^1_{X^\sharp/S^\sharp}. \tag{3.1.3.2.2}$$

In particular, since $p_{0*}\mathcal{P}^1_{X^\sharp/S^\sharp}$ is a locally free $\mathcal{O}_X$-module, then so is $\Omega^1_{X^\sharp/S^\sharp}$.

(c) Via the isomorphism 3.1.3.2.2, we get the $\mathcal{O}_X$-linear epimorphism

$$\varpi_{X^\sharp/S^\sharp}\colon p_{0*}\mathcal{P}^1_{X^\sharp/S^\sharp} \twoheadrightarrow \Omega^1_{X^\sharp/S^\sharp} \tag{3.1.3.2.3}$$

which is a left inverse of the inclusion $\Omega^1_{X^\sharp/S^\sharp} \subset p_{0*}\mathcal{P}^1_{X^\sharp/S^\sharp}$. We compute $\varpi_{X^\sharp/S^\sharp} = \mathrm{id} - p^1_0 \circ \psi^{1,0}_{X^\sharp/S^\sharp}$.

(d) We have the exact sequence of $\mathcal{O}_X$-modules

$$0 \to \Omega^1_{X^\sharp/S^\sharp} \xrightarrow{j} p_{1*}\mathcal{P}^1_{X^\sharp/S^\sharp} \xrightarrow{\psi^{1,0}_{X^\sharp/S^\sharp}} \mathcal{O}_X \to 0, \tag{3.1.3.2.4}$$

The exact sequence 3.1.3.2.4 splits via the section $p^1_1\colon \mathcal{O}_X \to p_{1*}\mathcal{P}^1_{X^\sharp/S^\sharp}$, which yields the isomorphism of $\mathcal{O}_X$-modules

$$(p^1_1, j)\colon \mathcal{O}_X \oplus \Omega^1_{X^\sharp/S^\sharp} \xrightarrow{\sim} p_{1*}\mathcal{P}^1_{X^\sharp/S^\sharp}. \tag{3.1.3.2.5}$$

Definition 3.1.3.3. We can extend the definition 1.1.3.2 as follows: Let $\mathcal{E}, \mathcal{F}$ be two $\mathcal{O}_X$-modules, $n \geq 0$ be an integer. We say that a $f^{-1}\mathcal{O}_S$-linear homomorphism $D\colon \mathcal{E} \to \mathcal{F}$ is a "differential operator of order $\leq n$ (relatively to $X^\sharp/S^\sharp$)" if there exists a homomorphism of $\mathcal{O}_X$-modules $u\colon p^n_{0*}(\mathcal{P}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}) \to \mathcal{F}$ such that $D = u \circ p^n_{1,\mathcal{E}}$ (see notation 3.2.2.13). Beware that this is not clear that such a u is unique (hence one might prefer to call such a u as a differential operator of order $\leq n$ relatively to $X^\sharp/S^\sharp$). However, when $\mathcal{F}$ is a locally free $\mathcal{O}_X$-module, then by using 3.1.1.3 to check the unicity, we can reduce to the case where the log structures are trivial, which has already been checked.

3.1.3.4. We have the following description of $(d_{X^\sharp/S^\sharp}, d\log_{X^\sharp/S^\sharp})$.

(a) The map $d_{X^\sharp/S^\sharp}\colon \mathcal{O}_X \to \Omega^1_{X^\sharp/S^\sharp}$ is given by $a \mapsto p^1_1(a) - p^1_0(a)$ for any local section a of $\mathcal{O}_X$. Indeed, let $v\colon X^\sharp \to X$ be the canonical morphism. Since the construction of $\Omega^1_{X^\sharp/S^\sharp}$, the sheaf of relative differentials of $X^\sharp/S^\sharp$ (see notation 3.1.3.2), is functorial then for any $i = 0, 1$, we have the commutative diagram:

$$\begin{array}{ccccc} X^\sharp & \hookrightarrow & \Delta^1_{X^\sharp/S^\sharp} & \xrightarrow{p^1_i} & X^\sharp \\ \downarrow{\scriptstyle v} & & \downarrow & & \downarrow{\scriptstyle v} \\ X & \hookrightarrow & \Delta^1_{X/S} & \xrightarrow{p^1_i} & X. \end{array} \tag{3.1.3.4.1}$$

By construction (see the proof of [Ogu18, IV.1.2.4]), the composition of the constant $\mathcal{O}_X$-derivation $d_{X/S}\colon \mathcal{O}_X \to \Omega^1_{X/S}$ (see 1.1.2.6) with the canonical map $\Omega^1_{X/S} \to \Omega^1_{X^\sharp/S^\sharp}$ is $d_{X^\sharp/S^\sharp}$. Hence, by using the commutativity of 3.1.3.4.1 we are done.

(b) Moreover, $d\log_{X^\sharp/S^\sharp}\colon M_{X^\sharp} \to \Omega^1_{X^\sharp/S^\sharp}$ is given by $u \mapsto \mu^1(u) - 1$ (see notation 3.1.2.1.2). Indeed, we compute

$$\alpha_{X^\sharp}(u)(\mu^1(u) - 1) = p^1_0(u)(\mu^1(u) - 1) = p^1_1(u) - p^1_0(u) = p^1_1(\alpha_{X^\sharp}(u)) - p^1_0(\alpha_{X^\sharp}(u)) = d_{X^\sharp/S^\sharp}(\alpha_{X^\sharp}(u)).$$

Since $\alpha_{X^\sharp}(u) d\log_{X^\sharp/S^\sharp} = d_{X^\sharp/S^\sharp}(\alpha_{X^\sharp}(u))$ (see 3.1.3.1.ai), then $\alpha_{X^\sharp}(u)(\mu^1(u)-1) = \alpha_{X^\sharp}(u) d\log_{X^\sharp/S^\sharp}$. Since $\Omega^1_{X^\sharp/S^\sharp}$ is locally free, then we conclude by using 3.1.1.3.

(c) The composition of $\varpi_{X^\sharp/S^\sharp}$ with $p^1_1\colon \mathcal{O}_X \to \mathcal{P}^1_{X^\sharp/S^\sharp}$ is the constant $\mathcal{O}_S$-derivation $d_{X^\sharp/S^\sharp}$. (Indeed, since $\psi^{1,0}_{X^\sharp/S^\sharp} \circ p^1_1 = \mathrm{id}$, then $\varpi_{X^\sharp/S^\sharp} \circ p^1_1 = p^1_1 - p^1_0 = d_{X^\sharp/S^\sharp}$.) Since $\varpi_{X^\sharp/S^\sharp}$ is $\mathcal{O}_X$-linear, this means that $d_{X^\sharp/S^\sharp}$ (or $\varpi_{X^\sharp/S^\sharp}$) is a differential operator of order ≤ 1 relatively to $X^\sharp/S^\sharp$ (see Definition 3.1.3.3).

3.1.3.5 (Local computation)**.** Suppose $X^\sharp/S^\sharp$ has logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,d}$. Let $\tau_{\sharp\lambda,1} := \mu^1(u_\lambda) - 1$ in $\mathcal{P}^1_{X^\sharp/S^\sharp}$ for $\lambda = 1, \dots, d$. It follows from 3.1.3.4.b that $\tau_{\sharp\lambda,1} = d\log\, u_\lambda$. Moreover, following 3.1.2.3, $\mathcal{P}^1_{X^\sharp/S^\sharp}$ is $\mathcal{O}_X$-free with the basis $1, \tau_{\sharp 1,1}, \dots, \tau_{\sharp d,1}$. Since $\psi^{1,0}_{X^\sharp/S^\sharp}(\tau_{\sharp\lambda,1}) = 0$ and $\psi^{1,0}_{X^\sharp/S^\sharp}(1) = 1$, then $\Omega^1_{X^\sharp/S^\sharp}$ is $\mathcal{O}_X$-free with the basis $\tau_{\sharp 1,1}, \dots, \tau_{\sharp d,1}$, i.e. $d\log\, u_1, \dots, d\log\, u_d$. Moreover, $\varpi_{X^\sharp/S^\sharp}(1) = 0$ (and $\ker \varpi_{X^\sharp/S^\sharp} = \mathcal{O}_X$) and $\varpi_{X^\sharp/S^\sharp}(\tau_{\sharp,\lambda,1}) = \tau_{\sharp\lambda,1}$.

We complete this subsection by checking that our notion of fine formally log unramified is the same than that of formally log unramified appearing in the literature.

Proposition 3.1.3.6. *Let $f\colon X^\sharp \to Y^\sharp$ be an $S^\sharp$-morphism of fine log schemes and $\Delta_{X^\sharp/Y^\sharp}\colon X^\sharp \hookrightarrow X^\sharp \times_{Y^\sharp} X^\sharp$ (as always the product is taken in the category of fine log schemes) be the diagonal $S^\sharp$-immersion. The following assertions are equivalent:*

(a) the morphism $P^{\sharp 1}(\Delta_{X^\sharp/Y^\sharp})$ is an isomorphism ;

(b) the morphism f is fine formally log unramified ;

(c) the morphism f is formally log unramified (this notion is defined at [Ogu18, IV.3.1.1]).

Proof. Following [Ogu18, IV.3.1.3], the first and the last assertions are equivalent. Moreover, by definition, if f is formally log unramified then f is fine formally log unramified. It follows from 3.1.3.2.a that the property $\Omega_{X^\sharp/Y^\sharp} = 0$ is equivalent to saying that $P^{\sharp 1}(\Delta_{X^\sharp/Y^\sharp})$ is an isomorphism. Copying the proof of "if f is formally log unramified then $\Omega_{X^\sharp/Y^\sharp} = 0$" of [Ogu18, IV.3.1.3] we can check in the same way that if f is fine formally log unramified then $\Omega_{X^\sharp/Y^\sharp} = 0$ (indeed, since $X^\sharp$ fine, then the log scheme $T := X^\sharp \oplus \Omega_{X^\sharp/Y^\sharp}$ is fine because its log structure is $M_{X^\sharp} \oplus \Omega_{X^\sharp/Y^\sharp}$: see [Ogu18, IV.2.1.5]). □

3.1.4 Sheaf of differential operators relative to weakly log smooth schemes

We keep notation 3.1.2.

3.1.4.1. The exact closed immersions $\Delta^n_{X^\sharp/S^\sharp}$ and $\Delta^{n'}_{X^\sharp/S^\sharp}$ induce $\Delta^{n,n'}_{X^\sharp/S^\sharp} := (\Delta^n_{X^\sharp/S^\sharp}, \Delta^{n'}_{X^\sharp/S^\sharp}) \colon X^\sharp \hookrightarrow \Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp}$. Since the morphisms p^n_1 and p^n_0 are strict (see 3.1.2.2), then $\Delta^{n,n'}_{X^\sharp/S^\sharp}$ is also an exact closed immersion. We get $\Delta^{n,n'}_{X^\sharp/S^\sharp} \in \mathscr{C}_{\sharp n+n'}$. Using the universal property of the $n+n'$ infinitesimal neighborhood of $\Delta_{X^\sharp/S^\sharp}$, we get a unique morphism $p^{n,n'}_{02} \colon \Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} \to \Delta^{n+n'}_{X^\sharp/S^\sharp}$ of $\mathscr{C}_{\sharp n+n'}$ inducing the commutative diagram

$$\begin{array}{ccccc} X^\sharp & \hookrightarrow & \Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} & \longrightarrow & X^\sharp \times_{S^\sharp} X^\sharp \times_{S^\sharp} X^\sharp \\ \| & & \downarrow{\scriptstyle p^{n,n'}_{02}} & & \downarrow{\scriptstyle p_{02}} \\ X^\sharp & \hookrightarrow & \Delta^{n+n'}_{X^\sharp/S^\sharp} & \longrightarrow & X^\sharp \times_{S^\sharp} X^\sharp. \end{array} \tag{3.1.4.1.1}$$

We denote by $\delta^{n,n'} \colon \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp}$ the ring homomorphism induced by $p^{n,n'}_{02}$. By composing the canonical morphism $\Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} \to X^\sharp \times_{S^\sharp} X^\sharp \times_{S^\sharp} X^\sharp$ with the three projections $p_i \colon X^\sharp \times_{S^\sharp} X^\sharp \times_{S^\sharp} X^\sharp \to X^\sharp$ for $i = 0, 1, 2$, we get three projections

$$p^{n,n'}_i \colon \Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} \to X^\sharp. \tag{3.1.4.1.2}$$

This yields three structures of locally free of finite type $\mathcal{O}_X$-algebra on $\mathcal{P}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp}$: the left one, the middle one (equal the structure given by the tensor product) and the right one. Since $p_0 \circ p_{02} = p_0$ and $p_1 \circ p_{02} = p_2$, then we remark that $\delta^{n,n'}$ is also a homomorphism of $\mathcal{O}_X$-algebra for respectively the left structure and for the right structure.

By replacing p_{02} by p_{01} (resp. p_{12}), we get a unique morphism $p^{n,n'}_{01}$ (resp. $p^{n,n'}_{12}$ of the form $\Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} \to \Delta^{n+n'}_{X^\sharp/S^\sharp}$ making commutative the diagram 3.2.2.14.1. We notice that $p^{n,n'}_{01}$ is the composition $\Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} \to \Delta^n_{X^\sharp/S^\sharp} \xrightarrow{\psi^{n+n',n}_{X^\sharp/S^\sharp}} \Delta^{n+n'}_{X^\sharp/S^\sharp}$, where the first morphism is given by the left projection. Similarly, $p^{n,n'}_{12}$ is the composition $\Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} \to \Delta^{n'}_{X^\sharp/S^\sharp} \to \Delta^{n+n'}_{X^\sharp/S^\sharp}$, where the first morphism is given by the right projection. We denote by $q^{n,n'}_0 \colon \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp}$ (resp. $q^{n,n'}_1 \colon \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp}$) the corresponding morphism (or simply $q^{n,n'}_0$ or q_0). The morphism $q^{n,n'}_0$ is equal to the composition $q^{n,n'}_0 \colon \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp}$ (the last morphism is $\tau \mapsto \tau \otimes 1$). Moreover, $q^{n,n'}_1$ is equal to the composition $q^{n,n'}_1 \colon \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} \to \mathcal{P}^{n'}_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp}$ (the last morphism is $\tau \mapsto 1 \otimes \tau$).

Lemma 3.1.4.2. *For any $a \in M_{X^\sharp}$, for any integers $n, n' \in \mathbb{N}$, we have $\delta^{n,n'}(\mu^{n+n'}(a)) = \mu^n(a) \otimes \mu^{n'}(a)$.*

Proof. Removing some (m), we copy word by word the proof of Lemma 3.2.2.17. □

Definition 3.1.4.3. The sheaf of differential operators of order $\leq n$ of f is defined by putting $\mathcal{D}_{X^\sharp/S^\sharp,n} := \mathcal{H}om_{\mathcal{O}_X}(p^n_{0*}\mathcal{P}^n_{X^\sharp/S^\sharp}, \mathcal{O}_X)$. For any $n' \geq n$, from the canonical epimorphisms $\psi^{n',n*}_{X^\sharp/S^\sharp} \colon \mathcal{P}^{n'}_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp}$ (see notation 3.1.2.1.1), we get the inclusion

$$\mathcal{D}_{X^\sharp/S^\sharp,n} \hookrightarrow \mathcal{D}_{X^\sharp/S^\sharp,n'}.$$

The sheaf of differential operators of f is defined by putting $\mathcal{D}_{X^\sharp/S^\sharp} := \cup_{n\in\mathbb{N}}\mathcal{D}_{X^\sharp/S^\sharp,n}$.

Let $P \in \mathcal{D}_{X^\sharp/S^\sharp,n}$, $P' \in \mathcal{D}_{X^\sharp/S^\sharp,n'}$. We define the product $PP' \in \mathcal{D}_{X^\sharp/S^\sharp,n+n'}$ to be the composition

$$PP' \colon \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} \xrightarrow{\delta^{n,n'}} \mathcal{P}^{n}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp} \xrightarrow{\mathrm{id}\otimes P'} \mathcal{P}^{n}_{X^\sharp/S^\sharp} \xrightarrow{P} \mathcal{O}_X. \tag{3.1.4.3.1}$$

Suppose f has the formal logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. Put $\tau_{\sharp\lambda} := \mu^n(u_\lambda)-1$. For any $\underline{k} \in \mathbb{N}^r$, set $\underline{\tau}_\sharp^{\underline{k}} := \prod_{i=1}^r \tau_{\sharp i}^{k_i}$. Following 3.1.2.3, the elements $\{\underline{\tau}_\sharp^{\underline{k}}\}_{|\underline{k}|\leq n}$ form a basis of $\mathcal{P}^n_{X^\sharp/S^\sharp}$. The corresponding dual basis of $\mathcal{D}_{X^\sharp/S^\sharp,n}$ will be denoted by $\{\underline{\partial}^{[\underline{k}]},\ |\underline{k}|\leq n\}$. Hence, $\mathcal{D}_{X^\sharp/S^\sharp}$ is a free $\mathcal{O}_X$-module (for both structures) with the basis $\{\underline{\partial}_\sharp^{[\underline{k}]},\ \underline{k}\in\mathbb{N}^r\}$.

Proposition 3.1.4.4. *The sheaf $\mathcal{D}_{X^\sharp/S^\sharp}$ is a sheaf of rings with the product as defined in 3.1.4.3.1.*

Proof. Using Lemma 3.1.4.2 (instead of Lemma 3.2.2.17), we can check the proposition 3.1.4.4 similarly to the proposition 3.2.3.3. □

3.1.4.5. We would like to endow the sheaf $\mathcal{O}_X$ with a canonical structure of left $\mathcal{D}_{X^\sharp/S^\sharp}$-module so that we retrieve the canonical left $\mathcal{D}_{X^\sharp/S^\sharp}$-module of 1.1.4.1.2 when log structure are trivial. By definition, the action of $P \in \mathcal{D}_{X^\sharp/S^\sharp,n}$ on $f \in \mathcal{O}_X$ is denoted by $P(f)$ (in general we avoid to write $P\cdot f$ since this can be confused with the multiplication in $\mathcal{D}_{X^\sharp/S^\sharp}$) and is defined by setting

$$P(f) := P \circ p_1^n(f). \tag{3.1.4.5.1}$$

Contrary to the non-logarithmic case, we need to check that this gives a structure of left $\mathcal{D}_{X^\sharp/S^\sharp}$-module: Let $P \in \mathcal{D}_{X^\sharp/S^\sharp,n}$, $P' \in \mathcal{D}_{X^\sharp/S^\sharp,n'}$. Consider the following diagram

$$\begin{array}{ccccccc}
\mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} & \xrightarrow{\delta^{n,n'}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp} & \xrightarrow{\mathrm{id}\otimes P'} & \mathcal{P}^{n}_{X^\sharp/S^\sharp} & \xrightarrow{P} & \mathcal{O}_X \\
{\scriptstyle p_1^{n+n'}}\uparrow & & \uparrow & & \uparrow{\scriptstyle p_1^{n}} & & \\
\mathcal{O}_X & \xrightarrow{p_1^{n'}} & \mathcal{P}^{n'}_{X^\sharp/S^\sharp} & \xrightarrow{P'} & \mathcal{O}_X, & &
\end{array} \tag{3.1.4.5.2}$$

where the middle vertical map is given by the projection $\Delta^n_{X^\sharp/S^\sharp} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp} \to \Delta^{n'}_{X^\sharp/S^\sharp}$. Since $\delta^{n,n'}_{(m)}$ is a homomorphism of $\mathcal{O}_X$-algebras for the right structure, then the left square of 3.1.4.5.2 is commutative. Since the right square of the diagram 3.1.4.5.2 is commutative by functoriality, then 3.1.4.5.2 is commutative. Hence, by definition of the product given at 3.1.4.3.1 this means that $PP'(x) = P(P'(x))$.

3.2 Sheaf of differential operators of finite level m and finite order on logarithmic schemes

We keep notation of the section 3.1.

3.2.1 Log m-PD envelope

Let $m, i \in \mathbb{N}$ be two integers and $S^\sharp$ be a fine log scheme over the scheme $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$. Let (I_S, J_S, γ) be a quasi-coherent m-PD-ideal of $\mathcal{O}_S$. Let us fix some definitions.

Definition 3.2.1.1. Let $n \geq 1$ be an integer.

(a) Let $\mathscr{C}^{(m)}_{\sharp\gamma}$ (resp. $\mathscr{C}^{(m)}_{\sharp\gamma,n}$) be the category whose objects are pairs (u,δ) where u is an exact closed $S^\sharp$-immersion $Z^\sharp \hookrightarrow X^\sharp$ of fine log-schemes and δ is an m-PD-structure on the ideal $\mathcal{I}$ of $\mathcal{O}_X$ given by u which is compatible (see definition 1.2.4.3) with γ (resp. and such that $\mathcal{I}^{\{n+1\}_{(m)}} = 0$), where $\mathcal{I}^{\{n+1\}_{(m)}}$ is defined in the appendix of [Ber00]) ; whose morphisms $(u',\delta') \to (u,\delta)$ are commutative diagrams of the form

$$\begin{array}{ccc}
X'^\sharp & \xrightarrow{f} & X^\sharp \\
{\scriptstyle u'}\uparrow & & \uparrow{\scriptstyle u} \\
Z'^\sharp & \longrightarrow & Z^\sharp
\end{array} \tag{3.2.1.1.1}$$

such that f is an m-PD-morphism with respect to the m-PD-structures δ and δ' (i.e., denoting by $\mathcal{I}'$ the sheaf of ideals of $\mathcal{O}_{X'}$ defined by u', for any affine open sets U' of $X'^\sharp$ and U of $X^\sharp$ such that $f(U') \subset U$, the morphism f induces the m-PD-morphism $(\mathcal{O}_X(U), \mathcal{I}(U), \delta) \to (\mathcal{O}_{X'}(U'), \mathcal{I}'(U'), \delta')$). Beware that theses categories depend on $S^\sharp$ and also on the quasi-coherent m-PD-ideal (I_S, J_S, γ). The objects of $\mathscr{C}^{(m)}_{\sharp\gamma}$ (resp. $\mathscr{C}^{(m)}_{\sharp\gamma,n}$) are called m-PD-$S^\sharp$-immersions compatible with γ (resp. m-PD-$S^\sharp$-immersions of order n compatible with γ). We remark that we have the inclusions $\mathscr{C}^{(m)}_{\sharp\gamma} \subset \mathscr{C}^{(m')}_{\sharp\gamma}$ for any integer $m' \geq m$ (recall an m-PD-structure is also an m'-PD-structure).

We say that a morphism $(u', \delta') \to (u, \delta)$ of $\mathscr{C}^{(m)}_{\sharp\gamma}$ (resp. $\mathscr{C}^{(m)}_{\sharp\gamma,n}$) is strict (resp. flat, resp. cartesian) if f is strict (resp. $\underline{f}$ is flat, resp. the square 3.2.1.1.1 is cartesian).

(b) Let u be an object of $\mathscr{C}_\sharp$ (see the notation 3.1.1.10). An "m-PD-envelope compatible with γ of u" is an object (u', δ') of $\mathscr{C}^{(m)}_{\sharp\gamma}$ endowed with a morphism $u' \to u$ in $\mathscr{C}_\sharp$ satisfying the following universal property: for any object (u'', δ'') of $\mathscr{C}^{(m)}_{\sharp\gamma}$ endowed with a morphism $f: u'' \to u$ of $\mathscr{C}_\sharp$ there exists a unique morphism $(u'', \delta'') \to (u', \delta')$ of $\mathscr{C}^{(m)}_{\sharp\gamma}$ whose composition with $u' \to u$ is f. The unicity up to canonical isomorphism of the m-PD-envelope compatible with γ of u is obvious. We will denote by $P^\sharp_{(m),\gamma}(u)$ the m-PD-envelope compatible with γ of u. By abuse of notation we also denote by $P^\sharp_{(m),\gamma}(u)$ the underlying exact closed immersion or its target. The existence is checked below (see 3.2.1.9).

(c) Let u be an object of $\mathscr{C}_\sharp$. An "m-PD-envelope of order n compatible with γ of u" is an object (u', δ') of $\mathscr{C}^{(m)}_{\sharp\gamma,n}$ endowed with a morphism $u' \to u$ in $\mathscr{C}_\sharp$ satisfying the following universal property: for any object (u'', δ'') of $\mathscr{C}^{(m)}_{\sharp\gamma,n}$ endowed with a morphism $f: u'' \to u$ of $\mathscr{C}_\sharp$ there exists a unique morphism $(u'', \delta'') \to (u', \delta')$ of $\mathscr{C}^{(m)}_{\sharp\gamma,n}$ whose composition with $u' \to u$ is f. The unicity up to canonical isomorphism of the m-PD-envelope of order n compatible with γ of u is obvious. We will denote by $P^{\sharp n}_{(m),\gamma}(u)$ the m-PD-envelope of order n compatible with γ of u. By abuse of notation we also denote by $P^{\sharp n}_{(m),\gamma}(u)$ the underlying exact closed immersion or its target. The existence is checked below (see 3.2.1.9).

(d) Since p is nilpotent in $S^\sharp$, we get the forgetful functor $For^{(m)}_\sharp: \mathscr{C}^{(m)}_{\sharp\gamma} \to \mathscr{T}hick_{(p)}$ (resp. $For^{(m)}_{\sharp n}: \mathscr{C}^{(m)}_{\sharp\gamma,n} \to \mathscr{T}hick_{(p)}$) given by $(u, \delta) \mapsto u$. We denote by $\mathscr{C}'^{(m)}_{\sharp\gamma}$ (resp. $\mathscr{C}'^{(m)}_{\sharp\gamma,n}$) the image of $For^{(m)}_\sharp$ (resp. $For^{(m)}_{\sharp n}$).

Notation 3.2.1.2. In this paragraph, suppose $J_S = p\mathcal{O}_S$. Then, there is a unique PD-structure on J_S which we will denote by $\gamma_\emptyset$. Let $u: Z^\sharp \hookrightarrow X^\sharp$ be an exact closed $S^\sharp$-immersion of fine log-schemes and δ be an m-PD-structure on the ideal $\mathcal{I}$ of $\mathcal{O}_X$ defined by u. It follows from Lemma 1.2.3.4 that the m-PD-structure δ of $\mathcal{I}$ is always compatible with $\gamma_\emptyset$. Hence, in the description of $\mathscr{C}^{(m)}_{\sharp\gamma_\emptyset}$ (resp. $\mathscr{C}^{(m)}_{\sharp\gamma_\emptyset,n}$) we can remove "compatible with $\gamma_\emptyset$" without changing the respective categories. For this reason, we put $\mathscr{C}^{(m)}_\sharp := \mathscr{C}^{(m)}_{\sharp\gamma_\emptyset}$ (resp. $\mathscr{C}^{(m)}_{\sharp n} := \mathscr{C}^{(m)}_{\sharp\gamma_\emptyset,n}$). But, recall these categories depend on $S^\sharp$ even if this is not written in the notation. Finally, for any quasi-coherent m-PD-ideal (I_S, J_S, γ) of $\mathcal{O}_S$, we have the inclusions

$$\mathscr{C}^{(m)}_{\sharp\gamma} \subset \mathscr{C}^{(m)}_\sharp \text{ and } \mathscr{C}^{(m)}_{\sharp\gamma,n} \subset \mathscr{C}^{(m)}_{\sharp n}. \tag{3.2.1.2.1}$$

The following proposition gives the link between our categories.

Proposition 3.2.1.3. *Suppose that $J_S + p\mathcal{O}_S$ is locally principal.*

(a) We have the inclusion $\mathscr{C}_{\sharp 1} \subset \mathscr{C}'^{(m)}_{\sharp\gamma,1}$.

(b) For any $n, m \in \mathbb{N}$ such that $n + 1 \leq p^m$, we have the inclusion $\mathscr{C}_{\sharp n} \subset \mathscr{C}'^{(m)}_{\sharp\gamma,n}$;

(c) We have the equality $\cup_{m\in\mathbb{N}} \mathscr{C}'^{(m)}_{\sharp\gamma} = \mathscr{T}hick_{(p)}$.

Proof. Let us check the first two assertions. Let $u: U^\sharp \hookrightarrow T^\sharp$ a $S^\sharp$-log-thickening of order n, let $\mathcal{I}$ be the ideal defined by the closed immersion $\underline{u}$. When $\mathcal{I}^2 = 0$, we get a PD-structure γ on $\mathcal{I}$ defined by putting $\gamma_n = 0$ for any integer $n \geq 2$. Since $J_S + p\mathcal{O}_S$ is locally principal, then from [Ber96c, 1.3.2.(i).b)]

γ extends to T. Hence, $\mathscr{C}_{\sharp 1} \subset \mathscr{C}^{\sharp \prime (0)}_{\gamma,1}$, which yields the first inclusion to prove. Suppose now $\mathcal{I}^{n+1} = 0$ and $n+1 \leq p^m$. In that case, $\mathcal{I}^{(p^m)} = 0$. Hence, $(0, \delta)$ is an m-PD-structure of $\mathcal{I}$ (where δ is the unique PD-structure on 0). Let us check that the m-PD structure $(0, \delta)$ of $\mathcal{I}$ is compatible with γ. By definition, we have to check two properties (see 1.2.4.3). Since γ extends to T, then the property 1.2.4.3.(iia) is satisfied (see Definition [Ber96c, 1.2.2]). The second one 1.2.4.3.(iib) is a straightforward consequence of Lemma [Ber96c, 1.2.4.(i)]. Hence, $(u, \delta) \in \mathscr{C}^{(m)}_{\sharp\gamma}$. Since $\mathcal{I}^{n+1} = 0$, we have in fact $(u, \delta) \in \mathscr{C}^{(m)}_{\sharp\gamma,n}$. By definition, this yields $u \in \mathscr{C}'^{(m)}_{\sharp\gamma,n}$.

Let us check the last statement. The inclusion $\cup_{m\in\mathbb{N}} \mathscr{C}'^{(m)}_{\sharp\gamma} \subset \mathscr{T}hick_{(p)}$ is tautologic. Conversely, let $u\colon U^\sharp \hookrightarrow T^\sharp$ be an $S^\sharp$-log-thickening of order (p^m), let $\mathcal{I}$ be the ideal defined by the closed immersion $\underline{u}$. Since $\mathcal{I}^{(p^m)} = 0$, then following the first part of the proof, we get that the m-PD structure $(0, \delta)$ is compatible with γ of $\mathcal{I}$. Hence, $u \in \mathscr{C}'^{(m)}_{\sharp\gamma}$, which concludes the proof of the last statement. □

3.2.1.4. Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ be an exact $S^\sharp$-immersion of fine log-schemes. Set $(\underline{v}, \delta) := P_{(m),\gamma}(\underline{u})$ (see 1.3.3.4). Let (v, δ) be the object of $\mathscr{C}^{(m)}_{\sharp\gamma}$ whose underlying object of $\mathscr{C}^{(m)}_{\gamma}$ is $(\underline{v}, \delta)$ and v is defined so that the morphism $v \to u$ of $\mathscr{C}_\sharp$ is strict (see the definition 3.1.1.10). Then (v, δ) is the m-PD-envelope compatible with γ of u.

Remark 3.2.1.5. Let $\alpha\colon (u', \delta') \to (u, \delta)$ be a strict cartesian morphism of $\mathscr{C}^{(m)}_{\sharp\gamma}$. Let (u'', δ'') be an object of $\mathscr{C}^{(m)}_{\sharp\gamma}$ and $\beta\colon u'' \to u'$ be a morphism of $\mathscr{C}_\sharp$. We remark that if $For^{(m)}_\sharp(\alpha) \circ \beta$ is in the image of $For^{(m)}_\sharp$ then so is β. Indeed, the morphism α is defined by a cartesian diagram of the form 3.2.1.1.1. Since α is moreover strict, then we remark that $Z'^\sharp = Z^\sharp \times_{X^\sharp} X'^\sharp$, i.e. the diagram 3.2.1.1.1 remains cartesian after applying the forgetful functor from the category of fine log schemes to the category of schemes. Hence, we can conclude.

3.2.1.6. Let $u' \to u$ be a strict, flat, cartesian morphism of $\mathscr{C}_\sharp$, i.e. let

$$\begin{array}{ccc} X'^\sharp & \xrightarrow{g} & X^\sharp \\ {\scriptstyle u'}\uparrow & \square & \uparrow{\scriptstyle u} \\ Z'^\sharp & \longrightarrow & Z^\sharp \end{array}$$

be a cartesian square whose morphism g is strict and $\underline{g}$ is flat. Suppose that the m-PD-envelope compatible with γ of u exists (in fact, this existence will be proved later in 3.2.1.9). Let (v, δ) be this m-PD-envelope. Set $v' := v \times_u u'$ and let $g'\colon v' \to v$ be the projection. Since $\underline{g}$ is flat and g is strict, then g' is strict and $\underline{g}'$ is flat. From [Ber96c, 1.3.2.(i)], there exists a canonical m-PD-structure δ' compatible with γ on the ideal defined by $v' := v \times_u u'$ such that the projection $g'\colon v' \to v$ induces a strict cartesian morphism of $\mathscr{C}^{(m)}_{\sharp\gamma}$ of the form $(v', \delta') \to (v, \delta)$. With the remark 3.2.1.5, we can check that (v', δ') is an m-PD-envelope compatible with γ of u'.

Lemma 3.2.1.7. *Let $f\colon X^\sharp \to Y^\sharp$ be a log étale $S^\sharp$-morphism, $u\colon Z^\sharp \hookrightarrow X^\sharp$ and $v\colon Z^\sharp \hookrightarrow Y^\sharp$ be two $S^\sharp$-immersions of fine log schemes such that $v = f \circ u$. If the m-PD envelope of order n exists then it is also an m-PD envelope of order n of v.*

Proof. Let $(P(u), \delta)$ be the m-PD envelope (resp. of order n) of u. Let us check that the composition of the canonical morphism $P(u) \to u$ with the morphism $u \to v$ (induced by f) satisfies the universal property of the m-PD envelope (resp. of order n). Let (v', δ') be an object of $\mathscr{C}^{(m)}_{\sharp\gamma}$ (resp. $\mathscr{C}^{(m)}_{\sharp\gamma,n}$) and $g\colon v' \to v$ be a morphism of $\mathscr{C}_\sharp$. Using the universal property of log étaleness, we get a unique morphism $h\colon v' \to u$ of $\mathscr{C}_\sharp$ whose composition with $u \to v$ gives g. Using the universal property of the m-PD-envelope of u compatible with γ that there exists a unique morphism $(v', \delta') \to (P(u), \delta)$ of $\mathscr{C}^{(m)}_{\sharp\gamma}$ (resp. $\mathscr{C}^{(m)}_{\sharp\gamma,n}$) such that the composition of $v' \to P(u)$ with $P(u) \to u$ is h.

□

Lemma 3.2.1.8. *The inclusion functor $For_{\sharp n}\colon \mathscr{C}^{(m)}_{\sharp\gamma,n} \to \mathscr{C}^{(m)}_{\sharp\gamma}$ has a right adjoint. We denote by $Q^{\sharp n}_{(m),\gamma}\colon \mathscr{C}^{(m)}_{\sharp\gamma} \to \mathscr{C}^{(m)}_{\sharp\gamma,n}$ this right adjoint functor. The functor $Q^{\sharp n}_{(m),\gamma}$ preserves the sources.*

Proof. Let (u, δ) be an object of $\mathscr{C}^{(m)}_{\sharp\gamma}$ and $\mathcal{I}$ be the ideal defined by the exact closed immersion $u \colon Z^\sharp \hookrightarrow X^\sharp$. Let $Q^n \hookrightarrow X^\sharp$ be the exact closed immersion which is defined by $\mathcal{I}^{\{n+1\}_{(m)}}$. It follows from 1.3.1.4 that $Q^{\sharp n}_{(m),\gamma}(u)$ exists and is equal to the exact closed immersion $Z^\sharp \hookrightarrow Q^n$. □

Proposition 3.2.1.9. *Let $u \colon Z^\sharp \hookrightarrow X^\sharp$ be an object of $\mathscr{C}_\sharp$.*

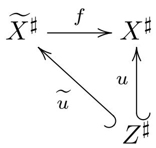
(a) The m-PD-envelope compatible with γ of u exists. In other words, the canonical functor $For^{(m)}_\sharp \colon \mathscr{C}^{(m)}_{\sharp\gamma} \to \mathscr{C}_\sharp$ has a right adjoint. We denote by $P^\sharp_{(m),\gamma} \colon \mathscr{C}_\sharp \to \mathscr{C}^{(m)}_{\sharp\gamma}$ this right adjoint functor. Similarly, the m-PD-envelope of order n compatible with γ of u exists, i.e. we get the right adjoint functor $P^{\sharp n}_{(m),\gamma} \colon \mathscr{C}_\sharp \to \mathscr{C}^{(m)}_{\sharp\gamma,n}$ of the canonical functor $For^{(m)}_{\sharp n} \colon \mathscr{C}^{(m)}_{\sharp\gamma,n} \to \mathscr{C}_\sharp$. We have the relation $P^{\sharp n}_{(m),\gamma} = Q^{\sharp n}_{(m),\gamma} \circ P^\sharp_{(m),\gamma}$.

(b) If γ extends to $Z^\sharp$ then the source of $P^\sharp_{(m),\gamma}(u)$ is $Z^\sharp$.

(c) By an abuse of notation we let $P^\sharp_{(m),\alpha}(u)$ (resp. $P^{\sharp n}_{(m),\alpha}(u)$) denote the target of the arrow $P^\sharp_{(m),\alpha}(u)$ (resp. $P^{\sharp n}_{(m),\alpha}(u)$). Let $U^\sharp$ be an open of $X^\sharp$ containing $Z^\sharp$ such that the induced immersion $v \colon Z^\sharp \hookrightarrow U^\sharp$ is closed. Then $P^\sharp_{(m),\alpha}(u) = P^\sharp_{(m),\alpha}(v)$ and the underling morphism of schemes of $P^\sharp_{(m),\alpha}(u) \to U$ (resp. $P^{\sharp n}_{(m),\alpha}(u) \to U$) is affine. We denote by $\mathcal{P}_{(m),\gamma}(u)$ (resp. $\mathcal{P}^n_{(m),\gamma}(u)$) the quasi-coherent $\mathcal{O}_U$-algebra so that $P_{(m),\gamma}(u) = \mathrm{Spec}(\mathcal{P}_{(m),\gamma}(u))$ (resp. $P^n_{(m),\gamma}(u) = \mathrm{Spec}(\mathcal{P}^n_{(m),\gamma}(u))$) where $P_{(m),\gamma}(u)$ (resp. $P^n_{(m),\gamma}(u)$) is the underlying scheme of $P^\sharp_{(m),\gamma}(u)$ (resp. $P^{\sharp n}_{(m),\gamma}(u)$). The m-PD ideal of $\mathcal{P}_{(m),\gamma}(u)$ will be denoted by $(\mathscr{I}_{(m),\gamma}(u), \mathscr{J}_{(m),\gamma}(u), ^{[\,]})$. Moreover, the sheaf $\mathcal{P}_{(m),\gamma}(u)$ has his support in $v(Z)$ and we can simply denote $v^{-1}\mathcal{P}_{(m),\gamma}(u)$ by $\mathcal{P}_{(m),\gamma}(u)$.

(d) Suppose that $J_S + p\mathcal{O}_S$ is locally principal and that X is noetherian. Then $P^n_{(m),\gamma}(u)$ is a noetherian scheme.

Proof. 1) We can suppose u is a closed immersion. First, let us check the proposition concerning the existence of $P^\sharp_{(m),\gamma}(u)$ and its properties (i.e. the second part of the proposition and the affinity of the morphism $P^\sharp_{(m),\gamma}(u) \to X^\sharp$). Using 3.2.1.6, the existence of $P^\sharp_{(m),\gamma}(u)$ and its properties are étale local on $X^\sharp$. Hence, by 3.1.1.14, we may thus assume that there exists a commutative diagram of the form



such that f is log étale, $\underline{f}$ is affine and $\widetilde{u}$ is an exact closed $S^\sharp$-immersion. In that case, following 3.2.1.4 the m-PD-envelope compatible with γ of $\widetilde{u}$ exists and the induced object of $\mathscr{C}^{(m)}_\gamma$ is $P_{(m),\gamma}(\underline{\widetilde{u}})$. Following 3.2.1.7, the m-PD-envelope compatible with γ of u exists and is isomorphic to that of $\widetilde{u}$. Concerning the second statement, when γ extends to $Z^\sharp$, following [Ber96c, 2.1.1] (or [Ber96c, 1.4.5] for the affine version), the source of the immersion $P_{(m),\gamma}(\underline{\widetilde{u}})$ is $Z^\sharp$. Since $P^\sharp_{(m),\gamma}(\widetilde{u})$, $\widetilde{u}$ are exact closed immersion, since the morphism $P^\sharp_{(m),\gamma}(\widetilde{u}) \to \widetilde{u}$ is strict (see 3.2.1.4), then so is the morphism of sources induced by $P^\sharp_{(m),\gamma}(\widetilde{u}) \to \widetilde{u}$. Hence, we get the second statement. We can check the third statement by recalling that the target of $P_{(m),\gamma}(\underline{\widetilde{u}})$ is affine over $\widetilde{X}$ (see 1.3.3.4) and that $P_{(m),\gamma}(\underline{\widetilde{u}}) \to \widetilde{u}$ is strict. Concerning the noetherianity, if X is noetherian then so is $\widetilde{X}$. Hence, using [Ber96c, 1.4.4] and the description of the m-PD filtration given in the proof of [Ber96c, A.2], we get that $P^n_{(m),\gamma}(\underline{\widetilde{u}})$ is noetherian (but not $P_{(m),\gamma}(\underline{\widetilde{u}})$).

2) From Lemma 3.2.1.8, we can check that the functor $Q^{\sharp n}_{(m),\gamma} \circ P^\sharp_{(m),\gamma}$ is a right adjoint of $For^{(m)}_{\sharp n} \colon \mathscr{C}^{(m)}_{\sharp\gamma,n} \to \mathscr{C}_\sharp$. Moreover, with the description of the functor $Q^{\sharp n}_{(m),\gamma}$ given in the proof of 3.2.1.8, we can check the other properties concerning $P^{\sharp n}_{(m),\gamma}$ from that of $P^\sharp_{(m),\gamma}$.

□

Remark 3.2.1.10. Let (u, δ) be an object of $\mathscr{C}^{(m)}_{\sharp\gamma}$. Then $P^{\sharp}_{(m),\delta}(u) = (u, \delta)$. But, beware that $P_{(m),\gamma}(u) \neq (u, \delta)$ in general.

3.2.1.11 (The case of an exact closed immersion)**.** Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ be an exact closed $S^\sharp$-immersion of fine log-schemes and $\mathcal{I}$ be the ideal defined by u. We denote by $u^{(m)}\colon Z^{\sharp(m)} \hookrightarrow X^\sharp$ the exact closed $S^\sharp$-immersion of fine log-schemes so that $\mathcal{I}^{(p^m)}$ is the ideal defined by $u^{(m)}$. Since the closed immersion u is exact, in the proof of 3.2.1.9, we can skip the part concerning the exactification of u (i.e. we can suppose $f = \mathrm{id}$ or equivalently $\widetilde{u} = u$). Hence, we remark that, as in the proof of [Ber96c, 1.4.1], we get the equality

$$P^{\sharp}_{(m),\gamma}(u) = P^{\sharp}_{(0),\gamma}(u^{(m)}). \tag{3.2.1.11.1}$$

We have also the same construction as in the proof of [Ber96c, 1.4.1] (too technical to be described here in few words) of the m-PD ideal $(\mathscr{I}_{(m),\gamma}(u), \mathscr{J}_{(m),\gamma}(u), ^{[\,]})$ of $\mathcal{P}_{(m),\gamma}(u)$ directly from the level 0 case. For the detailed descriptions, see the proof of [Ber96c, 1.4.1]. These descriptions, in particular 3.2.1.11.1, are useful to check the Frobenius descent for arithmetic $\mathcal{D}$-modules (see [Ber00, 2.3.6]).

Lemma 3.2.1.12. *We have the equality* $P^{\sharp n}_{(m),\gamma} \circ For_{\sharp n} \circ P^{\sharp n} = P^{\sharp n}_{(m),\gamma}$*, where* $For_{\sharp n}\colon \mathscr{C}_{\sharp n} \to \mathscr{C}_{\sharp}$ *is the canonical functor and* $P^{\sharp n}\colon \mathscr{C}_{\sharp} \to \mathscr{C}_{\sharp n}$ *is its right adjoint (see 3.1.1.17).*

Proof. Let $u\colon Z^\sharp \hookrightarrow X^\sharp$ be an object of $\mathscr{C}_\sharp$. Looking at the construction of P^n and $P^{\sharp n}_{(m),\gamma}$ (see the proof of 3.1.1.17 and 3.2.1.9), we reduce to the case where u is an exact closed immersion. In that case, the Lemma is a reformulation of 1.3.2.8.2. □

The following proposition will not be useful later but it allows us to extend 3.1.3.6 is some particular case.

Proposition 3.2.1.13. *Suppose that* $J_S + p\mathcal{O}_S$ *is locally principal. Let* $f\colon X^\sharp \to Y^\sharp$ *be an* $S^\sharp$*-morphism of fine log schemes and* $\Delta_{X^\sharp/Y^\sharp}\colon X^\sharp \hookrightarrow X^\sharp \times_{Y^\sharp} X^\sharp$ *(as always the product is taken in the category of fine log schemes) be the diagonal* $S^\sharp$*-immersion. The following assertions are equivalent:*

1. *the morphism* f *is fine formally log unramified ;*
2. *the morphism* $P^{\sharp 1}(\Delta_{X^\sharp/Y^\sharp})$ *is an isomorphism ;*
3. *the morphism* $P^{\sharp 1}_{(m),\gamma}(\Delta_{X^\sharp/Y^\sharp})$ *is an isomorphism.*

Proof. The equivalence between 1) and 2) has already been checked (see 3.1.3.6). Following 3.2.1.3, since $J_S + p\mathcal{O}_S$ is locally principal, then $\mathscr{C}_{\sharp 1} \subset \mathscr{C}'^{(m)}_{\sharp\gamma,1}$. Hence, we have 3) $\Rightarrow$ 1). It follows from 3.2.1.12 that $P^{\sharp 1}_{(m),\gamma}(P^{\sharp 1}(\Delta_{X^\sharp/Y^\sharp})) = P^{\sharp 1}_{(m),\gamma}(\Delta_{X^\sharp/Y^\sharp})$. If $P^{\sharp 1}(\Delta_{X^\sharp/Y^\sharp})$ is an isomorphism, then $P^{\sharp 1}_{(m),\gamma}(P^{\sharp 1}(\Delta_{X^\sharp/Y^\sharp})) = P^{\sharp 1}(\Delta_{X^\sharp/Y^\sharp})$. Hence, we get the implication 2) $\Rightarrow$ 4). It remains to check 4) $\Rightarrow$ 3). Suppose $P^{\sharp 1}_{(m),\gamma}(\Delta_{X^\sharp/Y^\sharp})$ is an isomorphism and let $(\iota, \delta) \in \mathscr{C}^{(m)}_{\sharp,\gamma,1}$ and let

$$\begin{array}{ccc} U^\sharp & \xrightarrow{u_0} & X^\sharp \\ {\scriptstyle \iota}\big\downarrow & & \big\downarrow{\scriptstyle f} \\ T^\sharp & \xrightarrow{v} & Y^\sharp \end{array}$$

be a commutative diagram of fine log schemes. Suppose there exist a morphism $u\colon T^\sharp \to X^\sharp$ such that $u \circ \iota = u_0$ and $f \circ u = v$, and a morphism $u'\colon T^\sharp \to X^\sharp$ such that $u' \circ \iota = u_0$ and $f \circ u' = v$. We get the morphism $(u, u')\colon T^\sharp \to X^\sharp \times_{Y^\sharp} X^\sharp$. We denote by and $\phi\colon \iota \to \Delta_{X^\sharp/Y^\sharp}$ be a morphism of $\mathscr{C}_\sharp$ induced by (u', u) and u_0. Using the universal property of the m-PD envelope of order 1, there exists a unique morphism $\psi\colon (\iota, \delta) \to P^{\sharp 1}_{(m),\gamma}(\Delta_{X^\sharp/Y^\sharp})$ of $\mathscr{C}^{(m)}_{\sharp,\gamma,1}$ such that the composition of $For^{(m)}_{\sharp n}(\psi)$ with the canonical map $P^{\sharp 1}_{(m),\gamma}(\Delta_{X^\sharp/Y^\sharp}) \to \Delta_{X^\sharp/Y^\sharp}$ is ϕ. Since $P^{\sharp 1}_{(m),\gamma}(\Delta_{X^\sharp/Y^\sharp})$ is an isomorphism, this yields that $(u, u')\colon T^\sharp \to X^\sharp \times_{Y^\sharp} X^\sharp$ is the composition of a morphism of the form $T^\sharp \to X^\sharp$ with $\Delta_{X^\sharp/Y^\sharp}$. Hence, $u = u'$. □

Lemma 3.2.1.14. *Let $u \to v$ be a morphism of $\mathscr{C}_\sharp$. Let δ be the m-PD-structure of $P^\sharp_{(m),\gamma}(v)$ and $w := P^\sharp_{(m),\gamma}(v) \times_v u$ (this is the product in $\mathscr{C}_\sharp$). We denote by $P^\sharp_{(m),\delta}(w)$ the m-PD-envelope of w compatible with δ. Then $P^\sharp_{(m),\delta}(w)$ and $P^\sharp_{(m),\gamma}(u)$ are isomorphic in $\mathscr{C}^{(m)}_{\sharp\gamma}$. Moreover, $P^{\sharp n}_{(m),\delta}(w)$ and $P^{\sharp n}_{(m),\gamma}(u)$ are isomorphic in $\mathscr{C}^{(m)}_{\sharp\gamma,n}$.*

Proof. Since the second assertion is checked in the same way, let us prove the first one. Let us check that the composition $P^\sharp_{(m),\delta}(w) \to w \to u$ satisfies the universal property of $P^\sharp_{(m),\gamma}(u) \to u$. Let $(u', \delta') \in \mathscr{C}^{(m)}_{\sharp\gamma}$ and $f : u' \to u$ be a morphism of $\mathscr{C}_\sharp$. First let us check the existence. Composing f with $u \to v$ we get a morphism $g : u' \to v$. Using the universal property of the m-PD envelope, there exists a morphism $\phi : (u', \delta') \to (P_{(m),\gamma}(v), \delta)$ of $\mathscr{C}^{(m)}_{\sharp\gamma}$ such that the composition $u' \to P^\sharp_{(m),\gamma}(v) \to v$ is g. Hence, we get the morphism $(\phi, f) : u' \to w$. Using the universal property of $P^\sharp_{(m),\delta}(w)$, we get a morphism $u' \to P^\sharp_{(m),\delta}(w)$ of $\mathscr{C}^{(m)}_{\sharp\delta}$ (and then of $\mathscr{C}^{(m)}_{\sharp\gamma}$) whose composition with $P^\sharp_{(m),\delta}(w) \to w \to u$ is f. Let us check the unicity. Let $\alpha : u' \to P^\sharp_{(m),\delta}(w)$ be a morphism of $\mathscr{C}^{(m)}_{\sharp\gamma}$ whose composition with $P^\sharp_{(m),\delta}(w) \to w \to u$ is f. This implies that the composition of α with $P^\sharp_{(m),\delta}(w) \to w \to P^\sharp_{(m),\gamma}(v) \to v$ is g. Since the composition $P^\sharp_{(m),\delta}(w) \to w \to P^\sharp_{(m),\gamma}(v)$ is a morphism of $\mathscr{C}^{(m)}_{\sharp\delta}$, then so is the composition of α with $P^\sharp_{(m),\delta}(w) \to w \to P^\sharp_{(m),\gamma}(v)$ (in particular, this implies that $\alpha \in \mathscr{C}^{(m)}_{\sharp\delta}$). Using the universal property of $P^\sharp_{(m),\gamma}(v)$, this latter composition morphism is uniquely determined by g. Hence, the composition of α with $P^\sharp_{(m),\delta}(w) \to w$ is a morphism of $\mathscr{C}_\sharp$ uniquely determined by f. Since α is a morphism of $\mathscr{C}^{(m)}_{\sharp\delta}$, we conclude using the universal property of $P^\sharp_{(m),\delta}(w)$. □

Lemma 3.2.1.15. *Let $r \geq 0$ be an integer, $(v, \delta) \in \mathscr{C}^{(m)}_{\sharp\gamma}$ where $v : T^\sharp \hookrightarrow D^\sharp$ is an exact closed $S^\sharp$-immersion of fine log-schemes and $(\widetilde{\mathcal{K}}, \delta)$ is an m-PD-structure compatible with γ on the ideal $\mathcal{K}$ of $\mathcal{O}_D$ defined by v. Let $(e_\lambda)_{\lambda=1\dots r}$ be the canonical basis of $\mathbb{Z}^r$. Let $i : D^\sharp \to D^\sharp \times_{\mathbb{Z}} A_{\mathbb{Z}^r}$ be the exact closed D-immersion defined by $e_\lambda \mapsto 1 \in \Gamma(D, M_{D^\sharp})$. With notation 3.2.1.9 and 1.3.3.6, we have the following properties.*

(a) The homomorphism of rings

$$\mathcal{O}_D\langle T_1, \dots, T_r\rangle_{(m)} \to \mathcal{P}_{(m),\delta}(i \circ v)$$

given by $T_\lambda \mapsto e_\lambda - 1$ is an isomorphism.

(b) The structural m-PD ideal $(\mathscr{I}_{(m),\gamma}(i \circ v), \mathscr{J}_{(m),\gamma}(i \circ v), {}^{[\,]})$ of $\mathcal{P}_{(m),\delta}(i \circ v)$ is given by

$$\mathscr{I}_{(m),\gamma}(i \circ v) = \mathscr{I}_{D,(m),r} + \mathcal{K}\mathcal{P}_{(m),\delta}(i \circ v),$$
$$\mathscr{J}_{(m),\gamma}(i \circ v) = \mathscr{J}_{D,(m),r} + \widetilde{\mathcal{K}}\mathcal{P}_{(m),\delta}(i \circ v).$$

Proof. By using the remark 1.3.2.9 and 3.2.1.4, we can suppose that $v = \mathrm{id}$. Since the ideal of the exact closed immersion i is generated by the regular sequence $(e_\lambda - 1)_{\lambda=1,\dots r}$, using 1.3.2.6 and 3.2.1.4 we can check that the morphism of $\mathcal{O}_D$-algebras $\mathcal{O}_D\langle T_1, \dots, T_r\rangle_{(m)} \to \mathcal{P}_{(m),\delta}(i)$ given by $T_\lambda \mapsto e_\lambda - 1$ is an isomorphism. □

Notation 3.2.1.16. With notation 3.2.1.15, we set $\mathcal{O}_{(v,\delta)}\langle T_1, \dots, T_r\rangle_{(m)} := \mathcal{P}_{(m),\delta}(i \circ v)$ and $\mathcal{O}_{(v,\delta)}\langle T_1, \dots, T_r\rangle_{(m),n} := \mathcal{P}^n_{(m),\delta}(i \circ v)$.

Proposition 3.2.1.17. *Let $f : X^\sharp \to Y^\sharp$ be an $S^\sharp$-morphism of fine log-schemes, $(b_\lambda)_{\lambda=1,\dots,r}$ be some elements of $\Gamma(X, M_{X^\sharp})$ such that $(b_\lambda)_{\lambda=1,\dots,r}$ are formal logarithmic coordinates of f.*

Let $u : Z^\sharp \hookrightarrow X^\sharp$ and $v : Z^\sharp \hookrightarrow Y^\sharp$ be two $S^\sharp$-immersions of fine log schemes such that $v = f \circ u$. Suppose given $y_\lambda \in \Gamma(Y, M_{Y^\sharp})$ whose images in $\Gamma(Z, M_{Z^\sharp})$ coincide with the images of b_λ.

Let $P^\sharp_{(m),\gamma}(u) = (T'^\sharp \hookrightarrow D'^\sharp, \delta')$, $P^\sharp_{(m),\gamma}(v) = (T^\sharp \hookrightarrow D^\sharp, \delta)$, and $\alpha : D'^\sharp \to X^\sharp$ be the canonical morphism. Using multiplicative notation, put $u_\lambda := \frac{\alpha^*(b_\lambda)}{\alpha^*(f^*(y_\lambda))} \in \ker(\Gamma(D', M^{\mathrm{gr}}_{D'^\sharp}) \to \Gamma(T', M^{\mathrm{gr}}_{T'^\sharp})) = \ker(\Gamma(D', \mathcal{O}^*_{D'}) \to \Gamma(T', \mathcal{O}^*_{T'}))$ (see 3.1.1.24). Let $P^{\sharp n}_{(m),\gamma}(u) = (T'^\sharp \hookrightarrow D'^\sharp_n, \delta'_n)$, and $u_{\lambda,n}$ be the image of u_λ in $\ker(\Gamma(D'_n, \mathcal{O}^*_{D'_n}) \to \Gamma(T', \mathcal{O}^*_{T'}))$.

(a) By using notation 3.2.1.16, we have the isomorphism of m-PD-$\mathcal{O}_D$-algebras

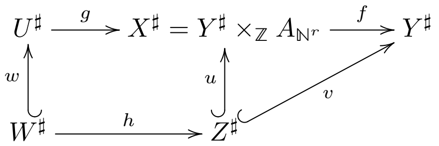
$$\mathcal{O}_{P_{(m),\gamma}(v)}\langle T_1,\dots,T_r\rangle_{(m),n} \xrightarrow{\sim} \mathcal{P}^n_{(m),\gamma}(u)$$
$$T_\lambda \mapsto u_{\lambda,n} - 1. \qquad (3.2.1.17.1)$$

(b) If $(b_\lambda)_{\lambda=1,\dots,r}$ are moreover logarithmic coordinates then we have the isomorphism of m-PD-$\mathcal{O}_D$-algebras

$$\mathcal{O}_{P_{(m),\gamma}(v)}\langle T_1,\dots,T_r\rangle_{(m)} \xrightarrow{\sim} \mathcal{P}_{(m),\gamma}(u)$$
$$T_\lambda \mapsto u_\lambda - 1. \qquad (3.2.1.17.2)$$

Proof. In order to check 3.2.1.17.1 (resp. 3.2.1.17.2), using the first part of lemma 3.2.1.7 (resp. the second part of lemma 3.2.1.7) and using the first remark of 3.1.1.9, we may assume that $X^\sharp = Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{N}^r}$, $f\colon X^\sharp \to Y^\sharp$ is the first projection, and that the family $(b_\lambda)_{\lambda=1,\dots,r}$ are the elements of $\Gamma(X, M_{X^\sharp})$ corresponding to the canonical basis $(e_\lambda)_{\lambda=1\dots r}$ of $\mathbb{N}^r$. Using lemma 3.2.1.14, we may furthermore assume that $Y^\sharp = S^\sharp$, $Z^\sharp \hookrightarrow Y^\sharp$ is the exact closed immersion whose ideal of definition is I_S. In particular, we get $D^\sharp = Y^\sharp$ and γ is the canonical m-PD structure of $D^\sharp$.

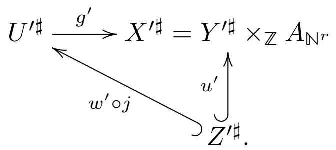
Let $\overline{z}$ be a geometric point of $Z^\sharp$. From 3.1.1.14, there exists a commutative diagram of the form



(3.2.1.17.3)

where g is log étale, h is an étale neighborhood of $\overline{z}$ in $Z^\sharp$, and w is an exact closed $S^\sharp$-immersion. We set $v_\lambda := \frac{g^*(b_\lambda)}{(f\circ g)^*(y_\lambda)} \in \mathrm{Ker}(\Gamma(U, M^{\mathrm{gp}}_{U^\sharp}) \to \Gamma(W, M^{\mathrm{gp}}_{W^\sharp}))$. Since w is an exact closed immersion, using 3.1.1.24, shrinking $U^\sharp$ if necessary we may thus assume that $v_\lambda \in \Gamma(U, \mathcal{O}^*_U)$.

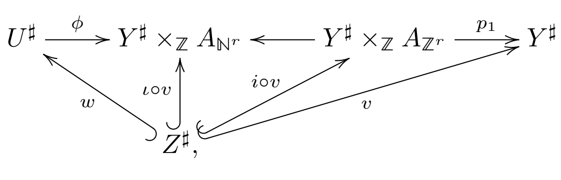
1) In this step, we reduce to the case where $h = \mathrm{id}$. According to [Gro67, IV.18.1.1], there exist an étale neighborhood $Y'^\sharp \to Y^\sharp$ of $\overline{z}$ in $Y^\sharp$ and an open $Z^\sharp$-immersion (see the definition 3.1.1.8) $\rho\colon Z'^\sharp := Z^\sharp \times_{Y^\sharp} Y'^\sharp \to W^\sharp$ which is a morphism of étale neighborhoods of $\overline{z}$ in $Z^\sharp$ (in particular $h\circ\rho\colon Z^\sharp \times_{Y^\sharp} Y'^\sharp \to Z^\sharp$ is the canonical projection). Let us use the prime symbol to denote the base change by $Y'^\sharp \to Y^\sharp$ of a $Y^\sharp$-log scheme or a morphism of $Y^\sharp$-log schemes. Set $j := (\rho, v')\colon {}'^\sharp \to W^\sharp \times_{Y^\sharp} Y'^\sharp = W'^\sharp$. Since $h\circ\rho\colon Z'^\sharp \to Z^\sharp$ is the canonical projection, then we compute that $h'\circ j = \mathrm{id}$. Since *id* is an immersion, then j is an immersion (see the first remark of 3.1.1.9). Since h' and *id* are etale then so is j. Hence, j is an open $Y^\sharp$-immersion. Using $h'\circ j = \mathrm{id}$, we get the commutative diagram over $Y'^\sharp$



Using 3.1.1.9.c we may assume (shrinking $U^\sharp$ if necessary) that the exact $Y^\sharp$-immersion $w'\circ j$ is closed. Since the proposition is étale local on $Y^\sharp$, we can drop the primes, i.e. we can suppose $h = \mathrm{id}$.

2) Consider the $Y^\sharp$-morphism $\phi\colon U^\sharp \to Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{N}^r}$ defined by the v_λ's. Since the $(d\log g^*(b_1),\dots,d\log g^*(b_r))$ forms a basis of $\Omega_{U^\sharp/Y^\sharp}$ (because g is log étale), then so does $(d\log v_1,\dots,d\log v_r)$. This implies that the canonical map $\phi^*\Omega_{X^\sharp/Y^\sharp} \to \Omega_{U^\sharp/Y^\sharp}$ induced by ϕ is an isomorphism. Since $U^\sharp/Y^\sharp$ is log smooth we get that ϕ is log étale (use [Kat89, 3.12]).

Let $\iota\colon Y^\sharp \to Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{N}^r}$ be the $Y^\sharp$-morphism defined by $e_\lambda \mapsto 1 \in \Gamma(Y, M_{Y^\sharp})$, and $i\colon Y^\sharp \to Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{Z}^r}$ be the exact closed $Y^\sharp$-immersion defined by $e_\lambda \mapsto 1 \in \Gamma(Y, M_{Y^\sharp})$. We compute that the diagram of morphisms of log schemes



(3.2.1.17.4)

where p_1 is the first projection, is commutative.

3) In this step, we reduce to the case where $u = i \circ v$, $X^\sharp = Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{Z}^r}$, $(b_\lambda)_{\lambda=1,\dots,r}$ are the elements of $\Gamma(X, M_{X^\sharp})$ corresponding to the canonical basis of $\mathbb{Z}^r$, and $(y_\lambda)_{\lambda=1,\dots,r}$ are equal to 1.

By using the commutativity of 3.2.1.17.3 (in the case where $h = \mathrm{id}$ thanks to the step 1), and using Lemma 3.2.1.7, since g is log etale, then the m-PD envelope compatible with γ of w is equal to $T'^\sharp \hookrightarrow D'^\sharp$. Again, by using the commutativity of 3.2.1.17.4, and using Lemma 3.2.1.7, since ϕ is log etale, then the m-PD envelope compatible with γ of w (equal to $T'^\sharp \hookrightarrow D'^\sharp$) is equal to the m-PD envelope compatible with γ of $\iota \circ v$. More precisely, following the proof of Lemma 3.2.1.7, the composition of the structural morphism $(T'^\sharp \hookrightarrow D'^\sharp) \to w$ with ϕ is equal to the structural morphism $(T'^\sharp \hookrightarrow D'^\sharp) \to \iota \circ v)$. Hence, we compute the image of b_λ via the structural morphism $(T'^\sharp \hookrightarrow D'^\sharp) \to \iota \circ v)$ is u_λ. Again, since $Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{Z}^r} \to Y^\sharp \times_{\mathbb{Z}} A_{\mathbb{N}^r}$ is log etale, then the m-PD envelope compatible with γ of $i \circ v$ is equal to $T'^\sharp \hookrightarrow D'^\sharp$. Hence, the image of b_λ via the structural morphism $(T'^\sharp \hookrightarrow D'^\sharp) \to i \circ v)$ is still u_λ.

4) By using Lemma 3.2.1.15, we conclude. □

3.2.2 Sheaf of principal parts of level m

Let $m, i \in \mathbb{N}$ be two integers and $S^\sharp$ be a fine log scheme over the scheme $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$. Let $f\colon X^\sharp \to S^\sharp$ be a log smooth morphism of fine log-schemes. Let (I_S, J_S, γ) be a quasi-coherent m-PD-ideal of $\mathcal{O}_S$ such that γ extends to $X^\sharp$ (e.g. from [Ber96c, 1.3.2.(i).c)] when $J_S + p\mathcal{O}_S$ is locally principal, or with the remark 3.1.1.7 when the log structure on $S^\sharp$ is trivial). Let $m \geq 0$ be an integer.

Remark 3.2.2.1. Since γ extends to $X^\sharp$, then the m-PD envelope compatible with γ (of order n) of the identity of $X^\sharp$ is the identity of $X^\sharp$. Indeed, using the arguments given in the proof of 3.2.1.3, we can check that the ideal 0 of $\mathcal{O}_X$ is endowed with a (unique) m-PD structure compatible with γ.

Notation 3.2.2.2. Let $\Delta_{X^\sharp/S^\sharp}(r)\colon X^\sharp \hookrightarrow X^{\sharp r+1}_{/S^\sharp}$ denote the diagonal immersion. With notation 3.2.1.9, we set

$$\Delta^n_{X^\sharp/S^\sharp,(m),\gamma}(r) := P^{\sharp n}_{(m),\gamma}(\Delta_{X^\sharp/S^\sharp}(r)), \qquad \Delta_{X^\sharp/S^\sharp,(m),\gamma}(r) := P^\sharp_{(m),\gamma}(\Delta_{X^\sharp/S^\sharp}(r)).$$

For any $n' \geq n$, we denote by

$$\psi^{n',n}_{X^\sharp/S^\sharp,(m),\gamma}(r)\colon \Delta^n_{X^\sharp/S^\sharp,(m),\gamma}(r) \hookrightarrow \Delta^{n'}_{X^\sharp/S^\sharp,(m),\gamma}(r) \tag{3.2.2.2.1}$$

the canonical exact closed immersion. We denote by $M_{X^\sharp/S^\sharp,(m),\gamma}(r)$ (resp. $M^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$) the log structure of $\Delta_{X^\sharp/S^\sharp,(m),\gamma}(r)$ (resp. $\Delta^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$). Since γ extends to $X^\sharp$, the source of $\Delta^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$ is $X^\sharp$. We can denote abusively the underlying scheme of the target of $\Delta_{X^\sharp/S^\sharp,(m),\gamma}(r)$ by $\Delta_{X^\sharp/S^\sharp,(m),\gamma}(r)$.

Let us write $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r) := \mathcal{P}^n_{(m),\gamma}(\Delta_{X^\sharp/S^\sharp}(r))$ (see Notation 3.2.1.9). By default, we only consider $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$ as a sheaf on X: Let $U^\sharp$ be an open of $X^{\sharp r+1}_{/S^\sharp}$ containing the image of $\Delta_{X^\sharp/S^\sharp}(r)$ such that the immersion $v\colon X^\sharp \to U^\sharp$ induced by $\Delta_{X^\sharp/S^\sharp}(r)$ is closed. Recall, by definition, $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$ is the sheaf of rings on X such that $v_*\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$ is a quasi-coherent $\mathcal{O}_U$-algebra satisfying $\mathrm{Spec}(v_*\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r)) = \Delta^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$ (see Notation 3.2.1.9).

For $i = 0, \dots, r$, let $p_i\colon X^{\sharp r+1}_{/S^\sharp} \to X^\sharp$ be the projections. Let $p_i^{U^\sharp}\colon U^\sharp \hookrightarrow X^{\sharp r+1}_{/S^\sharp} \to X^\sharp$ be the morphism induced by the projection p_i. Since $p_i^{U^\sharp} \circ v = \mathrm{id}$ then $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r) = p^{U^\sharp}_{i*}(v_*(\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r)))$. Since $v_*(\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r))$ is endowed with a structure of quasi-coherent $\mathcal{O}_U$-algebra, this yields $r+1$-structures of quasi-coherent $\mathcal{O}_{X^\sharp}$-algebras on $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$. To clarify which $\mathcal{O}_{X^\sharp}$-algebra structure we consider, we write $p_{i*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}(r)$ to mean we use the structure induced by the ith projection. By composing $p_i^{U^\sharp}$ with the canonical morphism $\Delta^n_{X^\sharp/S^\sharp,(m)}(r) \to U^\sharp$, we get the projection $p^n_{i(m)}\colon \Delta^n_{X^\sharp/S^\sharp,(m),\gamma}(r) \to X^\sharp$ and $p_{i(m)}\colon \Delta_{X^\sharp/S^\sharp,(m),\gamma}(r) \to X^\sharp$, for $i = 0, \dots, r$. We get the ring homomorphisms $p^n_{i(m)}\colon \mathcal{O}_{X^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}(r)$ and $p_{i(m)}\colon \mathcal{O}_{X^\sharp} \to \mathcal{P}_{X^\sharp/S^\sharp,(m)}(r)$. We can simply denote $p^n_{i(m)}$ by p^n_i and $p_{i(m)}$ by p_i. The m-PD-ideal of $\mathcal{P}_{X^\sharp/S^\sharp,(m)}(r)$ will be denoted by $(\mathcal{I}_{X^\sharp/S^\sharp,(m)}(r), \mathcal{J}_{X^\sharp/S^\sharp,(m)}(r), ^{[\,]})$. The m-PD-ideal of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}(r)$ will be denoted by $(\mathcal{I}^n_{X^\sharp/S^\sharp,(m)}(r), \mathcal{J}^n_{X^\sharp/S^\sharp,(m)}(r), ^{[\,]})$.

When $r = 1$, we remove "(r)" and we simply write $\psi^{n',n}_{X^\sharp/S^\sharp,(m),\gamma}$, $\Delta^n_{X^\sharp/S^\sharp,(m),\gamma}$, $\Delta_{X^\sharp/S^\sharp,(m),\gamma}$, $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}$, $\mathcal{P}_{X^\sharp/S^\sharp,(m),\gamma}$ etc. The left (resp. right) structure of $\mathcal{O}_{X^\sharp}$-algebra on $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}$ is by definition the one given by $p_{0*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}$ (resp. $p_{1*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}$). As in 3.1.2.2, we can check that $p^n_{1,(m)}, p^n_{0,(m)} \colon \Delta^n_{X^\sharp/S^\sharp,(m),\gamma} \to X^\sharp$ are strict morphisms.

If $a \in M_{X^\sharp}$, using 3.1.1.24, we denote by $\mu_{(m),\gamma}(a)$ the unique section of $\ker(\mathcal{P}^*_{X^\sharp/S^\sharp,(m),\gamma} \to \mathcal{O}^*_X)$ such that we get in $M_{X^\sharp/S^\sharp,(m),\gamma}$ the equality

$$p^*_{1,(m)}(a) = p^*_{0,(m)}(a)\mu_{(m),\gamma}(a). \tag{3.2.2.2.2}$$

We get the monoid homomorphism $\mu_{(m),\gamma} \colon M_{X^\sharp/S^\sharp,(m),\gamma} \to \ker(\mathcal{P}^*_{X^\sharp/S^\sharp,(m),\gamma} \to \mathcal{O}^*_X) = 1 + \mathcal{I}^n_{X^\sharp/S^\sharp,(m)}$ given by $a \mapsto \mu_{(m),\gamma}(a)$. Similarly we have the monoid homomorphism

$$\mu^n_{(m),\gamma} \colon M^n_{X^\sharp/S^\sharp,(m),\gamma} \to \ker(\mathcal{P}^{n*}_{X^\sharp/S^\sharp,(m),\gamma} \to \mathcal{O}^*_X) \tag{3.2.2.2.3}$$

given by the formula

$$p^{n*}_{1,(m)}(a) = p^{n*}_{0,(m)}(a)\mu^n_{(m),\gamma}(a). \tag{3.2.2.2.4}$$

3.2.2.3. Suppose $X^\sharp/S^\sharp$ is strict. Then X/S is smooth and we get $\mathcal{P}^n_{X/S,(m)} = \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$.

Proposition 3.2.2.4 (Local description of $\mathcal{P}_{X^\sharp/S^\sharp,(m),\gamma}$)**.** *Suppose f is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. Put $\tau_{\sharp\lambda(m),\gamma} := \mu_{(m),\gamma}(u_\lambda) - 1 \in \mathcal{I}_{X^\sharp/S^\sharp,(m)}$, and $\tau_{\sharp\lambda(m),\gamma,n} := \mu^n_{(m),\gamma}(u_\lambda) - 1$.*

(a) We have the following $\mathcal{O}_X$-m-PD isomorphism

$$\begin{aligned} \mathcal{O}_X\langle T_1,\dots,T_r\rangle_{(m),n} &\xrightarrow{\sim} \mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma} \\ T_\lambda &\mapsto \tau_{\sharp\lambda,(m),\gamma,n}, \end{aligned} \tag{3.2.2.4.1}$$

where the structure of $\mathcal{O}_X$-module of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}$ is given by p^n_1 or p^n_0.

(b) We have the following $\mathcal{O}_X$-m-PD isomorphism

$$\begin{aligned} \mathcal{O}_X\langle T_1,\dots,T_r\rangle_{(m)} &\xrightarrow{\sim} \mathcal{P}_{X^\sharp/S^\sharp,(m),\gamma} \\ T_\lambda &\mapsto \tau_{\sharp\lambda,(m),\gamma}, \end{aligned} \tag{3.2.2.4.2}$$

where the structure of $\mathcal{O}_X$-module of $\mathcal{P}_{X^\sharp/S^\sharp,(m),\gamma}$ is given by p_1 or p_0.

Proof. By symmetry, we can focus on the case where the structure of $\mathcal{O}_X$-module of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}$ (resp. $\mathcal{P}_{X^\sharp/S^\sharp,(m),\gamma}$) is given by p^n_0 (resp. p_0). In the first assertion (resp. the second one), we are in the situation to use formula 3.2.1.17.1 (resp. 3.2.1.17.2) in the case where $u = \Delta$ and f is the left projection $p_0 \colon X^\sharp \times_{S^\sharp} X^\sharp \to X^\sharp$. Indeed, we first remark that $(p^*_1(u_\lambda))_{\lambda=1,\dots,r}$ are logarithmic coordinates of p_0. Indeed, log étaleness is stable under base change. Since the m-PD envelope compatible with γ of order n (resp. m-PD envelope compatible with γ) of the identity of $X^\sharp$ is $X^\sharp$ (see remark 3.2.2.1), proposition 3.2.1.17 yields the result. □

Notation 3.2.2.5. With the following remarks, we can lighten the notation.

(a) From the local description 3.2.2.4.1, we get that $\mathcal{P}^n_{X^\sharp/S^\sharp,(m),\gamma}$ does not depend on the m-PD-structure (satisfying the conditions of the subsection). Hence, from now, we reduce to the case where $\gamma = \gamma_\emptyset$ (see Notation 3.2.1.2) and we remove γ in the notation: we simply write $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$, $\Delta^n_{X^\sharp/S^\sharp,(m)}$, $M^n_{X^\sharp/S^\sharp,(m)}$, $\mu^n_{(m)}$, and $\tau_{\sharp\lambda(m),n}$.

(b) From 3.2.2.4.2, $\mathcal{P}_{X^\sharp/S^\sharp,(m),\gamma}$ does not depend on the m-PD-structure (satisfying the conditions of the subsection). Hence, we can remove γ in the corresponding notation.

Remark 3.2.2.6. From the local description of 3.2.2.4, we get that the morphisms $p^n_{1,(m)}$ and $p^n_{0,(m)}$ are finite (i.e. the underlying morphism of schemes is finite). Moreover, since the composition the closed nil-immersion $X^\sharp \hookrightarrow \Delta^n_{X^\sharp/S^\sharp,(m),\gamma}$ with $p^n_{1,(m)}$ or $p^n_{0,(m)}$ is the identity, then $p^n_{1,(m)}$ or $p^n_{0,(m)}$ are homeomorphisms and $p^n_{1,(m)*} = p^n_{0,(m)*}$.

Notation 3.2.2.7. Suppose f is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,r}$. With notation 3.2.2.4, for any integer $m' \geq m$ and $n' \geq n$, we remark that the canonical map $\mathcal{P}^n_{X^\sharp/S^\sharp,(m')} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ (resp. $\mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$) sends $\tau_{\sharp\lambda(m'),n}$ to $\tau_{\sharp\lambda(m),n}$ (resp. $\tau_{\sharp\lambda(m),n'}$ to $\tau_{\sharp\lambda(m),n}$). Hence, this will be harmless to denote abusively $\tau_{\sharp\lambda(m),n}$ by $\tau_{\sharp\lambda}$. For any $\underline{k} \in \mathbb{N}^r$, we put

$$\underline{\tau}_\sharp^{\underline{k}} := \prod_{i=1}^r \tau_{\sharp i}^{k_i}, \qquad \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}} := \prod_{i=1}^r \tau_{\sharp i}^{\{k_i\}_{(m)}}. \tag{3.2.2.7.1}$$

Remark 3.2.2.8. Noticing that the main Theorem [Ogu18, IV.3.2.6] on log smoothness is valid for coherent log structures and not only fine log structures, one might wonder why we are focusing on fine log structures. The first reason we have in mind is that the important tool consisting of exactifying closed immersions (see 3.1.1.14) needs fine log structures. One might refute that in the first chapter we might replace in the definition of $\mathscr{C}_\sharp$ (see 3.1.1.10) the word fine by the word coherent (but in the other categories, e.g. $\mathscr{C}^{(m)}_{\sharp\gamma}$ we keep fine log structures). But, if we replace in 3.2.2.4 fine log structures by coherent log structures, the isomorphism 3.2.2.4.1 is not any more true: instead we have $\mathcal{O}_{X^{\mathrm{int}}}\langle T_1,\ldots,T_r\rangle_{(m),n} \xrightarrow{\sim} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$. Recall that since $X^\sharp$ is only coherent and not fine then we have in general $\mathcal{O}_{X^{\mathrm{int}}} \neq \mathcal{O}_X$.

3.2.2.9. Let $g\colon S^{\sharp\prime} \to S^\sharp$ be a morphism of fine log schemes over $\mathbb{Z}_{(p)}$, let $(I_{S'}, J_{S'}, \gamma')$ be a quasi-coherent m-PD-ideal of $\mathcal{O}_{S'}$ such that g becomes an m-PD-morphism. Put $X'^\sharp := X^\sharp \times_{S^\sharp} S'^\sharp$. We suppose that γ' extends to $X'^\sharp$. Then, the m-PD-morphism $\Delta_{X'^\sharp/S'^\sharp,(m)} \to \Delta_{X^\sharp/S^\sharp,(m)}$ induces the isomorphism $\Delta_{X'^\sharp/S'^\sharp,(m)} \xrightarrow{\sim} \Delta_{X^\sharp/S^\sharp,(m)} \times_{S^\sharp} S'^\sharp$. Indeed, since the morphisms $p_0\colon \Delta_{X^\sharp/S^\sharp,(m)} \to X^\sharp$ and $p_0\colon \Delta_{X'^\sharp/S'^\sharp,(m)} \to X'^\sharp$ are strict, then the morphism $\Delta_{X'^\sharp/S'^\sharp,(m)} \to \Delta_{X^\sharp/S^\sharp,(m)} \times_{S^\sharp} S'^\sharp$ is strict. Hence, this is sufficient to check that the morphism $g^*\mathcal{P}_{X^\sharp/S^\sharp,(m)} \to \mathcal{P}_{X'^\sharp/S'^\sharp,(m)}$ is an isomorphism. This can be checked by using the local description of 3.2.2.4.1.

3.2.2.10. Let $m' \geq m$ be two integers. Since $\mathscr{C}'^{(m)}_{\sharp n} \subset \mathscr{C}'^{(m')}_{\sharp n}$, then by using the universal property defining $\Delta^n_{X^\sharp/S^\sharp,(m')}$ we get a morphism $\psi^n_{m,m'}\colon \Delta^n_{X^\sharp/S^\sharp,(m)} \to \Delta^n_{X^\sharp/S^\sharp,(m')}$ and then the homomorphism $\psi^n_{m,m'}\colon \mathcal{P}^n_{X^\sharp/S^\sharp,(m')} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$.

From 3.2.1.12, we get $P^{\sharp n}_{(m)}(P^{\sharp n}(\Delta_{X^\sharp/S^\sharp})) = P^{\sharp n}_{(m)}(\Delta_{X^\sharp/S^\sharp})$. Hence, we get a canonical map $\psi^n_m\colon \Delta^n_{X^\sharp/S^\sharp,(m)} \to \Delta^n_{X^\sharp/S^\sharp}$ and then the homomorphism $\psi^n_m\colon \mathcal{P}^n_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$.

Now, suppose that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,r}$. With the notation of 1.2.1.3, 3.2.2.4 and 3.2.2.7, we have

$$\psi^n_{m,m'}(\underline{\tau}_\sharp^{\{\underline{k}\}_{(m')}}) = \frac{q^{(m)}_{\underline{k}}!}{q^{(m')}_{\underline{k}}!}\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}, \qquad \psi^n_m(\underline{\tau}_\sharp^{\underline{k}}) = q^{(m)}_{\underline{k}}!\,\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}. \tag{3.2.2.10.1}$$

3.2.2.11. By composing the canonical morphism $\Delta_{X^\sharp/S^\sharp,(m)}(r) \to X^{\sharp r+1}_{/S^\sharp}$ and $\Delta^n_{X^\sharp/S^\sharp,(m)}(r) \to X^{\sharp r+1}_{/S^\sharp}$ with the ith projection $p_i\colon X^{\sharp r+1}_{/S^\sharp} \to X^\sharp$ for $i = 0,\ldots,r$, we get

$$p_{i,(m)}(r)\colon \Delta^n_{X^\sharp/S^\sharp,(m)}(r) \to X^\sharp, \qquad p^n_{i,(m)}(r)\colon \Delta^n_{X^\sharp/S^\sharp,(m)}(r) \to X^\sharp. \tag{3.2.2.11.1}$$

If there are no risk of confusion, we can simply write p_i.

We denote by $\Delta_{X^\sharp/S^\sharp,(m)}(r) \times_{p_i,X^\sharp,p_{i'}} \Delta_{X^\sharp/S^\sharp,(m)}(r')$ the base change of $p_{i,(m)}(r)\colon \Delta_{X^\sharp/S^\sharp,(m)}(r) \to X^\sharp$ by $p_{i',(m)}(r')\colon \Delta_{X^\sharp/S^\sharp,(m)}(r') \to X^\sharp$. Since $p_{i,(m)}(r)$ and $p_{i',(m)}(r')$ are strict, then we can check the immersion $X^\sharp \hookrightarrow \Delta_{X^\sharp/S^\sharp,(m)}(r) \times_{p_i,X^\sharp,p_{i'}} \Delta_{X^\sharp/S^\sharp,(m)}(r')$ induced by $X^\sharp \hookrightarrow \Delta_{X^\sharp/S^\sharp,(m)}(r)$ and $X^\sharp \hookrightarrow \Delta_{X^\sharp/S^\sharp,(m)}(r')$ is an exact closed immersion. Using 3.2.2.4, we easily check this is an m-PD closed immersion (for more details, see [Ber96c, 2.1.3.(i)]). Moreover, thanks to the universal property of m-PD-envelopes, we get the m-PD-morphism $q_{(m)}(r,r')$ making commutative the diagram:

$$\begin{array}{ccccccc}
X^\sharp & \hookrightarrow & \Delta_{X^\sharp/S^\sharp,(m)}(r) \times_{p_i,X^\sharp,p_{i'}} \Delta_{X^\sharp/S^\sharp,(m)}(r') & \longrightarrow & X^{\sharp r+1}_{/S^\sharp} \times_{p_i,X^\sharp,p_{i'}} X^{\sharp r'+1}_{/S^\sharp} & \xrightarrow{p_i\times p_{i'}} & X^\sharp \times_{X^\sharp} X^\sharp \\
\| & & \downarrow{\scriptstyle q_{(m)}(r,r')} & & \downarrow\wr & & \downarrow\wr \\
X^\sharp & \hookrightarrow & \Delta_{X^\sharp/S^\sharp,(m)}(r+r') & \longrightarrow & X^{\sharp r+r'+1}_{/S^\sharp} & \xrightarrow{p_i} & X^\sharp.
\end{array} \tag{3.2.2.11.2}$$

By using again 3.2.2.4, we check that this arrow $q_{(m)}(r,r')$ is in fact an m-PD-isomorphism. Similarly, the immersion $X^\sharp \hookrightarrow \Delta^n_{X^\sharp/S^\sharp,(m)}(r) \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp,(m)}(r')$ induced by $X^\sharp \hookrightarrow \Delta^n_{X^\sharp/S^\sharp,(m)}(r)$ and $X^\sharp \hookrightarrow \Delta^{n'}_{X^\sharp/S^\sharp,(m)}(r')$ is an exact closed immersion endowed with a canonical m-PD structure of order $n+n'$ and we have the m-PD-morphism $q^{n,n'}_{(m)}(r,r')$ making commutative the diagram

$$\begin{array}{ccccccc} X^\sharp & \hookrightarrow & \Delta^n_{X^\sharp/S^\sharp,(m)}(r) \times_{p_i,X,p_{i'}} \Delta^{n'}_{X^\sharp/S^\sharp,(m)}(r') & \longrightarrow & X^{\sharp r+1}_{/S^\sharp} \times_{p_i,X,p_{i'}} X^{\sharp r'+1}_{/S^\sharp} & \xrightarrow{p_i \times p_{i'}} & X^\sharp \times_{X^\sharp} X^\sharp \\ \| & & \Big\downarrow{\scriptstyle q^{n,n'}_{(m)}(r,r')} & & \Big\downarrow \wr & & \Big\downarrow \wr \\ X^\sharp & \hookrightarrow & \Delta^{n+n'}_{X^\sharp/S^\sharp,(m)}(r+r') & \longrightarrow & X^{\sharp r+r'+1}_{/S^\sharp} & \xrightarrow{p_i} & X^\sharp . \end{array} \tag{3.2.2.11.3}$$

When $r=r'=1$, we simply write $q_{(m)}$ and $q^{n,n'}_{(m)}$.

Notation 3.2.2.12. For any integer n and any integers $0 \le i < j \le 2$, it follows from the universal property of m-PD-envelopes of order n that we get a unique m-PD-morphism $q^n_{ij,(m)} \colon \Delta^n_{X^\sharp/S^\sharp,(m)}(2) \to \Delta^n_{X^\sharp/S^\sharp,(m)}$ making commutative the diagram

$$\begin{array}{ccccccc} X^\sharp & \hookrightarrow & \Delta^n_{X^\sharp/S^\sharp,(m)}(2) & \longrightarrow & X^\sharp \times_{S^\sharp} X^\sharp \times_{S^\sharp} X^\sharp & \overset{p_i}{\underset{p_j}{\rightrightarrows}} & X^\sharp \\ \| & & \Big\downarrow{\scriptstyle q^n_{ij,(m)}} & & \Big\downarrow{\scriptstyle p_{ij}} & & \| \\ X^\sharp & \hookrightarrow & \Delta^n_{X^\sharp/S^\sharp,(m)} & \longrightarrow & X^\sharp \times_{S^\sharp} X^\sharp & \overset{p_0}{\underset{p_1}{\rightrightarrows}} & X^\sharp \end{array} \tag{3.2.2.12.1}$$

We still denote by $q^n_{ij,(m)} \colon p_{0*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \to p_{i*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}(2)$ or $q^n_{ij,(m)} \colon p_{1*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \to p_{j*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}(2)$ the corresponding homomorphism of m-PD-$\mathcal{O}_X$-algebras. We can simply write the m-PD-morphism $q^n_{ij,(m)} \colon \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}(2)$ and recall that this homomorphism is also a homomorphism of m-PD-$\mathcal{O}_X$-algebras for two structures. Similarly we denote by $q_{ij,(m)} \colon \Delta_{X^\sharp/S^\sharp,(m)}(2) \to \Delta_{X^\sharp/S^\sharp,(m)}$ making commutative the diagram 3.2.2.12.1 without the order n condition.

Notation 3.2.2.13. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. By convention, $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$ means $p^n_{1*}(\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}) \otimes_{\mathcal{O}_X} \mathcal{E}$ and $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ means $\mathcal{E} \otimes_{\mathcal{O}_X} p^n_{0*}(\mathcal{P}^n_{X^\sharp/S^\sharp,(m)})$. For instance, $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}$ is $p^n_{1*}(\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}) \otimes_{\mathcal{O}_X} p^{n'}_{0*}(\mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)})$.

We have two structures of $\mathcal{O}_X$-module on the sheaf $\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$: the "left structure" given by functoriality from the left structure of $\mathcal{P}^n_{X/S,(m)}$ and the "right structure" given by the internal tensor product. We denote by $p_{0*}(\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E})$ (resp. $p_{1*}(\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E})$) to clarify we are considering the left structure (resp. right structure).

Similarly, we denote by $p_{0*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)})$ (resp. $p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)})$) the $\mathcal{O}_X$-module given by the internal tensor product (resp. by functoriality from the right $\mathcal{O}_X$-module structure of $\mathcal{P}^n_{X/S,(m)}$) which is called the left (resp. right) structure.

We denote by $p^n_{0,\mathcal{E}} \colon \mathcal{E} \to p_{0*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X/S,(m)})$ the canonical $\mathcal{O}_X$-linear map given by $x \mapsto x \otimes \mathbb{1}$, i.e. is the composition of $\mathrm{id}_{\mathcal{E}} \otimes p^n_0$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^0_{X/S,(m)}$. We denote by $p^n_{1,\mathcal{E}} \colon \mathcal{E} \to p_{1*}(\mathcal{P}^n_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E})$ the canonical map given by $x \mapsto \mathbb{1} \otimes x$, i.e. is the composition of $p^n_1 \otimes \mathrm{id}_{\mathcal{E}}$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{P}^0_{X/S,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}$.

Notation 3.2.2.14. We simply denote by $\Delta^n_{X^\sharp/S^\sharp,(m)} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp,(m)}$ the base change of $p^{n'}_{0,(m)} \colon \Delta^{n'}_{X^\sharp/S^\sharp,(m)} \to X^\sharp$ by $p^n_{1,(m)} \colon \Delta^n_{X^\sharp/S^\sharp,(m)} \to X^\sharp$. Similarly, $X^{\sharp 2}_{/S^\sharp} \times_{p_1,X^\sharp,p_0} X^{\sharp 2}_{/S^\sharp}$ is simply denoted by $X^{\sharp 2}_{/S^\sharp} \times_{X^\sharp} X^{\sharp 2}_{/S^\sharp}$.

By composition of 3.2.2.11.3 and 3.2.2.12.1, we get

$$
\begin{array}{ccccccc}
X^{\sharp} & \hookrightarrow & \Delta^{n}_{X^{\sharp}/S^{\sharp},(m)} \times_{X^{\sharp}} \Delta^{n'}_{X^{\sharp}/S^{\sharp},(m)} & \longrightarrow \; X^{\sharp 2}_{/S^{\sharp}} \times_{X^{\sharp}} X^{\sharp 2}_{/S^{\sharp}} \xrightarrow{\sim} & X^{\sharp} \times_{S^{\sharp}} X^{\sharp} \times_{S^{\sharp}} X^{\sharp} & & \\
\| & & \downarrow{\scriptstyle q^{n,n'}_{(m)}} & & \| & & \\
X^{\sharp} & \hookrightarrow & \Delta^{n+n'}_{X^{\sharp}/S^{\sharp},(m)}(2) & \longrightarrow & X^{\sharp} \times_{S^{\sharp}} X^{\sharp} \times_{S^{\sharp}} X^{\sharp} & \overset{p_i}{\underset{p_j}{\rightrightarrows}} & X^{\sharp} \\
\| & & \downarrow{\scriptstyle q^{n+n'}_{ij,(m)}} & & \downarrow{\scriptstyle p_{ij}} & & \| \\
X^{\sharp} & \hookrightarrow & \Delta^{n+n'}_{X^{\sharp}/S^{\sharp},(m)} & \longrightarrow & X^{\sharp} \times_{S^{\sharp}} X^{\sharp} & \overset{p_0}{\underset{p_1}{\rightrightarrows}} & X^{\sharp}.
\end{array}
\tag{3.2.2.14.1}
$$

We get the morphism $p^{n,n'}_{ij,(m)} := q^{n+n'}_{ij,(m)} \circ q^{n,n'}_{(m)} : \Delta^{n}_{X^{\sharp}/S^{\sharp},(m)} \times_{X^{\sharp}} \Delta^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to \Delta^{n+n'}_{X^{\sharp}/S^{\sharp},(m)}$ (which satisfies also a universal property). The morphism $p^{n,n'}_{01,(m)}$ is the composition

$$p^{n,n'}_{01,(m)} : \Delta^{n}_{X^{\sharp}/S^{\sharp},(m)} \times_{X^{\sharp}} \Delta^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to \Delta^{n}_{X^{\sharp}/S^{\sharp},(m)} \overset{\psi^{n+n',n}_{X^{\sharp}/S^{\sharp},(m)}}{\hookrightarrow} \Delta^{n+n'}_{X^{\sharp}/S^{\sharp},(m)},$$

where the first morphism is given by the left projection. Similarly, $p^{n,n'}_{12,(m)}$ is the composition $\Delta^{n}_{X^{\sharp}/S^{\sharp},(m)} \times_{X^{\sharp}} \Delta^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to \Delta^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to \Delta^{n+n'}_{X^{\sharp}/S^{\sharp},(m)}$, where the first morphism is given by the right projection.

By composing the canonical morphism $\Delta^{n}_{X^{\sharp}/S^{\sharp},(m)} \times_{X^{\sharp}} \Delta^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to X^{\sharp} \times_{S^{\sharp}} X^{\sharp} \times_{S^{\sharp}} X^{\sharp}$ with the ith projection $p_i : X^{\sharp} \times_{S^{\sharp}} X^{\sharp} \times_{S^{\sharp}} X^{\sharp} \to X^{\sharp}$ for $i = 0, 1, 2$, we get

$$p^{n,n'}_{i,(m)} : \Delta^{n}_{X^{\sharp}/S^{\sharp},(m)} \times_{X^{\sharp}} \Delta^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to X^{\sharp}. \tag{3.2.2.14.2}$$

This yields three ring homomorphisms $p^{n,n'}_{i,(m)} : \mathcal{O}_X \to \mathcal{P}^{n}_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X,(m)}$. When $i = 0$ (resp. $i = 1$, resp. $i = 2$), this is said to be the left (resp. middle, resp right) $\mathcal{O}_X$-algebra structure of $\mathcal{P}^{n}_{X,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X,(m)}$ and this is equal to the $\mathcal{O}_X$-algebra structure given by the left structure of $\mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)}$ (resp. the tensor product, resp. the right structure of $\mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$). Using the associated universal properties, we have the equalities $p^{n,n'}_{i,(m)} = p^{n+n'}_{i,(m)}(2) \circ p^{n,n'}_{ij,(m)}$ for any $i, j = 0, 1, 2$.

We denote by $\delta^{n,n'}_{(m)} : \mathcal{P}^{n+n'}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$ (resp. $q^{n,n'}_{0(m)} : \mathcal{P}^{n+n'}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$, resp. $q^{n,n'}_{1(m)} : \mathcal{P}^{n+n'}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$) the morphism of m-PD-algebras associated to the morphism $p^{n,n'}_{02,(m)}$ (resp. $p^{n,n'}_{01,(m)}$, resp. $p^{n,n'}_{12,(m)}$). If there is no doubt on the level, we can also simply write $\delta^{n,n'}$, $q^{n,n'}_0$, $q^{n,n'}_1$.

The morphism $q^{n,n'}_{0(m)}$ is equal to the composition $q^{n,n'}_{0(m)} : \mathcal{P}^{n+n'}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$ (the last morphism is $\tau \mapsto \tau \otimes 1$). Moreover, $q^{n,n'}_{1(m)}$ is equal to the composition $q^{n,n'}_{1(m)} : \mathcal{P}^{n+n'}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$ (the last morphism is $\tau \mapsto 1 \otimes \tau$). In order words, we have the relation $q^{n,n'}_{0(m)} = \varpi^{n,n'}_{i(m)} \circ \psi^{n+n',n}_{X^{\sharp}/S^{\sharp},(m)}$ and $q^{n,n'}_{1(m)} = \varpi^{n,n'}_{i(m)} \circ \psi^{n+n',n'}_{X^{\sharp}/S^{\sharp},(m)}$, where $\varpi^{n,n'}_{0(m)} : \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$ and $\varpi^{n,n'}_{1(m)} : \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)} \to \mathcal{P}^{n}_{X^{\sharp}/S^{\sharp},(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp},(m)}$ are the homomorphisms associated with the projections. The morphism $q^{n,n'}_{0(m)}$ is $\mathcal{O}_X$-linear for the left (resp. right) structure of $\mathcal{P}^{n+n'}_{X^{\sharp}/S^{\sharp}(m)}$ and the left structure (resp. of the center) of $\mathcal{P}^{n}_{X^{\sharp}/S^{\sharp}(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp}(m)}$. Finally, the morphism $q^{n,n'}_{0(m)}$ is $\mathcal{O}_X$-linear for the left (resp. right) structure of $\mathcal{P}^{n+n'}_{X^{\sharp}/S^{\sharp}(m)}$ and the structure of the center (resp. right) of $\mathcal{P}^{n}_{X^{\sharp}/S^{\sharp}(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^{\sharp}/S^{\sharp}(m)}$.

Using the commutativity of the diagram 3.2.2.14.1, we see that $\delta^{n,n'}_{(m)}$ is also an $\mathcal{O}_X$-algebra homomorphism for the respective left structures and for the respective right structures, i.e., $\delta^{n,n'}_{(m)} \circ p^{n+n'}_{0,(m)} = p^{n,n'}_{0,(m)}$ and $\delta^{n,n'}_{(m)} \circ p^{n+n'}_{1,(m)} = p^{n,n'}_{2,(m)}$. Using the commutativity of the diagram 3.2.2.14.1, we see that the morphism

$q^{n,n'}_{0(m)}$ is $\mathcal{O}_X$-linear for the left (resp. right) structure of $\mathcal{P}^{n+n'}_{X^\sharp/S^\sharp(m)}$ and the left (resp. middle) structure of $\mathcal{P}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}$.

By using 1.4.1.11 and the universal property of the m-PD envelopes, these morphisms are compatible with the change of level and we have the commutative diagram:

$$\begin{array}{ccccc}
\mathcal{P}^{n+n'}_{X^\sharp/S^\sharp} & \longrightarrow & \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp,(m')} & \xrightarrow{\psi^{n+n'}_{m,m'}} & \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp,(m)} \\
\downarrow{\scriptstyle \delta^{n,n'}} & & \downarrow{\scriptstyle \delta^{n,n'}_{(m')}} & & \downarrow{\scriptstyle \delta^{n,n'}_{(m)}} \\
\mathcal{P}^{n}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp} & \longrightarrow & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m')} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m')} & \xrightarrow{\psi^{n}_{m,m'}\otimes\psi^{n'}_{m,m'}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}.
\end{array} \tag{3.2.2.14.3}$$

Remark 3.2.2.15. The canonical m-PD structure on $\Delta^{n}_{X^\sharp/S^\sharp,(m)} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp,(m)}$ is characterized by the following property: the projections $q^{n,n'}_{0(m)} \colon \Delta^{n}_{X^\sharp/S^\sharp,(m)} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp,(m)} \to \Delta^{n}_{X^\sharp/S^\sharp,(m)}$ and $q^{n,n'}_{1(m)} \colon \Delta^{n}_{X^\sharp/S^\sharp,(m)} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp,(m)} \to \Delta^{n'}_{X^\sharp/S^\sharp,(m)}$ are morphisms of $\mathscr{C}^{(m)}_{\sharp n+n'}$.

Notation 3.2.2.16. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. With notation 3.2.2.14), we get the following three $\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}$-modules

$$\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} := \mathcal{E} \otimes_{\mathcal{O}_X} \left(\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}\right) := p^{n,n'*}_{0(m)}(\mathcal{E}) \tag{3.2.2.16.1}$$

$$\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} := p^{n,n'*}_{1(m)}(\mathcal{E}) \tag{3.2.2.16.2}$$

$$\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} := \left(\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}\right) \otimes_{\mathcal{O}_X} \mathcal{E} := p^{n,n'*}_{2(m)}(\mathcal{E}). \tag{3.2.2.16.3}$$

Lemma 3.2.2.17. *For any $a \in M_{X^\sharp}$, for any integers $n, n' \in \mathbb{N}$, we have $\delta^{n,n'}_{(m)}(\mu^{n+n'}_{(m)}(a)) = \mu^{n}_{(m)}(a) \otimes \mu^{n'}_{(m)}(a)$.*

Proof. We fix the integers $n, n' \in \mathbb{N}$. We denote by $M^{n,n'}_{X^\sharp/S^\sharp,(m)}$ the log structure of $\Delta^{n}_{X^\sharp/S^\sharp,(m)} \times_{X^\sharp} \Delta^{n'}_{X^\sharp/S^\sharp,(m)} = \mathrm{Spec}(\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)})$. Let $a \in M_{X^\sharp}$. We denote by $\mu^{n,n'}_{i,j(m)}(a)$ the unique section of $\ker((\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)})^* \to \mathcal{O}^*_X)$ such that we get in $M^{n,n'}_{X^\sharp/S^\sharp,(m)}$ the equality $p^{n,n'}_{j,(m)}(a) = p^{n,n'}_{i,(m)}(a)\mu^{n,n'}_{i,j(m)}(a)$ (use Lemma 3.1.1.24) for any integers $i, j \in \{0, 1, 2\}$. We get

$$\mu^{n,n'}_{i,j(m)} \colon M_{X^\sharp/S^\sharp,(m),\gamma} \to \ker((\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)})^* \to \mathcal{O}^*_X)$$

given by $a \mapsto \mu^{n,n'}_{i,j(m)}(a)$. For any $i, j, k \in \{0, 1, 2\}$ we have,

$$\mu^{n,n'}_{i,j(m)}(a)\mu^{n,n'}_{j,k(m)}(a) = \mu^{n,n'}_{i,k(m)}(a). \tag{3.2.2.17.1}$$

With notation 3.2.2.2.3, 3.2.2.14.1 and 3.2.2.14.2, since $p^{n,n'}_{i,(m)} = p^{n+n'}_{0(m)} \circ p^{n,n'}_{ij,(m)}$ and $p^{n,n'}_{j,(m)} = p^{n+n'}_{1(m)} \circ p^{n,n'*}_{ij,(m)}$ then

$$\begin{aligned}
p^{n,n'*}_{j,(m)}(a) &= p^{n,n'*}_{ij,(m)}(p^{n+n'*}_1(a)) \\
&= p^{n,n'*}_{ij,(m)}(p^{n+n'*}_0(a) \cdot \mu^{n+n'}_{(m)}(a)) \\
&= p^{n,n'*}_{i,(m)}(a) \cdot p^{n,n'*}_{ij,(m)}(\mu^{n+n'}_{(m)}(a))
\end{aligned}$$

We deduce by uniqueness that

$$p^{n,n'*}_{ij,(m)}(\mu^{n+n'}_{(m)}(a)) = \mu^{n,n'}_{i,j(m)}. \tag{3.2.2.17.2}$$

Since $p^{n,n'*}_{02,(m)}(\mu^{n+n'}_{(m)}(a)) = \delta^{n,n'}_{(m)}(\mu^{n+n'}_{(m)}(a))$, since $p^{n,n'*}_{01,(m)}(\mu^{n+n'}_{(m)}(a)) = (\mu^{n+n'}_{(m)}(a)) = q^{n,n'}_{0(m)}(\mu^{n+n'}_{(m)}(a)) = \mu^{n}_{(m)}(a) \otimes 1$, since $p^{n,n'*}_{12,(m)}(\mu^{n+n'}_{(m)}(a)) = (\mu^{n+n'}_{(m)}(a)) = q^{n,n'}_{1(m)}(\mu^{n+n'}_{(m)}(a)) = 1 \otimes \mu^{n'}_{(m)}(a)$, then it follows from equations 3.2.2.17.1 and 3.2.2.17.2 that

$$\begin{aligned}\delta^{n,n'}_{(m)}(\mu^{n+n'}_{(m)}(a)) &= p^{n,n'*}_{01,(m)}(\mu^{n+n'}_{(m)}(a))p^{n,n'*}_{12,(m)}(\mu^{n+n'}_{(m)}(a)),\\ &= (\mu^{n}_{(m)}(a)\otimes 1)(1\otimes \mu^{n'}_{(m)}(a)),\\ &= \mu^{n}_{(m)}(a)\otimes \mu^{n'}_{(m)}(a).\end{aligned}$$

□

Proposition 3.2.2.18. *We have the commutative diagram:*

$$\begin{array}{ccc} \mathcal{P}^{n+n'+n''}_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\delta^{n,n'+n''}_{(m)}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'+n''}_{X^\sharp/S^\sharp,(m)} \\ \downarrow{\scriptstyle \delta^{n+n',n''}_{(m)}} & & \downarrow{\scriptstyle \mathrm{id}\otimes\delta^{n',n''}_{(m)}} \\ \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp,(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n''}_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\delta^{n,n'}_{(m)}\otimes\mathrm{id}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n''}_{X^\sharp/S^\sharp,(m)} \end{array} \quad (3.2.2.18.1)$$

Proof. Since this is local, we can suppose that f has logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. Using Lemma 3.2.2.17, we compute that the images of $\mu^{n+n'+n''}_{(m)}(u_\lambda)$ by both maps $\mathcal{P}^{n+n'+n''}_{X^\sharp/S^\sharp,(m)}\to\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n''}_{X^\sharp/S^\sharp,(m)}$ are the same and equal to $\mu^{n}_{(m)}(u_\lambda)\otimes\mu^{n'}_{(m)}(u_\lambda)\otimes\mu^{n''}_{(m)}(u)$. Since $\tau_{\sharp\lambda}:=\mu^{n}_{(m)}(u_\lambda)-1$, then so is $\tau_{\sharp\lambda}$. Since all maps of the diagram 3.2.2.18.1 are m-PD-morphisms (see 3.2.2.19 for the m-PD-structure), then by using the isomorphism 3.2.2.4.2, we get the desired commutativity. □

The following Lemma will be useful to check the associativity of the product law of the sheaf of differential operator:

Lemma 3.2.2.19. *We denote by $\Delta^{n}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}$ the base change of $p^{n'}_0\circ q^{n',n''}_0\colon\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}\to X^\sharp$ by $p^n_1\colon\Delta^{n}_{X^\sharp/S^\sharp,(m)}\to X^\sharp$. The exact closed immersion $X^\sharp\hookrightarrow\Delta^{n}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}$ induced by $X^\sharp\hookrightarrow\Delta^{n}_{X^\sharp/S^\sharp,(m)}$, $X^\sharp\hookrightarrow\Delta^{n'}_{X^\sharp/S^\sharp,(m)}$ and $X^\sharp\hookrightarrow\Delta^{n''}_{X^\sharp/S^\sharp,(m)}$ is endowed with a canonical m-PD structure. By abuse of notation, we denote by $\Delta^{n}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}$ this object of $\mathscr{C}^{(m)}_{\sharp,n+n'+n''}$. This m-PD structure on $\Delta^{n}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}$ is characterized by the following property: the projections $\Delta^{n}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}\to\Delta^{n}_{X^\sharp/S^\sharp,(m)}$, $\Delta^{n}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}\to\Delta^{n'}_{X^\sharp/S^\sharp,(m)}$, and $\Delta^{n}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n'}_{X^\sharp/S^\sharp,(m)}\times_{X^\sharp}\Delta^{n''}_{X^\sharp/S^\sharp,(m)}\to\Delta^{n''}_{X^\sharp/S^\sharp,(m)}$ are morphisms of $\mathscr{C}^{(m)}_{\sharp,n+n'+n''}$.*

Proof. This is checked similarly to 3.2.2.14. □

3.2.3 Sheaf of logarithmic differential operators of level m and finite order on log smooth schemes

We keep notation 3.2.2.

Definition 3.2.3.1. The sheaf of differential operators of level m and order $\le n$ of f is defined by putting $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}:=\mathcal{H}om_{\mathcal{O}_X}(p^n_{0,(m)*}\mathcal{P}^n_{X^\sharp/S^\sharp,(m)},\mathcal{O}_X)$. Following notation 3.2.2.2.1, for any $n'\ge n$, we have the canonical projection $\psi^{n',n*}_{X^\sharp/S^\sharp,(m)}\colon\mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}\to\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)}$. By duality, this yields the monomorphisms

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}\hookrightarrow\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n'}.$$

The sheaf of differential operators of level m of f is defined by putting $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}:=\cup_{n\in\mathbb{N}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$.

Let $P\in\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$, $P'\in\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n'}$. We define the product $PP'\in\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n+n'}$ to be the composition

$$PP'\colon\mathcal{P}^{n+n'}_{X^\sharp/S^\sharp,(m)}\xrightarrow{\delta^{n,n'}_{(m)}}\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}\xrightarrow{\mathrm{id}\otimes P'}\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)}\xrightarrow{P}\mathcal{O}_X. \quad (3.2.3.1.1)$$

Example 3.2.3.2. Suppose $X^\sharp/S^\sharp$ is strict. Then X/S is smooth and we get $\mathcal{P}^n_{X/S,(m)} = \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ (see 3.2.2.3). This yields $\mathcal{D}^{(m)}_{X/S} = \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$, where $\mathcal{D}^{(m)}_{X/S}$ is the sheaf of differential operators defined by Berthelot in 1.4.2.

Proposition 3.2.3.3. *The sheaf $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a sheaf of rings with the product as defined in 3.2.3.1.1.*

Proof. We have to check the product as defined in 3.2.3.1.1 is associative. One checks the commutativity of the diagram

$$\begin{array}{ccccccc}
\mathcal{P}^{n+n'+n''}_{X^\sharp/S^\sharp,(m)} & = & \mathcal{P}^{n+n'+n''}_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\delta^{n,n'+n''}_{(m)}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'+n''}_{X^\sharp/S^\sharp,(m)} & = & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'+n''}_{X^\sharp/S^\sharp,(m)} \\
 & & \downarrow \delta^{n+n',n''}_{(m)} & & \downarrow \mathrm{id} \otimes \delta^{n',n''}_{(m)} & & \\
 & & \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n''}_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\delta^{n,n'}_{(m)} \otimes \mathrm{id}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n''}_{X^\sharp/S^\sharp,(m)} & & \\
\downarrow (PP')P'' & & \downarrow \mathrm{id} \otimes P'' & & \downarrow \mathrm{id} \otimes \mathrm{id} \otimes P'' & & \downarrow \mathrm{id} \otimes P'P'' \\
 & & \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\delta^{n,n'}_{(m)}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} & & \\
 & & \downarrow PP' & & \downarrow \mathrm{id} \otimes P' & & \\
\mathcal{O}_X & = & \mathcal{O}_X & \xleftarrow{P} & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} & = & \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}.
\end{array} \tag{3.2.3.3.1}$$

Indeed, the commutativity of the top square of the middle was already proved (see 3.2.2.18.1). Since the commutativity of the other squares are obvious, we conclude the proof. □

Notation 3.2.3.4 (Description in logarithmic coordinates)**.** Suppose that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. With the notation 3.2.2.7, the elements $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}, |\underline{k}| \leq n\}$ form a basis of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$. The corresponding dual basis of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$ will be denoted by $\{\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}, |\underline{k}| \leq n\}$. This yields the basis (as $\mathcal{O}_X$-module for both structures) $\{\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}, \underline{k} \in \mathbb{N}^r\}$ of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

Let $\underline{\epsilon}_1, \dots, \underline{\epsilon}_r$ be the canonical basis of $\mathbb{N}^r$, i.e. the coordinates of $\underline{\epsilon}_i$ are 0 except for the ith term which is 1. We put $\partial_{\sharp i} := \underline{\partial}_\sharp{}^{\langle \underline{\epsilon}_i\rangle_{(m)}}$ and $\partial_{\sharp i}^{\langle k\rangle_{(m)}} := \underline{\partial}_\sharp{}^{\langle k\underline{\epsilon}_i\rangle_{(m)}}$ for any $k \in \mathbb{N}$.

3.2.3.5. For any $m' \geq m$, from the homomorphisms $\psi^n_{m,m'} \colon \mathcal{P}^n_{X^\sharp/S^\sharp,(m')} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ and $\psi^n_m \colon \mathcal{P}^n_{X^\sharp/S^\sharp} \to \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ of 3.2.2.10, we get by duality, the maps

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \overset{\rho_{m',m}}{\longrightarrow} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \overset{\rho_{m'}}{\longrightarrow} \mathcal{D}_{X^\sharp/S^\sharp}. \tag{3.2.3.5.1}$$

It follows from 3.1.4.3.1, 3.2.3.1.1 and the log version of 3.2.2.14.3 that the maps of 3.2.3.5.1 are homomorphisms of filtered rings.

When $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$, with notation 3.2.3.4 dualizing 3.2.2.10.1, we get the formula

$$\rho_{m',m}(\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}) = \frac{q^{(m)}_{\underline{k}}!}{q^{(m')}_{\underline{k}}!} \underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m')}} \text{ and } \rho_m(\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}) = q^{(m)}_{\underline{k}}! \underline{\partial}_\sharp^{[\underline{k}]}. \tag{3.2.3.5.2}$$

Since this is local, by using the formula 3.2.3.5.2, we can check that the filtered ring morphism

$$\rho \colon \varinjlim_m \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{D}_{X^\sharp/S^\sharp}. \tag{3.2.3.5.3}$$

induced by taking the inductive limit of ρ_m is an isomorphism. However, beware that the homomorphisms 3.2.3.5.1 are not necessarily injective.

Since $\mathcal{O}_X$ is endowed with a canonical structure of left $\mathcal{D}_{X^\sharp/S^\sharp}$-module (see 3.1.4.5), then this induces a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{O}_X$. It follows from 3.1.4.5.1 and 3.2.3.5.1 that the structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{O}_X$ is given via the formula

$$P(f) := P \circ p^n_{1(m)}(f). \tag{3.2.3.5.4}$$

Notation 3.2.3.6. For $P \in \Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n})$, with notation 3.2.2.2.3 define $P \colon M^n_{X^\sharp/S^\sharp,(m),\gamma} \times \mathcal{O}_X \to \mathcal{O}_X$ by:

$$P(a,x) = P(\mu^n_{(m)}(a) {p^n_{1,(m)}}^*(x)). \tag{3.2.3.6.1}$$

For any $n' \geq n$, we can also view P as an element of $\Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n'})$ but we remark that the formula 3.2.3.6.1 does not depend on n such that $P \in \Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n})$.

For any $a \in M$ and any $x \in \mathcal{O}_X$, we write simply $P(x) = P(0,x)$ and $P_a(x) = P(a,x)$. Following 3.2.3.5.4 that $\mathcal{O}_X$ is a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module and that $P(x)$ corresponds to the action of P on x, i.e. the notation are compatible.

Proposition 3.2.3.7. *Suppose f is endowed with logarithmic coordinates $(u_1, \ldots, u_r)$. With notations 1.2.1.3 and 3.2.3.4, we have the following properties.*

(a) For any $x \in \Gamma(X, \mathcal{O}_X)$, $s \in \Gamma(X, M_{X^\sharp})$, we have the following Taylor formulas:

$$p^n_{1,(m)}(x) = \sum_{|\underline{k}| \leq n} p^n_{0,(m)}(\underline{\partial}^{\langle \underline{k} \rangle}_\sharp(x)) \underline{\tau}^{\{\underline{k}\}}_\sharp, \qquad \mu^n_{(m)}(s) = \sum_{|\underline{k}| \leq n} \underline{\partial}^{\langle \underline{k} \rangle}(s,1) \underline{\tau}^{\{\underline{k}\}}_\sharp. \tag{3.2.3.7.1}$$

(b) For any $x \in \Gamma(X, \mathcal{O}_X)$ and $\underline{k} \in \mathbb{N}^r$, we have in $\Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$

$$\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_\sharp x = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{k} - \underline{i} \rangle_{(m)}}_\sharp (x) \underline{\partial}^{\langle \underline{i} \rangle_{(m)}}_\sharp. \tag{3.2.3.7.2}$$

Proof. a) Both Taylor formulas 3.2.3.7.1 come from the fact that $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_\sharp, |\underline{k}| \leq n\}$ is the dual basis of $\{\underline{\tau}^{\{\underline{k}\}_{(m)}}_\sharp, |\underline{k}| \leq n\}$ (recall $\underline{\partial}^{\langle \underline{k} \rangle}_\sharp(s,1) = \underline{\partial}^{\langle \underline{k} \rangle}_\sharp(\mu^n_{(m)}(s))$).

b) We do the same computation than in 1.4.2.7.b. □

Lemma 3.2.3.8. *Let $\Phi \in \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$ and $\Psi \in \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n'}$, $a, a' \in M_{X^\sharp}$ and $x \in \mathcal{O}_X$. Then:*

(a) $\Phi(a', \alpha_X(a)x) = \alpha_X(a)\Phi(a \cdot a', x)$,

(b) $(\Phi \circ \Psi)(a,x) = \Phi(a, \Psi(a,x))$.

Proof. With notation 3.1.1.23, since, $p^{n*}_{i,(m)}(\alpha_X(a)) = \alpha(p^{n*}_{i,(m)}(a))$ (recall, $p^n_{i,(m)}$ is a morphism of log schemes), then it follows from 3.2.2.2.4 that $p^{n*}_{1,(m)}(\alpha_X(a)) = p^{n*}_{0,(m)}(\alpha_X(a))\mu^n_{(m)}(a)$. Since the morphism $\mu^n_{(m)}$ of 3.2.2.2.3 is a monoid morphism, by $\mathcal{O}_X$-linearity of Φ, then we check a) as follows:

$$\begin{aligned} \Phi(a', \alpha_X(a)x) &= \Phi\left(\mu^n_{(m)}(a') p^{n*}_{1,(m)}(\alpha_X(a)x)\right) \\ &= \Phi\left(\mu^n_{(m)}(a') p^{n*}_{1,(m)}(\alpha_X(a)) p^{n*}_{1,(m)}(x)\right) \\ &= \Phi\left(\mu^n_{(m)}(a') p^{n*}_{0,(m)}(\alpha_X(a)) \mu^n_{(m)}(a) p^{n*}_{1,(m)}(x)\right) \\ &= \alpha_X(a)\Phi\left(\mu^n_{(m)}(a \cdot a') p^{n*}_{1,(m)}(x)\right) \\ &= \alpha_X(a)\Phi(a \cdot a', x). \end{aligned}$$

b) Fix $a \in M_{X^\sharp}$. Omit $S^\sharp$ in the notations. Consider the following diagram

$$\begin{array}{ccccccc} \mathcal{O}_X & \xrightarrow{\mu^{n'}_{(m)}(a) p^{n'*}_{1,(m)}} & \mathcal{P}^{n'}_{X^\sharp,(m)} & \xrightarrow{\Psi} & \mathcal{O}_X & & \\ \downarrow{\scriptstyle \mu^{n+n'}_{(m)}(a) p^{n+n'*}_{1,(m)}} & & \downarrow{\scriptstyle \mu^n_{(m)}(a) \otimes \mathrm{id}} & & \downarrow{\scriptstyle \mu^n_{(m)}(a) p^{n*}_{1,(m)}} & \searrow^{\Phi_a} & \\ \mathcal{P}^{n+n'}_{X^\sharp,(m)} & \xrightarrow[\delta^{n,n'}_{(m)}]{} & \mathcal{P}^n_{X^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp,(m)} & \xrightarrow[\mathrm{id} \otimes \Psi]{} & \mathcal{P}^n_{X^\sharp,(m)} & \xrightarrow[\Phi]{} & \mathcal{O}_X \end{array} \quad , \tag{3.2.3.8.1}$$

where $\mu^n_{(m)}(a) \otimes \mathrm{id}$ is the morphism given by $e' \mapsto \mu^n_{(m)}(a) \otimes e'$, where $id \otimes \Psi$ is the morphism given by $e \otimes e' \mapsto e p^{n*}_{1,(m)}(\Psi(e'))$. The right triangle commutes by definition of Φ_a. Via a straightforward computation, we get that the middle square commutes. It remains to check the commutativity of the left square. On one hand,

$$(\mu^n_{(m)}(a)\otimes id)\circ(\mu^{n'}_{(m)}(a)p^{n'*}_{1,(m)})(x)=\mu^n_{(m)}(a)\otimes\mu^{n'}_{(m)}(a)p^{n'*}_{1,(m)}(x).$$

Since $\delta^{n,n'}_{(m)}$ is a homomorphism of $\mathcal{O}_X$-algebras for the right structures (more precisely, see 3.2.2.14), then we get $\delta^{n,n'}_{(m)}(p^{n+n'*}_{1,(m)}(x))=1\otimes p^{n'*}_{1,(m)}(x)$. With the formula 3.2.2.17, then we get

$$\begin{aligned}\delta^{n,n'}_{(m)}(\mu^{n+n'}_{(m)}(a)p^{n+n'*}_{1,(m)}(x))&=\delta^{n,n'}_{(m)}(\mu^{n+n'}_{(m)}(a))\delta^{n,n'}_{(m)}(p^{n+n'*}_{1,(m)}(x))\\&=(\mu^n_{(m)}(a)\otimes\mu^{n'}_{(m)}(a))\cdot(1\otimes p^{n'*}_{1,(m)}(x))\\&=\mu^n_{(m)}(a)\otimes\mu^{n'}_{(m)}(a)p^{n'*}_{1,(m)}(x).\end{aligned}$$

Hence, the diagram 3.2.3.8.1 is commutative. The composition above of 3.2.3.8.1 is $\Phi_a\circ\Psi_a$ and that below is $(\Phi\circ\Psi)_a$. This proves b). □

3.2.3.9 (Comparison of the local description of differential operators with or without logarithmic structure)**.** Suppose $X^\sharp/S^\sharp$ is strict and there exists coordinates $(t_\lambda)_{\lambda=1,\dots,r}$ of $X^\sharp/S^\sharp$ (see definition 3.1.1.21).

(a) Copying the proof of 1.3.3.11, we get the following isomorphism of m-PD-$\mathcal{O}_X$-algebras

$$\begin{aligned}\mathcal{O}_X\langle T_1,\dots,T_r\rangle_{(m),n}&\xrightarrow{\sim}\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}\\T_\lambda&\mapsto\tau_\lambda,\end{aligned}\qquad(3.2.3.9.1)$$

where $\tau_\lambda:=p_1^*(t_\lambda)-p_0^*(t_\lambda)$. The elements $\{\underline{\tau}^{\{\underline{k}\}_{(m)}}\}_{|\underline{k}|\leq n}$ form a basis of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$. The corresponding dual basis of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$ will be denoted by $\{\underline{\partial}^{\langle\underline{k}\rangle_{(m)}}\}_{|\underline{k}|\leq n}$.

(b) Consider the following diagram

$$\begin{array}{ccc}Y^\sharp & \xrightarrow{u} & A_{\mathbb{N}^r}\times T^\sharp\\ \downarrow{\scriptstyle f} & & \downarrow\\ X^\sharp & \xrightarrow{t} & \mathbb{A}^r\times S^\sharp\end{array}\qquad(3.2.3.9.2)$$

where the right arrow is induced by a morphism of fine log schemes of the form $T^\sharp\to S^\sharp$ and by the canonical morphism $A_{\mathbb{N}^r}\to\mathbb{A}^r$, the bottom arrow is induced by the coordinates $(t_\lambda)_{\lambda=1,\dots,r}$ and where the top arrow is induced by the logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. Let $\underline{\tau}_\sharp$ (resp. $\underline{\partial}_\sharp{}^{\langle\underline{k}\rangle_{(m)}}$) be the element constructed from $(u_\lambda)_{\lambda=1,\dots,r}$ (resp. $(t_\lambda)_{\lambda=1,\dots,r}$) as defined in 3.2.2.4 (resp. 3.2.3.4) and according to notation 3.2.2.7. Then the functorial morphism $f^*\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}\to\mathcal{P}^n_{Y^\sharp/T^\sharp,(m)}$ (see 3.2.3.17) is explicitly described by

$$\underline{\tau}^{\{\underline{k}\}_{(m)}}\mapsto\underline{t}^{\underline{k}}\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}},\qquad(3.2.3.9.3)$$

where the action of $\underline{t}^{\underline{k}}$ is induced by the left structure of $\mathcal{O}_Y$-algebra of $\mathcal{P}^n_{Y^\sharp/T^\sharp,(m)}$. Indeed, since $f^*\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}\to\mathcal{P}^n_{Y^\sharp/T^\sharp,(m)}$ is an m-PD-morphism, we reduce to compute the image of τ_i. We compute the image of τ_i is $1\otimes u_i-u_i\otimes 1=u_i\tau_{i\sharp}=t_i\tau_{i\sharp}$ (recall definition 3.2.2.4 of $\tau_{i\sharp,(m)}$). Moreover, by duality, we get $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}\to f^*\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ (see 3.2.3.17) is explicitly described by

$$\underline{\partial}_\sharp{}^{\langle\underline{k}\rangle_{(m)}}\mapsto\underline{t}^{\underline{k}}\underline{\partial}^{\langle\underline{k}\rangle_{(m)}}.\qquad(3.2.3.9.4)$$

(c) Suppose now that the t_λ's lie in $\Gamma(X,\mathcal{O}_X^*)$. Then $(t_\lambda)_{\lambda=1,\dots,r}$ are also logarithmic coordinates of $X^\sharp/S^\sharp$ (see definition 3.1.1.20). We have

$$\underline{\tau}^{\{\underline{k}\}_{(m)}}=p_0^*(\underline{t}^{\underline{k}})\underline{\tau}_{\sharp(m)}^{\{\underline{k}\}_{(m)}}\quad\text{and}\quad\underline{\partial}_\sharp{}^{\langle\underline{k}\rangle_{(m)}}=\underline{t}^{\underline{k}}\underline{\partial}^{\langle\underline{k}\rangle_{(m)}},\qquad(3.2.3.9.5)$$

where $\underline{\tau}_{\sharp(m)}$ (resp. $\underline{\partial}_\sharp{}^{\langle\underline{k}\rangle_{(m)}}$) is defined in 3.2.2.4 (resp. 3.2.3.4).

Lemma 3.2.3.10. *Suppose that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,r}$. With notation 3.2.3.4, we have the formula*

$$\delta^{n,n'}_{(m)}(\tau_{\sharp i}) = \tau_{\sharp i} \otimes \tau_{\sharp i} + \tau_{\sharp i} \otimes 1 + 1 \otimes \tau_{\sharp i}. \tag{3.2.3.10.1}$$

Proof. This is a consequence of 3.2.2.17:

$$\begin{aligned}\delta^{n,n'}_{(m)}(\tau_{\sharp i}) &= \delta^{n,n'}_{(m)}(\mu^{n+n'}_{(m)}(u_i) - 1) = \delta^{n,n'}_{(m)}(\mu^{n+n'}_{(m)}(u_i)) - 1 \\ &\overset{3.2.2.17}{=} \mu^{n}_{(m)}(u_i) \otimes \mu^{n'}_{(m)}(u_i) - 1 = (\tau_{\sharp i} + 1) \otimes (1 + \tau_{\sharp i}) - 1 = \tau_{\sharp i} \otimes \tau_{\sharp i} + \tau_{\sharp i} \otimes 1 + 1 \otimes \tau_{\sharp i}.\end{aligned}$$

□

Lemma 3.2.3.11. *Suppose f is endowed with logarithmic coordinates $(u_1, \ldots, u_r)$. We set $t_\lambda := \alpha_{X^\sharp}(u_\lambda)$, for any $\lambda = 1, \ldots, r$. Let $\underline{n}, \underline{k} \in \mathbb{N}^r$. We write $\underline{u}^{\underline{n}} := \prod_{i=1}^r u_i^{n_i}$, $\underline{t}^{\underline{n}} := \prod_{i=1}^r t_i^{n_i}$. With notation 3.2.3.4 we have the following formulas.*

(a) If $\underline{k} \leq \underline{n}$ (see convention 1.2.1.3), then $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(\underline{u}^{\underline{n}}, 1) = \underline{q}_{\underline{k}}^{(m)}!\binom{\underline{n}}{\underline{k}}$. If $\underline{k} \not\leq \underline{n}$ then $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(\underline{u}^{\underline{n}}, 1) = 0$.

(b) If $\underline{k} \leq \underline{n}$, then $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(\underline{t}^{\underline{n}}) = \underline{q}_{\underline{k}}^{(m)}!\binom{\underline{n}}{\underline{k}}\underline{t}^{\underline{n}-\underline{k}}$. Otherwise, $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(\underline{t}^{\underline{n}}) = 0$.

(c) We have the formula $\frac{\underline{k}!}{\underline{q}_{\underline{k}}^{(m)}!}\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}} = \prod_{0 \leq \underline{k}' < \underline{k}}(\underline{\partial}_\sharp - \underline{k}')$,

where $\underline{k}' < \underline{k}$ means $k'_i < k_i$ for any i.

Proof. a) By definition (see 3.2.3.6.1), we compute:

$$\begin{aligned}\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(\underline{u}^{\underline{n}}, 1) &\overset{3.2.3.6.1}{=} \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}\left(\mu^{|\underline{k}|}_{(m)}(\underline{u}^{\underline{n}})\right) = \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}\left(\prod_{j=1}^r \mu^{|\underline{k}|}_{(m)}(u_j)^{n_j}\right) \\ &= \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}\left(\prod_{j=1}^r (\tau_{\sharp j} + 1)^{n_j}\right) = \underline{\partial}_\sharp^{\langle \underline{k} \rangle}\left(\prod_{j=1}^r \sum_{l_j=0}^{n_j} \binom{n_j}{l_j} \tau_{\sharp j}^{l_j}\right) \\ &= \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}\left(\prod_{j=1}^r \sum_{l_j=0}^{n_j} \binom{n_j}{l_j} q_{l_j}^{(m)}!\tau_{\sharp j}^{\{l_j\}_{(m)}}\right) \\ &= \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}\left(\sum_{\underline{l}=\underline{0}}^{\underline{n}} \binom{\underline{n}}{\underline{l}} \underline{q}_{\underline{l}}^{(m)}!\underline{\tau}_\sharp^{\{\underline{l}\}_{(m)}}\right).\end{aligned}$$

When $\underline{k} \leq \underline{n}$, this yields

$$\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}\left(\sum_{\underline{l}=\underline{0}}^{\underline{n}} \binom{\underline{n}}{\underline{l}} \underline{q}_{\underline{l}}^{(m)}!\underline{\tau}_\sharp^{\{\underline{l}\}_{(m)}}\right) = \underline{q}_{\underline{k}}^{(m)}!\binom{\underline{n}}{\underline{k}}, \tag{3.2.3.11.1}$$

and otherwise this is null. Hence we are done.

b) By using the formula 3.2.3.8.(a) in the case where $a = \underline{u}^{\underline{n}}$, $a' = 0$ and $x = 1$ and next 3.2.3.11.a, since $\alpha(\underline{u}^{\underline{n}}) = \underline{t}^{\underline{n}}$, then we get $\underline{\partial}_\sharp^{\langle \underline{k} \rangle}(0, \underline{t}^{\underline{n}}) = \underline{t}^{\underline{n}}\underline{\partial}_\sharp^{\langle \underline{k} \rangle}(\underline{u}^{\underline{n}}, 1) = \underline{t}^{\underline{n}}\underline{q}_{\underline{k}}^{(m)}!\binom{\underline{n}}{\underline{k}}$.

c) We calculate $\delta^{n,n'}_{(m)}(\underline{\tau}_\sharp^{\{\underline{k}\}})$ as follows. Since $q^{n,n'}_{1(m)} \colon \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \to \mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}$ is an m-PD-morphism (see 3.2.2.14), then by using 1.2.4.5.c, we have

$$(\tau_{\sharp i} \otimes \tau_{\sharp i})^{\{\alpha\}} = ((\tau_{\sharp i} \otimes 1) \cdot (1 \otimes \tau_{\sharp i}))^{\{\alpha\}} = (\tau_{\sharp i}^{\alpha} \otimes 1) \cdot (1 \otimes \tau_{\sharp i})^{\{\alpha\}} = (\tau_{\sharp i}^{\alpha} \otimes 1) \cdot (1 \otimes \tau_{\sharp i}^{\{\alpha\}}) = q_\alpha^{(m)}!\tau_{\sharp i}^{\{\alpha\}} \otimes \tau_{\sharp i}^{\{\alpha\}}.$$

Since $\delta^{n,n'}_{(m)}$, $q^{n,n'}_{0(m)}$ and $q^{n,n'}_{1(m)}$ are m-PD morphisms, with the formulas of 1.2.4.5 (e.g. 1.2.4.5.2 and 1.2.4.5.3), then we have

$$\begin{aligned}
\delta^{n,n'}_{(m)}(\tau_{\sharp i}^{\{k_i\}}) &= \delta^{n,n'}_{(m)}(\tau_{\sharp i})^{\{k_i\}} \overset{3.2.3.10.1}{=} (\tau_{\sharp i}\otimes\tau_{\sharp i}+\tau_{\sharp i}\otimes 1+1\otimes\tau_{\sharp i})^{\{k_i\}}\\
&= \sum_{\alpha=0}^{k_i}\left\langle {k_i \atop \alpha}\right\rangle (\tau_{\sharp i}\otimes\tau_{\sharp i})^{\{\alpha\}}(\tau_{\sharp i}\otimes 1+1\otimes\tau_{\sharp i})^{\{k_i-\alpha\}}\\
&= \sum_{\alpha=0}^{k_i}\left\langle {k_i \atop \alpha}\right\rangle q^{(m)}_{\alpha}!\tau_{\sharp i}^{\{\alpha\}}\otimes\tau_{\sharp i}^{\{\alpha\}}\left(\sum_{\beta+\gamma=k_i-\alpha}\left\langle {k_i-\alpha \atop \beta}\right\rangle (1\otimes\tau_{\sharp i}^{\{\beta\}})(\tau_{\sharp i}^{\{\gamma\}}\otimes 1)\right)\\
&= \sum_{\alpha+\beta+\gamma=k_i}\left\langle {k_i \atop \alpha}\right\rangle\left\langle {k_i-\alpha \atop \beta}\right\rangle q^{(m)}_{\alpha}!(\tau_{\sharp i}^{\{\alpha\}}\otimes\tau_{\sharp i}^{\{\alpha\}})(1\otimes\tau_{\sharp i}^{\{\beta\}})(\tau_{\sharp i}^{\{\gamma\}}\otimes 1)\\
&= \sum_{\alpha+\beta+\gamma=k_i}\left\langle {k_i \atop \alpha}\right\rangle\left\langle {k_i-\alpha \atop \beta}\right\rangle q^{(m)}_{\alpha}!\tau_{\sharp i}^{\{\alpha\}}\tau_{\sharp i}^{\{\gamma\}}\otimes\tau_{\sharp i}^{\{\alpha\}}\tau_{\sharp i}^{\{\beta\}}\\
&= \sum_{\alpha+\beta+\gamma=k_i}\left\langle {k_i \atop \alpha}\right\rangle\left\langle {k_i-\alpha \atop \beta}\right\rangle q^{(m)}_{\alpha}!\left\{ {\alpha+\gamma \atop \alpha}\right\}\left\{ {\alpha+\beta \atop \alpha}\right\}\tau_{\sharp i}^{\{\alpha+\gamma\}}\otimes\tau_{\sharp i}^{\{\alpha+\beta\}}\\
&= \sum_{\alpha+\beta+\gamma=k_i}\binom{k_i}{\alpha}\binom{k_i-\alpha}{\beta}\frac{q^{(m)}_{\alpha+\gamma}!q^{(m)}_{\alpha+\beta}!}{q^{(m)}_{k_i}!}\tau_{\sharp i}^{\{\alpha+\gamma\}}\otimes\tau_{\sharp i}^{\{\alpha+\beta\}}.
\end{aligned}$$

Hence we deduce that

$$\delta^{n,n'}_{(m)}(\underline{\tau}_{\sharp}^{\{\underline{k}\}}) = \sum_{\underline{\alpha}+\underline{\beta}+\underline{\gamma}=\underline{k}}\binom{\underline{k}}{\underline{\alpha}}\binom{\underline{k}-\underline{\alpha}}{\underline{\beta}}\frac{q^{(m)}_{\underline{\alpha}+\underline{\gamma}}!q_{\underline{\alpha}+\underline{\beta}}!}{q^{(m)}_{\underline{k}}!}\underline{\tau}_{\sharp}^{\{\underline{\alpha}+\underline{\gamma}\}}\otimes\underline{\tau}_{\sharp}^{\{\underline{\alpha}+\underline{\beta}\}}. \tag{3.2.3.11.2}$$

Since $\underline{\partial}_{\sharp}^{\langle\underline{l}\rangle}\partial_{\sharp i,} = \underline{\partial}_{\sharp}^{\langle\underline{l}\rangle}\circ(id\otimes\partial_{\sharp i})\circ\delta^{n,n'}_{(m)}$, then it follows from 3.2.3.11.2 that $\underline{\partial}_{\sharp}^{\langle\underline{l}\rangle}\partial_{\sharp i,}(\underline{\tau}_{\sharp}^{\{\underline{k}\}})\neq 0$ if and only if there exists $\underline{\alpha},\underline{\beta},\underline{\gamma}\in\mathbb{N}^r$ such that $\underline{\alpha}+\underline{\beta}+\underline{\gamma}=\underline{k}$, $\underline{\alpha}+\underline{\gamma}=l$ and $\underline{\alpha}+\underline{\beta}=\underline{\varepsilon}_i$. We have two cases: either $\underline{\alpha}=\underline{\varepsilon}_i$, $\underline{\beta}=\underline{0}$, $\underline{\gamma}=\underline{l}-\underline{\varepsilon}_i$ and $\underline{k}=\underline{l}$ or $\underline{\alpha}=\underline{0}$, $\underline{\beta}=\underline{\varepsilon}_i$, $\underline{\gamma}=\underline{l}$ and $\underline{k}=\underline{l}+\underline{\varepsilon}_i$. Hence, we compute:

$$\underline{\partial}_{\sharp}^{\langle\underline{l}\rangle}\partial_{\sharp i,} = l_i\underline{\partial}_{\sharp}^{\langle\underline{l}\rangle}+(l_i+1)\frac{q^{(m)}_{l_i}!}{q^{(m)}_{l_i+1}!}\underline{\partial}_{\sharp}^{\langle\underline{l}+\underline{\varepsilon}_i\rangle} = l_i\underline{\partial}_{\sharp}^{\langle\underline{l}\rangle}+(l_i+1)\frac{q^{(m)}_{\underline{l}}!}{q^{(m)}_{\underline{l}+\underline{\varepsilon}_i}!}\underline{\partial}_{\sharp}^{\langle\underline{l}+\underline{\varepsilon}_i\rangle}. \tag{3.2.3.11.3}$$

Since $(l_i+1)=\frac{(\underline{l}+\underline{\varepsilon}_i)!}{\underline{l}!}$, then we get the first equality from 3.2.3.11.3:

$$\frac{(\underline{l}+\underline{\varepsilon}_i)!}{q^{(m)}_{\underline{l}+\underline{\varepsilon}_i}!}\underline{\partial}_{\sharp}^{\langle\underline{l}+\underline{\varepsilon}_i\rangle} = \frac{\underline{l}!}{q^{(m)}_{\underline{l}}!}\underline{\partial}_{\sharp}^{\langle\underline{l}\rangle}(\partial_{\sharp i,}-l_i).$$

By induction on $|\underline{k}|$, this yields

$$\frac{(\underline{l}+\underline{\varepsilon}_i)!}{q^{(m)}_{\underline{l}+\underline{\varepsilon}_i}!}\underline{\partial}_{\sharp}^{\langle\underline{l}+\underline{\varepsilon}_i\rangle} = \left(\prod_{0\leq\underline{n}<\underline{l}}(\partial_{\sharp i}-n_i)\right)(\partial_{\sharp i,}-l_i) = \prod_{0\leq\underline{n}<\underline{l}+\underline{\varepsilon}_i}(\partial_{\sharp i}-n_i).$$

□

Remark 3.2.3.12. It follows from part c) of the above lemma that in characteristic p we have

$$(\underline{\partial}_{\sharp}^{\langle\underline{\varepsilon}_i\rangle_{(1)}})^p = \underline{\partial}^{\langle\underline{\varepsilon}_i\rangle_{(1)}}.$$

Indeed, according to the lemma,

$$(\underline{\partial}_{\sharp}^{\langle\underline{\varepsilon}_i\rangle_{(1)}})^p - \underline{\partial}^{\langle\underline{\varepsilon}_i\rangle_{(1)}} = \prod_{j=0}^{p-1}(\underline{\partial}_{\langle\underline{\varepsilon}_i\rangle}-j) = p!\underline{\partial}_{\langle p\underline{\varepsilon}_i\rangle} = 0.$$

From this we deduce that the p-curvature of the canonical connection associated to a $\mathcal{D}^{(1)}_X$-module $\mathcal{E}$ is zero. In fact the p-curvature of ∇ is $\psi(\nabla)(\partial) = \nabla(\partial)^p - \nabla(\partial^{(p)})$. Then $\nabla(\partial_{\sharp i}) = (id \otimes \partial_{\sharp i}) \circ \nabla = \underline{\partial}_{\sharp i}$ and $\partial^{(p)}_{\sharp i} = \partial_{\sharp i}$. Thus $\psi(\nabla)(\partial_{\sharp i}) = 0$.

Lemma 3.2.3.13. *Suppose f is endowed with logarithmic coordinates $(u_1, \dots, u_r)$. With notations 1.2.1.3 and 3.2.3.4, for any $\underline{k}'$, $\underline{k}'' \in \mathbb{N}^r$, we have the formula*

$$\underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle_{(m)}} \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle_{(m)}} = \sum_{\underline{k}=\sup\{\underline{k}',\underline{k}''\}}^{\underline{k}'+\underline{k}''} \frac{\underline{k}!}{(\underline{k}'+\underline{k}''-\underline{k})!(\underline{k}-\underline{k}')!(\underline{k}-\underline{k}'')!} \frac{q^{(m)}_{\underline{k}'}!q^{(m)}_{\underline{k}''}!}{q^{(m)}_{\underline{k}}!} \underline{\partial}_{\sharp}^{\langle \underline{k} \rangle_{(m)}}, \qquad (3.2.3.13.1)$$

with $\frac{\underline{k}!}{(\underline{k}'+\underline{k}''-\underline{k})!(\underline{k}-\underline{k}')!(\underline{k}-\underline{k}'')!} \frac{q^{(m)}_{\underline{k}'}!q^{(m)}_{\underline{k}''}!}{q^{(m)}_{\underline{k}}!} \in \mathbb{Z}_{(p)}$.

Proof. Let $\underline{k}$, $\underline{k}'$, $\underline{k}'' \in \mathbb{N}^r$. If $\underline{k}'' \leq \underline{k}$, then it follows from 3.2.3.11.2 that we have

$$(id \otimes \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle}) \circ \delta^{n,n'}_{(m)}(\underline{\tau}_{\sharp}^{\{\underline{k}\}}) = \sum_{\underline{\alpha}=0}^{\underline{k}''} \binom{\underline{k}}{\underline{\alpha}} \binom{\underline{k}-\underline{\alpha}}{\underline{k}''-\underline{\alpha}} \frac{q^{(m)}_{\underline{k}-\underline{k}''+\underline{\alpha}}!q^{(m)}_{\underline{k}''}!}{q^{(m)}_{\underline{k}}!} \underline{\tau}_{\sharp}^{\{\underline{k}-\underline{k}''+\underline{\alpha}\}}. \qquad (3.2.3.13.2)$$

When $\underline{k}'' \not\leq \underline{k}$ the left hand side of 3.2.3.13.2 is 0. Since we have

$$\underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle}(\underline{\tau}_{\sharp}^{\{\underline{k}\}}) := \underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \circ (id \otimes \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle}) \circ \delta^{n,n'}_{(m)}(\underline{\tau}_{\sharp}^{\{\underline{k}\}}), \qquad (3.2.3.13.3)$$

then from 3.2.3.13.2, the term 3.2.3.13.3 is not null if and only if there exists $0 \leq \underline{\alpha} \leq \underline{k}''$ such that $\underline{k} - \underline{k}'' + \underline{\alpha} = \underline{k}'$, i.e. $\underline{k} = (\underline{k}'' - \underline{\alpha}) + \underline{k}'$. This is equivalent to saying that $\sup\{\underline{k}', \underline{k}''\} \leq \underline{k} \leq \underline{k}' + \underline{k}''$. In that case, we compute

$$\underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle}(\underline{\tau}_{\sharp}^{\{\underline{k}\}}) := \underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \circ (id \otimes \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle}) \circ \delta^{n,n'}_{(m)}(\underline{\tau}_{\sharp}^{\{\underline{k}\}}) = \frac{\underline{k}!}{(\underline{k}'+\underline{k}''-\underline{k})!(\underline{k}-\underline{k}')!(\underline{k}-\underline{k}'')!} \frac{q^{(m)}_{\underline{k}'}!q^{(m)}_{\underline{k}''}!}{q^{(m)}_{\underline{k}}!}$$

and the lemma follows.

It follows from 1.2.1.5.a that we have the equalities in $\mathbb{Z}_{(p)}$:

$$\left\langle \begin{matrix} \underline{\alpha}+\underline{\beta}+\underline{\gamma} \\ \underline{\alpha} \end{matrix} \right\rangle \left\langle \begin{matrix} \underline{\beta}+\underline{\gamma} \\ \underline{\beta} \end{matrix} \right\rangle q^{(m)}_{\underline{\alpha}}! \left\{ \begin{matrix} \underline{\alpha}+\underline{\gamma} \\ \underline{\alpha} \end{matrix} \right\} \left\{ \begin{matrix} \underline{\alpha}+\underline{\beta} \\ \underline{\alpha} \end{matrix} \right\} = \binom{\underline{\alpha}+\underline{\beta}+\underline{\gamma}}{\underline{\alpha}} \binom{\underline{\beta}+\underline{\gamma}}{\underline{\beta}} \frac{q^{(m)}_{\underline{\alpha}+\underline{\gamma}}!q_{\underline{\alpha}+\underline{\beta}}!}{q^{(m)}_{\underline{\alpha}+\underline{\beta}+\underline{\gamma}}!}$$
$$= \frac{(\underline{\alpha}+\underline{\beta}+\underline{\gamma})!}{\underline{\alpha}!\underline{\beta}!\underline{\gamma}!} \frac{q^{(m)}_{\underline{\alpha}+\underline{\gamma}}!q_{\underline{\alpha}+\underline{\beta}}!}{q^{(m)}_{\underline{\alpha}+\underline{\beta}+\underline{\gamma}}!}. \qquad (3.2.3.13.4)$$

Replacing $\underline{\alpha}$, $\underline{\beta}$, $\underline{\gamma}$ by respectively $\underline{k}' + \underline{k}'' - \underline{k}$, $\underline{k} - \underline{k}'$, $\underline{k} - \underline{k}''$ we are done. ☐

Remark 3.2.3.14. With its notation, it follows from the formula 3.2.3.13, the following assertions.

(a) We have $\underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \circ \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle} = \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle} \circ \underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle}$.

(b) In general, contrary to the non-logarithmic formula (see 1.4.2.7.c) the equality $\underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle} = \left\langle \begin{matrix} \underline{k}'+\underline{k}'' \\ \underline{k}' \end{matrix} \right\rangle_{(m)} \underline{\partial}_{\sharp}^{\langle \underline{k}'+\underline{k}'' \rangle}$ is false but it becomes true modulo the operator of less order i.e.

$$\underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle} - \left\langle \begin{matrix} \underline{k}' - \underline{k}'' \\ \underline{k}' \end{matrix} \right\rangle_{(m)} \underline{\partial}_{\sharp}^{\langle \underline{k}'+\underline{k}'' \rangle} \in \oplus_{\sup\{\underline{k}',\underline{k}''\} \leq \underline{k} < \underline{k}'+\underline{k}''} \mathbb{Z}_{(p),X} \underline{\partial}_{\sharp}^{\langle \underline{k} \rangle} \subset \oplus_{|\underline{k}| < |\underline{k}'+\underline{k}''|-1} \mathbb{Z}_{(p),X} \underline{\partial}_{\sharp}^{\langle \underline{k} \rangle}.$$
(3.2.3.14.1)

(c) In the particular case where $\underline{k}'$, $\underline{k}'' \in \mathbb{N}^r$ have disjoint supports, we get $\underline{\partial}_{\sharp}^{\langle \underline{k}' \rangle} \circ \underline{\partial}_{\sharp}^{\langle \underline{k}'' \rangle} = \underline{\partial}_{\sharp}^{\langle \underline{k}'+\underline{k}'' \rangle}$. For any $\underline{k} \in \mathbb{N}^r$, this yields the formula

$$\underline{\partial}_{\sharp}^{\langle \underline{k} \rangle} = \partial_{\sharp,1}^{\langle k_1 \rangle} \circ \partial_{\sharp,2}^{\langle k_2 \rangle} \cdots \partial_{\sharp,r}^{\langle k_r \rangle}. \qquad (3.2.3.14.2)$$

(d) Suppose m is finite. If $\underline{k} = p^m \underline{q} + \underline{r}$ with $0 \leq r_i < p^m$, if $r_i = \sum_{j=0}^{m-1} a_{i,j} p^j$ with $0 \leq a_{i,j} < p$, then by using 3.2.3.14.1, following the computations of 1.4.2.8.3 we get

$$\underline{\partial}_\sharp^{\langle \underline{k} \rangle} - u_{\underline{k}} \prod_{i=1}^{p} \left(\prod_{j=0}^{m-1} (\partial_{\sharp,i}^{\langle p^j \rangle})^{a_{i,j}} \right) (\partial_{\sharp,i}^{[p^m]})^{q_i} \in \oplus_{|\underline{l}|<|\underline{k}|-1} \mathbb{Z}_{(p),X} \underline{\partial}_\sharp^{\langle \underline{l} \rangle}. \tag{3.2.3.14.3}$$

for some invertible elements $u_{\underline{k}}$ in $\mathbb{Z}_{(p)}^*$.

Proposition 3.2.3.15. *Suppose m is finite. Suppose f is endowed with logarithmic coordinates $(u_1, \ldots, u_r)$. With notation3.2.3.4, the sheaf $\mathcal{D}_{X^\sharp/S^\sharp}^{(m)}$ is generated as $\mathcal{O}_S$-algebra by $\mathcal{O}_X$ and the two by two commuting operators $\partial_{\sharp,i}, \partial_{\sharp,i}^{\langle p \rangle}, \cdots, \partial_{\sharp,i}^{\langle p^m \rangle}$, $1 \leq i \leq r$.*

More precisely, fix $1 \leq i \leq r$. Then, for any $0 \leq j \leq m$, for any $0 \leq k < p^j$, the operator $\partial_{\sharp,i}^{\langle k \rangle}$ belongs to the sub $\mathbb{Z}_{(p)}$-algebra of $\mathcal{D}_{X^\sharp/S^\sharp}^{(m)}$ generated by $\partial_{\sharp,i}, \partial_{\sharp,i}^{\langle p \rangle}, \cdots, \partial_{\sharp,i}^{\langle p^{j-1} \rangle}$. Moreover, for any $k \in \mathbb{N}$, $\partial_{\sharp,i}^{\langle k \rangle}$ belongs to the sub $\mathbb{Z}_{(p)}$-algebra of $\mathcal{D}_{X^\sharp/S^\sharp}^{(m)}$ generated by $\partial_{\sharp,i}, \partial_{\sharp,i}^{\langle p \rangle} \cdots, \partial_{\sharp,i}^{\langle p^m \rangle}$.

Proof. It follows from 3.2.3.14.2 that we reduce to check the proposition without multi-indices. By doing an induction on $|\underline{k}|$ and by using 3.2.3.14.3, we conclude. □

Proposition 3.2.3.16. *Suppose m is finite. We have the following properties.*

(a) The graded ring gr $\mathcal{D}_{X^\sharp/S^\sharp}^{(m)}$ associated to the order filtration $(\mathcal{D}_{X^\sharp/S^\sharp,n}^{(m)})_{n\in\mathbb{N}}$ is a commutative ring. If $X^\sharp/S^\sharp$ is endowed with logarithmic coordinates, the relation $\underline{\partial}_\sharp^{\langle \underline{k} \rangle} \underline{\partial}_\sharp^{\langle \underline{h} \rangle} = \left\langle \begin{smallmatrix} \underline{k}+\underline{h} \\ \underline{k} \end{smallmatrix} \right\rangle \underline{\partial}_\sharp^{\langle \underline{k}+\underline{h} \rangle}$ becomes exact in $\operatorname{gr} \mathcal{D}_{X^\sharp/S^\sharp}^{(m)}$.

(b) Suppose S be a locally noetherian scheme. Let U be an affine open of X (resp. $x \in X$). Then $\Gamma(U, \operatorname{gr}\ \mathcal{D}_{X^\sharp/S^\sharp}^{(m)})$ (resp. $D_U^{(m)} := \Gamma(U, \mathcal{D}_{X^\sharp/S^\sharp}^{(m)})$, resp. $\operatorname{gr}\ \mathcal{D}_{X^\sharp/S^\sharp,x}^{(m)}$, resp. $\mathcal{D}_{X^\sharp/S^\sharp,x}^{(m)}$) is left and right noetherian.

(c) For any inclusion of affine opens of X of the form $V \subset U$, the canonical morphism $\Gamma(U, \mathcal{D}_{X^\sharp/S^\sharp}^{(m)}) \to \Gamma(V, \mathcal{D}_{X^\sharp/S^\sharp}^{(m)})$ is flat.

(d) Suppose S be a locally noetherian scheme. Then the sheaf of rings $\mathcal{D}_{X^\sharp/S^\sharp}^{(m)}$ is right and left coherent.

Proof. The first statement is a consequence of 3.2.3.14.1 and of 3.2.3.7.2. By replacing Proposition 1.4.2.10 by 3.2.3.15, to check the second assertion we can simply copy the proof of 1.4.2.11.(b). Finally, we get the last two statements by copying the proof of 1.4.5.3. □

3.2.3.17. Let $g\colon S'^\sharp \to S^\sharp$ be a morphism of fine log schemes over $\mathbb{Z}_{(p)}$. Consider the commutative diagram

$$\begin{array}{ccc} X'^\sharp & \xrightarrow{f} & X^\sharp \\ \downarrow{\scriptstyle \pi_{X'^\sharp}} & & \downarrow{\scriptstyle \pi_{X^\sharp}} \\ S'^\sharp & \xrightarrow{g} & S^\sharp \end{array} \tag{3.2.3.17.1}$$

such that $\pi_{X^\sharp}$ and $\pi_{X'^\sharp}$ are formal log smooth of level m. Using the universal property of the m-PD envelope, we get the m-PD-morphism $f^*\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \to \mathcal{P}^n_{X'^\sharp/S'^\sharp,(m)}$. This yields the morphism $\mathcal{D}^{(m)}_{X'^\sharp/S'^\sharp,n} \to f^*\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$ and then $\mathcal{D}^{(m)}_{X'^\sharp/S'^\sharp} \to f^*\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

When the diagram 3.2.3.17.1 is cartesian (in the category of fine log schemes), the morphism $f^*\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \to \mathcal{P}^n_{X'^\sharp/S'^\sharp,(m)}$ is in fact an isomorphism of rings and so is $\mathcal{D}^{(m)}_{X'^\sharp/S'^\sharp} \to f^*\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

When $g = \mathrm{id}$ and f is formally log étale of level m, then the morphism $f^*\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \to \mathcal{P}^n_{X'^\sharp/S^\sharp,(m)}$ is in fact an isomorphism and so is $\mathcal{D}^{(m)}_{X'^\sharp/S^\sharp} \to f^*\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

3.2.4 Increasing the level: finiteness of the tor-dimension

Let $S^\sharp$ be a nice fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$, where $i \geq 0$ is an integer (see definition 3.1.1.1). Moreover, let $X^\sharp \to S^\sharp$ be a log smooth morphism of log schemes. Let $m \in \mathbb{N}$ be an integer.

Proposition 3.2.4.1. Suppose S is of characteristic $p > 0$. Suppose that $X^\sharp$ have logarithmic coordinates $t_1, \ldots, t_d$.

(a) For any integer q, we have $\left(\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}\right)^q = v_{m,q}\partial_{\sharp,i}^{\langle p^{m+1}q\rangle_{(m)}}$, with $v_{m,q} \in \mathbb{Z}_{(p)}^*$.

(b) The center of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ contains the polynomial algebra with coefficients in $\mathcal{O}_{X^{(m+1)}}$ in the operators $\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}$.

(c) For any integer $q \geq 0$, $0 \leq r \leq p^{m+1} - 1$, by setting $k := p^{m+1}q + r$, we have $\partial_{\sharp,i}^{\langle k\rangle_{(m)}} = u_{m,k}\left(\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}\right)^q \partial_{\sharp,i}^{\langle r\rangle_{(m)}}$, for $i = 1, \ldots, d$, with $u_{m,k} \in \mathbb{Z}_{(p)}^*$.

(d) Let $\mathcal{K}_{(m)}$ be the set whose elements are the finite sums of the form $\sum_{\underline{k}\not< p^{m+1}} a_{\underline{k}}\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$, with $a_{\underline{k}} \in \mathcal{O}_X$ and $\underline{k} \not< p^{m+1}$ meaning that $k_i \geq p^{m+1}$ for at least one $1 \leq i \leq d$. Then $\mathcal{K}_{(m)}$ is the two-sided ideal of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ generated by the operators $\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}$.

Proof. Following 1.4.4.1, both $t_i^{p^{m+1}}$ and $\partial_i^{\langle p^{m+1}\rangle_{(m)}}$ are in the center of $\mathcal{D}^{(m)}_{U/S^\sharp}$. Since $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to j_{U*}\mathcal{D}^{(m)}_{U/S^\sharp}$ is an injective morphism of rings then $\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}} = t_i^{p^{m+1}}\partial_i^{\langle p^{m+1}\rangle_{(m)}}$ is in the center of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. Hence, a and b is a consequence of 1.4.4.1.a and 1.4.4.1.d. Moreover, it follows from 1.4.4.1 that $\partial_i^{\langle k\rangle_{(m)}} = u_{m,k}\left(\partial_i^{\langle p^{m+1}\rangle_{(m)}}\right)^q \partial_i^{\langle r\rangle_{(m)}}$, for $i = 1, \ldots, d$, with $u_{m,k} \in \mathbb{Z}_{(p)}^*$. This yields

$$\partial_{\sharp,i}^{\langle k\rangle_{(m)}} = t_i^k\partial_i^{\langle k\rangle_{(m)}} = u_{m,k}t_i^r\left(\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}\right)^q\partial_i^{\langle r\rangle_{(m)}} = u_{m,k}\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}\partial_{\sharp,i}^{\langle r\rangle_{(m)}},$$

the last equality being a consequence of the fact that $\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}$ is in the center of $\mathcal{D}^{(m)}_{U/S^\sharp}$. Finally, c implies d. □

The following proposition is the logarithmic version of 1.4.4.2.

Proposition 3.2.4.2. Suppose that $X^\sharp$ have logarithmic coordinates $t_1, \ldots, t_d$. Let $m' \geq m+1$ be an integer.

(a) The kernel of the canonical homomorphism $\rho^{(m,m')} \colon \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ is $\mathcal{K}_{(m)}$, the two-sided ideal of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ generated by the operators $\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}}$.

(b) Moreover, $\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ is free on the image of $\rho^{(m,m')}$, with the operators of the form $\underline{\partial}_\sharp^{\langle p^{m+1}\underline{n}\rangle_{(m')}}$, $\underline{n} \in \mathbb{N}^d$ as a basis.

Proof. Suppose that $X^\sharp$ have logarithmic coordinates $t_1, \ldots, t_d$. It follows from the computations of the proof of 1.4.4.2 (in particular, the three last lignes) that the kernel of $\rho^{(m,m')}$ is By using 3.2.4.1.c, this yields that $\partial_{\sharp,i}^{\langle p^{m+1}\rangle_{(m)}} = t_i^{p^{m+1}}\partial_i^{\langle p^{m+1}\rangle_{(m)}}$ generates $\partial_{\sharp,i}^{\langle k\rangle_{(m)}} = t_i^k\partial_i^{\langle k\rangle_{(m)}}$ for $k \geq p^{m+1}$. This yields the result for the kernel. This implies, that the image of $\rho^{(m,m')}$ is the set of finite sums of the form $\sum_{\underline{k}<p^{m+1}} a_{\underline{k}}\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m')}}$, where $\underline{k} < p^{m+1}$ means $k_i < p^{m+1}$ for any $i = 1, \ldots, d$ (we use that $\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}} = \underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m')}}$ for $\underline{k} < p^{m+1}$). For $\underline{r} < p^{m+1}$, $\underline{q} \geq 0$ (i.e. $q_i \geq 0$ for any $i = 1, \ldots, d$) and $\underline{k} = p^{m+1}\underline{q} + \underline{r}$, by using 1.4.2.7.(c) we have $\underline{\partial}^{\langle \underline{k}\rangle_{(m')}} = \underline{\partial}^{\langle \underline{r}\rangle_{(m')}} \cdot \underline{\partial}^{\langle p^{m+1}\underline{q}\rangle_{(m')}}$. Since $t_i^{p^{m+1}}$ is in the center of $\mathcal{D}^{(m)}_P$, then $t_i^{p^{m+1}}$ is in the center of the image of $\rho^{(m,m')}$. Since $\underline{\partial}^{\langle \underline{r}\rangle_{(m')}}$ is in this image, this yields that $\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m')}} = \underline{\partial}_\sharp^{\langle \underline{r}\rangle_{(m')}} \cdot \underline{\partial}_\sharp^{\langle p^{m+1}\underline{q}\rangle_{(m')}}$. Hence we are done. □

Corollary 3.2.4.3. *Suppose p is locally nilpotent on S. For any $m' > m$, $\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ has left and right tor-dimension d over $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.*

Proof. Similarly to 1.4.4.4, this follows from the proposition 3.2.4.2. □

3.3 Sheaf of differential operators of finite order on logarithmic formal schemes

Let $\mathcal{V}$ be complete discrete valuation ring of mixed characteristic $(0, p)$. We denote by $\mathfrak{S} := \mathrm{Spf}\ \mathcal{V}$ be the p-adic formal scheme, i.e. such that $p\mathcal{V}$ is an ideal of definition. A formal $\mathcal{V}$-scheme (or formal $\mathfrak{S}$-scheme) is by definition an adic morphism of the form $\mathfrak{X} \to \mathfrak{S}$ (in the sense of [Gro60, 10.12], i.e. we assume that a $\mathcal{V}$-formal scheme is always locally noetherian). We recall that Shiho introduced the notion of $\mathcal{V}$-log formal schemes (see [Shi00, 2.1.1.(4)]) as follows: A $\mathcal{V}$-log formal scheme $\mathfrak{X}^\sharp$ is a formal $\mathcal{V}$-scheme $\mathfrak{X}$ endowed with a logarithmic structure $\alpha\colon M_{\mathfrak{X}^\sharp} \to \mathcal{O}_{\mathfrak{X}}$ (this means that α is a logarithmic morphism of sheaves of monoids for the étale topology over $\mathfrak{X}^\sharp$, i.e. α is such that $\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}}) \to \mathcal{O}^*_{\mathfrak{X}}$ is an isomorphism). When $M_{\mathfrak{X}^\sharp}$ is fine as sheaf for the étale topology over the special fiber of $\mathfrak{X}^\sharp$ (i.e. when $M_{\mathfrak{X}^\sharp}$ is integral and $M_{\mathfrak{X}^\sharp}$ is coherent in the sense defined at the end of the remark [Ogu18, II.2.1.5]), we say that the logarithmic structure $M_{\mathfrak{X}^\sharp}$ is fine. We say that $\mathfrak{X}^\sharp$ is a "fine $\mathcal{V}$-log formal scheme" if $M_{\mathfrak{X}^\sharp}$ is fine.

Let $i \geq 0$ be an integer. We set $S_i := \mathrm{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$. If $\mathfrak{X}^\sharp$ is a fine $\mathcal{V}$-log formal scheme and $i \in \mathbb{N}$, then we denote by $X^\sharp_i$ the fine log S_i-scheme so that $X_i := \mathfrak{X} \times_{\mathfrak{S}} S_i$ and the morphism $X^\sharp_i \to \mathfrak{X}^\sharp$ is strict. For $i = 0$, we can simply denote $X^\sharp_0$ by $X^\sharp$. If $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ is a morphism of fine $\mathcal{V}$-log formal schemes, then we denote by $f_i\colon X^\sharp_i \to Y^\sharp_i$ the induced morphism of fine S_i-log schemes. We remark that if $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ is a morphism of fine $\mathfrak{S}$-log formal schemes, then $f_i\colon X^\sharp_i \to Y^\sharp_i$ is a morphism of fine log S_i-schemes.

3.3.1 From log schemes to formal log schemes

3.3.1.1 (Charts for $\mathfrak{S}$ log formal schemes)**.** Let P be a fine monoid and $\mathcal{V}\{P\}$ be the p-adic completion of $\mathcal{V}[P]$. Since $\mathcal{V}$ is fixed, we denote by $\mathfrak{A}_P$ the fine $\mathcal{V}$-log formal scheme whose underlying formal $\mathcal{V}$-scheme is $\mathrm{Spf}(\mathcal{V}\{P\})$ and whose log structure is the log structure associated with the pre-log structure induced canonically by $P \to \mathcal{V}\{P\}$.

Let $\mathfrak{X}^\sharp$ be a fine $\mathfrak{S}$-log formal scheme. We denote by $P_{\mathfrak{X}^\sharp}$ the sheaf associated to the constant presheaf of P over $\mathfrak{X}^\sharp$. Following Shiho's definition of [Shi00, 2.1.7], a chart of $\mathfrak{X}^\sharp$ is a morphism of monoids $\alpha\colon P_{\mathfrak{X}^\sharp} \to \mathcal{O}_{\mathfrak{X}}$ whose associated log structure is isomorphic to $M_{\mathfrak{X}^\sharp} \to \mathcal{O}_{\mathfrak{X}}$. A chart of $\mathfrak{X}^\sharp$ is equivalent to the data of a strict morphism of the form $\mathfrak{X}^\sharp \to \mathfrak{A}_P$.

Lemma 3.3.1.2. *Let $\mathfrak{X}^\sharp$ be a fine $\mathfrak{S}$-log formal scheme. Let $i \geq 0$ be an integer. Then, the morphisms $\mathcal{O}^*_{\mathfrak{X}} \to \mathcal{O}^*_{X^\sharp_i}$ and $M_{\mathfrak{X}^\sharp} \to M_{X^\sharp_i}$ are surjective.*

Proof. The fact that $\mathcal{O}^*_{\mathfrak{X}} \to \mathcal{O}^*_{X^\sharp_i}$ is surjective comes from the fact that $\mathcal{O}_{\mathfrak{X}}$ is complete for the p-adic topology. The fact that $M_{\mathfrak{X}^\sharp} \to M_{X^\sharp_i}$ is surjective is étale local on $\mathfrak{X}^\sharp$. Hence, we can suppose there exists a fine monoid P and a morphism of sheaves of monoids $\alpha\colon P_{\mathfrak{X}^\sharp} \to \mathcal{O}_{\mathfrak{X}}$ (here $P_{\mathfrak{X}^\sharp}$ means the sheaf associated to the constant presheaf of P over $\mathfrak{X}^\sharp$) which induces the isomorphism of sheaves of monoids $P_{\mathfrak{X}^\sharp} \oplus_{\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}})} \mathcal{O}^*_{\mathfrak{X}} \xrightarrow{\sim} M_{\mathfrak{X}^\sharp}$ and the isomorphism $P_{X^\sharp_i} \oplus_{\alpha_i^{-1}(\mathcal{O}^*_{X^\sharp_i})} \mathcal{O}^*_{X^\sharp_i} \xrightarrow{\sim} M_{X^\sharp_i}$. Since $\mathcal{O}^*_{\mathfrak{X}} \to \mathcal{O}^*_{X^\sharp_i}$ is surjective, we conclude.

□

Proposition 3.3.1.3. Let $\mathfrak{X}^\sharp$ be a fine $\mathfrak{S}$-log formal scheme. Then, in the category of fine $\mathfrak{S}$-log formal schemes, $\mathfrak{X}^\sharp$ is the inductive limit of the system $(X^\sharp_i)_i$.

Proof. From [Gro60, I.10.6.1], $\underline{\mathfrak{X}}$ is the inductive limit of the system $(\underline{X}_i)_i$. It remains to check that the canonical morphism of sheaves of monoids $M_{\mathfrak{X}^\sharp} \to \varprojlim_i M_{X^\sharp_i}$ is an isomorphism. Since this is étale local on $\mathfrak{X}^\sharp$ and since $\mathfrak{X}^\sharp$ is fine then we can suppose there exists a fine monoid P and a morphism of sheaves of monoids $\alpha\colon P_{\mathfrak{X}^\sharp} \to \mathcal{O}_{\mathfrak{X}}$ which induces the isomorphism of sheaves of monoids $P_{\mathfrak{X}^\sharp} \oplus_{\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}})} \mathcal{O}^*_{\mathfrak{X}} \xrightarrow{\sim} M_{\mathfrak{X}^\sharp}$. Let $i \geq 0$ be an integer. We get the morphism of sheaves of monoids $\alpha_i\colon P_{X_i^\sharp} \to \mathcal{O}_{X_i^\sharp}$ which induces the isomorphism $P_{X_i^\sharp} \oplus_{\alpha_i^{-1}(\mathcal{O}^*_{X_i^\sharp})} \mathcal{O}^*_{X_i^\sharp} \xrightarrow{\sim} M_{X_i^\sharp}$. Hence, we reduce to prove that the canonical map $P_{\mathfrak{X}^\sharp} \oplus_{\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}})} \mathcal{O}^*_{\mathfrak{X}} \to \varprojlim_i P_{X_i^\sharp} \oplus_{\alpha_i^{-1}(\mathcal{O}^*_{X_i^\sharp})} \mathcal{O}^*_{X_i^\sharp}$ is an isomorphism. We put $\mathcal{F}_i := P_{X_i^\sharp}\text{“}\oplus\text{”}_{\alpha_i^{-1}(\mathcal{O}^*_{X_i^\sharp})}\mathcal{O}^*_{X_i^\sharp}$ where “ $\oplus$ ” means that the amalgamated sum is computed in the category of presheaves. We put $\mathcal{E}_i := P_{X_i^\sharp} \oplus \mathcal{O}^*_{X_i^\sharp}$, $\theta_i\colon \mathcal{E}_i \to \mathcal{F}_i$ the canonical surjective morphism, $\mathcal{G}_i := P_{X_i^\sharp} \oplus_{\alpha_i^{-1}(\mathcal{O}^*_{X_i^\sharp})} \mathcal{O}^*_{X_i^\sharp}$ and $\epsilon_i\colon \mathcal{F}_i \to \mathcal{G}_i$ the canonical morphism from a presheaf to its associated sheaf. We put $\phi_i := \epsilon_i \circ \theta_i$. We denote by $\pi_i\colon \mathcal{O}^*_{X_{i+1}^\sharp} \to \mathcal{O}^*_{X_i^\sharp}$, $\pi_i\colon \mathcal{E}_{i+1} \to \mathcal{E}_i$ $\pi_i\colon \mathcal{F}_{i+1} \to \mathcal{F}_i$, $\pi_i\colon \mathcal{G}_{i+1} \to \mathcal{G}_i$ the canonical projections. Let $\mathfrak{U} \to \mathfrak{X}$ be an étale map such that $\mathfrak{U}$ is connected.

1) Let $s_{i+1} \in \mathcal{F}_{i+1}(U_{i+1})$ and $s_i := \pi_i(s_{i+1}) \in \mathcal{F}_i(U_i)$. Then the canonical map $\pi_i\colon \theta_{i+1}^{-1}(s_{i+1}) \to \theta_i^{-1}(s_i)$ induced by $\pi_i\colon \mathcal{E}_{i+1}(U_{i+1}) \to \mathcal{E}_i(U_i)$ is a bijection.

a) Let us check the injectivity. Let $(x,a),(x',a') \in \theta_{i+1}^{-1}(s_{i+1})$ such that $\pi_i(x,a) = \pi_i(x',a')$ (where $x, x' \in P$ and $a, a' \in \mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1})$). The latter equality yields $x = x'$. Since P is integral, $\theta_{i+1}(x,a) = \theta_{i+1}(x,a')$ implies $a = a'$ (for the computation, use the remark of [Kat89, 1.3]).

b) Let us check the surjectivity. Let $(y,b) \in \theta_i^{-1}(s_i)$. We remark that $\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}})(\mathfrak{U}) = \alpha_i^{-1}(\mathcal{O}^*_{X_i^\sharp})(U_i)$ and we denote it by Q. Since θ_{i+1} is an epimorphism (in the category of presheaves) then there exists $(x,a) \in \theta_{i+1}^{-1}(s_{i+1})$. Since $\pi_i(x,a) = (x, \pi_i(a)) \in \theta_i^{-1}(s_i)$, there exists $q, q' \in Q(U_i)$ such that $\pi_i(a)\alpha_i(q) = b\alpha_i(q')$ and $xq' = yq$ (see the remark of [Kat89, 1.3]). Set $a' := a\alpha_{i+1}(q)\alpha_{i+1}(q')^{-1}$. Then $\pi_i(a') = b$ and $\theta_{i+1}(x,a) = \theta_{i+1}(y,a')$, i.e. $\pi_i(y,a') = (y,b)$ and $(y,a') \in \theta_{i+1}^{-1}(s_{i+1})$.

2) Let $t_{i+1} \in \mathcal{G}_{i+1}(U_{i+1})$ and $t_i := \pi_i(t_{i+1}) \in \mathcal{G}_i(U_i)$. Then the canonical map $\pi_i\colon \phi_{i+1}^{-1}(t_{i+1}) \to \phi_i^{-1}(t_i)$ is a bijection.

a) Let us check the injectivity. Let $r, r' \in \phi_{i+1}^{-1}(t_{i+1})$ such that $\pi_i(r) = \pi_i(r')$. There exists an étale covering $(\mathfrak{U}_\lambda \to \mathfrak{U})_\lambda$ of $\mathfrak{U}$ such that $\theta_{i+1}(r)|U_\lambda = \theta(r')_{i+1}|U_\lambda$. From 1) (applied for $\mathfrak{U}_\lambda$ instead of $\mathfrak{U}$), this yields $r|U_\lambda = r'|U_\lambda$. Hence, $r = r'$.

b) Let us check the surjectivity. Let $r \in \phi_i^{-1}(t_i)$. Put $s := \theta_i(r)$. There exist an étale covering $(\mathfrak{U}_\lambda \to \mathfrak{U})_\lambda$ of $\mathfrak{U}$ and sections $s_\lambda \in \mathcal{F}_{i+1}(U_\lambda)$ such that $\epsilon_{i+1}(s_\lambda) = t_{i+1}|U_\lambda$ and $\pi_i(s_\lambda) = s|U_\lambda$. From 1.b), there exists $r_\lambda \in \mathcal{E}_{i+1}(U_\lambda)$ such that $\pi_i(r_\lambda) = r|U_\lambda$ and $\theta_{i+1}(r_\lambda) = s_\lambda$. Hence, $\pi_i(r_\lambda) = r|U_\lambda$ and $\phi_{i+1}(r_\lambda) = t_{i+1}|U_\lambda$. From 2.a), this yields that $(r_\lambda)_\lambda$ come from a section of $\mathcal{E}_{i+1}(U_{i+1})$.

3) Now, let us check that the canonical map $P_{\mathfrak{X}^\sharp} \oplus_{\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}})} \mathcal{O}^*_{\mathfrak{X}} \to \varprojlim_i P_{X_i^\sharp} \oplus_{\alpha_i^{-1}(\mathcal{O}^*_{X_i^\sharp})} \mathcal{O}^*_{X_i^\sharp}$ is an isomorphism. First, we start with the injectivity. As above, put $\mathcal{E} := P_{\mathfrak{X}^\sharp} \oplus \mathcal{O}^*_{\mathfrak{X}}$, $\mathcal{F} := P_{\mathfrak{X}^\sharp}\text{“}\oplus\text{”}_{\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}})}\mathcal{O}^*_{\mathfrak{X}}$, $\mathcal{G} := P_{\mathfrak{X}^\sharp} \oplus_{\alpha^{-1}(\mathcal{O}^*_{\mathfrak{X}})} \mathcal{O}^*_{\mathfrak{X}}$, $\theta\colon \mathcal{E} \to \mathcal{F}$, $\epsilon\colon \mathcal{F} \to \mathcal{G}$, $\phi := \epsilon \circ \theta$. Let $(x,a),(y,b) \in \mathcal{E}(\mathfrak{U})$ such that the image of $\phi(x,a)$ and $\phi(y,b)$ in $\varprojlim_i P_{X_i^\sharp} \oplus_{\alpha_i^{-1}(\mathcal{O}^*_{X_i^\sharp})} \mathcal{O}^*_{X_i^\sharp}(\mathfrak{U})$ are equal (where $x, y \in P$, and $a, b \in \mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U})$). Since the injectivity is locally etale, we reduce to check that $\phi(x,a) = \phi(y,b)$. Denote by $(x,a_i),(y,b_i) \in \mathcal{E}_i$ the image of $(x,a),(y,b)$. Shrinking $\mathfrak{U}$ if necessary, we can suppose that $\theta_0(x,a_0) = \theta_0(y,b_0)$. Doing the same computation as in 1.b), we can check there exists $c \in \mathcal{O}^*_{\mathfrak{X}}$ such that $\theta(x,a) = \theta(y,c)$. Moreover, since P is integral, we can check that $\phi_i(y,c_i) = \phi_i(y,b_i)$ if and only if $c_i = b_i$ (since this is etale local, we reduce to check $\theta_i(y,c_i) = \theta_i(y,b_i)$ if and only if $c_i = b_i$). Hence, $b = c$, which implies $\phi(x,a) = \phi(y,b)$. Hence, we have checked the injectivity. The surjectivity is an easy consequence of 2). □

Définition 3.3.1.4. We define the category of strict inductive systems of noetherian fine log schemes over $(S_i)_{i\in\mathbb{N}}$ as follows. A strict inductive system of noetherian fine log schemes over $(S_i)_{i\in\mathbb{N}}$ is the data, for any integer $i \in \mathbb{N}$, of a noetherian fine S_i-log scheme $X_i^\sharp$, of an exact closed S_i immersion $X_i^\sharp \hookrightarrow X_{i+1}^\sharp$ such that the induced morphism $X_i^\sharp \to X_{i+1}^\sharp \times_{S_{i+1}} S_i$ is an isomorphism. A morphism $(X_i^\sharp)_{i\in\mathbb{N}} \to (Y_i^\sharp)_{i\in\mathbb{N}}$ of strict inductive systems of noetherian fine log schemes over $(S_i)_{i\in\mathbb{N}}$ is a family of S_i-morphism $X_i^\sharp \to Y_i^\sharp$ making commutative the diagram

$$\begin{array}{ccc} X_i^\sharp & \longrightarrow & X_{i+1}^\sharp \\ \downarrow & & \downarrow \\ Y_i^\sharp & \longrightarrow & Y_{i+1}^\sharp. \end{array}$$

Définition 3.3.1.5. Let X be a scheme. Let M be a sheaf (for the étale topology) of monoids over X

1. Following [Ogu18, II.1.1.3], we say that M is integral if for every $x \in X$, M_x is integral.
2. We say that M is coherent if there exists an open covering $\mathfrak{U}$ such that the restriction of M to each U in $\mathfrak{U}$ admits a chart subordinate to a finitely generated monoid (see definition [Ogu18, II.2.1.5]).
3. We say that M is fine if M is integral and coherent.
4. Let $f\colon M \to N$ be a morphism of sheaves (for the étale topology) of monoids over X. We say that f is local if the induced morphism $M^* \to M \times_N N^*$ is an isomorphism (see Definitions [Ogu18, I.4.1.1] for monoids and we have taken a similar to [Ogu18, II.1.1.4] definition for sheaves of monoids).

Lemma 3.3.1.6. *Let X be a scheme. Let $M \to N$ be a local morphism of sheaves (for the étale topology) of monoids over X. Suppose M integral, N fine. Then M is fine.*

Proof. Let us fix some notation. Let $\overline{x}$ be a geometric point of X. Since N is fine, using [Ogu18, I.1.3.3 and II.1.8.1], we can check that $\overline{N}_{\overline{x}}$ is fine. Since $\overline{M} = \overline{N}$, we get that $\overline{M}_{\overline{x}}$ is fine. Hence, there exist a free $\mathbb{Z}$-module of finite type L endowed with a morphism $\alpha\colon L \to M^{\mathrm{gr}}_{\overline{x}}$ such that the composition of α with the projection $M^{\mathrm{gr}}_{\overline{x}} \to \overline{M}^{\mathrm{gr}}_{\overline{x}}$ is surjective (following Ogus's terminology appearing in [Ogu18, II.3.3], this means $\alpha\colon L \to M^{\mathrm{gr}}_{\overline{x}}$ is a markup of $M_{\overline{x}}$). We put $P := L \times_{M^{\mathrm{gr}}_{\overline{x}}} M_{\overline{x}}$. Since $M_{\overline{x}}$ is integral, then following [Ogu18, I.4.2.1] the homomorphism of monoids $M_{\overline{x}} \to \overline{M}_{\overline{x}}$ is exact. Hence, we get the equality $P := L \times_{M^{\mathrm{gr}}_{\overline{x}}} M_{\overline{x}} = L \times_{\overline{M}^{\mathrm{gr}}_{\overline{x}}} \overline{M}_{\overline{x}}$. Following [Ogu18, I.2.1.17.6], since L and $\overline{M}_{\overline{x}}$ are fine and since $\overline{M}^{\mathrm{gr}}_{\overline{x}}$ is integral, then $P = L \times_{\overline{M}^{\mathrm{gr}}_{\overline{x}}} \overline{M}_{\overline{x}}$ is fine.

Let $P \to M_{\overline{x}}$ be the projection. Using [Ogu18, II.2.2.4], there exist an étale neighborhood $u\colon U \to X$ of $\overline{x}$ and a morphism of monoids $P \to M(U)$ inducing $P \to M_{\overline{x}}$. Let $\beta\colon P_U \to u^*M$ be the corresponding morphism. We get the factorization of β of the form $P_U \to P^{\beta}_U \xrightarrow{\beta^{\mathrm{a}}} u^*M$, where β^{a} is the log structure associated to β i.e. the homomorphism of monoids β^{a} is logarithmic and is universal for such a factorization (see [Ogu18, II.1.1.5]).

We prove that, shrinking U is necessary, the morphism β^{a} is an isomorphism (and then M is coherent). Following [Ogu18, I.4.1.2], for any geometric point $\overline{y}$ of U, since $\beta^{\mathrm{a}}_{\overline{y}}$ is sharp and since $M_{\overline{y}}$ is quasi-integral, we can check that the morphism $\beta^{\mathrm{a}}_{\overline{y}}\colon (P^{\beta}_U)_{\overline{y}} \to M_{\overline{y}}$ is an isomorphism if and only if $\overline{\beta^{\mathrm{a}}}_{\overline{y}}\colon : \overline{(P^{\beta}_U)}_{\overline{y}} \to \overline{M}_{\overline{y}}$ is an isomorphism (recall $\overline{M}_{\overline{y}} = \overline{M_{\overline{y}}}$). Using [Ogu18, II.1.8.1], we can check that the canonical morphism $P/\beta^{-1}_{\overline{y}}(M^*_{\overline{y}}) \to \overline{(P^{\beta}_U)}_{\overline{y}}$ is an isomorphism. Hence, $\beta^{\mathrm{a}}_{\overline{y}}$ is an isomorphism if and only if the canonical morphism $P/\beta^{-1}_{\overline{y}}(M^*_{\overline{y}}) \to \overline{M}_{\overline{y}}$ is an isomorphism.

Let β_0 be the composition of β with $u^*M \to u^*N$. We get the factorization of β_0 of the form $P_U \to P^{\beta_0}_U \xrightarrow{\beta^{\mathrm{a}}_0} u^*N$, where β^{a}_0 is the sharp localisation of β_0. Since $P := L \times_{M^{\mathrm{gr}}_{\overline{x}}} M_{\overline{x}} = L \times_{\overline{M}^{\mathrm{gr}}_{\overline{x}}} \overline{M}_{\overline{x}} = L \times_{\overline{N}^{\mathrm{gr}}_{\overline{x}}} \overline{N}_{\overline{x}} = L \times_{N^{\mathrm{gr}}_{\overline{x}}} N_{\overline{x}}$, since N is fine, following [Ogu18, II.3.4] (which is checked similarly than [Kat89, 2.10]), replacing U if necessary, we can suppose that β^{a}_0 is an isomorphism. For any geometric point $\overline{y}$ of U, this yields that the morphism $\beta^{\mathrm{a}}_{0,\overline{y}}\colon (P^{\beta_0}_U)_{\overline{y}} \to N_{\overline{y}}$ is an isomorphism. Hence so is $\overline{\beta^{\mathrm{a}}_0}_{\overline{y}}\colon \overline{(P^{\beta_0}_U)}_{\overline{y}} \to \overline{N}_{\overline{y}}$, i.e., $P/\beta^{-1}_{0,\overline{y}}(N^*_{\overline{y}}) \to \overline{N}_{\overline{y}}$ is an isomorphism.

Since the morphism $M \to N$ is local, the induced morphism $M^* \to M \times_N N^*$ is an isomorphism. Hence, we get $M^*_{\overline{y}} \to M_{\overline{y}} \times_{N_{\overline{y}}} N^*_{\overline{y}}$, i.e. the morphism $M_{\overline{y}} \to N_{\overline{y}}$ is local. Hence, we get $\beta^{-1}_{0,\overline{y}}(N^*_{\overline{y}}) = \beta^{-1}_{\overline{y}}(M^*_{\overline{y}})$. Recalling that $\overline{M}_{\overline{y}} = \overline{N}_{\overline{y}}$, this implies that $P/\beta^{-1}_{\overline{y}}(M^*_{\overline{y}}) \to \overline{M}_{\overline{y}}$ is an isomorphism. Hence, we are done.

□

Proposition 3.3.1.7. Let $(X^{\sharp}_i)_{i \in \mathbb{N}}$ be a strict inductive systems of noetherian fine log schemes over $(S_i)_{i \in \mathbb{N}}$. Then $\varinjlim_i X^{\sharp}_i$ is a fine $\mathfrak{S}$-log formal scheme. Moreover, the canonical morphism $X^{\sharp}_i \to (\varinjlim_i X^{\sharp}_i) \times_{\mathfrak{S}} S_i$ is an isomorphism of fine log schemes.

Proof. We already know that $\mathfrak{X} := \varinjlim_i X_i$ is a formal $\mathcal{V}$-scheme such that $X_i \xrightarrow{\sim} \underline{\mathfrak{X}} \times_{\mathfrak{S}} S_i$. We have $\varinjlim_i X^{\sharp}_i = (\varinjlim_i X_i, \varprojlim_i M_{X^{\sharp}_i})$. Put $M := \varprojlim_i M_{X^{\sharp}_i}$, $\mathfrak{X}^{\sharp} := \varinjlim_i X^{\sharp}_i$. It remains to check that M is fine log structure of $\mathfrak{X}$. This is checked in the step I).

I)1) The canonical map $\theta\colon M \to \mathcal{O}_{\mathfrak{X}}$, canonically induced by the structural morphisms $\theta_i\colon M_{X_i^\sharp} \to \mathcal{O}_{X_i^\sharp}$, is a log structure. Indeed, we compute $M^*(\mathfrak{U}) = (\varprojlim_i M_{X_i^\sharp}(U_i))^* = \varprojlim_i (M_{X_i^\sharp}(U_i))^* = \varprojlim_i M^*_{X_i^\sharp}(U_i) = \varprojlim_i \mathcal{O}^*_{X_i^\sharp}(U_i) = \mathcal{O}^*_{\mathfrak{X}^\sharp}(\mathfrak{U})$, for any etale morphism $\mathfrak{U} \to \mathfrak{X}$. Hence, $M^* = \mathcal{O}^*_{\mathfrak{X}^\sharp}$. It remains to check that the morphism $M^* \to M \times_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}^*_{\mathfrak{X}}$ is an isomorphism, i.e. $M^*(\mathfrak{U}) \to M(\mathfrak{U}) \times_{\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})} \mathcal{O}_{\mathfrak{X}}(\mathfrak{U})^*$ is an isomorphism. Since $M(\mathfrak{U}) \times_{\mathcal{O}_{\mathfrak{X}}(\mathfrak{U})} \mathcal{O}_{\mathfrak{X}}(\mathfrak{U})^* \subset M(\mathfrak{U})$, the injectivity is obvious. Let us check the surjectivity. Let $(a_i)_{i\in\mathbb{N}} \in \varprojlim_i M_{X_i^\sharp}(U_i)$ such that $(\theta_i(a_i))_{i\in\mathbb{N}} \in \varprojlim_i \mathcal{O}^*_{X_i^\sharp}(U_i)$. Since $M_{X_i^\sharp}$ is a log structure of $X_i^\sharp$, we get $a_i \in \mathcal{O}^*_{X_i^\sharp}(U_i)$, hence $(a_i)_{i\in\mathbb{N}} \in M^*(\mathfrak{U})$.

2) Let $\mathfrak{U}^\sharp \to \mathfrak{X}^\sharp$ be an etale morphism. Suppose $\mathfrak{U}$ affine. We prove in this step that the canonical morphisms $M^{\mathrm{gr}}_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) \to M^{\mathrm{gr}}_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i)$ and $M_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) \to M_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i)$ are isomorphisms. First, we remark that since $(\pi^i\mathcal{O}_{X_{i+1}^\sharp})^2 = 0$, then we have the canonical isomorphism of groups $(1+\pi^i\mathcal{O}_{X_{i+1}^\sharp}, \times) \xrightarrow{\sim} (\pi^i\mathcal{O}_{X_{i+1}^\sharp}, +)$. Since U_{i+1} is affine and $\pi^i\mathcal{O}_{X_{i+1}^\sharp}$ is quasi-coherent, this yields $H^1(U_{i+1}, 1+\pi^i\mathcal{O}_{X_{i+1}^\sharp}) = 0$. Hence, we get the commutative diagram (we use in the proof multiplicative notation)

$$\begin{array}{ccccccccc}
 & & 1 & & 1 & & & & \\
 & & \uparrow & & \uparrow & & & & \\
1 & \to & \mathcal{O}^*_{X_i^\sharp}(U_i) & \to & M^{\mathrm{gr}}_{X_i^\sharp}(U_i) & \to & M^{\mathrm{gr}}_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i) & \to & 1 \\
 & & \uparrow & & \uparrow & & \uparrow & & \\
1 & \to & \mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) & \to & M^{\mathrm{gr}}_{X_{i+1}^\sharp}(U_{i+1}) & \to & M^{\mathrm{gr}}_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) & \to & 1 \\
 & & \uparrow & & \uparrow & & & & \\
 & & 1+\pi^i\mathcal{O}_{X_{i+1}^\sharp}(U_{i+1}) & = & 1+\pi^i\mathcal{O}_{X_{i+1}^\sharp}(U_{i+1}) & & & & \\
 & & \uparrow & & \uparrow & & & & \\
 & & 1 & & 1 & & & &
\end{array} \tag{3.3.1.7.1}$$

whose two rows and two columns are exact. Hence, the morphism $M^{\mathrm{gr}}_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) \to M^{\mathrm{gr}}_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i)$ is an isomorphism. Since $M_{X_{i+1}^\sharp} \to M_{X_i^\sharp}$ is are exact closed immersion, then following this is a log thickening of finite order (see definition [Ogu18, IV.2.1.1]). Following [Ogu18, IV.2.1.2.4], this yields that we have the surjective projection $M_{X_{i+1}^\sharp}(U_{i+1}) = M^{\mathrm{gr}}_{X_{i+1}^\sharp}(U_{i+1}) \times_{M^{\mathrm{gr}}_{X_i^\sharp}(U_i)} M_{X_i^\sharp}(U_i) \to M_{X_i^\sharp}(U_i)$. Hence, $M_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) \to M_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i)$ is surjective. Since $M_{X_i^\sharp}(U_i)$ and $M_{X_{i+1}^\sharp}(U_{i+1})$ is integral, from [Ogu18, I.1.3.3], the horizontal morphisms of the commutative diagram

$$\begin{array}{ccc}
M_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) & \hookrightarrow & M^{\mathrm{gr}}_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) \\
\downarrow & & \downarrow\wr \\
M_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i) & \hookrightarrow & M^{\mathrm{gr}}_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i)
\end{array}$$

are injective. Hence, $M_{X_{i+1}^\sharp}(U_{i+1})/\mathcal{O}^*_{X_{i+1}^\sharp}(U_{i+1}) \to M_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i)$ is an isomorphism.

3) Using Mittag-Leffler condition, we get the exact sequence

$$1 \to \varprojlim_i \mathcal{O}^*_{X_i^\sharp}(U_i) \to \varprojlim_i M^{\mathrm{gr}}_{X_i^\sharp}(U_i) \to \varprojlim_i M^{\mathrm{gr}}_{X_i^\sharp}(U_i)/\mathcal{O}^*_{X_i^\sharp}(U_i) \to 1.$$

Since $\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) = \varprojlim_i \mathcal{O}^*_{X_i^\sharp}(U_i)$, using the step 2) we obtain $(\varprojlim_i M^{\mathrm{gr}}_{X_i^\sharp}(U_i))/\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) \xrightarrow{\sim} M^{\mathrm{gr}}_{X_0^\sharp}(U_0)/\mathcal{O}^*_{X_0^\sharp}(U_0)$.

By considering the commutative diagram

$$\begin{array}{ccc} (\varprojlim_i M^{\mathrm{gr}}_{X_i^\sharp}(U_i))/\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) & \xrightarrow{\sim} & M^{\mathrm{gr}}_{X_0^\sharp}(U_0)/\mathcal{O}^*_{X_0^\sharp}(U_0) \\ \uparrow & & \uparrow \\ M(\mathfrak{U})/\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) = (\varprojlim_i M_{X_i^\sharp}(U_i))/\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) & \longrightarrow & M_{X_0^\sharp}(U_0)/\mathcal{O}^*_{X_0^\sharp}(U_0) \end{array}$$

we get the injectivity of the map $M(\mathfrak{U})/\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) \to M_{X_0^\sharp}(U_0)/\mathcal{O}^*_{X_0^\sharp}(U_0)$. Since the maps $M_{X_{i+1}^\sharp}(U_{i+1}) \to M_{X_i^\sharp}(U_i)$ are surjective (this is checked in the step 2), we get that $M(\mathfrak{U}) \to M_{X_0^\sharp}(U_0)$ is surjective and then so is $M(\mathfrak{U})/\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) \to M_{X_0^\sharp}(U_0)/\mathcal{O}^*_{X_0^\sharp}(U_0)$. Hence, the canonical morphism $M(\mathfrak{U})/\mathcal{O}^*_{\mathfrak{X}}(\mathfrak{U}) \to M_{X_0^\sharp}(U_0)/\mathcal{O}^*_{X_0^\sharp}(U_0)$ is an isomorphism. This yields $\overline{M} = M/M^* = M_{X_0^\sharp}/M^*_{X_0^\sharp} = \overline{M_{X_0^\sharp}}$.

4) We compute that the induced morphism $M^* \to M \times_{M_{X_0^\sharp}} M^*_{X_0^\sharp}$ is an isomorphism, i.e. that the morphism $M \to M_{X_0^\sharp}$ is local. Hence, since $\overline{M} = \overline{M_{X_0^\sharp}}$ (see step 3), since $M_{X_0^\sharp}$ is fine and M is integral, using Lemma 3.3.1.6, we get that M is fine.

II) In this last step, we establish that $X_i^\sharp \to \mathfrak{X}^\sharp \times_{\mathfrak{S}} S_i$ is an isomorphism of fine log schemes. Let $u_i \colon X_i^\sharp \to \mathfrak{X}^\sharp$ be the canonical morphism. We already know that $\underline{X}_i \xrightarrow{\sim} \mathfrak{X} \times_{\mathfrak{S}} S_i$. It remains to check that the morphism $u_i^* M \to M_{X_i^\sharp}$ is an isomorphism. Since this is a morphism of fine log structures, then using [Ogu18, I.4.1.2], this is equivalent to check the isomorphism $\overline{u_i^* M} \xrightarrow{\sim} \overline{M_{X_i^\sharp}}$. Following [Kat89, 1.4.1], $\overline{u_i^* M} = \overline{M}$. From the step I).3), we have $\overline{M} \xrightarrow{\sim} \overline{M_{X_i^\sharp}}$ and we are done. □

Theorem 3.3.1.8. The functors $\mathfrak{X}^\sharp \mapsto (X_i^\sharp)_{i\in\mathbb{N}}$ and $(X_i^\sharp)_{i\in\mathbb{N}} \mapsto \varinjlim_i X_i^\sharp$ are quasi-inverse equivalences of categories between the category of fine $\mathfrak{S}$-log formal schemes to that of strict inductive systems of noetherian fine log schemes over $(S_i)_{i\in\mathbb{N}}$.

Proof. This is a consequence of Propositions 3.3.1.3 and 3.3.1.7. □

Lemma 3.3.1.9. *Let $f \colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of fine $\mathfrak{S}$-log formal schemes. Then f is strict if and only if, for any $i \in \mathbb{N}$, f_i is strict.*

Proof. If f is strict then f_i, the base change of f by $S_i \hookrightarrow \mathfrak{S}$ is strict. Conversely, suppose that for any $i \in \mathbb{N}$, f_i is strict. Let $\mathfrak{Z}^\sharp$ be the fine $\mathfrak{S}$-log formal scheme whose underlying fine formal $\mathfrak{S}$-scheme is $\mathfrak{X}$ and whose log structure is $f^*(M^\sharp_{\mathfrak{Y}})$. Then $Z_i^\sharp \to Y_i^\sharp$ is strict and $Z_i = X_i^\sharp$. Hence, $Z_i^\sharp = X_i^\sharp$. Using 3.3.1.3, this yields that $\mathfrak{X}^\sharp = \mathfrak{Z}^\sharp$, i.e. f is strict. □

Let us finish the section by the following definition which will be useful from 3.4. The "very nice" notion will only be useful from 9.2.1.

Definition 3.3.1.10. Let $\mathfrak{S}^\sharp$ be a fine $\mathcal{V}$-log formal scheme.

(a) We say that $\mathfrak{S}^\sharp$ is a "nice" fine $\mathcal{V}$-log formal scheme if there exists a $\mathcal{V}$-formal scheme $\mathfrak{T}$ such that $\mathfrak{S}^\sharp$ is a log flat $\mathfrak{T}$-log formal scheme, i.e. for any integer $i \geq 0$ $S_i^\sharp$ is a log flat T_i-log scheme (see definition [Ogu18, IV.4.1.1]). Following 3.1.1.1, if $\mathfrak{S}^\sharp$ is a nice fine $\mathcal{V}$-log formal scheme, then $S_i^\sharp$ is a nice fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ for any integer $i \geq 0$.

(b) We say that $\mathfrak{S}^\sharp$ is a "very nice" fine $\mathcal{V}$-log formal scheme if there exists a p-torsion free Noetherian of finite Krull dimension $\mathcal{V}$-formal scheme $\mathfrak{T}$ such that $\mathfrak{S}^\sharp$ is a log flat of finite type $\mathfrak{T}$-log formal scheme. Remark that since $\mathfrak{S}^\sharp \to \mathfrak{T}$ is a log flat and integral (because the log structure of $\mathfrak{T}$ is trivial: see [Ogu18, III.2.5.3.3]) then following [Ogu18, IV.4.3.5] the underlying morphism $\mathfrak{S} \to \mathfrak{T}$ is flat. In particular $\mathfrak{S}$ is also p-torsion free.

Definition 3.3.1.11. Let $f \colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a (adic) morphism of fine $\mathcal{V}$-log formal schemes and $\mathcal{B}_{\mathfrak{X}}$ be an $\mathcal{O}_{\mathfrak{X}}$-algebra. We have the following quasi-flatness notions which will be useful in 4.6.3.3 to define duality or tensor products over the ring of differential operators.

(a) We say that f is quasi-flat if there exists a morphism of $\mathcal{V}$-formal schemes $g \colon \mathfrak{Y} \to \mathfrak{Z}$ such that the morphism of schemes $g \circ f \colon \mathfrak{X} \to \mathfrak{Z}$ is flat.

(b) We say that $\mathcal{B}_{\mathfrak{X}}$ is a quasi-flat $f^{-1}\mathcal{O}_{\mathfrak{Y}}$-algebra if there exists a morphism of $\mathcal{V}$-formal schemes $g\colon \mathfrak{Y} \to \mathfrak{Z}$ such that the (induced by $g \circ f$) morphism of ringed spaces $(\mathfrak{X}, \mathcal{B}_{\mathfrak{X}}) \to \mathfrak{Z}$ is flat.

Remark 3.3.1.12. Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of fine $\mathcal{V}$-log formal schemes. We suppose that for any $y \in \mathfrak{Y}$, the monoid $(M_{\mathfrak{Y}^\sharp}/\mathcal{O}^*_{\mathfrak{Y}})_y$ is generated by one element. It follows from 3.1.1.7 that the morphism of schemes $X_i^\sharp \to Y_i^\sharp$ is flat. Since f is of finite type, then f is flat.

3.3.2 Around log etaleness

Définition 3.3.2.1. Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of fine $\mathfrak{S}$-log formal schemes. We say that f is "log étale" (resp. "log smooth, resp. "formally log étale") if for any integer $i \in \mathbb{N}$ the morphism f_i is log étale (resp. log smooth, resp. fine formally log étale).

When the morphism is strict, we remove the word "log". For instance, f is étale means that f is strict and f is log étale.

Remark 3.3.2.2. Our definition of log étaleness was named by Shiho formal log étaleness (see [Shi00, 2.2.2]). We hope there will be no confusion.

Proposition 3.3.2.3. Let $\mathfrak{Y}^\sharp$ be a fine $\mathfrak{S}$-log formal schemes. Let $f_0\colon X_0^\sharp \to Y_0^\sharp$ be a log smooth morphism of fine log S_0-schemes such that X_0 is affine. Then there exists a log smooth morphism of fine $\mathfrak{S}$-log formal schemes of the form $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ whose reduction modulo π is f_0. We say that such morphism f is a log smooth lifting of f_0.

Proof. From [Kat89, 3.14.(1)], there exists a unique up to isomorphism log smooth morphism of fine log S_i-schemes $f_i\colon X_i^\sharp \to Y_i^\sharp$ endowed with an isomorphism $X_0^\sharp \xrightarrow{\sim} X_i^\sharp \times_{Y_i^\sharp} Y_0^\sharp$. Put $\mathfrak{Y}^\sharp := \varinjlim_i Y_i^\sharp$. Let $f\colon \mathfrak{Y}^\sharp \to \mathfrak{X}^\sharp$ be the induced morphism. Following Theorem 3.3.1.8, $\mathfrak{Y}^\sharp$ is a fine $\mathfrak{S}$-log formal schemes. By construction, f is log smooth since f_i is log smooth for any $i \in \mathbb{N}$. □

Proposition 3.3.2.4. Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of fine $\mathfrak{S}$-log formal schemes. The morphism f is log étale if and only if f is formally log étale and f_0 is log étale.

Proof. If f_0 is log étale then $\underline{f_0}$ is of finite type. This yields that $\underline{f_i}$ is of finite type, which proves the non-respective case. □

Lemma 3.3.2.5. *Let A be a commutative $\mathcal{V}$-algebra, $\phi\colon M' \to M$ be a morphism of A-modules. Suppose that M is π-torsion free and ϕ induces the isomorphism $\overline{\phi}\colon M'/\pi M' \xrightarrow{\sim} M/\pi M$.*

The p-adic completion of ϕ, $\widehat{M'} \to \widehat{M}$, is therefore an isomorphism.

Proof. The fact that $\overline{\phi}$ is injective means that we have the inclusion $\phi^{-1}(\pi M) \subset \pi M'$. SInce M is π-torsion free, we get by induction on n the inclusion $\phi^{-1}(\pi^n M) \subset \pi^n M'$.

The fact tha $\overline{\phi}$ is surjective can be translated by the relation: $M = \phi(M') + \pi M$. This yields by induction on $n \geq 1$ the equality: $M = \phi(M') + \pi^n M$. Hence, ϕ induces the isomorphisms $\overline{\phi}_n\colon M'/\pi^n M' \xrightarrow{\sim} M/\pi^n M$. We are done. □

3.3.2.6. Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of fine $\mathfrak{S}$-log formal schemes. We set $\Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp} := \varprojlim_i \Omega^1_{X_i^\sharp/Y_i^\sharp}$. When f is log smooth, then from [Kat89, 3.10] the $\mathcal{O}_{\mathfrak{X}}$-module $\Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Y}^\sharp}$ is locally free of finite type.

Lemma 3.3.2.7. *Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$, $g\colon \mathfrak{Y}^\sharp \to \mathfrak{Z}^\sharp$ be two morphisms of fine $\mathfrak{S}$-log formal schemes such that $\mathcal{O}_{\mathfrak{X}}$ is p-torsion free, the morphism $g \circ f$ is log smooth and $f_0\colon X_0^\sharp \to Y_0^\sharp$ is log étale. Then f is log étale.*

Proof. We construct by p-adic completion the morphism $\phi\colon f^*\Omega^1_{\mathfrak{Y}^\sharp/\mathfrak{Z}^\sharp} \to \Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Z}^\sharp}$, where we put $f^*\Omega^1_{\mathfrak{Y}^\sharp/\mathfrak{Z}^\sharp} := \varprojlim_i f_i^*\Omega^1_{Y_i^\sharp/Z_i^\sharp}$. Since $g\circ f\colon \mathfrak{X}^\sharp \to \mathfrak{Z}^\sharp$ is log smooth, the $\mathcal{O}_{\mathfrak{X}}$-module $\Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Z}^\sharp}$ is locally free of finite type (see 3.3.2.6). In particular, $\Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Z}^\sharp}$ is p-torsion free. The reduction of ϕ modulo π is canonically isomorphic to $f_0^*\Omega^1_{Y_0^\sharp/Z_0} \to \Omega^1_{X_0/Z_0}$. Since f_0 is log étale, this latter homomorphism is an isomorphism. Since $\Omega^1_{\mathfrak{X}^\sharp/\mathfrak{Z}^\sharp}$ is p-torsion free, this yields that ϕ is an isomorphism (e.g. use Lemma 3.3.2.5). This implies that the canonical morphism $f_i^*\Omega^1_{Y_i^\sharp/Z_i^\sharp} \to \Omega^1_{X_i^\sharp/Z_i^\sharp}$ is an isomorphism. Since $X_i^\sharp \to Z_i^\sharp$ is log smooth, from [Kat89, 3.12], we conclude that f_i is log-étale. □

Proposition 3.3.2.8. Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of fine $\mathfrak{S}$-log formal schemes such that $\mathcal{O}_{\mathfrak{X}}$ is p-torsion free. The morphism f is log smooth if and only if, étale locally on $\mathfrak{X}^\sharp$ there exists a log étale $\mathfrak{Y}^\sharp$-morphism of the form $\mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp \times_{\mathfrak{S}} \mathfrak{A}_{\mathbb{N}^r}$.

Proof. Suppose f is log smooth. Since f_0 is log smooth, when can suppose there exists a morphism $X_0^\sharp \to A_{\mathbb{N}^r}$ such that the induced $Y_0^\sharp$-morphism $X_0^\sharp \to Y_0^\sharp \times A_{\mathbb{N}^r}$ is log-étale.Using 3.3.1.2, we can suppose that $X_0^\sharp \to A_{\mathbb{N}^r}$ has the lifting of the form $\mathfrak{X}^\sharp \to \mathfrak{A}_{\mathbb{N}^r}$. We get the $\mathfrak{Y}^\sharp$-morphism $\mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp \times_{\mathfrak{S}} \mathfrak{A}_{\mathbb{N}^r}$. We conclude by applying Lemma 3.3.2.7 that this latter morphism is log-étale. □

3.3.3 Sheaf of differential operators of infinite level and finite order over weakly log smooth $\mathfrak{S}$-log formal scheme

Définition 3.3.3.1. As in 3.1.1.10 we define the category $\mathfrak{C}_\sharp$ of $\mathfrak{S}$-immersions of fine $\mathfrak{S}$-log formal schemes. For any integer n, we denote by $\mathfrak{C}_n$ the full subcategory of $\mathfrak{C}$ whose objects are exact closed immersions of order n.

3.3.3.2. By using [Kat89, 3.111 and 3.14] we easily get the following formal version of 3.1.1.14 of the exactification of an immersion: Let $u\colon \mathfrak{Z}^\sharp \hookrightarrow \mathfrak{X}^\sharp$ be an $\mathfrak{S}^\sharp$-immersion of fine log formal schemes. Let $\overline{z}$ be a geometric point of $\mathfrak{Z}^\sharp$. There exists a commutative diagram of the form

$$\begin{array}{ccccc} \widetilde{\mathfrak{X}}^\sharp & \xrightarrow{f} & \mathfrak{X}'^\sharp & \xrightarrow{g} & \mathfrak{X}^\sharp \\ & {}^{v'}\nwarrow & \uparrow{\scriptstyle u'} & \square & \uparrow{\scriptstyle u} \\ & & \mathfrak{Z}'^\sharp & \xrightarrow{h} & \mathfrak{Z}^\sharp \end{array}$$

such that the square is cartesian, f is log étale, $\underline{f}$ is affine, g is étale, v' is an exact closed $\mathfrak{S}^\sharp$-immersion and h is an étale neighborhood of $\overline{z}$ in $\mathfrak{Z}^\sharp$.

Lemma 3.3.3.3. *The inclusion functor $\mathfrak{C}_{\sharp n} \to \mathfrak{C}_\sharp$ has a right adjoint functor which we will denote by $P^{\sharp n}\colon \mathfrak{C}_\sharp \to \mathfrak{C}_{\sharp n}$. Let $u\colon \mathfrak{Z}^\sharp \hookrightarrow \mathfrak{X}^\sharp$ be an object of $\mathfrak{C}_\sharp$. Then $\mathfrak{Z}^\sharp$ is also the source of $P^{\sharp n}(u)$.*

Proof. Let $u\colon \mathfrak{Z}^\sharp \hookrightarrow \mathfrak{X}^\sharp$ be an object of $\mathfrak{C}_\sharp$. Since $u_i\colon Z_i^\sharp \hookrightarrow X_i^\sharp$ is an object of $\mathscr{C}_\sharp$, from 3.1.1.17, we get the object $P^{\sharp n}(u_i)\colon Z_i^\sharp \hookrightarrow P^{\sharp n}(u_i)$ of $\mathscr{C}_{\sharp n}$ such that $P^{\sharp n}(u_i) \to X_i^\sharp$ is affine and $P^{\sharp n}(u_i)$ is noetherian. Hence, using Theorem 3.3.1.8, we get that $\varinjlim_i P^{\sharp n}(u_i)$ satisfies the universal property of $P^{\sharp n}(u)$. □

Définition 3.3.3.4. Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp$ be a morphism of fine $\mathfrak{S}$-log formal schemes.

1. We say that a finite set $(b_\lambda)_{\lambda=1,\ldots,r}$ of elements of $\Gamma(\mathfrak{X}, M_{\mathfrak{X}^\sharp})$ are " formal logarithmic coordinates of f" if the induced $\mathfrak{Y}^\sharp$-morphism $\mathfrak{X}^\sharp \to \mathfrak{Y}^\sharp \times_{\mathfrak{S}} \mathfrak{A}_{\mathbb{N}^r}$ is formally log étale (concerning $\mathfrak{A}_{\mathbb{N}^r}$, see the notation of 3.3.1.1).
2. We say that f is "weakly log smooth" if, étale locally on $\mathfrak{X}^\sharp$, f has formal log coordinates. Notice that this notion of weak log smoothness is étale local on $\mathfrak{Y}^\sharp$. We also say that $\mathfrak{X}^\sharp$ is a "weakly log smooth $\mathfrak{Y}^\sharp$-log formal scheme" (following our terminology, the log structure of such an $\mathfrak{X}^\sharp$ is understood to be fine).
3. When f is strict we remove "log" in the terminology, e.g. we get the notion of "étale" morphisms, "smooth" morphisms or "weakly smooth" morphisms.

Remark 3.3.3.5. Following Proposition 3.3.2.8, a log smooth morphism is weakly log smooth which justifies the terminology.

3.3.3.6 (nth infinitesimal neighborhood)**.** Let $f\colon \mathfrak{X}^\sharp \to \mathfrak{T}^\sharp$ be a weakly log smooth morphism of fine $\mathfrak{S}$-log formal schemes. Let $\Delta_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}\colon \mathfrak{X}^\sharp \hookrightarrow \mathfrak{X}^\sharp \times_{\mathfrak{T}^\sharp} \mathfrak{X}^\sharp$ be the diagonal immersion. Since $\Delta_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$ is an object of $\mathfrak{C}_\sharp$, then we can put $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} := P^n(\Delta_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp})$. From 3.1.1.15, we have $\Delta^n_{X_i^\sharp/S_i} = \Delta^n_{X_{i+1}^\sharp/T_{i+1}^\sharp} \times_{T_{i+1}^\sharp} T_i^\sharp$. Hence, using Theorem 3.3.1.8, we get the equality of fine $\mathfrak{S}$-log formal schemes $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} = \varinjlim_i \Delta^n_{X_i^\sharp/T_i^\sharp}$. Taking the inductive limits to the strict morphisms of fine log schemes $p_0^n\colon \Delta^n_{X_i^\sharp/T_i^\sharp} \to X_i^\sharp$ (resp. $p_1^n\colon \Delta^n_{X_i^\sharp/T_i^\sharp} \to$

$X_i^\sharp$), using Lemma 3.3.1.9 we get the strict morphism of fine $\mathfrak{T}^\sharp$-log formal schemes $p_0^n \colon \Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \to \mathfrak{X}^\sharp$ (resp. $p_1^n \colon \Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \to \mathfrak{X}^\sharp$). Using the remark 3.1.2.4, we can check that the underlying morphism of formal $\mathfrak{S}$-schemes of $p_0^n \colon \Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \to \mathfrak{X}^\sharp$ and $p_1^n \colon \Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \to \mathfrak{X}^\sharp$ are finite (more precisely, we can check the local description 3.3.3.7.1). Hence, we denote by $\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$ the coherent $\mathcal{O}_{\mathfrak{X}}$-algebra such that $\operatorname{Spf} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} = \underline{\Delta}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$.

If $a \in M_{\mathfrak{X}^\sharp}$, we denote by $\mu_{(m)}(a)$ the unique section of $\ker(\mathcal{O}^*_{\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}} \to \mathcal{O}^*_{\mathfrak{X}})$ such that we get in $M^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$ the equality $p_1^{n*}(a) = p_0^{n*}(a)\mu^n(a)$ (see 3.1.1.24). We get $\mu^n \colon M_{\mathfrak{X}^\sharp} \to \ker(\mathcal{O}^*_{\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}} \to \mathcal{O}^*_{\mathfrak{X}})$ given by $a \mapsto \mu^n(a)$.

Proposition 3.3.3.7 (Local description of $\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$)**.** With notation 3.3.3.6, suppose given $(u_\lambda)_{\lambda=1,\dots,r}$ some formal log coordinates of f. Put $\tau_{\sharp\lambda,n} := \mu^n(u_\lambda) - 1$. We have the following isomorphism of $\mathcal{O}_{\mathfrak{X}}$-algebras:

$$\mathcal{O}_{\mathfrak{X}}[T_1, \dots, T_r]_n \xrightarrow{\sim} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$$
$$T_\lambda \mapsto \tau_{\sharp\lambda,n}. \tag{3.3.3.7.1}$$

Proof. This is a consequence of 3.1.2.3. □

Définition 3.3.3.8. With the notation 3.3.3.6, the sheaf of differential operators of order $\leq n$ of f is defined by putting $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,n} := \mathcal{H}om_{\mathcal{O}_{\mathfrak{X}}}(p^n_{0*}\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}, \mathcal{O}_{\mathfrak{X}})$. The sheaf of differential operators of $f$is defined by putting $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} := \cup_{n\in\mathbb{N}}\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,n}$.

Let $P \in \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,n}$, $P' \in \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,n'}$. We define the product $PP' \in \mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,n+n'}$ to be the composition

$$PP' \colon \mathcal{P}^{n+n'}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \xrightarrow{\delta^{n,n'}} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{P}^{n'}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \xrightarrow{\mathrm{id}\otimes P'} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp} \xrightarrow{P} \mathcal{O}_{\mathfrak{X}}. \tag{3.3.3.8.1}$$

Similarly to 3.1.4.4, we can check that the sheaf $\mathcal{D}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$ is a sheaf of rings with the product as defined in 3.3.3.8.1

3.3.4 Sheaf of differential operators of finite level m and order over log smooth $\mathfrak{S}$-log formal schemes

Let $m \geq 0$ be an integer. The principal ideal (p) of $\mathcal{V}$ is endowed with a canonical m-PD-structure, which we will denote by $\gamma_\emptyset$.

Définition 3.3.4.1. As in 3.2.1.1, we define the categories $\mathfrak{C}^{(m)}_{\sharp n}$ whose objects are pairs (u, δ) where u is an exact closed $\mathfrak{S}$-immersion of fine log $\mathfrak{S}$-schemes and δ is an m-PD-structure on the ideal $\mathcal{I}$ defined by u (which is compatible with $\gamma_\emptyset$) and such that $\mathcal{I}^{\{n+1\}_{(m)}} = 0$ and whose morphisms $(u', \delta') \to (u, \delta)$ are morphisms $u' \to u$ of $\mathfrak{C}_\sharp$ which are compatible with the m-PD-structures δ and δ'.

Proposition 3.3.4.2.

1. The canonical functor $\mathfrak{C}^{(m)}_{\sharp n} \to \mathfrak{C}_\sharp$ has a right adjoint, which we will denote by $P^{\sharp n}_{(m)} \colon \mathfrak{C}_\sharp \to \mathfrak{C}^{(m)}_{\sharp n}$.
2. Let u be an object of $\mathfrak{C}_\sharp$. The source of $P^{\sharp n}_{(m)}(u)$ is the source of u.

Proof. The first assertion is a consequence of 3.3.1.8 and 3.2.1.9 (we need in particular the 3.2.1.9.4). Since $\gamma_\emptyset$ extends to any $\mathfrak{S}$-log formal schemes (because the ideal of the m-PD-structure $\gamma_\emptyset$ is locally principal: see [Ber96c, 1.3.2.c)]), we get the second assertion. □

3.3.4.3. Let u be an object of $\mathfrak{C}_\sharp$. We call $P^{\sharp n}_{(m)}(u)$ the m-PD-envelope compatible of order n of u. We sometimes denote abusively by $P^{\sharp n}_{(m)}(u)$ the target of the arrow $P^{\sharp n}_{(m)}(u)$.

3.3.4.4. Let $f \colon \mathfrak{X}^\sharp \to \mathfrak{T}^\sharp$ be a log smooth morphism of fine $\mathcal{V}$-log formal schemes. Using 3.2.2.6, we can check the underlying scheme of $\Delta^n_{X_i^\sharp/T_i^\sharp,(m)}$ is noetherian. Moreover, from the local description 3.2.2.4.1, we get $\Delta^n_{X_i^\sharp/T_i^\sharp,(m)} \xrightarrow{\sim} \Delta^n_{X_{i+1}^\sharp/T_{i+1}^\sharp,(m)} \times_{T_{i+1}^\sharp} T_i^\sharp$ (recall also that $p_0^n \colon \Delta^n_{X_i^\sharp/T_i^\sharp,(m)} \to$

$X_i^\sharp$ is strict). Using Theorem 3.3.1.8, we get the fine $\mathfrak{T}^\sharp$-log formal schemes $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$ by putting $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)} := \varinjlim_i \Delta^n_{X_i^\sharp/T_i^\sharp,(m)}$. Let $p_1^n,\, p_0^n \colon \Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)} \to \mathfrak{X}^\sharp$ be the morphisms induced respectively by $p_1^n,\, p_0^n \colon \Delta^n_{X_i^\sharp/T_i^\sharp,(m)} \to X_i^\sharp$. From 3.2.2.2, 3.3.1.9 and 3.2.2.6, the morphisms $p_1^n,\, p_0^n \colon \Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)} \to \mathfrak{X}^\sharp$ are strict and finite (more precisely concerning the finiteness, we have the local description 3.3.4.5.1).

We denote by $M^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$ the log structure of $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$. We denote by $\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$ the coherent $\mathcal{O}_{\mathfrak{X}}$-algebra corresponding to the underlying formal $\mathcal{V}$-scheme of $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$. Hence, $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$ is an exact closed immersion of the form $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)} \colon \mathfrak{X}^\sharp \hookrightarrow (\operatorname{Spf} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}, M^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)})$. We sometimes denote abusively by $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$ the target of the arrow $\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$.

As in paragraph 3.2.3.1, we can define $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp}$, the sheaf of differential operator on $\mathfrak{X}^\sharp$ of level m.

3.3.4.5 (Local description)**.** Suppose in this paragraph that $\mathfrak{X}^\sharp \to \mathfrak{T}^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$ of f. Put $\tau_{\sharp\lambda(m)} := \mu^n_{(m)}(u_\lambda) - 1$ (or simply $\tau_{\sharp\lambda}$), where $\mu^n_{(m)}(a)$ is the unique section of $\ker(\mathcal{O}^*_{\Delta^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}} \to \mathcal{O}^*_{\mathfrak{X}})$ such that we get in $M^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$ the equality$p_1^{n*}(a) = p_0^{n*}(a)\mu^n_{(m)}(a)$. Taking the limits to 3.2.2.4, we get the isomorphism of m-PD-$\mathcal{O}_{\mathfrak{X}}$-algebras

$$\begin{aligned} \mathcal{O}_{\mathfrak{X}}\langle T_1,\dots,T_r\rangle_{(m),n} &\xrightarrow{\sim} \mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)} \\ T_\lambda &\mapsto \tau_{\sharp\lambda,(m)} \end{aligned} \tag{3.3.4.5.1}$$

where the first term is defined as in 1.3.3.6. In particular, the elements $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}\}_{|\underline{k}|\leq n}$ form an $\mathcal{O}_{\mathfrak{X}}$-basis of $\mathcal{P}^n_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,(m)}$. The corresponding dual basis of $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{T}^\sharp,n}$ will be denoted by $\{\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}\}_{|\underline{k}|\leq n}$. Let $\epsilon_1,\dots,\epsilon_r$ be the canonical basis of $\mathbb{N}^r$, i.e. the coordinates of ϵ_i are 0 except for the ith term which is 1. We put $\partial_{\sharp i} := \underline{\partial}_\sharp^{\langle \epsilon_i\rangle_{(m)}}$. We can define the logarithmic adjoint operator as in 3.4.1.2 and we can check that the properties analogous to the subsection 3.4.1 are still satisfied of the formal context.

3.4 Logarithmic differential modules

Let $m \in \mathbb{N}\cup\{+\infty\}$. When $m = +\infty$, we remove (m) in the notation. We consider here simultaneously the following both cases.

(i) Algebraic case: $S^\sharp$ is a nice fine log scheme over $\operatorname{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$, where i is an integer (see definition 3.1.1.1). Moreover, $X^\sharp \to S^\sharp$ is a log smooth morphism of log schemes.

(ii) Formal case: $S^\sharp$ is a nice fine $\mathcal{V}$-log formal scheme (see definition 3.3.1.10). Moreover, $X^\sharp \to S^\sharp$ is a log smooth morphism of log formal schemes.

Recall notation 3.2.2.5 and the fact that we can simply consider the case where the m-PD-structure $\gamma_\emptyset$ on the base is given by the unique PD-structure on $p\mathcal{O}_S$. Let $Y := X^{\sharp *}$ be the open of X where $M_{X^\sharp}$ is trivial and $j\colon Y \hookrightarrow X^\sharp$ be the canonical open immersion. Remark $\omega_{Y/S^\sharp} = \omega_{Y/(S^\sharp)^*}$ and $\mathcal{D}^{(m)}_{Y/S^\sharp} = \mathcal{D}^{(m)}_{Y/(S^\sharp)^*}$, i.e. over Y we come back to the non-logarithmic case. Since $X^\sharp$ is nice (see 3.1.1.2), then the canonical morphisms $\omega_{X^\sharp/S^\sharp} \to j_*\omega_{Y/S^\sharp}$ and $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to j_*\mathcal{D}^{(m)}_{Y/S^\sharp}$ are injective (this is a consequence of 3.1.1.3).

3.4.1 Logarithmic adjoint operators

We suppose that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,n}$. Let $(t_\lambda)_{\lambda=1,\dots,n}$ be the induced coordinates of Y/S, $\underline{\tau}_{\sharp(m)}$ (resp. $\underline{\partial}_\sharp{}^{\langle \underline{k}\rangle_{(m)}}$) be the element constructed from $(u_\lambda)_{\lambda=1,\dots,n}$ (resp. $(t_\lambda)_{\lambda=1,\dots,n}$) as defined in 3.2.2.4 (resp. 3.2.3.4).

3.4.1.1. Following 3.2.3.9.5, via the inclusion $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to j_*\mathcal{D}^{(m)}_{Y/S^\sharp}$ we have the equality

$$\underline{\partial}_\sharp{}^{\langle \underline{k}\rangle_{(m)}} = \underline{t}^{\underline{k}}\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}. \tag{3.4.1.1.1}$$

Let $Q \in \Gamma(Y, \mathcal{D}^{(m)}_{Y/S^\sharp})$ and by using 3.4.1.1.1, Q can be written of the form $Q = \sum_{\underline{k}} b_{\underline{k}}\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}$, with $b_{\underline{k}} \in \Gamma(Y, \mathcal{O}_Y)$. The adjoint operator of Q is by definition ${}^{\mathrm{t}}Q := \sum_{\underline{k}} (-1)^{|\underline{k}|}\underline{\partial}^{\langle \underline{k}\rangle_{(m)}} b_{\underline{k}}$.

Notation 3.4.1.2. Let us fix some notation concerning the logarithmic adjoint operator.

(a) We set $\alpha_{0,0} := 1$. Let $j \geq 1$ be an integer. We set $\alpha_{0,j} = 0$. For any $1 \leq i \leq j$, we set $\alpha_{i,j} := (-1)^j \left\{ {j \atop i} \right\}_{(m)} q^{(m)}_{j-i}! \left({j-1 \atop j-i} \right)$ where $q^{(m)}_{j-i}$ means the quotient of the Euclidian division of $j-i$ by p^m.

For any integer $\lambda = 1, \ldots, n$, for any $k \geq 0$, we set

$$\widetilde{\partial}^{\langle k \rangle_{(m)}}_{\sharp\lambda} := \sum_{0 \leq i \leq k} \alpha_{i,k} \partial^{\langle i \rangle_{(m)}}_{\sharp\lambda}. \tag{3.4.1.2.1}$$

In particular, $\widetilde{\partial}^{\langle 0 \rangle_{(m)}}_{\sharp\lambda} = 1$. Remark that when $k \geq 1$, we have in fact, $\widetilde{\partial}^{\langle k \rangle_{(m)}}_{\sharp\lambda} = \sum_{1 \leq i \leq k} \alpha_{i,k} \partial^{\langle i \rangle_{(m)}}_{\sharp\lambda}$.

(b) Let $\underline{k} = (k_1, \ldots, k_n) \in \mathbb{N}^n$. We set $\widetilde{\underline{\partial}}^{\langle \underline{k} \rangle_{(m)}}_{\sharp} := \prod_{\lambda=1}^n \widetilde{\partial}^{\langle k_\lambda \rangle_{(m)}}_{\sharp\lambda}$. For any $\underline{i} \leq \underline{k}$, we put $\alpha_{\underline{i},\underline{k}} := \prod_{\lambda=1}^n \alpha_{i_\lambda, k_\lambda} \in \mathbb{Z}$.

$$\widetilde{\underline{\partial}}^{\langle \underline{k} \rangle_{(m)}}_{\sharp} := \prod_{\lambda=1}^n \widetilde{\partial}^{\langle k_\lambda \rangle_{(m)}}_{\sharp\lambda} = \sum_{\underline{i} \leq \underline{k}} \alpha_{\underline{i},\underline{k}} \underline{\partial}^{\langle \underline{i} \rangle_{(m)}}_{\sharp}. \tag{3.4.1.2.2}$$

(c) Let $P \in \Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$ be differential operator. We can uniquely write P of the form $P = \sum_{\underline{k}} a_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{\sharp}$ with $a_{\underline{k}} \in \Gamma(X, \mathcal{O}_X)$. We set

$$\widetilde{P} := \sum_{\underline{k}} \widetilde{\underline{\partial}}^{\langle \underline{k} \rangle_{(m)}}_{\sharp} a_{\underline{k}}. \tag{3.4.1.2.3}$$

We say that $\widetilde{P}$ is the "logarithmic adjoint operator" of P. We can sometimes write it by ${}^{t_{\log}}P$ instead of $\widetilde{P}$.

(d) For any differential operators $P, Q \in \Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$, for any $a \in \Gamma(X, \mathcal{O}_X)$, we can easily check $\widetilde{a} = a$, $\widetilde{P+Q} = \widetilde{P} + \widetilde{Q}$ and $\widetilde{aP} = \widetilde{P}a$.

Proposition 3.4.1.3 (Comparison between adjoint operator with or without logarithmic structure)**.** *Suppose $u_1, \ldots, u_n \in \mathcal{O}_X^*$. Let P be a differential operator of $\Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$. We have the equality*

$$\widetilde{P} = \underline{t}\ {}^{\mathrm{t}}P\ \frac{1}{\underline{t}}, \tag{3.4.1.3.1}$$

where $\underline{t} = \underline{t}^{\underline{1}} = t_1 \cdots t_n$ and where ${}^tP$ means the adjoint operator of P as an object of $\Gamma(Y, \mathcal{D}^{(m)}_{Y/S^\sharp})$ via the canonical inclusion $\Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \subset \Gamma(Y, \mathcal{D}^{(m)}_{Y/S^\sharp})$.

Proof. By additivity of the functors $P \mapsto \widetilde{P}$ and of $P \mapsto {}^tP$, since for any $a \in \Gamma(X, \mathcal{O}_X)$ and differential operator $P \in \Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$, we have $\widetilde{aP} = \widetilde{P}a$ and ${}^t(aP) = {}^t(P)a$, then we reduce to check the formula 3.4.1.3.1 in the case where $P = \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{\sharp}$. Following 3.4.1.1.1, we have $\underline{\partial}_{\sharp}{}^{\langle \underline{k} \rangle_{(m)}} = \underline{t}^{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$. We compute

$$\begin{aligned} \underline{t}\ {}^{\mathrm{t}}(\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{\sharp})\ \frac{1}{\underline{t}} &= \underline{t}\ {}^{\mathrm{t}}(\underline{t}^{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}})\ \frac{1}{\underline{t}} = \underline{t}(-1)^{|\underline{k}|} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} \underline{t}^{\underline{k}-\underline{1}} \\ &= (-1)^{|\underline{k}|} \underline{t}^{\underline{1}-\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{\sharp} \underline{t}^{\underline{k}-\underline{1}} = \prod_{\lambda=1}^n (-1)^{k_\lambda} t_\lambda^{1-k_\lambda} \partial^{\langle k_\lambda \rangle_{(m)}}_{\sharp\lambda} t_\lambda^{k_\lambda - 1}, \end{aligned}$$

where $\underline{1} := (1, 1, \ldots, 1) \in \mathbb{N}^n$. Hence, we reduce to check $\widetilde{\partial}^{\langle k \rangle_{(m)}}_{\sharp\lambda} = (-1)^k t_\lambda^{1-k} \partial^{\langle k \rangle_{(m)}}_{\sharp\lambda} t_\lambda^{k-1}$, for any integer $k \geq 0$. When $k = 0$, the equality is obvious since $\partial^{\langle k \rangle_{(m)}}_{\sharp\lambda} = 1$ and $\widetilde{\partial}^{\langle k \rangle_{(m)}}_{\sharp\lambda} = 1$. Let us suppose $k \geq 1$. From 3.2.3.7.2, we have $\partial^{\langle k \rangle_{(m)}}_{\sharp\lambda} t_\lambda^{k-1} = \sum_{i \leq k} \left\{ {k \atop i} \right\} \partial^{\langle k-i \rangle_{(m)}}_{\sharp\lambda} (t_\lambda^{k-1}) \partial^{\langle i \rangle_{(m)}}_{\sharp\lambda}$. Following the formula 3.2.3.11, we have $\partial^{\langle k-i \rangle_{(m)}}_{\sharp\lambda} (t_\lambda^{k-1}) = t_\lambda^{k-1} q_{k-i}! \left({k-1 \atop k-i} \right)$ if $i \geq 1$ and 0 if $i = 0$. Hence,

$$(-1)^k t_\lambda^{1-k} \partial^{\langle k \rangle_{(m)}}_{\sharp\lambda} t_\lambda^{k-1} = (-1)^k \sum_{1 \leq i \leq k} \left\{ {k \atop i} \right\} q_{k-i}! \left({k-1 \atop k-i} \right) \partial^{\langle i \rangle_{(m)}}_{\sharp\lambda} = \widetilde{\partial}^{\langle k \rangle_{(m)}}_{\sharp\lambda}.$$

□

Remark 3.4.1.4. With notation 3.4.1.4, the definition of 3.4.1.2.3 was precisely introduced to get $\widetilde{\underline{\partial}_\sharp}^{\langle \underline{k}\rangle_{(m)}} = \underline{t}\ {}^{\mathrm{t}}\underline{\partial}_\sharp{}^{\langle \underline{k}\rangle_{(m)}}\ \frac{1}{\underline{t}}$. One reason to introduce the logarithmic adjoint operator is the formula 3.4.5.1.1.

Proposition 3.4.1.5. *For any differential operators P and Q of $\Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$, we have the equalities $\widetilde{\widetilde{P}} = P$ and $\widetilde{PQ} = \widetilde{Q}\widetilde{P}$.*

Proof. Via the canonical inclusion $\Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \subset \Gamma(Y, \mathcal{D}^{(m)}_{Y/S^\sharp})$, we reduce to check the equalities in $\Gamma(Y, \mathcal{D}^{(m)}_{Y/S^\sharp})$. Hence, we can suppose $u_1, \ldots, u_n \in \mathcal{O}^*_X$. The proposition is therefore a consequence of 3.4.1.3. □

Remark 3.4.1.6 (Logarithmic adjoint operator at the level 0). The definition of $\widetilde{\underline{\partial}_\sharp}^{\langle \underline{k}\rangle_{(m)}}$ given at 3.4.1.2.2 looks very complicated compared to the non-logarithmic adjoint operator. At the level 0, this is possible to get a definition as simple as in the non-logarithmic case as follows. Any differential operator of $\mathcal{D}^{(0)}_{X^\sharp/S^\sharp}$ can be written uniquely of the form $P = \sum_{\underline{k}} a_{\underline{k}} \underline{\partial}_\sharp{}^{\underline{k}}$, where $\underline{\partial}_\sharp{}^{\underline{k}} = \prod_{\lambda=1}^n \partial_{\sharp\lambda}^{k_\lambda}$ with $\partial_{\sharp\lambda} = \partial_{\sharp\lambda}^{\langle 1\rangle_{(0)}}$. Beware that $\underline{\partial}_\sharp{}^{\underline{k}} \neq \underline{\partial}_\sharp{}^{\langle \underline{k}\rangle_{(0)}}$. Since $\widetilde{\underline{\partial}_\sharp} = -\underline{\partial}_\sharp$, we get $\widetilde{P} = \sum_{\underline{k}} (-1)^{|\underline{k}|} \underline{\partial}_\sharp{}^{\underline{k}} a_{\underline{k}}$, which looks like the non-logarithmic adjoint operator definition.

Remark 3.4.1.7. Recall that from 3.2.3.7.2, for any $a \in \Gamma(X, \mathcal{O}_X)$ and $\underline{k} \in \mathbb{N}^r$, we have in $\Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$, $\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}} a = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i}\rangle_{(m)}}(a) \underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}}$. Using 3.4.1.5, this yields

$$a\widetilde{\underline{\partial}_\sharp}^{\langle \underline{k}\rangle_{(m)}} = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \widetilde{\underline{\partial}_\sharp}^{\langle \underline{i}\rangle_{(m)}} \times \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i}\rangle_{(m)}}(a). \tag{3.4.1.7.1}$$

of the formula 3.4.1.7.1, beware that we can not replace $\widetilde{\underline{\partial}_\sharp}$ by $\underline{\partial}_\sharp$.

3.4.1.8. The logarithmic adjoint operator commutes with the canonical morphism $\rho_{m+1,m} \colon \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{D}^{(m+1)}_{X^\sharp/S^\sharp}$, i.e., for any $P \in \Gamma(X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$, we have the formula $\rho_{m+1,m}(\widetilde{P}) = (\rho_{m+1,m}(P))^\sim$. Indeed, by additivity of the logarithmic adjoint operator, we reduce to check the case where $P = a\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$, with $a \in \Gamma(X, \mathcal{O}_X)$ and $\underline{k} \in \mathbb{N}^d$. By $\mathcal{O}_X$-bilinearity of $\rho_{m+1,m}$, we come down to the case where $P = \underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$. For any $\underline{i} \in \mathbb{N}^d$, we have $\rho_{m+1,m}(\underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}}) = \gamma_{\underline{i}} \underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m+1)}}$, with $\gamma_{\underline{i}} \in \mathbb{Z}$. Hence, using 3.4.1.2.2, we can check that both terms $\rho_{m+1,m}(\widetilde{\underline{\partial}_\sharp}^{\langle \underline{k}\rangle_{(m)}})$ and $(\rho_{m+1,m}(\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}))\sim$ are of the form $\sum_{\underline{i} \leq \underline{k}} \alpha_{\underline{i}} \underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}}$, with $\alpha_{\underline{i}} \in \mathbb{Z}$. Hence, using the same arguments of the part 1.iii) of the proof, we reduce to the case where $u_1, \ldots, u_n \in \mathcal{O}^*_X$, i.e., we can use the formula 3.4.1.3.1. Via the formula 3.4.1.3.1, we reduce to check $\rho_{m+1,m}({}^{\mathrm{t}}\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}) = {}^{\mathrm{t}}(\rho_{m+1,m}(\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}))$, which is obvious.

3.4.2 PD stratification of level m

We keep notation 3.2.2 (resp. 3.3.3 and 3.3.4). Even if one might consider the étale topology, an $\mathcal{O}_X$-module will mean an $\mathcal{O}_X$-module for the Zariski topology.

Definition 3.4.2.1. Let $\mathcal{E}$ be an $\mathcal{O}_X$-module. With notations 3.2.2.13 and 3.2.2.16, an m-PD-stratification (or a PD-stratification of level m) relatively to $X^\sharp/S^\sharp$ is the data of a family indexed by $n \in \mathbb{N}$ of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$-linear homomorphisms

$$\varepsilon^{\mathcal{E}}_n \colon \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$$

satisfying the following conditions:

(a) $\varepsilon^{\mathcal{E}}_0 = \mathrm{id}_{\mathcal{E}}$ and the family is compatible with respect to the exact closed immersion $\psi^{n+1,n}_{X^\sharp/S^\sharp,(m)}$ (see 3.2.2.2.1), i.e. for any $n' \geq n$ in $\mathbb{N}$ we have the commutative diagram:

$$\begin{array}{ccc} \psi^{n',n*}_{X^\sharp/S^\sharp,(m)}(\mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E}) & \xrightarrow{\psi^{n',n*}_{X^\sharp/S^\sharp,(m)}(\varepsilon^{\mathcal{E}}_{n'})} & \psi^{n',n*}_{X^\sharp/S^\sharp,(m)}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}) \ ; \\ \downarrow\wr & & \downarrow\wr \\ \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\varepsilon^{\mathcal{E}}_n} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \end{array}$$

(b) for any n, n' in $\mathbb{N}$, the diagram of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}$-modules:

$$\begin{array}{ccc}
\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\delta^{n,n'*}_{(m)}(\varepsilon^{\mathcal{E}}_{n+n'})} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \\
{\scriptstyle q^{n,n'*}_{1(m)}(\varepsilon^{\mathcal{E}}_{n+n'})} \searrow & & \nearrow {\scriptstyle q^{n,n'*}_{0(m)}(\varepsilon^{\mathcal{E}}_{n+n'})} \\
& \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} &
\end{array}$$

is commutative.

Say an $\mathcal{O}_X$-linear homomorphism $\varphi : \mathcal{E} \to \mathcal{F}$ between modules equipped with m-PD stratifications relatively to $X^\sharp/S^\sharp$ is *horizontal* if it commutes with all ε_n.

3.4.2.2. Similarly to 2.1.1.2, with notation 3.2.2.12, this yields that the above condition 3.4.2.1.b is equivalent to

$$\forall\, n \in \mathbb{N}, \qquad q^{n*}_{02,(m)}(\varepsilon_n) = q^{n*}_{01,(m)}(\varepsilon_n) \circ q^{n*}_{12,(m)}(\varepsilon_n). \tag{3.4.2.2.1}$$

Proposition 3.4.2.3. *Let $\mathcal{E}$ be an $\mathcal{O}_X$-module together with an m-PD stratification $(\varepsilon^{\mathcal{E}}_n)$ relative to $X^\sharp/S^\sharp$. Then the homomorphisms $\varepsilon^{\mathcal{E}}_n$ are $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$-linear isomorphisms.*

Proof. We can copy the proof of 2.1.1.3. □

Example 3.4.2.4. For example, $\mathcal{O}_X$ is endowed with the m-PD-stratification of $\mathcal{O}_X$ given by the isomorphisms $\varepsilon^{\mathcal{O}_X}_n$ making commutative the diagram

$$\begin{array}{ccc}
\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{O}_X & \underset{\sim}{\xrightarrow{\varepsilon^{\mathcal{O}_X}_n}} & \mathcal{O}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \\
\sim \searrow & & \swarrow \sim \\
& \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}, &
\end{array} \tag{3.4.2.4.1}$$

where the oblique arrows are the canonical ones. Indeed, we can check the cocycle conditions with the following diagram

$$\begin{array}{ccccc}
\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{O}_X & & \underset{\sim}{\xrightarrow{\delta^{n,n'*}_{(m)}(\epsilon^{\mathcal{O}_X}_{n+n'})}} & & \mathcal{O}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \\
\| & \sim \searrow & & \swarrow \sim & \uparrow {\scriptstyle \sim\ q^{n,n'*}_{0(m)}(\epsilon^{\mathcal{O}_X}_{n+n'})} \\
\| & & \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} & & \\
\| & \sim \nearrow & & \nwarrow \sim & \\
\mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{O}_X & & \underset{q^{n,n'*}_{1(m)}(\epsilon^{\mathcal{O}_X}_{n+n'})}{\xrightarrow{\sim}} & & \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{O}_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)}
\end{array} \tag{3.4.2.4.2}$$

where the oblique arrows are the canonical ones and where the triangles (except the left one) are the images under $\delta^{n,n'*}_{(m)}$, $q^{n,n'*}_{0(m)}$ and $q^{n,n'*}_{1(m)}$ of the triangle 3.4.2.4.1.

Proposition 3.4.2.5. *We have the following properties.*

(I) Given an $\mathcal{O}_X$-module $\mathcal{E}$. The following are equivalent.

(a) A left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure on $\mathcal{E}$ extending its $\mathcal{O}_X$-module structure.

(b) A family of $\mathcal{O}_X$-linear homomorphisms $\theta_n \colon \mathcal{E} \to p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)})$ (the $\mathcal{O}_X$-module structure of this latter is induced by the right structure of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$) satisfying

(i) $\theta_0 = \mathrm{id}_{\mathcal{E}}$ *and for any* $n, n' \in \mathbb{N}$, *the diagram*

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\theta_n} & \mathcal{E} \otimes \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \\ \| & & \uparrow {\scriptstyle \mathrm{id} \otimes \psi^{n+n',n}_{X^\sharp/S^\sharp,(m)}} \\ \mathcal{E} & \xrightarrow[\theta_{n+n'}]{} & \mathcal{E} \otimes \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp,(m)} \end{array} \tag{3.4.2.5.1}$$

is commutative.

(ii) *for all* n, n' *we have commutative diagrams (cocycle condition)*

$$\begin{array}{ccc} \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\mathrm{id} \otimes \delta^{n,n'}_{(m)}} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \\ {\scriptstyle \theta^{\mathcal{E}}_{n+n'}} \uparrow & & \uparrow {\scriptstyle \theta^{\mathcal{E}}_n \otimes \mathrm{id}} \\ \mathcal{E} & \xrightarrow{\theta^{\mathcal{E}}_{n'}} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp,(m)} \end{array} \tag{3.4.2.5.2}$$

(c) *An* m*-PD stratification* $\varepsilon = (\varepsilon^{\mathcal{E}}_n)$ *on* $\mathcal{E}$.

(II) *Let* $\mathcal{E}$ *be left* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-module and let* $\theta^{\mathcal{E}} = (\theta^{\mathcal{E}}_n)$, $\varepsilon^{\mathcal{E}} = (\varepsilon^{\mathcal{E}}_n)$ *be the associated family or* m*-PD stratification.*

(a) *We retrieve from* $\theta^{\mathcal{E}}$ *(resp.* $\varepsilon^{\mathcal{E}}$*) the action by a section* P *of* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ *on* $\mathcal{E}$ *via the following composition of the bottom (resp. top) horizontal morphisms of the commutative diagram:*

$$\begin{array}{ccccccc} \mathcal{E} & \xrightarrow[3.2.2.13]{p^n_{1(m),\mathcal{E}}} & \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{E} & \xrightarrow{\varepsilon^{\mathcal{E}}_n} & \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\mathrm{id} \otimes P} & \mathcal{E} \\ \| & & & & \| & & \| \\ \mathcal{E} & & \xrightarrow{\theta^{\mathcal{E}}_n} & & p_{1*}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}) & \xrightarrow{\mathrm{id} \otimes P} & \mathcal{E}. \end{array} \tag{3.4.2.5.3}$$

(b) *Suppose* $X^\sharp \to S^\sharp$ *is endowed with logarithmic coordinates* $(u_\lambda)_{\lambda=1,\dots,d}$. *Conversely, with notation 3.2.3.4, for any* $x \in \mathcal{E}$, *we have the Taylor expansion formula*

$$\theta^{\mathcal{E}}_n(x) = \varepsilon^{\mathcal{E}}_n(1 \otimes x) = \sum_{|\underline{k}| \leq n} \underline{\partial}^{\langle \underline{k} \rangle}_\sharp x \otimes \underline{\tau}^{\{\underline{k}\}}_\sharp. \tag{3.4.2.5.4}$$

(III) *An* $\mathcal{O}_X$*-linear morphism* $\phi \colon \mathcal{E} \to \mathcal{F}$ *between two left* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-modules is* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-linear if and only if* ϕ *is horizontal.*

Proof. The proof is identical to that of 2.1.1.5 except that the inverse of $\varepsilon^{\mathcal{E}}_n$ is given by the formula 3.4.5.3.1, formula which is computed later. □

Example 3.4.2.6. For example, $\mathcal{O}_X$ is endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure via its canonical m-PD-stratification defined at 3.4.2.4. Using 3.4.2.5.3, the action by a section P of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ on $\mathcal{O}_X$ is given by the composition:

$$\mathcal{O}_X \xrightarrow{p^n_{1(m)}} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \xrightarrow{P} \mathcal{O}_X. \tag{3.4.2.6.1}$$

The following proposition will be generalized with coefficients (see 4.2.3.1.1). However, in order to define what is a coefficient and its properties (see Lemma 4.1.1.2), we need at least the case of a tensor product of two left $\mathcal{D}$-modules.

Proposition 3.4.2.7. *Let $\mathcal{E}$, $\mathcal{F}$ be two left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules. There exists on the tensor product $\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{F}$ a unique structure of left $\widetilde{\mathcal{D}}^{(m)}_X$-module functorial in $\mathcal{E}$ and $\mathcal{F}$ such that, for any system of logarithmic coordinates on an open subset $U\subset X$, and any $\underline{k}\in\mathbb{N}^d$, $x\in\Gamma(U,\mathcal{E})$, $y\in\Gamma(U,\mathcal{F})$, we have*

$$\underline{\partial}^{\langle \underline{k}\rangle}_\sharp(x\otimes y)=\sum_{\underline{i}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{i}\end{smallmatrix}\right\}\underline{\partial}^{\langle \underline{i}\rangle}_\sharp(x)\otimes\underline{\partial}^{\langle \underline{k}-\underline{i}\rangle}_\sharp(y). \tag{3.4.2.7.1}$$

Moreover, the following formula holds

$$\widetilde{\underline{\partial}}^{\langle \underline{k}\rangle}_\sharp(x\otimes y)=\sum_{\underline{i}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{i}\end{smallmatrix}\right\}\widetilde{\underline{\partial}}^{\langle \underline{i}\rangle}_\sharp x\otimes\widetilde{\underline{\partial}}^{\langle \underline{k}-\underline{i}\rangle}_\sharp y. \tag{3.4.2.7.2}$$

Proof. The proof is similar to that of Proposition 2.1.3.1.a: We endow the sheaf $\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{F}$ with the m-PD stratification with coefficients in $\mathcal{O}_X$: $\varepsilon^{\mathcal{E}\otimes\mathcal{F}}_n:=\varepsilon^{\mathcal{E}}_n\otimes_{\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}}\varepsilon^{\mathcal{F}}_n$. By using the formulas 3.4.2.5.4, we get 3.4.2.7.1.

By replacing the use of the formula 3.4.2.5.4 by that of 3.4.5.3.1, instead of 3.4.2.7.1 we get the formula 3.4.2.7.2 by symmetrical computations. More precisely, since $(\varepsilon^{\mathcal{E}\otimes\mathcal{F}}_n)^{-1}:=(\varepsilon^{\mathcal{E}}_n)^{-1}\otimes(\varepsilon^{\mathcal{F}}_n)^{-1}$, then we compute

$$(\varepsilon^{\mathcal{E}\otimes\mathcal{F}}_n)^{-1}((x\otimes y)\otimes 1)=\left(\sum_{|\underline{i}|\leq n}\underline{\tau}^{\{\underline{i}\}}_\sharp\otimes\widetilde{\underline{\partial}}^{\langle \underline{i}\rangle}_\sharp x\right)\otimes\left(\sum_{|\underline{j}|\leq n}\underline{\tau}^{\{\underline{j}\}}_\sharp\otimes\widetilde{\underline{\partial}}^{\langle \underline{j}\rangle}_\sharp y\right)=\sum_{|\underline{k}|\leq n}\underline{\tau}^{\{\underline{k}\}}_\sharp\otimes\left(\sum_{\underline{i}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{i}\end{smallmatrix}\right\}\widetilde{\underline{\partial}}^{\langle \underline{k}-\underline{i}\rangle}_\sharp y\otimes\widetilde{\underline{\partial}}^{\langle \underline{i}\rangle}_\sharp x\right),$$

Using again 3.4.5.3.1, we get 3.4.2.7.2. □

Remark 3.4.2.8. With notation 3.4.2.7, if $\mathcal{F}$ is moreover a $\widetilde{\mathcal{D}}^{(m)}_X$-bimodule, then $\mathcal{E}\otimes_{\mathcal{O}_X}\mathcal{F}$ has a unique structure of $\widetilde{\mathcal{D}}^{(m)}_X$-bimodule induced by functoriality from 3.4.2.7.

3.4.3 PD-costratifications of level m

Definition 3.4.3.1. An m-PD-*costratification on $\mathcal{M}$ relatively to $X^\sharp/S^\sharp$* on an $\mathcal{O}_X$-module $\mathcal{M}$ is the data of a family of isomorphisms $\mathcal{P}_{X^\sharp/S^\sharp(m)}$-linear

$$\varepsilon_n\colon \mathcal{H}om_{\mathcal{O}_X}(p^n_{0*}\mathcal{P}_{X^\sharp/S^\sharp(m)},\mathcal{M})\to\mathcal{H}om_{\mathcal{O}_X}(p^n_{1*}\mathcal{P}_{X^\sharp/S^\sharp(m)},\mathcal{M}),$$

this ones satisfying the following conditions :

(a) $\varepsilon_0=\mathrm{id}_{\mathcal{M}}$ and for any $n'\geq n$ in $\mathbb{N}$, ε_n and $\psi^{n',n\flat}_{X/S,(m)}(\varepsilon_{n'})$ are canonically isomorphic, i.e. the following diagram

$$\begin{array}{ccc}\psi^{n',n\flat}_{X^\sharp/S^\sharp,(m)}(p^{n'\flat}_{0,(m)}(\mathcal{M})) & \xrightarrow{\psi^{n',n\flat}_{X^\sharp/S^\sharp,(m)}(\varepsilon_{n'})} & \psi^{n',n\flat}_{X^\sharp/S^\sharp,(m)}(p^{n'\flat}_{1,(m)}(\mathcal{M}))\\ \downarrow\wr & & \downarrow\wr\\ p^{n\flat}_{0,(m)}(\mathcal{M}) & \xrightarrow{\varepsilon_n} & p^{n\flat}_{1,(m)}(\mathcal{M})\end{array} \tag{3.4.3.1.1}$$

whose vertical isomorphisms are the canonical ones, is commutative ;

(b) For any n, n', the diagram

$$\begin{array}{ccc}\mathcal{H}om_{\mathcal{O}_X}(p^{n,n'}_{0*}(\mathcal{P}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}),\mathcal{M}) & \xrightarrow{\delta^{n,n'\flat}_{(m)}(\varepsilon_{n+n'})} & \mathcal{H}om_{\mathcal{O}_X}(p^{n,n'}_{2*}(\mathcal{P}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}),\mathcal{M})\\ {\scriptstyle q^{n,n'\flat}_0(\varepsilon_{n+n'})}\searrow & & \nearrow{\scriptstyle q^{n,n'\flat}_1(\varepsilon_{n+n'})}\\ & \mathcal{H}om_{\mathcal{O}_X}(p^{n,n'}_{1*}(\mathcal{P}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{O}_X}\mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}),\mathcal{M}) & \end{array} \tag{3.4.3.1.2}$$

is commutative.

Say an $\mathcal{O}_X$-linear homomorphism $\varphi : \mathcal{M} \to \mathcal{N}$ between $\mathcal{O}_X$-modules equipped with m-PD costratifications relatively to $X^\sharp/S^\sharp$ is *horizontal* if it commutes with all ε_n.

3.4.3.2. With notation 3.2.2.12, similarly to 2.1.1.2, we check that the above condition 3.4.3.1.2 is equivalent to

$$\forall\, n, \qquad q^{n\flat}_{02,(m)}(\varepsilon_n) = q^{n\flat}_{01,(m)}(\varepsilon_n) \circ q^{n\flat}_{12,(m)}(\varepsilon_n). \tag{3.4.3.2.1}$$

Proposition 3.4.3.3. *Let $\mathcal{M}$ be an $\mathcal{O}_X$-module together with an m-PD costratification $(\varepsilon^{\mathcal{M}}_n)$ relative to $X^\sharp/S^\sharp$. Then the homomorphisms $\varepsilon^{\mathcal{M}}_n$ are $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$-linear isomorphisms.*

Proof. Copy the proof of 2.1.1.3. □

Proposition 3.4.3.4. *For any $\mathcal{O}_X$-module $\mathcal{M}$, there is equivalence between the following data :*

(a) A structure of right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{M}$ extending its structure of $\mathcal{O}_X$-module ;

(b) An m-PD-costratification $(\varepsilon^{\mathcal{M}}_n)$ relatively to $X^\sharp/S^\sharp$ on $\mathcal{M}$.

A $\mathcal{O}_X$-linear homomorphism between two right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear if and only if it is horizontal. Finally, via the identification 2.1.2.6.1 and 2.1.2.6.2, in logarithmic coordinates, for each section x of $\mathcal{M}$, we have the formula :

$$\varepsilon^{\mathcal{M}}_n(x \otimes \underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}) = \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\star\langle \underline{h}\rangle} \otimes x \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h}\rangle}, \tag{3.4.3.4.1}$$

where $\{\underline{\partial}_\sharp^{\star\langle \underline{h}\rangle},\ |\underline{h}| \leq n\}$ is the basis of $\mathcal{H}om_{\mathcal{O}_X}(p^n_{1*}\mathcal{P}^n_{X^\sharp/S^\sharp(m)}, \mathcal{O}_X)$ which is the dual basis of the basis $\{\underline{\tau}_\sharp^{\{\underline{h}\}},\ |\underline{h}| \leq n\}$ of $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$.

Proof. By copying 2.1.2.8 and 2.1.2.9, we obtain the proposition. □

3.4.4 On the preservation of $\mathcal{D}$-module structures under pullbacks, base change

Let

$$\begin{array}{ccc} X^\sharp & \xrightarrow{\quad f \quad} & Y^\sharp \\ \downarrow & & \downarrow \\ (S^\sharp, \mathfrak{a}_S, \mathfrak{b}_S, \alpha_S) & \xrightarrow{\ \phi\ } & (T^\sharp, \mathfrak{a}_T, \mathfrak{b}_T, \alpha_T), \end{array} \tag{3.4.4.0.1}$$

be a commutative diagram where $S^\sharp$ and $T^\sharp$ are nice fine log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ as defined in 3.1.1.1 (resp. $S^\sharp$ and $T^\sharp$ are nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10 endowed with quasi-coherent (resp. coherent) m-PD-ideals, where the bottom arrow is an m-PD-morphism and where $X^\sharp$ is a log smooth $S^\sharp$-log scheme (resp. log smooth $S^\sharp$-log formal scheme) and $Y^\sharp$ is a log smooth $T^\sharp$-log scheme (resp. log smooth $T^\sharp$-log formal scheme).

3.4.4.1. Let us now construct the inverse image of a $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module We denote by $(f,\phi)\colon X^\sharp/S^\sharp \to Y^\sharp/T^\sharp$ the morphism of relative logarithmic schemes induced by the diagram 3.4.4.0.1. When $\phi\colon S^\sharp \to T^\sharp$ in understood, by abuse of notation, we also simply denote (f,ϕ) by f. According to notation 3.2.2.2, we denote by $p^n_{0,(m)}$ and $p^n_{1,(m)}\colon \Delta^n_{X^\sharp/S^\sharp(m)} \to X$ the left and right projections. According to notation 3.2.2.12, for any integer n and any integers $0 \leq i < j \leq 2$, it follows from the universal property of m-PD-envelopes of order n (see 3.2.1.1) that we get a unique m-PD-morphism $q^n_{ij,(m)}\colon \Delta^n_{X^\sharp/S^\sharp,(m)}(2) \to \Delta^n_{X^\sharp/S^\sharp,(m)}$ making commutative the diagram 3.2.2.12.1. For any integer $n \geq 0$ by using the universal property of the m-PD-envelopes of order n, we have the m-PD-morphisms $f^n_{(m)}\colon \Delta^n_{X^\sharp/S^\sharp(m)} \to \Delta^n_{Y^\sharp/T^\sharp(m)}$

and $f^n_{(m)}(2)\colon \Delta^n_{X^\sharp/S^\sharp(m)}(2) \to \Delta^n_{Y^\sharp/T^\sharp(m)}(2)$ making commutative the diagram of logarithmic schemes for any integers $0 \le i < j \le 2$ and $0 \le k \le 1$:

$$\begin{array}{ccccc} \Delta^n_{X^\sharp/S^\sharp,(m)}(2) & \xrightarrow{q^n_{ij,(m)}} & \Delta^n_{X^\sharp/S^\sharp,(m)} & \xrightarrow{p^n_{k,(m)}} & X^\sharp \\ \downarrow {\scriptstyle f^n_{(m)}(2)} & & \downarrow {\scriptstyle f^n_{(m)}} & & \| \\ \Delta^n_{Y^\sharp/S^\sharp,(m)}(2) & \xrightarrow{q^n_{ij,(m)}} & \Delta^n_{Y^\sharp/T^\sharp,(m)} & \xrightarrow{p^n_{k,(m)}} & Y^\sharp. \end{array} \tag{3.4.4.1.1}$$

These homomorphisms are compatible when n varies, i.e., with notation 3.2.2.2.1, we have the equality $\psi^{n',n}_{Y^\sharp/T^\sharp,(m),\gamma}(r) \circ f^n_{(m)}(r) = f^{n'}_{(m)}(r) \circ \psi^{n',n}_{X^\sharp/S^\sharp,(m),\gamma}(r)$, for any $n' \ge n$. Let $n \in \mathbb{N}$. This yields the m-PD ring homomorphism

$$f^{-1}(\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}(r)) \to \mathcal{P}^n_{X^\sharp/S(m)}(r). \tag{3.4.4.1.2}$$

which is $f^{-1}\mathcal{O}_Y$-linear for any structures (via the canonical ring homomorphism $f^{-1}\mathcal{O}_Y \to \mathcal{O}_X$ for $\mathcal{P}^n_{X^\sharp/S(m)}$). We get the $\mathcal{O}_X$-module $f^*(p^n_{0,(m)*}\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}) := \mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}(p^n_{0,(m)*}\mathcal{P}^n_{Y^\sharp/T^\sharp(m)})$ and the homomorphism of $\mathcal{O}_X$-modules:

$$f^n_{(m)}\colon f^*(p^n_{0,(m)*}\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}) \to p^n_{0,(m)*}\mathcal{P}^n_{X^\sharp/S(m)}. \tag{3.4.4.1.3}$$

3.4.4.2. Let $\mathcal{E}$ be a left $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module and $(\varepsilon^{\mathcal{E}}_n)$ its m-PD-stratification. The $\mathcal{O}_X$-module $f^*\mathcal{E}$ has a canonical structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. More precisely, the isomorphisms $\varepsilon^{f^*\mathcal{E}}_n := f^{n*}_{(m)}(\varepsilon^{\mathcal{E}}_n)$ endow $f^*\mathcal{E}$ with an m-PD-stratification (for the cocycle conditions, we use the commutativity of 3.4.4.1.1).

Let $\mathcal{D}$ be a sheaf of rings. When $\mathcal{E}$ is a $(\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{D})$-bimodule, then by functoriality $f^*(\mathcal{E})$ is a $(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\mathcal{D})$-bimodule. For instance we get the $(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp})$-bimodule $f^*(\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp})$ that we will denote by $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}$.

3.4.4.3. Dualizing the morphisms 3.4.4.1.3, we get

$$f^{n\vee}_{(m)}\colon \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n} = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^n_{X^\sharp/S(m)}, \mathcal{O}_X) \to \mathcal{H}om_{\mathcal{O}_X}(f^*(\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}, \mathcal{O}_X) \xrightarrow[\iota]{\sim} f^*\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp,n}, \tag{3.4.4.3.1}$$

where ι is the canonical morphism. Passing to limit we get the canonical homomorphisms

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to f^*\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}. \tag{3.4.4.3.2}$$

Proposition 3.4.4.4. *The canonical homomorphism 3.4.4.3.2 sends* 1 *to* $1 \otimes 1$ *and is* $(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\mathcal{O}_Y)$*-bilinear.*

Proof. Let $P \in \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$ for some integer n. Since the lemma is local, we can suppose that $Y^\sharp \to T^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,r}$. Put $\tau_{\sharp\lambda} := \mu^n_{(m),\gamma}(u_\lambda) - 1$, where $\mu^n_{(m),\gamma}\colon M^n_{Y^\sharp/T^\sharp,(m),\gamma} \to \ker(\mathcal{P}^{n*}_{Y^\sharp/T^\sharp,(m),\gamma} \to \mathcal{O}^*_Y)$ is the morphism defined as in 3.2.2.2.3. The elements $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}, |\underline{k}| \le n\}$ form a basis of $\mathcal{P}^n_{Y^\sharp/T^\sharp,(m)}$ as $\mathcal{O}_Y$-module. The corresponding dual basis of $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp,n}$ will be denoted by $\{\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}, |\underline{k}| \le n\}$. This induces the basis $\{1 \otimes \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}, |\underline{k}| \le n\}$ of $f^*\mathcal{P}^n_{Y^\sharp/T^\sharp,(m)}$ as $\mathcal{O}_X$-module and the basis $\{1 \otimes \underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}, |\underline{k}| \le n\}$ of $f^*\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp,n}$ as $\mathcal{O}_X$-module.

By definition (see 3.4.4.3.1), $f^{n\vee}_{(m)}(P) = \iota(P \circ f^n_{(m)})$. Hence,

$$f^{n\vee}_{(m)}(P) = \sum_{|\underline{k}| \le n} P \circ f^n_{(m)}(1 \otimes \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}) \otimes (1 \otimes \underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}). \tag{3.4.4.4.1}$$

Let $(\varepsilon^{\mathcal{D}}_n)$ be the m-PD-stratification associated with $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$. Following 3.4.2.5.4, we have, $\varepsilon^{\mathcal{D}}_n(1 \otimes 1) = \sum_{|\underline{k}| \le n} \underline{\partial}_\sharp^{\langle\underline{k}\rangle} \otimes \underline{\tau}_\sharp^{\{\underline{k}\}}$. This yields: $f^{n*}_{(m)}(\varepsilon^{\mathcal{D}}_n)(1 \otimes (1 \otimes 1)) = \sum_{|\underline{k}| \le n} (1 \otimes \underline{\partial}_\sharp^{\langle\underline{k}\rangle}) \otimes f^n_{(m)}(1 \otimes \underline{\tau}_\sharp^{\{\underline{k}\}})$. Then following, 3.4.2.5.3, the action of P on $1 \otimes 1 \in f^*\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp,n}$ is

$$P(1 \otimes 1) = (id \otimes P) \circ f^{n*}_{(m)}(\varepsilon^{\mathcal{D}}_n)(1 \otimes (1 \otimes 1)) = \sum_{|\underline{k}| \le n} P \circ f^n_{(m)}(1 \otimes \underline{\tau}_\sharp^{\{\underline{k}\}})(1 \otimes \underline{\partial}_\sharp^{\langle\underline{k}\rangle}). \tag{3.4.4.4.2}$$

It follows from the equalities 3.4.4.4.1 and 3.4.4.4.2 that $P(1 \otimes 1) = f^{n\vee}_{(m)}(P)$. Since $1(1 \otimes 1) = 1 \otimes 1$ then the canonical homomorphism 3.4.4.3.2 sends 1 to $1 \otimes 1$ and is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. This yields the $(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\mathcal{O}_Y)$-bilinearity by an easy computation. □

Proposition 3.4.4.5. *We have the canonical isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules:*

$$f^*\mathcal{E} \xrightarrow{\sim} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{E}. \tag{3.4.4.5.1}$$

Proof. We have the isomorphism of $(\mathcal{O}_X, f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp})$-bimodules:

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \xrightarrow{\sim} \mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}.$$

This yields the $\mathcal{O}_X$-linear isomorphism of the form 3.4.4.5.1 given by $a \otimes x \mapsto (a \otimes 1) \otimes x$ for any section a of $\mathcal{O}_X$ and section x of $f^{-1}\mathcal{E}$. It remains to check its $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linearity.

Let $\rho\colon \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp} \to \mathcal{E}$ be a $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-linear morphism and let x be the image of 1 via ρ. By applying the functor f^*, this yields the $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear morphism $f^*(\rho)\colon \mathcal{D}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \to f^*\mathcal{E}$, which is given by $a \otimes Q \mapsto a \otimes (Q \cdot x)$ for any section a of $\mathcal{O}_X$ and section Q of $f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$. Hence, $f^*(\rho)(P \cdot (a \otimes 1)) = P \cdot (a \otimes x)$ for any section P of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and any section a of $\mathcal{O}_X$.

By composing $f^*(\rho)$ with 3.4.4.5.1, we get the morphism $\mathcal{D}_{X^\sharp/S^\sharp} \to \mathcal{D}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{E}$ given by $a \otimes Q \mapsto (a \otimes 1) \otimes (Q \cdot x) = (a \otimes Q) \otimes x$, which is the image of ρ by the functor $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}(-)$ and therefore is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Hence, the map 3.4.4.5.1 sends $P \cdot (a \otimes x)$ to $P \cdot ((a \otimes 1) \otimes x)$ for any section P of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and we are done. □

3.4.4.6. Let $\mathcal{B}_Y$ be a commutative $\mathcal{O}_Y$-algebra endowed with of a compatible structure of left $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module. Then the action of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $f^*\mathcal{B}_Y$ is compatible with its structure of $\mathcal{O}_X$-algebra.

3.4.5 Canonical right $\mathcal{D}_{X^\sharp/S^\sharp}$-module structure on $\omega_{X^\sharp/S^\sharp}$ and an inverse formula

Lemma 3.4.5.1. *The sheaf $\omega_{X^\sharp/S^\sharp}$ is a right $\mathcal{D}_{X^\sharp/S^\sharp}$-submodule of $j_*\omega_{Y/S^\sharp}$. Suppose there exists logarithmic coordinates $u_1, \dots, u_d \in M_{X^\sharp}$. The action of $P \in \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ on the section $a\, d\log u_1 \wedge \cdots \wedge d\log u_d$, where a is section of $\mathcal{O}_X$ is given by the formula*

$$(a\ d\log u_1 \wedge \cdots \wedge d\log u_d) \cdot P = \widetilde{P}(a) d\log u_1 \wedge \cdots \wedge d\log u_d. \tag{3.4.5.1.1}$$

Proof. Since this can been checked locally, we can suppose there exists logarithmic coordinates $u_1, \dots, u_d \in M_{X^\sharp}$. Let $(t_\lambda)_{\lambda=1,\dots,r}$ be the induced coordinates of Y/S. Then $\omega_{X^\sharp/S^\sharp}$ is a free $\mathcal{O}_X$-module of rank 1 and a basis is given by $d\log u_1 \wedge \cdots \wedge d\log u_d$. The map $\omega_{X^\sharp/S^\sharp} \to j_*\omega_{Y/S^\sharp}$ sends $d\log u_1 \wedge \cdots \wedge d\log u_d$ to $\frac{1}{t_1 \cdots t_d} dt_1 \wedge \cdots \wedge dt_d$. Then this is an easy computation from 2.2.1.5 and 3.4.1.3.1. □

Lemma 3.4.5.2. *We suppose that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,n}$. If $\underline{k} \neq 0$ then we have the formula:*

$$0 = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{h} \rangle_{(m)}} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k} - \underline{h} \rangle}. \tag{3.4.5.2.1}$$

Proof. Consider the diagram

$$\begin{array}{ccc} p_0^{n\flat}(\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) & \xrightarrow{\epsilon_n} & p_1^{n\flat}(\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \\ \downarrow \simeq & & \downarrow \simeq \\ p_0^{n\flat}(\omega_{X^\sharp/S^\sharp}) \otimes_{\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}} p_0^{n*}(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) & \xrightarrow{\epsilon_n} & p_1^{n\flat}(\omega_{X^\sharp/S^\sharp}) \otimes_{\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}} p_1^{n*}(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \end{array} \tag{3.4.5.2.2}$$

Let $e_0 := d\log t_1 \wedge \cdots \wedge d\log t_d$. It follows from 3.4.3.4.1 the formula

$$\varepsilon_n((e_0 \otimes P) \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}) = \sum_{\underline{j} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{j} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\star \langle \underline{j} \rangle} \otimes (e_0 \otimes P) \underline{\partial}_\sharp^{\langle \underline{k} - \underline{j} \rangle}. \tag{3.4.5.2.3}$$

The element $(e_0 \otimes P) \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}$ is sent via the left arrow of the diagram 3.4.5.2.2 to $(e_0 \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}) \otimes (P \otimes 1)$. This latter is sent via the bottom arrow to

$$\epsilon_n(e_0 \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}) \otimes \epsilon_n^{-1}(P \otimes 1) \overset{3.4.3.4.1}{=} \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left(\underline{\partial}_\sharp^{\star \langle \underline{h} \rangle} \otimes e_0 \underline{\partial}_\sharp^{\langle \underline{k} - \underline{h} \rangle} \right) \otimes \epsilon_n^{-1}(P \otimes 1).$$

Since $e_0 \underline{\partial}_\sharp^{\langle \underline{i} \rangle} = \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle}(1) e_0 = 0$ if $\underline{i} \neq \underline{0}$, then we get

$$\sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left(\underline{\partial}_\sharp^{\star \langle \underline{h} \rangle} \otimes e_0 \underline{\partial}_\sharp^{\langle \underline{k} - \underline{h} \rangle} \right) = \underline{\partial}_\sharp^{\star \langle \underline{k} \rangle} \otimes e_0.$$

Hence,

$$\epsilon_n(e_0 \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}) \otimes \epsilon_n^{-1}(P \otimes 1) = \underline{\partial}_\sharp^{\star \langle \underline{k} \rangle} \otimes e_0 \otimes \epsilon_n^{-1}(P \otimes 1). \tag{3.4.5.2.4}$$

Let us write $\epsilon_n^{-1}(P \otimes 1) = \sum_{|\underline{i}| \leq n} \underline{\tau}_\sharp^{\{\underline{i}\}} \otimes a_{\underline{i}}$, with $a_{\underline{i}} \in \mathcal{D}_{X^\sharp}^{(m)}$. This yields

$$\epsilon_n(e_0 \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}) \otimes \epsilon_n^{-1}(P \otimes 1) = \sum_{|\underline{i}| \leq n} \underline{\partial}_\sharp^{\star \langle \underline{k} \rangle} \otimes e_0 \otimes \underline{\tau}_\sharp^{\{\underline{i}\}} \otimes a_{\underline{i}}, \tag{3.4.5.2.5}$$

which is sent via the right arrow of the diagram 3.4.5.2.2 to

$$\underline{\tau}_\sharp^{\{\underline{j}\}} \mapsto \sum_{|\underline{i}| \leq n} \underline{\partial}_\sharp^{\star \langle \underline{k} \rangle} (\underline{\tau}_\sharp^{\{\underline{j}\}} \underline{\tau}_\sharp^{\{\underline{i}\}}) e_0 \otimes a_{\underline{i}} = \left\{ \begin{smallmatrix} \underline{k} \\ \underline{j} \end{smallmatrix} \right\} e_0 \otimes a_{\underline{k} - \underline{j}}, \tag{3.4.5.2.6}$$

i.e. to $\sum_{\underline{j} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{j} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\star \langle \underline{j} \rangle} \otimes (e_0 \otimes a_{\underline{k} - \underline{j}})$. By using the commutativity of the diagram 3.4.5.2.2, and the formula 3.4.5.2.3, this yields $e_0 \otimes a_{\underline{i}} = (e_0 \otimes P) \underline{\partial}_\sharp^{\langle \underline{i} \rangle} \overset{3.4.5.1.1}{=} e_0 \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle} P$. Hence,

$$\epsilon_n^{-1}(P \otimes 1) = \sum_{|\underline{i}| \leq n} \underline{\tau}_\sharp^{\{\underline{i}\}} \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle} P. \tag{3.4.5.2.7}$$

From 3.4.2.5.4, this yields

$$\begin{aligned} P \otimes 1 = \epsilon_n \circ \epsilon_n^{-1}(P \otimes 1) &= \epsilon_n \Big(\sum_{|\underline{i}| \leq n} \underline{\tau}_\sharp^{\{\underline{i}\}} \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle} P \Big) = \sum_{|\underline{i}| \leq n} \underline{\tau}_\sharp^{\{\underline{i}\}} \epsilon_n (1 \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle} P) \\ = \sum_{|\underline{i}| \leq n} \underline{\tau}_\sharp^{\{\underline{i}\}} \sum_{|\underline{j}| \leq n} \underline{\partial}_\sharp^{\langle \underline{j} \rangle_{(m)}} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle} P \otimes \underline{\tau}_{\sharp (m)}^{\{\underline{j}\}} &= \sum_{|\underline{i}| \leq n} \sum_{|\underline{j}| \leq n} \left\{ \begin{smallmatrix} \underline{i} + \underline{j} \\ \underline{j} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{j} \rangle_{(m)}} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle} P \otimes \underline{\tau}_{\sharp (m)}^{\{\underline{j} + \underline{i}\}} \\ &= \sum_{|\underline{k}| \leq n} \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{h} \rangle_{(m)}} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k} - \underline{h} \rangle} P \otimes \underline{\tau}_{\sharp (m)}^{\{\underline{k}\}} \end{aligned} \tag{3.4.5.2.8}$$

This yields, if $\underline{k} \neq 0$,

$$0 = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{h} \rangle_{(m)}} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k} - \underline{h} \rangle}. \tag{3.4.5.2.9}$$

□

Proposition 3.4.5.3. *Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\mathcal{D}_{X^\sharp/S^\sharp}^{(m)}$-module. We suppose that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,n}$.*

(a) Then we have the inverse formula of the Taylor formula 3.4.2.5.4 satisfied by $\mathcal{E}$:

$$(\epsilon_n^{\mathcal{E}})^{-1}(x \otimes 1) = \sum_{|\underline{i}| \leq n} \underline{\tau}_\sharp^{\{\underline{i}\}} \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{i} \rangle} \cdot x. \tag{3.4.5.3.1}$$

(b) We have the inverse formula of the Taylor formula 3.4.3.4.1 satisfied by $\mathcal{M}$:

$$(\varepsilon_n^{\mathcal{M}})^{-1}(\underline{\partial}^{\star\langle\underline{k}\rangle}\otimes x)=\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}x\widetilde{\underline{\partial}}_\sharp^{\langle\underline{k}-\underline{h}\rangle}\otimes\underline{\partial}_\sharp^{\langle\underline{h}\rangle}. \tag{3.4.5.3.2}$$

Proof. a) Since, we have $\epsilon_n^{\mathcal{E}}(1\otimes y)=\sum_{|\underline{i}|\leq n}\underline{\partial}_\sharp^{\langle\underline{i}\rangle}\cdot y\otimes\underline{\tau}_\sharp^{\{\underline{i}\}}$, then the formula 3.4.5.3.1 is a consequence of 3.4.5.2.1 and of the computation 3.4.5.2.8.

b) Let us now check that the morphism $\zeta_n^{\mathcal{M}}$ defined by the formula 3.4.5.3.2 is the inverse of the morphism $\varepsilon_n^{\mathcal{M}}$. We compute

$$\varepsilon_n^{\mathcal{M}}\circ\zeta_n^{\mathcal{M}}(\underline{\partial}^{\star\langle\underline{k}\rangle}\otimes x)=\varepsilon_n^{\mathcal{M}}\left(\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}x\widetilde{\underline{\partial}}_\sharp^{\langle\underline{h}\rangle}\otimes\underline{\partial}_\sharp^{\langle\underline{k}-\underline{h}\rangle}\right)$$
$$=\sum_{\underline{h}\leq\underline{k}}\sum_{\underline{i}\leq\underline{k}-\underline{h}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\left\{\begin{smallmatrix}\underline{k}-\underline{h}\\ \underline{i}\end{smallmatrix}\right\}\underline{\partial}_\sharp^{\star\langle\underline{k}-\underline{h}-\underline{i}\rangle}\otimes x\widetilde{\underline{\partial}}_\sharp^{\langle\underline{h}\rangle}\underline{\partial}_\sharp^{\langle\underline{i}\rangle}=\sum_{\underline{j}\leq\underline{k}}\sum_{\underline{i}\leq\underline{j}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{j}-\underline{i}\end{smallmatrix}\right\}\left\{\begin{smallmatrix}\underline{k}-\underline{j}+\underline{i}\\ \underline{i}\end{smallmatrix}\right\}\underline{\partial}_\sharp^{\star\langle\underline{k}-\underline{j}\rangle}\otimes x\widetilde{\underline{\partial}}_\sharp^{\langle\underline{j}-\underline{i}\rangle}\underline{\partial}_\sharp^{\langle\underline{i}\rangle}$$
$$\sum_{\underline{j}\leq\underline{k}}\sum_{\underline{i}\leq\underline{j}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{j}\end{smallmatrix}\right\}\left\{\begin{smallmatrix}\underline{j}\\ \underline{i}\end{smallmatrix}\right\}\underline{\partial}_\sharp^{\star\langle\underline{k}-\underline{j}\rangle}\otimes x\widetilde{\underline{\partial}}_\sharp^{\langle\underline{j}-\underline{i}\rangle}\underline{\partial}_\sharp^{\langle\underline{i}\rangle}\overset{3.4.5.2.1}{=}\underline{\partial}^{\star\langle\underline{k}\rangle}\otimes x. \tag{3.4.5.3.3}$$

Similarly, we compute $\zeta_n^{\mathcal{M}}\circ\varepsilon_n^{\mathcal{M}}(x\otimes\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}})=x\otimes\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}$. □

Chapter 4

Logarithmic differential modules with coefficients

4.1 Sheaf of logarithmic differential operators of finite order with coefficients

We keep notation 3.4.

4.1.1 Coefficients

We will need later to add overconvergent singularities to the sheaf of differential operators (see 8.7.3.1). To do so, let us introduce the notion of coefficients of the sheaves of differential operators.

Definition 4.1.1.1. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra. We say that a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure on $\mathcal{B}_X$ is compatible with its $\mathcal{O}_X$-algebra structure, if

(a) the $\mathcal{O}_X$-module structure coming from the left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure via the canonical inclusion $\mathcal{O}_X \subset \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ agrees with the one coming from its $\mathcal{O}_X$-algebra structure ;

(b) the isomorphisms $\varepsilon^{\mathcal{B}_X}_n : \mathcal{P}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\sim} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ of the m-PD-stratification coming from the $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure of $\mathcal{B}$ are isomorphisms of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$-algebras.

Such an $\mathcal{O}_X$ algebra can be viewed as an extended version of $\mathcal{O}_X$ which is the coefficient of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

Lemma 4.1.1.2. *Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra endowed with a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure such that the condition (a) of 4.1.1.1 holds. We endow $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{B}_X$ with its canonical left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module induced by that of $\mathcal{B}_X$ (see 3.4.2.7). Then the following condition are equivalent:*

(b) The condition (b) of 4.1.1.1 holds.

(c) For any open $U^\sharp$ such that $U^\sharp/S^\sharp$ has logarithmic coordinates, for any $f, g \in \Gamma(U, \mathcal{B}_X)$ we have the Leibniz formula:

$$\underline{\partial}_\sharp^{\langle \underline{k} \rangle}(fg) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{h} \rangle}(f) \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h} \rangle}(g). \tag{4.1.1.2.1}$$

(d) The multiplication map $\mu \colon \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{B}_X \to \mathcal{B}_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. Since the assertions are local, then we can suppose $X^\sharp/S^\sharp$ has logarithmic coordinates. For any $f, g \in \Gamma(X, \mathcal{B}_X)$, for any $x, y \in \Gamma(X, \mathcal{P}^n_{X^\sharp/S^\sharp,(m)})$, we compute

$$\varepsilon_n^{\mathcal{E}}(x \otimes f)\varepsilon_n^{\mathcal{E}}(y \otimes g) \overset{3.4.2.5.4}{=} \left(\sum_{|\underline{i}|\leq n} \underline{\partial}_\sharp^{\langle \underline{i}\rangle}(f) \otimes \underline{\tau}_\sharp^{\{\underline{i}\}} x\right)\left(\sum_{|\underline{j}|\leq n} \underline{\partial}_\sharp^{\langle \underline{j}\rangle}(g) \otimes \underline{\tau}_\sharp^{\{\underline{j}\}} y\right)$$

$$\overset{1.2.4.5.3}{=} \sum_{|\underline{k}|\leq n} \sum_{\underline{i}+\underline{j}=\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{i}\rangle}(f)\underline{\partial}_\sharp^{\langle \underline{j}\rangle}(g) \otimes \underline{\tau}_\sharp^{\{\underline{k}\}} xy \qquad (4.1.1.2.2)$$

Hence, we get the equivalence between (b) and (c) conditions. Finally, the equivalence between (c) and (d) conditions follows from 3.4.2.7.1. □

Example 4.1.1.3. For example, the canonical left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure on $\mathcal{O}_X$ (see 3.4.2.4) is compatible with its $\mathcal{O}_X$-algebra structure. Indeed, since the oblique arrows of the diagram 3.4.2.4.1 are isomorphisms of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$-algebras, then so are the isomorphisms $\varepsilon_n^{\mathcal{O}_X}$ of the canonical m-PD-stratification of $\mathcal{O}_X$.

4.1.1.4. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure which is compatible with its algebra structure. Let $\rho\colon \mathcal{O}_X \to \mathcal{B}_X$ be the structure algebra homomorphism. Then ρ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Indeed, since $\varepsilon_n^{\mathcal{B}_X}$ is a $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$-algebra homomorphism, then for any section a of $\mathcal{O}_X$ we compute in $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$ the equalities $\varepsilon_n^{\mathcal{B}_X}(1 \otimes \rho(a)) = \varepsilon_n^{\mathcal{B}_X}(p^n_{1(m)}(a) \otimes 1) = (1 \otimes 1)p^n_{1(m)}(a) = (\rho \otimes \mathrm{id})(1 \otimes p^n_{1(m)}(a)) = (\rho \otimes \mathrm{id})(\varepsilon_n^{\mathcal{B}_X}(1 \otimes a))$.

Remark 4.1.1.5. Let $\rho\colon \mathcal{B}_X \to \mathcal{B}'_X$ be a commutative algebra homomorphism. We suppose $\mathcal{B}_X$ and $\mathcal{B}'_X$ are endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module such that ρ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Since ρ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear, then $\mathcal{C}_X := \operatorname{Im}\rho$ is endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module so that the epimorphism $\mathcal{B}_X \twoheadrightarrow \mathcal{C}_X$ and the monomorphism $\mathcal{C}_X \hookrightarrow \mathcal{B}'_X$ are $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. We easily see (e.g. use 4.1.1.2.1) that this is a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure on $\mathcal{C}_X$ which is compatible with its $\mathcal{O}_X$-algebra structure.

Proposition 4.1.1.6. *Let $\mathcal{B}_X$ (resp. $\mathcal{C}_X$) be a commutative $\mathcal{O}_X$ algebra endowed with a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure which is compatible with its $\mathcal{O}_X$-algebra structure (see definition 4.1.1.1). Then the natural left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module on the tensor product $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{C}_X$ (see 3.4.2.7) is compatible with its $\mathcal{O}_X$-algebra structure.*

Proof. By construction, the m-PD-stratification is given by $\epsilon_n^{\mathcal{B}\otimes\mathcal{C}} := \varepsilon_n^{\mathcal{B}} \otimes \varepsilon_n^{\mathcal{C}}$ and is indeed an isomorphism of $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-algebras. □

4.1.2 Sheaf of logarithmic differential operators of finite order with coefficients

Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure which is compatible with its algebra structure.

4.1.2.1. The canonical morphisms of $\mathcal{B}_X$-modules $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n} \to \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^n_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X)$ given by $b \otimes P \mapsto (\tau \mapsto P(\tau)b)$ is an isomorphism for any $n \in \mathbb{N}$. Via this identification, the product $P \cdot P' \in \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n+n'}$ of the operators $P \in \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$ and $P' \in \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n'}$ is by definition the composition

$$\mathcal{P}^{n+n'}_{X^\sharp/S^\sharp(m)} \xrightarrow{\delta^{n,n'}_{(m)}} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \xrightarrow{\mathrm{id}\otimes P'} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\epsilon_n^{\mathcal{B}_X}} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \xrightarrow{\mathrm{id}\otimes P} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\mu} \mathcal{B}_X, \qquad (4.1.2.1.1)$$

where μ is the canonical multiplication of $\mathcal{B}_X$.

Proposition 4.1.2.2. *The sheaf $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a sheaf of rings with the product as defined in 4.1.2.1.1. This is the unique ring structure on $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ such that*

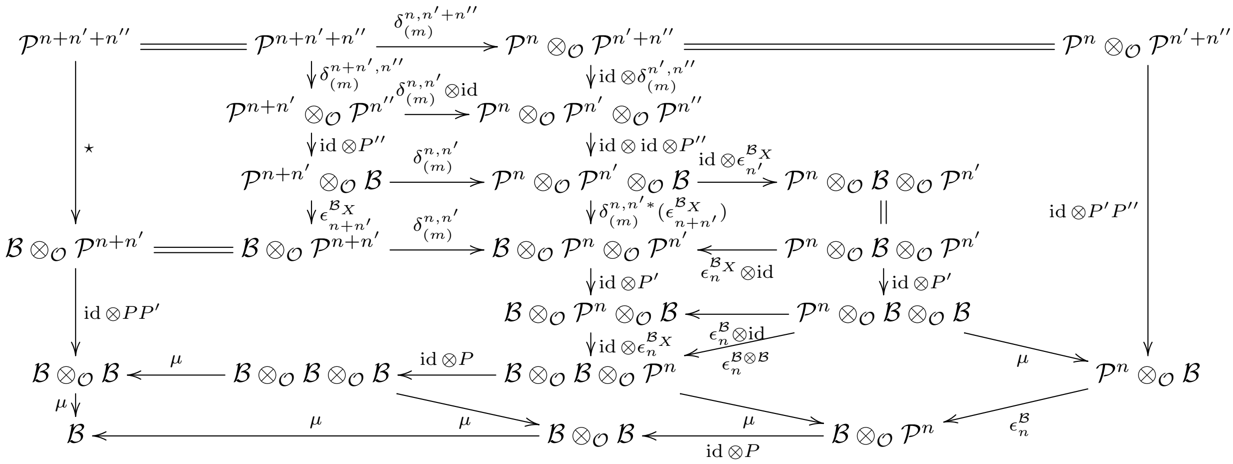
$$\mathcal{B}_X \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} : b \mapsto b \otimes 1, \tag{4.1.2.2.1}$$

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} : P \mapsto 1 \otimes P \tag{4.1.2.2.2}$$

are ring homomorphisms satisfying the formula $(b\otimes 1)(1\otimes P) = b\otimes P$ and for any logarithmic coordinates

$$(1 \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle})(b \otimes 1) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h} \rangle}(b) \otimes \underline{\partial}_\sharp^{\langle \underline{h} \rangle}. \tag{4.1.2.2.3}$$

Proof. i) Let us check in this step that the sheaf $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a sheaf of rings with the product as defined in 4.1.2.1.1. Let $P \in \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$, $P' \in \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n'}$ and $P'' \in \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n''}$ be three operators. Consider the following diagram



(4.1.2.2.4)

where the $\star$ morphism is the one making commutative the top left rectangle. Following 3.2.2.18.1, the top square (in the middle) is commutative. The commutativity of the right square of the third row comes from the cocycle condition of the m-PD-stratification of $\mathcal{B}$. The triangle is commutative by definition of the m-PD-stratification of $\mathcal{B} \otimes_{\mathcal{O}_X} \mathcal{B}$ (see the proof of 3.4.2.7). The commutativity of the right rhombus follows from the $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linearity of μ (see 4.1.1.2). The other squares or rhombus are commutative by functoriality. The other parts of the diagram are commutative by definition. Hence, the diagram 4.1.2.2.4 is commutative. The composition of the left vertical arrows of the contour is equal to $(PP')P''$, whereas the composition of the top,right bottom morphisms of the contour gives $P(P'P'')$. Hence, we are done.

ii) Via the canonical isomorphisms $\mathcal{B}_X \xrightarrow{\sim} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,0} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^0_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X) = \mathcal{H}om_{\mathcal{O}_X}(\mathcal{O}_X, \mathcal{B}_X)$, by using the case where $n = 0$ and $n' = 0$ in the definition of the product, we check that the canonical map $\mathcal{B}_X \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is an injective ring homomorphism. Moreover, to check that $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a ring homomomorphism, either we use 3.2.3.1.1 or we use the local computations 3.2.3.7.2 and 4.1.2.2.3 (use also the fact that following 4.1.1.4 the canonical homorphism $\rho\colon \mathcal{O}_X \to \mathcal{B}_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear). □

Remark 4.1.2.3. When the log structure of $X^\sharp$ and $S^\sharp$ are trivial, then replacing logarithmic coordinates the non-logarithmic version of 4.1.2.2.3 holds, i.e. we have

$$(1 \otimes \underline{\partial}^{\langle \underline{k} \rangle})(b \otimes 1) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{k}-\underline{h} \rangle}(b) \otimes \underline{\partial}^{\langle \underline{h} \rangle}. \tag{4.1.2.3.1}$$

4.1.2.4. Let $\rho\colon \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ be the canonical morphism (see 4.1.2.2.2).

(a) The $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bimodule structure on $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ induced by ρ is equal to the $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bimodule structure induced by the tensor product from the left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure of $\mathcal{B}_X$ and the canonical $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bimodule structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ (see 3.4.2.8).

Indeed, the first equality of 4.1.2.2 implies $(b\otimes P)(1\otimes P') = b\otimes PP'$, i.e. $(b\otimes P)\cdot P' = (b\otimes P)(1\otimes P')$, where the action of P' on $b \otimes P$ is that given by the right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure induced by functoriality of the tensor product (see 3.4.2.8). Finally, via the formulas 4.1.2.2.3 and 3.4.2.7.1, we get $(1 \otimes \underline{\partial}^{\langle \underline{k}\rangle}_\sharp)(b \otimes 1) = \underline{\partial}^{\langle \underline{k}\rangle}_\sharp \cdot (b \otimes 1)$ where the action of $\underline{\partial}^{\langle \underline{k}\rangle}_\sharp$ on $b \otimes 1$ is that given by the tensor product.

(b) It follows from (a) and 3.4.2.7.2 the formula:

$$\underline{\widetilde{\partial}}^{\langle \underline{k}\rangle}_\sharp \times b = \underline{\widetilde{\partial}}^{\langle \underline{k}\rangle}_\sharp (b \otimes 1) = \sum_{\underline{i}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}^{\langle \underline{i}\rangle}_\sharp (b) \otimes \underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{i}\rangle}_\sharp = \sum_{\underline{i}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{i}\rangle}_\sharp (b) \times \underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{i}\rangle}_\sharp, \tag{4.1.2.4.1}$$

where $\times$ is the product given by the ring structure of $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

Notation 4.1.2.5. We define a sheaf of $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-algebras by setting $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$. The canonical morphism $\widetilde{p}^n_{0(m)} \colon \mathcal{B}_X \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$ endows the sheaf $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ with a structure of $\mathcal{B}_X$-algebra, that we will call *left* structure. Moreover, the morphism of $\mathcal{B}_X$-algebras

$$\widetilde{p}^n_{1(m)} \colon \mathcal{B}_X \to \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\epsilon^{\mathcal{B}_X}_n} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$$

induces a second structure of $\mathcal{B}_X$-algebra on $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$, that we call the *right* structure. If there are no risk of confusion, we can simply write $\widetilde{p}^n_0$ and $\widetilde{p}^n_1$ instead of $\widetilde{p}^n_{0(m)}$ and $\widetilde{p}^n_{1(m)}$. To sum-up $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ is canonically a $(\mathcal{B}_X, \mathcal{B}_X)$-algebra (i.e. a $\mathcal{B}_X \otimes_{\mathbb{Z}} \mathcal{B}_X$-algebra).

Lemma 4.1.2.6. *The canonical map*

$$\rho_n \colon \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \tag{4.1.2.6.1}$$

given by $\tau \mapsto 1 \otimes \tau$ is a homomorphism of $(\mathcal{O}_X, \mathcal{O}_X)$-algebras making cocartesian for any $j = 0, 1$ the diagrams of algebras

$$\begin{array}{ccc} \mathcal{O}_X & \xrightarrow{p^n_{j(m)}} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \\ \downarrow & & \downarrow{\scriptstyle \rho_n} \\ \mathcal{B}_X & \xrightarrow{\widetilde{p}^n_{j(m)}} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}, \end{array} \tag{4.1.2.6.2}$$

where the homomorphisms $p^n_{j(m)}$ (resp. $\widetilde{p}^n_{j(m)}$) are defined at 3.2.2.2 (resp. 4.1.2.5).

Proof. The commutativity and cocartesianity of 4.1.2.6.2 are clear for the case $j = 0$. Moreover, as $\mathcal{O}_X \to \mathcal{B}_X$ is horizontal (see 4.1.1.4), then we obtain the commutative diagram which concludes the proof:

$$\begin{array}{ccccc} \mathcal{B}_X & \longrightarrow & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X & \xrightarrow[\sim]{\epsilon^{\mathcal{B}_X}_n} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \\ \uparrow & & \uparrow & & \uparrow \\ \mathcal{O}_X & \longrightarrow & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{O}_X & \xrightarrow[\sim]{\epsilon^{\mathcal{O}_X}_n} & \mathcal{O}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \\ \| & & \downarrow{\scriptstyle \sim} & & \downarrow{\scriptstyle \sim} \\ \mathcal{O}_X & \xrightarrow{p^n_{1(m)}} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} & \overline{\overline{\qquad\qquad}} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)}. \end{array} \tag{4.1.2.6.3}$$

□

Notation 4.1.2.7. Let $\mathcal{E}$ be a $\mathcal{B}_X$-module. By convention, $\widetilde{\mathcal{P}}^n_{X/S,(m)} \otimes_{\mathcal{B}_X} \mathcal{E}$ means $p^n_{1*}(\widetilde{\mathcal{P}}^n_{X/S,(m)}) \otimes_{\mathcal{B}_X} \mathcal{E}$ and $\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X/S,(m)}$ means $\mathcal{E} \otimes_{\mathcal{B}_X} p^n_{0*}(\widetilde{\mathcal{P}}^n_{X/S,(m)})$. For instance, $\widetilde{\mathcal{P}}^n_{X/S,(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X/S,(m)}$ is $p^n_{1*}(\widetilde{\mathcal{P}}^n_{X/S,(m)}) \otimes_{\mathcal{B}_X} p^{n'}_{0*}(\widetilde{\mathcal{P}}^{n'}_{X/S,(m)})$.

We have two structures of $\mathcal{B}_X$-module on the sheaf $\widetilde{\mathcal{P}}^n_{X/S,(m)} \otimes_{\mathcal{B}_X} \mathcal{E}$: the "left structure" given by functoriality from the left structure of $\widetilde{\mathcal{P}}^n_{X/S,(m)}$ and the "right structure" given by the internal tensor product. We denote by $p_{0*}(\widetilde{\mathcal{P}}^n_{X/S,(m)} \otimes_{\mathcal{B}_X} \mathcal{E})$ (resp. $p_{1*}(\widetilde{\mathcal{P}}^n_{X/S,(m)} \otimes_{\mathcal{B}_X} \mathcal{E})$) to clarify we are considering the left structure (resp. right structure).

Similarly, we denote by $p_{0*}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X/S,(m)})$ (resp. $p_{1*}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X/S,(m)})$) the $\mathcal{B}_X$-module given by the internal tensor product (resp. by functoriality from the right $\mathcal{B}_X$-module structure of $\widetilde{\mathcal{P}}^n_{X/S,(m)}$) which is called the left (resp. right) structure.

We denote by $\widetilde{p}^n_{0,\mathcal{E}} \colon \mathcal{E} \to p_{0*}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X/S,(m)})$ the canonical $\mathcal{B}_X$-linear map given by $x \mapsto x \otimes \mathbb{1}$, i.e. is the composition of $\mathrm{id}_{\mathcal{E}} \otimes p^n_0$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^0_{X/S,(m)}$. We denote by $\widetilde{p}^n_{1,\mathcal{E}} \colon \mathcal{E} \to p_{1*}(\widetilde{\mathcal{P}}^n_{X/S,(m)} \otimes_{\mathcal{B}_X} \mathcal{E})$ the canonical map given by $x \mapsto \mathbb{1} \otimes x$, i.e. is the composition of $\widetilde{p}^n_1 \otimes \mathrm{id}_{\mathcal{E}}$ with the canonical isomorphism $\mathcal{E} \xrightarrow{\sim} \widetilde{\mathcal{P}}^0_{X/S,(m)} \otimes_{\mathcal{B}_X} \mathcal{E}$.

Notation 4.1.2.8. We denote by $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}$ the tensor product of $\mathcal{B}_X$-algebras with the right structure of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ and the left structure of $\widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}$. We endow $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}$ with three structures of locally free of finite type $\mathcal{B}_X$-algebra: the left one given by the left structure of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}$, the middle one given by the tensor product and the right one given by the right structure of $\widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)}$. This endows $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}$ with a structure of $(\mathcal{B}_X, \mathcal{B}_X, \mathcal{B}_X)$-algebra, i.e. of $(\mathcal{B}_X \otimes_{\mathbb{Z}} \mathcal{B}_X \otimes_{\mathbb{Z}} \mathcal{B}_X)$-algebra. When $\mathcal{B}_X = \mathcal{O}_X$, we retrieve the usual three structures (defined at 3.2.2.14). With 4.1.2.6, we get the morphism of $(\mathcal{O}_X, \mathcal{O}_X, \mathcal{O}_X)$-algebras

$$\rho_{n,n'} := \rho_n \otimes \rho_{n'} \colon \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}. \tag{4.1.2.8.1}$$

4.1.2.9. With notation 3.2.2.16 we can endow $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}$ with three canonical structures of $\mathcal{B}_X$-algebras as follows First, the *left* structure is induced by the canonical morphism $\widetilde{p}^{n,n'}_{0(m)} \colon \mathcal{B}_X \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}$ given by $b \mapsto b \otimes 1 \otimes 1$. Next, we define the *middle* structure via the morphism of $\mathcal{B}_X$-algebras

$$\widetilde{p}^{n,n'}_{1(m)} \colon \mathcal{B}_X \to \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \xrightarrow{q_0^{n,n'*}(\epsilon^{\mathcal{B}_X}_{n+n'})} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)},$$

where the first morphism is given by $b \mapsto 1 \otimes b \otimes 1$. Finally, the *right* structure can be built as follows :

$$\widetilde{p}^{n,n'}_{2(m)} \colon \mathcal{B}_X \to \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\delta^{n,n'*}_{(m)}(\epsilon^{\mathcal{B}_X}_{n+n'})} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}, \tag{4.1.2.9.1}$$

where the first morphism is given by $b \mapsto 1 \otimes 1 \otimes b$.

Proposition 4.1.2.10. *a) The canonical map*

$$\mathcal{B}_X \otimes_{\mathcal{O}_X} (\mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}) \xrightarrow{\sim} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}, \tag{4.1.2.10.1}$$

given by $b \otimes \tau \otimes \tau' \mapsto (b \otimes \tau) \otimes (1 \otimes \tau')$, is an isomorphism of $\mathcal{B}_X$-algebras for the left (resp. middle, resp. right) structures as defined respectively in 4.1.2.5 and 4.1.2.9. Hence, we still denote therefore by $\widetilde{p}^{n,n'}_{j(m)}$ for $j = 0, 1, 2$ the corresponding ring homomorphisms $\mathcal{B}_X \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}$.

b) Moreover, for any $j = 0, 1, 2$, we have the following canonical cocartesian diagram

$$\begin{array}{ccc} \mathcal{O}_X & \xrightarrow{p^{n,n'}_{j(m)}} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \\ \downarrow & & \downarrow {\scriptstyle \rho_{n,n'}\ 4.1.2.8.1} \\ \mathcal{B}_X & \xrightarrow{\widetilde{p}^{n,n'}_{j(m)}} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}. \end{array} \tag{4.1.2.10.2}$$

Proof. a) i) By using the $(\mathcal{O}_X, \mathcal{O}_X)$-linearity of the morphism ρ_n and $\rho_{n'}$ of 4.1.2.6.1, we get the well defined isomorphism

$$\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \xrightarrow{\sim} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}) \otimes_{\mathcal{B}_X} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}) \quad (4.1.2.10.3)$$

given by $b \otimes \tau \otimes \tau' \mapsto (b \otimes \tau) \otimes (1 \otimes \tau')$, which is the isomorphism 4.1.2.10.1.

ii) It remains to check the linearity. The $\mathcal{B}_X$-linearity for the respective left structures is obvious. By using $\epsilon^{\mathcal{B}}_n \otimes \mathrm{id} = q_0^{n,n'*}(\epsilon^{\mathcal{B}_X}_{n+n'})$, we get that 4.1.2.10.3 is $\mathcal{B}_X$-linear for the middle structures thanks to the commutative diagram

$$\begin{array}{ccccccc}
\mathcal{B}_X & \longrightarrow & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} & \underset{\sim}{\xrightarrow{\epsilon^{\mathcal{B}}_n \otimes \mathrm{id}}} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} & \overset{4.1.2.10.3}{\underset{\sim}{\searrow}} & \\
\| & & \uparrow{\scriptstyle \mathrm{id} \otimes \mathrm{id} \otimes p^{n'}_{0(m)}} & & \uparrow{\scriptstyle \mathrm{id} \otimes \mathrm{id} \otimes p^{n'}_{0(m)}} & & \\
\mathcal{B}_X & \longrightarrow & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X & \underset{\sim}{\xrightarrow{\epsilon^{\mathcal{B}}_n \otimes \mathrm{id}}} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} & \xrightarrow{\widetilde{p}^{n'}_{0(m)}} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}
\end{array}$$

where the left top arrow is given by $b \mapsto 1 \otimes b \otimes 1$, the left bottom arrow is given by $b \mapsto 1 \otimes b$, the homomorphisms $p^{n'}_{0(m)}$ (resp. $\widetilde{p}^{n'}_{0(m)}$) is defined at 3.2.2.2 (resp. 4.1.2.5).

Now, let us check the morphism 4.1.2.10.1 is a morphism of $\mathcal{B}_X$-algebras for the right structures. In the following commutative diagram,

$$\begin{array}{ccccccccc}
\mathcal{B} & \longrightarrow & \mathcal{P}^{n'} \otimes_{\mathcal{O}} \mathcal{B} & \underset{\sim}{\xrightarrow{\epsilon^{\mathcal{B}}_{n'}}} & \mathcal{B} \otimes_{\mathcal{O}} \mathcal{P}^{n'} & \longrightarrow & (\mathcal{P}^n \otimes_{\mathcal{O}} \mathcal{B}) \otimes_{\mathcal{B}} (\mathcal{B} \otimes_{\mathcal{O}} \mathcal{P}^{n'}) & \underset{\sim}{\xrightarrow{\epsilon^{\mathcal{B}}_n \otimes \mathrm{id}}} & (\mathcal{B} \otimes_{\mathcal{O}} \mathcal{P}^n) \otimes_{\mathcal{B}} (\mathcal{B} \otimes_{\mathcal{O}} \mathcal{P}^{n'}) \\
\| & & \downarrow & & \downarrow & \underset{\sim}{\nearrow} & & \underset{\sim}{\nearrow} & \\
\mathcal{B} & \rightarrow & \mathcal{P}^n \otimes_{\mathcal{O}} \mathcal{P}^{n'} \otimes_{\mathcal{O}} \mathcal{B} & \underset{\sim}{\xrightarrow{\mathrm{id} \otimes \epsilon^{\mathcal{B}}_{n'}}} & \mathcal{P}^n \otimes_{\mathcal{O}} \mathcal{B} \otimes_{\mathcal{O}} \mathcal{P}^{n'} & \underset{\sim}{\xrightarrow{\epsilon^{\mathcal{B}}_n \otimes \mathrm{id}}} & \mathcal{B} \otimes_{\mathcal{O}} \mathcal{P}^n \otimes_{\mathcal{O}} \mathcal{P}^{n'} & & \\
\| & & & & & & \| & & \\
\mathcal{B} & \rightarrow & \mathcal{P}^n \otimes_{\mathcal{O}} \mathcal{P}^{n'} \otimes_{\mathcal{O}} \mathcal{B} & & \underset{\sim}{\xrightarrow{\delta^{n,n'*}_{(m)}(\epsilon^{\mathcal{B}_X}_{n+n'})}} & & \mathcal{B} \otimes_{\mathcal{O}} \mathcal{P}^n \otimes_{\mathcal{O}} \mathcal{P}^{n'}, & &
\end{array}$$

(4.1.2.10.4)

where we omitted to indicate the indices "$X^\sharp$" or "$X^\sharp/S^\sharp(m)$", that of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}$ is equal the composite morphism of the top, whereas that of $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}$ is the composite morphism of the bottom. By using the cocycle condition 3.4.2.1 (noticing that $\mathrm{id} \otimes \epsilon^{\mathcal{B}}_{n'} = q_1^{n,n'*}(\epsilon^{\mathcal{B}_X}_{n+n'})$ and $\epsilon^{\mathcal{B}}_n \otimes \mathrm{id} = q_0^{n,n'*}(\epsilon^{\mathcal{B}_X}_{n+n'})$), $\widetilde{p}_2^{n,n'}$ correspond to the path of 4.1.2.10.4 going through by the bottom. Hence we are done.

b) Since the other cases are treated similarly, let us only prove the cocartesian diagram 4.1.2.10.2 when $j = 2$. We have the following commutative diagram

$$\begin{array}{ccccc}
\mathcal{O}_X & \xrightarrow{p^{n,n'}_{2(m)}} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} & = & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \\
\| & & \uparrow\wr & & \uparrow\wr \\
\mathcal{O}_X & \longrightarrow & \left(\mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}\right) \otimes_{\mathcal{O}_X} \mathcal{O}_X & \xrightarrow{\delta^{n,n'*}_{(m)}(\epsilon^{\mathcal{O}_X}_{n+n'})} & \mathcal{O}_X \otimes_{\mathcal{O}_X} \left(\mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}\right) \\
\downarrow & & \downarrow & & \downarrow \\
\mathcal{B}_X & \longrightarrow & \left(\mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}\right) \otimes_{\mathcal{O}_X} \mathcal{B}_X & \xrightarrow{\delta^{n,n'*}_{(m)}(\epsilon^{\mathcal{B}_X}_{n+n'})} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \left(\mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}\right)
\end{array}$$

where the left bottom square and the bottom rectangle are cocartesian (and therefore so is the right bottom square). Since the bottom composite morphism is $\widetilde{p}^{n,n'}_{2(m)}$, then we are done. □

4.1.2.11. We introduce the following $\mathcal{B}_X$-algebra homomorphisms

$$\widetilde{\delta}^{n,n'}_{(m)} \colon \widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} \xrightarrow{\mathrm{id} \otimes \delta^{n,n'}_{(m)}} \mathcal{B}_X \otimes_{\mathcal{O}_X} (\mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}) \underset{\sim}{\xrightarrow{4.1.2.10.1}} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} ,$$

$$\widetilde{q_0}^{n,n'} \colon \widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} \longrightarrow \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \longrightarrow \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)},$$

$$\widetilde{q_1}^{n,n'} \colon \widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} \longrightarrow \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \longrightarrow \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}.$$

We have the canonical cocartesian diagram :

$$\begin{array}{ccc} \mathcal{P}^{n+n'}_{X^\sharp/S^\sharp(m)} & \substack{\longrightarrow \\ \longrightarrow \\ \longrightarrow} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \\ \downarrow & & \downarrow \\ \widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} & \substack{\longrightarrow \\ \longrightarrow \\ \longrightarrow} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}, \end{array} \tag{4.1.2.11.1}$$

where the top (resp. bottom) triple arrows are the morphisms $q_0^{n,n'}$, $q_1^{n,n'}$, $\delta^{n,n'}_{(m)}$ (resp. $\widetilde{q_0}^{n,n'}$, $\widetilde{q_1}^{n,n'}$, $\widetilde{\delta}^{n,n'}_{(m)}$). Moreover, these homomorphisms satisfy the analogous properties without the tildes. For instance, the morphism $\widetilde{\delta}^{n,n'}_{(m)}$ is $\mathcal{B}_X$-linear for the respective right structures. Indeed, this is by construction a consequence of 4.1.2.9.1.

By applying the functor $\mathcal{B}_X \otimes_{\mathcal{O}_X} -$ to the commutative diagram 3.2.2.18.1, we get (up to canonical isomorphism) the commutative diagram

$$\begin{array}{ccc} \widetilde{\mathcal{P}}^{n+n'+n''}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\widetilde{\delta}^{n+n',n''}_{(m)}} & \widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n''}_{X^\sharp/S^\sharp(m)} \\ \downarrow{\scriptstyle \widetilde{\delta}^{n,n'+n''}_{(m)}} & & \downarrow{\scriptstyle \widetilde{\delta}^{n,n'}_{(m)} \otimes \mathrm{id}} \\ \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'+n''}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\mathrm{id} \otimes \widetilde{\delta}^{n',n''}_{(m)}} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n''}_{X^\sharp/S^\sharp(m)}. \end{array} \tag{4.1.2.11.2}$$

To finish, we remark that the diagram similar to 4.1.2.11.2, with "$\widetilde{\delta}_{(m)}$" replaced by "$\widetilde{q_0}$" (resp. "$\widetilde{q_1}$"), is not commutative.

4.1.2.12. We will denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n} := \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X)$ the $\mathcal{B}_X$-linear dual for the left structure of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$. For $n' \geq n$, from the canonical projection $\psi^{n',n}_{X^\sharp/S^\sharp,(m)} \colon \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} \to \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$ (see 3.2.2.2.1), we get the canonical projections

$$\widetilde{\psi}^{n',n}_{X^\sharp/S^\sharp,(m)} := \mathrm{id}_{\mathcal{B}_X} \otimes \psi^{n',n}_{X^\sharp/S^\sharp,(m)} \colon \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}. \tag{4.1.2.12.1}$$

By construction, the map 4.1.2.12.1 is $\mathcal{B}_X$-linear for the left structure. In fact, since the m-PD stratification of $\mathcal{B}_X$ are compatible with respect to the morphism $\psi^{n',n}_{X^\sharp/S^\sharp,(m)}$ (see 3.4.2.1.a) then we get that 4.1.2.12.1 is $\mathcal{B}_X$-linear for the right structure. By taking the duality of 4.1.2.12.1 with respect to the left structures, this gives the monomorphisms

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n} \hookrightarrow \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n'}.$$

We endow the sheaf $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} := \cup_{n\in\mathbb{N}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n}$ with a ring structure by using the pairings

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n} \times \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n'} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n+n'} \tag{4.1.2.12.2}$$

defined as follows: if $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n}$, $P' \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n'}$, then $P \cdot P'$ is the composition homomorphism

$$\widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} \xrightarrow{\widetilde{\delta}^{n,n'}_{(m)}} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \xrightarrow{\mathrm{id} \otimes P'} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \xrightarrow{P} \mathcal{B}_X. \tag{4.1.2.12.3}$$

Similarly to 3.2.3.3 (e.g. use the commutative diagram 4.1.2.11.2), we can check this law of composition is associative and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is therefore a ring.

Remark 4.1.2.13. With the notations 4.1.2.11 and 4.1.2.12.1, we have the relation $\widetilde{q}^{n,n'}_{i(m)} = \widetilde{\varpi}^{n,n'}_{i(m)} \circ \widetilde{\psi}^{n+n',n}_{X^\sharp/S^\sharp,(m)}$ for $i = 0, 1$, where $\widetilde{\varpi}^{n,n'}_{0(m)} \colon \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp,(m)} \to \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)}$ and $\widetilde{\varpi}^{n,n'}_{1(m)} \colon \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)} \to \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{O}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)}$ are the homomorphisms corresponding to the projections.

4.1.2.14. From the canonical isomorphisms of $\mathcal{B}_X$-algebras

$$\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,\,n} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^{n}_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X) = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\,n}, \qquad (4.1.2.14.1)$$

we get $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. The proposition below means that these two structures of $\mathcal{B}_X$-algebra are compatible.

Proposition 4.1.2.15. *The canonical isomorphism $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ (see 4.1.2.14), is an isomorphism of rings where the right (resp. left) term is endowed with the ring structure of 4.1.2.2 (resp. 4.1.2.12).*

Proof. Let $P \in \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^{n}_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X) = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n}$ and of $P' \in \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X) = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X,n'}$. Let us denote by Q (resp. Q') the operator of $\mathcal{H}om_{\mathcal{B}_X}(\widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X)$ (resp. $\mathcal{H}om_{\mathcal{B}_X}(\widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X)$) associated to P (resp. P') via the isomorphisms 4.1.2.14.1.

Since $Q = \mu \circ (\mathrm{id} \otimes P)$, we reduce to check the commutativity of the following diagram.

$$\begin{array}{ccccccc}
\mathcal{P}^{n+n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\delta^{n,n'}_{(m)}} & \mathcal{P}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\mathrm{id}\otimes P'} & \mathcal{P}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X & \xrightarrow{\epsilon^{\mathcal{B}_X}_n} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n}_{X^\sharp/S^\sharp(m)} \\
\downarrow & & \downarrow & & & & \| \\
\widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\widetilde{\delta}^{n,n'}_{(m)}} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\mathrm{id}\otimes Q'} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{B}_X & \xrightarrow[\iota]{\sim} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)}
\end{array} \qquad (4.1.2.15.1)$$

where the isomorphism ι is the canonical one. It follows from 4.1.2.11.1 that the left square is commutative.

Let $\tau \in \mathcal{P}^{n}_{X^\sharp/S^\sharp(m)}$ and $\tau \in \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}$. Since $\epsilon^{\mathcal{B}_X}_n$ is a morphism of $\mathcal{P}^{n}_{X^\sharp/S^\sharp(m)}$-algebras,

$$\epsilon^{\mathcal{B}_X}_n \circ (\mathrm{id} \otimes P')(\tau \otimes \tau') = \epsilon^{\mathcal{B}_X}_n(\tau \otimes P'(\tau')) = (1 \otimes \tau) \times \epsilon^{\mathcal{B}_X}_n(1 \otimes P'(\tau')).$$

We put $\widetilde{\tau} := 1 \otimes \tau \in \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)}$, $\widetilde{\tau}' := 1 \otimes \tau' \in \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}$. We have the relation

$$\iota \circ (\mathrm{id} \otimes Q')(\widetilde{\tau} \otimes \widetilde{\tau}') = \widetilde{\tau} \cdot P'(\tau'),$$

the term $P'(\tau')$ acting on $\widetilde{\tau}'$ for the right structure of $\mathcal{B}_X$-algebra of $\widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)}$. By definition, then we have

$$\widetilde{\tau} \cdot P'(\tau') = \widetilde{\tau} \times \epsilon^{\mathcal{B}_X}_n(1 \otimes P'(\tau')).$$

This yields the commutativity of the right rectangle of 4.1.2.15.1. □

4.1.2.16 (Local description and notation)**.** Suppose in this paragraph that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,r}$.

(a) For any $\lambda = 1, \ldots, r$, put $\tau_{\sharp\lambda(m)} := \mu^{n}_{(m)}(u_\lambda) - 1$ (or simply $\tau_{\sharp\lambda}$), where for any $a \in M_{X^\sharp}$ $\mu^{n}_{(m)}(a)$ is the unique section of $\ker(\mathcal{O}^{*}_{\Delta^{n}_{X^\sharp/S^\sharp,(m)}} \to \mathcal{O}^{*}_{X})$ such that we get in $M^{n}_{X^\sharp/S^\sharp,(m)}$ the equality $p^{n*}_1(a) = p^{n*}_0(a)\mu^{n}_{(m)}(a)$. We still denote by $\tau_{\sharp\lambda(m)}$ its image via the canonical morphism $\mathcal{P}^{n}_{X^\sharp/S^\sharp,(m)} \to \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp,(m)}$. Taking the limits to 3.2.2.4, we get the isomorphism of m-PD-$\mathcal{B}_X$-algebras

$$\begin{aligned} \mathcal{B}_X\langle T_1, \ldots, T_r\rangle_{(m),n} &\xrightarrow{\sim} \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp,(m)} \\ T_\lambda &\mapsto \tau_{\sharp\lambda,(m)}, \end{aligned} \qquad (4.1.2.16.1)$$

where the first term is defined as in 1.3.3.6. In particular, the elements $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}\}_{|\underline{k}|\le n}$ form a $\mathcal{B}_X$-basis of $\widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp,(m)}$. The corresponding dual basis of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}$ will still be denoted by $\{\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}\}_{|\underline{k}|\le n}$.

Let $\epsilon_1, \dots, \epsilon_r$ be the canonical basis of $\mathbb{N}^r$, i.e. the coordinates of ϵ_i are 0 except for the ith term which is 1. We put $\partial_{\sharp i} := \underline{\partial}_{\sharp}^{\langle \epsilon_i \rangle_{(m)}}$. A section $P \in \Gamma(\mathfrak{X}, \mathcal{B}_X \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$ can uniquely be written of the form

$$P = \sum_{\underline{k} \in \mathbb{N}^d} b_{\underline{k}} \underline{\partial}_{\sharp}^{\langle \underline{k} \rangle_{(m)}}, \tag{4.1.2.16.2}$$

where $b_{\underline{k}} \in B_X$ and the sum is finite.

(b) Let $(t_\lambda)_{\lambda=1,\dots,r}$ be the coordinates of Y/S induced by $(u_\lambda)_{\lambda=1,\dots,r}$. Set $\mathcal{B}_Y := \mathcal{B}_X|Y$. For any $\lambda = 1, \dots, r$, set $\tau_\lambda := p_1^*(t_\lambda) - p_0^*(t_\lambda)$. We still denote by τ_λ its image in $\mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y/S,(m)}$. It follows from 1.3.3.11, the elements $\{\underline{\tau}^{\{\underline{k}\}_{(m)}}\}_{|\underline{k}| \leq n}$ form a basis of the $\mathcal{B}_Y$-module $\mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y/S,(m)}$. The corresponding dual basis of $\mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y/S,n}$ is denoted by $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}\}_{|\underline{k}| \leq n}$. A section $P \in \Gamma(\mathfrak{X}, \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y/S})$ can uniquely be written of the form

$$P = \sum_{\underline{k} \in \mathbb{N}^d} b_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}, \tag{4.1.2.16.3}$$

where $b_{\underline{k}} \in B_Y$ and the sum is finite.

Proposition 4.1.2.17. *Suppose m is finite. We have the following properties.*

(a) The graded ring (associated to the order filtration) $\operatorname{gr} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is a commutative ring. If $X^\sharp/S^\sharp$ is endowed with logarithmic coordinates, the relation $\underline{\partial}_{\sharp}^{\langle \underline{k} \rangle} \underline{\partial}_{\sharp}^{\langle \underline{h} \rangle} = \left\langle \begin{smallmatrix} \underline{k}+\underline{h} \\ \underline{k} \end{smallmatrix} \right\rangle \underline{\partial}_{\sharp}^{\langle \underline{k}+\underline{h} \rangle}$ becomes exact in $\operatorname{gr} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$.

(b) Suppose $X^\sharp$ is endowed with logarithmic coordinates. Then for any integers $1 \leq i \leq d$ and $k \in \mathbb{N}$, the operator $\partial_{\sharp i}^{\langle k \rangle_{(m)}}$ belongs to the $\mathbb{Z}_{(p)}$-algebra generated by the $m+1$ operators $\partial_{\sharp i}^{[p^j]} = \partial_{\sharp i}^{\langle p^j \rangle_{(m)}}$ where $0 \leq j \leq m$. The operators $\partial_{\sharp i}^{\langle k \rangle_{(m)}}$ and $\partial_{\sharp i'}^{\langle k' \rangle_{(m)}}$ commutes and the sheaf $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is generated as $\mathbb{Z}_{(p)}$-algebra by $\mathcal{B}_X$ and by the operators $\partial_{\sharp i}^{\langle p^j \rangle_{(m)}}$, where $1 \leq i, i' \leq d$ and $0 \leq j \leq m$.

(c) For any affine open subscheme $U \subset X$, the canonical homomorphism

$$\Gamma(U, \mathcal{B}_X) \otimes_{\Gamma(U, \mathcal{O}_X)} \Gamma(U, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \to \Gamma(U, \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \tag{4.1.2.17.1}$$

is an isomorphism.

(d) Suppose there exist a basis of affine opens $\mathfrak{B}$ of X such that for any $U \in \mathfrak{B}$, the ring $\Gamma(U, \mathcal{B}_X)$ is noetherian. Then for any $U \in \mathfrak{B}$, the rings $\Gamma(U, \operatorname{gr} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\Gamma(U, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ (resp. $\operatorname{gr} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,x}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,x}$ for any $x \in X^\sharp$) are right and left noetherian.

(e) Suppose that there exists a basis of affine opens $\mathfrak{B}$ of X such that

(i) For any $U \in \mathfrak{B}$, the ring $\Gamma(U, \mathcal{B}_X)$ is noetherian ;

(ii) For any $U, V \in \mathfrak{B}$ such that $V \subset U$, the homomorphism $\Gamma(U, \mathcal{B}_X) \to \Gamma(V, \mathcal{B}_X)$ is flat.

Then for any $U, V \in \mathfrak{B}$ such that $V \subset U$, the canonical morphism $\Gamma(U, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to \Gamma(V, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ is flat. Moreover, the sheaf of rings $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is right and left coherent.

Proof. We check (a) (resp. (b)) as 3.2.3.16.(a) (resp. 3.2.3.15). Let us check (c). Since $\mathcal{D}^{(m)}_{U^\sharp/S^\sharp,n}$ is a locally free $\mathcal{O}_U$-module of finite type, since U is affine, then $\mathcal{D}^{(m)}_{U^\sharp/S^\sharp,n}$ is a direct summand of a free $\mathcal{O}_U$-module of finite type. Replacing in 4.1.2.17.1 the sheaf $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ by a free $\mathcal{O}_U$-module of finite type (and therefore by $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$), we get an isomorphism. Since U is affine, then U is a coherent topological space and $\Gamma(U, -)$ commutes with filtered inductive limits (see [SGA4.2, VI.5.3]). Hence, we get (c). Moreover, we can check (d) as 3.2.3.16.(b). Finally, by using (c), we get the flatness of the canonical morphism $\Gamma(U, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to \Gamma(V, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. With 1.4.5.2, we are done. □

4.1.3 Good filtrations, Theorems A and B for coherent $\mathcal{D}$-modules

We keep notation 4.1.2 but we suppose the level is finite, i.e. $m \in \mathbb{N}$. Let $\mathfrak{B}$ be the category of affine opens of X. We suppose

(i) For any $U \in \mathfrak{B}$, the ring $\Gamma(U, \mathcal{B}_X)$ is noetherian ;

(ii) For any $U, V \in \mathfrak{B}$ such that $V \subset U$, the homomorphism $\Gamma(U, \mathcal{B}_X) \to \Gamma(V, \mathcal{B}_X)$ is flat.

Recall that it follows from 1.4.5.2 that $\mathcal{B}_X$ is a coherent sheaf of rings. Moreover, we suppose that $\mathcal{B}_X$ satisfies theorems A and B for coherent modules in the sense 1.4.3.14 below (remark following 4.1.3.2 this is automatic in the algebraic case, i.e., when X is a scheme):

Remark 4.1.3.1. This subsection remains valid by replacing (left) modules by right modules. Moreover, we can extend the results of this subsection in the case where $\mathfrak{B}$ is replaced by a basis of affine opens of X: in that case we need to replace everywhere "affine open of X" by "object of $\mathfrak{B}$".

In the case of schemes, we have the well known following example.

Proposition 4.1.3.2 (Theorems A and B for quasi-coherent $\mathcal{D}$-module over schemes)**.** *Suppose X is a scheme. $\mathcal{D}$ be a sheaf of rings on X such that, for any affine open $U \subset X$, $\Gamma(U, \mathcal{D})$ is a noetherian ring. We suppose there is a morphism $\mathcal{O}_X \to \mathcal{D}$ such that the left multiplication by the sections of $\mathcal{O}_X$ makes $\mathcal{D}$ a quasi-coherent $\mathcal{O}_X$-module. We have therefore the following properties.*

(a) The sheaf $\mathcal{D}$ is a left coherent.

(b) For a left $\mathcal{D}$-module $\mathcal{M}$ to be coherent, it is necessary and sufficient that both conditions are fulfilled

(i) $\mathcal{M}$ is quasi-coherent and that

(ii) there exists a covering $(U_\lambda)_{\lambda \in \Lambda}$ of X by affine opens such that for any $\lambda \in \Lambda$, $\Gamma(U_\lambda, \mathcal{M})$ is a left $\Gamma(U_\lambda, \mathcal{D})$-module of finite type.

(c) Suppose X is affine, and $D := \Gamma(X, \mathcal{D})$.

(i) The functors $\mathcal{M} \mapsto \Gamma(X, \mathcal{M})$ and $M \mapsto \mathcal{D} \otimes_D M$ are exact quasi-inverse equivalences of categories between coherent left $\mathcal{D}$-modules and left D-modules of finite type (resp. quasi-coherent left $\mathcal{D}$-modules and left D-modules).

(ii) For any quasi-coherent $\mathcal{D}$-module $\mathcal{M}$, we have $H^q(X, \mathcal{M}) = 0$ for all $q \geq 1$.

Proof. The assertion (a) is a consequence of 1.4.5.2. We know that any quasi-coherent $\mathcal{O}_X$-module $\mathcal{M}$ satisfyies $H^q(X, \mathcal{M}) = 0$ for all $q \geq 1$. Since $\mathcal{D}$ is quasi-coherent, then the functors $\mathcal{M} \mapsto \Gamma(X, \mathcal{M})$ and $M \mapsto \mathcal{D} \otimes_D M$ are exact quasi-inverse equivalences of categories between quasi-coherent left $\mathcal{D}$-modules and left D-modules. Hence, by using the five lemma and their exactness, the functors $\mathcal{M} \mapsto \Gamma(X, \mathcal{M})$ and $M \mapsto \mathcal{D} \otimes_D M$ are exact quasi-inverse equivalences of categories between left $\mathcal{D}$-modules having a global finite presentation and left D-modules of finite type.

Suppose $X = \operatorname{Spec} A$ is affine and let $\mathcal{M}$ be a quasi-coherent left $\mathcal{D}$-module such that there exists a covering $(U_\lambda)_{\lambda \in \Lambda}$ of X by affine opens such that for any $\lambda \in \Lambda$, $\Gamma(U_\lambda, \mathcal{M})$ is a left $\Gamma(U_\lambda, \mathcal{D})$-module of finite type. To finish the proof, it remains to check that $\Gamma(X, \mathcal{M})$ is a left D-modules of finite type, which is standard (e.g. compare with [Har77, II.3.2]) and is proved as follows. Since X is noetherian, we can suppose $\Lambda = \{1, 2, \ldots, r\}$ and that there exists $f_\lambda \in A$ such that $U_\lambda = D(f_\lambda)$. Set $M := \Gamma(X, \mathcal{M})$, $D_{f_\lambda} := A_{f_\lambda} \otimes_A D$, $M_{f_\lambda} := D_{f_\lambda} \otimes_D M$. By hypothesis, M_{f_λ} is a D_{f_λ}-module of finite type. If N is a sub D-module of M, then $N = M$ if and only if for any λ we have $M_{f_\lambda} = N_{f_\lambda}$. Since D_{f_λ} are noetherian, we conclude that M is noetherian.

□

4.1.3.3. Let $\mathcal{D}$ be a sheaf of rings on X which satisfies theorems A and B for coherent modules. Suppose X affine and set $D := \Gamma(X, \mathcal{D})$. Then the quasi-inverse equivalences of categories $\Gamma(X, -)$ and $\mathcal{D} \otimes_D -$ between the category of coherent $\mathcal{D}$-modules and that of coherent D-modules are exact. Then, we have the following (non-exhaustive) properties:

(a) Let $\phi\colon \mathcal{E}\to\mathcal{F}$ be a morphism of left coherent $\mathcal{D}$-modules. Denote by $D:=\Gamma(X,\mathcal{D})$, $E:=\Gamma(X,\mathcal{E})$, $F:=\Gamma(X,\mathcal{F})$ and by $f\colon E\to F$ the induced morphism of left D-modules. Then $\Gamma(X,\operatorname{Ker}\phi)=\operatorname{Ker} f$, $\Gamma(X,\operatorname{Coker}\phi)=\operatorname{Coker} f$. Moreover, f is a monomorphism (resp. epimorphism) if and only if ϕ is a monomorphism (resp. epimorphism).

(b) Let $\mathcal{E},\mathcal{F}$ be two coherent sub-$\mathcal{D}$-modules of a coherent $\mathcal{D}$-module $\mathcal{G}$. Then $\mathcal{E}+\mathcal{F}$ (resp. $\mathcal{E}\cap\mathcal{F}$, resp. $\mathcal{E}\cup\mathcal{F}$) is a coherent sub-$\mathcal{D}$-modules of $\mathcal{G}$ and $\Gamma(X,\mathcal{E}+\mathcal{F})=\Gamma(X,\mathcal{E})+\Gamma(X,\mathcal{F})$ (resp. $\Gamma(X,\mathcal{E}\cap\mathcal{F})=\Gamma(X,\mathcal{E})\cap\Gamma(X,\mathcal{F})$, resp. $\Gamma(X,\mathcal{E}\cup\mathcal{F})=\Gamma(X,\mathcal{E})\cup\Gamma(X,\mathcal{F})$).

(c) Let $\mathcal{E}$ be a $\mathcal{D}$-module, let $(\mathcal{E})_{n\in\mathbb{N}}$ be an exhaustive increasing filtration of $\mathcal{E}$ by coherent left $\mathcal{D}$-module. Then the canonical morphism $\mathcal{D}\otimes_D\Gamma(X,\mathcal{E}_n)\to\mathcal{E}_n$ are isomorphisms and the morphisms $\Gamma(X,\mathcal{E}_n)\to\Gamma(X,\mathcal{E}_{n+1})$ are injective. Since filtered inductive limits commute to the global section functor $\Gamma(X,-)$, we then obtain the canonical isomorphisms $\varinjlim_{n\in\mathbb{N}}\Gamma(X,\mathcal{E}_n)\xrightarrow{\sim}\Gamma(X,\mathcal{E})$ and the canonical morphism $\Gamma(X,\mathcal{E}_n)\to\Gamma(X,\mathcal{E})$ is therefore injective. Hence, $(\Gamma(X,\mathcal{E}_n))_{n\in\mathbb{N}}$ is an exhaustive filtration of $\mathcal{E}$.

(d) Suppose $\mathcal{D}$ is commutative and let $\mathcal{E},\mathcal{F}$ be two coherent $\mathcal{D}$-modules. Then $\mathcal{E}\otimes_{\mathcal{D}}\mathcal{F}$ is coherent $\mathcal{D}$-module and $\Gamma(X,\mathcal{E}\otimes_{\mathcal{D}}\mathcal{F})=\Gamma(X,\mathcal{E})\otimes_D\Gamma(X,\mathcal{F})$.

Notation 4.1.3.4. For any integers n and n', we put $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\cdot\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n'}$ as the image via the $\mathcal{B}_X$-linear homomorphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n'}\to\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n+n'}$. Since this is a morphism of coherent $\mathcal{B}_X$-modules, then $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\cdot\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n'}$ is a coherent $\mathcal{B}_X$-module.

Suppose X is affine. For any integers n,n', set $D^{(m)}_{X^\sharp/S^\sharp,n}:=\Gamma(X,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})$ and define similarly $D^{(m)}_{X^\sharp/S^\sharp,n}\cdot D^{(m)}_{X^\sharp/S^\sharp,n'}$. With 4.1.3.3 we get

$$\Gamma(X,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\cdot\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n'})=\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n}\cdot\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n'}.\tag{4.1.3.4.1}$$

Proposition 4.1.3.5. For $n<0$, we set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}:=0$. For any couple $(r,s)\in\mathbb{N}^2$,

$$\sum_{j=0}^{p^m-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r-j}\cdot\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,s+j}=\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r+s}.$$

Proof. Since this is local, we can suppose $\mathfrak{X}$ affine and endowed with logarithmic coordinates. Since the sheaves $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r-j}$, $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,s+j}$ et $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r+s}$ are $\mathcal{B}_X$-coherent, then so is the sheaf $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r-j}\cdot\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,s+j}$. Hence, we have the inclusion of coherent $\mathcal{B}_X$-modules:

$$\sum_{j=0}^{p^m-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r-j}\cdot\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,s+j}\subset\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r+s}.$$

Since Theorems A and B for coherent modules hold for $\mathcal{B}_X$, with 4.1.3.3, 4.1.3.4.1 and its notation, it remains to prove that an element of $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,r+s}$ belongs to $\sum_{j=0}^{p^m-1}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,r-j}\cdot\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,s+j}$. By $\mathcal{B}_X$-linearity and since for any $\underline{k}\in\mathbb{N}^d$ we have $\underline{\partial}_\sharp^{\langle\underline{k}\rangle}=\prod_{i=1,\dots,d}\partial_{\sharp,i}^{\langle k_i\rangle}$, we reduce to consider the differential operators of the form $\partial_{\sharp i}^{\langle k\rangle}$, for some i with $0\le k\le r+s$. We proceed by induction on $0\le k\le r+s$ to check that

$$\partial_{\sharp i}^{\langle k\rangle}\in\sum_{j=0}^{p^m-1}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,r-j}\cdot\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,s+j}.$$

When $k\le r$, this is a consequence of $\partial_{\sharp i}^{\langle k\rangle}\in\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,r}$ and $1\in\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,s}$. Hence, we reduce to suppose $r\le k\le r+s$. Set $k=\sum_{l=0}^{m-1}a_lp^l+ap^m$, with $0\le a_l<p$. By using the induction hypothesis, it follows from the formula 3.2.3.14.3 that we reduce to check

$$\left(\prod_{l=0}^{m-1}(\partial_{\sharp i}^{[p^l]})^{a_l}\right)(\partial_{\sharp i}^{[p^m]})^a\in\sum_{j=0}^{p^m-1}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,r-j}\cdot\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,s+j}.\tag{4.1.3.5.1}$$

Let j be the rest of the euclidian division of r by p^m and q be its quotient. The element $(\partial_{\sharp i}^{[p^m]})^q$ belongs therefore to $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,r-j}$. Moreover, since $r \leq k \leq r+s$, then $s+j \geq k-(r-j) = \sum_{l=0}^{m-1} a_l p^l + (a-q)p^m$. The element $\left(\prod_{l=0}^{m-1}(\partial_{\sharp i}^{[p^l]})^{a_l}\right)(\partial_{\sharp i}^{[p^m]})^{a-q}$ belongs therefore to $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,s+j}$. Hence, we are done. $\square$

Notation 4.1.3.6. Let $\mathcal{M}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Let $\mathcal{M}'$ be a sub-$\mathcal{B}_X$-module of $\mathcal{M}$. For any integer r, we denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r} \cdot \mathcal{M}'$ is the image of the map $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r} \otimes_{\mathcal{B}_X} \mathcal{M}' \to \mathcal{M}$.

Définition 4.1.3.7. Let $\mathcal{M}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. A *filtration* of $\mathcal{M}$ (as $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module) is a family $(\mathcal{M}_r)_{r\in\mathbb{N}}$ of sub-$\mathcal{B}_X$-modules of $\mathcal{M}$ satisfying:

(a) For any $r,\ s \in \mathbb{N}$: $\mathcal{M}_r \subset \mathcal{M}_{r+1}$, and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r} \cdot \mathcal{M}_s \subset \mathcal{M}_{r+s}$,

(b) $\mathcal{M} = \cup_{r\in\mathbb{N}}\mathcal{M}_r$.

Définition 4.1.3.8. Let $\mathcal{M}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module endowed with a filtration $(\mathcal{M}_r)_{r\in\mathbb{N}}$. The filtration $(\mathcal{M}_r)_{r\in\mathbb{N}}$ is *good* (resp. *quasi-good*) if the following two conditions hold (resp. the following first condition holds):

(a) For any $r \in \mathbb{N}$, $\mathcal{M}_r$ is $\mathcal{B}_X$-coherent ;

(b) There exists an integer $r_1 \in \mathbb{N}$ such that for any integer $r \geq r_1$, we have

$$\mathcal{M}_r = \sum_{j=0}^{p^m-1} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r-r_1+j} \cdot \mathcal{M}_{r_1-j}.$$

Example 4.1.3.9. The family $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r})_{r\in\mathbb{N}}$ is a good filtration of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. Indeed, following proposition 4.1.3.5, the condition (b) is satisfied for any integer r_1. The condition (a) being also valid, this filtration is therefore good. We call it the *order filtration*.

Proposition 4.1.3.10. *Suppose X is quasi-compact. Let $\mathcal{M}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module endowed with two good filtrations $(\mathcal{M}_r)_{r\in\mathbb{N}}$ and $(\mathcal{M}'_r)_{r\in\mathbb{N}}$. Then there exists $k \in \mathbb{N}$ such that for any $r \geq k$ we have*

$$\mathcal{M}_{r-k} \subset \mathcal{M}'_r \subset \mathcal{M}_{r+k}. \tag{4.1.3.10.1}$$

Proof. Since the filtrations are good, there exists r_1 such that the condition (b) of 4.1.3.8 is satisfied for both filtrations. Hence, we reduce to check the inclusions 4.1.3.10.1 for $r \leq r_1 + p^m$ for some k large enough, which easily follows from the condition (a) of 4.1.3.8 and the quasi-compactness of X. $\square$

Proposition 4.1.3.11 (Theorem B)**.** *Suppose X affine and let $\mathcal{M}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module admitting a quasi-good filtration. We have the following properties.*

(a) For any $U, V \in \mathfrak{B}$ such that $V \subset U$, the homomorphism $\Gamma(U, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to \Gamma(V, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ is flat.

(b) For any integer $i > 0$, $H^i(X, \mathcal{M}) = 0$.

Proof. Since filtered inductive limits commute to the functors $H^i(X, -)$ for any $i \geq 0$, since $\mathcal{B}_X$ is a sheaf of rings on X which satisfies theorems A and B for coherent modules, then we are done. $\square$

We will need the following lemmas to check Proposition 4.1.3.16.

Lemma 4.1.3.12. *Let ϕ: $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^r \to (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^s$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear morphism. There exists an integer $n_0 \geq 0$ such that for any $l \in \mathbb{N}$ we have*

$$\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r) \subset (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l+n_0})^s. \tag{4.1.3.12.1}$$

Proof. Since this is local, we can suppose X is affine and $X^\sharp/S^\sharp$ is endowed with logarithmic coordinates. The data of a morphism $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^r \to (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^s$ is equivalent to that of a family of global sections $(P_{i,j})_{i=1,\dots r; i=1,\dots,s}$ of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. The integer n_0 equal to the maximum order of the differential operators $(P_{i,j})_{i=1,\dots r; i=1,\dots,s}$ then fits. □

Lemma 4.1.3.13. *Let X be a coherent topological space. Let I be a small filtered category, let J be a finite category and $\mathcal{E}\colon I \times J^{op} \to \mathrm{Sh}(X)$ be a functor also denoted by $(i,j) \mapsto \mathcal{E}_{i,j}$. Then the canonical morphism*

$$\varinjlim_{i\in I}\varprojlim_{j\in J}\mathcal{E}_{i,j} \to \varprojlim_{j\in J}\varinjlim_{i\in I}\mathcal{E}_{i,j} \qquad (4.1.3.13.1)$$

is an isomorphism. In other words, filtered inductive limits of sheaves on X of sets commute to finite projective limits.

Proof. Let U be a coherent open subset of X. Let $\mathcal{E}_j := \varinjlim_{i\in I}\mathcal{E}_{i,j}$, $E_{i,j} := \Gamma(U, \mathcal{E}_{i,j})$ and $E_j := \varinjlim_{i\in I} E_{i,j}$. We have the canonical maps $\alpha_{ij}\colon \mathcal{E}_{i,j} \to \mathcal{E}_i$ and $\beta_{ij}\colon E_{i,j} \to E_j$. Recall the morphism 4.1.3.13.1 that we will denote by α is the one induced by the family of morphisms

$$\alpha_i := \varprojlim_{j\in J}\alpha_{ij}\colon \varprojlim_{j\in J}\mathcal{E}_{i,j} \to \varprojlim_{j\in J}\mathcal{E}_j$$

(use the universal property of the inductive limits indexed by I). Similarly, we set the family of morphisms $\beta_i := \varprojlim_{j\in J}\beta_{ij}\colon \varprojlim_{j\in J} E_{i,j} \to \varprojlim_{j\in J} E_j$ which induces $\beta\colon \varinjlim_{i\in I}\varprojlim_{j\in J} E_{i,j} \to \varprojlim_{j\in J}\varinjlim_{i\in I} E_{i,j}$. We have the commutative diagram

$$\begin{array}{ccc}
\Gamma(U, \varprojlim_{j\in J}\mathcal{E}_{ij}) & \xrightarrow{\Gamma(U,\alpha_i)} & \Gamma(U, \varprojlim_{j\in J}\mathcal{E}_j) \\
\downarrow\sim & & \downarrow\sim \\
\varprojlim_{j\in J}\Gamma(U, \mathcal{E}_{ij}) & \xrightarrow{\varprojlim_{j\in J}\Gamma(U,\alpha_{ij})} & \varprojlim_{j\in J}\Gamma(U, \mathcal{E}_j)
\end{array} \qquad (4.1.3.13.2)$$

Since U is coherent and I is filtered, then $\Gamma(U, -)$ and $\varinjlim_{i\in I}$ commutes (see [SGA4.2, VI.5.2]) and this yields the canonical commutative diagram

$$\begin{array}{ccc}
\Gamma(U, \mathcal{E}_{ij}) & \xrightarrow{\Gamma(U,\alpha_{ij})} & \Gamma(U, \mathcal{E}_j) \\
\| & & \downarrow\sim \\
E_{ij} & \xrightarrow{\beta_{ij}} & E_j.
\end{array} \qquad (4.1.3.13.3)$$

By applying the functor $\varprojlim_{j\in J}$ to the square 4.1.3.13.3, we get a square whose composition with 4.1.3.13.2 is the following diagram:

$$\begin{array}{ccc}
\Gamma(U, \varprojlim_{j\in J}\mathcal{E}_{ij}) & \xrightarrow{\Gamma(U,\alpha_i)} & \Gamma(U, \varprojlim_{j\in J}\mathcal{E}_j) \\
\downarrow\sim & & \downarrow\sim \\
\varprojlim_{j\in J} E_{ij} & \xrightarrow{\beta_i} & \varprojlim_{j\in J} E_j.
\end{array} \qquad (4.1.3.13.4)$$

Next, we obtain from 4.1.3.13.4 the commutative bottom square of the diagram

$$\begin{array}{ccc}
\Gamma(U, \varinjlim_{i\in I}\varprojlim_{j\in J}\mathcal{E}_{ij}) & \xrightarrow{\Gamma(U,\alpha)} & \Gamma(U, \varprojlim_{j\in J}\varinjlim_{i\in I}\mathcal{E}_{ij}) \\
\downarrow\sim & & \| \\
\varinjlim_{i\in I}\Gamma(U, \varprojlim_{j\in J}\mathcal{E}_{ij}) & \longrightarrow & \Gamma(U, \varprojlim_{j\in J}\mathcal{E}_j) \\
\downarrow\sim & & \downarrow\sim \\
\varinjlim_{i\in I}\varprojlim_{j\in J} E_{ij} & \xrightarrow{\beta} & \varprojlim_{j\in J}\varinjlim_{i\in I} E_{i,j},
\end{array} \qquad (4.1.3.13.5)$$

where the top commutative square comes from the functoriality of the commutation of $\Gamma(U,-)$ with $\varinjlim_{i\in I}$. Since the bottom morphism is an isomorphism (see [KS06, 3.1.6]), then we are done. $\square$

Lemma 4.1.3.14. *Let $\mathcal{M}$ be a coherent $\mathcal{B}_X$-module, and $(\mathcal{M}_l)_{l\in\mathbb{N}}$ an increasing sequence of coherent sub-$\mathcal{B}_X$-modules of $\mathcal{M}$. Then the sequence $\mathcal{M}_l$ is stationary.*

Proof. Since X is quasi-compact, the proposition is local on X. We can therefore assume that X is affine. The lemma then follows from the theorem A for coherent $\mathcal{B}_X$-modules and of the fact that the ring $\Gamma(X,\mathcal{B}_X)$ is noetherian. $\square$

Lemma 4.1.3.15. *Let $\phi\colon \mathcal{E}\to\mathcal{F}$ be a morphism of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. Let $\mathcal{E}'$ be a sub-$\mathcal{B}_X$-module of $\mathcal{E}$. Then we have the equality of $\mathcal{B}_X$-modules:*

$$\phi\left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r}\cdot\mathcal{E}'\right)=\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r}\cdot\phi(\mathcal{E}') \tag{4.1.3.15.1}$$

Proof. Since ϕ is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear, we get the commutative square

$$\begin{array}{ccccc}
\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r}\otimes_{\mathcal{B}_X}\mathcal{E}' & \longrightarrow & \mathcal{E} & \longrightarrow & \mathcal{F}\\
\downarrow & & & & \|\\
\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,r}\otimes_{\mathcal{B}_X}\phi(\mathcal{E}') & & \longrightarrow & & \mathcal{F}
\end{array}$$

whose right arrow is surjective. Hence, we are done by definition (see notation 4.1.3.6). $\square$

Proposition 4.1.3.16. A $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module having a global finite presentation admits a good filtration.

Proof. Choose a finite presentation of $\mathcal{E}$ of the form

$$(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^r\xrightarrow{\phi}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^s\xrightarrow{\psi}\mathcal{E}\to 0.$$

Set $\mathcal{E}_n:=\psi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s)$. By $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity of ψ, by using 4.1.3.15.1 we get the first equality:

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\cdot\psi\left((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n'})^s\right)=\psi\left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\cdot\left((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n'})^s\right)\right)=\psi\left(\left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\cdot\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n'}\right)^s\right).$$

With 4.1.3.5, this yields that the family $(\mathcal{E}_n)_{n\in\mathbb{N}}$ is a filtration of $\mathcal{E}$ satisfying the condition (b) of the definition 4.1.3.8 for any integer r_1. As for condition (a), this is equivalent to saying that for any integer n, the $\mathcal{B}_X$-modules $\mathrm{Im}(\phi)\cap(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s$ are coherent. Let $n_0\geq 0$ be an integer satisfying the inclusion 4.1.3.12.1 for any $l\in\mathbb{N}$. Since $\mathcal{B}_X$ is coherent, then the image of a $\mathcal{B}_X$-linear morphism between two coherent $\mathcal{B}_X$-module is coherent. Hence, $\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r)$ is $\mathcal{B}_X$-coherent. Since $\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r)$ and $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s$ are coherent sub-$\mathcal{B}_X$-modules of the coherent $\mathcal{B}_X$-module $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l+n+n_0})^s$, then the $\mathcal{B}_X$-module $\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r)\cap(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s$ is coherent. Since $\mathrm{Im}\phi=\cup_{l\in\mathbb{N}}\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r)$ and that filtered inductive limits of sheaves on X commute to finite projective limits (see 4.1.3.13), we get

$$\mathrm{Im}\phi\cap(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s=\bigcup_{l\in\mathbb{N}}\left(\phi\left((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r\right)\cap\left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\right)^s\right). \tag{4.1.3.16.1}$$

By applying the lemma 4.1.3.14 to $\mathcal{M}=(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s$ and $\mathcal{M}_l=\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r)\cap(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s$, we obtain an integer l_0 such that

$$\bigcup_{l\in\mathbb{N}}\left(\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l})^r)\cap(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s\right)=\phi((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l_0})^r)\cap(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s.$$

With 4.1.3.16.1, this implies that $\mathrm{Im}\phi\cap(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^s$ is $\mathcal{B}_X$-coherent. Hence we are done. $\square$

In the algebraic case, we can improve 4.1.3.16:

Proposition 4.1.3.17. *Suppose we are in the algebraic case of 3.4. A coherent $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\mathcal{F}$ admits a good filtration.*

Proof. Since $\mathcal{F}$ is a quasi-coherent $\mathcal{O}_X$-module, then it is the inductive limit of its coherent $\mathcal{O}_X$-submodules (see [Gro60, 9.4.9]), there exists a coherent $\mathcal{O}_X$-submodule $\mathcal{G}$ of $\mathcal{F}$ such that the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear map $\varpi\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{G} \twoheadrightarrow \mathcal{F}$ is surjective. This yields the filtration $(\mathcal{F}_l)_{l\in\mathbb{N}}$ by setting $\mathcal{F}_l = \varpi(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,l} \otimes_{\mathcal{O}_X} \mathcal{G})$. It follows from 4.1.3.5 that this is a good filtration. □

4.1.3.18. Suppose X is affine. Set $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp} := \Gamma(X, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n} := \Gamma(X, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})$, $B_X := \Gamma(X, \mathcal{B}_X)$. Since the ring sheaf $\mathcal{B}_X$ verifies theorem A and B for coherent modules, with 4.1.3.3, the sequence $(\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n})_{n\in\mathbb{N}}$ endowed $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$ with a filtration (i.e., in the definition 4.1.3.7 we replace $\mathcal{D}$ by D). Moreover, the canonical morphism $\Gamma(X, \mathcal{B}_X \otimes_B \widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n}) \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}$ is an isomorphism. The commutation of filtered inductive limits with $\Gamma(X,-)$ and tensor products then gives us the isomorphisms:

$$\mathcal{B}_X \otimes_{B_X} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} \mathcal{B}_X \otimes_{B_X} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n} \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}. \tag{4.1.3.18.1}$$

Theorem 4.1.3.19 (Theorem A)**.** *Suppose X is affine. Then the functors $\mathcal{E} \mapsto \Gamma(X,\mathcal{E})$ and $E \mapsto \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} E$ are canonical quasi-inverse equivalences between the category of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules globally of finite presentation and the category of $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-modules of finite type.*

Proof. 1) Let E be a $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module of finite type. Since $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$ is a Noetherian ring (see 4.1.2.17), then E is a $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module of finite presentation. The $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} E$ is therefore globally of finite presentation, i.e., the second functor of the proposition is therefore well defined.

2) Let $(\widetilde{D}^{(m)}_{X^\sharp/S^\sharp})^r \xrightarrow{\epsilon} E$ be a surjective morphism of left $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-modules. We now show that the canonical morphism

$$E \to \Gamma(X, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} E).$$

is an isomorphism. Let us then note E_n the image of $(\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n})^r$ by ϵ and $B := \Gamma(X, \mathcal{B}_X)$. The module E is therefore equal to the union of the B-modules E_n which are of finite type. As the ring sheaf $\mathcal{B}_X$ verifies theorem A, then the functorial in E_n canonical morphism $E_n \to \Gamma(X, \mathcal{B}_X \otimes_B E_n)$ is an isomorphism. Commutation of filtered inductive limits to tensor products and to the functor $\Gamma(X,-)$ then gives us the canonical isomorphisms

$$\Gamma(X, \mathcal{B}_X \otimes_B E) \xrightarrow{\sim} \Gamma(X, \varinjlim_{n\in\mathbb{N}} \mathcal{B}_X \otimes_B E_n) \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} \Gamma(X, \mathcal{B}_X \otimes_B E_n) \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} E_n \xrightarrow{\sim} E. \tag{4.1.3.19.1}$$

We deduce from the isomorphisms 4.1.3.18.1 than the canonical morphism

$$\mathcal{B}_X \otimes_B E \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} E \tag{4.1.3.19.2}$$

is an isomorphism. Using 4.1.3.19.1, this yields that the canonical morphism

$$E \to \Gamma(X, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} E)$$

is an isomorphism.

3) Let $\mathcal{E}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module endowed with a finite presentation

$$(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^r \xrightarrow{\phi} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^s \xrightarrow{\epsilon} \mathcal{E} \to 0. \tag{4.1.3.19.3}$$

i) Let's start by showing that $\Gamma(X,\mathcal{E})$ is a $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module of finite type. According to the lemma 4.1.3.12, there exists an integer n_0 such that for any integer n, the composite morphism $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^r \hookrightarrow$

$(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^r \xrightarrow{\phi} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^s$ factorizes into a morphism ϕ_n: $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})^r \to (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n+n_0})^s$. The $\mathcal{B}_X$-modules $\mathcal{M}_n := \mathrm{Im}(\phi_n)$ are then coherent. The family of $\mathcal{B}_X$-modules $(\mathcal{M}_n)_{n\in\mathbb{N}}$ endows therefore $\mathcal{M} := \mathrm{Im}(\phi)$ with an exhaustive filtration by coherent $\mathcal{B}_X$-modules.

Moreover, it follows from 4.1.3.19.3 the exact sequence:

$$0 \to \mathcal{M} \to (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^s \xrightarrow{\epsilon} \mathcal{E} \to 0, \tag{4.1.3.19.4}$$

where the morphism $\mathcal{M} \to (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^s$ is the canonical injection. Since the functor $H^1(X,-)$ commutes to filtered inductive limits, since $\mathcal{B}_X$ satisfies theorems A and B for coherent modules, then $H^1(X,\mathcal{M}) \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} H^1(X,\mathcal{M}_n) \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} 0 \xrightarrow{\sim} 0$. By applying the functor $\Gamma(X,-)$ to the exact sequence 4.1.3.19.4, we therefore get that the morphism $\Gamma(X,\epsilon)$: $(\widetilde{D}^{(m)}_{X^\sharp/S^\sharp})^s \to \Gamma(X,\mathcal{E})$ is surjective. We have therefore shown that the functor $\Gamma(X,-)$ of the proposition is well defined.

ii) It remains to show that the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} \Gamma(X,\ E) \to \mathcal{E}$ is an isomorphism. Thanks to proposition 4.1.3.16, there is a good filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ of $\mathcal{E}$. Since the $\mathcal{B}_X$-modules $\mathcal{E}_n$ are coherent, since $\mathcal{B}_X$ satisfies the theorems A and B for coherent modules, then the canonical morphism $\mathcal{B}_X \otimes_B \Gamma(X,\mathcal{E}_n) \to \mathcal{E}_n$ are isomorphisms. Since filtered inductive limits commute to the global section functors and tensor products, we then obtain the canonical isomorphisms

$$\mathcal{B}_X \otimes_B \Gamma(X,\mathcal{E}) \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} \mathcal{B}_X \otimes_B \Gamma(X,\mathcal{E}_n) \xrightarrow{\sim} \varinjlim_{n\in\mathbb{N}} \mathcal{E}_n \xrightarrow{\sim} \mathcal{E}. \tag{4.1.3.19.5}$$

The canonical isomorphism $\mathcal{B}_X \otimes_B \Gamma(X,\mathcal{E}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} \Gamma(X,\mathcal{E})$ (see 4.1.3.19.2) and 4.1.3.19.5 then provide us with the expected canonical isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} \Gamma(X,\mathcal{E}) \xrightarrow{\sim} \mathcal{E}.$$

□

Remark 4.1.3.20. Suppose $X^\sharp$ is a log-scheme and not a formal log-scheme, i.e. we consider the algebraic case of 3.4. Suppose moreover X affine and $\mathcal{B}_X$ is quasi-coherent. Let $\mathcal{E}$ be a coherent $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Then $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ and $\mathcal{E}$ are quasi-coherent $\mathcal{O}_X$-modules and the canonical morphisms $\mathcal{O}_X \otimes_{\Gamma(X,\mathcal{O}_X)} \Gamma(X,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ and $\mathcal{O}_X \otimes_{\Gamma(X,\mathcal{O}_X)} \Gamma(X,\mathcal{E}) \to \mathcal{E}$ are isomorphisms. The first one induces that the canonical morphism $\mathcal{O}_X \otimes_{\Gamma(X,\mathcal{O}_X)} \Gamma(X,\mathcal{E}) \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\Gamma(X,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})} \Gamma(X,\mathcal{E})$ is an isomorphism. Hence, so is the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\Gamma(X,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})} \Gamma(X,\mathcal{E}) \to \mathcal{E}$ is an isomorphism. This yields that $\mathcal{E}$ is globally of finite presentation. Hence, 4.1.3.19, remain valid by replacing the hypothesis "globally of finite presentation" by "coherent". With 4.1.3.16 and 4.1.3.11, this implies that $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ satisfies theorems A and B for coherent modules in the sense of 1.4.3.14.

Theorem 4.1.3.21. *Let $\mathcal{E}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Then $\mathcal{E}$ is coherent if and only if it admits good filtrations locally.*

Proof. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is coherent (see 4.1.2.17), then it follows from the proposition 4.1.3.16, that if $\mathcal{E}$ is a coherent $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module then it locally admits good filtrations. Let us show the converse.

The assertion being local, we are reduced to the case where X is an affine formal scheme above which there is a good filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ of $\mathcal{E}$. By hypothesis, there therefore exists an integer $r_1 \in \mathbb{N}$ such that for any integer $n \geq r_1$, we have $\mathcal{E}_n = \sum_{j=0}^{p^m-1} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n-r_1+j} \cdot \mathcal{E}_{r_1-j}$. Since the sheaf of rings $\mathcal{B}_X$ verifies theorems A and B for coherent modules, then we get from 4.1.3.3 the equality

$$\Gamma(X,\mathcal{E}_n) = \sum_{j=0}^{p^m-1} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n-r_1+j} \Gamma(X,\mathcal{E}_{n_1-j}).$$

This yields that $\Gamma(X,\mathcal{E})$ is generated as $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module by $\Gamma(X,\mathcal{E}_{n_1})$. It is thus a $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module of finite type.

Since is $\mathcal{E}$ is equipped with a filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ by coherent $\mathcal{B}_X$-modules, then it follows from 4.1.3.19.5 (to check this isomorphism, we only need a filtration by coherent $\mathcal{B}_X$-modules) that we have the canonical isomorphism:

$$\mathcal{B}_X \otimes_{\Gamma(X,\mathcal{B}_X)} \Gamma(X,\mathcal{E}) \xrightarrow{\sim} \mathcal{E}. \tag{4.1.3.21.1}$$

Now, the proposition 4.1.3.19 gives us the isomorphism

$$\mathcal{B}_X \otimes_{\Gamma(X,\mathcal{B}_X)} \Gamma(X,\mathcal{E}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\Gamma(X,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})} \Gamma(X,\mathcal{E}). \tag{4.1.3.21.2}$$

By using 4.1.3.21.1 and 4.1.3.21.2, we obtain that the canonical morphism

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\Gamma(X,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})} \Gamma(X,\mathcal{E}) \to \mathcal{E}.$$

is an isomorphism. The theorem 4.1.3.19 allows us to conclude. □

4.1.3.22. The canonical order filtration $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n})_{n\in\mathbb{N}}$ of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ gives us a sheaf of rings

$$\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} := \oplus_{n\in\mathbb{N}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n-1}.$$

Also, the graduated ring associated with this filtration $\operatorname{gr}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp} := \oplus_{n\in\mathbb{N}}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n}/\widetilde{D}^{(m)}_{X^\sharp/S^\sharp,n-1}$ is isomorphic to $\Gamma(X,\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ (this results from the commutation of $\Gamma(X,-)$ to filtered inductive limits and from the fact that $\mathcal{B}_X$ satisfies the theorems A and B for coherent -modules). Similarly to 4.1.3.18.1, we have the canonical isomorphism

$$\mathcal{B}_X \otimes_{B_X} \operatorname{gr}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \left(\oplus_{n\in\mathbb{N}}\mathcal{B}_X \otimes_{B_X} \operatorname{gr}_n \widetilde{D}^{(m)}_{X^\sharp/S^\sharp}\right) \xrightarrow{\sim} \oplus_{n\in\mathbb{N}} \operatorname{gr}_n \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}. \tag{4.1.3.22.1}$$

This yields that for any $\mathcal{B}_X \otimes_{B_X} \operatorname{gr}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module G, the canonical morphism

$$\mathcal{B}_X \otimes_{B_X} G \to \operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\operatorname{gr}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} G \tag{4.1.3.22.2}$$

is an isomorphism.

When a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\mathcal{E}$ is endowed with a filtration $(\mathcal{E}_r)_{r\in\mathbb{N}}$, if we take the convention that $\mathcal{E}_r = 0$ for any integer $r \leq -1$ and then writing for $r \geq 0$, $\operatorname{gr}_r \mathcal{E} := \mathcal{E}_r/\mathcal{E}_{r-1}$ we can then associate its graded ring with him:

$$\operatorname{gr}(\mathcal{E}) := \oplus_{r\in\mathbb{N}} \operatorname{gr}_r \mathcal{E}.$$

The sheaf $\operatorname{gr}(\mathcal{E})$ is then equipped with a canonical structure of $\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.

Following 4.1.2.17.a, the sheaf of rings $\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is commutative. Moreover, the canonical ring morphism $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ (see 4.1.2.2) induces a commutative ring homomorphism $\operatorname{gr}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. Also, as with all $r \in \mathbb{N}$, $\operatorname{gr}_r \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is a locally free $\mathcal{B}_X$-module, we verify that the canonical morphism $\mathcal{B}_X \otimes_{\mathcal{O}_{X^\sharp/S^\sharp}} \operatorname{gr}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is a ring isomorphism.

Proposition 4.1.3.23 (Theorem A)**.** *Suppose X is affine. Then the functors $\mathcal{G} \mapsto \Gamma(X,\mathcal{G})$ and $G \mapsto \operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\operatorname{gr}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} G$ are quasi-inverse category equivalences between the category of left $\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module globally of finite presentation and the category of $\operatorname{gr}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-modules of finite type.*

Proof. The proof is analogous to that of the theorem 4.1.3.19. □

Remark 4.1.3.24. Suppose $X^\sharp$ is a log-scheme and not a formal log-scheme, i.e. we consider the algebraic case of 3.4. Suppose moreover X affine and $\mathcal{B}_X$ is quasi-coherent. Similarly to 4.1.3.20, we can check that a coherent $\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module is globally of finite presentation.

The following theorem gives us a characterization of the good filtrations among the filtrations.

Theorem 4.1.3.25. *Let $\mathcal{E}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and $(\mathcal{E}_n)_{n\in\mathbb{N}}$ a filtration of $\mathcal{E}$. The following two assertions are equivalent:*

(a) The filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ is good.

(b) The $\mathrm{gr}\,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\mathrm{gr}\,\mathcal{E}$ is coherent.

Proof. The proposition being of local nature, we are therefore reduced to assuming that X is affine and that $X^\sharp/S^\sharp$ is endowed with logarithmic coordinates.

1) Let us prove that $(a) \Rightarrow (b)$. So let's assume that the filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ is good. By hypothesis, there therefore exists an integer $n_1 \in \mathbb{N}$ such that for any integer $n \geq n_1$, we have

$$\mathcal{E}_n = \sum_{j=0}^{p^m-1} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp, n-n_1+j}\mathcal{E}_{n_1-j}.$$

We deduce that the canonical morphism of coherent $\mathcal{B}_X$-modules

$$\oplus_{j=0}^{p^m-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp, n-n_1+j} \otimes_{\mathcal{B}_X} \mathcal{E}_{n_1-j} \to \mathcal{E}_n,$$

is surjective. Since the sheaf of rings $\mathcal{B}_X$ satisfies the theorem A and B for coherent modules, then it follows from 4.1.3.3 that the canonical morphism of $B := \Gamma(X, \mathcal{B}_X)$-modules

$$\Gamma(X, \oplus_{j=0}^{p^m-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp, n-n_1+j} \otimes_{\mathcal{B}_X} \mathcal{E}_{n_1-j}) = \oplus_{j=0}^{p^m-1}\widetilde{D}^{(m)}_{X^\sharp/S^\sharp, n-n_1+j} \otimes_B \Gamma(X, \mathcal{E}_{n_1-j}) \to \Gamma(X, \mathcal{E}_n),$$

is surjective. We therefore deduce the equality $\Gamma(X, \mathcal{E}_n) = \sum_{j=0}^{p^m-1} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp, n-n_1+j}\Gamma(X, \mathcal{E}_{n_1-j})$. Moreover, since the $\mathcal{B}_X$-modules $\mathcal{E}_n$ are coherent, using again 4.1.3.3, we obtain the equality $\Gamma(X, \mathrm{gr}\,\mathcal{E}) = \oplus_{n=0}^{\infty}\Gamma(X, \mathcal{E}_n)/\Gamma(X, \mathcal{E}_{n-1})$. From these two formulas, we conclude that $\Gamma(X, \mathrm{gr}\,\mathcal{E})$ is generated as $\mathrm{gr}\,\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module by $\oplus_{n=0}^{n=n_1}\Gamma(X, \mathrm{gr}\,\mathcal{E}_n)$. Since $\oplus_{n=0}^{n=n_1}\Gamma(X, \mathrm{gr}\,\mathcal{E}_n)$ is a $\Gamma(X, \mathcal{B}_X)$-module of finite type, $\Gamma(X, \mathrm{gr}\,\mathcal{E})$ is therefore a $\mathrm{gr}\,\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module of finite type. Since $\mathrm{gr}\,\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$ is noetherian, then it is of finite presentation.

Since $\mathcal{B}_X$ satisfies theorems A and B for coherent modules, then the canonical morphisms $\mathcal{B}_X \otimes_B \Gamma(X, \mathrm{gr}_n\,\mathcal{E}) \to \mathrm{gr}_n\,\mathcal{E}$ are isomorphisms for any $n \in \mathbb{N}$. The tensor product commuting to direct sums, we deduce that the canonical morphism $\mathcal{B}_X \otimes_B \Gamma(X, \mathrm{gr}\,\mathcal{E}) \to \mathrm{gr}\,\mathcal{E}$ is an isomorphism. With 4.1.3.22.2, this yields that the canonical morphism $\mathrm{gr}\,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathrm{gr}\,\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}} \Gamma(X, \mathrm{gr}\,\mathcal{E}) \to \mathrm{gr}\,\mathcal{E}$ is also an isomorphism.

We then deduce from the proposition 4.1.3.23 that $\mathrm{gr}\,\mathcal{E}$ is a $\mathrm{gr}\,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of finite presentation and therefore a coherent $\mathrm{gr}\,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.

2) Conversely, let us check $(b) \Rightarrow (a)$. So suppose $\mathrm{gr}\,\mathcal{E}$ is $\mathrm{gr}\,\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-coherent.

i) By induction on $n \in \mathbb{N}$, we find that the $\mathcal{B}_X$-coherence for all n of $\mathcal{E}_n$ is equivalent to the $\mathcal{B}_X$-coherence for all n of $\mathrm{gr}_n\,\mathcal{E}$. Let us show this last assertion. Now, according to the proposition 4.1.3.23, we have the canonical morphism:

$$\mathcal{B}_X \otimes_B \Gamma(X, \mathrm{gr}\,\mathcal{E}) \xrightarrow{\sim} \mathrm{gr}\,\mathcal{E}$$

is an isomorphism. Since the functor $\Gamma(X, -)$ commutes to filtered direct sums, then this yields that the canonical morphisms

$$\mathcal{B}_X \otimes_B \Gamma(X, \mathrm{gr}_n\,\mathcal{E}) \to \mathrm{gr}_n\,\mathcal{E}$$

are isomorphisms for all $n \in \mathbb{N}$. It only remains for us to show that for all n the B-module $\Gamma(X, \mathrm{gr}_n\,\mathcal{E})$ is of finite type. For this, according to the proposition 4.1.3.23, we use the fact that $\Gamma(X, \mathrm{gr}\,\mathcal{E})$ is a $\mathrm{gr}\,\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$-module of finite type. So there are homogeneous elements $x_1, ..., x_r$, of respective degree $n_1, ..., n_r$ generating $\Gamma(X, \mathrm{gr}\,\mathcal{E})$ and therefore we obtain by identification the equality for all $n \in \mathbb{N}$:

$$\Gamma(X, \mathrm{gr}_n\,\mathcal{E}) = \sum_{l=1}^{r} \mathrm{gr}_{n-n_l}\,\widetilde{D}^{(m)}_{X^\sharp/S^\sharp} \cdot x_l. \tag{4.1.3.25.1}$$

It therefore follows that $\Gamma(X, \mathrm{gr}_n\,\mathcal{E})$ is a B-module of finite type. We have therefore shown that for all n, $\mathrm{gr}\,\mathcal{E}_n$ is a coherent $\mathcal{B}_X$-module.

ii) Also, since $\Gamma(X, \operatorname{gr}_n \mathcal{E}) = \Gamma(X, \mathcal{E}_n)/\Gamma(X, \mathcal{E}_{n-1})$ and in setting $N_0 = \sup(n_1, ..., n_r)$, by using the equality 4.1.3.25.1, we can check by induction on the integer $n \geq -N_0$ the following equality:

$$\Gamma(X, \mathcal{E}_{N_0+n}) = \sum_{l=1}^{r} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp, n+N_0-n_l} x_l. \tag{4.1.3.25.2}$$

We further know that $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp, n+N_0-n_l} = \sum_{j=0}^{p^m-1} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp, n+j} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp, N_0-n_l-j}$. By injecting this equality into 4.1.3.25.2, we then obtain

$$\Gamma(X, \mathcal{E}_{N_0+n}) = \sum_{j=0}^{p^m-1} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp, n+j} (\sum_{l=1}^{r} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp, N_0-n_l-j} . x_l). \tag{4.1.3.25.3}$$

However, the formula 4.1.3.25.2 applied to n equal to $-j$ shows that the term placed between parentheses of the sum of 4.1.3.25.3 is none other than $\Gamma(X, \mathcal{E}_{N_0-j})$. We therefore obtain:

$$\Gamma(X, \mathcal{E}_{N_0+n}) = \sum_{j=0}^{p^m-1} \widetilde{D}^{(m)}_{X^\sharp/S^\sharp, n+j} \Gamma(X, \mathcal{E}_{N_0-j}),$$

which completes the demonstration. □

Corollary 4.1.3.26. *Let $0 \to \mathcal{E}' \to \mathcal{E} \to \mathcal{E}'' \xrightarrow{\epsilon} 0$ be an exact sequence of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-coherent modules, and $(\mathcal{E}_n)_{n\in\mathbb{N}}$ a good filtration of E. Then the filtrations of $\mathcal{E}'$, $\mathcal{E}''$ defined by: $\mathcal{E}'_n := \mathcal{E}_n \cap \mathcal{E}'$, $\mathcal{E}''_n = \epsilon(\mathcal{E}_n)$ are good.*

Proof. The filtrations induce the exact sequence $0 \to \operatorname{gr}\mathcal{E}' \to \operatorname{gr}\mathcal{E} \to \operatorname{gr}\mathcal{E}'' \to 0$. According to the theorem 4.1.3.25, it then suffices to show that $\operatorname{gr}\mathcal{E}'$ is $\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-coherent. Since the assertion is local, we are reduced to the case where X is affine.

As the functor $\Gamma(X, -)$ is left exact, $\Gamma(X, \operatorname{gr}\mathcal{E}')$ is a submodule of $\Gamma(X, \operatorname{gr}\mathcal{E})$. Since X is affine, then $\Gamma(X, \operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ is Noetherian and $\Gamma(X, \operatorname{gr}\mathcal{E}')$ is therefore of finite type. Show coherence of $\operatorname{gr}\mathcal{E}'$ then amounts to showing that the canonical morphism

$$\operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\Gamma(X, \operatorname{gr}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})} \Gamma(X, \operatorname{gr}\mathcal{E}') \to \operatorname{gr}\mathcal{E}',$$

is an isomorphism. By identifying the terms of the same degree, it is up to the same to show that, for all n, the induced canonical morphisms $\operatorname{gr}_n \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\Gamma(X, \operatorname{gr}_n \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})} \Gamma(X, \operatorname{gr}_n \mathcal{E}') \to \operatorname{gr}_n \mathcal{E}'$ are isomorphisms. It suffices to show that the $\mathcal{B}_X$-modules $\mathcal{E}_n$ are coherent for any integer n. Since $B := \Gamma(X, \mathcal{B}_X)$ is a Noetherian ring and we have a canonical inclusion $\Gamma(X, \mathcal{E}'_n) \subset \Gamma(X, \mathcal{E}_n)$, we deduce that $\Gamma(X, \mathcal{E}'_n)$ is of finite type. Also, the extension $B \to \mathcal{B}_X$ being flat, we then have

$$\mathcal{B}_X \otimes_B \Gamma(X, \mathcal{E}'_n) \xrightarrow{\sim} \mathcal{B}_X \otimes_B (\Gamma(X, \mathcal{E}_n) \cap \Gamma(X, \mathcal{E}')) \xrightarrow{\sim} (\mathcal{B}_X \otimes_B \Gamma(X, \mathcal{E}_n)) \cap (\mathcal{B}_X \otimes_B \Gamma(X, \mathcal{E}')) \xrightarrow{\sim} \mathcal{E}_n \cap \mathcal{E}',$$

the last isomorphism comes from the fact that $\mathcal{E}'$ is a coherent $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module (use 4.1.3.19) and that $\mathcal{E}_n$ is a coherent $\mathcal{B}_X$-module. □

Remark 4.1.3.27. This subsection (definitions and properties) still holds replacing left modules by right modules. For instance, if $\mathcal{M}$ is a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module endowed with a filtration $(\mathcal{M}_r)_{r\in\mathbb{N}}$, the filtration $(\mathcal{M}_r)_{r\in\mathbb{N}}$ is said to be *good* (resp. *quasi-good*) if the following two conditions hold (resp. the following first condition holds):

(a) For any $r \in \mathbb{N}$, $\mathcal{M}_r$ is $\mathcal{B}_X$-coherent ;

(b) There exists an integer $r_1 \in \mathbb{N}$ such that for any integer $r \geq r_1$, we have

$$\mathcal{M}_r = \sum_{j=0}^{p^m-1} \mathcal{M}_{r_1-j} \cdot \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp, r-r_1+j}.$$

Besides, the equivalence of categories 4.3.5.4 are compatible with this notion of good filtration, i.e., if $\mathcal{E}$ is a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{M} := \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$ is the corresponding right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module then $(\mathcal{E}_r)_{r\in\mathbb{N}} \mapsto (\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}_r)_{r\in\mathbb{N}}$ is a bijection between (quasi-)good filtrations of $\mathcal{E}$ and (quasi-)good filtrations of $\mathcal{M}$.

The following corollary will be useful later.

Corollary 4.1.3.28. *We suppose $\mathcal{B}_X = \mathcal{O}_X$. Let $\mathcal{E}$ be a coherent $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. There exists $Y \subset X$ open dense on which $\mathcal{E}$ is $\mathcal{O}_Y$-locally free.*

Proof. Since this is local, we can suppose $\mathfrak{X}$ is affine and $\mathcal{E}$ has a global finite presentation. Hence, $\mathcal{E}$ admits a good filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ (see 4.1.3.16) and the induced $\operatorname{gr}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module $\operatorname{gr}\mathcal{E}$ is coherent (see 4.1.3.25). Hence, following theorem A of 4.1.3.19 and 4.1.3.23, since $\operatorname{gr}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a commutative $\mathcal{O}_X$-algebra of finite type, then it follows from [Gro65, IV.6.9.1] (in the noetherian case) that there exists a principal open subset Y of X such that $\operatorname{gr}\mathcal{E}|Y$ is $\mathcal{O}_Y$-free. Hence, for any $n \in \mathbb{N}$, $\operatorname{gr}_n \mathcal{E}|Y$ is a projective $\mathcal{O}_Y$-module and we get a section $\operatorname{gr}_n \mathcal{E}|Y \to \mathcal{E}_n|Y$ of the canonical projection $\mathcal{E}_n|Y \to \operatorname{gr}_n \mathcal{E}|Y$. Denote by $\alpha_n\colon \operatorname{gr}_n \mathcal{E}|Y \to \mathcal{E}_n|Y \subset \mathcal{E}|Y$ the composite morphism. By induction on n, we can check that the morphism $\oplus_{i=0}^n \alpha_i \colon \oplus_{i=0}^n \colon \oplus_{i=0}^n \operatorname{gr}_i \mathcal{E}|Y \to \mathcal{E}|Y$ in injective and its image is $\mathcal{E}_n$. This yields the isomorphism $\oplus_{i=0}^n \alpha_i \colon \oplus_{i=0}^\infty \colon \oplus_{i=0}^\infty \operatorname{gr}_i \mathcal{E}|Y \to \mathcal{E}|Y$. □

4.2 Tensor products and internal homomorphism of $\mathcal{D}$-modules

We keep notation 3.4. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure which is compatible with its algebra structure. We keep notation 4.1.2, in particular we set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

4.2.1 PD-stratifications of level m with coefficients, nilpotence

Definition 4.2.1.1. An *m-PD-stratification* (or *PD-stratification of level m*) ε *relatively to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$* on a $\mathcal{B}_X$-module $\mathcal{E}$ is the data of a family of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$-linear homomorphisms

$$\varepsilon_n \colon \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)},$$

where the tensor products are taken respectively for the right and left structures of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$, these isomorphisms satisfying the following conditions:

(a) $\varepsilon_0^{\mathcal{E}} = \mathrm{id}_{\mathcal{E}}$ and the family is compatible with respect to the projections $\widetilde{\psi}^{n+1,n*}_{X^\sharp/S^\sharp,(m)}$ (see 4.1.2.12.1), i.e. for any $n' \geq n$ in $\mathbb{N}$ we have the commutative diagram:

$$\begin{array}{ccc} \widetilde{\psi}^{n',n*}_{X^\sharp/S^\sharp,(m)}(\widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \mathcal{E}) & \xrightarrow{\widetilde{\psi}^{n',n*}_{X^\sharp/S^\sharp,(m)}(\varepsilon_{n'})} & \widetilde{\psi}^{n',n*}_{X^\sharp/S^\sharp,(m)}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)}) \, ; \\ \downarrow \wr & & \downarrow \wr \\ \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \mathcal{E} & \xrightarrow{\varepsilon_n} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} \end{array}$$

(b) The cocycle condition is satisfied, i.e., for any n, n', the diagram

$$\begin{array}{ccc} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \otimes \mathcal{E} & \xrightarrow{\widetilde{\delta}^{n,n'*}_{(m)}(\varepsilon_{n+n'})} & \mathcal{E} \otimes \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \\ & \searrow^{\tilde{q}^{n,n'*}_{1(m)}(\varepsilon_{n+n'})} \quad \nearrow_{\tilde{q}^{n,n'*}_{0(m)}(\varepsilon_{n+n'})} & \\ & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes \mathcal{E} \otimes \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} & \end{array} \tag{4.2.1.1.1}$$

is commutative.

Say a $\mathcal{B}_X$-linear homomorphism $\varphi : \mathcal{E} \to \mathcal{F}$ between $\mathcal{B}_X$-modules equipped with m-PD stratifications relatively to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$ is *horizontal* if it commutes with all ε_n.

4.2.1.2. With notation 3.2.2.12 (add some tildes), similarly to 2.1.1.2, we check that the above condition 4.2.1.1.1 is equivalent to

$$\forall\, n, \qquad \tilde{q}^{n*}_{02,(m)}(\varepsilon_n) = \tilde{q}^{n*}_{01,(m)}(\varepsilon_n) \circ \tilde{q}^{n*}_{12,(m)}(\varepsilon_n). \tag{4.2.1.2.1}$$

Proposition 4.2.1.3. *Let $\mathcal{M}$ be a $\mathcal{B}_X$-module together with an m-PD stratification $(\varepsilon^{\mathcal{M}}_n)$ relative to $X^\sharp/S^\sharp$ with coefficient in $\mathcal{B}_X$. Then the homomorphisms $\varepsilon^{\mathcal{M}}_n$ are $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}$-linear isomorphisms.*

Proof. Copy the proof of 2.1.1.3. □

Proposition 4.2.1.4. *Let $\mathcal{E}$ be an $\mathcal{O}_X$-module together with an m-PD stratification $(\varepsilon^{\mathcal{E}}_n)$ relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$. Then the homomorphisms $\varepsilon^{\mathcal{E}}_n$ are $\mathcal{P}^n_{X/S,(m)}$-linear isomorphisms.*

Proof. We can copy word by word the proof of 2.1.1.3. □

Proposition 4.2.1.5. *We have the following properties.*

(I) Given a $\mathcal{B}_X$-module $\mathcal{E}$. The following are equivalent.

(a) A left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structure on $\mathcal{E}$ extending its $\mathcal{B}_X$-module structure.

(b) A family of $\mathcal{B}_X$-linear homomorphisms $\theta_n \colon \mathcal{E} \to p_{1*}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)})$ (the $\mathcal{B}_X$-module structure of this latter is induced by the right structure of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}$) satisfying

(i) $\theta_0 = \mathrm{id}_{\mathcal{E}}$ and for any $n, n' \in \mathbb{N}$, the diagram

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\theta_n} & \mathcal{E} \otimes \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} \\ \| & & \uparrow{\scriptstyle \mathrm{id} \otimes \widetilde{\psi}^{n+n',n}_{X^\sharp/S^\sharp,(m)}} \\ \mathcal{E} & \xrightarrow[\theta_{n+n'}]{} & \mathcal{E} \otimes \widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp,(m)} \end{array} \tag{4.2.1.5.1}$$

is commutative.

(ii) for all n, n' we have the commutative diagrams (cocycle condition)

$$\begin{array}{ccc} \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\mathrm{id} \otimes \delta^{n,n'}_{(m)}} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)} \\ \uparrow{\scriptstyle \theta^{\mathcal{E}}_{n+n'}} & & \uparrow{\scriptstyle \theta^{\mathcal{E}}_n \otimes \mathrm{id}} \\ \mathcal{E} & \xrightarrow{\theta^{\mathcal{E}}_{n'}} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp,(m)} \end{array} \tag{4.2.1.5.2}$$

(c) An m-PD stratification $\varepsilon = (\varepsilon^{\mathcal{E}}_n)$ on $\mathcal{E}$.

(II) Let $\mathcal{E}$ be left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and let $\theta^{\mathcal{E}} = (\theta^{\mathcal{E}}_n)$, $\varepsilon^{\mathcal{E}} = (\varepsilon^{\mathcal{E}}_n)$ be the associated family or m-PD stratification.

(a) The action by a section P of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ on $\mathcal{E}$ can be retrieved from $\theta^{\mathcal{E}}$ (resp. $\varepsilon^{\mathcal{E}}$) via the following composition of the bottom (resp. top) horizontal morphisms of the commutative diagram:

$$\begin{array}{ccccc} \mathcal{E} \xrightarrow[4.1.2.7]{\widetilde{p}^n_{1,(m),\mathcal{E}}} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \mathcal{E} & \xrightarrow{\varepsilon^{\mathcal{E}}_n} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\mathrm{id} \otimes P} & \mathcal{E} \\ \| & & \| & & \| \\ \mathcal{E} & \xrightarrow{\theta^{\mathcal{E}}_n} & p_{1*}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}) & \xrightarrow{\mathrm{id} \otimes P} & \mathcal{E}. \end{array} \tag{4.2.1.5.3}$$

(b) *Suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,d}$. Conversely, with notation 4.1.2.16 for any $x \in \mathcal{E}$, we have the Taylor expansion formula*

$$\theta_n^{\mathcal{E}}(x) = \varepsilon_n^{\mathcal{E}}(1 \otimes x) = \sum_{|\underline{k}| \leq n} \underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x) \otimes \underline{\tau}_\sharp^{\{\underline{k}\}}, \tag{4.2.1.5.4}$$

where $\underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x)$ is the action of the operator $\underline{\partial}_\sharp^{\langle \underline{k} \rangle}$ on x. The inverse of 4.2.1.5.4 can be described via the formula:

$$(\varepsilon_n^{\mathcal{E}})^{-1}(x \otimes 1) = \sum_{|\underline{k}| \leq n} \underline{\tau}_\sharp^{\{\underline{k}\}} \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k} \rangle} x. \tag{4.2.1.5.5}$$

(III) *A $\mathcal{B}_X$-linear morphism $\phi \colon \mathcal{E} \to \mathcal{F}$ between two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear if and only if ϕ is horizontal.*

Proof. We can copy the proof of the proposition without coefficients, i.e. when $\mathcal{B}_X = \mathcal{O}_X$ (see 3.4.2.5). We check 4.2.1.5.5 similarly to 3.4.5.3.1 by using 3.4.5.2.1. □

Remark 4.2.1.6. Suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(b_\lambda)_{\lambda=1,\dots,d}$. Let $\mathcal{E}$ be a $\mathcal{B}_X$-module endowed with a family (as n varies) of $\widetilde{\mathcal{P}}^n_{X,(m)}$-linear isomorphisms

$$\varepsilon_n \colon \widetilde{\mathcal{P}}^n_{X,(m)} \otimes_{\mathcal{B}_X} \mathcal{E} = p_{1(m)}^{n*}(\mathcal{E}) \xrightarrow{\sim} p_{0(m)}^{n*}(\mathcal{E}) = \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X,(m)},$$

satisfying the condition (a) of 4.2.1.1. For any x of $\mathcal{E}$, for any $\underline{k} \in \mathbb{N}^d$, for any $n \geq |\underline{k}|$, let us denote by $\underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x)$ the section of $\mathcal{E}$ such that we get

$$\varepsilon_n^{\mathcal{E}}(1 \otimes x) = \sum_{|\underline{k}| \leq n} \underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x) \otimes \underline{\tau}_\sharp^{\{\underline{k}\}}.$$

First remark that these elements do not depend on the choice of n which justifies the notation. Moreover, the cocycle condition is equivalent to the condition that the formula

$$\sum_{\underline{k}=\sup\{\underline{i},\underline{j}\}}^{\underline{i}+\underline{j}} \frac{\underline{k}!}{(\underline{i}+\underline{j}-\underline{k})!(\underline{k}-\underline{i})!(\underline{k}-\underline{j})!} \frac{\underline{q}_{\underline{i}}^{(m)}! \underline{q}_{\underline{j}}^{(m)}!}{\underline{q}_{\underline{k}}^{(m)}!} \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}(x) = \underline{\partial}_\sharp^{\langle \underline{i} \rangle}(\underline{\partial}_\sharp^{\langle \underline{j} \rangle}(x)) \tag{4.2.1.6.1}$$

holds for any section x of $\mathcal{E}$, for any $\underline{i}, \underline{j} \in \mathbb{N}^d$ (to understand where this formula is coming from, recall the formula 3.2.3.13.1).

Indeed, this is a consequence of the following computation: since $\delta^{n,n'}_{(m)}(\tau_{\sharp i}) = \tau_{\sharp i} \otimes \tau_{\sharp i} + \tau_{\sharp i} \otimes 1 + 1 \otimes \tau_{\sharp i}$ (see 3.2.3.10.1) and $\delta^{n,n'}_{(m)}$ is an m-PD-morphism, then using the formula 1.2.4.5.2, we get

$$\widetilde{\delta}^{n,n'*}_{(m)}(\varepsilon_{n+n'})(1 \otimes 1 \otimes x) = \sum_{|\underline{k}| \leq n+n'} \underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x) \otimes \delta^{n,n'}_{(m)}(\underline{\tau}_\sharp^{\{\underline{k}\}}) = \sum_{|\underline{k}| \leq n+n'} \sum_{|\underline{i}| \leq n} \sum_{|\underline{j}| \leq n'} \alpha^{\underline{k}}_{\underline{i},\underline{j}} \underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x) \otimes \underline{\tau}_\sharp^{\{\underline{i}\}} \otimes \underline{\tau}_\sharp^{\{\underline{j}\}} \tag{4.2.1.6.2}$$

where $\alpha^{\underline{k}}_{\underline{i},\underline{j}} \in \mathbb{N}$. On the other hand, we have

$$\tilde{q}^{n,n'*}_{0(m)}(\varepsilon_{n+n'}) \circ \tilde{q}^{n,n'*}_{1(m)}(\varepsilon_{n+n'})(1 \otimes 1 \otimes x) = \tilde{q}^{n,n'*}_{0(m)}(\varepsilon_{n+n'}) \left(\sum_{|\underline{j}| \leq n'} \underline{\partial}_\sharp^{\langle \underline{j} \rangle}(x) \otimes \underline{\tau}_\sharp^{\{\underline{j}\}} \right)$$
$$= \sum_{|\underline{j}| \leq n'} \sum_{|\underline{i}| \leq n} \underline{\partial}_\sharp^{\langle \underline{i} \rangle}(\underline{\partial}_\sharp^{\langle \underline{j} \rangle}(x)) \otimes \underline{\tau}_\sharp^{\{\underline{i}\}} \otimes \underline{\tau}_\sharp^{\{\underline{j}\}} \tag{4.2.1.6.3}$$

The cocycle condition is satisfied if and only if the last terms of respectively 4.2.1.6.2 and 4.2.1.6.3 are equal. When $\mathcal{E}' = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$, the cocycle condition is satisfied and since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is a free $\mathcal{B}_X$-module, then in the case $x = 1$ we get the first equality

$$\sum_{|\underline{k}| \leq n+n'} \alpha^{\underline{k}}_{\underline{i},\underline{j}} \underline{\partial}_\sharp^{\langle \underline{k} \rangle} = \underline{\partial}_\sharp^{\langle \underline{i} \rangle} \underline{\partial}_\sharp^{\langle \underline{j} \rangle} \overset{3.2.3.13.1}{=} \sum_{\underline{k}=\sup\{\underline{i},\underline{j}\}}^{\underline{i}+\underline{j}} \frac{\underline{k}!}{(\underline{i}+\underline{j}-\underline{k})!(\underline{k}-\underline{i})!(\underline{k}-\underline{j})!} \frac{\underline{q}_{\underline{i}}^{(m)}! \underline{q}_{\underline{j}}^{(m)}!}{\underline{q}_{\underline{k}}^{(m)}!} \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}.$$

Hence, we are done.

Example 4.2.1.7. We denote by $\varepsilon_n^{\mathcal{B}_X}$ the m-PD-stratification induced by the left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure of $\mathcal{B}_X$. We denote by $\varepsilon^{\mathcal{B}_X}_{n/\mathcal{B}_X}\colon \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{B}_X \xrightarrow{\sim} \mathcal{B}_X \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ the isomorphism making commutative the diagram of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$-algebras

$$\begin{array}{ccc} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} & \xleftarrow{\sim} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{B}_X \\ \| & & \downarrow{\scriptstyle \sim\ \varepsilon^{\mathcal{B}_X}_{n/\mathcal{B}_X}} \\ \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} & \xleftarrow{\sim} & \mathcal{B}_X \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \end{array} \tag{4.2.1.7.1}$$

where the horizontal isomorphisms are the canonical ones. Similarly to 3.4.2.4, we can check that this is an m-PD-stratification relatively to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$. The induced canonical structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{B}_X$ is then described as follows : if $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ and $b \in \mathcal{B}_X$, the action of P on b is the image of b via the composition morphism: $\mathcal{B}_X \xrightarrow{\widetilde{p}^n_1} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \xrightarrow{P} \mathcal{B}_X$. Since $\{\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}, |\underline{k}| \leq n\}$ is the dual basis of $\{\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}, |\underline{k}| \leq n\}$ (for the left structure), this yields the Taylor formula:

$$\widetilde{p}^n_{1,(m)}(b) = \sum_{|\underline{k}|\leq n} \widetilde{p}^n_{0,(m)}(\underline{\partial}_\sharp^{\langle \underline{k}\rangle}(b))\underline{\tau}_\sharp^{\{\underline{k}\}}. \tag{4.2.1.7.2}$$

Lemma 4.2.1.8. *Let $\rho\colon \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ be the canonical morphism (see 4.1.2.2.2). Then the left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module induced via ρ by this left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structure on $\mathcal{B}_X$ defined at 4.2.1.7 is equal to the given left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure of $\mathcal{B}_X$.*

Proof. Since this is local, we can suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(b_\lambda)_{\lambda=1,\ldots,d}$. Then by using the Taylor formula satisfied by $\varepsilon_n^{\mathcal{B}_X}$ (see 3.4.2.5.4) for any section b of $\mathcal{B}_X$ we compute in $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$

$$(1\otimes 1)\cdot \widetilde{p}^n_{1(m)}(b) = (1\otimes 1)\cdot \epsilon_n^{\mathcal{B}_X}(1\otimes b) = \sum_{|\underline{k}|\leq n} \underline{\partial}_\sharp^{\langle \underline{k}\rangle}(b) \otimes \underline{\tau}_\sharp^{\{\underline{k}\}}$$

where $\widetilde{p}^n_{1(m)})$ is defined at 4.1.2.5. Since the top horizontal isomorphism of the diagram 4.2.1.7.1 sends $(1\otimes 1)\otimes b$ to $(1\otimes 1)\cdot \widetilde{p}^n_{1(m)}(b)$ and the bottom horizontal isomorphism sends $\sum_{|\underline{k}|\leq n} \underline{\partial}_\sharp^{\langle \underline{k}\rangle}(b) \otimes (1\otimes \underline{\tau}_\sharp^{\{\underline{k}\}})$ to $\sum_{|\underline{k}|\leq n} \underline{\partial}_\sharp^{\langle \underline{k}\rangle}(b) \otimes \underline{\tau}_\sharp^{\{\underline{k}\}}$, then we get

$$\varepsilon^{\mathcal{B}_X}_{n/\mathcal{B}_X}((1\otimes 1)\otimes b) = \sum_{|\underline{k}|\leq n} \underline{\partial}_\sharp^{\langle \underline{k}\rangle}(b) \otimes (1\otimes \underline{\tau}_\sharp^{\{\underline{k}\}}).$$

Hence, we conclude thanks to the formula 4.2.1.5.4 (recall by abuse of notation $1\otimes \underline{\tau}_\sharp^{\{\underline{k}\}} = \underline{\tau}_\sharp^{\{\underline{k}\}}$). □

4.2.1.9. We define a sheaf of $\mathcal{P}_{X^\sharp/S^\sharp(m)}$-algebras by setting $\widetilde{\mathcal{P}}_{X^\sharp/S^\sharp(m)} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}_{X^\sharp/S^\sharp(m)}$.
We have the following $\mathcal{B}_X$-m-PD isomorphism

$$\begin{aligned} \mathcal{B}_X\langle T_1,\ldots,T_r\rangle_{(m)} &\xrightarrow{\sim} \widetilde{\mathcal{P}}_{X^\sharp/S^\sharp,(m)} \\ T_\lambda &\mapsto \tau_{\sharp\lambda}, \end{aligned} \tag{4.2.1.9.1}$$

where the structure of $\mathcal{B}_X$-module of $\widetilde{\mathcal{P}}_{X^\sharp/S^\sharp,(m),\gamma}$ is given by the left structure or the right one.

Proposition 4.2.1.10. *Suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(b_\lambda)_{\lambda=1,\ldots,d}$. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. The following conditions are equivalent:*

(a) For any section e of $\mathcal{E}$, locally there exists an integer N such that $\underline{\partial}_\sharp^{\langle \underline{k}\rangle}(x) = 0$ for any $|\underline{k}| \geq N$.

(b) The condition (a) holds for any local system of logarithmic coordinates on any open of X.

(c) There exists an isomorphism

$$\varepsilon\colon \widetilde{\mathcal{P}}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}_{X^\sharp/S^\sharp(m)},$$

satisfying the cocycle condition, and inducing by extension via the epimorphisms $\widetilde{\mathcal{P}}_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ *the m-PD-stratification of* $\mathcal{E}$*.*

Proof. By using the Taylor formula 4.2.1.5.4 and its inverse 4.2.1.5.5 (use the formula 3.4.1.2.2 to check the can be extended to an inverse of ε) and the description of 4.2.1.9.1, we can follow the proof of [Ber96c, 2.3.7]. □

Definition 4.2.1.11. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. We say that $\mathcal{E}$ is "quasi-nilpotent" is locally on $\mathfrak{X}$ the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\mathcal{E}$ satisfies the conditions of the proposition 4.2.1.10. If moreover we can choose such an integer N for any local section e of $\mathcal{E}$, we say that $\mathcal{E}$ is "nilpotent".

4.2.2 PD-costratifications of level m with coefficients

We define m-PD-*costratifications relatively to* $X^\sharp/S^\sharp$ *with coefficients in* $\mathcal{B}_X$ as follows.

Definition 4.2.2.1. An m-PD-*costratification relatively to* $X^\sharp/S^\sharp$ *with coefficients in* $\mathcal{B}_X$ on a $\mathcal{B}_X$-module $\mathcal{M}$ is the data of a family of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}$-linear homomorphisms

$$\varepsilon_n\colon \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}, \mathcal{M}) \to \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}, \mathcal{M}),$$

this ones satisfying the following conditions :

(a) $\varepsilon_0 = \mathrm{id}_{\mathcal{M}}$ and for any $n' \geq n$ in $\mathbb{N}$, ε_n and $\widetilde{\psi}^{n',n\flat}_{X/S,(m)}(\varepsilon_{n'})$ are canonically isomorphic, i.e. the following diagram

$$\begin{array}{ccc} \widetilde{\psi}^{n',n\flat}_{X^\sharp/S^\sharp,(m)}(p^{n'\flat}_{0,(m)}(\mathcal{M})) & \xrightarrow{\widetilde{\psi}^{n',n\flat}_{X^\sharp/S^\sharp,(m)}(\varepsilon_{n'})} & \widetilde{\psi}^{n',n\flat}_{X^\sharp/S^\sharp,(m)}(p^{n'\flat}_{1,(m)}(\mathcal{M})) \\ \downarrow\wr & & \downarrow\wr \\ \widetilde{p}^{n\flat}_{0,(m)}(\mathcal{M}) & \xrightarrow{\varepsilon_n} & \widetilde{p}^{n\flat}_{1,(m)}(\mathcal{M}) \end{array} \quad (4.2.2.1.1)$$

whose vertical isomorphisms are the canonical ones, is commutative ;

(b) For any n, n', with notation 2.1.2.1 the diagram

$$\begin{array}{ccc} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^{n,n'}_{0*}(\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}), \mathcal{M}) & \xrightarrow{\widetilde{\delta}^{n,n'\flat}_{(m)}(\varepsilon_{n+n'})} & \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^{n,n'}_{2*}(\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}), \mathcal{M}) \\ & \searrow^{\tilde{q}^{n,n'\flat}_0(\varepsilon_{n+n'})} \quad \nearrow_{\tilde{q}^{n,n'\flat}_1(\varepsilon_{n+n'})} & \\ & \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^{n,n'}_{1*}(\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)}), \mathcal{M}) & \end{array}$$

(4.2.2.1.2)

is commutative.

Say a $\mathcal{B}_X$-linear homomorphism $\varphi\colon \mathcal{E} \to \mathcal{F}$ between $\mathcal{B}_X$-modules equipped with m-PD costratifications relatively to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$ is *horizontal* if it commutes with all ε_n.

4.2.2.2. With notation 3.2.2.12 (with some tildes), similarly to 2.1.1.2, we check that the above condition 4.2.2.1.2 is equivalent to

$$\forall\, n, \qquad \tilde{q}^{n\flat}_{02,(m)}(\varepsilon_n) = \tilde{q}^{n\flat}_{01,(m)}(\varepsilon_n) \circ \tilde{q}^{n\flat}_{12,(m)}(\varepsilon_n). \quad (4.2.2.2.1)$$

Proposition 4.2.2.3. *Let* $\mathcal{M}$ *be a* $\mathcal{B}_X$*-module together with an m-PD costratification* $(\varepsilon^{\mathcal{M}}_n)$ *relative to* $X^\sharp/S^\sharp$ *with coefficient in* $\mathcal{B}_X$*. Then the homomorphisms* $\varepsilon^{\mathcal{M}}_n$ *are* $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}$*-linear isomorphisms.*

Proof. Copy the proof of 2.1.1.3. ☐

Notation 4.2.2.4. Let $\mathcal{M}$ be a $\mathcal{B}_X$-module. Since $p_{i*}\mathcal{P}^n_{X,(m)}$ is locally free as $\mathcal{B}_X$-modules, then the canonical homomorphism

$$\iota_n^{\mathcal{M}} \colon \mathcal{M}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X,n} = \mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)},\mathcal{B}_X) \to \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)},\mathcal{M}) = \widetilde{p}^{n\flat}_{0,(m)}(\mathcal{M}) \tag{4.2.2.4.1}$$

given by $x\otimes P\mapsto(\tau\mapsto xP(\tau))$ is an isomorphism. Similarly, we have the canonical isomorphism

$$\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)},\mathcal{B}_X)\otimes_{\mathcal{B}_X}\mathcal{M} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)},\mathcal{M}) = \widetilde{p}^{n\flat}_{1,(m)}(\mathcal{M}). \tag{4.2.2.4.2}$$

Proposition 4.2.2.5. *For any $\mathcal{B}_X$-module $\mathcal{M}$, there is an equivalence between the following data :*

(a) A structure of right $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{M}$ extending its structure of $\mathcal{B}_X$-module ;

(b) An m-PD-costratification $(\varepsilon_n^{\mathcal{M}})$ with coefficients in $\mathcal{B}_X$ on $\mathcal{M}$;

A $\mathcal{B}_X$-linear homomorphism between two right $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules is $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear if and only if it is horizontal.

Proof. Copy the proof of 2.1.2.8. ☐

Lemma 4.2.2.6. *Let $\mathcal{M}$ be a right $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. Let $(\varepsilon_n^{\mathcal{M}})$ be the m-PD-costratification with coefficients in $\mathcal{B}_X$ associated with $\mathcal{M}$.*

(a) With notation 4.2.2.4.1, the action of $P\in\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ on $x\in\mathcal{M}$ is given from the costratification by the formula

$$xP = \mathrm{ev}_1\circ\epsilon_n\circ\iota_n^{\mathcal{M}}(x\otimes P). \tag{4.2.2.6.1}$$

(b) Suppose $u_1,\dots,u_d$ are logarithmic coordinates of $X^\sharp/S^\sharp$. Let $\{\underline{\partial}_\sharp^{\star\langle\underline{h}\rangle},|\underline{h}|\le n\}$ be the dual basis of $\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)},\mathcal{B}_X)$ of the basis $\{\underline{\tau}_\sharp^{\{\underline{h}\}},|\underline{h}|\le n\}$ of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$. Conversely, via the identification 4.2.2.4.1 and 4.2.2.4.2, the costratification ε_n of $\mathcal{M}$ satisfies the following formula for any $x\in\mathcal{M}$ and any $\underline{k}\in\mathbb{N}^d$:

$$\varepsilon_n^{\mathcal{M}}(x\otimes\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}) = \sum_{\underline{h}\le\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\underline{\partial}_\sharp^{\star\langle\underline{h}\rangle}\otimes x\underline{\partial}_\sharp^{\langle\underline{k}-\underline{h}\rangle}, \tag{4.2.2.6.2}$$

We have the following formula for the inverse

$$(\varepsilon_n^{\mathcal{M}})^{-1}(\underline{\partial}^{\star\langle\underline{k}\rangle}\otimes x) = \sum_{\underline{h}\le\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}x\widetilde{\underline{\partial}}_\sharp^{\langle\underline{k}-\underline{h}\rangle}\otimes\underline{\partial}_\sharp^{\langle\underline{h}\rangle}. \tag{4.2.2.6.3}$$

Proof. Copy the proof of 2.1.2.9 and 3.4.5.3.2. ☐

Remark 4.2.2.7. Let $\mathcal{M}$ be a $\mathcal{B}_X$-module endowed with a family (as n varies) of $\mathcal{P}^n_{X,(m)}$-linear isomorphisms

$$\varepsilon_n\colon \widetilde{p}^{n\flat}_{0,(m)}(\mathcal{M})\to\widetilde{p}^{n\flat}_{1,(m)}(\mathcal{M}),$$

satisfying the condition (a) of 4.2.2.1. We remark that the cocycle condition is local. Let us give a local description of this condition. Suppose $X^\sharp\to S^\sharp$ is endowed with logarithmic coordinates $(b_\lambda)_{\lambda=1,\dots,d}$. For any x of $\mathcal{M}$, for any $\underline{k}\in\mathbb{N}^d$, for any $n\ge|\underline{k}|$, we set

$$x\cdot\underline{\partial}^{\langle\underline{k}\rangle} := \mathrm{ev}_1\circ\varepsilon_n(x\otimes\underline{\partial}^{\langle\underline{k}\rangle}). \tag{4.2.2.7.1}$$

First remark that these elements do not depend on the choice of n which justifies the notation. Moreover, the cocycle condition is equivalent to the condition that the formula

$$\sum_{\underline{k}=\sup\{\underline{i},\underline{j}\}}^{\underline{i}+\underline{j}}\frac{\underline{k}!}{(\underline{i}+\underline{j}-\underline{k})!(\underline{k}-\underline{i})!(\underline{k}-\underline{j})!}\frac{q_{\underline{i}}^{(m)}!q_{\underline{j}}^{(m)}!}{q_{\underline{k}}^{(m)}!}x\cdot\underline{\partial}^{\langle\underline{k}\rangle} = (x\cdot\underline{\partial}^{\langle\underline{i}\rangle})\cdot\underline{\partial}^{\langle\underline{j}\rangle} \tag{4.2.2.7.2}$$

holds for any section x of $\mathcal{E}$, for any $\underline{i}, \underline{j} \in \mathbb{N}^d$. Indeed, as for the proof of 2.1.2.8 the family (ε_n) is equivalent to the family of $\mathcal{B}_X$-linear homomorphisms of the form $\mu_n^{\mathcal{M}} \colon \widetilde{p}_{1*}(\mathcal{M} \otimes_{\mathcal{B}_X} \mathcal{D}^{(m)}_{X,n}) \to \mathcal{M}$ such that $\mu_0^{\mathcal{M}} = \mathrm{id}_{\mathcal{M}}$ and the analogue (i.e. replace $\mathcal{O}_X$ by $\mathcal{B}_X$ and add some tildes) of the left square of 2.1.2.8.4 is commutative. Moreover, we have checked the cocycle condition is equivalent to the commutativity of the analogue (i.e. replace $\mathcal{O}_X$ by $\mathcal{B}_X$ and add some tildes) of the right square of 2.1.2.8.4, i.e. of the associativity of the definition 4.2.2.7.1 (recall by construction, $x \cdot \underline{\partial}^{\langle \underline{k} \rangle} := \mu_n(x \otimes \underline{\partial}^{\langle \underline{k} \rangle})$. By $\mathcal{B}_X$-linearity of $\mu_n^{\mathcal{M}}$, we reduce to the case where the operators are of the form $\underline{\partial}^{\langle \underline{i} \rangle}$ and we are done thanks to the formula 3.2.3.13.1

4.2.3 Internal tensor products and internal homomorphisms

Proposition 4.2.3.1. *Let $\mathcal{E}$ and $\mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.*

(a) There exists on the tensor product $\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}$ a unique structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module functorial in $\mathcal{E}$ and $\mathcal{F}$ such that, for any system of logarithmic coordinates on an open subset $U \subset X$, and any $\underline{k} \in \mathbb{N}^d$, $x \in \Gamma(U, \mathcal{E})$, $y \in \Gamma(U, \mathcal{F})$, we have

$$\underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x \otimes y) = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{i} \rangle} x \otimes \underline{\partial}_\sharp^{\langle \underline{k} - \underline{i} \rangle} y. \tag{4.2.3.1.1}$$

Moreover, the following formula holds

$$\underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} \rangle}(x \otimes y) = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_\sharp^{\langle \underline{i} \rangle} x \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} - \underline{i} \rangle} y. \tag{4.2.3.1.2}$$

(b) There exists on the sheaf $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F})$ a unique structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module functorial in $\mathcal{E}$ and $\mathcal{F}$ such that, for any system of logarithmic coordinates on a open subset $U \subset X$, and any $\underline{k} \in \mathbb{N}^d$, $x \in \Gamma(U, \mathcal{E})$, $\phi \colon \mathcal{E}_{|U} \to \mathcal{F}_{|U}$, we have

$$(\underline{\partial}_\sharp^{\langle \underline{k} \rangle} \phi)(x) = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k} - \underline{i} \rangle}(\phi(\underline{\widetilde{\partial}}_\sharp^{\langle \underline{i} \rangle} x)), \tag{4.2.3.1.3}$$

Moreover, the following formula holds

$$(\underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} \rangle} \phi)(x) = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} - \underline{i} \rangle}(\phi(\underline{\partial}_\sharp^{\langle \underline{i} \rangle} x)). \tag{4.2.3.1.4}$$

(c) Let $\mathcal{D}$ be a sheaf of rings on X. Suppose that the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{E}$ or $\mathcal{F}$ extends to a structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \mathcal{D})$-bimodule. Then the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}$ extends to a structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \mathcal{D})$-bimodule where the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module is the tensor product structure . In the same way, the sheaf $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F})$ is endowed with a canonical structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \mathcal{D})$-bimodule where the left structure is the internal homomorphism structure.

Proof. (a) The proof of (a) is similar to that of 2.1.3.1.(a): modulo the canonical isomorphisms of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$-modules

$$\widetilde{p}^n_{i,(m)*} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} (\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}) \xrightarrow{\sim} (\widetilde{p}^n_{i,(m)*} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{E}) \otimes_{\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}} (\widetilde{p}^n_{i,(m)*} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{F}), \tag{4.2.3.1.5}$$

we endow the sheaf $\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}$ with the m-PD stratification with coefficients in $\mathcal{B}_X$ by setting

$$\epsilon_n^{\mathcal{E} \otimes \mathcal{F}} := \varepsilon_n^{\mathcal{E}} \otimes \varepsilon_n^{\mathcal{F}} \colon \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} (\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}) \xrightarrow{\sim} (\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}) \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}.$$

By using the formulas 4.2.1.5.4, we get 4.2.3.1.1 similarly to 2.1.3.1.(a). By replacing the use of the formula 4.2.1.5.4 by that of 4.2.1.5.5, instead of 4.2.3.1.1 similarly to 3.4.2.7.2, we get the formula 4.2.3.1.2 by symmetrical computations.

(b) Similarly to 2.1.4.1.a, modulo the canonical isomorphisms of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$-modules

$$\widetilde{p}^n_{i,(m)*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F}) \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}}(\widetilde{p}^n_{i,(m)*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{B}_X}\mathcal{E}, \widetilde{p}^n_{i,(m)*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{B}_X}\mathcal{F}),$$

we endow $\mathcal{G} := \mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})$ with a m-PD-structure with coefficients in $\mathcal{B}_X$ by setting

$$\epsilon^{\mathcal{G}}_n = \mathcal{H}om_{\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}}((\epsilon^{\mathcal{E}}_n)^{-1}, \epsilon^{\mathcal{F}}_n).$$

By copying (resp. doing symmetrical computations of that of) the proof of 2.1.4.1.a, we check then the formula 4.2.3.1.3 (resp. 4.2.3.1.4) by using 4.2.1.5.4 and 4.2.1.5.5 (resp. and the equality $(\epsilon^{\mathcal{G}}_n)^{-1} = \mathcal{H}om_{\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}}(\epsilon^{\mathcal{E}}_n, (\epsilon^{\mathcal{F}}_n)^{-1})$).

The functoriality in $\mathcal{E}$ and $\mathcal{F}$ of these structures of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules is a consequence for instance of formula 4.2.3.1.1 and 4.2.3.1.3. It follows from this functoriality that the part (c) is exact (we can also prove it directly via the formula 4.2.3.1.1 and 4.2.3.1.3). □

Remark 4.2.3.2. When the log structure of $X^\sharp$ and $S^\sharp$ are trivial, then replacing logarithmic coordinates by coordinates, the formulas of Propositions 2.1.4.1 and 2.1.3.1 still holds with coefficients. Indeed, we can either check it similarly or deduce them from 3.4.1.3.1.

Remark 4.2.3.3. Let $f\colon X^\sharp \to Y^\sharp$ be a morphism of fine log smooth $S^\sharp$-schemes (resp. fine log smooth formal $S^\sharp$-schemes). Similarly to 4.2.1.1, we define on a $f^{-1}\mathcal{B}_Y$-module $\mathcal{E}$ an m-PD-stratification as being the data of a compatible family of $f^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp(m)}$-linear isomorphisms

$$\epsilon^{\mathcal{E}}_n\colon f^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp(m)} \otimes_{f^{-1}\mathcal{B}_Y} \mathcal{E} \xrightarrow{\sim} \mathcal{E} \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp(m)}$$

satisfying two similar to 4.2.1.1 conditions. As for 4.2.1.5, if $\mathcal{E}$ is a $f^{-1}\mathcal{B}_Y$-module, then there is an equivalence between the data of a structure of left $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp}$-module extending its structure of $f^{-1}\mathcal{B}_Y$-module and the data of an m-PD-stratification. Moreover, if $\mathcal{E}$ and $\mathcal{F}$ are two left $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp}$-modules, we endow the tensor product $\mathcal{E} \otimes_{f^{-1}\mathcal{B}_Y} \mathcal{F}$ (resp. $\mathcal{H}om_{f^{-1}\mathcal{B}_Y}(\mathcal{E},\mathcal{F})$) with a structure of left $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp}$-module taking the stratification $\epsilon^{\mathcal{E}}_n \otimes_{f^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp(m)}} \epsilon^{\mathcal{F}}_n$ (resp. $\mathcal{H}om_{f^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp(m)}}((\epsilon^{\mathcal{E}}_n)^{-1}, \epsilon^{\mathcal{F}}_n)$).

Remark 4.2.3.4. The structures of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules defined in the corollary above, does not depend of the choice of the level. Let us clarify what it means. Let $m' \leq m$ be a couple of nonnegative integers and let us denote by then $\mathrm{forg}_{m',m}$ the forgetful functor from the category of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules to that of $\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp}$-modules. If $\mathcal{E}$ and $\mathcal{F}$ are two $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules, then we have the equalities

$$\mathrm{forg}_{m',m}(\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}) = \mathrm{forg}_{m',m}(\mathcal{E}) \otimes_{\mathcal{B}_X} \mathrm{forg}_{m',m}(\mathcal{F}),$$
$$\mathrm{forg}_{m',m}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F}) = \mathcal{H}om_{\mathcal{B}_X}(\mathrm{forg}_{m',m}\mathcal{E}, \mathrm{forg}_{m',m}\mathcal{F}).$$

Indeed, this is a consequence of formula 4.2.3.1.1 and 4.2.3.1.3, as well as of the relation 1.4.2.5.2.

Proposition 4.2.3.5. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{M}$, $\mathcal{N}$ be two right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.*

(a) There exists on $\mathcal{M} \otimes_{\mathcal{B}_X} \mathcal{E}$ (resp. $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{M})$) a unique structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module which is functorial in $\mathcal{M}$ and $\mathcal{E}$ such that, for any system of logarithmic coordinates we have open $U \subset X$, and any $\underline{k} \in \mathbb{N}^d$, $x \in \Gamma(U,\mathcal{E})$, $y \in \Gamma(U,\mathcal{M})$ (resp. $\phi\colon \mathcal{E}_{|U} \to \mathcal{M}_{|U}$), we have

$$(y \otimes x)\underline{\partial}_\sharp^{\langle \underline{k}\rangle} = \sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} y\underline{\partial}_\sharp^{\langle \underline{k}-\underline{h}\rangle} \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{h}\rangle} x, \tag{4.2.3.5.1}$$

$$(\phi\underline{\partial}_\sharp^{\langle \underline{k}\rangle})(x) = \sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \phi(\underline{\partial}_\sharp^{\langle \underline{h}\rangle} x)\underline{\partial}_\sharp^{\langle \underline{k}-\underline{h}\rangle}. \tag{4.2.3.5.2}$$

Moreover, the following formulas hold

$$(y \otimes x)\widetilde{\underline{\partial}}_\sharp^{\langle \underline{k}\rangle} = \sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} y\widetilde{\underline{\partial}}_\sharp^{\langle \underline{k}-\underline{h}\rangle} \otimes \underline{\partial}_\sharp^{\langle \underline{h}\rangle} x, \tag{4.2.3.5.3}$$

$$(\phi\widetilde{\underline{\partial}}_\sharp^{\langle \underline{k}\rangle})(x) = \sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \phi(\widetilde{\underline{\partial}}_\sharp^{\langle \underline{h}\rangle} x)\widetilde{\underline{\partial}}_\sharp^{\langle \underline{k}-\underline{h}\rangle}. \tag{4.2.3.5.4}$$

(b) *There exists on* $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{N},\mathcal{M})$ *a unique structure of left* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module functorial in* $\mathcal{N}$ *and* $\mathcal{M}$ *such that, for any system of logarithmic coordinates we have open* $U\subset X$*, and any* $\underline{k}\in\mathbb{N}^d$*,* $z\in\Gamma(U,\mathcal{N})$*,* $\psi\colon\mathcal{N}_{|U}\to\mathcal{M}_{|U}$*, we have*

$$(\underline{\partial}_\sharp^{\langle \underline{k}\rangle}\psi)(z)=\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\psi(z\underline{\partial}_\sharp^{\langle \underline{h}\rangle})\underline{\widetilde{\partial}}_\sharp^{\langle \underline{k}-\underline{h}\rangle}. \tag{4.2.3.5.5}$$

Moreover, the following formula holds

$$(\underline{\widetilde{\partial}}_\sharp^{\langle \underline{k}\rangle}\psi)(z)=\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\psi(z\underline{\widetilde{\partial}}_\sharp^{\langle \underline{h}\rangle})\underline{\partial}_\sharp^{\langle \underline{k}-\underline{h}\rangle}. \tag{4.2.3.5.6}$$

(c) *Let* $\mathcal{D}$ *be a sheaf of rings on* X*. If the structure of right (resp. left)* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module of* $\mathcal{M}$ *(resp.* $\mathcal{E}$*) extends to a structure of* $(\mathcal{D},\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$*-bimodule (resp.* $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp},\mathcal{D})$*-bimodule), then the structure of right* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module of* $\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E}$ *extends to a structure of (resp. right)* $(\mathcal{D},\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$*-bimodule and that of* $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{M})$ *extends to a structure of* $(\mathcal{D},\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp},\mathcal{D})$*-bimodule.*

If the structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module of* $\mathcal{N}$ *(resp.* $\mathcal{M}$*) extends to a structure of* $(\mathcal{D},\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$*-bimodule, then the structure of left* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module of* $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{N},\mathcal{M})$ *extends to a structure of (resp. left)* $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp},\mathcal{D})$*-bimodule.*

In the same way, these structures of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module do not depend on the level* m*.*

Proof. By copying the proof of 2.1.3.1 and 2.1.4.1, we get the formulas 4.2.3.5.1, 4.2.3.5.2 and 4.2.3.5.5 from by using 4.2.1.5.4 and 4.2.1.5.5. By doing some symmetrical computations (more precisely see the part (a) of the proof of 4.2.3.1), we get the symmetrical formulas 4.2.3.1.4 and 4.2.3.1.2. □

4.2.3.6. Let $\mathcal{E},\mathcal{F}$ be two quasi-nilpotent left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules, $\mathcal{M}$, $\mathcal{N}$ be two quasi-nilpotent right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. Then $\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F}$ (resp. $\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E}$, resp. $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})$, resp. $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{M})$, resp. $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{N})$) is a quasi-nilpotent left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Indeed, this is easily checked by using the local formulas of 4.2.3.1 and 4.2.3.5.

Remark 4.2.3.7. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{M}$ a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule. To avoid the risks of confusions, we will keep the following convention : the tensor product structure of $\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{M}$ comes from the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{M}$ whereas that of $\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E}$ can be computed via the structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{M}$.

Remark 4.2.3.8. Let $\mathcal{C}_X$ (resp. $\mathcal{C}'_X$) be a $\mathcal{B}_X$-algebra commutative endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module such that $\mathcal{B}_X\to\mathcal{C}_X$ (resp. $\mathcal{B}_X\to\mathcal{C}'_X$) is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. The tensor product structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on the $\mathcal{B}_X$-algebra $\mathcal{C}_X\otimes_{\mathcal{B}_X}\mathcal{C}'_X$ is compatible. We have moreover the morphisms of algebras $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear $\mathcal{C}_X\to\mathcal{C}_X\otimes_{\mathcal{B}_X}\mathcal{C}'_X$ and $\mathcal{C}'_X\to\mathcal{C}_X\otimes_{\mathcal{B}_X}\mathcal{C}'_X$.

Proposition 4.2.3.9. *Let* $\mathcal{E}$ *and* $\mathcal{G}$ *be two left* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-modules and* $\mathcal{F}$ *be a right or left* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module. The following canonical isomorphisms*

$$\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{G}\xrightarrow{\sim}\mathcal{G}\otimes_{\mathcal{B}_X}\mathcal{E},\ \mathcal{E}\otimes_{\mathcal{B}_X}(\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G})\xrightarrow{\sim}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}. \tag{4.2.3.9.1}$$

are $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-linear.*

Proof. This is a consequence of the formulas 4.2.3.5.1 and 4.2.3.1.1. □

4.2.4 Cartan isomorphisms and other relations between tensor products and homomorphisms

Proposition 4.2.4.1. *Let $\mathcal{E}$, $\mathcal{F}$, $\mathcal{G}$ be three left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and $\mathcal{M},\mathcal{N}$ be two right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. The following canonical isomorphisms are $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear :*

$$(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}\xrightarrow{\sim}\mathcal{E}\otimes_{\mathcal{B}_X}(\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G}),\tag{4.2.4.1.1}$$

$$(\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}\xrightarrow{\sim}\mathcal{M}\otimes_{\mathcal{B}_X}(\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G}),\ \mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F}\xrightarrow{\sim}\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{E}.\tag{4.2.4.1.2}$$

Proof. We prove that these isomorphisms are horizontal which is straightforward by definition. □

Notation 4.2.4.2. Let $\mathcal{E},\mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.

(a) Let $\mathcal{K}$ be a (resp. left, resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule. In both respective cases, usually, one $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structure of $\mathcal{K}$ is called the "left structure" and the other one is called the "right one". In the non-respective case, the left (resp. right) structure is the structure of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.

By convention, when we write $\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{K}$ (resp. $\mathcal{K}\otimes_{\mathcal{B}_X}\mathcal{E}$), we use the left (resp. right) structure of $\mathcal{K}$ to compute the tensor product.

Moreover, $\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{K}$ is endowed with a structure of (resp. left, resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule as follow: the "left structure" is by convention the structure given by tensor product (in the sense of 4.2.3.5) from the left structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{K}$ and from the structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{E}$, the other one given by functoriality from the (resp. left, resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule structure of $\mathcal{K}$ is called the " right structure".

Similarly, $\mathcal{K}\otimes_{\mathcal{B}_X}\mathcal{E}$ is endowed with a structure of (resp. left, resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule: the left structure is given by functoriality and the right one is given by the tensor product.

Similarly, in the case where $\mathcal{K}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule, $\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{K}$ (resp. $\mathcal{K}\otimes_{\mathcal{B}_X}\mathcal{M}$) is endowed with a structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule: the right (resp. left) structure is given by functoriality and the left (resp. right) one is given by the tensor product.

(b) Let $\mathcal{K}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule. To distinguish which structure is used, we write

$$(\mathcal{K})_r\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E},\qquad(\mathcal{K})_l\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}\tag{4.2.4.2.1}$$

where the symbole r (resp. l) means that the right (resp. left) structure is taken to compute the tensor product. We keep the same notation in similar situation when a choice is needed in the computation of tensor products. Remark that by bifunctoriality we have the canonical isomorphism:

$$((\mathcal{K})_r\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{F}\xrightarrow{\sim}((\mathcal{K})_l\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{F})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}.\tag{4.2.4.2.2}$$

Proposition 4.2.4.3 (Associativity of the tensor product)**.** *Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{N}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule, $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. With notation 4.2.4.2, the canonical bijections*

$$(\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{N})_r\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}\xrightarrow{\sim}\mathcal{M}\otimes_{\mathcal{B}_X}(\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}),\tag{4.2.4.3.1}$$

$$\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{N}\otimes_{\mathcal{B}_X}\mathcal{E})\xrightarrow{\sim}(\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{N})\otimes_{\mathcal{B}_X}\mathcal{E}.\tag{4.2.4.3.2}$$

given by associativity of the tensor product are isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.

Similarly, when $\mathcal{E}$ and $\mathcal{M}$ are two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules, $\mathcal{N}$ is a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule (resp. right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule), then 4.2.4.3.1 is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear. Similarly, when $\mathcal{M}$ right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{N}$ is a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule, and $\mathcal{E}$ is a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module then 4.2.4.3.2 is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. 1) Let us prove the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity of the map 4.2.4.3.1. Since the other cases can be checked similarly, we can only check the first case. a) By associativity of the tensor product, we have the canonical isomorphisms of $\mathcal{B}_X$-modules

$$\theta\colon (\mathcal{M}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}\xrightarrow{\sim}\mathcal{M}\otimes_{\mathcal{B}_X}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E})\xrightarrow{\sim}\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E} \tag{4.2.4.3.3}$$

given by $(x\otimes P)\otimes y\mapsto x\otimes Py$ where x, y, P are local sections of respectively $\mathcal{M}$, $\mathcal{E}$, $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. Let us check θ is right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear. Since this is local, we can suppose $X^\sharp/S^\sharp$ has logarithmic coordinates. By additivity, we reduce to check $\theta(((x\otimes 1)\otimes y)\cdot\underline{\partial}_\sharp^{\langle\underline{k}\rangle})=(x\otimes y)\cdot\underline{\partial}_\sharp^{\langle\underline{k}\rangle}$. We compute

$$((x\otimes 1)\otimes y)\cdot\underline{\partial}_\sharp^{\langle\underline{k}\rangle}=\Big((x\otimes 1)\cdot_l\underline{\partial}_\sharp^{\langle\underline{k}\rangle}\Big)\otimes y\overset{4.2.3.5.1}{=}\left(\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}x\underline{\partial}_\sharp^{\langle\underline{k}-\underline{h}\rangle}\otimes\underline{\widetilde{\partial}}_\sharp^{\langle\underline{h}\rangle}\right)\otimes y$$

where $\cdot_l$ means that we take the left structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of the right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule $\mathcal{M}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. This yields

$$\theta(((x\otimes 1)\otimes y)\cdot\underline{\partial}_\sharp^{\langle\underline{k}\rangle})=\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}x\underline{\partial}_\sharp^{\langle\underline{k}-\underline{h}\rangle}\otimes\underline{\widetilde{\partial}}_\sharp^{\langle\underline{h}\rangle}y\overset{4.2.3.5.1}{=}(x\otimes y)\cdot\underline{\partial}_\sharp^{\langle\underline{k}\rangle}.$$

b) Replacing $\mathcal{E}$ by $\mathcal{N}$ in 4.2.4.3.3, we get by functoriality that the canonical map

$$(\mathcal{M}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{N}\xrightarrow{\sim}\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{N} \tag{4.2.4.3.4}$$

is an isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodules. Replacing $\mathcal{E}$ by $\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}$ in 4.2.4.3.3, we get the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear isomorphism

$$(\mathcal{M}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E})\xrightarrow{\sim}\mathcal{M}\otimes_{\mathcal{B}_X}(\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}). \tag{4.2.4.3.5}$$

This yields the general case via the isomorphisms:

$$(\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{N})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}\underset{4.2.4.3.4}{\xleftarrow{\sim}}(\mathcal{M}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}\underset{4.2.4.3.5}{\xrightarrow{\sim}}\mathcal{M}\otimes_{\mathcal{B}_X}(\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}).$$

2) We proceed similarly to check the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity of 4.2.4.3.2. □

Proposition 4.2.4.4. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{F}$ be a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Let $\mathcal{M}$, $\mathcal{N}$ be two right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. The canonical isomorphism*

$$\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})\xrightarrow{\sim}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F}),\qquad \mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{N})\xrightarrow{\sim}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{M}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp},\mathcal{N}),$$

are $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. Let us denote by θ the first isomorphism of 4.2.4.4. Let us consider the non-respective case. By construction, this isomorphism is $\mathcal{B}_X$-linear. Hence, it is sufficient to prove that for any $\underline{k}\in\mathbb{N}^d$, for any sections e of $\mathcal{E}$, P of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ we have

$$\theta(\underline{\partial}_\sharp^{\langle\underline{k}\rangle}\cdot\phi)(P\otimes e)=(\underline{\partial}_\sharp^{\langle\underline{k}\rangle}\cdot\theta(\phi))(P\otimes e).$$

We compute

$$\theta(\underline{\partial}_\sharp^{\langle\underline{k}\rangle}\cdot\phi)(P\otimes e)=P\cdot\Big((\underline{\partial}_\sharp^{\langle\underline{k}\rangle}\cdot\phi)(e)\Big)\overset{4.2.3.1.3}{=}P\cdot\sum_{\underline{i}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{i}\end{smallmatrix}\right\}\underline{\partial}_\sharp^{\langle\underline{k}-\underline{i}\rangle}(\phi(\underline{\widetilde{\partial}}_\sharp^{\langle\underline{i}\rangle}e)), \tag{4.2.4.4.1}$$

Since $(P\otimes e)\underline{\partial}_\sharp^{\langle k\rangle} \overset{4.2.3.5.1}{=} \sum_{\underline{i}\leq\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} P\underline{\partial}_\sharp^{\langle \underline{k}-\underline{i}\rangle} \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{i}\rangle} e$, then we get

$$(\underline{\partial}_\sharp^{\langle \underline{k}\rangle} \cdot \theta(\phi))(P\otimes e) = \sum_{\underline{i}\leq\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} P\underline{\partial}_\sharp^{\langle \underline{k}-\underline{i}\rangle} \cdot (\phi(\underline{\widetilde{\partial}}_\sharp^{\langle \underline{i}\rangle} e)).$$

Hence, we are done. The other and respective cases are checked similarly. □

Proposition 4.2.4.5. *Let $\mathcal{E}$, $\mathcal{F}$ and $\mathcal{G}$ be three left or right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.*

(a) We have the canonical isomorphism:

$$\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F},\,\mathcal{G}) \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\,\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\,\mathcal{G})). \tag{4.2.4.5.1}$$

(b) If the structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{E}$, $\mathcal{F}$ or $\mathcal{G}$ extends to a structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule or left bimodule, then the isomorphism 4.2.4.5.1 is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. The isomorphism 4.2.4.7.1 is equal to the composite $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear isomorphism:

$$\begin{aligned}
\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F},\mathcal{G}) &\overset{4.2.4.4}{\xrightarrow{\sim}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F}),\mathcal{G}) \\
&\overset{4.2.4.3}{\xrightarrow{\sim}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}((\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{F}),\mathcal{G}) \\
&\overset{4.6.3.9}{\xrightarrow{\sim}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{F},\mathcal{G})) \\
&\overset{4.2.4.4}{\xrightarrow{\sim}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\mathcal{G})) \overset{4.2.4.4}{\xrightarrow{\sim}} \mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\mathcal{G})).
\end{aligned}$$

□

Corollary 4.2.4.6. *Let $\mathcal{F}$ and $\mathcal{G}$ be two complex of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. If $\mathcal{F}$ is a K-flat as complex of $\mathcal{B}_X$-modules and that $\mathcal{G}$ is a K-injective object of $K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, then $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\mathcal{G})$ is a K-injective object of $K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.*

Proof. For any $\mathcal{E}\in K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, it follows from 4.2.4.5.1 that we have

$$\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F},\,\mathcal{G}) \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\,\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\,\mathcal{G}))\,.$$

If $\mathcal{E}$ is acyclic, then it follows from the hypotheses on $\mathcal{F}$ and $\mathcal{G}$ that the left term is also acyclic. Hence, we are done. □

Proposition 4.2.4.7 (Cartan isomorphism bis)**.** *Let $\mathcal{E}$, $\mathcal{F}$, $\mathcal{G}$ three left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. The Cartan isomorphism*

$$\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\mathcal{G})), \tag{4.2.4.7.1}$$

is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. When all modules are left modules, the isomorphism **??** is equal to the composite $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear isomorphism:

$$\begin{aligned}
\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F},\mathcal{G}) &\overset{4.2.4.3}{\xrightarrow{\sim}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{F}),\mathcal{G}) \\
&\overset{4.6.3.9}{\xrightarrow{\sim}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{F},\mathcal{G})) \overset{4.2.4.4}{\xrightarrow{\sim}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\mathcal{G})).
\end{aligned}$$

□

Proposition 4.2.4.8. *Let $\mathcal{E}$, $\mathcal{F}$, $\mathcal{G}$ be three left or right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules except the case where $\mathcal{E}$ is right module and $\mathcal{F}$ is a left module. The canonical morphism:*

$$\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}\to\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G}) \tag{4.2.4.8.1}$$

is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. When all modules are left modules, the morphism 4.2.4.8.1 is equal to the composite $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear morphism:

$$\begin{aligned}
&\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}\xrightarrow[\sim]{4.2.4.4}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}\\
&\xrightarrow[\sim]{4.2.4.3}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{G})\\
&\to\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{G}))\\
&\xrightarrow[\sim]{4.2.4.3}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G})\xrightarrow[\sim]{4.2.4.4}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G}).
\end{aligned}$$

The other cases are treated similarly. □

Proposition 4.2.4.9. *Let $\mathcal{E}$ and $\mathcal{G}$ be two left or right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and $\mathcal{F}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule. The canonical morphism*

$$\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}\to\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G}), \tag{4.2.4.9.1}$$

is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. Since the other cases are similar, we can suppose $\mathcal{E}$ and $\mathcal{G}$ are left modules. The inverse of the isomorphism 4.2.4.3.1 applied to $\mathcal{M}=\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F})$, $\mathcal{N}=\widetilde{\mathcal{D}}^{(m)}_X$ and $\mathcal{E}=\mathcal{G}$ is written

$$\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F})\otimes_{\mathcal{B}_X}\mathcal{G}\xrightarrow{\sim}\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F})\otimes_{\widetilde{\mathcal{D}}^{(m)}_X}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{G}).$$

Moreover, we have the canonical morphism

$$\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{G})\to\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_X\otimes_{\mathcal{B}_X}\mathcal{G})).$$

Finally, by using 4.2.4.3.1, we obtain:

$$\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{G}))\xrightarrow{\sim}\mathcal{H}om_{1\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{G}).$$

By composing these three morphisms, we obtain 4.2.4.9.1. □

Proposition 4.2.4.10. *Let $\mathcal{E}$ and $\mathcal{G}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules, $\mathcal{M}$ and $\mathcal{N}$ be two right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and $\mathcal{F}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule. The canonical morphism*

$$\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{G}\to\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{G}), \tag{4.2.4.10.1}$$

$$\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{F})\to\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{N}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{F}), \tag{4.2.4.10.2}$$

is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. The map 4.2.4.10.1 is built by composing the following morphisms:

$$\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{G}\xrightarrow[\sim]{4.2.4.4}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{G} \tag{4.2.4.10.3}$$

$$\to\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{G})\xrightarrow[\sim]{4.2.4.4}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{G}). \tag{4.2.4.10.4}$$

We proceed similarly for 4.2.4.10.2. □

Corollary 4.2.4.11. *Let $\mathcal{E}$, $\mathcal{F}$, $\mathcal{G}$ be three left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and $\mathcal{M},\mathcal{N}$ be two right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. The following canonical morphisms are $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear :*

$$\mathrm{ev}\colon \mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})\to\mathcal{F},\qquad \mathrm{ev}\colon \mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{N})\to\mathcal{N} \tag{4.2.4.11.1}$$

$$\mathcal{E}\to\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F},\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{E}),\qquad \mathcal{E}\to\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E}). \tag{4.2.4.11.2}$$

Proof. The first (resp. second) isomorphism of 4.2.4.11.1 corresponds via the Cartan isomorphism to the identity of $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{F})$ (resp. $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{N})$). Since the identity is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear then we conclude with 4.2.4.5.1. The first (resp. second) isomorphism of 4.2.4.11.2 correspond via the Cartan isomorphism to the identity of $\mathcal{F}\otimes_{\mathcal{B}_X}\mathcal{E}$ (resp. $\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E}$). Since the identity is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear then we conclude with 4.2.4.5.1. □

4.2.5 Logarithmic transposition isomorphisms

We will need the following proposition to get the isomorphism 18.2.3.2.2 which will allow us to prove 18.2.3.12.

Proposition 4.2.5.1. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{E}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}$ the sheaves obtained by computing the tensor product via respectively the left and right structure of $\mathcal{B}_X$-algebra of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. There exists a unique isomorphism of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodules*

$$\gamma_{\mathcal{E}}\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}\xrightarrow{\sim}\mathcal{E}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \tag{4.2.5.1.1}$$

such that for each section e of $\mathcal{E}$, $\gamma_{\mathcal{E}}(1\otimes e)=e\otimes 1$. In logarithmic coordinates, we have the following formulas

$$\gamma_{\mathcal{E}}(\underline{\partial}_\sharp^{\langle \underline{k}\rangle}\otimes e)=\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\underline{\partial}_\sharp^{\langle \underline{h}\rangle}e\otimes\underline{\partial}_\sharp^{\langle \underline{k}-\underline{h}\rangle},\qquad \gamma_{\mathcal{E}}^{-1}(e\otimes\underline{\partial}_\sharp^{\langle \underline{k}\rangle})=\sum_{\underline{h}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}e\underline{\partial}_\sharp^{\langle \underline{k}-\underline{h}\rangle}\otimes\underline{\widetilde{\partial}}_\sharp^{\langle \underline{h}\rangle}. \tag{4.2.5.1.2}$$

Proof. 1) The unicity of such a homomorphism $\gamma_{\mathcal{E}}$ follows from its linearity as left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. By left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity of $\gamma_{\mathcal{E}}$ (resp. by right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity of $\gamma_{\mathcal{E}}^{-1}$), the left (resp. right) formula of 4.2.5.1.2 is a consequence of 4.2.3.1.1 (resp. 4.2.3.5.1).

2) i) We construct the map as follows $\gamma_{\mathcal{E}}$: from the homomorphism of $\mathcal{B}_X$-modules $\mathcal{E}\to\mathcal{E}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ given by $x\mapsto x\otimes 1$ we get by extension the homomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules $\gamma_{\mathcal{E}}$. By construction, $\gamma_{\mathcal{E}}(P\otimes e)=P(e\otimes 1)$, where $P\in\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $e\in\mathcal{E}$.

ii) Let us check now the right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linearity of $\gamma_{\mathcal{E}}$. Since this is local, we can suppose $X^\sharp\to S^\sharp$ is endowed with logarithmic coordinates $u_1,\dots,u_r$ and keep notation 4.3.5.2. It is therefore sufficient to establish, for any $\underline{k}\in\mathbb{N}^r$,

$$\gamma_{\mathcal{E}}((1\otimes e)\underline{\widetilde{\partial}}_\sharp^{\langle \underline{k}\rangle})=(e\otimes 1)\underline{\widetilde{\partial}}_\sharp^{\langle \underline{k}\rangle}. \tag{4.2.5.1.3}$$

In regards to the right term of 4.2.5.1.3, we have $(e \otimes 1)\underline{\widetilde{\partial}}_{\sharp}^{\langle k \rangle} = e \otimes \underline{\widetilde{\partial}}_{\sharp}^{\langle k \rangle}$. As for the left term, we compute

$$\gamma_{\mathcal{E}}\left((1 \otimes e)\underline{\widetilde{\partial}}_{\sharp}^{\langle k \rangle}\right) \overset{4.2.3.5.3}{=} \gamma_{\mathcal{E}}\left(\sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_{\sharp}^{\langle h \rangle} \otimes \underline{\partial}_{\sharp}^{\langle k-h \rangle} e\right) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_{\sharp}^{\langle h \rangle} (\underline{\partial}_{\sharp}^{\langle k-h \rangle} e \otimes 1).$$

$$\overset{4.2.3.1.2}{=} \sum_{\underline{h} \leq \underline{k}} \sum_{\underline{i} \leq \underline{h}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{h} \\ \underline{i} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_{\sharp}^{\langle h-i \rangle} \underline{\partial}_{\sharp}^{\langle k-h \rangle} e \otimes \underline{\widetilde{\partial}}_{\sharp}^{\langle i \rangle}$$

$$= \sum_{\underline{i} \leq \underline{k}} \left(\sum_{\underline{i} \leq \underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{h} \\ \underline{i} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_{\sharp}^{\langle h-i \rangle} \underline{\partial}_{\sharp}^{\langle k-h \rangle} e \right) \otimes \underline{\widetilde{\partial}}_{\sharp}^{\langle i \rangle}.$$

To get the formula 4.2.5.1.3, it is therefore sufficient to establish the equality

$$\sum_{\underline{i} \leq \underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{h} \\ \underline{i} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_{\sharp}^{\langle h-i \rangle} \underline{\partial}_{\sharp}^{\langle k-h \rangle} = \delta_{\underline{i},\underline{k}}, \qquad (4.2.5.1.4)$$

where in the sum $\underline{i}$ and $\underline{k}$ are fixed and $\delta_{\underline{i},\underline{k}}$ is the Kronecker symbol. For this purpose, let us proceed as follows.

Suppose $\mathcal{E}$ is equal to $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ (to avoid confusion between the two $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$, it is still written $\mathcal{E}$). We have the commutative diagram:

$$\begin{array}{ccc} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E} & \hookrightarrow & j_*(\mathcal{D}^{(m)}_{Y} \otimes_{\mathcal{O}_Y} \mathcal{E}|Y) \\ {\scriptstyle \gamma_{\mathcal{E}}} \downarrow {\scriptstyle 4.2.5.1.1} & & {\scriptstyle j_*(\gamma_{\mathcal{E}|Y})} \downarrow \wr \\ \mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} & \hookrightarrow & j_*(\mathcal{E}|Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y}). \end{array} \qquad (4.2.5.1.5)$$

where $\gamma_{\mathcal{E}|Y}$ is the (non-logarithmic) transposition isomorphism of $\mathcal{E}|Y$ (see 2.2.2.1.1) and where horizontal morphisms are injective (this is an consequence of 3.1.1.3 and of the fact that $\mathcal{E}$ is free as $\mathcal{O}_X$-module). Indeed, horizontal morphisms are $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bilinear, vertical arrows are left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear and $1 \otimes e \mapsto e \otimes 1$ via both paths. Moreover, it follows from 2.2.2.1, that the morphism $j_*\gamma_{\mathcal{E}|Y}$ is right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Hence, $\gamma_{\mathcal{E}}$ is right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Since $\mathcal{E} = \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a free $\mathcal{O}_X$-module, then this implies that the desired formula 4.2.5.1.4 holds.

It remains to check that $\gamma_{\mathcal{E}}$ is an isomorphism. It is sufficient to construct similarly the unique morphism of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bimodules $\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}$ which sends, for each section e of $\mathcal{E}$, $e \otimes 1$ on $1 \otimes e$. □

Example 4.2.5.2. We have the commutative diagram whose oblique isomorphisms are the canonical ones:

$$\begin{array}{ccc} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{B}_X & \xrightarrow{\gamma_{\mathcal{B}_X}} & \mathcal{B}_X \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \\ \nwarrow \sim & & \sim \nearrow \\ & \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} & \end{array} \qquad (4.2.5.2.1)$$

4.2.5.3. For any $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, we have the isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X/S}$-bimodules

$$(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp}) \overset{\mathrm{l}}{\otimes}_{\mathcal{B}_X} \mathcal{E} \xrightarrow{\sim} \mathcal{E} \overset{\mathrm{r}}{\otimes}_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp}), \qquad (4.2.5.3.1)$$

where the symbole "l" or "r" means that we use respectively the left and right structure of left $\widetilde{\mathcal{D}}^{(m)}_{X/S}$ of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp}$ to compute the $\widetilde{\mathcal{D}}^{(m)}_{X/S}$ structure given by $- \otimes_{\mathcal{B}_X} -$. making commutative the following diagram commutative:

$$\begin{array}{ccc} (\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \otimes_{\mathcal{O}_X} \omega_X^{-1} & \xrightarrow[\sim]{} & \mathcal{E} \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \omega_X^{-1}) \\ \sim \uparrow {\scriptstyle \gamma_{\mathcal{E}} \otimes_{\mathcal{O}_X} \omega_X^{-1}} & & \vdots \uparrow \\ (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}) \otimes_{\mathcal{O}_X} \omega_X^{-1} & \xrightarrow[\sim]{} & (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \omega_X^{-1}) \otimes_{\mathcal{B}_X} \mathcal{E}. \end{array} \qquad (4.2.5.3.2)$$

In order to give a complement of the first remark of 4.3.2.7, let us give the following lemma.

Lemma 4.2.5.4. *Suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $u_1, \ldots, u_r$. For any $\underline{k} \in \mathbb{N}^r$, we have the formula in $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$:*

$$b \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}} = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left(1 \otimes \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h} \rangle}\right) \cdot \left(\widetilde{\underline{\partial}}_\sharp^{\langle \underline{h} \rangle}(b) \otimes 1\right), \tag{4.2.5.4.1}$$

$$b \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k} \rangle_{(m)}} = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left(1 \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k}-\underline{h} \rangle}\right) \cdot \left(\underline{\partial}_\sharp^{\langle \underline{h} \rangle}(b) \otimes 1\right). \tag{4.2.5.4.2}$$

When log structures are trivial, for any $\underline{k} \in \mathbb{N}^r$, we have the formula in $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X/S}$:

$$b \otimes \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} = \sum_{\underline{h} \leq \underline{k}} (-1)^{|\underline{h}|} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left(1 \otimes \underline{\partial}^{\langle \underline{k}-\underline{h} \rangle}\right) \cdot \left(\underline{\partial}^{\langle \underline{h} \rangle}(b) \otimes 1\right). \tag{4.2.5.4.3}$$

Proof. Since the formula 4.2.5.4.3 is checked similarly, let us focus on 4.2.5.4.1. It follows from (the version without coefficient of) 4.2.5.1 that we have the transposition isomorphism $\gamma_{\mathcal{B}_X} : \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\sim} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. By right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linearity of $\gamma_{\mathcal{B}_X}$ we compute $\gamma_{\mathcal{B}_X}((1 \otimes b)\underline{\partial}_\sharp^{\langle \underline{k} \rangle}) = (b \otimes 1) \cdot \underline{\partial}_\sharp^{\langle \underline{k} \rangle} = b \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle}$. From (the version without coefficient of) 4.2.3.5.1, we get $(1 \otimes b)\underline{\partial}_\sharp^{\langle \underline{k} \rangle} = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h} \rangle} \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{h} \rangle}(b)$. By left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linearity of $\gamma_{\mathcal{B}_X}$ this yields $\gamma_{\mathcal{B}_X}((1 \otimes b)\underline{\partial}_\sharp^{\langle \underline{k} \rangle}) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left(1 \otimes \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h} \rangle}\right) \cdot \left(\widetilde{\underline{\partial}}_\sharp^{\langle \underline{h} \rangle}(b) \otimes 1\right)$. Hence, we are done. We get the formula 4.2.3.5.3 instead of 4.2.3.5.1. □

Proposition 4.2.5.5. *Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ the sheaf obtained by computing the tensor product via the left structure of $\mathcal{B}_X$-algebra of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. There exists a unique involution of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodules*

$$\delta_{\mathcal{M}} \colon \mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \tag{4.2.5.5.1}$$

exchanging the two structures of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and such that, for each section m of $\mathcal{M}$, $\delta_{\mathcal{M}}(m \otimes 1) = m \otimes 1$. In logarithmic coordinates, we have the following formula

$$\delta_{\mathcal{M}}(m \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle}) = \sum_{\underline{h} \leq \underline{k}} m \underline{\partial}_\sharp^{\langle \underline{k}-\underline{h} \rangle} \otimes \widetilde{\underline{\partial}}_\sharp^{\langle \underline{h} \rangle}. \tag{4.2.5.5.2}$$

Proof. We have the canonical $\mathcal{B}_X$-linear morphism $\mathcal{M} \to \mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ given by $x \mapsto x \otimes 1$ where the structure of $\mathcal{B}_X$-module on $\mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ comes from its right structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. This yields by extension the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear morphism

$$\delta_{\mathcal{M}} \colon \mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \tag{4.2.5.5.3}$$

for the right (resp. left) structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of the left (resp. right) term. Such a morphism is the unique one so that $\delta_{\mathcal{M}}(x \otimes 1) = x \otimes 1$. By $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity, we get the formula 4.2.5.5.2 from 4.2.3.5.1.

By an easy computation, doing a similar to 4.2.5.1 computation, we can check the second right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity (i.e. for the left structure for the source and the right structure for the target) from 2.2.2.1 and the local formula. Hence, $\delta_{\mathcal{M}} \circ \delta_{\mathcal{M}} = \mathrm{id}$. □

4.2.5.6. We get from 4.2.5.5 the transposition isomorphism

$$\widetilde{\delta}_{X^\sharp/S^\sharp} := \delta_{\widetilde{\omega}_{X^\sharp/S^\sharp}} \colon \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}. \tag{4.2.5.6.1}$$

exchanging left and right structure. By applying to this isomorphism the functor $- \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}$ to the right (resp. left) structure from the source (resp. target), we get the isomorphism

$$\widetilde{\alpha}_{X^\sharp/S^\sharp} : \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \tag{4.2.5.6.2}$$

where $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp} = (\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \overset{\mathrm{r}}{\otimes}_{\mathcal{O}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp} = \widetilde{\omega}_{X^\sharp/S^\sharp} \overset{\mathrm{l}}{\otimes}_{\mathcal{O}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp})$, where the symbol l or r means we choose respectively the left or right structure of the corresponding (left or right) bimodule in order to compute the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structure given by the internal tensor product $- \otimes_{\mathcal{O}_X} -$ (see 4.2.3.1 or 4.2.3.5).

By applying to this isomorphism the functor $- \otimes_{\mathcal{B}_X} \widetilde{\omega}_{X^\sharp/S^\sharp}$ to the left (resp. right) structure from the source (resp. target), this yields the isomorphism

$$\widetilde{\beta}_{X^\sharp/S^\sharp} : \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}. \tag{4.2.5.6.3}$$

exchanging the two structures of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.

Proposition 4.2.5.7. *We endow the sheaf $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$ with a ring structure via the transposition isomorphism $\gamma_{\mathcal{B}_X} : \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\sim} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. This is the unique ring structure on $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$ such that*

$$\mathcal{B}_X \to \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X : b \mapsto 1 \otimes b, \tag{4.2.5.7.1}$$

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X : P \mapsto P \otimes 1 \tag{4.2.5.7.2}$$

are ring homomorphisms such that for any $b \in \mathcal{B}_X$ and $P \in \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ we have the formula $(P \otimes 1)(1 \otimes b) = P \otimes b$ and for any logarithmic coordinates

$$(1 \otimes b)(\underline{\partial}^{\langle \underline{k} \rangle}_\sharp \otimes 1) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{k} - \underline{h} \rangle}_\sharp \otimes \widetilde{\underline{\partial}}^{\langle \underline{h} \rangle}_\sharp b. \tag{4.2.5.7.3}$$

Proof. a) Since $\varepsilon^{\mathcal{B}_X}(1 \otimes b) = b \otimes 1$, then it follows from 4.1.2.2.1 that the map 4.2.5.7.1 is a ring homomorphism.

b) Since $\varepsilon^{\mathcal{B}_X}$ are isomorphisms of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$-algebras, then $\widetilde{\underline{\partial}}^{\langle \underline{h} \rangle}_\sharp (1_{\mathcal{B}_X}) = 0$ if $\underline{h} \neq 0$ (here $1_{\mathcal{B}_X}$ is the unity of $\mathcal{B}_X$, usually simply denoted 1). Hence, it follows from the left equality of 4.2.5.1.2 that we get $\varepsilon^{\mathcal{B}_X}(P \otimes 1) = 1 \otimes P$. By using 4.1.2.2.2, this yields that the map 4.2.5.7.2 is a ring homomorphism.

c) Since $\varepsilon^{\mathcal{B}_X}$ is a ring homomorphism, we get the equality $\varepsilon^{\mathcal{B}_X}((P \otimes 1)(1 \otimes b)) = (1 \otimes P)(b \otimes 1) = P \cdot (b \otimes 1)$ (see also 4.1.2.4) for the last one). Since $\varepsilon^{\mathcal{B}_X}$ is a homomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module, we get the equality $\varepsilon^{\mathcal{B}_X}(P \otimes b) = \varepsilon^{\mathcal{B}_X}(P \cdot (1 \otimes b)) = P \cdot (b \otimes 1)$. Hence, $P \otimes b = (P \otimes 1)(1 \otimes b)$.

d) Since $\gamma^{-1}_{\mathcal{B}_X}(b \otimes \underline{\partial}^{\langle \underline{k} \rangle}_\sharp) = \gamma^{-1}_{\mathcal{B}_X}((b \otimes 1)(1 \otimes \underline{\partial}^{\langle \underline{k} \rangle}_\sharp)) = (1 \otimes b)(\underline{\partial}^{\langle \underline{k} \rangle}_\sharp \otimes 1)$, then we get the formula 4.2.5.7.3 from the right formula of 4.2.5.1.2. □

4.2.5.8. The $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bimodule structure on $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$ induced by the canonical ring homomorphism $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$ (see 4.2.5.7.2) is equal to the $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bimodule structure induced by the tensor product from the left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module structure of $\mathcal{B}_X$ and the canonical $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-bimodule structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ (see 4.2.3.5). Indeed, this comes from the formulas 4.2.5.7.3 (compare with 4.2.3.5.1) and $(P' \otimes 1)(P \otimes b) = P'P \otimes b$.

4.2.6 An isomophism switching $\mathcal{B}$ and $\mathcal{D}$ in tensor products

We give an application of the logarithmic transposition isomorphism.

Proposition 4.2.6.1 (Switching $\mathcal{B}$ and $\widetilde{\mathcal{D}}$). *Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule), $\mathcal{E},\mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. We have the functorial in $\mathcal{E}$, $\mathcal{F}$, $\mathcal{M}$ canonical isomorphism of $\mathcal{O}_S$-modules (resp. left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules):*

$$(\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{F}\xrightarrow{\sim}\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F}), \tag{4.2.6.1.1}$$

which is given by $(m\otimes e)\otimes f\mapsto m\otimes(e\otimes f)$ for any local section e,f,m of $\mathcal{E},\mathcal{F},\mathcal{M}$.

Proof. We have the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear isomorphism

$$\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E}\xrightarrow{\sim}(\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\otimes_{\mathcal{B}_X}\mathcal{E}\xrightarrow[4.2.4.3.2]{\sim}\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}) \tag{4.2.6.1.2}$$

We get from the transposition isomorphism:

$$(\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{E})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{F}\xrightarrow[4.2.6.1.2]{\sim}\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{F} \tag{4.2.6.1.3}$$

$$\xrightarrow[4.2.5.1.1]{\sim}\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{F}\xrightarrow{\sim}\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{F}). \tag{4.2.6.1.4}$$

□

4.3 Coefficients extension of the ring of differential operators

We keep notation 3.4. Let $\rho\colon\mathcal{B}_X\to\mathcal{B}'_X$ be a homomorphism of commutative $\mathcal{O}_X$-algebras. We suppose $\mathcal{B}_X$ and $\mathcal{B}'_X$ are endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module which is compatible to its underlying $\mathcal{O}_X$-algebra structure such that $\mathcal{B}_X\to\mathcal{B}'_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear.

4.3.1 Some homomorphisms of rings of differential operators

Before considering the case where the level is fixed, let us give some preliminary ring homomorphism constructions. Let $m'\geq m$ be a second integer. Let $\sigma\colon\mathcal{B}_X\to\mathcal{C}_X$ be a homomorphism of commutative $\mathcal{O}_X$-algebras. We suppose $\mathcal{C}_X$ is endowed with a structure of left $\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$-module which is compatible to its underlying $\mathcal{O}_X$-algebra structure. We suppose moreover that $\mathcal{B}_X\to\mathcal{C}_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear where $\mathcal{C}_X$ is viewed as a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module via the canonical homomorphism $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\to\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$.

Proposition 4.3.1.1. *We generalize with some coefficients the homomorphisms of 3.2.3.5.1 as follows.*

(a) The canonical $\mathcal{B}_X$-linear morphism

$$\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\to\mathcal{C}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \tag{4.3.1.1.1}$$

given by $b\otimes P\mapsto\sigma(b)\otimes\rho_{m',m}(P)$ is a ring homomorphism.

(b) The canonical $\mathcal{B}_X$-linear morphism we have the canonical map

$$\mathcal{D}^{(m)}_{X^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}_X\to\mathcal{D}^{(m')}_{X^\sharp}\otimes_{\mathcal{O}_X}\mathcal{C}_X \tag{4.3.1.1.2}$$

given by $P\otimes b\mapsto\rho_{m',m}(P)\otimes\sigma(b)$ is a ring homomorphism. Moreover, we have the commutative diagram

$$\begin{array}{ccc}\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp} & \xrightarrow{4.3.1.1.1} & \mathcal{C}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m')}_{X^\sharp}\\ {\scriptstyle\gamma_{\mathcal{B}_X}}\uparrow{\scriptstyle 4.2.5.1.1} & & {\scriptstyle\gamma_{\mathcal{C}_X}}\uparrow{\scriptstyle 4.2.5.1.1}\\ \mathcal{D}^{(m)}_{X^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}_X & \xrightarrow{4.3.1.1.2} & \mathcal{D}^{(m')}_{X^\sharp}\otimes_{\mathcal{O}_X}\mathcal{C}_X.\end{array} \tag{4.3.1.1.3}$$

Proof. a) Removing $/S^\sharp$ in the notation, consider the diagram:

$$\begin{array}{ccccccccccc}
\mathcal{P}^{n+n'}_{X^\sharp(m')} & \xrightarrow{\delta^{n,n'}_{(m')}} & \mathcal{P}^{n}_{X^\sharp(m')} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp(m')} & \xrightarrow{\mathrm{id}\otimes P'} & \mathcal{P}^{n}_{X^\sharp(m')} \otimes_{\mathcal{O}_X} \mathcal{B}_X & \xrightarrow{\epsilon_n^{\mathcal{B}_X}} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n}_{X^\sharp(m')} & \xrightarrow{\mathrm{id}\otimes P} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{B}_X & \xrightarrow{\mu} & \mathcal{B}_X \\
\downarrow{\scriptstyle \psi^{n+n'}_{m,m'}} & & \downarrow{\scriptstyle \psi^{n}_{m,m'}\otimes\psi^{n'}_{m,m'}} & & \downarrow{\scriptstyle \psi^{n}_{m,m'}\otimes\sigma} & & \downarrow{\scriptstyle \sigma\otimes\psi^{n}_{m,m'}} & & \downarrow{\scriptstyle \sigma\otimes\sigma} & & \downarrow{\scriptstyle \sigma} \\
\mathcal{P}^{n+n'}_{X^\sharp(m)} & \xrightarrow{\delta^{n,n'}_{(m)}} & \mathcal{P}^{n}_{X^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp(m)} & \xrightarrow{\mathrm{id}\otimes P'} & \mathcal{P}^{n}_{X^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{C}_X & \xrightarrow{\epsilon_n^{\mathcal{C}_X}} & \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n}_{X^\sharp(m)} & \xrightarrow{\mathrm{id}\otimes P} & \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{C}_X & \xrightarrow{\nu} & \mathcal{C}_X
\end{array} \qquad (4.3.1.1.4)$$

where ν is the multiplication of $\mathcal{C}_X$, $\psi^n_{m,m'}$ are the canonical morphisms (see notation 3.2.2.10). Since σ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear then the middle square is commutative. Since so are the other square by functoriality, then the diagram 4.3.1.1.4 is commutative. Since the composition of the top or bottom horizontal arrows is by definition the product law (see 4.1.2.1.1), then the canonical $\mathcal{B}_X$-linear morphism $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ is a ring homomorphism.

b) Via an easy computation using the left formula of 4.2.5.1.2, we can check the commutativity of the diagram 4.3.1.1.3. Since 4.3.1.1.1 and the transposition isomorphisms are ring homomorphisms, then so is 4.3.1.1.2. □

Proposition 4.3.1.2. *Using respectively the ring homomorphisms of 4.3.1.1.1 and 4.3.1.1.2, we have the following isomorphisms of bimodules.*

(a) The canonical morphism of $(\mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp})$*-bimodules*

$$(\mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \otimes_{\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}) \to \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}, \qquad (4.3.1.2.1)$$

given by $(c \otimes P) \otimes (b \otimes P') \mapsto (c \otimes \rho_{m',m}(P))(\sigma(b) \otimes P')$*, is an isomorphism.*

(b) The canonical morphism of $(\mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{C}_X)$*-bimodules,*

$$(\mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X) \otimes_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X} (\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{C}_X) \to \mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{C}_X, \qquad (4.3.1.2.2)$$

given by $(P' \otimes b) \otimes (P \otimes c) \mapsto (P' \otimes \sigma(b))(\rho_{m',m}(P) \otimes c)$*, is an isomorphism.*

Proof. a) From the ring homomorphism $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \to \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ (see 4.3.1.1.1), we get by extension the homomorphism of $(\mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp})$-bimodules 4.3.1.2.1. Since the canonical homomorphism $\mathcal{C}_X \otimes_{\mathcal{B}_X} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \to \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ of $(\mathcal{C}_X, \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$-bimodules is an isomorphism, then the canonical homomorphism of $(\mathcal{C}_X, \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp})$-bimodules:

$$\mathcal{C}_X \otimes_{\mathcal{B}_X} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}) \to (\mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \otimes_{\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}). \qquad (4.3.1.2.3)$$

is an isomorphism. By composing 4.3.1.2.3 with 4.3.1.2.1, we get the canonical homomorphism

$$\mathcal{C}_X \otimes_{\mathcal{B}_X} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}) \to \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \qquad (4.3.1.2.4)$$

which is an isomorphism. Hence, so is 4.3.1.2.1.

b) We proceed similarly to check the map 4.3.1.2.2 is an isomorphism. □

Proposition 4.3.1.3. *We have the following isomorphisms of bimodules.*

(a) The canonical morphism of $(\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}, \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$*-bimodules*

$$(\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}) \otimes_{\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} (\mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \to \mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}, \qquad (4.3.1.3.1)$$

given by $(b \otimes P') \otimes (c \otimes P) \mapsto (\sigma(b) \otimes P')(c \otimes \rho_{m',m}(P))$*, is an isomorphism.*

(b) *The canonical morphism of* $(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{C}_X, \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}_X)$*-bimodules,*

$$(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{C}_X)\otimes_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}_X}(\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}_X)\to\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{C}_X, \tag{4.3.1.3.2}$$

given by $(P\otimes c)\otimes(P'\otimes b)\mapsto(\rho_{m',m}(P)\otimes c)(P'\otimes\sigma(b))$*, is an isomorphism.*

Proof. Consider the following diagram:

$$\begin{array}{ccc}
(\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m')}_{X^\sharp/S^\sharp})\otimes_{\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{C}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) & \xrightarrow[4.3.1.3.1]{} & \mathcal{C}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m')}_{X^\sharp/S^\sharp} \\
\uparrow{\scriptstyle \gamma_{\mathcal{B}_X}\otimes\gamma_{\mathcal{C}_X}}\ \wr & & \uparrow{\scriptstyle\gamma_{\mathcal{C}_X}}\ \wr \\
(\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}_X)\otimes_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}_X}(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{C}_X) & \xrightarrow[4.3.1.2.2]{\sim} & \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{C}_X.
\end{array} \tag{4.3.1.3.3}$$

whose left vertical arrow is well defined thanks to 4.3.1.1.3. Since the arrows of the square 4.3.1.3.3 are left $\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$-linear, then to check its commutativity, we reduce to compute that the image of the element $(1\otimes b)\otimes(1\otimes c)$ of the bottom left term of the square is sent via both maps to the same element of the top right term, which is the case (more precisely, we compute $(\sigma(b)c\otimes 1)$. Via the commutativity of 4.3.1.3.3, we obtain that the canonical morphism 4.3.1.3.1 is an isomorphism. Similarly, via the transposition isomorphisms, since 4.3.1.2.1 is an isomorphism, then so is 4.3.1.3.2. □

4.3.2 Semi-linear PD-stratifications of level m

Lemma 4.3.2.1. *We suppose* $\mathcal{B}'_X$ *is endowed with a compatible structure of left* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-module such that* $\mathcal{B}_X\to\mathcal{B}'_X$ *is* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-linear. We still denote by* $\rho\colon\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\to\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ *the canonical ring homomorphism induced by* ρ *(see 4.3.1.1.a). From 3.4.2.5, let* $(\varepsilon_n^{\mathcal{B}_X})$ *(resp.* $(\varepsilon_n^{\mathcal{B}'_X})$*) be the m-PD-stratification with coefficients in* $\mathcal{O}_X$ *of* $\mathcal{B}_X$ *(resp. of* $\mathcal{B}'_X$*). The left* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module structure of* $\mathcal{B}'_X$ *induced via* ρ *by its left* $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-module structure gives an m-PD-stratification with coefficients in* $\mathcal{B}_X$ *of* $\mathcal{B}'_X$ *that we denote by* $(\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X})$*.*

(a) *The isomorphism* $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$ *is the one making commutative the diagram of commutative* $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$*-algebras*

$$\begin{array}{ccccc}
\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{B}_X}\mathcal{B}'_X & \xleftarrow[\varepsilon_n^{\mathcal{B}_X}\otimes\mathrm{id}]{\sim} & (\mathcal{P}^n_{X^\sharp/S^\sharp(m)}\underset{\mathcal{O}_X}{\otimes}\mathcal{B}_X)\otimes_{\mathcal{B}_X}\mathcal{B}'_X & \xrightarrow[\sim]{\alpha} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)}\underset{\mathcal{O}_X}{\otimes}\mathcal{B}'_X \\
\wr\ \vdots\ {\scriptstyle\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}} & & & & \wr\downarrow{\scriptstyle\varepsilon_n^{\mathcal{B}'_X}} \\
\mathcal{B}'_X\otimes_{\mathcal{B}'_X}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} & & \xrightarrow[\sim]{\beta} & & \mathcal{B}'_X\underset{\mathcal{O}_X}{\otimes}\mathcal{P}^n_{X^\sharp/S^\sharp(m)},
\end{array} \tag{4.3.2.1.1}$$

where α *(resp.* β*) is given by* $(\tau\otimes b)\otimes b'\mapsto\tau\otimes\rho(b)b'$ *(resp. by* $b'\otimes(b\otimes\tau)\mapsto\rho(b)b'\otimes\tau$*).*

(b) *The map* $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$ *are isomorphisms of* $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$*-algebras.*

Proof. Since this is local, we can suppose $X^\sharp\to S^\sharp$ is endowed with logarithmic coordinates $(b_\lambda)_{\lambda=1,\dots,d}$. Since $\varepsilon_n^{\mathcal{B}_X}(1\otimes 1)=1\otimes 1$, then by using the Taylor formula satisfied by $\varepsilon_n^{\mathcal{B}'_X}$ (see 3.4.2.5.4) we compute the morphism $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$ making commutative the diagram 4.3.2.1.1 should satisfied in $\mathcal{B}'_X\otimes_{\mathcal{B}'_X}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ the formula

$$\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}((1\otimes 1)\otimes b')=\sum_{|\underline{k}|\le n}\underline{\partial}_\sharp^{\langle\underline{k}\rangle}(b')\otimes(1\otimes\underline{\tau}_\sharp^{\{\underline{k}\}}),$$

for any section b' of $\mathcal{B}'_X$. Hence, since 4.3.2.1.1 is a diagram of $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-algebras, since $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}\otimes_{\mathcal{B}_X}\mathcal{B}'_X$ is generated as $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-module by the elements of the form $(1\otimes 1)\otimes b'$ with b' a section of $\mathcal{B}'_X$, then we conclude thanks to the formula 4.2.1.5.4 (where by abuse of notation $1 \otimes \underline{\tau}_\sharp^{\{\underline{k}\}} = \underline{\tau}_\sharp^{\{\underline{k}\}}$). Finally, via the commutative diagram 4.3.2.1.1, we get that the isomorphism $\varepsilon_{n/\mathcal{B}_X}^{\mathcal{B}'_X}$ are more precisely isomorphisms of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$-algebras. □

Remark 4.3.2.2. Taking the case where $\mathcal{B}_X$ (resp. $\mathcal{B}'_X$) is replaced in 4.3.2.1 by $\mathcal{O}_X$ (resp. by $\mathcal{B}_X$) we retrieve the lemma 4.2.1.7 from 4.3.2.1.

Lemma 4.3.2.3. *Let $\rho\colon \mathcal{B}_X \to \mathcal{B}'_X$ be an algebra homomorphism. We suppose $\mathcal{B}'_X$ is endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module which is compatible to its underlying $\mathcal{O}_X$-algebra structure. We suppose moreover that $\mathcal{B}_X \to \mathcal{B}'_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Let $\mathcal{E}'$ be a left $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. We denote by $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X})$ the m-PD-stratification with coefficients in $\mathcal{B}'_X$ associated with $\mathcal{E}'$ (see 4.2.1.5). Following 4.3.1.1, we get the ring homomorphism $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ given by $b \otimes P \mapsto \rho(b) \otimes P$ that we still denote by ρ. Let us denote by $\rho_*(\mathcal{E}')$ the sheaf $\mathcal{E}'$ viewed as a left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module via ρ_*. Let $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X})$ be the m-PD-stratification with coefficients in $\mathcal{B}_X$ associated with $\rho_*(\mathcal{E}')$ (see 4.2.1.5). Let us denote by $\widetilde{\mathcal{P}}^n := \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ and $\widetilde{\mathcal{P}}'^n := \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$. Then we get the commutative diagram of $\widetilde{\mathcal{P}}^n$-modules:*

$$\begin{array}{ccccc} \widetilde{\mathcal{P}}'^n \otimes_{\mathcal{B}'_X} \mathcal{E}' & \xleftarrow[\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X} \otimes \mathrm{id}]{\sim} & (\widetilde{\mathcal{P}}^n \underset{\mathcal{B}_X}{\otimes} \mathcal{B}'_X) \otimes_{\mathcal{B}'_X} \mathcal{E}' & \xrightarrow{\sim} & \widetilde{\mathcal{P}}^n \underset{\mathcal{B}_X}{\otimes} \mathcal{E}' \\ \downarrow{\scriptstyle \sim\ \varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}} & & & & \downarrow{\scriptstyle \sim\ \varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X}} \\ \mathcal{E}' \otimes_{\mathcal{B}'_X} \widetilde{\mathcal{P}}'^n & & \xrightarrow{\sim} & & \mathcal{E}' \underset{\mathcal{B}_X}{\otimes} \widetilde{\mathcal{P}}^n. \end{array} \tag{4.3.2.3.1}$$

Proof. Since this is local, we can suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,d}$. Since $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$ are isomorphisms of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$-algebras, then $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}(1 \otimes 1) = 1 \otimes 1$. Hence, by using the Taylor formula satisfied by $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X}$ (see 3.4.2.5.4) we compute the morphism $\varepsilon\colon \widetilde{\mathcal{P}}'^n \otimes_{\mathcal{B}'_X} \mathcal{E}' \to \mathcal{E}' \otimes_{\mathcal{B}'_X} \widetilde{\mathcal{P}}'^n$ making commutative the diagram 4.3.2.3.1 (i.e. ε is the composition of the top, right, bottom morphisms of the diagram 4.3.2.3.1) should satisfied in $\mathcal{E}' \otimes_{\mathcal{B}'_X} \widetilde{\mathcal{P}}'^n$ the formula

$$\varepsilon((1 \otimes 1) \otimes x') = \sum_{|\underline{k}| \leq n} \underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x') \otimes (1 \otimes \underline{\tau}_\sharp^{\{\underline{k}\}}),$$

for any section x' of $\mathcal{E}'$. Hence, since the morphisms of the diagram 4.3.2.3.1 are $\widetilde{\mathcal{P}}^n$-linear, since $\widetilde{\mathcal{P}}'^n \otimes_{\mathcal{B}'_X} \mathcal{E}'$ is generated as $\widetilde{\mathcal{P}}^n$-module by the elements of the form $(1 \otimes 1) \otimes x'$, then thanks to the formula 4.2.1.5.4, we get $\varepsilon = \varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}$. □

Remark 4.3.2.4. Let $\rho\colon \mathcal{B}_X \to \mathcal{C}_X$ be a commutative algebra homomorphism. We suppose $\mathcal{C}_X$ is endowed with a structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module such that $\mathcal{B}_X \to \mathcal{C}_X$ is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear. Following 4.3.2.3.1 (where we replace $\mathcal{B}'_X$ by $\mathcal{B}_X$, $\mathcal{B}_X$ by $\mathcal{O}_X$ and $\mathcal{E}'$ by $\mathcal{C}_X$), we have the commutative diagram

$$\begin{array}{ccccc} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{C}_X & \xleftarrow[\varepsilon^{\mathcal{B}_X}_n \otimes \mathrm{id}]{\sim} & (\mathcal{P}^n_{X^\sharp/S^\sharp} \underset{\mathcal{O}_X}{\otimes} \mathcal{B}_X) \otimes_{\mathcal{B}_X} \mathcal{C}_X & \xrightarrow{\sim} & \mathcal{P}^n_{X^\sharp/S^\sharp} \underset{\mathcal{O}_X}{\otimes} \mathcal{C}_X \\ \downarrow{\scriptstyle \sim\ \varepsilon^{\mathcal{C}_X}_{n/\mathcal{B}_X}} & & & & \downarrow{\scriptstyle \sim\ \varepsilon^{\mathcal{C}_X}_n} \\ \mathcal{C}_X \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp} & & \xrightarrow{\sim} & & \mathcal{C}_X \underset{\mathcal{O}_X}{\otimes} \mathcal{P}^n_{X^\sharp/S^\sharp}. \end{array} \tag{4.3.2.4.1}$$

Hence, the isomorphisms of the m-PD-stratification with coefficients in $\mathcal{O}_X$, denoted by $\epsilon^{\mathcal{C}_X}_n$, are isomorphisms of $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-algebras if and only if the $\varepsilon^{\mathcal{C}_X}_{n/\mathcal{B}_X}$ are isomorphisms of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$-algebras. If we define the notion of $\mathcal{B}_X$*-algebras compatible with its structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module* by asking that the isomorphisms $\varepsilon^{\mathcal{C}_X}_{n/\mathcal{B}_X}$ are isomorphisms of $\widetilde{\mathcal{P}}^n$-algebras, it amounts to demanding that the structure of $\mathcal{O}_X$-algebra is compatible with its structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module.

Definition 4.3.2.5. Let $\rho \colon \mathcal{B}_X \to \mathcal{B}'_X$ be a commutative algebra homomorphism. We suppose $\mathcal{B}'_X$ is endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module which is compatible to its underlying $\mathcal{O}_X$-algebra structure. We suppose moreover that $\mathcal{B}_X \to \mathcal{B}'_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. We keep notation 4.3.2.1. Let $\mathcal{E}'$ be a left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. Let us denote by $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X})$ the m-PD-stratification with coefficients in $\mathcal{B}_X$ associated with $\mathcal{E}'$. We suppose the underlying structure of $\mathcal{B}_X$-module of $\mathcal{E}'$ extends to a structure of $\mathcal{B}'_X$-module. Set $\widetilde{\mathcal{P}}^n := \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ and $\widetilde{\mathcal{P}}'^n := \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$. Let us denote by

$$\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X} \colon \widetilde{\mathcal{P}}'^n \otimes_{\mathcal{B}'_X} \mathcal{E}' \xrightarrow{\sim} \mathcal{E}' \otimes_{\mathcal{B}'_X} \widetilde{\mathcal{P}}'^n$$

the isomorphism making commutative the diagram of $\widetilde{\mathcal{P}}^n$-modules

$$\begin{array}{ccccc}
\widetilde{\mathcal{P}}'^n \otimes_{\mathcal{B}'_X} \mathcal{E}' & \xleftarrow[\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X} \otimes \mathrm{id}]{\sim} & (\widetilde{\mathcal{P}}^n \underset{\mathcal{B}_X}{\otimes} \mathcal{B}'_X) \otimes_{\mathcal{B}'_X} \mathcal{E}' & \xrightarrow{\sim} & \widetilde{\mathcal{P}}^n \underset{\mathcal{B}_X}{\otimes} \mathcal{E}' \\
\sim \Big\downarrow \varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X} & & & & \sim \Big\downarrow \varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X} \\
\mathcal{E}' \otimes_{\mathcal{B}'_X} \widetilde{\mathcal{P}}'^n & & \xrightarrow{\sim} & & \mathcal{E}' \underset{\mathcal{B}_X}{\otimes} \widetilde{\mathcal{P}}^n .
\end{array} \tag{4.3.2.5.1}$$

We say that the isomorphisms $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X}$ are "semi-linear with respect to $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$" if the isomorphisms $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}$ are $\widetilde{\mathcal{P}}'^n$-linear.

Proposition 4.3.2.6. *Let $\mathcal{B}'_X$ be a commutative $\mathcal{B}_X$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module such that $\mathcal{B}_X \to \mathcal{B}'_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Let $\mathcal{E}'$ be a left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. We suppose the underlying structure of $\mathcal{B}_X$-module of $\mathcal{E}'$ extends to a structure of $\mathcal{B}'_X$-module. Let $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X})$ be the m-PD-stratification with coefficients in $\mathcal{B}_X$ associated with $\mathcal{E}'$. The following assertions are equivalent.*

(a) Both structures of left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{B}'_X$-module of $\mathcal{E}'$ extend (uniquely) to a structure of left $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module.

(b) The isomorphisms $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X}$ are semi-linear with respect to the isomorphisms $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$ for any $n \in \mathbb{N}$.

Proof. $(a) \to (b)$. Suppose $\mathcal{E}'$ is endowed with a structure of left $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module extending both structures of $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{B}'_X$. Then following 4.3.2.3, since the isomorphisms $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X})$ are equal to the m-PD-stratification with coefficients in $\mathcal{B}'_X$ associated with $\mathcal{E}'$, then they are in particular $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-linear which means the isomorphisms $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X})$ are semi-linear with respect to $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$.

$(b) \to (a)$. Suppose the isomorphisms $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X}$ are semi-linear with respect to the isomorphisms $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}$. Let $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}$ be the isomorphism making commutative the diagram 4.3.2.5.1. By hypothesis, $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}$ are $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-linear. In order to check that the data $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X})$ is an m-PD-stratification with coefficients in $\mathcal{B}'_X$ of $\mathcal{E}'$, it remains to prove the cocycle condition. Following the remark 4.2.1.6, this is equivalent to check the formula 4.2.1.6.1. By using the commutative diagram 4.3.2.5.1, since $\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}(1) = 1$, then we have

$$\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}((1 \otimes 1) \otimes x') = \sum_{|\underline{k}| \leq n} \underline{\partial}^{\langle \underline{k} \rangle}_{\sharp}(x') \otimes (1 \otimes \underline{\tau}^{\{\underline{k}\}}_{\sharp})$$

for any section x' of $\mathcal{E}'$. Since $\mathcal{E}'$ is a left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module, this yields the formula 4.2.1.6.1 holds. Hence, we are done. $\square$

Remark 4.3.2.7. Suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,d}$. With its notation, both conditions of 4.3.2.6 hold if and only if we have the formula

$$b' \cdot \left(\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}_{\sharp} \cdot x' \right) = \sum_{\underline{h} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \underline{\partial}^{\langle \underline{k}-\underline{h} \rangle}_{\sharp} \cdot \left(\widetilde{\underline{\partial}}^{\langle \underline{h} \rangle}_{\sharp}(b') \cdot x' \right). \tag{4.3.2.7.1}$$

for any $b' \in \mathcal{B}'_X$, $x' \in \mathcal{E}'$, $\underline{k} \in \mathbb{N}^d$.

Indeed, let $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}$ be the isomorphism making commutative the diagram 4.3.2.5.1. Since $\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}$ is $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-linear then it is $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-linear if and only if we have the formula $b'\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}((1\otimes 1)\otimes x') = \varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}((b'\otimes 1)\otimes x')$ for any sections b' of $\mathcal{B}'_X$ and x' of $\mathcal{E}'$. We compute

$$\left((\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X})^{-1}\otimes \mathrm{id}\right)((b'\otimes 1)\otimes x') \overset{4.2.1.5.5}{=} \sum_{|\underline{i}|\le n}\left(\underline{\tau}^{\{\underline{i}\}}_\sharp \otimes \underline{\widetilde{\partial}}^{\langle \underline{i}\rangle}_\sharp(b')\right)\otimes x';$$

$$\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X}\left(\sum_{|\underline{i}|\le n}\underline{\tau}^{\{\underline{i}\}}_\sharp \otimes \underline{\widetilde{\partial}}^{\langle \underline{i}\rangle}_\sharp(b')\cdot x'\right) \overset{4.2.1.5.4}{=} \sum_{|\underline{i}|\le n}\sum_{|\underline{j}|\le n}\underline{\partial}^{\langle \underline{j}\rangle}_\sharp(\underline{\widetilde{\partial}}^{\langle \underline{i}\rangle}_\sharp(b')\cdot x')\otimes \underline{\tau}^{\{\underline{j}\}}_\sharp\underline{\tau}^{\{\underline{i}\}}_\sharp$$

$$= \sum_{|\underline{k}|\le n}\left(\sum_{\underline{h}\le\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\underline{\partial}^{\langle \underline{k}-\underline{h}\rangle}_\sharp\cdot\left(\underline{\widetilde{\partial}}^{\langle \underline{h}\rangle}_\sharp(b')\cdot x'\right)\right)\otimes\underline{\tau}^{\{\underline{k}\}}.$$

This yields

$$\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}((b'\otimes 1)\otimes x') = \sum_{|\underline{k}|\le n}\left(\sum_{\underline{h}\le\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\}\underline{\partial}^{\langle \underline{k}-\underline{h}\rangle}_\sharp\cdot\left(\underline{\widetilde{\partial}}^{\langle \underline{h}\rangle}_\sharp(b')\cdot x'\right)\right)\otimes(1\otimes\underline{\tau}^{\{\underline{k}\}}).$$

On the other hand, we compute

$$b'\cdot\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}'_X}((1\otimes 1)\otimes x') = b'\left(\sum_{|\underline{k}|\le n}\underline{\partial}^{\langle \underline{k}\rangle}_\sharp(x')\otimes(1\otimes\underline{\tau}^{\{\underline{k}\}}_\sharp)\right) = \sum_{|\underline{k}|\le n} b'(\underline{\partial}^{\langle \underline{k}\rangle}_\sharp(x'))\otimes(1\otimes\underline{\tau}^{\{\underline{k}\}}_\sharp),$$

Hence, we are done.

4.3.3 Semi-linear PD-costratifications of level m

Proposition 4.3.3.1. *Let $\mathcal{M}'$ be a right $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. We denote by $(\varepsilon^{\mathcal{M}'}_{n/\mathcal{B}'_X})$ the m-PD-costratification with coefficients in $\mathcal{B}'_X$ associated with $\mathcal{M}'$ (see 4.2.2.5). Following 4.3.1.1, we get the ring homomorphism $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\to\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ given by $b\otimes P\mapsto\rho(b)\otimes P$ that we still denote by ρ. We denote by $\rho_*(\mathcal{M}')$ the sheaf $\mathcal{M}'$ viewed as a left $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module via ρ_*. Let $(\varepsilon^{\mathcal{M}'}_{n/\mathcal{B}_X})$ be the m-PD-costratification with coefficients in $\mathcal{B}_X$ associated with $\rho_*(\mathcal{M}')$ (see 4.2.2.5). Let us denote by $\widetilde{\mathcal{P}}^n:=\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ and $\widetilde{\mathcal{P}}'^n:=\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$. Then we get the commutative diagram of $\widetilde{\mathcal{P}}^n$-modules:*

$$\begin{array}{ccc}
\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n,\mathcal{M}') & \xrightarrow[\sim]{\alpha} & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{0*}\widetilde{\mathcal{P}}'^n,\mathcal{M}') \\
\sim\downarrow\varepsilon^{\mathcal{M}'}_n & & \sim\downarrow\varepsilon'^{\mathcal{M}'}_n \\
\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n,\mathcal{M}') \xrightarrow[\sim]{\beta} \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{\mathcal{P}}^n\otimes_{\mathcal{B}_X}\mathcal{B}'_X,\mathcal{M}') & \xleftarrow[\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}]{\sim} & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{1*}\widetilde{\mathcal{P}}'^n,\mathcal{M}'),
\end{array}\tag{4.3.3.1.1}$$

where α and β are the canonical isomorphisms.

Proof. We easily compute that the following diagram

$$\begin{array}{ccc}
\mathcal{M}'\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n,\mathcal{B}_X) & \xrightarrow{4.2.2.4.1} & \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n,\mathcal{M}') \\
\downarrow\sim & & \\
\mathcal{M}'\otimes_{\mathcal{B}'_X}\left(\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n,\mathcal{B}_X)\right) & & \sim\downarrow\alpha \\
\downarrow\sim & & \\
\mathcal{M}'\otimes_{\mathcal{B}'_X}\mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{0*}\widetilde{\mathcal{P}}'^n,\mathcal{B}'_X) & \xrightarrow{4.2.2.4.1} & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{0*}\widetilde{\mathcal{P}}'^n,\mathcal{M}')
\end{array}\tag{4.3.3.1.2}$$

where the bottom arrow is constructed as for 4.2.2.4.1 with $\mathcal{B}_X$ replaced by $\mathcal{B}'_X$, where the vertical isomorphism is the canonical ones, is commutative. To distinguish them, let $\{\underline{\partial}_\sharp^{\langle \underline{h} \rangle}, |\underline{h}| \leq n\}$ (resp. $\{\underline{\partial}_\sharp'^{\langle \underline{h} \rangle}, |\underline{h}| \leq n\}$) be the dual basis of $\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X)$ (resp. $\mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{0*}\widetilde{\mathcal{P}}'^n, \mathcal{B}'_X)$) of the basis $\{1 \otimes \underline{\tau}_\sharp^{\{\underline{h}\}}, |\underline{h}| \leq n\}$ of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ (resp. $\widetilde{\mathcal{P}}'^n_{X^\sharp/S^\sharp(m)}$). We compute the composition of the left vertical isomorphisms of 4.3.3.1.2 is given by for any $x' \in \mathcal{M}'$ and any $\underline{k} \in \mathbb{N}^d$ by $x' \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}} \mapsto x' \otimes \underline{\partial}_\sharp'^{\langle \underline{k} \rangle_{(m)}}$

Consider the commutative diagram

$$\begin{array}{ccc}
\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n, \mathcal{B}_X) \otimes_{\mathcal{B}_X} \mathcal{M}' & \xrightarrow{4.2.2.4.2} & \mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n, \mathcal{M}') \\
\downarrow \wr & & \wr \downarrow \\
\mathcal{H}om_{\mathcal{B}'_X}(\widetilde{\mathcal{P}}^n \otimes_{\mathcal{B}_X} \mathcal{B}'_X, \mathcal{B}'_X) \otimes_{\mathcal{B}'_X} \mathcal{M}' & & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{\mathcal{P}}^n \otimes_{\mathcal{B}_X} \mathcal{B}'_X, \mathcal{M}') \\
\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X} \uparrow \wr & & \varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X} \uparrow \wr \\
\mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{1*}\widetilde{\mathcal{P}}'^n, \mathcal{B}'_X) \otimes_{\mathcal{B}'_X} \mathcal{M}' & \xrightarrow{4.2.2.4.2} & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{1*}\widetilde{\mathcal{P}}'^n, \mathcal{M}')
\end{array} \tag{4.3.3.1.3}$$

where both top vertical isomorphism are the canonical ones. To distinguish them, let $\{\underline{\partial}_\sharp^{\star\langle \underline{h} \rangle}, |\underline{h}| \leq n\}$ (resp. $\{\underline{\partial}_\sharp'^{\star\langle \underline{h} \rangle}, |\underline{h}| \leq n\}$) be the dual basis of $\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}, \mathcal{B}_X)$ (resp. $\mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{1*}\widetilde{\mathcal{P}}'^n, \mathcal{B}'_X)$) of the basis $\{1 \otimes \underline{\tau}_\sharp^{\{\underline{h}\}}, |\underline{h}| \leq n\}$ of $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ (resp. $\widetilde{\mathcal{P}}'^n_{X^\sharp/S^\sharp(m)}$). We compute the composition of the left vertical isomorphisms of 4.3.3.1.3 is given by for any $x' \in \mathcal{M}'$ and any $\underline{k} \in \mathbb{N}^d$ by $\underline{\partial}^{\star\langle \underline{k} \rangle} \otimes x' \mapsto \underline{\partial}'^{\star\langle \underline{k} \rangle} \otimes x'$. Henc, we conclude by using the local formula 4.2.2.6.2. □

Definition 4.3.3.2. Let $\rho \colon \mathcal{B}_X \to \mathcal{B}'_X$ be a commutative algebra homomorphism. We suppose $\mathcal{B}'_X$ is endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module which is compatible to its underlying $\mathcal{O}_X$-algebra structure. We suppose moreover that $\mathcal{B}_X \to \mathcal{B}'_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. We keep notation 4.3.2.1. Let $\mathcal{E}'$ be a left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. Let us denote by $(\varepsilon^{\mathcal{E}'}_{n/\mathcal{B}_X})$ the m-PD-stratification with coefficients in $\mathcal{B}_X$ associated with $\mathcal{E}'$. We suppose the underlying structure of $\mathcal{B}_X$-module of $\mathcal{E}'$ extends to a structure of $\mathcal{B}'_X$-module. Set $\widetilde{\mathcal{P}}^n := \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ and $\widetilde{\mathcal{P}}'^n := \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$. Let us denote by $\varepsilon^{\mathcal{M}'}_{n/\mathcal{B}'_X} \colon \mathcal{H}om_{\mathcal{B}'}(\widetilde{p}'^n_{0*}\widetilde{\mathcal{P}}'^n, \mathcal{M}') \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}'}(\widetilde{p}'^n_{1*}\widetilde{\mathcal{P}}'^n, \mathcal{M}')$ the isomorphism making commutative the diagram of $\widetilde{\mathcal{P}}^n$-modules

$$\begin{array}{ccccc}
\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{0*}\widetilde{\mathcal{P}}^n, \mathcal{M}') & & \xrightarrow{\quad\sim\quad} & & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{0*}\widetilde{\mathcal{P}}'^n, \mathcal{M}') \\
\wr\downarrow \varepsilon^{\mathcal{M}'}_{n/\mathcal{B}_X} & & & & \wr \downarrow \varepsilon^{\mathcal{M}'}_{n/\mathcal{B}'_X} \\
\mathcal{H}om_{\mathcal{B}_X}(\widetilde{p}^n_{1*}\widetilde{\mathcal{P}}^n, \mathcal{M}') & \xrightarrow[\sim]{} & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{\mathcal{P}}^n \otimes_{\mathcal{B}_X} \mathcal{B}'_X, \mathcal{M}') & \xleftarrow[\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X}]{\sim} & \mathcal{H}om_{\mathcal{B}'_X}(\widetilde{p}'^n_{1*}\widetilde{\mathcal{P}}'^n, \mathcal{M}')
\end{array} \tag{4.3.3.2.1}$$

We say that the isomorphisms $\varepsilon^{\mathcal{M}'}_{n/\mathcal{B}_X}$ are "semi-linear with respect to $(\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X})^{-1}$" if the isomorphisms $\varepsilon^{\mathcal{M}'}_{n/\mathcal{B}'_X}$ are $\widetilde{\mathcal{P}}'^n$-linear.

Proposition 4.3.3.3. *Let $\mathcal{B}'_X$ be a commutative $\mathcal{B}_X$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module such that $\mathcal{B}_X \to \mathcal{B}'_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Let $\mathcal{M}'$ be a right $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. We suppose the underlying structure of $\mathcal{B}_X$-module of $\mathcal{M}'$ extends to a structure of $\mathcal{B}'_X$-module. Let $(\varepsilon^{\mathcal{M}'}_{n/\mathcal{B}_X})$ be the m-PD-costratification with coefficients in $\mathcal{B}_X$ associated with $\mathcal{M}'$. The following assertions are equivalent.*

(a) Both structures of right $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{B}'_X$-module of $\mathcal{M}'$ extend (uniquely) to a structure of right $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module.

(b) The isomorphisms $\varepsilon^{\mathcal{M}'}_{n/\mathcal{B}_X}$ are semi-linear with respect to the isomorphisms $(\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X})^{-1}$ for any $n \in \mathbb{N}$.

Proof. The proof is analogous to that of 4.3.2.6: this is a consequence of the formula 4.2.2.6.2 used by composing it with the evaluation at 1 morphism (recall also the diagram 4.3.3.2.1 and the fact that $\varepsilon_{n/\mathcal{B}_X}^{\mathcal{B}'_X}$ sends 1 to 1). □

4.3.4 Coefficients extension

4.3.4.1. We will write $\widetilde{\mathcal{D}}_X^{\prime(m)} := \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}_{X^\sharp}^{(m)}$ and $\widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)} := \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S^\sharp(m)}$. Let us denote simply by $\rho\colon \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)}$ the homomorphism $\rho \otimes \mathrm{id}$. Similarly to 4.1.2.5, the canonical morphism $\widetilde{p}^{\prime n}_{0(m)}\colon \mathcal{B}'_X \to \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^{n}_{X^\sharp/S^\sharp(m)}$ endows the sheaf $\widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)}$ with a structure of $\mathcal{B}'_X$-algebra, that we will call *left* structure. Moreover, the morphism of $\mathcal{B}'_X$-algebras

$$\widetilde{p}^{\prime n}_{1(m)}\colon \mathcal{B}'_X \to \mathcal{P}^{\prime n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}'_X \xrightarrow{\epsilon_n^{\mathcal{B}'_X}} \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{P}^{\prime n}_{X^\sharp/S^\sharp(m)}$$

induces a second structure of $\mathcal{B}'_X$-algebra on $\widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)}$, that we call the *right* structure. Let $j = 0$ or 1. Since ρ is horizontal, then we can check the commutativity of the diagram in the case $j = 1$ (the case $j = 0$ is obvious):

$$\begin{array}{ccc} \mathcal{B}_X & \xrightarrow{\widetilde{p}_j^n} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \\ \downarrow{\scriptstyle \rho} & & \downarrow{\scriptstyle \rho^n_{(m)}} \\ \mathcal{B}'_X & \xrightarrow{\widetilde{p}_j^{\prime n}} & \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)}. \end{array} \tag{4.3.4.1.1}$$

This means that $\rho^n_{(m)}\colon \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)}$ is $\mathcal{B}_X$-linear for both left and right structures. This yields the homomorphism

$$\rho^n_{(m)} \otimes \rho^{n'}_{(m)}\colon \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{\prime n'}_{X^\sharp/S^\sharp(m)} \tag{4.3.4.1.2}$$

Similarly to 4.1.2.11, we define the homomorphisms

$$\widetilde{\delta}^{\prime n,n'}_{(m)}, \widetilde{q_0}^{\prime n,n'}, \widetilde{q_1}^{\prime n,n'}\colon \widetilde{\mathcal{P}}^{\prime n+n'}_{X^\sharp/S^\sharp(m)} \to \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{\prime n'}_{X^\sharp/S^\sharp(m)}.$$

We can also write the m-PD-algebras homomorphism $\widetilde{\delta}^{n,n'}_{(m)}$ (resp. $\widetilde{q}^{n,n'}_{0(m)}$, resp. $\widetilde{q}^{n,n'}_{1(m)}$) by $\widetilde{p}^{n,n'}_{02,(m)}$ (resp. $\widetilde{p}^{n,n'}_{01,(m)}$, resp. $\widetilde{p}^{n,n'}_{12,(m)}$) ; and similarly with some primes (see the notation 3.2.2.14). Then for $0 \le i < j \le 2$, we have the commutative diagram of commutative rings:

$$\begin{array}{ccc} \widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\widetilde{p}^{n,n'}_{ij,(m)}} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} \\ \downarrow{\scriptstyle \rho^{n+n'}_{(m)}} & & \downarrow{\scriptstyle \rho^n_{(m)} \otimes \rho^{n'}_{(m)}} \\ \widetilde{\mathcal{P}}^{\prime n+n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\widetilde{p}^{\prime n,n'}_{ij,(m)}} & \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}'_X} \widetilde{\mathcal{P}}^{\prime n'}_{X^\sharp/S^\sharp(m)}. \end{array} \tag{4.3.4.1.3}$$

4.3.4.2. We keep notation 4.3.4.2. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module. We will write $\mathcal{E}' := \mathcal{B}'_X \otimes_{\mathcal{B}_X} \mathcal{E}$. Let $(\varepsilon_n^{\mathcal{E}})$ be the m-PD-stratification with coefficients in $\mathcal{B}_X$ associated with $\mathcal{E}$. Let $\varepsilon_n^{\mathcal{E}'}$ be the $\widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)}$-linear homomorphism induced by extension from $\varepsilon_n^{\mathcal{E}}$, i.e. making commutative the diagram

$$\begin{array}{ccc} \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}'_X} \mathcal{E}' & \xrightarrow[\sim]{\alpha} & \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)} \otimes_{\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}} (\widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \mathcal{E}) \\ \downarrow{\scriptstyle \varepsilon_n^{\mathcal{E}'}} & & \sim \downarrow{\scriptstyle \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp}} \varepsilon_n^{\mathcal{E}}} \\ \mathcal{E}' \otimes_{\mathcal{B}'_X} \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)} & \xleftarrow[\beta]{\sim} & (\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)}) \otimes_{\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}} \widetilde{\mathcal{P}}^{\prime n}_{X^\sharp/S^\sharp(m)}, \end{array} \tag{4.3.4.2.1}$$

so that α and β are the canonical isomorphisms.

Lemma 4.3.4.3. *We keep notation 4.3.4.2. Suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $u_1, \ldots, u_r$. Let $b' \in \mathcal{B}'_X$, $x \in \mathcal{E}$. We have the formula*

$$\varepsilon_n^{\mathcal{E}'}((1\otimes 1)\otimes(b'\otimes x)) = \sum_{|\underline{k}|\leq n} \underline{\partial}_\sharp^{\langle \underline{k}\rangle}(b'\otimes x)\otimes \underline{\tau}_\sharp^{\{\underline{k}\}}, \tag{4.3.4.3.1}$$

where (by abuse of notation) $\{\underline{\tau}_\sharp^{\{\underline{k}\}},\ |\underline{k}|\leq n\}$ with $|\underline{k}|\leq n$ is the basis of $\widetilde{\mathcal{P}}'^n_{X^\sharp/S^\sharp(m)}$ induced by the basis $\{\underline{\tau}_\sharp^{\{\underline{k}\}},\ |\underline{k}|\leq n\}$ of $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$ and where $\underline{\partial}_\sharp^{\langle \underline{k}\rangle}(b'\otimes x)$ is given by the action of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E}$ via the tensor product (see 4.2.3.1.(a)).

Proof. With the notation 4.3.4.2.1, α (resp. β) is the homomorphism given by $\tau'\otimes(b'\otimes x)\mapsto \tau'\widetilde{p}'^n_{1(m)}(b')\otimes((1\otimes 1)\otimes x)$ (resp. $(x\otimes\tau)\otimes\tau'\mapsto(1\otimes x)\otimes\rho(\tau)\tau'$) where $(1\otimes 1)$ is the unit of $\widetilde{\mathcal{P}}'^n_{X^\sharp/S^\sharp(m)}$, $b'\in\mathcal{B}'_X$, $x\in\mathcal{E}$, $\tau\in\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ and $\tau'\in\widetilde{\mathcal{P}}'^n_{X^\sharp/S^\sharp(m)}$. Hence, we compute

$$\begin{aligned}
\varepsilon_n^{\mathcal{E}'}((1\otimes 1)\otimes(b'\otimes x)) &= \beta\left(\varepsilon_n^{\mathcal{E}}((1\otimes 1)\otimes x)\otimes\widetilde{p}'^n_{1(m)}(b')\right) \overset{4.2.1.5.4}{=} \beta\left((\sum_{|\underline{i}|\leq n}(\underline{\partial}_\sharp^{\langle\underline{i}\rangle}x\otimes\underline{\tau}_\sharp^{\{\underline{i}\}})\otimes\widetilde{p}'^n_{1(m)}(b')\right)\\
&= \sum_{|\underline{i}|\leq n}(1\otimes\underline{\partial}_\sharp^{\langle\underline{i}\rangle}x)\otimes\underline{\tau}_\sharp^{\{\underline{i}\}}\widetilde{p}'^n_{1(m)}(b') \overset{4.2.1.7.2}{=} \sum_{|\underline{i}|\leq n}\sum_{|\underline{j}|\leq n}(1\otimes\underline{\partial}_\sharp^{\langle\underline{i}\rangle}x)\otimes\widetilde{p}'^n_{0,(m)}(\underline{\partial}_\sharp^{\langle\underline{j}\rangle}(b'))\underline{\tau}_\sharp^{\{\underline{j}\}}\underline{\tau}_\sharp^{\{\underline{i}\}}\\
&= \sum_{|\underline{i}|\leq n}\sum_{|\underline{j}|\leq n}(\underline{\partial}_\sharp^{\langle\underline{j}\rangle}(b')\otimes\underline{\partial}_\sharp^{\langle\underline{i}\rangle}x)\otimes\underline{\tau}_\sharp^{\{\underline{j}\}}\underline{\tau}_\sharp^{\{\underline{i}\}} \overset{1.2.4.5.3}{=} \sum_{|\underline{k}|\leq n}\sum_{\underline{i}\leq\underline{k}}\left\{\begin{smallmatrix}\underline{k}\\ \underline{i}\end{smallmatrix}\right\}(\underline{\partial}_\sharp^{\langle\underline{k}-\underline{i}\rangle}(b')\otimes\underline{\partial}_\sharp^{\langle\underline{i}\rangle}x)\otimes\underline{\tau}_\sharp^{\{\underline{k}\}}\\
&\overset{4.2.3.1.1}{=} \sum_{|\underline{k}|\leq n}\underline{\partial}_\sharp^{\langle\underline{k}\rangle}(b'\otimes x)\otimes\underline{\tau}_\sharp^{\{\underline{k}\}}.
\end{aligned}$$

□

Proposition 4.3.4.4. *The family $(\varepsilon_n^{\mathcal{E}'})$ is an m-PD-stratification with coefficients in $\mathcal{B}'_X$ on $\mathcal{E}'$. This yields a canonical structure of left $\widetilde{\mathcal{D}}'^{(m)}_X$-module on $\mathcal{E}'$, which is named the structure induced by extension from the structure of left $\widetilde{\mathcal{D}}^{(m)}_X$-module of $\mathcal{E}$.*

Proof. Since this is local, we can suppose $X^\sharp\to S^\sharp$ is endowed with logarithmic coordinates. It follows from the formula 4.3.4.3.1 that the formula 4.2.1.6.1 holds. Hence, following 4.2.1.6 the cocycle condition holds for $(\varepsilon_n^{\mathcal{E}'})$. □

Lemma 4.3.4.5. *We keep notation 4.3.4.2. We still denote by $\rho\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\to\widetilde{\mathcal{D}}'^{(m)}_{X^\sharp/S^\sharp}$ the canonical ring homomorphism induced by ρ (see 4.3.1.1.a). Let $\rho_*(\mathcal{E}')$ be the sheaf $\mathcal{E}'$ endowed with the left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structure induced via ρ by its left $\widetilde{\mathcal{D}}'^{(m)}_{X^\sharp/S^\sharp}$-module structure. Since $\mathcal{B}'_X$ and $\mathcal{E}$ are both left $\widetilde{\mathcal{D}}^{(m)}_X$-modules, then there exists on $\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E}$ another structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module given by the tensor product (see 4.2.3.1.(a)). In fact, these two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structures on $\mathcal{E}'$ are equal.*

Proof. Since this is local, we can suppose $X^\sharp\to S^\sharp$ is endowed with logarithmic coordinates. Then this is a consequence of Taylor formula 4.2.1.5.4 and of the formula 4.3.4.3.1. □

Lemma 4.3.4.6. *If $\mathcal{E}$ is a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module. The canonical homomorphism*

$$\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E}\to(\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{D}^{(m)}_{X^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}}\mathcal{E}, \tag{4.3.4.6.1}$$

given by $b'\otimes x\mapsto(b'\otimes 1)\otimes x$, is an isomorphism of left $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules, where the structure of the left term $\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E}$ is defined at 4.3.4.2.

Proof. Since the canonical homomorphism $\mathcal{B}'_X \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp} \to \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ induced by the ring homomorphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp} \to \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ (see 4.3.1.1.1) is an isomorphism, then by associativity of the tensor product the map 4.3.4.6.1 is therefore an isomorphism of $\mathcal{B}'_X$-modules. It remains to check 4.3.4.6.1 is $\mathcal{D}^{(m)}_{X^\sharp}$-linear. Since this is local, we can suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $u_1, \ldots, u_r$ and keep notation 4.3.5.2. Let $\underline{k} \in \mathbb{N}^r$. It follows from the formula 4.2.3.1.1 and Lemma 4.3.4.5 that we have

$$\underline{\partial}_\sharp^{\langle \underline{k} \rangle} \cdot (b' \otimes x) = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{i} \rangle} b' \otimes \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i} \rangle} x.$$

Hence, $\underline{\partial}_\sharp^{\langle \underline{k} \rangle} \cdot (b' \otimes x)$ is sent via the homomorphism 4.3.4.6.1 to

$$\sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} (\underline{\partial}_\sharp^{\langle \underline{i} \rangle} b' \otimes 1) \otimes \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i} \rangle} x = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} (\underline{\partial}_\sharp^{\langle \underline{i} \rangle} b' \otimes 1)(1 \otimes \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i} \rangle}) \otimes x$$
$$= \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} (\underline{\partial}_\sharp^{\langle \underline{i} \rangle} b' \otimes \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i} \rangle}) \otimes x \overset{4.1.2.2.3}{=} \Big((1 \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle})(b' \otimes 1) \Big) \otimes x = \underline{\partial}_\sharp^{\langle \underline{k} \rangle} \cdot ((b' \otimes 1) \otimes x)\,.$$

□

4.3.4.7. We keep notation 4.3.4.2. Let $\mathcal{M}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module. We will write $\mathcal{M}' := \rho^\flat(\mathcal{M}) = \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}'_X, \mathcal{M})$. Let $(\varepsilon_n^{\mathcal{M}})$ be the m-PD-costratification with coefficients in $\mathcal{B}_X$ associated with $\mathcal{M}$. Let $\varepsilon_n^{\mathcal{M}'}$ be the $\widetilde{\mathcal{P}}'^n_{X^\sharp/S^\sharp(m)}$-linear homomorphism induced by $\varepsilon_n^{\mathcal{M}}$, i.e. making commutative the diagram

$$\begin{array}{ccc} \widetilde{p}'^{n\flat}_{0(m)}(\mathcal{M}) & \xrightarrow[\sim]{\alpha} & \rho^{n\flat}_{(m)}(\widetilde{p}^{n\flat}_{0(m)}(\mathcal{M})) \\ \Big\downarrow{\scriptstyle \varepsilon_n^{\mathcal{M}'}} & & \sim \Big\downarrow{\scriptstyle \rho^{n\flat}_{(m)}(\varepsilon_n^{\mathcal{M}})} \\ \widetilde{p}'^{n\flat}_{1(m)}(\mathcal{M}) & \xleftarrow[\beta]{\sim} & \rho^{n\flat}_{(m)}(\widetilde{p}^{n\flat}_{1(m)}(\mathcal{M})), \end{array} \tag{4.3.4.7.1}$$

so that α and β are the canonical isomorphisms. The family $(\varepsilon_n^{\mathcal{M}'})$ is an m-PD-costratification with coefficients in $\mathcal{B}'_X$ on $\mathcal{M}'$. This yields a canonical structure of left $\widetilde{\mathcal{D}}'^{(m)}_X$-module on $\mathcal{M}'$, which is named the structure induced by extension from the structure of left $\widetilde{\mathcal{D}}^{(m)}_X$-module of $\mathcal{M}$. We still denote by $\rho\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}'^{(m)}_{X^\sharp/S^\sharp}$ the canonical ring homomorphism induced by ρ (see 4.3.1.1.a). Let $\rho_*(\mathcal{M}')$ be the sheaf $\mathcal{M}'$ endowed with the right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structure induced via ρ by its right $\widetilde{\mathcal{D}}'^{(m)}_{X^\sharp/S^\sharp}$-module structure. There exists on $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}'_X, \mathcal{M})$ another structure of right $\widetilde{\mathcal{D}}^{(m)}_X$-module given by the internal homomorphism structure (see 4.2.3.5). Similarly to 4.3.4.5, we can check that these two right $\widetilde{\mathcal{D}}^{(m)}_X$-module structures on $\mathcal{M}'$ are equal.

4.3.4.8. Let $\mathcal{M}$ be a right $\mathcal{D}^{(m)}_{X^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$-module. Via the transposition isomorphism $\gamma_{\mathcal{B}_X} : \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X \xrightarrow{\sim} \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ (see 4.2.5.7), $\mathcal{M}$ can be viewed as a right $\mathcal{D}^{(m)}_{X^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$-module. By associativity of the tensor product, we can check that the canonical homomorphism

$$\mathcal{M} \otimes_{\mathcal{B}_X} \mathcal{B}'_X \to \mathcal{M} \otimes_{\mathcal{D}^{(m)}_{X^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X} (\mathcal{D}^{(m)}_{X^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}'_X), \tag{4.3.4.8.1}$$

given by $x \otimes b' \mapsto x \otimes (1 \otimes b')$ is an isomorphism of $\mathcal{B}'_X$-modules. It follows from the commutative diagram 4.3.1.1.3 that we have the canonical isomorphism

$$\mathrm{id} \otimes_{\gamma_{\mathcal{B}_X}} \gamma_{\mathcal{B}'_X} : \mathcal{M} \otimes_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X} (\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}'_X) \to \mathcal{M} \otimes_{\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} (\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \tag{4.3.4.8.2}$$

By composing 4.3.4.8.1 and 4.3.4.8.2, we get the canonical homomorphism

$$\mathcal{M} \otimes_{\mathcal{B}_X} \mathcal{B}'_X \to \mathcal{M} \otimes_{\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} (\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \tag{4.3.4.8.3}$$

given by $x\otimes b'\mapsto x\otimes(b'\otimes 1)$, which is therefore a $\mathcal{B}'_X$-linear isomorphism. Via the formulas 4.2.3.5.1 and 4.2.5.7.3, we compute that 4.3.4.8.3 is right $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp}$-linear, where the structure of the left term is given by 4.2.3.5. Hence both structures of right $\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{B}'_X$-module of $\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{B}'_X$ extend to a structure of right $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. In other words, following 4.3.3.3, this means that the tensor product m-PD-costratification $\varepsilon^{\mathcal{M}}_n\otimes(\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X})^{-1}$ of $\mathcal{M}\otimes_{\mathcal{B}_X}\mathcal{B}'_X$ is semi-linear with respect to $(\varepsilon^{\mathcal{B}'_X}_{n/\mathcal{B}_X})^{-1}$.

Proposition 4.3.4.9. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{F}$ a left $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{E}\to\mathcal{F}$ be a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear morphism. The canonical morphism*

$$\rho\colon\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E}\to\mathcal{F},$$

is $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. Since the morphism ρ is equal to the composition morphism

$$\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E}\xrightarrow[4.3.4.6.1]{\sim}\left(\mathcal{B}'_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}\right)\otimes_{\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}}\mathcal{E}\to\mathcal{F},$$

then ρ is $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. □

Corollary 4.3.4.10. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{F}$ be a left $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. There exists a canonical isomorphism*

$$\mathcal{H}om_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{F})\xrightarrow{\sim}\mathcal{H}om_{\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_X}(\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{F}).\tag{4.3.4.10.1}$$

Proof. By using 6.3.2.4, we construct the homomorphism 4.3.4.10.1. Since the canonical morphism $\mathcal{E}\to\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E}$ is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear, we construct the inverse homomorphism of 4.3.4.10.1 via this one. □

Proposition 4.3.4.11. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules, $\mathcal{M},\mathcal{N}$ be two right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{G}$ be a left or a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.*

(a) The canonical isomomorphism

$$\mathcal{B}'_X\otimes_{\mathcal{B}_X}(\mathcal{E}\otimes_{\mathcal{B}_X}\mathcal{G})\xrightarrow{\sim}(\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E})\otimes_{\mathcal{B}'_X}(\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{G}),\tag{4.3.4.11.1}$$

is $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear.

(b) The canonical homomorphisms

$$\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E},\mathcal{G})\to\mathcal{H}om_{\mathcal{B}'_X}(\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{E},\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{G})\tag{4.3.4.11.2}$$

$$\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M},\mathcal{N})\to\mathcal{H}om_{\mathcal{B}'_X}(\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{M},\mathcal{B}'_X\otimes_{\mathcal{B}_X}\mathcal{N})\tag{4.3.4.11.3}$$

are $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. By definition, we get the $\mathcal{B}'_X$-linearity of the isomorphisms. It remains to check the $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linearity. Since this is local we can suppose $X^\sharp/S^\sharp$ has logarithmic coordinates. Via the formulas of 4.2.3.1 and 4.2.3.5, we check the isomorphisms commute with the action of $\underline{\partial}_\sharp^{\langle\underline{k}\rangle}$ and then we are done. □

Proposition 4.3.4.12. *Let $\mathcal{E}$, $\mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules, $\mathcal{E}'$ be a left $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module, $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and $\mathcal{M}'$ a right $\mathcal{B}'_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module.*

(a) *The canonical isomorphisms*

$$(\mathcal{B}'_X \otimes_{\mathcal{B}_X} \mathcal{E}) \otimes_{\mathcal{B}'_X} \mathcal{E}' \xrightarrow{\sim} \mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{E}', \qquad \mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{E}') \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}'_X}(\mathcal{B}'_X \otimes_{\mathcal{B}_X} \mathcal{E}, \mathcal{E}'), \quad (4.3.4.12.1)$$

are $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear. Hence, by structure transport, we can endow $\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{E}'$ and $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{E}')$ with a canonical structure of left $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module which extends its structure of left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. For instance, the canonical structure (see 4.2.3.1) of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{B}'_X \otimes_{\mathcal{B}_X} \mathcal{E}$ extends to a structure of left $\mathcal{B}'_X \otimes_{\mathcal{B}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module.

(b) *In the same way, we obtain a canonical structure of left (resp. right) $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{M}, \mathcal{M}')$ (resp. $\mathcal{M} \otimes_{\mathcal{B}_X} \mathcal{E}'$, $\mathcal{M}' \otimes_{\mathcal{B}_X} \mathcal{E}$, $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{M}')$) which extends its structure of left (resp. right) $\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module.*

Proof. Use the same arguments than for the proof of 4.3.4.11. □

4.3.5 Switch left to right $\mathcal{D}$-module structures, (log) adjoint operators

We keep notations and hypotheses of 4.2.

Notation 4.3.5.1. Let us denote by $\widetilde{\omega}_{X^\sharp/S^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \omega_{X^\sharp/S^\sharp}$, $\mathcal{B}_Y := \mathcal{B}_X|Y$, $\widetilde{\mathcal{D}}^{(m)}_Y := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y$ and $\widetilde{\omega}_Y := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \omega_{Y/S^\sharp}$. Recall that $\omega_{X^\sharp/S^\sharp}$ is a right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-submodule of $j_*\omega_Y$ (see 3.4.5.1). Hence, by using 4.3.4.8, this yields a canonical structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module on $\widetilde{\omega}_{X^\sharp/S^\sharp}$.

4.3.5.2 (Adjoint operator with or without logarithmic structure)**.** Suppose in this paragraph that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. Let $(t_\lambda)_{\lambda=1,\dots,r}$ be the induced coordinates of Y/S.

(a) Set $\widetilde{D}^{(m)}_Y := \Gamma(Y, \widetilde{\mathcal{D}}^{(m)}_Y)$. With notation 4.1.2.16.3, the adjoint operator 2.2.1.2 extends to a map $\widetilde{D}^{(m)}_Y \to \widetilde{D}^{(m)}_Y$ given by

$$P = \sum_{\underline{k} \in \mathbb{N}^d} b_{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}} \in \widetilde{D}^{(m)}_Y \mapsto {}^t P = \sum_{\underline{k}} (-1)^{|\underline{k}|} \underline{\partial}^{\langle \underline{k} \rangle} b_{\underline{k}},$$

where $b_{\underline{k}}$ is a finite sequence of elements of $\Gamma(Y, \mathcal{B}_X)$.

(b) Set $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp} := \Gamma(\mathfrak{X}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. With notation 4.1.2.16, via the local description 4.1.2.16.2, the logarithmic adjoint operator (see 3.4.1.2.3) extends to a map $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$ given by

$$P = \sum_{\underline{k} \in \mathbb{N}^d} b_{\underline{k}} \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}} \mapsto \widetilde{P} := \sum_{\underline{k}} \widetilde{\underline{\partial}}_\sharp^{\langle \underline{k} \rangle_{(m)}} b_{\underline{k}},$$

where $b_{\underline{k}}$ is a finite sequence of elements of $\Gamma(X, \mathcal{B}_X)$.

Proposition 4.3.5.3 (Comparison between adjoint operator with or without logarithmic structure)**.** *Suppose $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $u_1, \dots, u_r$ and keep notation 4.3.5.2. Let P, Q be two differential operators of $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$. With notation 4.3.5.2, the following properties hold.*

(a) *We have ${}^t({}^t P) = P$, $\widetilde{\widetilde{P}} = P$, ${}^t(PQ) = {}^t Q {}^t P$ and $\widetilde{PQ} = \widetilde{Q}\widetilde{P}$.*

(b) *Suppose $u_1, \dots, u_r \in \mathcal{O}^*_X$. We have the equality*

$$\rho(\widetilde{P}) = \rho\left(\underline{t}\ {}^t P\ \frac{1}{\underline{t}}\right), \qquad (4.3.5.3.1)$$

where $\underline{t} = \underline{t}^{\underline{1}} = t_1 \cdots t_n$ and where ρ is the canonical map $\widetilde{D}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{D}^{(m)}_Y$.

Proof. (a) Let $b \in \Gamma(X, \mathcal{B}_X)$ and $\underline{k} \in \mathbb{N}^r$ and $P := b\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}} \in \Gamma(X, \widetilde{D}^{(m)}_{X^\sharp/S^\sharp})$. Following 4.1.2.4.1, we get $\widetilde{P} = \underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} \rangle} b = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\widetilde{\partial}}_\sharp^{\langle \underline{i} \rangle}(b) \times \underline{\widetilde{\partial}}_\sharp^{\langle \underline{k}-\underline{i} \rangle}$. Since $\widetilde{\widetilde{\underline{\partial}}}_\sharp^{\langle \underline{k}-\underline{i} \rangle} = \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i} \rangle}$, then we get

$$\widetilde{\widetilde{P}} = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i} \rangle} \times \underline{\widetilde{\partial}}_\sharp^{\langle \underline{i} \rangle}(b).$$

Hence, the equality $\widetilde{\widetilde{P}} = P$ follows from the computations:

$$\sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i} \rangle} \times \underline{\widetilde{\partial}}_\sharp^{\langle \underline{i} \rangle}(b) \overset{3.2.3.7.2}{=} \sum_{\underline{i} \leq \underline{k}} \sum_{\underline{j} \leq \underline{k}-\underline{i}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{k}-\underline{i} \\ \underline{j} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i}-\underline{j} \rangle_{(m)}} (\underline{\widetilde{\partial}}_\sharp^{\langle \underline{i} \rangle}(b)) \underline{\partial}_\sharp^{\langle \underline{j} \rangle_{(m)}}$$

$$= \sum_{\underline{j} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{j} \end{smallmatrix} \right\} \left(\sum_{\underline{i} \leq \underline{k}-\underline{j}} \left\{ \begin{smallmatrix} \underline{k}-\underline{j} \\ \underline{i} \end{smallmatrix} \right\} \underline{\partial}_\sharp^{\langle \underline{k}-\underline{i}-\underline{j} \rangle_{(m)}} \underline{\widetilde{\partial}}_\sharp^{\langle \underline{i} \rangle}(b) \right) \underline{\partial}_\sharp^{\langle \underline{j} \rangle_{(m)}} \overset{3.4.5.2.1}{=} b\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}.$$

We compute similarly the equality $\widetilde{PQ} = \widetilde{Q}\widetilde{P}$, whereas the equalities involving the adjoint operators are obvious.

(b) By using 4.1.1.5 and replacing $\mathcal{B}_X$ by the image of the morphism $\mathcal{B}_X \to j_*\mathcal{B}_Y$ if necessary, to check the assertion (b) we can suppose that ρ is injective. Similar to 2.2.1.3, 3.4.1.3 and 3.4.1.5, we can therefore conclude the proposition. □

4.3.5.4. Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.

(a) It follows from 4.2.4.3.1 that we have the canonical isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules:

$$(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_r \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}. \tag{4.3.5.4.1}$$

(b) Since $\widetilde{\omega}_{X^\sharp/S^\sharp}$ is locally free (of rank one), the canonical $\mathcal{B}_X$-linear morphism

$$\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, \mathcal{M}) \xrightarrow{\sim} \mathcal{M} \tag{4.3.5.4.2}$$

is an isomorphism. Following 4.2.4.11.1, this isomorphism is moreover $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear. Similarly, it follows from 4.2.4.11.2 that we have the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear isomorphism:

$$\mathcal{E} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}). \tag{4.3.5.4.3}$$

(c) Following 4.3.4.12, $\mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, -)$ and $\mathcal{H}om_{\mathcal{O}_X}(\omega_{X^\sharp/S^\sharp}, -)$ (resp. $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} -$ and $\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} -$) are canonically isomorphism on the category of right (resp. left) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.

(d) This yields that the functors $- \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp} = \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, -)$ and $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} -$ (resp. $- \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp} = \mathcal{H}om_{\mathcal{O}_X}(\omega_{X^\sharp/S^\sharp}, -)$ and $\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} -$) induce quasi-inverse equivalences between the category of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and that of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.

4.3.5.5 (Local description)**.** Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Suppose in this paragraph that $X^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,r}$. Let $(t_\lambda)_{\lambda=1,\ldots,r}$ be the induced coordinates of Y/S.

(a) The element $d\log u_1 \wedge \cdots \wedge d\log u_d$ is a basis of the free $\mathcal{B}_X$-module $\widetilde{\omega}_{X^\sharp/S^\sharp}$. For any section $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ and $e \in \mathcal{E}$, we have the formula in $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$:

$$(d\log u_1 \wedge \cdots \wedge d\log u_d \otimes e)P = d\log u_1 \wedge \cdots \wedge d\log u_d \otimes \widetilde{P}e. \tag{4.3.5.5.1}$$

Indeed, by $\mathcal{B}_X$-linearity, it is sufficient to check it for $P = \underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} \rangle}$. Moreover, via 4.3.4.12.1, the canonical isomomorphism $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \xrightarrow{\sim} \omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. It follows from 3.4.5.1, $(d\log u_1 \wedge \cdots \wedge d\log u_d) \cdot \underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} \rangle} = 0$ is $\underline{k} \neq 0$. By using the formula 4.2.3.5.3, this yields that 4.3.5.5.1 holds for $P = \underline{\widetilde{\partial}}_\sharp^{\langle \underline{k} \rangle}$. Hence, we are done.

(b) This yields that, by identifying as above $\widetilde{\omega}_{X^\sharp/S^\sharp}$ and $\mathcal{B}_X$ the left action of $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ on $m \in \mathcal{M}$ in $\mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}$ is equal to $m \cdot \widetilde{P}$. These structures are called "twisted" structures.

(c) We get the analogous description for $\widetilde{\omega}_Y \otimes_{\mathcal{B}_Y} \mathcal{E}|_Y$ and $\mathcal{M}|_Y \otimes_{\mathcal{B}_Y} \widetilde{\omega}_Y^{-1}$ by exchanging $\widetilde{P}$ by ${}^{\mathrm{t}}P$, i.e. by replacing the logarithmic adjoint by the adjoint.

Lemma 4.3.5.6. *Let $\mathcal{E}$ (resp. $\mathcal{M}$) be a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. We have the following isomorphism of $\mathcal{O}_S$-modules:*

$$\mathcal{M} \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} \mathcal{E} \xrightarrow{\sim} (\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}) \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} (\mathcal{M} \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp}). \tag{4.3.5.6.1}$$

Proof. We construct the isomorphism 4.3.5.6.1 as follows:

$$\begin{aligned}
\mathcal{M} \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} \mathcal{E} &\underset{4.3.5.4.2}{\xleftarrow{\sim}} \big(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, \mathcal{M})\big) \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} \mathcal{E} \\
&\underset{4.3.5.4.1}{\xleftarrow{\sim}} \Big((\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_r \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, \mathcal{M}) \Big) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E} \\
&\underset{4.2.4.2.2}{\xrightarrow{\sim}} \Big((\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_l \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E} \Big) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, \mathcal{M}) \\
&\underset{4.2.5.6.1}{\xrightarrow{\sim}} \Big((\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_r \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E} \Big) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, \mathcal{M}) \\
&\underset{4.3.5.4.1}{\xrightarrow{\sim}} \big(\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}\big) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, \mathcal{M}).
\end{aligned}$$

□

Lemma 4.3.5.7. *The functors $- \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp} = \mathcal{H}om_{\mathcal{B}_X}(\widetilde{\omega}_{X^\sharp/S^\sharp}, -)$ and $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} -$ are exact and induce quasi-inverse equivalences between the category of (resp. coherent, resp. flat, resp. locally projective of finite type) left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and that of (resp. coherent, resp. flat, resp. locally projective of finite type) right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules.*

Proof. The exactness is obvious. With regards to the coherence and the local projectivity of finite type, it is sufficient to use the descriptions of 4.3.5.5 on the twisted structures (and recalling that the arrows that associates the logarithmic adjoint to a differential operator are isomorphisms). Finally, for the flatness, this is a consequence of the following fact: for any left $\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}$-module $\mathcal{E}$ and right $\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}$-module $\mathcal{M}$, we have the canonical isomorphism 4.3.5.6.1. □

Proposition 4.3.5.8. *Let $\mathcal{E}$, $\mathcal{F}$ of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and $\mathcal{M}$, $\mathcal{N}$ of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. The following canonical isomorphisms*

$$\begin{gathered}
\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} (\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}) \xrightarrow{\sim} (\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}) \otimes_{\mathcal{B}_X} \mathcal{F}, \\
(\mathcal{M} \otimes_{\mathcal{B}_X} \mathcal{E}) \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp} \xrightarrow{\sim} (\mathcal{M} \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp}) \otimes_{\mathcal{B}_X} \mathcal{E} \\
(\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}) \otimes_{\mathcal{B}_X} (\mathcal{M} \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp}) \xrightarrow{\sim} \mathcal{M} \otimes_{\mathcal{B}_X} \mathcal{E}, \\
\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{F}), \\
\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{M}) \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{M} \otimes_{\mathcal{O}_X} \omega^{-1}_{X^\sharp/S^\sharp}), \\
\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}, \omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{F}).
\end{gathered}$$

are $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. The $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linearity being local, we reduce to suppose X affine and $X^\sharp/S^\sharp$ endowed with logarithmic coordinates. The formulas 4.2.3.1.1, 4.2.3.5.1, 4.2.3.1.3, 4.2.3.5.2 and 4.2.3.5.5 allow us to conclude. □

Proposition 4.3.5.9. *The functor $\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} -$ of the category of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules in that of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules is canonically isomorphic to the functor $(\omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} -$.*

Proof. By taking $\mathcal{M} = \omega_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$ and $\mathcal{N} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$, this is a consequence of 4.2.4.3.2. □

4.3.5.10. Let $\mathcal{E}, \mathcal{F}$ (resp. $\mathcal{M}, \mathcal{N}$) be two left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. It follows from 4.3.5.6 and 4.3.5.7 that we have the following isomorphism of $\mathcal{O}_S$-modules:

$$(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{F}) \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} \mathcal{E} \xrightarrow{\sim} (\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}) \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} \mathcal{F}, \tag{4.3.5.10.1}$$

$$\mathcal{M} \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} (\mathcal{N} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}) \xrightarrow{\sim} \mathcal{N} \otimes_{\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}} (\mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}). \tag{4.3.5.10.2}$$

4.4 On the preservation of $\mathcal{D}$-module structures under pullbacks, base change

4.4.1 Relative ringed topoi

Definition 4.4.1.1. We will need the following definition.

(a) We define the category of "ringed logarithmic schemes" as follows: a ringed logarithmic scheme consists in pairs $(U^\sharp, \mathcal{B}_U)$ where $U^\sharp$ is a logarithmic scheme and $\mathcal{B}_U$ is a commutative $\mathcal{O}_U$-algebra. A "morphism of ringed logarithmic schemes" $\widetilde{\alpha}\colon (U^\sharp, \mathcal{B}_U) \to (V^\sharp, \mathcal{B}_V)$ is the data of a morphism of log schemes of the form $U^\sharp \to V^\sharp$ (denoted by α) and of a morphism of commutative $\mathcal{O}_U$-algebras $\alpha^*\mathcal{B}_V \to \mathcal{B}_U$ (denoted by ρ_α). We compose such morphisms in the obvious way.

(b) We define the category of "relative ringed logarithmic schemes" as follows: a "relative ringed logarithmic schemes" $(U^\sharp, \mathcal{B}_U)/(V^\sharp, \mathcal{B}_V)$ is a morphism of ringed logarithmic schemes $(U^\sharp, \mathcal{B}_U) \to (V^\sharp, \mathcal{B}_V)$. A morphism of relative ringed logarithmic schemes $(U^\sharp, \mathcal{B}_U)/(V^\sharp, \mathcal{B}_V) \to (U'^\sharp, \mathcal{B}_{U'})/(V'^\sharp, \mathcal{B}_{V'})$ is a commutative square of the form

$$\begin{array}{ccc} (U^\sharp, \mathcal{B}_U) & \xrightarrow{\widetilde{f}} & (U'^\sharp, \mathcal{B}_{U'}) \\ \downarrow{\scriptstyle \widetilde{\alpha'}} & & \downarrow{\scriptstyle \widetilde{\alpha'}} \\ (V^\sharp, \mathcal{B}_V) & \xrightarrow{\widetilde{g}} & (V'^\sharp, \mathcal{B}_{V'}), \end{array} \tag{4.4.1.1.1}$$

such that all the arrows are morphisms of ringed logarithmic schemes.

(c) Similarly, we define the categories of "(relative) ringed $\mathcal{V}$-log formal schemes" and (resp. of "(relative) ringed topoi", resp. "(relative) ringed spaces") by replacing logarithmic schemes by $\mathcal{V}$-log formal schemes (resp. topoi, resp. topological spaces).

Example 4.4.1.2. A scheme or log scheme can be viewed as a ringed logarithmic scheme via the faithfully flat functor given by $Z^\sharp \mapsto (Z^\sharp, \mathcal{O}_Z)$.

Definition 4.4.1.3. We complete the definitions of the categories of 4.4.1.1 by introducing the following notion of (strongly) quasi-flatness as follow.

(a) A morphism of ringed logarithmic schemes (resp. a morphism of ringed $\mathcal{V}$-log formal schemes) of the form $\widetilde{\phi}\colon (U^\sharp, \mathcal{B}_U) \to V^\sharp$ is said to be "quasi-flat" if $\mathcal{B}_U$ is a quasi-flat $\phi^{-1}\mathcal{O}_V$-algebra (see definition 3.1.1.5 or resp. 3.3.1.11).

(b) A morphism of ringed $\mathcal{V}$-log formal schemes $(\mathfrak{U}^\sharp, \mathcal{B}_{\mathfrak{U}})/\mathfrak{V}^\sharp$ is "strongly quasi-flat" if there exists a morphism $\mathfrak{V} \to \mathfrak{T}$ of $\mathcal{V}$-formal schemes such that the induced morphism of ringed spaces $(\mathfrak{U}, \mathcal{B}_{\mathfrak{U}}) \to \mathfrak{T}$ is flat and such that, denoting by $\mathcal{I}_{\mathfrak{T}}$ an ideal of definition of $\mathfrak{T}$, the sheaf $\mathcal{O}_{T_0}$ (resp. $gr^\bullet_{\mathcal{I}_{\mathfrak{T}}}\mathcal{O}_{\mathfrak{T}}$) has finite tor dimension on $\mathcal{O}_{\mathfrak{T}}$ (resp. $\mathcal{O}_{T_0}$).

(c) A morphism of relative ringed logarithmic schemes (resp. a morphism of relative ringed $\mathcal{V}$-log formal schemes) of the form $(U^\sharp, \mathcal{B}_U)/V^\sharp \to (U'^\sharp, \mathcal{B}_{U'})/V'^\sharp$ is said to be "quasi-flat" if there exists a morphism of schemes (resp. a morphism of $\mathcal{V}$-formal schemes) $V' \to T$ such that both induced morphisms of ringed spaces $(U', \mathcal{B}_{U'}) \to T$ and $(U, \mathcal{B}_U) \to T$ are flat. Remark that in both $(U^\sharp, \mathcal{B}_U)/V^\sharp$ and $(U'^\sharp, \mathcal{B}_{U'})/V'^\sharp$ are quasi-flat in the sense of (a).

(d) Let $\widetilde{\alpha} \colon (\mathfrak{U}^\sharp, \mathcal{B}_{\mathfrak{U}})/\mathfrak{V}^\sharp \to (\mathfrak{U}'^\sharp, \mathcal{B}_{\mathfrak{U}'})/\mathfrak{V}'^\sharp$ be a morphism of relative ringed $\mathcal{V}$-log formal schemes. We say that $\widetilde{\alpha}$ is "strongly quasi-flat" if there exists a morphism $\mathfrak{V}' \to \mathfrak{T}$ of $\mathcal{V}$-formal schemes such that both induced morphisms of ringed spaces $(\mathfrak{U}', \mathcal{B}_{\mathfrak{U}'}) \to \mathfrak{T}$ and $(\mathfrak{U}, \mathcal{B}_{\mathfrak{U}}) \to \mathfrak{T}$ are flat and such that denoting by $\mathcal{I}_{\mathfrak{T}}$ an ideal of definition of $\mathfrak{T}$ the sheaf $\mathcal{O}_{T_0}$ (resp. $gr^\bullet_{\mathcal{I}_{\mathfrak{T}}} \mathcal{O}_{\mathfrak{T}}$) has finite tor dimension on $\mathcal{O}_{\mathfrak{T}}$ (resp. $\mathcal{O}_{T_0}$). Remark that in both $(\mathfrak{U}^\sharp, \mathcal{B}_{\mathfrak{U}})/\mathfrak{V}^\sharp$ and $(\mathfrak{U}'^\sharp, \mathcal{B}_{\mathfrak{U}'})/\mathfrak{V}'^\sharp$ are strongly quasi-flat in the sense of (b).

Example 4.4.1.4. We will give later that in the case of overconvergent singularities, we do have strongly quasi-flat morphisms (7.3.2.11.b).

4.4.1.5. Let us explain a bit the purpose of these notions of (strongly) quasi-flatness of 4.4.1.3.

(a) The quasi-flatness will be useful to be able to define correctly extraordinary pullbacks or pushforwards (see 5.1.1.3).

(b) Let $(\mathfrak{U}^\sharp, \mathcal{B}_{\mathfrak{U}})/\mathfrak{V}^\sharp$ be a strongly quasi-flat morphism of ringed $\mathcal{V}$-log formal schemes. Then denoting by $\mathcal{I}$ an ideal of definition of $\mathfrak{U}$, the sheaf $\mathcal{O}_{U_0}$ (resp. $gr^\bullet_{\mathcal{I}} \mathcal{O}_{\mathfrak{U}}$) has finite tor dimension on $\mathcal{O}_{\mathfrak{U}}$ (resp. $\mathcal{O}_{U_0}$). Hence, we will be able to use 7.3.2.9, 7.3.2.10 and 7.3.3.3.

4.4.2 Pullbacks

Let

$$\begin{array}{ccc} X^\sharp & \xrightarrow{f} & Y^\sharp \\ \downarrow & & \downarrow \\ S^\sharp & \longrightarrow & T^\sharp, \end{array} \tag{4.4.2.0.1}$$

be a commutative diagram where $S^\sharp$ and $T^\sharp$ are nice fine log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ as defined in 3.1.1.1 where i is an integer, (resp. $S^\sharp$ and $T^\sharp$ are nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10) where $X^\sharp$ is a log smooth $S^\sharp$-log scheme (resp. log smooth $S^\sharp$-log formal scheme) and $Y^\sharp$ is a log smooth $T^\sharp$-log scheme (resp. log smooth $T^\sharp$-log formal scheme). Let $\mathcal{B}_X$ (resp. $\mathcal{B}_Y$) be a commutative $\mathcal{O}_X$-algebra (resp. $\mathcal{O}_Y$-algebra) endowed with a compatible structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module). Let us recall that $f^*\mathcal{B}_Y$ is endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module (see 3.4.4.2) which is compatible with its structure of $\mathcal{O}_X$-algebra (see 3.4.4.6). We suppose finally that we have a morphism of algebras $f^*\mathcal{B}_Y \to \mathcal{B}_X$ which is moreover $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. We will denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$.

We denote by $\widetilde{X}^\sharp$ (resp. $\widetilde{Y}^\sharp$) the ringed logarithmic scheme $(X^\sharp, \mathcal{B}_X)$ (resp. $(Y^\sharp, \mathcal{B}_Y)$), and by $\tilde{f} \colon \widetilde{X}^\sharp/S^\sharp \to \widetilde{Y}^\sharp/T^\sharp$ the morphism of relative ringed logarithmic schemes induced by the diagram 4.4.2.0.1 and by $f^*\mathcal{B}_{\underset{\sim}{Y}} \to \mathcal{B}_{\underset{\sim}{X}}$. When $S^\sharp \to T^\sharp$ in understood, by abuse of notation, we also denote by $\tilde{f}$ the induced morphism $\widetilde{X}^\sharp \to \widetilde{Y}^\sharp$ of ringed logarithmic schemes.

Notation 4.4.2.1. We have the following notation that can be also used by replacing respectively S and $X^\sharp$ by T and $Y^\sharp$.

For $j = 0, 1$, recall the morphisms $p^n_{j,(m)} \colon \Delta^n_{X^\sharp/S^\sharp(m)} \to X$ are finite and are homeomorphisms. We get a sheaf of rings on $\Delta^n_{X^\sharp/S^\sharp(m)}$ by setting $\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}} := p^{n*}_{0,(m)}(\mathcal{B}_X)$, i.e. $p^n_{0,(m)*}\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S(m)} = \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$. We get the ringed logarithmic ($\mathcal{V}$-formal) scheme

$$\widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)} := (\Delta^n_{X^\sharp/S^\sharp(m)}, \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}).$$

We denote by $\tilde{p}^n_{0,(m)}\colon \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)} \to \widetilde{X}^\sharp$ the morphism induced by the morphism of log (formal) schemes $p^n_{0,(m)}$ and by the ring homomorphism $(p^n_{0,(m)})^{-1}(\mathcal{B}_X) \to \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}$. By applying $p^n_{0,(m)*}$ to $(p^n_{0,(m)})^{-1}(\mathcal{B}_X) \to \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}$ we get $\widetilde{p}^n_{0,(m)}\colon \mathcal{B}_X \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ (see notation 4.1.2.5).

We denote by $\tilde{p}^n_{1,(m)}\colon \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)} \to \widetilde{X}^\sharp$ the morphism induced by the morphism of log (formal) schemes $p^n_{1,(m)}$ and by the ring homomorphism $(p^n_{1,(m)})^{-1}(\mathcal{B}_X) \to p^{n*}_{1,(m)}(\mathcal{B}_X) \xrightarrow[\epsilon^{\mathcal{B}_X}_n]{\sim} p^{n*}_0(\mathcal{B}_X) = \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}$. Since $p^n_{1,(m)*} = p^n_{0,(m)*}$ (see remark 3.2.2.6), then by applying $p^n_{0,(m)*}$ to this latter map, we get the homomorphism $\widetilde{p}^n_{1,(m)}\colon \mathcal{B}_X \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ (see notation 4.1.2.5).

According to notation 3.2.2.12, for any integer n and any integers $0 \le i < j \le 2$, it follows from the universal property of m-PD-envelopes of order n (see 3.2.1.1) that we get a unique m-PD-morphism $q^n_{ij,(m)}\colon \Delta^n_{X^\sharp/S^\sharp,(m)}(2) \to \Delta^n_{X^\sharp/S^\sharp,(m)}$ making commutative the diagram 3.2.2.12.1. For any $0 \le i \le 2$, we denote by $p^n_{i,(m)}(2)\colon \Delta^n_{X^\sharp/S^\sharp(m)}(2) \to X^\sharp$ the homomorphism equal to the composition of $\Delta^n_{X^\sharp/S^\sharp(m)}(2) \to X^{\sharp 3}_{/S^\sharp}$ with the ith projection. Similarly to the remark 3.2.2.6, $p^n_{i,(m)}(2)$ are finite homeomorphisms such that $p^n_{i,(m)}(2)_* = p^n_{0,(m)}(2)_*$. We set $\widetilde{\mathcal{P}}^n_{X^\sharp/S(m)}(2) := \mathcal{B}_X \otimes_{\mathcal{O}_X} p^n_{0,(m)}(2)_* \mathcal{P}^n_{X^\sharp/S(m)}(2)$. We get a sheaf of rings on $\Delta^n_{X^\sharp/S^\sharp(m)}(2)$ by setting $\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}(2)} := (p^n_{0,(m)}(2))^*(\mathcal{B}_X)$, i.e. $(p^n_{0,(m)}(2))^n_*(\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}) = \widetilde{\mathcal{P}}^n_{X^\sharp/S(m)}(2)$. We get the ring homomorphism $\widetilde{p}^n_{0,(m)}(2)\colon (p^n_{0,(m)}(2))^{-1}(\mathcal{B}_X) \to (p^n_{0,(m)}(2))^*(\mathcal{B}_X)$.

For $j = 1, 2$, via the identifications $(q^n_{0j,(m)})^* \circ p^{n*}_{0,(m)} = (p^n_{0,(m)}(2))^*$ and $(q^n_{0j,(m)})^* \circ p^{n*}_{1,(m)} = (p^n_{j,(m)}(2))^*$, we get the ring isomorphism $(q^n_{0j,(m)})^*(\epsilon^{\mathcal{B}_X}_n)\colon (p^n_{j,(m)}(2))^*(\mathcal{B}_X) \xrightarrow{\sim} (p^n_{0,(m)}(2))^*(\mathcal{B}_X)$. By composing with $(p^n_{0,(m)}(2))^{-1}(\mathcal{B}_X) = (p^n_{j,(m)}(2))^{-1}(\mathcal{B}_X) \to (p^n_{j,(m)}(2))^*(\mathcal{B}_X)$, we get the ring homomorphism $\widetilde{p}^n_{j,(m)}(2)\colon (p^n_{0,(m)}(2))^{-1}(\mathcal{B}_X) \to (p^n_{0,(m)}(2))^*(\mathcal{B}_X)$.

We set the ringed logarithmic ($\mathcal{V}$-formal) scheme

$$\widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)}(2) := (\Delta^n_{X^\sharp/S^\sharp(m)}(2), \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}(2)}).$$

We denote by $\widetilde{p}^n_{j,(m)}(2)\colon \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)}(2) \to \widetilde{X}^\sharp$ the morphism induced by the morphism of log (formal) schemes $p^n_{j,(m)}(2)$ and by the ring homomorphism $\widetilde{p}^n_{j,(m)}(2)\colon (p^n_{0,(m)}(2))^{-1}(\mathcal{B}_X) \to (p^n_{j,(m)}(2))^*(\mathcal{B}_X)$.

For $j = 1, 2$, we set $\widetilde{q}^n_{0j,(m)}\colon (q^n_{0j,(m)})^{-1}(\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}) \to (q^n_{0j,(m)})^*(\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}) = \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}(2)}$. We have moreover, $\widetilde{q}^n_{12,(m)}\colon (q^n_{12,(m)})^{-1}(\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}) \to (q^n_{12,(m)})^*(\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}) = (p^n_{1,(m)}(2))^*(\mathcal{B}_X) = (q^n_{01,(m)})^* \circ p^{n*}_{1,(m)}(\mathcal{B}_X) \xrightarrow[\varepsilon^{\mathcal{B}_X}_n]{\sim} (q^n_{01,(m)})^* \circ p^{n*}_{0,(m)}(\mathcal{B}_X) = \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}(2)}$. For any integer n and any integers $0 \le i < j \le 2$, we denote by $\widetilde{q}^n_{ij,(m)}\colon \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)}(2) \to \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)}$ the morphism induced by the morphism of log (formal) schemes $q^n_{ij,(m)}$ and by the ring homomorphism $\widetilde{q}^n_{ij,(m)}\colon (q^n_{ij,(m)})^{-1}(\mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}}) \to (p^n_{0,(m)}(2))^{-1}(\mathcal{B}_X) \to \mathcal{B}_{\Delta^n_{X^\sharp/S^\sharp(m)}(2)}$. We have by construction the equality of morphism of ringed logarithmic ($\mathcal{V}$-formal) schemes:

$$\widetilde{p}^n_{0,(m)} \circ \widetilde{q}^n_{ij,(m)} = \widetilde{p}^n_{i,(m)}(2), \qquad \widetilde{p}^n_{1,(m)} \circ \widetilde{q}^n_{ij,(m)} = \widetilde{p}^n_{j,(m)}(2). \tag{4.4.2.1.1}$$

4.4.2.2. It follows from the ring homomorphisms of 3.4.4.1.2 and from $f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ that we get the ring homomorphisms

$$f^{-1}(\mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y^\sharp/T^\sharp(m)}) \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}; \tag{4.4.2.2.1}$$

$$f^{-1}(\mathcal{P}^n_{Y^\sharp/T^\sharp(m)} \otimes_{\mathcal{O}_Y} \mathcal{B}_Y) \to \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X. \tag{4.4.2.2.2}$$

The fact that the homomorphism $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear is equivalent to the commutativity of the following diagram:

$$\begin{array}{ccc} f^{-1}(\mathcal{P}^n_{Y^\sharp/T^\sharp(m)} \otimes_{\mathcal{O}_Y} \mathcal{B}_Y) & \xrightarrow{4.4.2.2.2} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X \\ {\scriptstyle f^{-1}(\varepsilon^{\mathcal{B}_Y}_n)}\downarrow\wr & & {\scriptstyle \varepsilon^{\mathcal{B}_X}_n}\downarrow\wr \\ f^{-1}(\mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y^\sharp/T^\sharp(m)}) & \xrightarrow{4.4.2.2.1} & \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}. \end{array} \tag{4.4.2.2.3}$$

With notation 4.1.2.5, it follows from the commutative diagram 4.4.2.2.3, the commutativity of the diagram in the case $j = 1$ (the case $j = 0$ is obvious):

$$\begin{array}{ccc} f^{-1}(\mathcal{B}_Y) & \xrightarrow{f^{-1}\widetilde{p}^n_{j,(m)}} & f^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)} \\ \downarrow & & \downarrow {\scriptstyle 4.4.2.2.1} \\ \mathcal{B}_X & \xrightarrow{\widetilde{p}^n_{j,(m)}} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}. \end{array} \tag{4.4.2.2.4}$$

According to notation 3.4.4.1, we have the canonical morphism $f^n_{(m)} \colon \Delta^n_{X^\sharp/S^\sharp(m)} \to \Delta^n_{Y^\sharp/T^\sharp(m)}$. We denote by $\widetilde{f}^n_{(m)} \colon \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)} \to \widetilde{\Delta}^n_{Y^\sharp/T^\sharp(m)}$ the morphism of ringed logarithmic ($\mathcal{V}$-formal) schemes given by the morphism of log (formal) schemes $f^n_{(m)}$ and by 4.4.2.2.1. For any couple of integers $n \geq n'$, for any integer $r \geq 0$, we denote by

$$\widetilde{\psi}^{n,n'}_{X^\sharp/S^\sharp,(m)}(r) \colon \widetilde{\Delta}^{n'}_{X^\sharp/S^\sharp,(m)}(r) \to \widetilde{\Delta}^n_{X^\sharp/S^\sharp,(m)}(r) \tag{4.4.2.2.5}$$

the canonical exact closed immersion induced by 4.1.2.12.1. We get from the commutativity of the right square of 3.4.4.1.1 and of 4.4.2.2.4 that of

$$\begin{array}{ccccc} \widetilde{\Delta}^{n'}_{X^\sharp/S^\sharp(m)} & \xhookrightarrow{\widetilde{\psi}^{n,n'}_{X^\sharp/S^\sharp,(m)}} & \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)} & \xrightarrow{\tilde{p}^n_{j,(m)}} & \widetilde{X}^\sharp \\ \downarrow {\scriptstyle \widetilde{f}^{n'}_{(m)}} & & \downarrow {\scriptstyle \widetilde{f}^n_{(m)}} & & \downarrow {\scriptstyle \tilde{f}} \\ \widetilde{\Delta}^{n'}_{Y^\sharp/T^\sharp(m)} & \xhookrightarrow{\widetilde{\psi}^{n,n'}_{Y^\sharp/T^\sharp,(m)}} & \widetilde{\Delta}^n_{Y^\sharp/T^\sharp(m)} & \xrightarrow{\tilde{p}^n_{j,(m)}} & \widetilde{Y}^\sharp. \end{array} \tag{4.4.2.2.6}$$

4.4.2.3. It follows from the ring homomorphisms of 3.4.4.1.2 and from $f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ that we get the ring homomorphisms

$$f^{-1}(\mathcal{B}_Y \otimes_{\mathcal{O}_Y} p^n_{0,(m)}(2)_* \mathcal{P}^n_{Y^\sharp/T^\sharp(m)}(2) \to \mathcal{B}_X \otimes_{\mathcal{O}_X} p^n_{0,(m)}(2)_* \mathcal{P}^n_{X^\sharp/S^\sharp(m)}(2). \tag{4.4.2.3.1}$$

We denote by $\widetilde{f}^n_{(m)}(2) \colon \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)}(2) \to \widetilde{\Delta}^n_{Y^\sharp/T^\sharp(m)}(2)$ the morphism of ringed logarithmic ($\mathcal{V}$-formal) schemes given by the morphism of log (formal) schemes $f^n_{(m)}(2)$ and by 4.4.2.3.1. These homomorphisms are compatible when n varies, i.e., with notation 3.2.2.2.1, we have the equality $\widetilde{\psi}^{n',n}_{Y^\sharp/T^\sharp,(m)}(2) \circ \widetilde{f}^n_{(m)}(2) = \widetilde{f}^{n'}_{(m)}(2) \circ \widetilde{\psi}^{n',n}_{X^\sharp/S^\sharp,(m)}(2)$, for any $n' \geq n$. We have the commutative diagram:

$$\begin{array}{ccc} \widetilde{\Delta}^n_{X^\sharp/S^\sharp,(m)}(2) & \xrightarrow{\widetilde{q}^n_{ij,(m)}} & \widetilde{\Delta}^n_{X^\sharp/S^\sharp,(m)} \\ \downarrow {\scriptstyle \widetilde{f}^n_{(m)}(2)} & & \downarrow {\scriptstyle \widetilde{f}^n_{(m)}} \\ \widetilde{\Delta}^n_{Y^\sharp/T^\sharp,(m)}(2) & \xrightarrow{\widetilde{q}^n_{ij,(m)}} & \widetilde{\Delta}^n_{Y^\sharp/T^\sharp,(m)}. \end{array} \tag{4.4.2.3.2}$$

4.4.2.4. Let us now construct the inverse image of a left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module within the terminology of m-PD-stratifications with coefficients in $\mathcal{B}_Y$.

Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module and $(\varepsilon^{\mathcal{E}}_n)$ its m-PD-stratification with coefficients in $\mathcal{B}_Y$. The $\mathcal{B}_X$-module $\widetilde{f}^*\mathcal{E}$ has a canonical structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Indeed, it is a consequence of the commutative diagram 4.4.2.2.6 that the isomorphisms $\varepsilon^{\widetilde{f}^*\mathcal{E}}_n := \widetilde{f}^{n*}_{(m)}(\varepsilon^{\mathcal{E}}_n)$ endow $\widetilde{f}^*\mathcal{E}$ with an m-PD-stratification with coefficients in $\mathcal{B}_Y$ (for the cocycle conditions, we use the commutativity of 4.4.2.3.2 and the equalities 4.4.2.1.1). Let $\mathcal{D}$ be a sheaf of rings. When $\mathcal{E}$ is a $(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{D})$-bimodule, then by functoriality $\widetilde{f}^*(\mathcal{E})$ is a $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\mathcal{D})$-bimodule. For instance we get the $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodule $\widetilde{f}^*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ that we will denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}$.

Example 4.4.2.5. Let us consider the morphism of ringed logarithmic ($\mathcal{V}$-formal) schemes : $(X^\sharp, \mathcal{B}_X) \xrightarrow{\widetilde{\mathrm{id}}} (X^\sharp, \mathcal{O}_X)$ (and $S^\sharp = T^\sharp$). If $\mathcal{E}$ is a left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module, it is a consequence of 4.3.4.2.1, that the structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module on $(\widetilde{\mathrm{id}})^*(\mathcal{E})$ defined by inverse image is equal to the structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module defined by extension.

4.4.2.6. We get the $\mathcal{B}_X$-algebra $\widetilde{f}^*(\widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) := \mathcal{B}_X \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}(\widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)})$. The morphism 4.4.2.2.1 factors throught (by abuse of notation): the homomorphism of $\mathcal{B}_X$-algebras:

$$\widetilde{f}^n_{(m)} \colon \widetilde{f}^*(\widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) \to \widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}. \tag{4.4.2.6.1}$$

Dualizing the formula 4.4.2.6.1, we obtain the homomorphism of $\mathcal{B}_X$-modules

$$\widetilde{f}^{n\vee}_{(m)} \colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n} \to \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp,n}. \tag{4.4.2.6.2}$$

Passing to the limit, we get the canonical homomorphism of $\mathcal{B}_X$-modules:

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}. \tag{4.4.2.6.3}$$

Example 4.4.2.7. Suppose $f = \mathrm{id}$. Then we get from 4.4.2.6.3

$$\rho^\star \colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to X^\sharp/T^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}, \tag{4.4.2.7.1}$$

which is by construction induced by the $\mathcal{B}_X$-linear dual of the natural maps $\rho_n := \widetilde{\mathrm{id}}^n_{(m)} \colon \widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp(m)} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$. Then it follows from the commutativity of 4.4.2.3.2 that for any $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\, n}$, $P' \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\, n'}$, we get the commutative diagram

$$\begin{array}{ccccccc}
\widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/T^\sharp(m)} & \xrightarrow{\widetilde{\delta}^{n,n'}_{(m)}} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/T^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\mathrm{id} \otimes \rho^\star(P')} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/T^\sharp(m)} & \xrightarrow{\rho^\star(P)} & \mathcal{B}_X \\
\downarrow{\scriptstyle \rho_{n+n'}} & & \downarrow{\scriptstyle \rho_n \otimes \rho_{n'}} & & \downarrow{\scriptstyle \rho_n} & & \| \\
\widetilde{\mathcal{P}}^{n+n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\widetilde{\delta}^{n,n'}_{(m)}} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^{n'}_{X^\sharp/S^\sharp(m)} & \xrightarrow{\mathrm{id} \otimes P'} & \widetilde{\mathcal{P}}^{n}_{X^\sharp/S^\sharp(m)} & \xrightarrow{P} & \mathcal{B}_X
\end{array} \tag{4.4.2.7.2}$$

whose horizontal bottom (resp. top) morphisms is then $P \cdot P'$ (resp. $\rho^\star(P) \cdot \rho^\star(P')$). This yields that 4.4.2.7.1 is a ring homomorphism. Besides, the structure of left $\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp}$ on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to X^\sharp/T^\sharp}$ is given by this ring homomorphism. When $S^\sharp \to T^\sharp$ is log-smooth, we will make some local commutations (see below 5.3.1).

Proposition 4.4.2.8. *The canonical homomorphism 4.4.2.6.3 sends* 1 *to* $1 \otimes 1$ *and is* $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\mathcal{B}_Y)$*-bilinear.*

Proof. We can copy 3.4.4.4. □

Proposition 4.4.2.9. *Let* $\mathcal{F}$ *be a left* $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$*-module. We have the canonical isomorphism of left* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-modules:*

$$\widetilde{f}^*\mathcal{F} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{F}. \tag{4.4.2.9.1}$$

Proof. We can copy the proof of 3.4.4.5.1. □

Corollary 4.4.2.10. *Let* $\mathcal{F}$ *be a left* $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$*-module. If* $\mathcal{F}$ *is quasi-nilpotent, then so is the* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-module* $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{F}$*.*

Proof. By functoriality of the m-PD-envelope, it follows from the characterization 4.2.1.10.(c) of the quasi-nilpotence that $\widetilde{f}^*\mathcal{F}$ is quasi-nilpotent. □

4.4.2.11. Denote by $\rho \colon f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ the given algebra homomorphism. Let $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}$, $Q \in \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp,n}$ such that $\widetilde{f}^{n\vee}_{(m)}(P) = 1 \otimes Q$ where $1 \otimes Q$ is the $\mathcal{B}_X$-linear map making commutative the top right square of the following diagram:

$$\begin{array}{ccccc} f^{-1}(\mathcal{B}_Y) & \xrightarrow{f^{-1}\widetilde{p}^n_{1,(m)}} & f^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)} & \xrightarrow{f^{-1}Q} & f^{-1}(\mathcal{B}_Y) \\ & & \downarrow & & \downarrow \rho \\ \downarrow \rho & & \widetilde{f}^*(\widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) & \xrightarrow{1\otimes Q} & \mathcal{B}_X \\ & & \widetilde{f}^n_{(m)} \downarrow 4.4.2.6.1 & & \| \\ \mathcal{B}_X & \xrightarrow{\widetilde{p}^n_{1,(m)}} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} & \xrightarrow{P} & \mathcal{B}_X. \end{array} \tag{4.4.2.11.1}$$

The equality $\widetilde{f}^{n\vee}_{(m)}(P) = 1\otimes Q$ means that the bottom right square of 4.4.2.11.1 is commutative. Following 4.4.2.2.4, the left rectangle is commutative. Hence, with 4.2.1.5.3, this commutativity of the whole diagram 4.4.2.11.1 implies that for any $b \in \mathcal{B}_Y$, the following formula holds:

$$\rho(Q \cdot b) = P \cdot \rho(b), \tag{4.4.2.11.2}$$

where $Q \cdot b$ means the action of Q on b given by the structure of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module on $\mathcal{B}_Y$ and $P \cdot \rho(b)$ means the action of P on $\rho(b)$ via the left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{B}_X$.

4.4.2.12. We can extend the formula 4.4.2.11.2 as follows. Let $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}$, $Q_1, \ldots, Q_r \in \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp,n}$ $a_1, \ldots, a_r \in \mathcal{O}_X$ such that $\widetilde{f}^{n\vee}_{(m)}(P) = \sum_{j=1}^r a_r \otimes Q_r$. Let $\mathcal{F}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module. The morphism 4.4.2.2.1 factors throught the homomorphism of $\mathcal{B}_X$-algebras:

$$\widetilde{f}^n_{(m),\mathrm{r}} \colon \widetilde{f}^*(\widetilde{p}^n_{1,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) \to \widetilde{p}^n_{1,(m)*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}, \tag{4.4.2.12.1}$$

where we add the symbol r to distinguish it from 4.4.2.6.1. Consider the diagram:

$$\begin{array}{ccccc} \widetilde{f}^{-1}(\widetilde{p}^n_{1,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)} \otimes_{\mathcal{B}_Y} \mathcal{F}) & \xrightarrow{\widetilde{f}^{-1}\varepsilon^{\mathcal{F}}_n} & \widetilde{f}^{-1}(\mathcal{F} \otimes_{\mathcal{B}_Y} \widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) & \xrightarrow{\sum_{j=1}^r a_r Q_r} & \widetilde{f}^*\mathcal{F} \\ \downarrow & & \downarrow & & \| \\ \widetilde{f}^*(\widetilde{p}^n_{1,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) \otimes_{\mathcal{B}_X} \widetilde{f}^*\mathcal{F} & & \widetilde{f}^*\mathcal{F} \otimes_{\mathcal{B}_X} \widetilde{f}^*(\widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) & \xrightarrow{\mathrm{id} \otimes \sum_{j=1}^r a_r \otimes Q_r} & \widetilde{f}^*\mathcal{F} \\ \downarrow \widetilde{f}^{n*}_{(m)\mathrm{r}} & & \downarrow \widetilde{f}^{n*}_{(m)} & & \| \\ \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \widetilde{f}^*\mathcal{F} & \xrightarrow{\varepsilon^{\widetilde{f}^*\mathcal{F}}_n} & \widetilde{f}^*\mathcal{F} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\mathrm{id} \otimes P} & \widetilde{f}^*\mathcal{F} \end{array} \tag{4.4.2.12.2}$$

By definition of the stratification of the inverse image, the left rectangle is commutative. Moreover, the equality $\widetilde{f}^{n\vee}_{(m)}(P) = \sum_{j=1}^r a_r \otimes Q_r$ means that the right square is commutative. Hence, the diagram 4.4.2.12.2 is commutative. By composing 4.4.2.12.2 with the following commutative diagram

$$\begin{array}{ccc} \widetilde{f}^{-1}\mathcal{F} & \xrightarrow[4.1.2.7]{\widetilde{f}^{-1}\widetilde{p}^n_{1,(m),\mathcal{F}}} & \widetilde{f}^{-1}(\widetilde{p}^n_{1,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)} \otimes_{\mathcal{B}_Y} \mathcal{F}) \\ \downarrow & & \downarrow \\ \widetilde{f}^*\mathcal{F} & \xrightarrow[4.1.2.7]{\widetilde{f}^*\widetilde{p}^n_{1,(m),\mathcal{F}}} & \widetilde{f}^*(\widetilde{p}^n_{1,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) \otimes_{\mathcal{B}_X} \widetilde{f}^*\mathcal{F} \\ \| & & \downarrow \widetilde{f}^{n*}_{(m)\mathrm{r}} \\ \widetilde{f}^*\mathcal{F} & \xrightarrow[4.1.2.7]{\widetilde{p}^n_{1,(m),\widetilde{f}^*\mathcal{F}}} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \widetilde{f}^*\mathcal{F} \end{array} \tag{4.4.2.12.3}$$

we get a commutative diagram which can be translated by the formula (recall 4.2.1.5.3): for any $x \in \mathcal{F}$, we have

$$P(1 \otimes x) = \sum_{j=1}^r a_j \otimes Q_j(x). \tag{4.4.2.12.4}$$

Suppose $Y^\sharp \to T^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,d}$. Then, it follows from 4.4.2.12.4 that for any $x \in \mathcal{F}$, we have the formula

$$P(1 \otimes x) = \sum_{|\underline{k}| \leq n} P \circ \widetilde{f}^n_{(m)}(\underline{\tau}_\sharp^{\{\underline{k}\}}) \otimes \underline{\partial}_\sharp^{\langle \underline{k} \rangle}(x). \tag{4.4.2.12.5}$$

For instance, if $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,1}$ is exactly of order 1 (i.e. $P(1) = 0$), then we compute

$$P(1 \otimes x) = \sum_{i=1}^{d} P(\widetilde{f}^*(t_i)) \otimes \partial_{\sharp i}(x). \tag{4.4.2.12.6}$$

4.4.2.13 (What about right $\mathcal{D}$-modules ?)**.** Suppose f is finite. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module. Following 4.2.2.5, this means that $\mathcal{M}$ is endowed with a PD-costratification of level m with coefficient in $\mathcal{B}_Y$. Similarly to 4.4.2.4 (we just have to replace functors of the form $\widetilde{f}^*$ by functors of the form $\widetilde{f}^\flat$), by applying the functors of the form $\widetilde{f}^\flat$ to the PD-costratification of level m of $\mathcal{M}$, we get a PD-costratification of level m structure on $\widetilde{f}^\flat(\mathcal{M})$, i.e. $\widetilde{f}^\flat(\mathcal{M})$ is canonically endowed with a structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module (we copy word by word 4.4.2.4). By functoriality, viewing $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$ as a $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-bimodule, we get a structure of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodule on $\widetilde{f}^\flat(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$. When f is an exact closed immersion, this will be studied more thoroughly (see 5.2.5.1).

4.4.3 Log étale case

We keep notation 4.4.2. We suppose the morphism f is log étale and that the bottom arrow of 4.4.2.0.1 is the identity.

Lemma 4.4.3.1. *We have the following properties.*

(a) The following canonical homomorphism of $\mathcal{B}_X$-algebras (see 4.4.2.6.1)

$$\widetilde{f}^n_{(m)} \colon \widetilde{f}^*(\widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp(m)}) \to \widetilde{p}^n_{0,(m)*}\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \tag{4.4.3.1.1}$$

is an isomorphism.

(b) The canonical homomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules (see 4.4.2.6.3)

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/S^\sharp} \tag{4.4.3.1.2}$$

is an isomorphism.

(c) The canonical composition map

$$\rho_{\widetilde{f}} \colon f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \to \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \underset{4.4.3.1.2}{\overset{\sim}{\longleftarrow}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \tag{4.4.3.1.3}$$

is a ring homomorphism which fits into the commutative diagram

$$\begin{array}{ccc} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} & \xrightarrow{4.4.3.1.3} & \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \\ \uparrow & & \uparrow \\ f^{-1}\mathcal{B}_Y & \longrightarrow & \mathcal{B}_X, \end{array} \tag{4.4.3.1.4}$$

where the vertical arrows are the canonical embeddings and the bottom arrow is given by the morphism $\widetilde{f}$.

(d) The canonical morphism 4.4.3.1.2 is in fact an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodules, where the structure of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is given via 4.4.3.1.3.

Proof. 0) Since the lemma is local we can suppose that $Y^\sharp \to T^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. By composing it with f this yields the logarithmic coordinates $(u'_\lambda)_{\lambda=1,\dots,r}$ of $X^\sharp \to T^\sharp$. For any $\lambda = 1,\dots,r$, put $\tau_{\sharp\lambda} := \mu^n_{(m)}(u_\lambda) - 1$ where for any $a \in M_{Y^\sharp}$ $\mu^n_{(m)}(a)$ is the unique section of $\ker(\mathcal{O}^*_{\Delta^n_{Y^\sharp/T^\sharp,(m)}} \to \mathcal{O}^*_Y)$ such that we get in $M^n_{Y^\sharp/T^\sharp,(m)}$ the equality $p_1^{n*}(a) = p_0^{n*}(a)\mu^n_{(m)}(a)$. We still denote by $\tau_\sharp$ its image via the canonical morphism $\mathcal{P}^n_{Y^\sharp/T^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp,(m)}$. Similarly, replacing $Y^\sharp/T^\sharp$ by $X^\sharp/S^\sharp$ we get the elements $\tau'_{\sharp\lambda} := \mu^n_{(m)}(u'_\lambda) - 1$ of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ or $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}$.

a) Following 4.1.2.16.1, we get the isomorphism of m-PD-$\mathcal{B}_Y$-algebras

$$\begin{aligned}\mathcal{B}_Y\langle T_1,\dots,T_r\rangle_{(m),n} &\xrightarrow{\sim} \widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp,(m)}\\ T_\lambda &\mapsto \tau_{\sharp\lambda,(m)},\end{aligned} \tag{4.4.3.1.5}$$

where the first term is defined as in 1.3.3.6. Then $\widetilde{f}^n_{(m)}(1\otimes\tau_{\sharp\lambda}) = \tau'_{\sharp\lambda}$ for any $\lambda = 1,\dots,r$. Indeed, we reduce to check it on $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$, i.e that $f^n_{(m)}(1\otimes\tau_{\sharp\lambda}) = \tau'_{\sharp\lambda}$. Since $X^\sharp$ is nice (see 3.1.1.2), then the canonical morphism $\mathcal{P}^n_{X^\sharp/S^\sharp(m)} \to j_*\mathcal{P}^n_{(X^\sharp)^*/S^\sharp(m)}$ is injective, where $j\colon (X^\sharp)^* \hookrightarrow X^\sharp$ is the open immersion (this is a consequence of 3.1.1.3). Hence, we reduce to the case where the logarithmic structures are trivial. By using the left equality of 3.2.3.9.5 and with the corresponding notation, we reduce to check $f^n_{(m)}(1\otimes\tau_\lambda) = \tau'_\lambda$, which is easy (use the right commutative square of the diagram 3.4.4.1.1). Since 3.4.4.1.2 is an m-PD morphism, then $\widetilde{f}^n_{(m)}(1\otimes\underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}) = \underline{\tau}'^{\{\underline{k}\}_{(m)}}_\sharp$. This yields that 4.4.3.1.1 is an isomorphism.

b) By duality and passing to the limit, we get the part b) form the part a).

c) From the part a) of the proof, with the similar to 4.1.2.16.2 notation, we get $\rho_{\widetilde{f}}(\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}) = \underline{\partial}'^{\langle\underline{k}\rangle_{(m)}}_\sharp$. Denote by $\rho\colon f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ the given algebra homomorphism. By $f^{-1}\mathcal{B}_Y$-linearity, we get for any section b of $f^{-1}\mathcal{B}_Y$, the equality $\rho_{\widetilde{f}}(b\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}) = \rho(b)\underline{\partial}'^{\langle\underline{k}\rangle_{(m)}}_\sharp$. Let Q_1, Q_2 be two sections of $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$. We have to check $\rho_{\widetilde{f}}(Q_1\cdot Q_2) = \rho_{\widetilde{f}}(Q_1)\cdot\rho_{\widetilde{f}}(Q_2)$. By additivity, it follows from the description 4.1.2.16.2 that we reduce to the case where Q_1 and Q_2 are of the form $b\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}$ with b a section of $f^{-1}\mathcal{B}_Y$. Following 4.4.2.11.2, $\rho(Q\cdot b) = \rho_{\widetilde{f}}(Q)\cdot\rho(b)$ for any section Q of $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$. In particular, $\rho(\underline{\partial}_\sharp^{\langle\underline{k}\rangle_{(m)}}(b)) = \underline{\partial}'^{\langle\underline{k}\rangle_{(m)}}_\sharp(\rho(b))$. Hence, we can conclude thanks to 3.2.3.13.1, 4.1.2.2.3. □

Proposition 4.4.3.2. *We have the canonical isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules:*

$$\widetilde{f}^*\mathcal{E} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{E}. \tag{4.4.3.2.1}$$

Proof. This is a consequence of 4.4.2.9.1 and 4.4.3.1.(d). □

Lemma 4.4.3.3. *The canonical homomorphism of $\mathcal{B}_X$-modules:*

$$\widetilde{f}^*(\widetilde{\omega}_{Y^\sharp/S^\sharp}) \to \widetilde{\omega}_{X^\sharp/S^\sharp} \tag{4.4.3.3.1}$$

is an isomorphism.

Let us denote by $\rho^\omega_{\widetilde{f}}\colon f^{-1}(\widetilde{\omega}_{Y^\sharp/S^\sharp}) \to \widetilde{\omega}_{X^\sharp/S^\sharp}$ the canonical homomorphism. With notation 4.4.3.1.3, let

$$f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp}\otimes_{\mathcal{B}_Y}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right) \to \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \tag{4.4.3.3.2}$$

be the map given by $\omega\otimes P \mapsto \rho^\omega_{\widetilde{f}}(\omega)\otimes\rho_{\widetilde{f}}(P)$. The map 4.4.3.3.2 is a homomorphism of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-bimodules, where the right structure (resp. the left structure i.e. the twisted one) of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module of $\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ comes from its right structure (resp. left structure) of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module via the ring homomorphism 4.4.3.1.3.

Proof. By construction, the map 4.4.3.3.2 is a homomorphism of right $(f^{-1}\mathcal{B}_Y, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$-bimodules. It remains to check the $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-linearity for the left structure. Since this is local we can suppose that $Y^\sharp \to S^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$. By composing with f this yields logarithmic coordinates $(u'_\lambda)_{\lambda=1,\dots,r}$ of $X^\sharp \to S^\sharp$. Then $d\log u_1 \wedge \cdots \wedge d\log u_r$ is a basis of $\widetilde{\omega}_{Y^\sharp/S^\sharp}$ and $d\log u'_1 \wedge \cdots \wedge d\log u'_r$ is a basis of $\widetilde{\omega}_{X^\sharp/S^\sharp}$. We compute $\rho^\omega_{\widetilde{f}}(d\log u_1 \wedge \cdots \wedge d\log u_r) = d\log u'_1 \wedge \cdots \wedge d\log u'_r$. Moreover, since $\rho_{\widetilde{f}}(\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}) = \underline{\partial}_\sharp'^{\langle \underline{k}\rangle_{(m)}}$ (see the proof of 4.4.3.1), then by using the local description of the twisted structure (see 4.3.5.5) of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ and of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$, we compute that 4.4.3.3.2 is $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-linearity for the respective twisted structures. □

4.4.3.4. By using the same computation than that of the proof of 4.4.3.3, we can check the following diagram

$$\begin{array}{ccc} f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right) & \xrightarrow{4.4.3.3.2} & \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \\ \downarrow{\scriptstyle 4.2.5.5.1} & & \downarrow{\scriptstyle 4.2.5.5.1} \\ f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right) & \xrightarrow{4.4.3.3.2} & \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \end{array} \tag{4.4.3.4.1}$$

where the vertical maps are the transposition isomorphisms, is commutative. This yields the isomorphism of right $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$-bimodules

$$f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right)_l \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \tag{4.4.3.4.2}$$

where the index l means that in the tensor product we use the left structure of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module, where the structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module) of $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is its left structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. comes from its structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module via the ring homomorphism $\rho_{\widetilde{f}}$ of 4.4.4.1.2). For any left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module $\mathcal{E}$, we get the isomorphisms of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules:

$$\begin{aligned} & f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp} \otimes_{\mathcal{B}_Y} \mathcal{E}\right) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \\ \xrightarrow[4.3.5.4.1]{\sim}\ & (f^{-1}(\widetilde{\omega}_{Y^\sharp/S^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})_r \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{E}) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \\ \xrightarrow[4.2.4.2.2]{\sim}\ & (f^{-1}(\widetilde{\omega}_{Y^\sharp/S^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})_l \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{E} \\ \xrightarrow[4.4.3.4.2]{\sim}\ & (\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_r \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \mathcal{E} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \mathcal{E}). \end{aligned} \tag{4.4.3.4.3}$$

4.4.3.5. Using 4.4.3.1.4, we get the canonical homomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}, \mathcal{B}_X)$-bimodules

$$f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \otimes_{f^{-1}\mathcal{B}_Y} \mathcal{B}_X \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}. \tag{4.4.3.5.1}$$

We can check by making a local computation that 4.4.3.5.1 is an isomorphism. For any right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module $\mathcal{M}$, this yields that the canonical morphism of $\mathcal{B}_X$-modules

$$\widetilde{f}^*\mathcal{M} := f^{-1}\mathcal{M} \otimes_{f^{-1}\mathcal{B}_Y} \mathcal{B}_X \to f^{-1}\mathcal{M} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \tag{4.4.3.5.2}$$

is an isomorphism. Hence, we can endow $\widetilde{f}^*\mathcal{M}$ with a structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module which extends its structure of $\mathcal{B}_X$-module by transport structure via 4.4.3.5.2. We can check by a local computation that the canonical isomophism

$$\widetilde{f}^*(\widetilde{\omega}_{Y^\sharp/S^\sharp}) \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp} \tag{4.4.3.5.3}$$

of 4.4.3.3.1 is an isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. Moreover, modulo the canonical isomorphism 4.4.3.2.1 and 4.4.3.5.2, for any left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module $\mathcal{E}$, the isomorphism 4.4.3.4.3 can be rewritten of the form:

$$\widetilde{f}^*\left(\widetilde{\omega}_{Y^\sharp/S^\sharp} \otimes_{\mathcal{B}_Y} \mathcal{E}\right) \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{f}^*(\mathcal{E}).$$

4.4.4 Base change

We keep notation 4.4.2. We suppose in this subsection that the diagram 4.4.2.0.1 is cartesian and the morphism $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism. In that case, we say that $\widetilde{f}^*$ is the base change via $S \to T$.

Proposition 4.4.4.1 (Base change)**.** *We have the following properties.*

(a) The morphism $\widetilde{f}^n_{(m)} \colon \widetilde{f}^*(\widetilde{\mathcal{P}}^n_{Y^\sharp/T(m)}) \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)}$ of 4.4.2.6.1 is an isomorphism (and then the right square of the diagram 4.4.2.2.6 is cartesian).

(b) The canonical morphism (see 4.4.2.6.3)

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}. \tag{4.4.4.1.1}$$

is an isomorphism.

(c) The composite map

$$\rho_{\widetilde{f}} \colon f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \to f^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}. \tag{4.4.4.1.2}$$

is a homomorphism of sheaves of rings which fits into the commutative diagram

$$\begin{array}{ccc} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} & \xrightarrow{4.4.4.1.2} & \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \\ \uparrow & & \uparrow \\ f^{-1}\mathcal{B}_Y & \longrightarrow & \mathcal{B}_X. \end{array} \tag{4.4.4.1.3}$$

The canonical morphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules 4.4.4.1.1 is in fact an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodules, where the structure of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is given via 4.4.4.1.2.

(d) For any left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module $\mathcal{F}$ we have a canonical isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F} \xrightarrow{\sim} \widetilde{f}^*\mathcal{F}. \tag{4.4.4.1.4}$$

Proof. Let us check (a). Since this is local we can suppose there exist logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$ of $Y^\sharp/T^\sharp$. This induces the logarithmic coordinates $(u'_\lambda = \widetilde{f}^*(u_\lambda))_{\lambda=1,\dots,r}$ of $X^\sharp/S^\sharp$. For any $\lambda = 1, \dots, r$, put $\tau_{\sharp\lambda} := \mu^n_{(m)}(u_\lambda) - 1$ where for any $a \in M_{Y^\sharp}$ $\mu^n_{(m)}(a)$ is the unique section of $\ker(\mathcal{O}^*_{\Delta^n_{Y^\sharp/T^\sharp,(m)}} \to \mathcal{O}^*_Y)$ such that we get in $M^n_{Y^\sharp/T^\sharp,(m)}$ the equality $p_1^{n*}(a) = p_0^{n*}(a)\mu^n_{(m)}(a)$. We still denote by $\tau_\sharp$ its image via the canonical morphism $\mathcal{P}^n_{Y^\sharp/T^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp,(m)}$. Similarly, replacing $Y^\sharp/T^\sharp$ by $X^\sharp/S^\sharp$ we get the elements $\tau'_{\sharp\lambda} := \mu^n_{(m)}(u'_\lambda) - 1$ of $\mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$ or $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)}$. Similarly to the proof of 4.4.3.1, we compute $\widetilde{f}^n_{(m)}(1 \otimes \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}) = \underline{\tau}_\sharp'^{\{\underline{k}\}_{(m)}}$. This yields that $\widetilde{f}^n_{(m)}$ is an isomorphism. By copying the proof of 4.4.3.1, we get (b) and (c). The statement (d) is a consequence of 4.4.2.9.1 and of (c). □

Lemma 4.4.4.2. *The canonical homomorphism of $\mathcal{B}_X$-modules:*

$$\widetilde{f}^*(\widetilde{\omega}_{Y^\sharp/T^\sharp}) \to \widetilde{\omega}_{X^\sharp/S^\sharp} \tag{4.4.4.2.1}$$

is an isomorphism. Let us denote by $\rho^\omega_{\widetilde{f}} \colon f^{-1}(\widetilde{\omega}_{Y^\sharp/T^\sharp}) \to \widetilde{\omega}_{X^\sharp/S^\sharp}$ the canonical homomorphism. With 4.4.4.1.2, this yields the map

$$f^{-1}\left(\widetilde{\omega}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}\right) \to \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \tag{4.4.4.2.2}$$

given by $\omega \otimes P \mapsto \rho^\omega_{\widetilde{f}}(\omega) \otimes \rho_{\widetilde{f}}(P)$. The map 4.4.4.2.2 is a homomorphism of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-bimodules, where the right structure (resp. the left structure i.e. the twisted one) of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module of $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ comes from its right structure (resp. left structure) of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module via the ring homomorphism 4.4.4.1.2.

Proof. The lemma follows from analogous to that of the proof of 4.4.3.3 local computations. □

4.4.4.3. Similarly to 4.4.3.4, we can check the following diagram

$$\begin{array}{ccc} f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp}\otimes_{\mathcal{B}_Y}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right) & \xrightarrow{4.4.4.2.2} & \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \\ \downarrow{\scriptstyle 4.2.5.5.1} & & \downarrow{\scriptstyle 4.2.5.5.1} \\ f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp}\otimes_{\mathcal{B}_Y}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right) & \xrightarrow{4.4.4.2.2} & \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \end{array} \tag{4.4.4.3.1}$$

where the vertical maps are the transposition isomorphisms, is commutative. This yields the isomorphism of right $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$-bimodules

$$f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp}\otimes_{\mathcal{B}_Y}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right)_l \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \tag{4.4.4.3.2}$$

where the index l means that in the tensor product we use the left structure of right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module, where the structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. right $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module) of $\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is its left structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. comes from its structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module via the ring homomorphism $\rho_{\widetilde{f}}$ of 4.4.4.1.2). Similarly to 4.4.3.4.3, for any left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module, this implies the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules:

$$f^{-1}\left(\widetilde{\omega}_{Y^\sharp/S^\sharp}\otimes_{\mathcal{B}_Y}\mathcal{E}\right)\otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}}\mathcal{E}). \tag{4.4.4.3.3}$$

4.4.4.4. Using 4.4.4.1.3, we get the canonical homomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}, \mathcal{B}_X)$-bimodules

$$f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\otimes_{f^{-1}\mathcal{B}_Y}\mathcal{B}_X \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}. \tag{4.4.4.4.1}$$

We can check by making a local computation that it is an isomorphism. For any right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module $\mathcal{M}$, this yields that the canonical morphism of $\mathcal{B}_X$-modules

$$\widetilde{f}^*\mathcal{M} := f^{-1}\mathcal{M}\otimes_{f^{-1}\mathcal{B}_Y}\mathcal{B}_X \to f^{-1}\mathcal{M}\otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \tag{4.4.4.4.2}$$

is an isomorphism. Hence, we can endow $\widetilde{f}^*\mathcal{M}$ with a structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module which extends its structure of $\mathcal{B}_X$-module by transport structure via 4.4.4.4.2. Via a local computation we can check the canonical isomophism

$$\widetilde{f}^*(\widetilde{\omega}_{Y^\sharp/S^\sharp}) \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp} \tag{4.4.4.4.3}$$

of 4.4.4.2.1 is an isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. Moreover, modulo the canonical isomorphisms 4.4.4.1.4 and 4.4.4.4.2, for any left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module $\mathcal{E}$, the isomorphism 4.4.4.3.3 can be rewritten of the form:

$$\widetilde{f}^*\left(\widetilde{\omega}_{Y^\sharp/S^\sharp}\otimes_{\mathcal{B}_Y}\mathcal{E}\right) \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{f}^*(\mathcal{E}). \tag{4.4.4.4.4}$$

4.4.4.5. Suppose $(u_\lambda)_{\lambda=1,\dots,r}$ are logarithmic coordinates of $Y^\sharp/T^\sharp$. This induces the logarithmic coordinates $(u'_\lambda = \widetilde{f}^*(u_\lambda))_{\lambda=1,\dots,r}$ of $X^\sharp/S^\sharp$. By using theses fixed logarithmic coordinates, we get the logarithmic adjoint operator ${}^{t_{\log}}\colon \widetilde{D}^{(m)}_{Y^\sharp/T^\sharp} \to \widetilde{D}^{(m)}_{Y^\sharp/T^\sharp}$ and $: \widetilde{D}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{D}^{(m)}_{X^\sharp/S^\sharp}$. It follows from the commutativity of 4.4.4.3.1 that the square

$$\begin{array}{ccc} \widetilde{D}^{(m)}_{Y^\sharp/T^\sharp} & \xrightarrow{t_{\log}} & \widetilde{D}^{(m)}_{Y^\sharp/T^\sharp} \\ \downarrow{\scriptstyle 4.4.4.1.2} & & \downarrow{\scriptstyle 4.4.4.1.2} \\ \widetilde{D}^{(m)}_{X^\sharp/S^\sharp} & \xrightarrow{t_{\log}} & \widetilde{D}^{(m)}_{X^\sharp/S^\sharp} \end{array} \tag{4.4.4.5.1}$$

is commutative.

4.4.5 Compatibility with composition, extension or forgetful of the coefficients, glueing, homorphisms, tensor products

We keep notation 4.4.2. We suppose that the bottom arrow of 4.4.2.0.1 is the identity.

Notation 4.4.5.1. We denote by "forg" the forgetful functor from the category of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-modules to that of left $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-modules ; and similarly by replacing Y by X.

Lemma 4.4.5.2. *We suppose that $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism. Let $\mathcal{F}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module and* $\mathrm{forg}(\mathcal{F})$ *(or simply $\mathcal{F}$) be the induced left $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module. Let $\mathcal{G} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.*

(a) The canonical $\mathcal{O}_X$-linear homomorphism

$$f^*(\mathrm{forg}(\mathcal{F})) \to \widetilde{f}^*(\mathcal{F}) \tag{4.4.5.2.1}$$

is an isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules.

(b) The canonical homomorphism

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F}, \tag{4.4.5.2.2}$$

is an isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules.

(c) If $f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_X$ are tor independent over $f^{-1}\mathcal{B}_Y$, then the canonical morphisms

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{G} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{G}, \tag{4.4.5.2.3}$$

is an isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

Proof. 1) Since $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism, then the canonical homomorphism 4.4.5.2.1 is an isomorphism. Let us now check that this canonical $\mathcal{O}_X$-linear isomorphism $f^*(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^*(\mathcal{F})$ is horizontal. Let $(\widetilde{\epsilon}^{\mathcal{F}}_n)_n$ be the m-PD-stratification with coefficient in $\mathcal{B}_Y$ of $\mathcal{F}$ associated to its structure of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module. Let $(\epsilon^{\mathcal{F}}_n)_n$ be the corresponding m-PD-stratification semi-linear with respect to $(\epsilon^{\mathcal{B}_Y}_n)$. Since $\mathcal{O}_X \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ is a ring isomorphism, since $\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)} = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y^\sharp/T^\sharp(m)}$ and $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}$ (see 4.4.2.6.1), then the following square of commutative rings

$$\begin{array}{ccc} f^{-1}\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}) & \xrightarrow{3.4.4.1.2} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \\ \downarrow & & \downarrow \\ f^{-1}(\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}) & \xrightarrow{4.4.2.2.1} & \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \end{array} \tag{4.4.5.2.4}$$

is cocartesian. Set $f^{n*}_{(m)} := \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{f^{-1}\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}} f^{-1}(-)$ and $\widetilde{f}^{n*}_{(m)} := \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\tilde{f}^{-1}\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}} \tilde{f}^{-1}(-)$. Let forg_n be the forgetful functor from the category of $\widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)}$-modules to that of $\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}$-modules, and similarly for $X^\sharp/S^\sharp$ instead of $Y^\sharp/T^\sharp$. The cocartesianity of 4.4.5.2.4 means that the functors $\mathrm{forg}_n \circ \widetilde{f}^{n*}_{(m)}$ and $f^{n*}_{(m)} \circ \mathrm{forg}_n$ are canonically isomorphic. Recall, following 4.3.2.5.1, the diagram of $\mathcal{P}^n_{Y^\sharp/T^\sharp(m)}$-modules

$$\begin{array}{ccccc} \widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)} \otimes_{\mathcal{B}_Y} \mathcal{F} & \xleftarrow[\varepsilon^{\mathcal{B}_Y}_n \otimes \mathrm{id}]{\sim} & (\mathcal{P}^n_{Y^\sharp/T^\sharp(m)} \otimes_{\mathcal{O}_Y} \mathcal{B}_Y) \otimes_{\mathcal{B}_Y} \mathcal{F} & \xrightarrow[\mathrm{can}]{\sim} & \mathcal{P}^n_{Y^\sharp/T^\sharp(m)} \otimes_{\mathcal{O}_Y} \mathcal{F} \\ \sim\downarrow \widetilde{\varepsilon}^{\mathcal{F}}_n & & & & \sim\downarrow \epsilon^{\mathcal{F}}_n \\ \mathcal{F} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{P}}^n_{Y^\sharp/T^\sharp(m)} & & \xleftarrow[\mathrm{can}]{\sim} & & \mathcal{F} \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y^\sharp/T^\sharp(m)} \end{array} \tag{4.4.5.2.5}$$

is commutative. By applying the functor $\mathrm{forg}_n \circ \widetilde{f}^{n*}_{(m)}$ (resp. $f^{n*}_{(m)}$) to the left arrow of 4.4.5.2.5 (resp. to the other ones), by using the commutative diagram 4.4.2.2.3 we get the commutative diagram of $\mathcal{P}^n_{X^\sharp/S^\sharp(m)}$-modules:

$$
\begin{array}{ccccc}
\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{B}_X} \widetilde{f}^*(\mathcal{F}) & \underset{\varepsilon_n^{\mathcal{B}_X} \otimes \mathrm{id}}{\overset{\sim}{\longleftarrow}} & (\mathcal{P}^n_{X^\sharp/T^\sharp(m)} \otimes_{\mathcal{O}_X} \mathcal{B}_X) \otimes_{\mathcal{B}_X} \widetilde{f}^*(\mathcal{F}) & \overset{\sim}{\longrightarrow} & \mathcal{P}^n_{X^\sharp/S^\sharp(m)} \otimes_{\mathcal{O}_X} f^*(\mathcal{F}) \\
{\scriptstyle \sim}\downarrow {\scriptstyle \widetilde{f}^{n*}_{(m)}(\widetilde{\varepsilon}_n)} & & & & {\scriptstyle \sim}\downarrow {\scriptstyle f^{n*}_{(m)}(\epsilon^{\mathcal{F}}_n)} \\
\widetilde{f}^*(\mathcal{F}) \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} & & \underset{can}{\overset{\sim}{\longleftarrow}} & & f^*(\mathcal{F}) \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp(m)}
\end{array}
\tag{4.4.5.2.6}
$$

Hence, the m-PD-stratification $(f^{n*}_{(m)}(\epsilon^{\mathcal{F}}_n))$ is semi-linear with respect to the isomorphisms $(\epsilon^{\mathcal{B}_X}_n)$ and its corresponding m-PD-stratification with coefficients in $\mathcal{B}_X$ is $\widetilde{f}^{n*}_{(m)}(\widetilde{\varepsilon}_n)$. Hence we are done.

2) Suppose $f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_X$ are tor independent over $f^{-1}\mathcal{B}_Y$. Let $\mathcal{P}$ be a K-flat complex of $K({}^l\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ representing $\mathcal{G}$. Then $f^{-1}\mathcal{P}$ is both a K-flat complex of $K({}^l f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ and a complex of $K({}^l f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp})$ which is a K-flat complex of $K(f^{-1}\mathcal{O}_Y)$. This yields the canonical morphism of $\mathbb{L}f^*(\mathrm{forg}(\mathcal{G})) \to \mathbb{L}\widetilde{f}^*(\mathcal{G})$ is an isomorphism of $D({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ from the part 1).

3) We conclude the Lemma by using 4.4.2.9. □

Proposition 4.4.5.3. *We only consider here the non-respective case, i.e. the non-formal case. Let* $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S)$ *be a quasi-coherent m-PD-ideal of* $\mathcal{O}_S$. *We denote by* $S_0 = V(\mathfrak{a}_S)$, *by* $X^\sharp_0 := X^\sharp \times_S S_0$ *and by* $f_0 \colon X^\sharp_0 \to Y^\sharp$ *the induced morphism. Let* $f' \colon X^\sharp \to Y^\sharp$ *be a second morphism of* $T^\sharp$*-log schemes inducing the same restriction* $f_0 \colon X^\sharp_0 \to Y^\sharp$. *Suppose the m-PD-ideal* $\mathfrak{a}_S$ *is m-PD-nilpotent.*

(a) Let $\mathcal{F}$ *be a left* $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$*-module. Then, we have a canonical isomorphism of left* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-modules of the form*

$$\tau_{f,f'} \colon f'^*(\mathcal{F}) \xrightarrow{\sim} f^*(\mathcal{F}) \tag{4.4.5.3.1}$$

such that $\tau_{f,f} = \mathrm{id}$, *and, for any third morphism* $f'' \colon X^\sharp \to Y^\sharp$ *inducing the same restriction* $f_0 \colon X^\sharp_0 \to Y^\sharp$, *we have* $\tau_{f,f''} = \tau_{f,f'} \circ \tau_{f',f''}$.

(b) Suppose that f *is finite. Let* $\mathcal{M}$ *be right* $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$*-module. Then, we have a canonical isomorphism of right* $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$*-modules of the form*

$$\sigma_{f,f'} \colon f'^\flat(\mathcal{M}) \xrightarrow{\sim} f^\flat(\mathcal{M}) \tag{4.4.5.3.2}$$

such that $\sigma_{f,f} = \mathrm{id}$, *and, for any third morphism* $f'' \colon X^\sharp \to Y^\sharp$ *inducing the same restriction* $f_0 \colon X^\sharp_0 \to Y^\sharp$, *we have* $\sigma_{f,f''} = \sigma_{f,f'} \circ \sigma_{f',f''}$.

Proof. Set $g := (f, f') \colon X^\sharp \to Y^\sharp \times_{T^\sharp} Y^\sharp$. Since the m-PD-ideal $\mathfrak{a}_S$ is m-PD-nilpotent, then for s large enough, there exists a factorisation $g^s_{(m)}$ making commutative the diagram:

$$
\begin{array}{ccccc}
X^\sharp & \underset{g^s_{(m)}}{\longrightarrow} & \Delta^s_{Y^\sharp/T^\sharp(m)} & \underset{\mathrm{can}}{\longrightarrow} & Y^\sharp \times_{T^\sharp} Y^\sharp \\
\uparrow & & & \nwarrow & \uparrow \\
X^\sharp_0 & & \longrightarrow & & Y^\sharp.
\end{array}
\qquad (g = \mathrm{can} \circ g^s_{(m)})
\tag{4.4.5.3.3}
$$

Since $p^n_{1,(m)} \circ g^s_{(m)} = f'$ and $p^n_{0,(m)} \circ g^s_{(m)} = f$, then we construct the isomorphism 4.4.5.3.1 by setting $\tau_{f,f'} := g^{s*}_{(m)}(\epsilon^{\mathcal{F}}_s)$. This isomorphism does not depend on the such of the large enough integer s. It follows from the cocycle condition that we have the transitivity formula $\tau_{f,f''} = \tau_{f,f'} \circ \tau_{f',f''}$.

Set $\mathcal{E}' := f'^*(\mathcal{F})$ and $\mathcal{E} := f^*(\mathcal{F})$. It remains to check that $\tau_{f,f'}$ is horizontal, i.e. that we have the commutative diagram

$$\begin{array}{ccc} p^{n*}_{1(m)}(\mathcal{E}') & \xrightarrow{p^{n*}_{1(m)}(\tau_{f,f'})} & p^{n*}_{1(m)}(\mathcal{E}) \\ \downarrow \epsilon^{\mathcal{E}'}_n & & \downarrow \epsilon^{\mathcal{E}}_n \\ p^{n*}_{0(m)}(\mathcal{E}') & \xrightarrow{p^{n*}_{0(m)}(\tau_{f,f'})} & p^{n*}_{0(m)}(\mathcal{E}), \end{array} \tag{4.4.5.3.4}$$

for any integer n. It follows from 3.4.2.1.a, that it is sufficient to check it for $n \geq s$. Since $\tau_{f,f'}$ does not depend on the choice of s, then we can suppose $n = s$.

Set $h := (f^2, f'^2)\colon X^{\sharp 2}_{/S^\sharp} \to Y^{\sharp 2}_{/T^\sharp} \times_{T^\sharp} Y^{\sharp 2}_{/T^\sharp} = Y^{\sharp 4}_{/T^\sharp}$ and for any $i, j \in \{0,1,2,3\}$ such that $i < j$, let $q_{ij}\colon Y^{\sharp 4}_{/T^\sharp} \to Y^{\sharp 2}_{/T^\sharp}$ be the projection on the ith and jth factors. It follows from 3.2.2.5.a that the m-PD structure of the exact closed immersion $X^\sharp \hookrightarrow \Delta^s_{X^\sharp/S^\sharp(m)}$ is compatible with α_S. This implies that we the closed immersion $X^\sharp_0 \hookrightarrow \Delta^s_{X^\sharp/S^\sharp(m)}$ is an m-PD-immersion. By universal property of the m-PD-envelope, there exist two factorisations $h^s_{(m)}$ and $q^s_{ij(m)}$ making commutative the diagram

$$\begin{array}{ccccc} X^{\sharp 2}_{/S^\sharp} & \xrightarrow{h} & Y^{\sharp 4}_{/T^\sharp} & \xrightarrow{q_{ij}} & Y^{\sharp 2}_{/T^\sharp} \\ \uparrow \text{can} & & \uparrow \text{can} & & \uparrow \text{can} \\ \Delta^s_{X^\sharp/S^\sharp(m)} & \xrightarrow{h^s_{(m)}} & \Delta^s_{Y^\sharp/T^\sharp(m)}(3) & \xrightarrow{q^s_{ij(m)}} & \Delta^s_{Y^\sharp/T^\sharp(m)} \\ \uparrow & & \uparrow & & \uparrow \\ X^\sharp_0 & \xrightarrow{f_0} & Y^\sharp & = & Y^\sharp. \end{array} \tag{4.4.5.3.5}$$

Since $q_{02} \circ h = g \circ p_0$ (resp. $q_{13} \circ h = g \circ p_1$), then by using the universal property of the m-PD-envelope, we get $q^s_{02(m)} \circ h^s_{(m)} = g^s_{(m)} \circ p^s_{0(m)}$ (resp. $q^s_{13(m)} \circ h^s_{(m)} = g^s_{(m)} \circ p^s_{1(m)}$). This yields

$$p^{s*}_{0(m)}(\tau_{f,f'}) = h^{s*}_{(m)} \circ q^{s*}_{02(m)}(\epsilon^{\mathcal{F}}_s), \qquad p^{s*}_{1(m)}(\tau_{f,f'}) = h^{s*}_{(m)} \circ q^{s*}_{13(m)}(\epsilon^{\mathcal{F}}_s).$$

Similarly, with notation 3.4.4.1, since $q_{01} \circ h = f \times f$ (resp. $q_{23} \circ h = f' \times f'$) then $q^s_{01(m)} \circ h^s_{(m)} = f^s_{(m)}$ (resp. $q^s_{23(m)} \circ h^s_{(m)} = f'^s_{(m)}$). This yields

$$\epsilon^{\mathcal{E}}_s := f^{s*}_{(m)}(\epsilon^{\mathcal{F}}_s) = h^{s*}_{(m)} \circ q^{s*}_{01(m)}(\epsilon^{\mathcal{F}}_s), \qquad \epsilon^{\mathcal{E}'}_s := f'^{s*}_{(m)}(\epsilon^{\mathcal{F}}_s) = h^{s*}_{(m)} \circ q^{s*}_{23(m)}(\epsilon^{\mathcal{F}}_s).$$

We conclude the proof of (a) by using the cocycle condition which yields the identifications:

$$q^{s*}_{01(m)}(\epsilon^{\mathcal{F}}_s) \circ q^{s*}_{13(m)}(\epsilon^{\mathcal{F}}_s) = q^{s*}_{03(m)}(\epsilon^{\mathcal{F}}_s) = q^{s*}_{02(m)}(\epsilon^{\mathcal{F}}_s) \circ q^{s*}_{23(m)}(\epsilon^{\mathcal{F}}_s).$$

For the second one, we can copy this proof above by replacing the functor $f \mapsto f^*$ by $f \mapsto f^\flat$ (and by replacing the use of m-PD-stratifications by that of m-PD-costratifications). ☐

4.4.5.4. We keep notation 4.4.5.3. We can add coefficients to Proposition 4.4.5.3 as follows. The isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules $\tau_{f,f'}\colon f^*(\mathcal{B}_Y) \xrightarrow{\sim} f'^*(\mathcal{B}_Y)$ of 4.4.5.3.1 is also a ring homomorphism (because so are the isomorphisms given by the stratification of $\mathcal{B}_Y$). Denote by $\rho_f\colon f^*\mathcal{B}_Y \to \mathcal{B}_X$ the given homomorphism and by $\rho_{f'}\colon f'^*\mathcal{B}_Y \to \mathcal{B}_X$ the map so that $\rho_{f'} \circ \tau_{f,f'} = \rho_f$. Then it follows from 4.3.1.1.1 that the map

$$\tau_{f,f'} \otimes \mathrm{id}\colon f'^*(\mathcal{B}_Y) \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} f^*(\mathcal{B}_Y) \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \tag{4.4.5.4.1}$$

is a ring isomorphism. We set $\widetilde{X}^\sharp_0 := (X^\sharp_0, f^*_0\mathcal{B}_Y)$, $\widetilde{Y}^\sharp := (Y^\sharp, \mathcal{B}_Y)$, $\widetilde{X}^\sharp := (X^\sharp, \mathcal{B}_X)$, $\widetilde{f}\colon \widetilde{X}^\sharp \to \widetilde{Y}^\sharp$ and $\widetilde{f}'\colon \widetilde{X}^\sharp \to \widetilde{Y}^\sharp$ the morphisms induced respectively by (f, ρ_f) and by $(f', \rho_{f'})$.

Set $\widetilde{g} := (\widetilde{f}, \widetilde{f}')\colon \widetilde{X}^\sharp \to \widetilde{Y}^\sharp \times_{T^\sharp} \widetilde{Y}^\sharp$. It follows from 4.4.5.3.3 that for s large enough, there exists a factorisation $\widetilde{g}^s_{(m)}$ making commutative the diagram:

$$\begin{array}{ccccc} & & \widetilde{g} & & \\ \widetilde{X}^\sharp & \xrightarrow{\widetilde{g}^s_{(m)}} & \widetilde{\Delta}^s_{Y^\sharp/T^\sharp(m)} & \xrightarrow{\mathrm{can}} & \widetilde{Y}^\sharp \times_{T^\sharp} \widetilde{Y}^\sharp \\ \uparrow & & & \nwarrow & \uparrow \\ \widetilde{X}^\sharp_0 & \longrightarrow & & & \widetilde{Y}^\sharp. \end{array} \tag{4.4.5.4.2}$$

Since $\widetilde{p}^n_{1,(m)} \circ \widetilde{g}^s_{(m)} = \widetilde{f}'$ and $\widetilde{p}^{n*}_{0,(m)} \circ \widetilde{g}^s_{(m)} = \widetilde{f}$, then we get the $\mathcal{B}_X$-linear isomorphism:

$$\tau_{\widetilde{f},\widetilde{f}'} := \widetilde{g}^s_{(m)}(\epsilon^{\mathcal{F}}_s)\colon \widetilde{f}'^*(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^*(\mathcal{F}). \tag{4.4.5.4.3}$$

This is clear that $\tau_{\widetilde{f},\widetilde{f}} = \mathrm{id}$. We prove via the following two steps that $\tau_{\widetilde{f},\widetilde{f}'}$ is an an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules that we have the transitivity formula $\tau_{\widetilde{f},\widetilde{f}''} = \tau_{\widetilde{f},\widetilde{f}'} \circ \tau_{\widetilde{f}',\widetilde{f}''}$ for any third morphism $f''\colon X^\sharp \to Y^\sharp$ inducing the same restriction $f_0\colon X^\sharp_0 \to Y^\sharp$.

1) Suppose $\rho_f = \mathrm{id}$. It follows from 4.4.5.2 and 4.4.5.3.1 that 4.4.5.4.3 is also an isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules such that, with notation 4.4.5.1, we have moreover $\mathrm{forg}(\tau_{\widetilde{f},\widetilde{f}'}) = \tau_{f,f'}$. Hence, 4.4.5.4.3 is an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. This implies the transitivity formula from 4.4.5.3.

2) In general, let $a_f\colon \widetilde{X} \to (X^\sharp, f^*\mathcal{B}_Y)$ be the morphism induced by ρ_f. The morphism f induces $\widetilde{a}\colon (X^\sharp, f^*\mathcal{B}_Y) \to \widetilde{Y}$. Let $\widetilde{a}'$ be the composition $\widetilde{a}'\colon (X^\sharp, f^*\mathcal{B}_Y) \xrightarrow{\sim} (X^\sharp, f'^*\mathcal{B}_Y) \to \widetilde{Y}^\sharp$, where the last map is induced by f' and the first map is given by the isomorphism $\tau_{f,f'}\colon f^*(\mathcal{B}_Y) \xrightarrow{\sim} f'^*(\mathcal{B}_Y)$. We have $a_f \circ \widetilde{a} = \widetilde{f}$, $a_f \circ \widetilde{a}' = \widetilde{f}'$ and $\tau_{\widetilde{f},\widetilde{f}'} = a_f^*(\tau_{\widetilde{a},\widetilde{a}'})$. This yields from 1) that $\tau_{\widetilde{f},\widetilde{f}'}$ is an an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and that the formula $\tau_{\widetilde{f},\widetilde{f}''} = \tau_{\widetilde{f},\widetilde{f}'} \circ \tau_{\widetilde{f}',\widetilde{f}''}$ holds.

4.4.5.5. To check that the inverse image behaves well by composition, let moreover be the commutative diagram

$$\begin{array}{ccc} Y^\sharp & \xrightarrow{g} & Z^\sharp \\ \downarrow & & \downarrow \\ T^\sharp & \longrightarrow & U^\sharp \end{array} \tag{4.4.5.5.1}$$

where $U^\sharp$ is nice fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ as defined in 3.1.1.1 (resp. $U^\sharp$ is nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10), where $Z^\sharp$ is a log smooth $U^\sharp$-log scheme (resp. log smooth $U^\sharp$-log formal scheme). Moreover, let $\mathcal{B}_Z$ be an $\mathcal{O}_Z$-algebra endowed with a compatible structure of $\mathcal{D}^{(m}_{Z^\sharp/U^\sharp}$-module and a morphism of algebras $g^*\mathcal{B}_Z \to \mathcal{B}_Y$ which is moreover $\mathcal{D}^{(m}_{Z^\sharp/U^\sharp}$-linear. Set $\widetilde{Z}^\sharp := (Z^\sharp, \mathcal{B}_Z)$. Let $\widetilde{g}\colon \widetilde{Y}^\sharp \to \widetilde{Z}^\sharp$ and $\widetilde{g \circ f}\colon : \widetilde{X}^\sharp \to \widetilde{Z}^\sharp$ be the induced morphisms. We set $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp} := \mathcal{B}_Z \otimes_{\mathcal{O}_Z} \mathcal{D}^{(m)}_{Z^\sharp/U^\sharp}$.

Proposition 4.4.5.6. *With notation 4.4.5.5, let $\mathcal{G}$ be a $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}$-module. The canonical isomorphism*

$$\tilde{f}^* \circ \tilde{g}^*(\mathcal{G}) \xrightarrow{\sim} \widetilde{g \circ f}^*(\mathcal{G})$$

is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. Let h be the composition morphism $g \circ f$. According to notation 3.4.4.1, for any $r = 1, 2$, we denote by $f^n_{(m)}(r)\colon \Delta^n_{X^\sharp/S^\sharp(m)}(r) \to \Delta^n_{Y^\sharp/T^\sharp(m)}(r)$ the canonical m-PD-morphism given by using the universal property of m-PD-envelopes of order n (see 3.2.1.1). We get similarly $g^n_{(m)}(r)$ and $h^n_{(m)}(r)$. It follows from the universal property of m-PD-envelopes of order n the equality $g^n_{(m)}(r) \circ f^n_{(m)}(r) = h^n_{(m)}(r)$. With notation 4.4.2.2, by adding coefficients, we get the morphism $\widetilde{f}^n_{(m)}(r)\colon \widetilde{\Delta}^n_{X^\sharp/S^\sharp(m)}(r) \to \widetilde{\Delta}^n_{Y^\sharp/T^\sharp(m)}(r)$, and similarly $\widetilde{g}^n_{(m)}(r)$, $\widetilde{h}^n_{(m)}(r)$. We have $\widetilde{g}^n_{(m)}(r) \circ \widetilde{f}^n_{(m)}(r) = \widetilde{h}^n_{(m)}(r)$. Hence we are done. □

Corollary 4.4.5.7. *Let $\mathcal{E}$ be a $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module. The canonical isomorphism*

$$\mathcal{B}_X \otimes_{\mathcal{O}_X} f^*\mathcal{E} \to \widetilde{f}^*(\mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{E}),$$

is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear.

Proof. This is a consequence of the example 4.4.2.5 and of the proposition 4.4.5.6. □

Proposition 4.4.5.8. *Let $\mathcal{E}$ and $\mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-modules. The canonical isomorphism*

$$\tilde{f}^*(\mathcal{E} \otimes_{\mathcal{B}_Y} \mathcal{F}) \xrightarrow{\sim} \tilde{f}^*\mathcal{E} \otimes_{\mathcal{B}_X} \tilde{f}^*\mathcal{F} \tag{4.4.5.8.1}$$

is $\widetilde{\mathcal{D}}^{(m)}_X$-linear. Moreover we have the following diagram

$$\begin{array}{ccc} \widetilde{f}'^*(\mathcal{E} \otimes_{\mathcal{B}_Y} \mathcal{F}) & \xrightarrow[4.4.5.14.1]{\sim} & \widetilde{f}'^*\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{f}'^*\mathcal{F} \\ \downarrow{\scriptstyle \tau_{\widetilde{f},\widetilde{f}'}} & & \downarrow{\scriptstyle \tau_{\widetilde{f},\widetilde{f}'} \otimes \tau_{\widetilde{f},\widetilde{f}'}} \\ \tilde{f}^*(\mathcal{E} \otimes_{\mathcal{B}_Y} \mathcal{F}) & \xrightarrow[4.4.5.14.1]{\sim} & \tilde{f}^*\mathcal{E} \otimes_{\mathcal{B}_X} \tilde{f}^*\mathcal{F} \end{array} \tag{4.4.5.8.2}$$

where $\tau_{\widetilde{f},\widetilde{f}'}$ is the glueing isomorphism of 4.4.5.4.2, is commutative.

Proof. Left to the reader. □

The glueing isomorphisms are compatible with composition:

Proposition 4.4.5.9. *With notation 4.4.5.5, we only consider the non-respective case, i.e. the non-formal case. Let $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S)$ be a quasi-coherent m-PD-ideal of $\mathcal{O}_S$, $(\mathfrak{a}_T, \mathfrak{b}_T, \alpha_T)$ be a quasi-coherent m-PD-ideal of $\mathcal{O}_T$ such that we get the m-PD-morphism $(S, \mathfrak{a}_S, \mathfrak{b}_T, \alpha_T) \to (T, \mathfrak{a}_T, \mathfrak{b}_T, \alpha_T)$. Suppose the m-PD-ideals $\mathfrak{a}_S$ and $\mathfrak{a}_T$ arem-PD-nilpotent.*

We denote by $S_0 = V(\mathfrak{a}_S)$, by $X^\sharp_0 := X^\sharp \times_S S_0$, and by $f_0 \colon X^\sharp_0 \to Y^\sharp$ the induced morphism ; by $T_0 = V(\mathfrak{a}_T)$, by $Y^\sharp_0 := Y^\sharp \times_T T_0$, and by $g_0 \colon Y^\sharp_0 \to Z^\sharp$ the induced morphism. Let $f' \colon X^\sharp \to Y^\sharp$ be a second morphism of $T^\sharp$-log schemes inducing the same restriction $f_0 \colon X^\sharp_0 \to Y^\sharp$. Let $g' \colon Y^\sharp \to Z^\sharp$ be a second morphism of $U^\sharp$-log schemes inducing the same restriction $g_0 \colon Y^\sharp_0 \to Z^\sharp$.

We suppose $\mathcal{B}_X = f^*(\mathcal{B}_Y)$ and $\mathcal{B}_Y = g^*(\mathcal{B}_Z)$. We set $\mathcal{B}'_X := f'^*(\mathcal{B}_Y)$, $\mathcal{B}'_Y := g'^*(\mathcal{B}_Z)$, $\widetilde{X}'^\sharp := (X^\sharp, \mathcal{B}'_X)$, $\widetilde{Y}'^\sharp := (Y^\sharp, \mathcal{B}'_Y)$, $\widetilde{f}' \colon \widetilde{X}'^\sharp \to \widetilde{Y}^\sharp$ and $\widetilde{g}' \colon \widetilde{Y}'^\sharp \to \widetilde{Z}^\sharp$ the morphisms induced respectively by f' and g'.

(a) We have a canonical isomorphism of functors from the category of left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}$-modules to that of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules of the form

$$\begin{array}{ccc} (\tilde{g} \circ \tilde{f}')^* & \xrightarrow[\sim]{\tau_{\tilde{g}\circ\tilde{f},\tilde{g}\circ\tilde{f}'}} & (\tilde{g} \circ \tilde{f})^* \\ \downarrow{\scriptstyle \sim} & & \downarrow{\scriptstyle \sim} \\ \tilde{f}'^* \circ \tilde{g}^* & \xrightarrow[\sim]{\tau_{\tilde{f},\tilde{f}'}\circ\tilde{g}^*} & \tilde{f}^* \circ \tilde{g}^* \end{array} \qquad \begin{array}{ccc} (\tilde{g}' \circ \tilde{f})^* & \xrightarrow[\sim]{\tau_{\tilde{g}\circ\tilde{f},\tilde{g}'\circ\tilde{f}}} & (\tilde{g} \circ \tilde{f})^* \\ \downarrow{\scriptstyle \sim} & & \downarrow{\scriptstyle \sim} \\ \tilde{f}^* \circ \tilde{g}^* & \xrightarrow[\sim]{\tilde{f}^*\circ\tau_{\tilde{g},\tilde{g}'}} & \tilde{f}^* \circ \tilde{g}'^* \end{array} \tag{4.4.5.9.1}$$

Modula the above canonical vertical isomorphisms, this can be written $\tau_{\tilde{g}\circ\tilde{f},\tilde{g}\circ\tilde{f}'} = \tau_{\tilde{f},\tilde{f}'} \circ \tilde{g}^*$ and $\tilde{f}^* \circ \tau_{\tilde{g},\tilde{g}'} = \tau_{\tilde{g}\circ\tilde{f},\tilde{g}'\circ\tilde{f}}$.

(b) Suppose that f and g are finite. Then we have the equality $\sigma_{\tilde{g}\circ\tilde{f},\tilde{g}\circ\tilde{f}'} = \sigma_{\tilde{f},\tilde{f}'} \circ \tilde{g}^*$ and $\tilde{f}^* \circ \sigma_{\tilde{g},\tilde{g}'} = \sigma_{\tilde{g}\circ\tilde{f},\tilde{g}'\circ\tilde{f}}$

Proof. We set $\widetilde{X}^\sharp_0 := (X^\sharp_0, f_0^*\mathcal{B}_Y)$, $\widetilde{Y}^\sharp_0 := (Y^\sharp_0, g_0^*\mathcal{B}_Z)$. We denote by $\tau_{f,f'} \colon \widetilde{X}^\sharp \to \widetilde{X}'^\sharp$ the morphism induced by $\tau_{f,f'}$ (and similarly for $\tau_{g,g'}$) The proposition is a consequence of the following commutative diagram for n large enough

$$
\begin{array}{ccccc}
\widetilde{X}_0^\sharp & \longrightarrow & \widetilde{X}^\sharp & & \\
\downarrow \tilde{f}_0 & & \downarrow \widetilde{f} & & \\
\widetilde{Y}_0^\sharp & \longrightarrow & \widetilde{Y}^\sharp & \overset{\widetilde{g}}{\underset{\widetilde{g}'\circ\tau_{g,g'}}{\rightrightarrows}} & \widetilde{Z}^\sharp \\
\downarrow & & \downarrow \delta^n_{\tilde{g},\tilde{g}'} & & \| \\
\widetilde{Z}^\sharp & \longrightarrow & \widetilde{\Delta}^n_{Z^\sharp/U^\sharp(m)} & \overset{\tilde{p}_1}{\underset{\tilde{p}_2}{\rightrightarrows}} & \widetilde{Z}^\sharp,
\end{array}
\qquad
\begin{array}{ccccc}
\widetilde{X}_0^\sharp & \longrightarrow & \widetilde{X}^\sharp & \overset{\widetilde{f}}{\underset{\widetilde{f}'\circ\tau_{f,f'}}{\rightrightarrows}} & \widetilde{Z}^\sharp \\
\downarrow & & \downarrow \delta^n_{\tilde{f},\tilde{f}'} & & \| \\
\widetilde{Y}^\sharp & \longrightarrow & \widetilde{\Delta}^n_{Y^\sharp/T^\sharp(m)} & \overset{\tilde{p}_1}{\underset{\tilde{p}_2}{\rightrightarrows}} & \widetilde{Y}^\sharp \\
\downarrow \widetilde{g} & & \downarrow & & \downarrow \widetilde{g} \\
\widetilde{Z}^\sharp & \longrightarrow & \widetilde{\Delta}^n_{Z^\sharp/U^\sharp(m)}, & \overset{\tilde{p}_1}{\underset{\tilde{p}_2}{\rightrightarrows}} & \widetilde{Z},
\end{array}
\tag{4.4.5.9.2}
$$

where we have denoted by $\delta^n_{\tilde{g},\tilde{g}'}$ and $\delta^n_{\tilde{f},\tilde{f}'}$ the morphisms making commutative the diagram (see 4.4.5.4.2).

□

4.4.5.10 (Non-lifted case notation)**.** To highlight the "crystalline nature" of the pullback operation, we consider here an extension of 4.4.2 to the case where the morphism f_0 is not the reduction of a morphism f as follows: Let $S^\sharp$ and $T^\sharp$ be nice fine log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ as defined in 3.1.1.1 where i is an integer (resp. $S^\sharp$ and $T^\sharp$ are nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10). Let $X^\sharp$ be a log smooth $S^\sharp$-log scheme (resp. log smooth $S^\sharp$-log formal scheme) and $Y^\sharp$ be a log smooth $T^\sharp$-log scheme (resp. log smooth $T^\sharp$-log formal scheme). We suppose that S has a quasi-coherent m-PD-nilpotent-ideal $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S) \subset \mathcal{O}_S$. Let $S_0^\sharp$ the exact closed logarithmic subscheme of $S^\sharp$ defined by $\mathfrak{a}_S$, $X_0^\sharp$ the reduction of $X^\sharp$ to $S_0^\sharp$. Let $\mathcal{B}_X$ (resp. $\mathcal{B}_Y$) be a commutative $\mathcal{O}_X$-algebra (resp. $\mathcal{O}_Y$-algebra) endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. left $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module).

Let $f_0 \colon X_0^\sharp \to Y^\sharp$ be a $T^\sharp$-morphism, $\mathcal{F}$ a left $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module. Any point $x \in X^\sharp$ has a neighbourhood $V^\sharp$ and a $f \colon V^\sharp \to Y^\sharp$ such that its restriction to $X_0 \cap V$ equals to f_0 (use [CV17, 1.24]). By Proposition 4.4.5.3 the left $\mathcal{D}^{(m)}_{U^\sharp/S^\sharp}$-module $f^*\mathcal{F}$ is independent, up to canonical linear $\mathcal{D}^{(m)}_{U^\sharp/S^\sharp}$ isomorphism of the form $\tau_{f,f'}$, of the choice of f. Hence, we can glue the locally defined $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module and obtain a canonical $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module starting from the data of $\mathcal{F}$ and f_0. We, by abuse of notation, denote this module by $f_0^*\mathcal{F}$; when f_0 lifts to f we have a canonical isomorphism $f_0^*\mathcal{F} \xrightarrow{\sim} f^*\mathcal{F}$.

Since the isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules $\tau_{f,f'} \colon f^*(\mathcal{B}_Y) \xrightarrow{\sim} f'^*(\mathcal{B}_Y)$ is a ring isomorphism (see 4.4.5.4), then the left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module $f_0^*\mathcal{B}_Y$ is endowed with a compatible structure of $\mathcal{O}_X$-algebra.

We suppose moreover that we have a morphism of algebras $\rho \colon f_0^*\mathcal{B}_Y \to \mathcal{B}_X$ which is moreover $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. We will denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$. Any point $x \in X^\sharp$ has a neighbourhood $U^\sharp$ and a $f \colon U^\sharp \to Y^\sharp$ such that its restriction to $X_0^\sharp \cap U^\sharp$ equals to f_0, which yields (with ρ) the homomorphism of ringed logarithmic ($\mathcal{V}$-formal) schemes $\widetilde{f} \colon (U^\sharp, \mathcal{B}_X \cap U) \to (Y^\sharp, \mathcal{B}_Y)$. Following 4.4.5.4.2 the left $\widetilde{\mathcal{D}}^{(m)}_{U^\sharp/S^\sharp}$-module $\widetilde{f}^*\mathcal{F}$ is independent, up to canonical linear $\widetilde{\mathcal{D}}^{(m)}_{U^\sharp/S^\sharp}$ isomorphism of the form $\tau_{\widetilde{f},\widetilde{f}'}$, of the choice of f. Hence, we can glue the locally defined $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and obtain a canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module starting from the data of $\mathcal{F}$, f_0 and ρ. We, by abuse of notation, denote this module by $\widetilde{f}_0^*\mathcal{F}$; when f_0 lifts to f we have a canonical isomorphism $\widetilde{f}_0^*\mathcal{F} \xrightarrow{\sim} \widetilde{f}^*\mathcal{F}$.

Suppose f_0 finite. Similarly, by glueing (via isomorphisms of the form $\sigma_{f,f'} \colon f'^\flat$ of 4.4.5.3.2), we get the functor $\widetilde{f}_0^\flat$ from the category of right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-modules to that of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules ; when f_0 lifts to f we have a canonical isomorphism $\widetilde{f}_0^\flat \xrightarrow{\sim} \widetilde{f}^\flat$.

Notation 4.4.5.11. We keep notation and hypotheses of 4.4.5.10. By functoriality, we get a $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodule by setting

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} := \widetilde{f}_0^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}.$$

Then for any left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module $\mathcal{F}$ we again have a canonical isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-modules

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f_0^{-1}\mathcal{F} \xrightarrow{\sim} \widetilde{f}_0^*\mathcal{F}.$$

4.4.5.12. We suppose that S has a quasi-coherent m-PD-nilpotent-ideal $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S) \subset \mathcal{O}_S$. Let $S_0^\sharp$ the exact closed logarithmic subscheme of $S^\sharp$ defined by $\mathfrak{a}_S$, $X_0^\sharp$ the reduction of $X^\sharp$ to $S_0^\sharp$. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module. Set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. It follows from 4.4.5.10 that the category of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules only depend, up to canonical equivalence, to quasi-coherent m-PD-nilpotent-ideal $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S) \subset \mathcal{O}_S$.

4.4.5.13. We keep notation and hypotheses of 4.4.5.10. Let $U^\sharp$ be a nice fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ where i is an integer (resp. $S^\sharp$ and $T^\sharp$ are nice fine $\mathcal{V}$-log formal schemes). Let $Z^\sharp$ be a log smooth $U^\sharp$-log scheme (resp. log smooth $U^\sharp$-log formal scheme).

Suppose that T has a quasi-coherent m-PD-nilpotent-ideal $(\mathfrak{a}_T, \mathfrak{b}_T, \alpha_T)$ such that $S^\sharp \to T^\sharp$ is a m-PD-morphism. Let $T_0^\sharp$ be the exact closed log subscheme defined by $\mathfrak{a}_T$, $Y_0^\sharp$ the reduction of $Y^\sharp$ on T_0. Let $\mathcal{B}_Z$ be a commutative $\mathcal{O}_Z$-algebra endowed with a compatible structure of $\mathcal{D}^{(m)}_{Z^\sharp/U^\sharp}$-module. Set $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp} = \mathcal{B}_Z \otimes_{\mathcal{O}_Z} \mathcal{D}^{(m)}_{Z^\sharp/U^\sharp}$. Let $g_0 \colon Y_0^\sharp \to Z^\sharp$ be a $T^\sharp$-morphism and $\sigma\colon g_0^*\mathcal{B}_Z \to \mathcal{B}_Y$ be a morphism of algebras which is moreover $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-linear. We get the functor $\widetilde{g}_0^*\colon M(\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}) \to M(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$. Denoting $g_0 \circ f_0 \colon X_0^\sharp \to Z^\sharp$ the composition of g_0 with the morphism $X_0^\sharp \to Y_0^\sharp$ induced by f_0, we get the functor $\widetilde{g_0 \circ f_0}^* \colon \mathrm{Mod}(\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}) \to M(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ induced by $g_0 \circ f_0$ and $\rho \circ \sigma$ as above. It follows from 4.4.5.9 that the functor $\widetilde{g_0 \circ f_0}^*$ is canonically isomorphic to $\widetilde{f_0}^* \circ \widetilde{g_0}^*$.

Proposition 4.4.5.14. *Let $\mathcal{E}$ and $\mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-modules. The canonical morphism*

$$\tilde{f}^*(\mathcal{H}om_{\mathcal{B}_Y}(\mathcal{E}, \mathcal{F})) \to \mathcal{H}om_{\mathcal{B}_X}(\tilde{f}^*\mathcal{E}, \tilde{f}^*\mathcal{F}) \tag{4.4.5.14.1}$$

is $\widetilde{\mathcal{D}}^{(m)}_X$-linear.

Proof. We set $\widetilde{\mathcal{P}}^n := \widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp/(m)}$. By functoriality, the following diagram

$$\begin{array}{ccc} \widetilde{f}^n_{(m)}(\mathcal{H}om_{\widetilde{\mathcal{P}}^n}(\widetilde{\mathcal{P}}^n \otimes_{\mathcal{B}_Y} \mathcal{E}, \widetilde{\mathcal{P}}^n \otimes_{\mathcal{B}_Y} \mathcal{F})) & \longrightarrow & \mathcal{H}om_{\widetilde{\mathcal{P}}^n}(\widetilde{f}^n_{(m)}(\widetilde{\mathcal{P}}^n \otimes_{\mathcal{B}_Y} \mathcal{E}), \widetilde{f}^n_{(m)}(\widetilde{\mathcal{P}}^n \otimes_{\mathcal{B}_Y} \mathcal{F})) \\ \sim\downarrow & & \sim\downarrow \\ \widetilde{f}^n_{(m)}(\mathcal{H}om_{\widetilde{\mathcal{P}}^n}(\mathcal{E} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{P}}^n, \mathcal{F} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{P}}^n)) & \longrightarrow & \mathcal{H}om_{\widetilde{\mathcal{P}}^n}(\widetilde{f}^n_{(m)}(\mathcal{E} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{P}}^n), \tilde{f}^*_n(\mathcal{F} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{P}}^n)), \end{array} \tag{4.4.5.14.2}$$

where the horizontal arrows are the canonical homomorphisms and the vertical ones are induced by the isomorphisms $\varepsilon_n^{\mathcal{E}}$ and $\varepsilon_n^{\mathcal{F}}$, is commutative. Moreover, by definition, the left morphism of the diagram 4.4.5.14.2 is the morphism defining the m-PD-stratification of $\tilde{f}^*(\mathcal{H}om_{\mathcal{B}_Y}(\mathcal{E}, \mathcal{F}))$ whereas the right one comes from the m-PD-stratification of $\mathcal{H}om_{\mathcal{B}_X}(\tilde{f}^*\mathcal{E}, f^*\mathcal{F})$. The morphism 4.4.5.14.1 is therefore horizontal. □

4.5 $\mathcal{D}$-modules in the case of relative strict normal crossing divisors

4.5.1 Semi-logarithmic coordinates

Let $T^\sharp$ be a noetherian nice (see definition 3.1.1.1) fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ with i an integer (resp. $T^\sharp$ be a p-torsion free noetherian nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10). Let $X^\sharp$ be a log smooth $T^\sharp$-log schemes (resp. a p-torsion free log smooth $T^\sharp$-log formal schemes). Let $Y := X^{\sharp *}$ be the open of X where $M_{X^\sharp}$ is trivial and $j\colon Y \hookrightarrow X^\sharp$ be the canonical open immersion. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$-module structure which is compatible with its algebra structure. We set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$.

4.5.1.1 (Notations)**.** Let $d \geq r \geq 0$ be two integers. Let $A^{d,r}$ be the log-scheme whose underlying space is $\mathbb{A}^d_{\mathbb{Z}} = \mathrm{Spec}\,\mathbb{Z}[t_1, \ldots, t_d]$ and such that a pre-log-structure is given by $\mathbb{N}^r \to \mathbb{Z}[t_1, \ldots, t_d]$ defined by

$e_i \mapsto t_i$ for $i = 1, \dots, r$. In other words, $A^{d,r} = A_{\mathbb{N}^r} \times \mathbb{A}^{d-r}_{\mathbb{Z}}$. We set $B^{d,r} = A_{\mathbb{Z}^r} \times \mathbb{A}^{d-r}_{\mathbb{Z}} = (A^{d,r})^*$. Let $\mathfrak{A}^{d,r}$ be the formal $\mathbb{Z}_p$-scheme equal to the p-adic completion of $A^{d,r}$. We get $\mathcal{D}^{(m)}_{A^{d,r}/\mathbb{Z}} = \mathcal{D}^{(m)}_{A_{\mathbb{N}^r}/\mathbb{Z}} \boxtimes \mathcal{D}^{(m)}_{\mathbb{A}^{d-r}_{\mathbb{Z}}/\mathbb{Z}}$ where by abuse of notation $\mathbb{Z}$ means $\operatorname{Spec} \mathbb{Z}$.

We set $A^{d,r}_{T^\sharp} := A^{d,r} \times_{\operatorname{Spec} \mathbb{Z}} T$. If $T^\sharp$ is a nice fine $\mathcal{V}$-log formal scheme, we set $A^{d,r}_{T^\sharp} := \mathfrak{A}^{d,r} \times_{\operatorname{Spf} \mathbb{Z}_p} T^\sharp$ or $\mathfrak{A}^{d,r}_{T^\sharp} := \mathfrak{A}^{d,r} \times_{\operatorname{Spf} \mathbb{Z}_p} T^\sharp$.

We have the canonical exact closed immersions: $A^{r,r}_{T^\sharp} \hookrightarrow A^{d,r}_{T^\sharp}$ given by $t_{r+1} = 0, \dots, t_d = 0$.

Let $m \in \mathbb{N} \cup \{\infty\}$. We have the inclusions $\mathcal{D}^{(m)}_{A^{d,0}_{T^\sharp}/T^\sharp} \subset \mathcal{D}^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp} \subset \mathcal{D}^{(m)}_{A^{d,d}_{T^\sharp}/T^\sharp}$. Since $t_1, \dots, t_d$ are coordinates of $A^{d,0}_{T^\sharp/T^\sharp}$, then the sheaf of rings $\mathcal{D}^{(m)}_{A^{d,0}_{T^\sharp}/T^\sharp}$ is a free $\mathcal{O}_{\mathbb{A}^d_{T^\sharp}}$-module (for both right or left structures) with the basis $\{\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}, \underline{k} \in \mathbb{N}^d\}$ (for both structures). Since $t_1, \dots, t_d$ are logarithmic coordinates of $A^{d,d}_{T^\sharp}/T^\sharp$, then the sheaf of rings $\mathcal{D}^{(m)}_{A^{d,d}_{T^\sharp}/T^\sharp}$ is is a free $\mathcal{O}_{\mathbb{A}^d_{T^\sharp}}$-module (for both right or left structures) with the basis $\{\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}, \underline{k} \in \mathbb{N}^d\}$ (for both structures). The canonical inclusion $\mathcal{D}^{(m)}_{A^{d,0}_{T^\sharp}/T^\sharp} \subset \mathcal{D}^{(m)}_{A^{d,d}_{T^\sharp}/T^\sharp}$ sends $\underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}$ to $\underline{t}^{\underline{k}} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$, which is abusively written by the relation $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}} = \underline{t}^{\underline{k}} \underline{\partial}_\sharp^{\langle \underline{k} \rangle_{(m)}}$, where $\underline{t}^{\underline{k}} := t_1^{k_1} \cdots t_d^{k_d}$ for $(k_1, \dots, k_d) = \underline{k}$. For any $(k_1, \dots, k_d) = \underline{k} \in \mathbb{N}^d$, we get an element of $\mathcal{D}^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp}$ by setting

$$\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} := \underline{\partial}_\sharp^{\langle (k_1, \dots, k_r, 0, \dots, 0) \rangle_{(m)}} \underline{\partial}^{\langle (0, \dots, 0, k_{r+1}, \dots, k_d) \rangle_{(m)}} = \underline{\partial}_\sharp^{\langle (\underline{i}, \underline{0}) \rangle_{(m)}} \underline{\partial}^{\langle (\underline{0}, \underline{j}) \rangle_{(m)}}. \tag{4.5.1.1.1}$$

Moreover, the $\mathcal{O}_{\mathbb{A}^d_{T^\sharp}}$-module (for both right or left structures) $\mathcal{D}^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp}$ is free with the base $\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}}$, $\underline{k} \in \mathbb{N}^d$.

Let $\underline{k} \in \mathbb{N}^d$ with $\underline{i} \in \mathbb{N}^r$ and $\underline{j} \in \mathbb{N}^{d-r}$. By using the tautological formula 3.4.1.2.2, the logarithmic adjoint operator $\widetilde{\underline{\partial}}_\sharp^{\langle (k_1, \dots, k_r, 0, \dots, 0) \rangle_{(m)}} = \widetilde{\underline{\partial}}_\sharp^{\langle (\underline{i}, \underline{0}) \rangle_{(m)}}$ of $\underline{\partial}_\sharp^{\langle (\underline{i}, \underline{0}) \rangle_{(m)}}$ belongs to $D^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp}$. The adjoint operator ${}^t\underline{\partial}^{\langle (0, \dots, 0, k_{r+1}, \dots, k_d) \rangle_{(m)}}$ of $\underline{\partial}^{\langle (\underline{0}, \underline{j}) \rangle_{(m)}}$ is an element of $D^{(m)}_{A^{d,0}_{T^\sharp}/T^\sharp}$. We get the semi-logarithmic adjoint operator of $\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}}$ by setting:

$${}^\tau \underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} := \widetilde{\underline{\partial}}_{(r)}^{\langle \underline{k} \rangle_{(m)}} := \widetilde{\underline{\partial}}_\sharp^{\langle (\underline{i}, \underline{0}) \rangle_{(m)}} {}^t\underline{\partial}^{\langle (\underline{0}, \underline{j}) \rangle_{(m)}}. \tag{4.5.1.1.2}$$

Lemma 4.5.1.2. *Let $f \colon X^\sharp \to Y^\sharp$ a morphism of log smooth $T^\sharp$-log-schemes (resp. p-torsion free fine log smooth $T^\sharp$-log-formal schemes). The morphism f is log-étale if and only if the canonical morphism $f^*\Omega^1_{Y^\sharp/T^\sharp} \to \Omega^1_{X^\sharp}$ is an isomorphism.*

Proof. It follows from 3.3.2.7 that we reduce to the non-respective case. Following [Ogu18, IV.3.2.3.2 and IV.3.1.3], if the canonical morphism $f^*\Omega^1_{Y^\sharp/T^\sharp} \to \Omega^1_{X^\sharp/T^\sharp}$ is an isomorphism then f is log-étale. Conversely, if f is log-étale then f is log-smooth and therefore (by using [Ogu18, IV.3.2.3.1]) $f^*\Omega^1_{Y^\sharp/T^\sharp} \to \Omega^1_{X^\sharp/T^\sharp}$ is injective. Since f is unramified then $\Omega^1_{X^\sharp/Y^\sharp} = 0$ (see [Ogu18, IV.3.1.3]). This yields that $f^*\Omega^1_{Y^\sharp/T^\sharp} \to \Omega^1_{X^\sharp/T^\sharp}$ is surjective. □

Lemma 4.5.1.3. *With notation 4.5.1.1, let $f \colon X^\sharp \to A^{d,r}_{T^\sharp}$ be a morphism of log smooth $T^\sharp$-log-(formal) schemes given by the global sections $e_1, \dots, e_r$ of $M_{X^\sharp}$ and $a_{r+1}, \dots, a_d$ of $\mathcal{O}_X$. The morphism f is log-étale if and only if the $\mathcal{O}_X$-module $\Omega^1_{X^\sharp/T^\sharp}$ is free and if $(d\log e_1, \dots, d\log e_r, da_{r+1}, \dots, da_d)$ is a basis.*

Proof. Following 4.5.1.2, f is log-étale if and only if the canonical morphism $f^*\Omega^1_{A^{d,r}_{T^\sharp}/T^\sharp} \to \Omega^1_{X^\sharp/T^\sharp}$ is an isomorphism. This last property is equivalent to the fact that the $\mathcal{O}_X$-module $\Omega^1_{X^\sharp/T^\sharp}$ is free and that $(d\log e_1, \dots, d\log e_r, da_{r+1}, \dots, da_d)$ is a base (to compute explicitly $\Omega^1_{A^{d,r}_{T^\sharp}/T^\sharp}$, it is better to use the remark [Ogu18, IV.1.1.8]). □

Definition 4.5.1.4 (Semi-logarithmic coordinates)**.** A $T^\sharp$-morphism of the form $f\colon X^\sharp \to A^{d,r}_{T^\sharp}$ is equivalent to the data of global sections $t_1, \dots, t_r$ of $M_{X^\sharp}$ and $t_{r+1}, \dots, t_d$ of $\mathcal{O}_X$. If f is log-étale then we say that $t_1, \dots, t_d$ are semi-logarithmic coordinates (of type d, r) of $X^\sharp/T^\sharp$. In that case the canonical morphism $\mathcal{D}^{(m)}_{X^\sharp/T^\sharp} \to f^*\mathcal{D}^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp}$ is an isomorphism. This yields a map $f^{-1}\mathcal{D}^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp} \to \mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$, which is in fact a ring homomorphism (see 4.4.3.1.3). We still write by $\underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_{(r)}$ the global sections of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ equal to the image of $\underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_{(r)}$ via the composite morphism $f^{-1}\mathcal{D}^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp} \to \mathcal{D}^{(m)}_{X^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. Moreover, the $\mathcal{B}_{X^\sharp}$-module (for both right or left structures) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$ is free with the base $\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}_{(r)}$, $\underline{k} \in \mathbb{N}^d$.

When $m = \infty$, we rather write $\underline{\partial}^{[\underline{i}]}_{(r)} := \underline{\partial}^{\langle \underline{i}\rangle_{(\infty)}}_{(r)}$. Finally, we have $\Omega_{X^\sharp/T^\sharp} \xrightarrow{\sim} f^*\Omega_{A^{d,r}_{T^\sharp}/T^\sharp}$.

4.5.1.5 (Semi-logarithmic adjoint operator)**.** Let $f\colon X^\sharp \to A^{d,r}_{T^\sharp}$ be a log-étale $T^\sharp$-morphism given by semi-logarithmic coordinates (of type d, r) $t_1, \dots, t_d$ of $X^\sharp/T^\sharp$. Set $\widetilde{D}^{(m)}_{X^\sharp/T^\sharp} := \Gamma(X, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$ and $B_X := \Gamma(X, \mathcal{B}_X)$. Let $\underline{k} \in \mathbb{N}^d$. We still denote by ${}^\tau\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}_{(r)}$ the image of the operator ${}^\tau\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}_{(r)}$ defined at 4.5.1.1.2 via the ring homomorphism $f^{-1}\mathcal{D}^{(m)}_{A^{d,r}_{T^\sharp}/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$.

Let $P = \sum_{\underline{k}\in\mathbb{N}^d} b_{\underline{k}}\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}_{(r)} \in \widetilde{D}^{(m)}_{X^\sharp/T^\sharp}$, with $b_{\underline{k}} \in B_X$. We define the "semi-logarithmic adjoint operator" of P by setting ${}^\tau P := \sum_{\underline{k}} {}^\tau\underline{\partial}^{\langle \underline{k}\rangle_{(m)}}_{(r)} b_{\underline{k}}$, which is a mixed version of the logarithmic and non-logarithmic adjoint operator.

Let P, Q be two differential operators of $\widetilde{D}^{(m)}_{X^\sharp/T^\sharp}$. Similarly to 4.3.5.3, we can check that the following properties hold:

(a) We have ${}^\tau({}^\tau P) = P$ and ${}^\tau(PQ) = {}^\tau Q {}^\tau P$

(b) We have the equality

$$\rho({}^\tau P) = \rho\left(\underline{t}_{(r)}{}^{\mathrm{t}}P\frac{1}{\underline{t}_{(r)}}\right), \tag{4.5.1.5.1}$$

where $\underline{t}_{(r)} = t_1 \cdots t_r$ and where ρ is the canonical map $\widetilde{D}^{(m)}_{X^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y/T^\sharp}$ (which is an inclusion when $\mathcal{B}_X = \mathcal{O}_X$).

Hence, ${}^\tau\colon (\widetilde{D}^{(m)}_{X^\sharp/T^\sharp})^o \to \widetilde{D}^{(m)}_{X^\sharp/T^\sharp}$ is an involution of $\mathcal{O}_T$-algebras, which is called the semi-logarithmic adjoint automorphism. Beware that this depends on the choice of the semi-logarithmic coordinates $t_1, \dots, t_d$.

Lemma 4.5.1.6. *Suppose $X^\sharp/T^\sharp$ has semi-logarithmic coordinates $t_1, \dots, t_d$ of type d, r. The sheaf $\widetilde{\omega}_{X^\sharp/T^\sharp}$ is a free $\mathcal{B}_X$-module of rank one with the basis $\widetilde{e}_0 := d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge t_d$ and $\widetilde{\omega}_{Y/T^\sharp}$ is a free $\mathcal{B}_Y$-module of rank one with the basis $dt_1 \wedge \cdots \wedge dt_d$.*

The sheaf $\widetilde{\omega}_{X^\sharp/T^\sharp}$ is a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-submodule of $j_*\widetilde{\omega}_{Y/T^\sharp}$. More precisely, the action of $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ on the section $b\,\widetilde{e}_0$, where b is section of $\mathcal{B}_X$ is given by the formula

$$(b\ \widetilde{e}_0) \cdot P = {}^\tau P(b)\ \widetilde{e}_0. \tag{4.5.1.6.1}$$

Proof. Using 4.5.1.2, we reduce to the case where $X^\sharp/T^\sharp = A^{d,r}_{T^\sharp}/T^\sharp$. By base change, we can suppose $T^\sharp = \operatorname{Spec}\mathbb{Z}$ or $T^\sharp = \operatorname{Spf}\mathbb{Z}_p$. Since $\omega_{A^{d,r}/\mathbb{Z}} = \omega_{A_{\mathbb{N}^r}/\mathbb{Z}} \boxtimes \omega_{\mathbb{A}^{d-r}_{\mathbb{Z}}/\mathbb{Z}}$ then we conclude using 3.4.5.1 and its non-logarithmic version 2.2.1.4. □

Lemma 4.5.1.7. *Consider the isomorphism*

$$\delta_{\mathcal{M}}\colon \mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \xrightarrow{\sim} \mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$$

of 4.2.5.5.1. Suppose $X^\sharp/T^\sharp$ has semi-logarithmic coordinates $t_1, \dots, t_d$ of type d, r. Then, we have the following formula

$$\delta_{\mathcal{M}}(x \otimes {}^\tau\underline{\partial}^{\langle \underline{k}\rangle}_{(r)}) = \sum_{\underline{h}\leq\underline{k}} x\,{}^\tau\underline{\partial}^{\langle \underline{k}-\underline{h}\rangle}_{(r)} \otimes \underline{\partial}^{\langle \underline{h}\rangle}_{(r)}. \tag{4.5.1.7.1}$$

Proof. Similar to 4.2.5.5. □

4.5.1.8 (Left to right $\mathcal{D}$-module)**.** Suppose $X^\sharp/T^\sharp$ has semi-logarithmic coordinates $t_1, \ldots, t_d$ of type d, r. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module. We denote by $\widetilde{e}_0 := d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge dt_d$ a basis of the free $\mathcal{B}_X$-module $\widetilde{\omega}_{X^\sharp/T^\sharp}$ has the basis, and by $\widetilde{e}_0^\vee$ its corresponding dual basis of the free $\mathcal{B}_X$-module $\widetilde{\omega}^{-1}_{X^\sharp/T^\sharp}$.

(a) Similarly to 4.3.5.5, we compute that the right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module structure on $\widetilde{\omega}_{X^\sharp/T^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$ is given by the formula
$$(\widetilde{e}_0 \otimes x)P = \widetilde{e}_0 \otimes {}^\tau P x, \tag{4.5.1.8.1}$$
for any local section x of $\mathcal{E}$ and P of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$.

(b) The left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module structure on $\mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/T^\sharp}$ is given by the formula
$$P(y \otimes \widetilde{e}_0^\vee) = y^\tau P \otimes \widetilde{e}_0^\vee, \tag{4.5.1.8.2}$$
for any local section y of $\mathcal{M}$ and P of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$.

4.5.1.9. The formulas 4.2.3.1, 4.2.3.5 and 4.2.5.4 remain valid replacing by $\underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$ by $\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}}$ and $\widetilde{\underline{\partial}}_\sharp^{\langle \underline{k} \rangle}$ by $\widetilde{\underline{\partial}}_{(r)}^{\langle \underline{k} \rangle_{(m)}}$.

4.5.2 Log structures associated with relative strict normal crossing divisor

We remind first the notion of strict normal crossing divisor and then of relative strict normal crossing divisor. We give some details in the case where the base is geometrically unibranch (and locally noetherian).

Definition 4.5.2.1. Let $X \to S$ be a morphism of schemes or a morphism of formal schemes. Following [KM85, 1.1.1] (resp. [Sta22, 01WR]), an effective Cartier divisor D in X/S (resp. an effective Cartier divisor D in X) is a closed (formal) subscheme $D \subset X$ satisfying both conditions (resp. the second one):

(i) D is flat over S,

(ii) the ideal sheaf $\mathcal{I}(D) \subset \mathcal{O}_X$ is an invertible $\mathcal{O}_X$-module, i.e., it is a locally free $\mathcal{O}_X$-module of rank one.

We denote by $\mathrm{Div}(X/S)_{\geq 0}$ (resp. $\mathrm{Div}(X)_{\geq 0}$) the integral monoid of effective Cartier divisors in X/S (resp. in X). We say that a family $\{E_i\}_{i \in I}$ of nonzero elements in $\mathrm{Div}(X/S)_{\geq 0}$ has a *locally finite intersection* if, for any point $x \in X$, there exists a Zariski open neighborhood U of x such that the set $\{i \in I \mid E_i \cap V \neq \emptyset\}$ is finite.

Lemma 4.5.2.2. *Let X be a locally Noetherian scheme. Let $D \subset X$ be an effective Cartier divisor. Let $x \in D$. The following (1) and (2) conditions are equivalent:*

1. *The local ring $\mathcal{O}_{X,x}$ is regular and there exist a regular system of parameters $t_1, \ldots, t_d \in \mathfrak{m}_{X,x}$ and an integer $1 \leq r \leq d$ such that D is cut out by $t_1 \ldots t_r$ in $\mathcal{O}_{X,x}$.*

2. *Let $D_1, \ldots, D_r$ be the irreducible components of D passing through x (viewed as reduced closed subschemes of X). There exists an open subset U of X containing x such that*

   (i) the scheme $D \cap U$ is reduced,

   (ii) each $D_i \cap U$ is an effective Cartier divisor in U,

   (iii) for any $J \subset \{1, \ldots, r\}$ the scheme theoretic intersection $D_J := \cap_{j \in J} D_j$ is a regular scheme at x and the irreducible component of $U \cap D_J$ containing x has codimension $|J|$ in X.

Proof. The proof can be found at [Sta22, 0BI9,0BIA]. For the reader convenience, let us recall the link between (1) and (2). Suppose the local ring $\mathcal{O}_{X,x}$ is regular and there exist a regular system of parameters $t_1, \ldots, t_d \in \mathfrak{m}_x$ and $1 \leq r \leq d$ such that D is cut out by $t_1 \ldots t_r$ in $\mathcal{O}_{X,x}$. Then the irreducible components $D_1, \ldots, D_r$ of D passing through x corresponds 1-to-1 to the Cartier divisors $V(t_1), \ldots, V(t_r)$. Conversely, let $t_1, \ldots, t_r$ be some local equations of $D_1, \ldots, D_r$. Set Z be the irreducible component of $D_1 \cap \cdots \cap D_r$ containing x. By choosing additional $t_{r+1}, \ldots, t_d \in \mathfrak{m}_{X,x}$ which map to a minimal system of generators of $\mathfrak{m}_{Z,x}$, we get the regular system of parameters $t_1, \ldots, t_d \in \mathfrak{m}_{X,x}$ such that D is cut out by $t_1 \ldots t_r$ in $\mathcal{O}_{X,x}$. □

Definition 4.5.2.3. Let X be a locally Noetherian scheme. Let $D \subset X$ be an effective Cartier divisor. Let $x \in D$. We say that D is a "strict normal crossing divisor on X at x" if one of the following equivalent conditions of 4.5.2.2 holds. We say that D is a "strict normal crossing divisor on X" if D is a strict normal crossing divisor on X at x for any $x \in D$.

4.5.2.4. Let X be a locally Noetherian scheme. Let $D \subset X$ be an effective Cartier divisor. Let $D_i \subset D$, $i \in I$ be its irreducible components viewed as reduced closed subschemes of X. We have the following equivalent conditions :

(a) D is a strict normal crossing divisor on X,

(b) D is a strict normal crossing divisor on X at any closed point x of D,

(c) D is reduced, each D_i is an effective Cartier divisor, and for any $J \subset I$ finite the scheme theoretic intersection $D_J := \cap_{j \in J} D_j$ is a regular scheme each of whose irreducible components has codimension $|J|$ in X (e.g. when D_J is empty this is automatic).

Indeed, a proof of the equivalence between (a) and (c) can be found at [Sta22, 0BI9,0BIA] (this is also a consequence of 4.5.2.2). Following [**?**, 0.17.3.2], to check that $\mathcal{O}_{D_J}$ is regular we reduce to check that $\mathcal{O}_{D_J,x}$ is regular for any closed point x of D_J. Hence, it follows from 4.5.2.2 that we get the equivalence between (b) and (c).

Example 4.5.2.5. Let X be a locally of finite type scheme over $S = \operatorname{Spec} k$ with k a *perfect* field. Following [Gro67, 17.15.1], a scheme locally of finite type over S is smooth at x if and if it is regular at x. Let $x \in X$ be a closed point, $d = \dim_x X$ and $t_1, \ldots, t_d$ be sections of $\mathcal{O}_X$ on X. Following [Gro67, 17.15.4], since the extension $k(x)/k$ is finite and étale, then the morphism $X \to \mathbb{A}^d$ induced by $t_1, \ldots, t_d$ is étale at x if and only if the sheaf $\mathcal{O}_{X,x}$ is regular and $(t_1)_x, \ldots, (t_d)_x$ is a regular system of parameter for $\mathcal{O}_{X,x}$. Let $D \subset X$ be an effective Cartier divisor. It follows from the above reminder that D is a strict normal crossing divisor on X if one of the following equivalent conditions holds:

(d) for every $x \in D$, there exists an open U of X containing x so that U/S is endowed with coordinates $t_1, \ldots, t_d$ such that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U,

(e) for every closed point $x \in D$, there exists an open U of X containing x so that U/S is endowed with coordinates $t_1, \ldots, t_d$ such that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U,

(f) D is reduced, and if $(D_i \subset D)_{i \in I}$ is the family of the irreducible components of D (viewed as reduced closed subschemes of X), each D_i is an effective Cartier divisor, and for any $J \subset I$ finite the scheme theoretic intersection $D_J := \cap_{j \in J} D_j$ is a smooth scheme over S each of whose irreducible components has codimension $|J|$ in X (e.g. when D_J is empty this is automatic).

Definition 4.5.2.6. Let $X \to S$ be a morphism of schemes or a morphism of formal schemes. Let $D \subset X$ be an effective Cartier divisor.

(a) We say that D admits a "decomposition by smooth components" if there exist effective Cartier divisors $(D_i)_{i \in I}$ in X/S which are smooth over S such that we have $D = \sum_{i \in I} D_i$ in $\operatorname{Div}(X/S)_{\geq 0}$.

(b) We say that D admits a decomposition by "irreducible smooth components" if there exist effective Cartier divisors $(D_i)_{i \in I}$ in X/S which are smooth over S, whose underlying topological space is irreducible and such that $D = \sum_{i \in I} D_i$ in $\operatorname{Div}(X/S)_{\geq 0}$.

We recall below the following definition given by Y. Nakkajima and A. Shiho in [NS, 2.1.7] (it is called "relative simple normal crossing divisor").

Definition 4.5.2.7. Let $X \to S$ be a morphism of schemes or a morphism of formal schemes. Let $D \subset X$ be an effective Cartier divisor.

1. Let $x \in D$. We say that D is a "relative to X/S strict normal crossing divisor at x" if there exists an open U of X containing x so that U/S is endowed with coordinates $t_1, \ldots, t_d$ such that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U.

2. We say that D is a "relative to X/S strict normal crossing divisor" if D is a relative to X/S strict normal crossing divisor at any $x \in D$ and if D admits a decomposition by smooth components.

Remark 4.5.2.8. We keep notation 4.5.2.7.

(a) When there exists an open U of X containing x so that U/S is endowed with coordinates $t_1, \ldots, t_d$ such that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U, then $D \cap U$ admits a decomposition by the smooth components given by $t_1, \ldots, t_r$ and $D \cap U$ is an effective Cartier divisor in U/S. However, since this is not clear that we can glue theses S-smooth closed subschemes, the hypothesis that D has a decomposition by smooth components is not useless in the notion of *relative to X/S strict normal crossing divisor*.

(b) A relative to X/S strict normal crossing divisor is necessarily an effective Cartier divisor in X/S.

(c) Contrary to the notion of strict normal crossing divisor, the definition 4.5.2.7 is relative. However, if S is the spectrum of a perfect field, then both notion of strict normal crossing divisor of X and of relative to X/S strict normal crossing divisor are equal (see 4.5.2.5).

Remark 4.5.2.9. Let $X \to S$ be a smooth morphism of schemes such that S is geometrically unibranch (see [Gro65, 6.15.1]). Then following [Gro67, 17.5.7], X is geometrically unibranch. In particular, for any $x \in X$, $\mathcal{O}_{X,x}$ is irreducible. Hence, when S is moreover locally noetherian, it follows from [Gro60, 6.1.10] that the irreducible components of X are equal to its connected components.

Let $\mathfrak{X} \to \mathfrak{S}$ be a smooth morphism of $\mathcal{V}$-formal schemes.We say that $\mathfrak{S}$ is geometrically unibranch if S_i is geometrically unibranch for any $i \in \mathbb{N}$. Hence, if $\mathfrak{S}$ is geometrically unibranch and locally noetherian, then the irreducible components of $\mathfrak{X}$ are equal to its connected components.

Proposition 4.5.2.10. *Let $X \to S$ be a morphism of schemes or $\mathcal{V}$-formal schemes. Suppose S is geometrically unibranch and locally noetherian. Let $D \subset X$ be an effective Cartier divisor in X/S. Let $x \in D$. The following (a) and (b) conditions are equivalent:*

(a) There exists an open U of X containing x so that U/S is endowed with coordinates $t_1, \ldots, t_d$ such that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U.

(b) There exists an open U of X containing x, a positive integer r and effective Cartier divisors $E_1, \ldots, E_r$ in U/S such that:

   (i) $D \cap U = \sum_{i=1}^{r} E_i$ in $\mathrm{Div}(U/S)_{\geq 0}$,

   (ii) $D \cap U$ is the scheme theoretic union of $E_1, \ldots, E_r$ (see definition [Sta22, 0C4H]),

   (iii) The underlying topological spaces of $E_1, \ldots, E_r$ corresponds 1-to-1 to the irreducible components of $D \cap U$,

   (iv) For any $J \subset \{1, \ldots, r\}$, denoting by $E_J := \cap_{j \in J} E_j$ the scheme theoretic intersection, E_J is a smooth scheme over S each of whose irreducible components has codimension $|J|$ in X.

Proof. Suppose the property (a) holds. By hypothesis, there exists an open U of X containing x so that U/S is endowed with coordinate $t_1, \ldots, t_d$ such that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U. This implies that U/S and $V(t_1), \ldots, V(t_r)$ are smooth over S. With the remark 4.5.2.9, this yields that the irreducible components of $V(t_1), \ldots, V(t_r)$ are respectively equal to their connected components. Shrinking U if necessary, we can therefore suppose $V(t_1), \ldots, V(t_r)$ are irreducible. We denote by $E_i := V(t_i)$ the effective Cartier divisors in U/S for $i = 1, \ldots, r$. The fact that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U can be translated by the equality $D \cap U = \sum_{i=1}^{r} E_i$ in $\mathrm{Div}(U/S)_{\geq 0}$. Moreover, for any $J \subset \{1, \ldots, r\}$, E_J is étale over $\mathbb{A}_S^{d-|J|}$ and therefore smooth over S. This implies the codimension formula thanks to [Gro67, 17.6.4]. Hence, the underlying topological spaces of $E_1, \ldots, E_r$ correspond 1-to-1 to the irreducible components of $D \cap U$. We remark also that $E_i \cap E_J$ is an effective Cartier divisor of E_i/S. Hence, using [Sta22, 0C4R and 01WW], this yields that $D \cap U$ is the scheme theoretic union of $E_1, \ldots, E_r$.

Conversely, suppose the property (b) holds. Let U be an open of X containing x and let $E_1, \ldots, E_r$ be some effective Cartier divisors in U/S satisfying the conditions of (b). Since $E_1, \ldots, E_r$ are effective Cartier divisors, shrinking U if necessary, we can suppose there exist sections $t_1, \ldots, t_r$ of $\mathcal{O}_X$ on U which are nonzerodivisors and such that $E_i = V(t_i)$ for any $i = 1, \ldots, r$. Hence, the closed immersion $E_1 \hookrightarrow U$ is regular. Since E_1 is smooth at x, this yields that U is smooth at x (see [Gro67, 17.12.1]). Let $\mathcal{I}$ be the ideal given by the closed immersion $E_1 \cap \cdots \cap E_r \hookrightarrow U$. Then $(t_1)_x, \ldots, (t_r)_x$ is a system of generators of $\mathcal{I}_x$ whose cardinal is the smallest possible (because the irreducible component of $E_1 \cap \cdots \cap E_r$ containing x has codimension r in X and because of Krull's height theorem). Moreover, since $E_1 \cap \cdots \cap E_r$ and U are smooth at x, shrinking U if necessary, it follows from [Gro67, 17.12.2] that there exist sections $t_{r+1}, \ldots, t_d$ of $\mathcal{O}_X$ on U such that $t_1, \ldots, t_d$ are coordinates of U/S. Hence, we are done. □

Proposition 4.5.2.11. *Let $X \to S$ be a morphism of schemes or $\mathcal{V}$-formal schemes. Suppose S is geometrically unibranch and locally noetherian. Let $D \subset X$ be an effective Cartier divisor in X/S. The following (a) and (b) conditions are equivalent:*

(a) The divisor D is a relative to X/S strict normal crossing divisor.

(b) There exists a unique family of effective Cartier divisors $(D_i)_{i \in I}$ in X/S with D_i irreducible and smooth over S such that:

  (i) $D = \sum_{i \in I} D_i$ in $\mathrm{Div}(X/S)_{\geq 0}$;

  (ii) D is the scheme theoretic union of the $(D_i)_{i \in I}$ (see definition [Sta22, 0C4H]) ;

  (iii) The underlying topological spaces of $(D_i)_{i \in I}$ corresponds 1-to-1 to the irreducible components of D ;

  (iv) For any $J \subset I$ finite the scheme theoretic intersection $D_J := \cap_{j \in J} D_j$ is a smooth scheme over S each of whose irreducible components has codimension $|J|$ in X (e.g. when D_J is empty this is automatic).

Proof. Suppose (a) holds. Then, if follows from the remark 4.5.2.9 that D has a decomposition by irreducible smooth components (see definition 4.5.2.6). Since S is locally noetherian, the unicity of such a decomposition is a consequence of [NS, A.0.3]. Since the other points to be checked are local, then we get (b) from 4.5.2.10. With 4.5.2.10, the converse is obvious. □

Definition 4.5.2.12. Let $X \to S$ be a morphism of schemes or $\mathcal{V}$-formal schemes. Suppose S is geometrically unibranch and locally noetherian. Let D is a relative to X/S strict normal crossing divisor. The elements of the unique family $(D_i)_{i \in I}$ of effective Cartier divisors in X/S satisfying the conditions of (b) are called the "irreducible S-smooth components of D".

Remark 4.5.2.13. Because of the nice description of 4.5.2.11, even if it might not be always useful later, when we will consider relative strict normal crossing divisors, by convenience we will only consider the case where the base is geometrically unibranch.

4.5.2.14. Let $X \to S$ be a morphism of schemes (resp. $\mathcal{V}$-formal schemes). Suppose S is geometrically unibranch and locally noetherian. Let $D \subset X$ be a relative to X/S strict normal crossing divisor and $Y = X \setminus D$.

(a) Let $x \in D$. Choose an open U of X containing x so that U/S is endowed with coordinates $t_1, \ldots, t_d$ such that $D \cap U$ is cut out by $t_1 \ldots t_r$ in U. Shrinking U if necessary, it follows from (the proof of) 4.5.2.10 that we can suppose the underlying spaces of $V(t_1), \ldots, V(t_r)$ are equal to the irreducible components of $D \cap U$. We remark then that the submonoid $t_1^{\mathbb{N}} \cdots t_r^{\mathbb{N}} \mathcal{O}_U^{\times} \subset \mathcal{O}_U$ does not depend on the choice of $t_1, \ldots, t_d$ such that $V(t_1), \ldots, V(t_r)$ are equal to the irreducible components of $D \cap U$. As the projective limits of monoids are well defined, this yields therefore by glueing (see [Gro60, 3.3]), a sheaf of monoids on X denoted by $M(D)$ and a canonical injection $M(D) \hookrightarrow \mathcal{O}_X$. This submonoid $M(D)$ of $\mathcal{O}_X$ is characterized by the properties $M(D)|_Y = \mathcal{O}_Y^{\times}$ and $M(D)|_U = t_1^{\mathbb{N}} \cdots t_r^{\mathbb{N}} \mathcal{O}_U^{\times}$ for any $x \in D$ and U such as above.

(b) The log (formal) scheme $(X, M(D))$ is smooth over S. Indeed, let $x \in D$. Since the formal case is checked identically we can consider the non-respective case. Choose an open U of X containing x so that U/S is endowed with coordinates $t_1, \dots, t_d$ such that $D \cap U$ is cut out by $t_1 \dots t_r$ in U and the underlying spaces of $V(t_1), \dots, V(t_r)$ are equal to the irreducible components of $D \cap U$. Then $M(D)|_U = t_1^{\mathbb{N}} \cdots t_r^{\mathbb{N}} \mathcal{O}_U^{\times}$ and we have the cartesian diagram of S-morphisms

$$\begin{array}{ccccc} (U, M(D)|_U) & \xrightarrow{t} & A_{\mathbb{N}^r} \times_{\operatorname{Spec} \mathbb{Z}} \mathbb{A}_S^{d-r} & \longrightarrow & A_{\mathbb{N}^r} \\ \downarrow f & \square & \downarrow & \square & \downarrow \\ U & \xrightarrow{t} & \mathbb{A}_S^d & \longrightarrow & \mathbb{A}^r \end{array} \tag{4.5.2.14.1}$$

where the right vertical arrow is induced by the canonical morphism, the bottom left arrow is induced by the coordinates $(t_\lambda)_{\lambda=1,\dots,d}$.

(c) When $r < d$, shrinking if necessary the open subset U containing x (and changing if necessary the elements $t_{r+1}, \dots, t_d$), we can suppose $U = U \setminus V(t_{r+1}, \dots, t_d)$, i.e., the $t_{r+1}, \dots, t_d$ are invertible, i.e. the top right horizontal morphism of 4.5.2.14.1 factors through the strict log étale morphism $(X, M(D)) \to A_{\mathbb{N}^r} \times_{\operatorname{Spec} \mathbb{Z}} \mathbb{G}_m^{d-r} \times_{\operatorname{Spec} \mathbb{Z}} S$. Hence, $t_1, \dots, t_d$ induce the log étale S-morphism $(X, M(D)) \to A_{\mathbb{N}^d} \times_{\operatorname{Spec} \mathbb{Z}} S$.

Definition 4.5.2.15. Let $X \to S$ be a morphism of schemes (resp. formal schemes). Suppose S is geometrically unibranch and locally noetherian. Let $D \subset X$ be a relative to X/S strict normal crossing divisor. Let $t_1, \dots, t_d$ be some sections of $\mathcal{O}_X$ on an open subset U of X. Let r be the number of irreducible components of $D \cap U$ ($r = 0$ means $D \cap U$ is empty). We say that "$t_1, \dots, t_d$ are semi-nice (resp. nice) coordinates of $(U, M(D)|_U)/S$" if the first two (resp. the three) properties are satisfied:

(a) $t_1, \dots, t_d$ are coordinates of U/S,

(b) either $D \cap U$ is empty or $D \cap U$ is cut out by $\prod_{1 \le j \le r} t_j$ in U for some $r \ge 1$ and the underlying spaces of the family $\{V(t_j)\}_{1 \le j \le r}$ correspond 1-to-1 to the irreducible components of $D \cap U$,

(c) t_l are invertible for any integer satisfying $d \ge l > r$.

4.5.2.16. Let $X \to S$ be a smooth morphism of schemes (resp. formal schemes). Suppose S is geometrically unibranch and locally noetherian. Let $D \subset X$ be a relative to X/S strict normal crossing divisor.

(a) Let $x \in X$. It follows from 4.5.2.14 (and remark the case $x \notin D$ is obvious) that there exist an open subset U of X containing x, some sections $t_1, \dots, t_d$ such that $t_1, \dots, t_d$ are nice coordinates of $(U, M(D)|_U)/S$. Then $t_1, \dots, t_d$ are coordinates of U/S and also are logarithmic coordinates of $(U, M(D)|_U)/S$.

(b) Let U be an open subset of X such that there exists semi-nice coordinates $t_1, \dots, t_d$ of $(U, M(D)|_U)/S$. Let r be the number of irreducible components of $D \cap U$. Then $M(D)|_U = t_1^{\mathbb{N}} \cdots t_r^{\mathbb{N}} \mathcal{O}_U^{\times}$ (when $r = 0$, this means $M(D)|_U = \mathcal{O}_U^{\times}$). It follows from 4.5.2.14.1 that $t_1, \dots, t_d$ induces the strict log-étale map $(U, M(D)|_U) \to A_S^{d,r}$ (see notation 4.5.1.1), i.e. $t_1, \dots, t_d$ are semi-logarithmic coordinates of $(U, M(D)|_U)/S$ (see definition 4.5.1.4).

Example 4.5.2.17. Let $\mathcal{V}$ be a complete discrete valuation ring of characteristic $(0, p)$ with perfect residue field k, $\mathfrak{S} = \operatorname{Spf} \mathcal{V}$ and $S = \operatorname{Spec} k$. Let X be a smooth k-scheme et $D \subset X$ be a strict normal crossing divisor on X (see 4.5.2.5). In that case, we can check $M(D) = \{g \in \mathcal{O}_X;\ g \text{ is invertible outside } D\}$.

Locally the smooth S-log scheme $(X, M(D))$ lifts to a smooth $\mathfrak{S}$-log formal scheme of the form $(\mathfrak{X}, M(\mathfrak{D}))$, with $\mathfrak{X}$ a smooth $\mathfrak{S}$-formal scheme and $\mathfrak{D} \subset \mathfrak{X}$ be a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor on $\mathfrak{X}$. Indeed, we can suppose X is affine and there exists nice coordinates $t_1, \dots, t_d$ of $(X, M(D))/S$ such that D is cut out by $\prod_{1 \le j \le r} t_j$ in D for some $r \ge 1$. Following [SGA1, III.6.10], there exists an affine smooth $\mathfrak{S}$-formal scheme which is a lifting of X. The étale morphism of the form $X \to \mathbb{A}_S^d$ given by $t_1, \dots, t_d$ lifts to an étale morphism of the form $\mathfrak{X} \to \widehat{\mathbb{A}}_{\mathfrak{S}}^d$. Let $\mathfrak{D} := V(\prod_{1 \le j \le r} t_j)$. Then $\mathfrak{D} \subset \mathfrak{X}$ is a relative to $\mathfrak{X}/\mathfrak{S}$ strict normal crossing divisor on $\mathfrak{X}$ so that $(\mathfrak{X}, M(\mathfrak{D}))$ is a lifting of $(X, M(D))$.

Let $f\colon X' \to X$ be a morphism of smooth k-schemes, $D \subset X$ (resp. $D' \subset X'$) be a strict normal crossing divisor on X (resp. X'). With the description of $M(D)$ and $M(D')$, if $X' \setminus D' \subset f^{-1}(X \setminus D)$ then f canonically induces a morphism of log-schemes $(X', M(D')) \to (X, M(D))$.

Let $\mathfrak{X}$ (resp. $\mathfrak{X}'$) be a smooth $\mathfrak{S}$-formal scheme and $\mathfrak{D} \subset \mathfrak{X}$ (resp. $\mathfrak{D}' \subset \mathfrak{X}'$) be a relative to $\mathfrak{X}/\mathfrak{S}$ (resp. $\mathfrak{X}'/\mathfrak{S}$) strict normal crossing divisor. Beware we do not have the equality $M(\mathfrak{D}) = \{g \in \mathcal{O}_{\mathfrak{X}};\ g \text{ is invertible outside } \mathfrak{D}\}$. However, if $f\colon \mathfrak{X}' \to \mathfrak{X}$ is a morphism of smooth $\mathfrak{S}$-formal schemes such that the closed immersion $f^{-1}(\mathfrak{D})_{\mathrm{red}} \hookrightarrow \mathfrak{X}'$ factors through $f^{-1}(\mathfrak{D})_{\mathrm{red}} \hookrightarrow \mathfrak{D}'$, then f induces (uniquely) a morphism of log-smooth $\mathfrak{S}$-log formal schemes $(\mathfrak{X}, M(\mathfrak{D})) \to (\mathfrak{X}', M(\mathfrak{D}'))$

Suppose there exists $f_0\colon X' \to X$ such that $X' \setminus D' \subset f^{-1}(X \setminus D)$ and $\mathfrak{X}'$ is affine. Then it follows from [Kat89, 3.11], that the morphism of smooth S-log-formal schemes $f_0^\sharp\colon (X', M(D')) \to (X, M(D))$ lifts to a morphism of smooth $\mathfrak{S}$-log-formal schemes of the form $f^\sharp\colon (\mathfrak{X}', M(\mathfrak{D}')) \to (\mathfrak{X}, M(\mathfrak{D}))$.

4.5.2.18. Let $X \to S$ be a smooth morphism of schemes (resp. formal schemes). Suppose S is geometrically unibranch and locally noetherian. Let $D \subset X$ be a relative to X/S strict normal crossing divisor. Set $X^\sharp := (X, M(D))$. Let $f\colon X^\sharp \to X$ be the canonical morphism. Remark f^* is the identity in the category of $\mathcal{O}_X$-modules. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$-module structure which is compatible with its algebra structure. We set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S}$, $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp(m)} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S(m)}$ and similarly without the symbol $\sharp$.

(a) Suppose there exist nice coordinates $t_1, \ldots, t_d$ of $X^\sharp/S$. Let $\tau_i = 1 \otimes t_i - t_i \otimes 1 \in \mathcal{O}_{X \times X}$, the τ_i forms a regular system of generators of $\mathcal{I}$. We still denote by τ_i the image of τ_i in $\mathcal{P}^n_{X/S,(m)}$ or in $\widetilde{\mathcal{P}}^n_{X/S,(m)}$. Then following 1.4.2.3, $\mathcal{P}^n_{X/S,(m)}$ is isomorphic to an m-PD polynomial algebra with coefficients in $\mathcal{O}_X$ of order n in d variables given by $\tau_1, \ldots, \tau_d$ (see 1.4.1.5 and 1.4.1.9). Hence, $\widetilde{\mathcal{P}}^n_{X/S,(m)}$ is a free $\mathcal{B}_X$-module with basis $\{\underline{\tau}^{\{\underline{k}\}_{(m)}} : |\underline{k}| \le n\}$. Let $\{\underline{\partial}^{\langle \underline{k}\rangle_{(m)}} : |\underline{k}| \le n\}$ be the dual basis for $\widetilde{\mathcal{D}}^{(m)}_{X/S,n}$. By taking the union, we get the basis $\{\underline{\partial}^{\langle \underline{k}\rangle_{(m)}} : \underline{k} \in \mathbb{N}^d\}$ of $\widetilde{\mathcal{D}}^{(m)}_{X/S}$.

Let $\underline{\tau}_{\sharp(m)}$ and $\underline{\partial}_\sharp{}^{\langle \underline{k}\rangle_{(m)}}$ be the elements constructed from $(t_\lambda)_{\lambda=1,\ldots,r}$ as defined in 4.1.2.16. Following 3.2.3.9.3, the canonical $\mathcal{B}_X$-algebras (for left or right structures) morphism $\widetilde{\mathcal{P}}^n_{X/S,(m)} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S,(m)}$ (see 3.2.3.17) is explicitly described by

$$\underline{\tau}^{\{\underline{k}\}_{(m)}} \mapsto \underline{t}^{\underline{k}} \underline{\tau}_\sharp^{\{\underline{k}\}_{(m)}}, \tag{4.5.2.18.1}$$

where the action of $\underline{t}^{\underline{k}}$ is induced by the left structure of $\mathcal{B}_X$-algebra of $\widetilde{\mathcal{P}}^n_{X^\sharp/S,(m)}$. By duality, we get $\rho\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} \to \widetilde{\mathcal{D}}^{(m)}_{X/S}$ is explicitly described by

$$\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}} \mapsto \underline{t}^{\underline{k}} \underline{\partial}^{\langle \underline{k}\rangle_{(m)}}. \tag{4.5.2.18.2}$$

The morphism $\rho\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} \to \widetilde{\mathcal{D}}^{(m)}_{X/S}$ is a ring morphism. Indeed, let $P \in \mathcal{D}_{X^\sharp/S^\sharp,n}$, $P' \in \mathcal{D}_{X^\sharp/S^\sharp,n'}$. Consider the diagram:

$$\begin{array}{ccccccc}
\mathcal{P}^{n+n'}_{X/S} & \xrightarrow{\delta^{n,n'}} & \mathcal{P}^n_{X/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X/S} & \xrightarrow{\mathrm{id} \otimes \rho(P')} & \mathcal{P}^n_{X/S} & \xrightarrow{\rho(P)} & \mathcal{O}_X \\
\downarrow & & \downarrow & & \downarrow & & \downarrow \\
\mathcal{P}^{n+n'}_{X^\sharp/S} & \xrightarrow{\delta^{n,n'}} & \mathcal{P}^n_{X^\sharp/S} \otimes_{\mathcal{O}_X} \mathcal{P}^{n'}_{X^\sharp/S} & \xrightarrow{\mathrm{id} \otimes P'} & \mathcal{P}^n_{X^\sharp/S} & \xrightarrow{P} & \mathcal{O}_X
\end{array} \tag{4.5.2.18.3}$$

Using the universal property of 3.1.4.1 (or use the formula 4.5.2.18.2), we get the commutativity of the left square. The other squares are commutative by definition of the map ρ. By definition (see 3.1.4.3.1), $\rho(P)\rho(P')$ (resp. $\rho(PP')$) is the top (resp. bottom) composite morphism of 4.5.2.18.3.

Since $t_1, \ldots, t_d$ are nonzero divisors, then via the description 4.5.2.18.1 and 4.5.2.18.2 we get that $\mathcal{P}^n_{X/S,(m)} \to \mathcal{P}^n_{X^\sharp/S,(m)}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} \to \widetilde{\mathcal{D}}^{(m)}_{X/S^\sharp}$ are injective. By abuse of notation, we get therefore the equality:

$$\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}} = \underline{t}^{\underline{k}} \underline{\partial}^{\langle \underline{k}\rangle_{(m)}}. \tag{4.5.2.18.4}$$

(b) Suppose there exist semi-nice coordinates $t_1, \dots, t_d$ of $X^\sharp/S$. With notation 4.5.1.4, we have the basis $\{\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} : \underline{k} \in \mathbb{N}^d\}$ of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$. The map $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} \to \widetilde{\mathcal{D}}^{(m)}_{X/S}$ is explicitly described by

$$\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} \mapsto \underline{t}^{(k_1, \dots, k_r, 0, \dots, 0)} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}. \tag{4.5.2.18.5}$$

Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} \to \widetilde{\mathcal{D}}^{(m)}_{X/S}$ is injective, then we can write $\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} = \underline{t}^{(k_1, \dots, k_r, 0, \dots, 0)} \underline{\partial}^{\langle \underline{k} \rangle_{(m)}}$.

(c) Let $\mathcal{E}$ and $\mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X/S}$-modules. Then the tensor product $\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}$ and $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F})$ are canonically endowed with a structure of left $\widetilde{\mathcal{D}}^{(m)}_{X/S}$-module functorial in $\mathcal{E}$ and $\mathcal{F}$ (see 4.2.3.1 in the case where the log structure are trivial). Denoting by f_* the forgetful functor from the category of left $\widetilde{\mathcal{D}}^{(m)}_{X/S}$-modules to that of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-modules (via the canonical monomorphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} \subset \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$ given by f), we get on $f_*(\mathcal{E}) \otimes_{\mathcal{B}_X} f_*(\mathcal{F})$ and $\mathcal{H}om_{\mathcal{B}_X}(f_*(\mathcal{E}), f_*(\mathcal{F}))$ a structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-module (see 4.2.3.1). Either by making a local computation or by identifying the m-PD-stratifications, we can easily check that we have the equalities $f_*(\mathcal{E}) \otimes_{\mathcal{B}_X} f_*(\mathcal{F}) = f_*(\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F})$ and $\mathcal{H}om_{\mathcal{B}_X}(f_*(\mathcal{E}), f_*(\mathcal{F})) = f_*(\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F}))$. We have similar results when $\mathcal{E}$ and $\mathcal{F}$ are right or left left $\widetilde{\mathcal{D}}^{(m)}_{X/S}$-modules (when this has a meaning).

4.5.3 An associativity isomorphism

Let $X \to S$ be a smooth morphism of schemes (resp. formal schemes). Let $D \subset X$ be a relative to X/S strict normal crossing divisor (see definition 4.5.2.7). Set $X^\sharp := (X, M(D))$. Suppose S is geometrically unibranch and locally noetherian (see the remark 4.5.2.13). Let $E \subset D$ be a subdivisor of D and set $X^\flat := (X, M(E))$. Moreover, let $d = \dim X$. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\flat/S}$-module structure which is compatible with its algebra structure. We set $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\flat/S}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S}$. Using a similar to 4.5.2.18.3 diagram, we easily check that the map $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S} \to \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$ is a ring morphism.

We prove in this section the associativity isomorphism 4.5.3.2.2. This corresponds to a level m variation of [CMNM05, 2.3.4]. We get similarly 4.5.3.9 (we remark that the meaning of “ associativity ” can be better understood for 4.5.3.9). Finally, we deduce from 4.5.3.2.2 the isomorphism 4.5.3.8.1 which will be used to establish 18.2.1.21.

4.5.3.1 (Local description)**.** Suppose there exist nice coordinates $t_1, \dots, t_d$ of $X^\sharp/S$ so that D is empty or D is cut out by $\prod_{1 \le j \le r} t_j$ in U for some $r \ge 1$, which is always locally possible (see 4.5.2.14). Hence, E is either empty of cut out by $\prod_{1 \le j \le s} t_j$ in U for some $r \ge s \ge 1$. Then $t_1, \dots, t_d$ of $X^\sharp/S$ are semi-nice coordinates of $X^\flat/S$ (because when $r > s$, t_r is not invertible). We get the description 4.5.2.18.(b). We get the bases $\{\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} : \underline{k} \in \mathbb{N}^d\}$ of $\mathcal{D}^{(m)}_{X^\sharp/S}$ and $\{\underline{\partial}_{(s)}^{\langle \underline{k} \rangle_{(m)}} : \underline{k} \in \mathbb{N}^d\}$ of $\mathcal{D}^{(m)}_{X^\flat/S}$. According to 4.5.1.9, in the computations of the subsection, when we refer to some logarithmic formulas, we will mean its semi-logarithmic avatar.

4.5.3.2. Let $\mathcal{E}^\sharp$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-module and $\mathcal{M}^\flat$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-module. We have the canonical morphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-modules : $\mathcal{E}^\sharp \to \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp$. By functoriality of the tensor product of 4.2.3.5, this yields the morphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-modules :

$$\mathcal{M}^\flat \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp \to \mathcal{M}^\flat \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp). \tag{4.5.3.2.1}$$

The morphism 4.5.3.2.1 induces by extension the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-linear morphism:

$$(\mathcal{M}^\flat \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \to \mathcal{M}^\flat \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp). \tag{4.5.3.2.2}$$

Theorem 4.5.3.3. *Let $\mathcal{E}^\sharp$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-module and $\mathcal{M}^\flat$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-module. The morphism 4.5.3.2.2 is an isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-modules.*

Proof. We can compare with the proof of the complex case given in [CMNM05, A.1]. The fact that the arrow 4.5.3.2.2 is an isomorphism is local. Let us suppose then $X^\sharp/S$ endowed with nice coordinates $t_1, \ldots, t_d$ (see definition 4.5.2.15) and let us keep the notations of 4.5.2.18. It is about proving that for any right $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-module $\mathcal{N}$, for any $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-linear morphism $\alpha\colon \mathcal{M}^\flat \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp \to \mathcal{N}$, there exists a unique morphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-modules $\beta\colon \mathcal{M}^\flat \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) \to \mathcal{N}$ making commutative the diagram

$$\mathcal{M}^\flat \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp \xrightarrow{4.5.3.2.1} \mathcal{M}^\flat \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) \overset{\exists!\beta}{\dashrightarrow} \mathcal{N}, \qquad \text{(composite } \alpha\text{)}.$$

I) Let us treat first the uniqueness of β. For this purpose, we check by induction on $N \in \mathbb{N}$ that for any $m \in \mathcal{M}^\flat$, $e \in \mathcal{E}^\sharp$, $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\flat,N}$, α uniquely determines the element $\beta(m \otimes (P \otimes e))$. When $N = 0$, we have necessarily $\beta(m \otimes (b \otimes e)) = \beta(mb \otimes (1 \otimes e)) = \alpha(mb \otimes e)$, for any $b \in \mathcal{B}_X$. By linearity, we can suppose P of the form $\underline{\partial}^{\langle \underline{k} \rangle}_{(s)}$. The following formula that β has to check (because β is $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-linear and we use the formula 4.2.3.5.3)

$$\beta(m \otimes (\underline{\partial}^{\langle \underline{k} \rangle}_{(s)} \otimes e)) = \beta(m \otimes (1 \otimes e))\widetilde{\underline{\partial}}^{\langle \underline{k} \rangle}_{(s)} - \sum_{\underline{h} \langle \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \beta(m\widetilde{\underline{\partial}}^{\langle \underline{k}-\underline{h} \rangle}_{(s)} \otimes (\underline{\partial}^{\langle \underline{h} \rangle}_{(s)} \otimes e))$$

allow us to conclude the induction.

II) Now let us establish the existence of β. By induction on $N \in \mathbb{N}$, we construct a $\mathbb{Z}$-trilinear morphism $v_N\colon \mathcal{M}^\flat \times \widetilde{\mathcal{D}}^{(m)}_{X^\flat,N} \times \mathcal{E}^\sharp \to \mathcal{N}$ inducing v_{N-1} as follows : for any $m \in \mathcal{M}^\flat$, $e \in \mathcal{E}^\sharp$, $b \in \mathcal{B}_X$, we set $v_0(m, b, e) := \alpha(mb \otimes e)$. Suppose v_N is defined. For any $\underline{k} \in \mathbb{N}^d$ such that $|\underline{k}| = N + 1$, for any $m \in \mathcal{M}^\flat$, $e \in \mathcal{E}^\sharp$, we set

$$v_{N+1}(m, \underline{\partial}^{\langle \underline{k} \rangle}_{(s)}, e) := \left(v_N(m, 1, e)\widetilde{\underline{\partial}}^{\langle \underline{k} \rangle}_{(s)} - \sum_{\underline{h} \langle \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} v_N(m\widetilde{\underline{\partial}}^{\langle \underline{k}-\underline{h} \rangle}_{(s)}, \underline{\partial}^{\langle \underline{h} \rangle}_{(s)}, e) \right). \tag{4.5.3.3.1}$$

Next, for any $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\flat,N}$, $Q = \sum_{|\underline{l}|=N+1} b_{\underline{l}} \underline{\partial}^{\langle \underline{l} \rangle}_{(s)} \in \widetilde{\mathcal{D}}^{(m)}_{X^\flat,N+1}$ where the sum runs over $\underline{l} \in \mathbb{N}^d$ such that $|\underline{l}| = N + 1$ and where $b_{\underline{l}} \in \mathcal{B}_X$, we set

$$v_{N+1}(m, P + Q, e) := v_N(m, P, e) + \sum_{\underline{l}} v_{N+1}(mb_{\underline{l}}, \underline{\partial}^{\langle \underline{l} \rangle}_{(s)}, e). \tag{4.5.3.3.2}$$

In particular, for any $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\flat,N}$, we have $v_{N+1}(m, P, e) = v_N(m, P, e)$. Moreover, since v_N is $\mathbb{Z}$-trilinear then so is v_{N+1}. The morphisms v_N induce therefore the $\mathbb{Z}$-trilinear morphism $v\colon \mathcal{M}^\flat \times \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \times \mathcal{E}^\sharp \to \mathcal{N}$. To end the proof of the theorem, we will need the lemmas below.

Lemma 4.5.3.4. *For any $b \in \mathcal{B}_X$, $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$, $m \in \mathcal{M}^\flat$, $e \in \mathcal{E}^\sharp$, $v(mb, P, e) = v(m, bP, e) = v(m, P, e)b$.*

Proof. The left equality of 4.5.3.4 is checked by induction on the order of the operator P from the formula 4.5.3.3.2. By additivity, to check that the right one holds, it is sufficient to establish that $\epsilon := v(m, \underline{\partial}^{\langle \underline{k} \rangle}_{(s)}, e)b - v(mb, \underline{\partial}^{\langle \underline{k} \rangle}_{(s)}, e)$ is null. We proceed by induction on $N := |\underline{k}|$. We get by $\mathcal{B}_X$-linearity of α the equality $v(m, 1, e)b = v(mb, 1, e)$, i.e. the case $N = 0$. Now, let us suppose the formula true for $N - 1 \geq 0$. Following 4.5.3.3.1 and next by induction hypothesis, we compute :

$$v(m, 1, e)\widetilde{\underline{\partial}}^{\langle \underline{k} \rangle}_{(s)} b = \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}^{\langle \underline{k}-\underline{i} \rangle}_{(s)}, \underline{\partial}^{\langle \underline{i} \rangle}_{(s)}, e)b = \epsilon + \sum_{\underline{i} \leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}^{\langle \underline{k}-\underline{i} \rangle}_{(s)} b, \underline{\partial}^{\langle \underline{i} \rangle}_{(s)}, e). \tag{4.5.3.4.1}$$

On the other side, following 4.1.2.4.1, $\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle} b = \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}(b) \widetilde{\underline{\partial}}_{(s)}^{\langle \underline{h}\rangle}$. Hence :

$$
\begin{aligned}
v(m,1,e)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle} b &= \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}(b), 1, e)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{h}\rangle} \\
&\underset{4.5.3.3.1}{=} \sum_{\underline{h}\leq \underline{k}} \sum_{\underline{i}\leq \underline{h}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{h} \\ \underline{i} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}(b)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{h}-\underline{i}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{i}\rangle}, e) \\
&= \sum_{\underline{i}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} \sum_{\underline{i}\leq \underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k}-\underline{i} \\ \underline{k}-\underline{h} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}(b)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{h}-\underline{i}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{i}\rangle}, e) \\
&\underset{4.1.2.4.1}{=} \sum_{\underline{i}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{i} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{i}\rangle} b, \underline{\partial}_{(s)}^{\langle \underline{i}\rangle}, e).
\end{aligned}
\tag{4.5.3.4.2}
$$

By comparing 4.5.3.4.1 and 4.5.3.4.2, we obtain $\epsilon = 0$. □

Lemma 4.5.3.5. *For any $b \in \mathcal{B}_X$, $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$, $m \in \mathcal{M}^\flat$, $e \in \mathcal{E}^\sharp$, $v(m, P, be) = v(m, Pb, e)$.*

Proof. By using the relation 4.5.3.4, we reduce to the case where P is of the form $\underline{\partial}_{(s)}^{\langle \underline{k}\rangle}$, with $\underline{k} \in \mathbb{N}^d$. We have to establish that $\epsilon := v(m, \underline{\partial}_{(s)}^{\langle \underline{k}\rangle}, be) - v(m, \underline{\partial}_{(s)}^{\langle \underline{k}\rangle} b, e)$ is null. We proceed by induction on $N := |\underline{k}|$. When $N = 0$, this comes from $v(m, 1, be) := \alpha(m \otimes be) = \alpha(mb \otimes e) =: v(m, b, e)$. Now, let us suppose the formula true for $N - 1 \geq 0$ (i.e. H_{N-1} holds). We compute:

$$
\begin{aligned}
v(m,1,be)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle} &\underset{4.5.3.3.1}{=} \sum_{\underline{l}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{l} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{l}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{l}\rangle}, be) \\
&\underset{H_{N-1}}{=} \epsilon + \sum_{\underline{l}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{l} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{l}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{l}\rangle} b, e) \\
&\underset{4.1.2.4.1}{=} \epsilon + \sum_{\underline{l}\leq \underline{k}} \sum_{\underline{h}\leq \underline{l}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{l} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{l} \\ \underline{h} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{l}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{l}-\underline{h}\rangle}(b)\underline{\partial}_{(s)}^{\langle \underline{h}\rangle}, e) \\
&\underset{4.5.3.4}{=} \epsilon + \sum_{\underline{l}\leq \underline{k}} \sum_{\underline{h}\leq \underline{l}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{l} \end{smallmatrix} \right\} \left\{ \begin{smallmatrix} \underline{l} \\ \underline{h} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{l}\rangle}(\underline{\partial}_{(s)}^{\langle \underline{l}-\underline{h}\rangle}(b)), \underline{\partial}_{(s)}^{\langle \underline{h}\rangle}, e) \\
&= \epsilon + \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} v\left(m \sum_{\underline{h}\leq \underline{l}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k}-\underline{h} \\ \underline{k}-\underline{l} \end{smallmatrix} \right\} \widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{l}\rangle}(\underline{\partial}_{(s)}^{\langle \underline{l}-\underline{h}\rangle}(b)), \underline{\partial}_{(s)}^{\langle \underline{h}\rangle}, e \right) \\
&\underset{4.2.5.4.2}{=} \epsilon + \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} v(mb\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{h}\rangle}, e) \\
&\underset{4.5.3.3.1}{=} \epsilon + v(mb,1,e)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle} = \epsilon + v(m,1,be)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle}.
\end{aligned}
$$

□

Lemma 4.5.3.6. *Let $\underline{a} \in \mathbb{N}^d$ such that $a_i = 0$ if $1 \leq i \leq s$ or $r + 1 \leq i \leq d$. For any $m \in \mathcal{M}^\flat$, $e \in \mathcal{E}^\sharp$, $\underline{k} \in \mathbb{N}^d$, the following formula is satisfied:*

$$
v(m, \underline{\partial}_{(s)}^{\langle \underline{a}\rangle}, e)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle} = \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{h}\rangle}\underline{\partial}_{(s)}^{\langle \underline{a}\rangle}, e).
\tag{4.5.3.6.1}
$$

Proof. Let us check the lemma by induction on $N := |\underline{a}|$. For $N = 0$, this is a consequence of 4.5.3.3.1. Let us suppose H_N true, i.e., the equality is satisfied for N. Let us check it for $N + 1$. Set $\epsilon := v(m, \underline{\partial}_{(s)}^{\langle \underline{a}\rangle}, e)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle} - \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{h}\rangle}\underline{\partial}_{(s)}^{\langle \underline{a}\rangle}, e)$. We have to check $\epsilon = 0$. We compute

$$
\begin{aligned}
v(m,1,e)\underline{\partial}_{(s)}^{\langle \underline{a}\rangle}\underline{\partial}_{(s)}^{\langle \underline{k}\rangle} &\underset{4.5.3.3.1}{=} \sum_{\underline{b}\leq \underline{a}} \left\{ \begin{smallmatrix} \underline{a} \\ \underline{b} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{a}-\underline{b}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{b}\rangle}, e)\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}\rangle} \\
&\underset{H_N}{=} \varepsilon + \sum_{\underline{b}\leq \underline{a}} \sum_{\underline{h}\leq \underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{h} \end{smallmatrix} \right\} \left\langle \begin{smallmatrix} \underline{h}+\underline{b} \\ \underline{b} \end{smallmatrix} \right\rangle \left\{ \begin{smallmatrix} \underline{a} \\ \underline{b} \end{smallmatrix} \right\} v(m\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{a}-\underline{b}\rangle}\widetilde{\underline{\partial}}_{(s)}^{\langle \underline{k}-\underline{h}\rangle}, \underline{\partial}_{(s)}^{\langle \underline{h}+\underline{b}\rangle}, e).
\end{aligned}
\tag{4.5.3.6.2}
$$

On the other side, by using three times the formula 2.1.3.1.2 (see the remark 4.2.3.2), we compute in $\mathcal{M}^\flat \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$ (by default we take the left structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-module) :

$$\sum_{\underline{b}\leq\underline{a}}\sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} \left\langle \begin{smallmatrix}\underline{h}+\underline{b}\\ \underline{b}\end{smallmatrix}\right\rangle \left\{ \begin{smallmatrix}\underline{a}\\ \underline{b}\end{smallmatrix}\right\} m\underline{\widetilde{\partial}}^{\langle \underline{a}-\underline{b}\rangle}_{(s)}\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}_{(s)} \otimes \underline{\partial}^{\langle \underline{h}+\underline{b}\rangle}_{(s)} = \sum_{\underline{b}\leq\underline{a}} \left\{ \begin{smallmatrix}\underline{a}\\ \underline{b}\end{smallmatrix}\right\} (m\underline{\widetilde{\partial}}^{\langle \underline{a}-\underline{b}\rangle}_{(s)} \otimes \underline{\partial}^{\langle \underline{b}\rangle}_{(s)})\underline{\partial}^{\langle \underline{k}\rangle}_{(s)}$$
$$= (m\otimes 1)\underline{\partial}^{\langle \underline{a}\rangle}_{(s)}\underline{\partial}^{\langle \underline{k}\rangle}_{(s)} = \left\langle \begin{smallmatrix}\underline{a}+\underline{k}\\ \underline{k}\end{smallmatrix}\right\rangle (m\otimes 1)\underline{\partial}^{\langle \underline{a}+\underline{k}\rangle}_{(s)} = \sum_{\underline{l}\leq\underline{a}+\underline{k}} \left\langle \begin{smallmatrix}\underline{a}+\underline{k}\\ \underline{k}\end{smallmatrix}\right\rangle \left\{ \begin{smallmatrix}\underline{a}+\underline{k}\\ \underline{l}\end{smallmatrix}\right\} m\underline{\widetilde{\partial}}^{\langle \underline{a}+\underline{k}-\underline{l}\rangle}_{(s)} \otimes \underline{\partial}^{\langle \underline{l}\rangle}_{(s)}. \tag{4.5.3.6.3}$$

Since $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$ is a free $\mathcal{B}_X$-module (for the left or right structure) with the basis consisting of the elements $\underline{\partial}^{\langle \underline{n}\rangle}_{(s)}$ with $\underline{n}$ going through $\mathbb{N}^d$, then by $\mathbb{Z}$-multilinearity of v it follows from 4.5.3.6.3 the first equality in $\mathcal{N}$:

$$\sum_{\underline{b}\leq\underline{a}}\sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} \left\langle \begin{smallmatrix}\underline{h}+\underline{b}\\ \underline{b}\end{smallmatrix}\right\rangle \left\{ \begin{smallmatrix}\underline{a}\\ \underline{b}\end{smallmatrix}\right\} v(m\underline{\widetilde{\partial}}^{\langle \underline{a}-\underline{b}\rangle}_{(s)}\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}_{(s)}, \underline{\partial}^{\langle \underline{h}+\underline{b}\rangle}_{(s)}, e) = \sum_{\underline{l}\leq\underline{a}+\underline{k}} \left\langle \begin{smallmatrix}\underline{a}+\underline{k}\\ \underline{k}\end{smallmatrix}\right\rangle \left\{ \begin{smallmatrix}\underline{a}+\underline{k}\\ \underline{l}\end{smallmatrix}\right\} v(m\underline{\widetilde{\partial}}^{\langle \underline{a}+\underline{k}-\underline{l}\rangle}_{(s)}, \underline{\partial}^{\langle \underline{l}\rangle}_{(s)}, e)$$
$$\underset{4.5.3.3.1}{=} \left\langle \begin{smallmatrix}\underline{a}+\underline{k}\\ \underline{k}\end{smallmatrix}\right\rangle v(m,1,e)\underline{\partial}^{\langle \underline{a}+\underline{k}\rangle}_{(s)} = v(m,1,e)\underline{\partial}^{\langle \underline{a}\rangle}_{(s)}\underline{\partial}^{\langle \underline{k}\rangle}_{(s)}. \tag{4.5.3.6.4}$$

Hence, by using 4.5.3.6.2 and 4.5.3.6.4 we get $\epsilon = 0$, i.e. 4.5.3.6.1 is therefore satisfied. □

Lemma 4.5.3.7. *For any $P^\sharp \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$, $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$, $m \in \mathcal{M}^\flat$, $e \in \mathcal{E}^\sharp$, $v(m, P, P^\sharp e) = v(m, PP^\sharp, e)$.*

Proof. 1) At first, let us suppose $P = 1$, i.e., let us check the equality $v(m, 1, P^\sharp e) = v(m, P^\sharp, e)$.

i) By induction on $|\underline{k}|$, let us establish the formula : $v(m, 1, \underline{\partial}^{\langle \underline{k}\rangle}_{(r)} e) = v(m, \underline{\partial}^{\langle \underline{k}\rangle}_{(r)}, e)$. By multiplying the equality 4.5.3.6.1 by $\underline{t}^{\underline{k}} = t_1^{k_1} \dots {}_d^{k_d}$, by using the equality 4.5.2.18.4 and thanks to the formula 4.5.3.4, we obtain:

$$v(m,1,e)\underline{\widetilde{\partial}}^{\langle \underline{k}\rangle}_{(r)} = \sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} v(m\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}_{(r)}, \underline{\partial}^{\langle \underline{h}\rangle}_{(r)}, e). \tag{4.5.3.7.1}$$

Moreover, by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-linearity of α, it follows from 4.2.3.5.1 the equality:

$$(\alpha(m\otimes e))\underline{\widetilde{\partial}}^{\langle \underline{k}\rangle}_{(r)} = \sum_{\underline{h}\leq\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} \alpha(m\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}_{(r)} \otimes \underline{\partial}^{\langle \underline{h}\rangle}_{(r)} e). \tag{4.5.3.7.2}$$

By induction hypothesis, for any $\underline{h}\langle\underline{k}$, $v(m\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}_{(r)}, \underline{\partial}^{\langle \underline{h}\rangle}_{(r)}, e) = v(m\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}_{(r)}, 1, \underline{\partial}^{\langle \underline{h}\rangle}_{(r)} e) = \alpha(m\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}_{(r)} \otimes \underline{\partial}^{\langle \underline{h}\rangle}_{(r)} e)$. Since $v(m,1,e)\underline{\widetilde{\partial}}^{\langle \underline{k}\rangle}_{(r)} = (\alpha(m\otimes e))\underline{\widetilde{\partial}}^{\langle \underline{k}\rangle}_{(r)}$, by comparing the formulas 4.5.3.7.1 and 4.5.3.7.2, this yields $v(m, \underline{\partial}^{\langle \underline{k}\rangle}_{(r)}, e) = \alpha(m \otimes \underline{\partial}^{\langle \underline{k}\rangle}_{(r)} e) = v(m, 1, \underline{\partial}^{\langle \underline{k}\rangle}_{(r)} e)$.

ii) Finally, if $P^\sharp$ is of the form $\sum_{\underline{k}} b_{\underline{k}}\underline{\partial}^{\langle \underline{k}\rangle}_{(r)}$, where $b_{\underline{k}} \in \mathcal{B}_X$, we compute $v(m, 1, P^\sharp e) = \alpha(m \otimes P^\sharp e) = \sum_{\underline{k}} \alpha(mb_{\underline{k}} \otimes \underline{\partial}^{\langle \underline{k}\rangle}_{(r)} e) = \sum_{\underline{k}} v(mb_{\underline{k}}, 1, \underline{\partial}^{\langle \underline{k}\rangle}_{(r)} e) = \sum_{\underline{k}} v(mb_{\underline{k}}, \underline{\partial}^{\langle \underline{k}\rangle}_{(r)}, e) \underset{4.5.3.4}{=} v(m, P^\sharp, e)$.

2) Let us treat now the general case. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$ is a right $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-module generated by the elements of the form $\underline{\partial}^{\langle \underline{k}\rangle}$, with $\underline{k} \in \mathbb{N}^d$ such that $k_i = 0$ if $1 \leq i \leq s$ or $r+1 \leq i \leq d$, then it is sufficient to check 4.5.3.7 when $P = \underline{\partial}^{\langle \underline{k}\rangle}$ for such $\underline{k}$. We proceed by induction on the integer $N := |\underline{k}|$. For $N = 0$, this is the step 1). Let us suppose the lemma holds for $N \geq 0$ and let us suppose $|\underline{k}| = N+1$. Following 4.5.3.3.1:

$$v(m, \underline{\partial}^{\langle \underline{k}\rangle}, P^\sharp e) = \left(v(m,1,P^\sharp e)\underline{\widetilde{\partial}}^{\langle \underline{k}\rangle} - \sum_{\underline{h}\langle\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} v(m\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}, \underline{\partial}^{\langle \underline{h}\rangle}, P^\sharp e) \right). \tag{4.5.3.7.3}$$

Moreover, it comes from 4.5.3.6.1 the formula :

$$v(m, \underline{\partial}^{\langle \underline{k}\rangle} P^\sharp, e) = \left(v(m,P^\sharp,e)\underline{\widetilde{\partial}}^{\langle \underline{k}\rangle} - \sum_{\underline{h}\langle\underline{k}} \left\{ \begin{smallmatrix}\underline{k}\\ \underline{h}\end{smallmatrix}\right\} v(m\underline{\widetilde{\partial}}^{\langle \underline{k}-\underline{h}\rangle}, \underline{\partial}^{\langle \underline{h}\rangle} P^\sharp, e) \right). \tag{4.5.3.7.4}$$

Via 4.5.3.7.3, 4.5.3.7.4 and by induction hypothesis, we get $v(m, \underline{\partial}^{\langle \underline{k}\rangle}, P^\sharp e) = v(m, \underline{\partial}^{\langle \underline{k}\rangle} P^\sharp, e)$. □

Let us now conclude the proof of the theorem. It follows from the formulas 4.5.3.4 and 4.5.3.7 that the morphism v induces a morphism of $\mathcal{B}_X$-modules $\beta\colon \mathcal{M}^\flat \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) \to \mathcal{N}$. Finally, using the formula of 4.5.3.6.1 and that of 4.2.3.2 (i.e. more precisely the generalization with coefficients of the formula 2.1.3.1.2) we conclude that β is $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-linear. □

Corollary 4.5.3.8. *Let $\mathcal{E}^\sharp$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-module, $\mathcal{F}^\flat$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-module (resp. a $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-bimodule). We have the isomorphism:*

$$(\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{F}^\flat \xrightarrow{\sim} (\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{F}^\flat) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp. \tag{4.5.3.8.1}$$

Proof. It follows from 4.5.3.3 the canonical isomorphism

$$(\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \xrightarrow{\sim} \widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp). \tag{4.5.3.8.2}$$

By applying to it the functor $- \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}} \mathcal{F}^\flat$, this gives the first isomorphism:

$$\begin{aligned}(\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{F}^\flat &\xrightarrow{\sim} \Big(\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp)\Big) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}} \mathcal{F}^\flat \\ \xrightarrow[4.3.5.10.1]{\sim} \Big(\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{F}^\flat\Big) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) &\xrightarrow{\sim} (\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{F}^\flat) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp.\end{aligned}$$

□

Theorem 4.5.3.9. *Let $\mathcal{E}^\sharp$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-module and $\mathcal{F}^\flat$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-module. We have the morphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}$-modules $\mathcal{E}^\sharp \otimes_{\mathcal{B}_X} \mathcal{F}^\flat \to (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) \otimes_{\mathcal{B}_X} \mathcal{F}^\flat$, sending $e \otimes f$ on $(1 \otimes e) \otimes f$ where $e \in \mathcal{E}^\sharp$, $f \in \mathcal{F}^\flat$. The $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-linear morphism induced by extension:*

$$\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} (\mathcal{E}^\sharp \otimes_{\mathcal{B}_X} \mathcal{F}^\flat) \to (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) \otimes_{\mathcal{B}_X} \mathcal{F}^\flat \tag{4.5.3.9.1}$$

is an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S}$-modules.

Proof. Switching from left to right $\mathcal{D}$-modules, this is a consequence of 4.5.3.3. More precisely, by using 4.3.5.7, we get 4.5.3.9.1 from the canonical composite isomorphism

$$\begin{aligned}\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \Big(\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} (\mathcal{E}^\sharp \otimes_{\mathcal{B}_X} \mathcal{F}^\flat)\Big) &\xleftarrow[4.5.3.3]{\sim} (\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} (\mathcal{E}^\sharp \otimes_{\mathcal{B}_X} \mathcal{F}^\flat)) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \\ \xrightarrow[4.5.2.18.c]{\sim} ((\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{F}^\flat) \otimes_{\mathcal{B}_X} \mathcal{E}^\sharp) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} &\xrightarrow[4.5.3.3]{\sim} (\widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \mathcal{F}^\flat) \otimes_{\mathcal{B}_X} (\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) \\ &\xrightarrow{\sim} \widetilde{\omega}_{X^\flat} \otimes_{\mathcal{B}_X} \Big((\widetilde{\mathcal{D}}^{(m)}_{X^\flat/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S}} \mathcal{E}^\sharp) \otimes_{\mathcal{B}_X} \mathcal{F}^\flat\Big).\end{aligned} \tag{4.5.3.9.2}$$

□

4.6 Complexes of $\mathcal{D}$-modules, first properties

4.6.1 Pseudo-coherent complexes, Theorems A and B

Let X be a scheme or a $\mathcal{V}$-formal scheme (e.g. see 3.4). We explain how to get Theorems A and B for pseudo-coherent complexes from Theorem A and B for coherent modules. First, let us recall the notion of pseudo-coherent complexes.

4.6.1.1. Let D be a ring. We denote by $D^-_{\mathrm{coh}}({}^lD)$ the full subcategory of $D^-(D)$ of pseudo-coherent complexes in the sense of [Sta22, 064Q], i.e. of complexes which are quasi-isomorphic to a bounded above complex of finite free left D-modules.

Suppose D is noetherian (resp. coherent). It follows from [Sta22, 066E] (resp. [Sta22, 0EWZ]) that a complex $E^\bullet$ of $D^-(D)$ is pseudo-coherent if and only if $H^n(E^\bullet)$ is a left D-module of finite type (resp. coherent left D-module) for any $n \in \mathbb{Z}$.

Lemma 4.6.1.2. *Let D be a coherent ring. Then the natural map*

$$D^{-}(\mathrm{Coh}(D)) \to D^{-}_{\mathrm{coh}}(D) \tag{4.6.1.2.1}$$

is an equivalence of categories.

Proof. Following [Sta22, 0EWZ] (see 4.6.1.1), the functor is well defined. The essential surjectivity is obvious by definition. It remains to check this is fully faithful. Let $E^{\bullet}, F^{\bullet} \in D^{-}(\mathrm{Coh}(D))$. Viewing $E^{\bullet}$ as a object of $D^{-}_{\mathrm{coh}}(D)$, there exists $P^{\bullet} \in K^{-}(D)$ such that P^{n} are finite free left D-modules for any $n \in \mathbb{Z}$ and endowed with a quasi-isomorphism $E^{\bullet} \xrightarrow{\sim} P^{\bullet}$ in $K^{-}(D)$. In fact, this is also a quasi-isomorphism of $K^{-}(\mathrm{Coh}(D))$ Since a finite free left D-module is a projective object in $\mathrm{Coh}(D)$ and in $M(D)$, then following [Sta22, 064B-13.19.8] we have

$$\mathrm{Hom}_{D(\mathrm{Coh}(D))}(P^{\bullet}, F^{\bullet}) = \mathrm{Hom}_{K(\mathrm{Coh}(D))}(P^{\bullet}, F^{\bullet}) = \mathrm{Hom}_{K(D)}(P^{\bullet}, F^{\bullet}) = \mathrm{Hom}_{D(D)}(P^{\bullet}, F^{\bullet}).$$

Hence we are done. □

4.6.1.3. Let $\mathcal{D}$ be a *coherent* sheaf of rings on X.

(a) With notation 1.4.3.27, it follows from [Sta22, 08FX] that if $\mathcal{E}^{\bullet} \in D^{-}_{\mathrm{coh}}(\mathcal{D})$, then $H^{n}(\mathcal{E}^{\bullet})$ is a coherent left $\mathcal{D}$-module for any $n \in \mathbb{Z}$. We will see the converse below (see 4.6.1.8) under some hypotheses.

(b) Let $\mathcal{E}^{\bullet} \in D^{\mathrm{b}}(\mathcal{D})$. By devissage, we check the converse of (a) is satisfied, i.e. that the following conditions are equivalent:

  (i) $H^{n}(\mathcal{E}^{\bullet})$ is a coherent left $\mathcal{D}$-module for any $n \in \mathbb{Z}$;

  (ii) $\mathcal{E}^{\bullet}$ is pseudo-coherent.

Definition 4.6.1.4 (Bounded cohomological dimension)**.** Let $F\colon \mathfrak{A} \to \mathfrak{B}$ be a left (resp. right) exact functor of abelian categories. Let $n \in \mathbb{N}$. We say that F has "cohomological dimension $\leq n$" or "bounded by n cohomological dimension" if

(i) every object of $\mathfrak{A}$ is a subobject (resp. quotient) of an object which is right acyclic (resp. left acyclic) for F,

(ii) $R^{n+1}F = 0$ (resp. $L^{n+1}F = 0$).

We say that F has"bounded cohomological dimension" if there exists $n \in \mathbb{N}$ such that F has cohomological dimension $\leq n$.

Notation 4.6.1.5. Let $\mathfrak{A}$ be an abelian category. Let $a \leq b$ be two integers.

(i) We denote by $K^{\leq a}(\mathfrak{A})$ (resp. $K^{\geq a}(\mathfrak{A})$, resp. $K^{[a,b]}(\mathfrak{A})$) the full subcategory of $K(\mathfrak{A})$ consisting of complexes $Y^{\bullet} \in K(\mathfrak{A})$ such that $Y^{i} = 0$ for any $i > a$ (resp. for any $i < a$, resp. $i \notin [a, b]$). By taking the union over $a \in \mathbb{Z}$ (resp. and $b \in \mathbb{Z}$), we get $K^{+}(\mathfrak{A})$ (resp. $K^{-}(\mathfrak{A})$, resp. $K^{\mathrm{b}}(\mathfrak{A})$), the strictly full subcategory of $K(\mathfrak{A})$ consisting of bounded above (resp. bounded below, resp. bounded) complexes.

(ii) We denote by $D^{\leq a}(\mathfrak{A})$ (resp. $D^{\geq a}(\mathfrak{A})$, resp. $D^{[a,b]}(\mathfrak{A})$) the full subcategory of $D(\mathfrak{A})$ consisting of complexes $Y^{\bullet} \in D(\mathfrak{A})$ such that $H^{i}(Y^{\bullet}) = 0$ for any $i > a$ (resp. for any $i < a$, resp. $i \notin [a, b]$). By taking the union over $a \in \mathbb{Z}$ (resp. and $b \in \mathbb{Z}$), we get $D^{+}(\mathfrak{A})$ (resp. $D^{-}(\mathfrak{A})$, resp. $D^{\mathrm{b}}(\mathfrak{A})$), the strictly full subcategory of $D(\mathfrak{A})$ consisting of bounded above (resp. bounded below, resp. bounded) complexes.

4.6.1.6. Let $F\colon \mathfrak{A} \to \mathfrak{B}$ be a left exact functor of abelian categories which has cohomological dimension $\leq n$ for some integer n.

(a) The functor F is exact if and only if we can choose $n = 0$. The functor F has cohomological dimension $\leq N$ for any $N \geq n$. Hence, we can suppose $n \geq 1$ in the rest of this paragraph 4.6.1.6.

(b) Let $a \leq b$ be two integers. Since F is left exact, then we have the functor $\mathbb{R}F\colon D^{\geq a}(\mathfrak{A}) \to D^{\geq a}(\mathfrak{B})$. Following [Sta22, 07K7], since F has moreover cohomological dimension $\leq n$, then 1) $\mathbb{R}F\colon D(\mathfrak{A}) \to D(\mathfrak{B})$ exists, 2) any complex consisting of right acyclic objects for F computes $\mathbb{R}F$ and 3) any complex is the source of a quasi-isomorphism into a complex consisting of right acyclic objects or F.

Let us now complete these results by giving the bounded above version. Let $Y^\bullet \in K^{\leq b}(\mathfrak{A})$ (resp. $Y^\bullet \in K^{[a,b]}(\mathfrak{A})$). Then there exists $X^\bullet \in K^{\leq b+n}(\mathfrak{A})$ (resp. $X^\bullet \in K^{[a,b+n]}(\mathfrak{A})$) with $X^i \in P$ for any i together with a quasi-isomorphism of $K(\mathfrak{A})$ of the form $Y^\bullet \to X^\bullet$. Indeed, let P be the collection of all the objects of $\mathfrak{A}$ which are right acyclic for F. Then we can check easily that the following conditions are fulfilled:

(i) Every object of $\mathfrak{A}$ is a subobject of an object which is right acyclic for F,

(ii) If $0 \to X \to Y \to Z \to 0$ is a short exact sequence of $\mathfrak{A}$, with $X \in P$, then $Y \in P \Leftrightarrow Z \in P$.

(iii) If
$$X^0 \to X^1 \to \cdots \to X^{n-1} \to Y^n \to 0$$
is an exact sequence of $\mathfrak{A}$, and $X^0, \ldots, X^{n-1} \in P$, then $Y^n \in P$.

Recall that following [Har66, Lemma I.4.6.2], we retrieve the above property 3), i.e. that for any collection P of objects of $\mathfrak{A}$ satisfying the properties (bi), (bii) and (biii), for any complex $Y^\bullet \in K(\mathfrak{A})$ there exists a complex $X^\bullet \in K(\mathfrak{A})$ with $X^i \in P$ for any i together with a quasi-isomorphism of $K(\mathfrak{A})$ of the form $Y^\bullet \to X^\bullet$.

There exists $Z^\bullet \in K(\mathfrak{A})$ (resp. $Z^\bullet \in K^{\geq a}(\mathfrak{A})$) together with a quasi-isomorphism of $K(\mathfrak{A})$ of the form $Y^\bullet \to Z^\bullet$ with $Z^i \in P$ for any $i \in \mathbb{Z}$. Let X^{b+n} be the image of $Z^{b+n-1} \to Z^{b+n}$. By applying the condition (biii), since $Z^\bullet$ is acyclic in degree $> b$, we get that $X^{b+n} \in P$. For any $i > b+n$, set $X^i := 0$ and for any $i < b+n$, set $X^i := Z^i$. In particular, $X^i \in P$ for any $i \in \mathbb{Z}$ and $X^\bullet \in K^{\leq b+n}(\mathfrak{A})$ (resp. $X^\bullet \in K^{[a,b+n]}(\mathfrak{A})$). Moreover, since $Y^i = 0$ for any $i > b$, since $b+n > b$, then the quasi-isomorphism $Y^\bullet \to Z^\bullet$ induces the quasi-isomorphism $Y^\bullet \to X^\bullet$. Hence we are done.

This yields that the functor $\mathbb{R}F\colon D(\mathfrak{A}) \to D(\mathfrak{B})$ induces $\mathbb{R}F\colon D^{\leq b}(\mathfrak{A}) \to D^{\leq b+n}(\mathfrak{B})$ and $\mathbb{R}F\colon D^{[a,b]}(\mathfrak{A}) \to D^{[a,b+n]}(\mathfrak{B})$.

(c) We clarify below the meaning of the statement: since F has bounded cohomological dimension then for any $Y^\bullet \in D(\mathfrak{A})$ we have the converging spectral sequence
$$E_2^{r,s} = R^rF(H^s(Y^\bullet)) \Rightarrow H^{r+s}\mathbb{R}F(Y^\bullet). \tag{4.6.1.6.1}$$

By shifting if necessary, we reduce to the case where $r+s=0$. Remark, we have $E_2^{r,s} = 0$ when $r \notin [0,n]$. Considering the long exact sequence induced by the exact triangle of $D(\mathfrak{B})$
$$\mathbb{R}F(\tau_{\leq 0}Y^\bullet) \to \mathbb{R}F(Y^\bullet) \to \mathbb{R}F(\tau_{\geq 1}Y^\bullet) \to \mathbb{R}F(\tau_{\leq 0}Y^\bullet)[1],$$
where $\tau_{\leq 0}$ and $\tau_{\geq 1}$ are the canonical truncations (see notation [Sta22, 0118]), we get that the morphism $H^0\mathbb{R}F(\tau_{\leq 0}Y^\bullet) \to H^0\mathbb{R}F(Y^\bullet)$ is an isomorphism. Considering the long exact sequence induced by the exact triangle of $D(\mathfrak{B})$
$$\mathbb{R}F(\tau_{\leq -n-1}Y^\bullet) \to \mathbb{R}F(\tau_{\leq 0}Y^\bullet) \to \mathbb{R}F(\tau_{\geq -n}\tau_{\leq 0}Y^\bullet) \to \mathbb{R}F(\tau_{\leq -n-1}Y^\bullet)[1],$$
since $\mathbb{R}F(\tau_{\leq -n-1}Y^\bullet) \in D^{\leq -1}(\mathfrak{B})$, then we get that the morphism $H^0\mathbb{R}F(\tau_{\leq 0}Y^\bullet) \to H^0\mathbb{R}F(\tau_{\geq -n}\tau_{\leq 0}Y^\bullet)$ is an isomorphism. Set $Z^\bullet := \tau_{\geq -n}\tau_{\leq 0}Y^\bullet$. Since $Z^\bullet \in D^+(\mathfrak{A})$ and since F is left exact, then we get the spectral sequence (see [Sta22, 015J]):
$$\widetilde{E}_2^{r,s} = R^rF(H^s(Z^\bullet)) \Rightarrow H^{r+s}\mathbb{R}F(Z^\bullet). \tag{4.6.1.6.2}$$

When $s \in [-n,0]$, we have $\widetilde{E}_2^{r,s} = E_2^{r,s}$. Hence, the spectral sequence 4.6.1.6.1 for $r+s=0$ is by definition the spectral sequence 4.6.1.6.2. In other words, we can build "locally in $(r,s) \in [0,n] \times \mathbb{Z}$" the spectral sequence 4.6.1.6.1 by using Cartan-Eilenberg resolutions.

Similarly, we get the spectral sequence
$$E_1^{r,s} = R^sF(Y^r)) \Rightarrow H^{r+s}\mathbb{R}F(Y^\bullet). \tag{4.6.1.6.3}$$

Proposition 4.6.1.7. *Suppose X is affine and noetherian. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorems A and B for coherent modules (see definition 1.4.3.14). Let $\sharp \in \{\emptyset, -, +, \mathrm{b}\}$*

a) Denote by $D^{\sharp}_{\mathrm{ccoh}}(\mathcal{D})$ (resp. $D^{\sharp}_{\mathrm{ccoh}}(D)$) the full subcategory of $D^{\sharp}(\mathcal{D})$ (resp. $D^{\sharp}(D)$) consisting of complexes $\mathcal{E}^{\bullet}$ such that $H^n(\mathcal{E}^{\bullet})$ is a coherent left $\mathcal{D}$-module (resp. coherent left D-module) for any $n \in \mathbb{Z}$. Then the functors $\mathbb{R}\Gamma(X, -)$ and $\mathcal{D} \otimes_D -$ induce canonically quasi-inverse equivalences of categories between $D^{\sharp}_{\mathrm{ccoh}}(D)$ and $D^{\sharp}_{\mathrm{ccoh}}(\mathcal{D})$.

b) Let $\mathcal{E}^{\bullet} \in D^{-}(\mathcal{D})$. The following conditions are equivalent

(i) $\mathcal{E}^{\bullet} \in D^{-}_{\mathrm{coh}}(\mathcal{D})$;

(ii) $\mathcal{E}^{\bullet} \in D^{-}_{\mathrm{ccoh}}(\mathcal{D})$;

(iii) $\mathcal{E}^{\bullet}$ is quasi-isomorphic to a bounded above complex of finite free left $\mathcal{D}$-modules.

c) Suppose moreover X is a scheme and $\mathcal{D}$ is a quasi-coherent $\mathcal{O}_X$-module. We denote by $D^{\sharp}_{\mathrm{qc}}(\mathcal{D})$ the full subcategory of $D^{\sharp}(\mathcal{D})$ consisting of complexes $\mathcal{E}^{\bullet}$ such that $H^n(\mathcal{E}^{\bullet})$ is quasi-coherent as $\mathcal{O}_X$-modules for any $n \in \mathbb{Z}$. Then the functors $\mathbb{R}\Gamma(X, -)$ and $\mathcal{D} \otimes_D -$ induce canonically quasi-inverse equivalences of categories between $D^{\sharp}(D)$ and $D^{\sharp}_{\mathrm{qc}}(\mathcal{D})$ (resp. between $D^{\sharp}_{\mathrm{tdf}}(D)$ and $D^{\sharp}_{\mathrm{qc,tdf}}(\mathcal{D})$).

Proof. a) 0) We denote by $\varpi_{X,*} := \Gamma(X, -)$ and $\varpi_X^* := \mathcal{D} \otimes_D -$. Since $D \to \mathcal{D}$ is flat, since $\mathcal{D}$ be a sheaf of rings on X satisfying theorems A and B for coherent modules, then the functor ϖ_X^* factors through $\varpi_X^* \colon D^{\sharp}_{\mathrm{ccoh}}(D) \to D^{\sharp}_{\mathrm{ccoh}}(\mathcal{D})$.

1) Let $\mathcal{E}^{\bullet} \in D^{\sharp}_{\mathrm{ccoh}}(\mathcal{D})$. We can suppose $\mathcal{E}^{\bullet} \in K^{\sharp}(\mathcal{D})$. Since X is noetherian, then $\varpi_{X,*}$ has bounded cohomological dimension. Hence, then there exist a complex $\mathcal{I}^{\bullet} \in K^{\sharp}(\mathcal{D})$ consisting of $\varpi_{X,*}$-acyclic $\mathcal{D}$-modules and a quasi-isomorphism $\mathcal{E}^{\bullet} \to \mathcal{I}^{\bullet}$ of $K^{\sharp}(\mathcal{D})$ (see the whole paragraph 4.6.1.6.b). Following [Sta22, 07K7], we have the isomorphism of $D^{\sharp}(\mathcal{D})$: $\varpi_{X,*}(\mathcal{I}^{\bullet}) \xrightarrow{\sim} \mathbb{R}\varpi_{X,*}(\mathcal{I}^{\bullet}) \xleftarrow{\sim} \mathbb{R}\varpi_{X,*}(\mathcal{E}^{\bullet})$. Since $\mathcal{I}^{\bullet} \in K^{\sharp}(\mathcal{D})$, then $I^{\bullet} := \varpi_{X,*}(\mathcal{I}^{\bullet}) \in K^{\sharp}(D)$. Since $\varpi_{X,*}$ has bounded cohomological dimension, then following 4.6.1.6.1 we have the spectral sequence $E_2^{r,s} = R^r\varpi_{X,*}(H^s(\mathcal{I}^{\bullet})) \Rightarrow H^{r+s}\mathbb{R}\varpi_{X,*}(\mathcal{I}^{\bullet})$. Since $H^s(\mathcal{I}^{\bullet})$ is $\mathcal{D}$-coherent for all $s \in \mathbb{Z}$, then $H^s(\mathcal{I}^{\bullet})$ is $\varpi_{X,*}$-acyclic (see 1.4.3.14.(iii)). Hence, the canonical map $H^n(I^{\bullet}) = H^n\varpi_{X,*}(\mathcal{I}^{\bullet}) \to \varpi_{X,*}H^n(\mathcal{I}^{\bullet})$ (coming from the above spectral sequence) is an isomorphism of D-modules. Since $H^n(\mathcal{I}^{\bullet})$ is a coherent $\mathcal{D}$-module, since $\mathcal{D}$ satisfies the condition 1.4.3.14.(iii), then this implies that $H^n(I^{\bullet})$ is a coherent D-module (and then $\mathbb{R}\varpi_{X,*}(\mathcal{E}^{\bullet}) \xrightarrow{\sim} I^{\bullet}$ is an object of $D^{\sharp}_{\mathrm{ccoh}}(D)$, i.e. we get the factorisation $\mathbb{R}\varpi_{X,*} \colon D^{\sharp}_{\mathrm{ccoh}}(\mathcal{D}) \to D^{\sharp}_{\mathrm{ccoh}}(D)$) and that the canonical morphism $\mathcal{D} \otimes_D H^n(I^{\bullet}) \to H^n(\mathcal{I}^{\bullet})$ is an isomorphism. Since $D \to \mathcal{D}$ is flat, then from the latter isomorphism we get that the canonical map $\mathcal{D} \otimes_D I^{\bullet} \to \mathcal{I}^{\bullet}$ is a quasi-isomorphism. Hence, the canonical morphism $\varpi_X^* \circ \mathbb{R}\varpi_{X,*}(\mathcal{E}^{\bullet}) \to \mathcal{E}^{\bullet}$ is an isomorphism in $D^{\sharp}_{\mathrm{ccoh}}(\mathcal{D})$.

2) Let $E^{\bullet} \in D^{\sharp}_{\mathrm{ccoh}}(D)$. Since $\mathcal{D} \otimes_D E^{\bullet}$ is a complex of $\varpi_{X,*}$-acyclic modules (see the remark 1.4.3.16), then we can check as above that the canonical map $E^{\bullet} \to \mathbb{R}\varpi_{X*}(\mathcal{D} \otimes_D E^{\bullet})$ is a quasi-isomorphism.

b) The implication $bi) \Rightarrow bii)$ is always true (see 4.6.1.3). Let us now prove the implication $bii) \Rightarrow biii)$. Let $\mathcal{E}^{\bullet} \in D^{-}_{\mathrm{ccoh}}(\mathcal{D})$. From the part a) of the proof, the canonical morphism $\varpi_X^* \circ \mathbb{R}\varpi_{X,*}(\mathcal{E}^{\bullet}) \to \mathcal{E}^{\bullet}$ is an isomorphism in $D^{-}_{\mathrm{ccoh}}(\mathcal{D})$ and $E^{\bullet} := \mathbb{R}\varpi_{X,*}(\mathcal{E}^{\bullet}) \in D^{-}_{\mathrm{ccoh}}(D)$. Since $D^{-}_{\mathrm{ccoh}}(D) = D^{-}_{\mathrm{coh}}(D)$ (see 4.6.1.1), then $E^{\bullet} \in D^{-}_{\mathrm{coh}}(D)$. Recall that by definition this means that $E^{\bullet}$ is quasi-isomorphic to a bounded above complex of finite free left D-modules (see 4.6.1.1). Since $D \to \mathcal{D}$ is flat, then $\varpi_X^* E^{\bullet}$ is quasi-isomorphic to a bounded above complex of finite free left $\mathcal{D}$-modules, and we have therefore proved the implication $bii) \Rightarrow biii)$. Since the implication $biii) \Rightarrow bi)$ is obvious, then we get the equivalence between the conditions of b.

c) To check the non-respective case, we proceed similarly to a) by using theorems of type A and B for quasi-coherent $\mathcal{O}_X$-modules (see 4.1.3.2), which is only valid when X is a scheme. Concerning the respective case, this easily follows from the following property: a quasi-coherent $\mathcal{D}$-module $\mathcal{E}$ on X is flat if and only if $\varpi_{X*}(\mathcal{E})$ is a flat D-module. Let us check this last property. Let $\mathcal{E}$ be a quasi-coherent $\mathcal{D}$-module and set $E := \varpi_{X*}(\mathcal{E})$. Then $\mathcal{E}$ is flat if and only if $\mathcal{E}_x$ is a flat $\mathcal{D}_X$-module for any $x \in X$. Moreover, E is a flat D-module if and only if E_x is a flat D_x-module for any $x \in X$. Since $\mathcal{E}_x \xrightarrow{\sim} E_x$, then we are done. □

Corollary 4.6.1.8. *Suppose X is locally noetherian. Let $\mathcal{D}$ be a sheaf of rings on X. Suppose there exists a covering $\{U_i\}_{i \in I}$ of X by affine opens such that $\mathcal{D}|_{U_i}$ satisfies theorems A and B for coherent* *modules (see definition 1.4.3.14) for any $i \in I$. Let $\mathcal{E}^\bullet \in D^-(\mathcal{D})$. Then the following conditions are equivalent:*

(i) $H^n(\mathcal{E}^\bullet)$ is a coherent left $\mathcal{D}$-module for any $n \in \mathbb{Z}$;

(ii) $\mathcal{E}^\bullet$ is pseudo-coherent.

Corollary 4.6.1.9. *Suppose X is affine and noetherian. Let $\mathcal{D}$ be a sheaf of rings on X satisfying theorems A and B for coherent modules (see definition 1.4.3.14). The canonical functor*

$$D^-(\mathrm{Coh}(\mathcal{D})) \to D^-_{\mathrm{coh}}(\mathcal{D}) \tag{4.6.1.9.1}$$

is an equivalence of categories.

Proof. Consider the commutative diagram

$$\begin{array}{ccc} D^-(\mathrm{Coh}(\mathcal{D})) & \longrightarrow & D^-_{\mathrm{coh}}(\mathcal{D}) \\ {\scriptstyle \mathcal{D}\otimes_D -}\uparrow & & \uparrow{\scriptstyle \mathcal{D}\otimes_D -} \\ D^-(\mathrm{Coh}(D)) & \longrightarrow & D^-_{\mathrm{coh}}(D) \end{array} \tag{4.6.1.9.2}$$

whose horizontal maps are respectively induced by the inclusions $\mathrm{Coh}(\mathcal{D}) \to M(\mathcal{D})$ and $\mathrm{Coh}(D) \to M(D)$, where the vertical arrows are induced by the exact functor $\mathcal{D} \otimes_D -$. Since D is coherent, then the bottom arrow is an equivalence of categories (see 4.6.1.2). Following 4.6.1.7.a, the right arrow of the diagram 4.6.1.9.2 is an equivalence of categories. Since the exact functor $\mathcal{D} \otimes_D -$ induces an equivalence of categories between $\mathrm{Coh}(D)$ and $\mathrm{Coh}(\mathcal{D})$ then so is the left arrow of the diagram 4.6.1.9.2. We conclude by commutativity of 4.6.1.9.2. □

4.6.2 Review on topoi, internal homomorphism

In this subsection, we fix some notation on topos, recall some facts on open subtopoi. This will be useful to understand better the (crucial in the theory of arithmetic $\mathcal{D}$-modules) topos of the form $\mathrm{Top}(X)_I$, where I is a partially ordered set and X is a topological space (7.1.2.12). We also recall the internal homomorphism functor.

4.6.2.1 (Sieves, opens of a site)**.** Let $\mathfrak{C}$ be a site. We denote by $\mathrm{PSh}(\mathfrak{C})$ (resp. $\mathrm{Sh}(\mathfrak{C})$) the category of presheaves (resp. sheaves) of set on $\mathfrak{C}$. Since the following notions are not well known, let us recall them.

(a) A "sieve" of $\mathfrak{C}$ is a full subcategory $\mathfrak{D}$ of $\mathfrak{C}$ such that for any morphism $X \to Y$ of $\mathfrak{C}$ if Y is an object of $\mathfrak{D}$ then so is X (see [SGA4.1, I.4.1]).

(b) We have a bijection between the set of sieves of $\mathfrak{C}$ and the set of subobjects of the final object e of $P\,\mathrm{Sh}(\mathfrak{C})$ described as follows. If $\mathfrak{D}$ is a sieve of $\mathfrak{C}$, then we get the subobject $R_{\mathfrak{D}}$ of e by setting $R_{\mathfrak{D}}(Y) := e(Y)$ if $Y \in \mathrm{Ob}(\mathfrak{D})$ and $R_{\mathfrak{D}}(Y)$ is empty otherwise. Conversely, if R is a subobject of e, then we get the full subcategory $\mathfrak{C}/R$ of $\mathfrak{C}$ (the inclusion is given by $(Y, u\colon Y \to R) \mapsto Y$).

(c) An "open" of $\mathfrak{C}$ is a "sieve of local nature", i.e. is a sieve $\mathfrak{D}$ such that for any covering $(X_i \to X)_{i\in I}$ of $\mathfrak{C}$, if the X_i are an object of $\mathfrak{D}$ for any i then X is an object of $\mathfrak{D}$. As above, we have a bijection between opens of $\mathfrak{C}$ and subobjects in $\mathrm{Sh}(\mathfrak{C})$ of its final object e (see [SGA4.1, IV.8.3]).

4.6.2.2. Let $\mathfrak{C}$ be a site. Let $U \in Ob(\mathfrak{C})$. We turn $\mathfrak{C}/U$ into a site by declaring a family of morphisms $\{V_j \to V\}$ of objects over U to be a covering of $\mathfrak{C}/U$ if and only if it is a covering in $\mathfrak{C}$. Consider the forgetful functor $j_U\colon \mathfrak{C}/U \to \mathfrak{C}$. Since j_U is cocontinuous and continuous, then we obtain a morphism of topoi $j_U\colon Sh(\mathfrak{C}/U) \to Sh(\mathfrak{C})$ given by j_U^{-1} and j_{U*}, as well as a functor $j_{U!}$.

Definition 4.6.2.3. Let $\mathfrak{C}$ be a site. Let $U \in Ob(\mathfrak{C})$.

1. The site $\mathfrak{C}/U$ is called the localization of the site $\mathfrak{C}$ at the object U.

2. The morphism of topoi $j_U\colon Sh(\mathfrak{C}/U) \to Sh(\mathfrak{C})$ is called the localization morphism.

3. The functor j_{U*} is called the direct image functor.

4. For a sheaf $\mathcal{F}$ on $\mathfrak{C}$ the sheaf $j_U^{-1}\mathcal{F}$ is called the restriction of $\mathcal{F}$ to $\mathfrak{C}/U$. For any object X/U of $\mathfrak{C}/U$ we have $j_U^{-1}\mathcal{F}(X/U) = \mathcal{F}(X)$.

5. For a sheaf $\mathcal{G}$ on $\mathfrak{C}/U$ the sheaf $j_{U!}(\mathcal{G})$ is called the extension of $\mathcal{G}$ by the empty set.

4.6.2.4. Let $\mathfrak{C}$ be a site. Let $U \in Ob(\mathfrak{C})$. Let $\star$ be the final object of $Sh(\mathfrak{C}/U)$. Since $j_{U!}(\star) = h_U^\sharp$ (use [Sta22, 03CD]), then for any $\mathcal{G} \in Sh(\mathfrak{C}/U)$ we get the functorial in $\mathcal{G}$ map $j_{U!}(\mathcal{G}) \to j_{U!}(\star)$, i.e. we get the functor $Sh(\mathfrak{C}/U) \to Sh(\mathfrak{C})/h_U^\sharp$ making commutative the diagram of categories

$$\begin{array}{ccc} Sh(\mathfrak{C}/U) & \longrightarrow & Sh(\mathfrak{C})/h_U^\sharp \\ & \searrow^{j_{U!}} & \downarrow j_{h_U^\sharp !} \\ & & Sh(\mathfrak{C}) \end{array} \tag{4.6.2.4.1}$$

where $j_{h_U^\sharp !}\colon Sh(\mathfrak{C})/h_U^\sharp \to Sh(\mathfrak{C})$ is by definition the forgetful functor. In fact, following [Sta22, 00Y1] the functor $Sh(\mathfrak{C}/U) \to Sh(\mathfrak{C})/h_U^\sharp$ is an equivalence of categories. Hence, we get a morphism of topoi $j_{h_U^\sharp}\colon Sh(\mathfrak{C})/h_U^\sharp \to Sh(\mathfrak{C})$ such that $j_{h_U^\sharp !}$, $j_{h_U^\sharp}^{-1}$ and $j_{h_U^\sharp *}$ correspond (via the equivalence of categories $Sh(\mathfrak{C}/U) \cong Sh(\mathfrak{C})/h_U^\sharp$) to $j_{U!}$, j_U^{-1} and j_{U*}, i.e., we get the commutative diagram of topoi

$$\begin{array}{ccc} Sh(\mathfrak{C}/U) & \xrightarrow{\cong} & Sh(\mathfrak{C})/h_U^\sharp \\ & \searrow^{j_U} & \downarrow j_{h_U^\sharp} \\ & & Sh(\mathfrak{C}). \end{array} \tag{4.6.2.4.2}$$

4.6.2.5. Let $\mathfrak{C}$ be a site. Let $\mathcal{F}$ be a sheaf on $\mathfrak{C}$. We can extend the localisation process 4.6.2.4 to $\mathcal{F}$ as follows. Then following [Sta22, 04GZ] the category $Sh(\mathfrak{C})/\mathcal{F}$ is a topos and there is a canonical morphism of topoi $j_{\mathcal{F}}\colon Sh(\mathfrak{C})/\mathcal{F} \to Sh(\mathfrak{C})$ such that

(i) the functor $j_{\mathcal{F}}^{-1}$ is the functor $\mathcal{H} \mapsto \mathcal{H} \times \mathcal{F}/\mathcal{F}$,

(ii) and the functor $j_{\mathcal{F}!}$ is the forgetful functor $\mathcal{G}/\mathcal{F} \mapsto \mathcal{G}$.

The topos $Sh(\mathfrak{C})/\mathcal{F}$ is called the localization of the topos $Sh(\mathfrak{C})$ at $\mathcal{F}$. The morphism of topoi $j_{\mathcal{F}}\colon Sh(\mathfrak{C})/\mathcal{F}) \to Sh(\mathfrak{C})$ is called the localization morphism. We can simply write $\mathcal{F}|_{\mathcal{F}} := j_{\mathcal{F}}^{-1}$.

Let $\mathcal{A}$ be a sheaf of rings on $\mathfrak{C}$. We get the ringed topos $(\mathrm{Sh}(\mathfrak{C}), \mathcal{A})$. Then we get from the localization of the topos $Sh(\mathfrak{C})$ at $\mathcal{F}$ the morphism of ringed topoi $j_{\mathcal{F}}\colon (Sh(\mathfrak{C})/\mathcal{F}, \mathcal{A}|_{\mathcal{F}}) \to (Sh(\mathfrak{C}), \mathcal{A})$.

4.6.2.6. Let $\mathfrak{C}$ be a site. Following [Sta22, 08LW], the following assertions are equivalent for any sheaf $\mathcal{F}$ on $\mathfrak{C}$:

(a) The sheaf $\mathcal{F}$ is an open of $Sh(\mathfrak{C})$, i.e. $\mathcal{F}$ is a subobject of the final object of $Sh(\mathfrak{C})$.

(b) The morphism $j_{\mathcal{F}}$ is an embedding, i.e. $j_{\mathcal{F}*}\colon Sh(\mathfrak{C})/\mathcal{F} \to Sh(\mathfrak{C})$ is fully faithful.

A strictly full subcategory $\mathfrak{E} \subset Sh(\mathfrak{C})$ is by definition an "open subtopos of $Sh(\mathfrak{C})$" if there exists a subsheaf $\mathcal{F}$ of the final object of $Sh(C)$ such that $\mathfrak{E}$ is the essential image of $j_{\mathcal{F}}$ (see Definition [Sta22, 08LX]). Finally, a morphism of topoi $f\colon Sh(\mathfrak{D}) \to Sh(\mathfrak{C})$ is said to be an "open immersion" if f is an embedding (i.e. f_* is fully faithful) and the essential image of f_* is an open subtopos. We will use the open immersion given at 7.1.2.18.3.

4.6.2.7. Let $\mathfrak{C}$ be a site. Let $\mathcal{A}, \mathcal{B}$ be two (not necessarily commutative) sheaves of rings on $\mathfrak{C}$. Writing $\mathscr{T} := \mathrm{Sh}(\mathfrak{C})$. We denote by $\mathbb{Z}_{\mathscr{T}}$ be the sheaf of $\mathscr{T}$ associated with the constant presheaf of $\mathscr{T}$ with value $\mathbb{Z}$.

(a) Let e be a final object of $\mathrm{Sh}(\mathfrak{C})$. The global sections functor $\Gamma(\mathscr{T}, -)\colon \mathscr{T} \to \mathrm{Sets}$, also denoted by $\Gamma(\mathfrak{C}, -)\colon \mathrm{Sh}(\mathfrak{C}) \to \mathrm{Sets}$, is defined by setting for any object K of $\mathscr{T}$,

$$\Gamma(\mathscr{T}, K) := \mathrm{Hom}_{\mathscr{T}}(e, K). \tag{4.6.2.7.1}$$

(b) Following [SGA4.1, IV.10.1], for any objects E, F of $\mathscr{T}$, Grothendieck has constructed an object of $\mathscr{T}$ that we will denote by $\mathscr{H}om_{\mathscr{T}}(E, F)$ which is characterized by the property: for any object K of $\mathscr{T}$,

$$\mathrm{Hom}_{\mathscr{T}}(K, \mathscr{H}om_{\mathscr{T}}(E, F)) = \mathrm{Hom}_{\mathscr{T}|_K}(E|_K, F|_K)). \tag{4.6.2.7.2}$$

With 4.6.2.7.1, in the case where K is a final object, this yields

$$\Gamma(\mathscr{T}, \mathscr{H}om_{\mathscr{T}}(E, F)) = \mathrm{Hom}_{\mathscr{T}}(E, F). \tag{4.6.2.7.3}$$

(c) Following [SGA4.1, IV.12.1], for any left (resp. right) $\mathcal{A}$-modules $\mathcal{E}$ and $\mathcal{F}$, Grothendieck has constructed an abelian sheaf on $\mathscr{T}$ that we will denote by $\mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F})$ which is characterized by the property: with notation 4.6.2.5, for any object K of $\mathscr{T}$,

$$\mathrm{Hom}_{\mathscr{T}}(K, \mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F})) = \mathrm{Hom}_{\mathcal{A}|_K}(\mathcal{E}|_K, \mathcal{F}|_K)). \tag{4.6.2.7.4}$$

With 4.6.2.7.1, in the case where K is a final object, this yields

$$\Gamma(\mathscr{T}, \mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F})) = \mathrm{Hom}_{\mathcal{A}}(\mathcal{E}, \mathcal{F}). \tag{4.6.2.7.5}$$

When $\mathcal{F}$ is injective, then $\mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F})$ is flasque (see [SGA4.2, V.4.10.2)]) and then is acyclic for the functor $\Gamma(\mathscr{T}, -)$. Hence, this yields from [Sta22, 05TA-13.16.8] that for any $\mathcal{E}^\bullet \in D^-(\mathcal{A})$, $\mathcal{F}^\bullet \in D^+(\mathcal{A})$ we have the isomorphism

$$\mathbb{R}\Gamma(\mathscr{T}, \mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet)) = \mathbb{R}\mathrm{Hom}_{\mathcal{A}}(\mathcal{E}^\bullet, \mathcal{F}^\bullet). \tag{4.6.2.7.6}$$

Following [SGA4.1, IV.12.6], for any object K of $\mathscr{T}$ and left $\mathcal{A}$-module $\mathcal{F}$, we have the isomorphism of left $\mathcal{A}$-modules:

$$\mathscr{H}om_{\mathscr{T}}(K, \mathcal{F}) \xrightarrow{\sim} \mathscr{H}om_{\mathcal{A}}(j_{K!}j_K^*\mathcal{A}, \mathcal{F}), \tag{4.6.2.7.7}$$

where $j_K \colon \mathscr{T}/K \to \mathscr{T}$ is the localisation morphism and the functors $j_{K!}$ and j_K^* are explicitely defined at [SGA4.1, IV.5.2]. Hence, if $\mathcal{F}$ is injective then $\mathscr{H}om_{\mathscr{T}}(K, \mathcal{F})$ is flasque. This yields from [Sta22, 05TA-13.16.8] that for any $K \in \mathscr{T}$, $\mathcal{F}^\bullet \in D^+(\mathcal{A})$ we have the isomorphism

$$\mathbb{R}\Gamma(\mathscr{T}, \mathbb{R}\mathscr{H}om_{\mathscr{T}}(K, \mathcal{F}^\bullet)) = \mathbb{R}\mathrm{Hom}_{\mathscr{T}}(K, \mathcal{F}^\bullet). \tag{4.6.2.7.8}$$

(d) Let $\mathcal{E}$ be an abelian sheaf on $\mathscr{T}$. The data of a left $(\mathcal{A}, \mathcal{B})$-bimodule on $\mathcal{E}$ (extending its structure of abelian sheaf) is equivalent to that of a left $\mathcal{A} \otimes_{\mathbb{Z}} \mathcal{B}$-module. Let $\mathcal{E}, \mathcal{F}$ be two left $(\mathcal{A}, \mathcal{B})$-bimodules. We denote by $\mathrm{Hom}_{({}^l\mathcal{A}, {}^l\mathcal{B})}(\mathcal{E}, \mathcal{F}) = \mathrm{Hom}_{\mathcal{A} \otimes_{\mathbb{Z}} \mathcal{B}}(\mathcal{E}, \mathcal{F})$ the set of $(\mathcal{A}, \mathcal{B})$-bilinear homomorphism. We denote by $\mathscr{H}om_{({}^l\mathcal{A}, {}^l\mathcal{B})}(\mathcal{E}, \mathcal{F}) := \mathscr{H}om_{\mathcal{A} \otimes_{\mathbb{Z}} \mathcal{B}}(\mathcal{E}, \mathcal{F})$, which is characterized by the property: with notation 4.6.2.5, for any object K of $\mathscr{T}$,

$$\mathrm{Hom}_{\mathscr{T}}(K, \mathscr{H}om_{({}^l\mathcal{A}, {}^l\mathcal{B})}(\mathcal{E}, \mathcal{F})) = \mathrm{Hom}_{({}^l\mathcal{A}|_K, {}^l\mathcal{B}|_K)}(\mathcal{E}|_K, \mathcal{F}|_K)). \tag{4.6.2.7.9}$$

We have similar notation for $(\mathcal{A}, \mathcal{B})$-bimodules or right $(\mathcal{A}, \mathcal{B})$-bimodules.

4.6.3 Derived tensor products, derived homomorphism functors, Cartan isomorphisms in general

Notation 4.6.3.1. Let $\mathcal{A}, \mathcal{A}', \mathcal{B}, \mathcal{C}$ be four sheaves of rings (not necessarily commutative) on some topos $\mathscr{T}$.

Following [SGA4.1, IV.12.1], for any left (resp. right) $\mathcal{A}$-modules $\mathcal{E}$ and $\mathcal{F}$, Grothendieck has constructed an abelian sheaf on $\mathscr{T}$ that we will denote by $\mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F})$ which is characterized by the property: with notation 4.6.2.5, for any object K of $\mathscr{T}$,

$$\mathrm{Hom}_{\mathscr{T}}(K, \mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F})) = \mathrm{Hom}_{\mathcal{A}|_K}(\mathcal{E}|_K, \mathcal{F}|_K)). \tag{4.6.3.1.1}$$

When the topos $\mathscr{T}$ it the topos associated with a topological space, then we prefer to write $\mathcal{H}om$ instead of $\mathscr{H}om$. When $\mathcal{E}$ is a $(\mathcal{C}, \mathcal{A})$-bimodule and $\mathcal{F}$ is a $(\mathcal{B}, \mathcal{A})$-bimodule, then $\mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F})$ is endowed with a canonical structure of $(\mathcal{C}, \mathcal{B})$-bimodule (see [SGA4.1, IV.12.5]). For any $* \in \{l, r\}$, we define the bifunctor

$$\mathscr{H}om^\bullet_{\mathcal{A}}(-,-) \colon K({}^{\mathrm{l}}\mathcal{C}, {}^*\mathcal{A}) \times K({}^{\mathrm{l}}\mathcal{B}, {}^*\mathcal{A}) \to K({}^{\mathrm{l}}\mathcal{B}, \mathcal{C}^{\mathrm{r}}). \tag{4.6.3.1.2}$$

by setting for any $\mathcal{E}^\bullet \in K({}^{\mathrm{l}}\mathcal{C}, \mathcal{A}^{\mathrm{r}})$, $\mathcal{F}^\bullet \in K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$, for any integer $n \in \mathbb{Z}$ setting:

$$\mathscr{H}om^n_{\mathcal{A}}(\mathcal{E}^\bullet,\ \mathcal{F}^\bullet) := \prod_{p\in\mathbb{Z}} \mathscr{H}om_{\mathcal{A}}(\mathcal{E}^p,\ \mathcal{F}^{p+n}) \tag{4.6.3.1.3}$$

and the transition morphisms are given by the formula $d = d_{\mathcal{E}} + (-1)^n d_{\mathcal{F}}$. We have the relation:

$$H^n(\Gamma(\mathscr{T}, \mathscr{H}om^\bullet_{\mathcal{A}}(\mathcal{E}, \mathcal{F}))) = \mathrm{Hom}_{K(\mathcal{A})}(\mathcal{E}, \mathcal{F}[n]). \tag{4.6.3.1.4}$$

For any $(\mathcal{C}, \mathcal{A})$-bimodule $\mathcal{E}$ and $(\mathcal{A}, \mathcal{B})$-bimodule $\mathcal{F}$, the abelian sheaf $\mathcal{E} \otimes_{\mathcal{A}} \mathcal{F}$ is fact a $(\mathcal{C}, \mathcal{B})$-bimodule. We define the bifunctor

$$- \otimes_{\mathcal{A}} -\colon K({}^*\mathcal{B}, \mathcal{A}^{\mathrm{r}}) \times K({}^{\mathrm{l}}\mathcal{A}, {}^{**}\mathcal{C}) \to K({}^*\mathcal{B}, {}^{**}\mathcal{C}), \tag{4.6.3.1.5}$$

by setting for any $\mathcal{E}^\bullet \in K({}^*\mathcal{B}, \mathcal{A}^{\mathrm{r}})$, $\mathcal{F}^\bullet \in K({}^{\mathrm{l}}\mathcal{A}, {}^{**}\mathcal{C})$, for any integer $n \in \mathbb{Z}$ setting:

$$(\mathcal{E}^\bullet \otimes_{\mathcal{A}} \mathcal{F}^\bullet)^n := \sum_{p\in\mathbb{Z}} \mathcal{E}^p \otimes_{\mathcal{A}} \mathcal{F}^{n-p} \tag{4.6.3.1.6}$$

and the transition morphisms are given by the formula $d = d_{\mathcal{E}} + (-1)^n d_{\mathcal{F}}$. We have similar bifunctors by changing the indices l and r.

4.6.3.2. Let $\mathcal{A}$, $\mathcal{B}$, $\mathcal{C}$ be three sheaves of rings on some site $\mathscr{T}$. In this paragraph, e.g. in order to get some associativity of the tensor product, we would like to extend the functor

$$\mathbb{R}\mathscr{H}om_{\mathcal{A}}(-,-)\colon D({}^{\mathrm{l}}\mathcal{B}, {}^*\mathcal{A}) \times D({}^*\mathcal{A}) \to D({}^{\mathrm{r}}\mathcal{B}), \tag{4.6.3.2.1}$$

$$- \otimes^{\mathbb{L}}_{\mathcal{A}} -\colon D({}^*\mathcal{B}, \mathcal{A}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{A}) \to D({}^*\mathcal{B}). \tag{4.6.3.2.2}$$

Let $\mathcal{E} \in K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$, let $\mathcal{F} \in K({}^{\mathrm{l}}\mathcal{A}, \mathcal{C}^{\mathrm{r}})$, $\mathcal{G} \in K({}^{\mathrm{l}}\mathcal{C}, \mathcal{A}^{\mathrm{r}})$.

(a) Consider the functor $- \otimes_{\mathcal{A}} \mathcal{F}\colon K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{B}, \mathcal{C}^{\mathrm{r}})$ defined by $\mathcal{E}' \mapsto \mathcal{E}' \otimes_{\mathcal{A}} \mathcal{F}$. In general, it is not clear that the left derived functor (localizing by quasi-isomorphisms) of $- \otimes_{\mathcal{A}} \mathcal{F}$ is defined at $\mathcal{E}$ (see Definition [Sta22, 05S9]). Indeed, this is not clear that there exists a complex of $(\mathcal{B}, \mathcal{A})$-bimodules representing $\mathcal{E}$ which is moreover a K-flat complex of $\mathcal{A}$-modules.

Similarly, since the existence of a complex of $(\mathcal{B}, \mathcal{A})$-bimodules representing $\mathcal{E}$ which is moreover a K-injective complex of $\mathcal{A}$-modules is not clear then it seems problematic to assert the functor $\mathscr{H}om_{\mathcal{A}}(\mathcal{G}, -)\colon K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{B}, \mathcal{C}^{\mathrm{r}})$ has a right derived functor at $\mathcal{E}$.

(b) However, under Berthelot's practical hypotheses below, theses derived functors can be computed as follows. Let us introduce the following definition. A commutative ring $\mathcal{R}$ is said to be a *left solving ring* (resp. *right solving ring*, resp. *solving ring*) of $(\mathcal{A}, \mathcal{B})$ if the following conditions are satisfied:

   (i) There exist ring homomorphisms $\mathcal{R} \to \mathcal{A}$ and $\mathcal{R} \to \mathcal{B}$ such that $\mathcal{R}$ is sent to the center of $\mathcal{A}$ and of $\mathcal{B}$ (in other words the ring structures of $\mathcal{A}$ and $\mathcal{B}$ are induced by a unital and associative $\mathcal{R}$-algebra structure) ;

   (ii) $\mathcal{B}$ is flat on $\mathcal{R}$ (resp. $\mathcal{A}$ is flat on $\mathcal{R}$, resp. $\mathcal{A}$ and $\mathcal{B}$ are flat on $\mathcal{R}$).

In that case, we say that the pair of rings $(\mathcal{A}, \mathcal{B})$ is left solvable (resp. right solvable, resp. solvable).

Let $\mathcal{E}^\bullet \in K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$. Let $\mathcal{R}$ be a left solving ring (resp. right solving ring, resp. solving ring) of $(\mathcal{A}, \mathcal{B})$. Then the following properties are equivalent

(1) The structures of $\mathcal{R}$-module induced on the $(\mathcal{B}, \mathcal{A})$-bimodules $\mathcal{E}^n$ by the structure of right $\mathcal{A}$-module and by that of left $\mathcal{B}$-module coincide for any $n \in \mathbb{Z}$;

(2) $\mathcal{E}^\bullet \in K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^o)$.

The complex $\mathcal{E}$ is then said to be *left solvable by* $\mathcal{R}$ (resp. *right solvable by* $\mathcal{R}$, resp. *solvable by* $\mathcal{R}$) as object of $K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$. The complex $\mathcal{E}$ is then said to be *left solvable* (resp. *right solvable*, resp. *solvable*) as object of $K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$ if there exists an left solving ring $\mathcal{R}$ (resp. right solving ring, resp. solving ring) of $(\mathcal{A}, \mathcal{B})$ such that $\mathcal{E}^\bullet \in K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^o)$.

Let $\mathcal{R}$ be a left or right solving ring of $(\mathcal{A}, \mathcal{B})$. We denote by $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{R}, \mathcal{A}^{\mathrm{r}})$ the strictly full subcategory of $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$ consisting of complexes isomorphic in $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$ to a complex which is also an object of $K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{o})$. We denote by $D_{\mathrm{l-sol}}({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$ (resp. $D_{\mathrm{r-sol}}({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$, resp. $D_{\mathrm{sol}}({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$) the strictly full subcategory of $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$ consisting of complexes isomorphic to some left solvable (resp. right solvable, resp. solvable) complex.

Beware that the sheaf $\mathcal{D}^{(m)}_{X_i^\sharp/S^\sharp}$ is solvable as $(\mathcal{D}^{(m)}_{X_i^\sharp/S^\sharp}, \mathcal{D}^{(m)}_{X_i^\sharp/S^\sharp})$-bimodule but is not (a priori) solvable as $(\mathcal{D}^{(m)}_{X_i^\sharp/S^\sharp}, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$-bimodule.

(c) Assume $\mathcal{E}^\bullet \in K({}^{\mathrm{l}}\mathcal{B}, \mathcal{A}^{\mathrm{r}})$ has a right solving ring $\mathcal{R}$ and we can view $\mathcal{E}$ as a complex of left $\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{o}$-modules (where $\mathcal{A}^{o}$ is the ring $\mathcal{A}$ with the opposite multiplication). By using (bi), $\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{o}$ can be endowed with a canonical ring structure. It follows from (bii) that the ring homomorphism $\mathcal{A}^{0} \to \mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{0}$ is flat. Hence, a K-flat complex of left $\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{0}$-modules representing $\mathcal{E}$, is also a K-flat complex of right $\mathcal{A}$-modules representing $\mathcal{E}$. This implies the functor $L(- \otimes_{\mathcal{A}} \mathcal{F})$ is defined at $\mathcal{E}$ and we write $\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{F} := L(- \otimes_{\mathcal{A}} \mathcal{F})(\mathcal{E}) \in D({}^{\mathrm{l}}\mathcal{B}, \mathcal{C}^{\mathrm{r}})$.

Moreover, a K-injective complex of left $\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{0}$-modules representing $\mathcal{E}$ (see definition [Sta22, 070H]) is also a K-injective complex of right $\mathcal{A}$-modules because $\mathcal{A}^{0} \to \mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{0}$ is flat. Hence, $R\mathscr{H}om_{\mathcal{A}}(\mathcal{G}, -)$ is defined at $\mathcal{E}$ and we set $\mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathcal{G}, \mathcal{E}) := R\mathscr{H}om_{\mathcal{A}}(\mathcal{G}, -)(\mathcal{E})$.

(d) A commutative ring $\mathcal{R}$ on $\mathscr{T}$ is said to be a *solving ring of* $\mathcal{A}$ if it is a solving ring of $\mathcal{A}$ as a $(\mathcal{A}, \mathcal{A})$-bimodule, i.e. if the ring structure of $\mathcal{A}$ comes from a structure of unital and associative $\mathcal{R}$-algebra.

(e) Suppose there exists a left solving ring $\mathcal{R}$ of $(\mathcal{A}, \mathcal{B})$. For any $*, ** \in \{\mathrm{r}, \mathrm{l}\}$, we obtain the bifunctors

$$\mathbb{R}\mathscr{H}om_{\mathcal{A}}(-,-) \colon D({}^{\mathrm{l}}\mathcal{C}, {}^{*}\mathcal{A}) \times D({}^{**}\mathcal{B}, \mathcal{R}, {}^{*}\mathcal{A}) \to D({}^{**}\mathcal{B}, {}^{\mathrm{r}}\mathcal{C}), \tag{4.6.3.2.3}$$

$$- \otimes^{\mathbb{L}}_{\mathcal{A}} - \colon D({}^{*}\mathcal{B}, \mathcal{R}, \mathcal{A}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{A}, {}^{**}\mathcal{C}) \to D({}^{*}\mathcal{B}, {}^{**}\mathcal{C}). \tag{4.6.3.2.4}$$

If moreover $(\mathcal{A}, \mathcal{C})$ is right or left solvable by $\mathcal{R}$, then we get the functors

$$\mathbb{R}\mathscr{H}om_{\mathcal{A}}(-,-) \colon D({}^{\mathrm{l}}\mathcal{C} \otimes_{\mathcal{R}} \mathcal{A}) \times D({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}) \to D({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}} \mathcal{C}^{o}), \tag{4.6.3.2.5}$$

$$- \otimes^{\mathbb{L}}_{\mathcal{A}} - \colon D({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}} \mathcal{A}^{o}) \times D({}^{\mathrm{l}}\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C}) \to D({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}} \mathcal{C}), \tag{4.6.3.2.6}$$

$$\mathbb{R}\mathscr{H}om_{\mathcal{A}}(-,-) \colon D({}^{\mathrm{l}}\mathcal{C}, \mathcal{R}, {}^{*}\mathcal{A}) \times D({}^{**}\mathcal{B}, \mathcal{R}, {}^{*}\mathcal{A}) \to D({}^{**}\mathcal{B}, \mathcal{R}, {}^{\mathrm{r}}\mathcal{C}), \tag{4.6.3.2.7}$$

$$- \otimes^{\mathbb{L}}_{\mathcal{A}} - \colon D({}^{*}\mathcal{B}, \mathcal{R}, \mathcal{A}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{A}, \mathcal{R}, {}^{**}\mathcal{C}) \to D({}^{*}\mathcal{B}, \mathcal{R}, {}^{**}\mathcal{C}). \tag{4.6.3.2.8}$$

Example 4.6.3.3. We will use essentially in this book the following cases.

(a) Suppose $X^\sharp \to S^\sharp$ is quasi-flat (see Definition 3.1.1.5 or respectively 3.3.1.11). Then $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a solvable ring. More precisely, choose a morphism of schemes $S \to B$ such that the composition morphism $g \colon X \to S \to B$ is flat (see 3.1.1.5). Then $g^{-1}\mathcal{O}_B$ is a solving ring of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$. This yields the bifunctors:

$$\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}}(-,-) \colon D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, {\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, g^{-1}\mathcal{O}_B, {\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, {\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}}^{\mathrm{r}}), \tag{4.6.3.3.1}$$

$$- \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} - \colon D({}^{*}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, {\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, g^{-1}\mathcal{O}_B, {}^{*}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{*}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, {}^{*}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}). \tag{4.6.3.3.2}$$

(b) More generally, suppose that $\mathcal{B}_X$ is a quasi-flat $\mathcal{O}_S$-algebra (see Definition 3.1.1.5 or respectively 3.3.1.11). Then $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a solvable ring. More precisely, choose a morphism of schemes $S \to B$ such that the composition morphism $\widetilde{g} \colon (X, \mathcal{B}_X) \to B$ is flat. Then $\widetilde{g}^{-1}\mathcal{O}_B$ is a solving ring of $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$.

For example, suppose $X^\sharp$ is a p-torsion free log smooth $S^\sharp$-formal log scheme. For any integer $i \geq 0$, set $X_i^\sharp := X^\sharp \times_{\mathrm{Spf}\, \mathcal{V}} \mathrm{Spec}(\mathcal{V}/\pi^{i+1}\mathcal{V})$. Let Z be a divisor of X_0. Then it follows from 8.7.4.2

that we can choose $\mathcal{V}/\pi^{i+1}\mathcal{V}$ as a solving ring of $\mathcal{B}_{X_i}(Z,r) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$ and $\mathcal{V}$ as a solving ring of $\varprojlim_i \mathcal{B}_{X_i}(Z,r) \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S_i^\sharp}$.

(c) To get nice properties of pullbacks and pushforwards in the theory of arithmetic $\mathcal{D}$-modules, we will see later in 5.1.1.3 other important cases.

4.6.3.4. Let $\mathcal{A}$, $\mathcal{B}$ be two sheaves of rings on some site $\mathscr{T}$. Suppose there exists a right solving ring $\mathcal{R}$ of $(\mathcal{A},\mathcal{B})$. For any $? \in \{\mathrm{tdf}, \mathrm{perf}, \mathrm{coh}\}$, we denote by $D_{.,?}({}^{\mathrm{l}}\mathcal{B},\mathcal{R},\mathcal{A}^{\mathrm{r}})$ (resp. $D_{.,?}({}^{\mathrm{l}}\mathcal{B},\mathcal{A}^{\mathrm{r}})$) the strictly full subcategory of $D({}^{\mathrm{l}}\mathcal{B},\mathcal{R},\mathcal{A}^{\mathrm{r}})$ (resp. $D_{\mathrm{r-sol}}({}^{\mathrm{l}}\mathcal{B},\mathcal{A}^{\mathrm{r}})$) consisting of complexes $\mathcal{E}$ whose image in $D(\mathcal{A}^{\mathrm{r}})$ belongs to $D_?(\mathcal{A}^{\mathrm{r}})$. We use similar notation when ? is on the left etc.

Concerning finite tor dimension complexes, we have the following remark: if $\mathcal{E} \in D_{.,\mathrm{tdf}}({}^{\mathrm{l}}\mathcal{B},\mathcal{R},\mathcal{A}^{\mathrm{r}})$, then $\mathcal{E}$ is isomorphism in $D({}^{\mathrm{l}}\mathcal{B},\mathcal{A}^{\mathrm{r}})$ to a complex which is also an object of $K^{\mathrm{b}}({}^{\mathrm{l}}\mathcal{B}\otimes_{\mathcal{R}}\mathcal{A}^o)$ whose term are flat as right $\mathcal{A}$-modules (moreover, except the first nonzero term, the other terms are flat left $\mathcal{B}\otimes_{\mathcal{R}}\mathcal{A}^o$-modules).

Proposition 4.6.3.5. *Let $\mathcal{A}$, $\mathcal{B}$, $\mathcal{C}$, $\mathcal{D}$ be four sheaves of rings on some topos $\mathscr{T}$. Let $*, ** \in \{r,l\}$. Let $\mathcal{E}^\bullet \in D_{\mathrm{r-sol}}({}^*\mathcal{B},\mathcal{A}^{\mathrm{r}})$, $\mathcal{F}^\bullet \in D({}^{\mathrm{l}}\mathcal{A},{}^{\mathrm{r}}\mathcal{C})$, $\mathcal{G}^\bullet \in D_{\mathrm{l-sol}}({}^{\mathrm{l}}\mathcal{C},{}^{**}\mathcal{D})$. The associativity of the derived tensor product holds, i.e. we have the isomorphism in $D({}^*\mathcal{B},{}^{**}\mathcal{D})$:*

$$\left(\mathcal{E}^\bullet \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{F}^\bullet\right) \otimes^{\mathbb{L}}_{\mathcal{C}} \mathcal{G}^\bullet \xrightarrow{\sim} \mathcal{E}^\bullet \otimes^{\mathbb{L}}_{\mathcal{A}} \left(\mathcal{F}^\bullet \otimes^{\mathbb{L}}_{\mathcal{C}} \mathcal{G}^\bullet\right). \tag{4.6.3.5.1}$$

Proof. Let $\mathcal{R}$ be a right solving ring of $\mathcal{E}$. Then we can choose a K-flat complex (of left $\mathcal{B}\otimes_{\mathcal{R}}\mathcal{A}^0$-modules if $* = l$ and of left $\mathcal{B}^0 \otimes_{\mathcal{R}} \mathcal{A}^0$-modules if $* = r$) representing $\mathcal{E}^\bullet$. Similarly, by choosing a left solving ring $\mathcal{R}'$ of $\mathcal{G}^\bullet$ and a K-flat complex representing $\mathcal{G}^\bullet$, we reduce to the case of the non-derived associativity isomorphism of the tensor product, which is well known. □

Proposition 4.6.3.6. *Let $\mathcal{A}$, $\mathcal{B}$, $\mathcal{C}$ and $\mathcal{D}$ be sheaves of rings on some topos $\mathscr{T}$. Let $\mathcal{R}$ be either a left solving ring of $(\mathcal{A},\mathcal{B})$, $(\mathcal{B},\mathcal{C})$ and $(\mathcal{C},\mathcal{D})$ or, only in the case where $\mathcal{C} = \mathcal{D} = \mathbb{Z}_{\mathscr{T}}$, let $\mathcal{R}$ be a left solving ring of $(\mathcal{A},\mathcal{B})$. Let $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A})$, $\mathcal{F} \in D({}^{\mathrm{l}}\mathcal{A},\mathcal{R},\mathcal{B}^{\mathrm{r}})$, and $\mathcal{G} \in D({}^{\mathrm{l}}\mathcal{B},\mathcal{R},\mathcal{C}^{\mathrm{r}})$ (or $\mathcal{G} \in D({}^{\mathrm{l}}\mathcal{B})$ in the case $\mathcal{C} = \mathbb{Z}_{\mathscr{T}}$).*

(i) Then there exists a canonical functorial in $\mathcal{E}$, $\mathcal{F}$ and $\mathcal{G}$ homomorphism in $D({}^*\mathcal{C})$:

$$\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{G} \to \mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{G}). \tag{4.6.3.6.1}$$

This one is an isomorphism if $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{A})$.

(ii) The isomorphism of i) is transitive, i.e., if $\mathscr{H} \in D({}^{\mathrm{l}}\mathcal{C},\mathcal{R},\mathcal{D}^{\mathrm{r}})$, we have the commutative diagram

$$\begin{array}{ccc}
\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{G} \otimes^{\mathbb{L}}_{\mathcal{C}} \mathcal{H} & \longrightarrow & \mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{G} \otimes^{\mathbb{L}}_{\mathcal{C}} \mathcal{H}) \\
 & \searrow \qquad \nearrow & \\
 & \mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{G}) \otimes^{\mathbb{L}}_{\mathcal{C}} \mathcal{H}. &
\end{array}$$

Proof. For the first part, it is sufficient to choose a K-injective complex representing $\mathcal{F}$ and a K-flat complex representing $\mathcal{G}$. The transitivity of this morphism is straightforward. □

Proposition 4.6.3.7. *Let $\mathcal{A}$ and $\mathcal{B}$ be some sheaves of rings on some topos $\mathscr{T}$. Let $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{A})$, $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{l-sol}}({}^{\mathrm{l}}\mathcal{A},{}^*\mathcal{B})$. Suppose $\mathscr{T}$ is coherent. We have :*

(a) $\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F}) \in D^{\mathrm{b}}({}^*\mathcal{B})$,

(b) If $\mathcal{F} \in D_{(.,\mathrm{perf})}({}^{\mathrm{l}}\mathcal{A},{}^*\mathcal{B})$ (resp. $D_{(.,\mathrm{tdf})}({}^{\mathrm{l}}\mathcal{A},{}^*\mathcal{B})$), then $\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F}) \in D_{\mathrm{perf}}({}^*\mathcal{B})$ (resp. $\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{F}) \in D_{\mathrm{tdf}}({}^*\mathcal{B})$).

Proof. This is checked by localisation and devissage (and use 4.6.3.6.1 to check the finiteness of the tor dimension). □

Remark 4.6.3.8. In proposition 4.6.3.7, if $\mathscr{T}$ is not coherent, then we have to replace "bounded complexes" by "locally bounded complexes" and "complexes of finite tor-dimension" by "complexes locally of finite tor-dimension".

The following lemma is obvious.

Lemma 4.6.3.9 (Cartan isomorphism)**.** *Let $\mathcal{A}$, $\mathcal{B}$ and $\mathcal{C}$ be three sheaves of rings on some topos $\mathscr{T}$.*

(a) Let $\mathcal{E}$ be a $(\mathcal{A},\mathcal{B})$-bimodule, $\mathcal{F}$ be a left $(\mathcal{B},\mathcal{C})$-bimodule and $\mathcal{G}$ be a left $(\mathcal{A},\mathcal{C})$-bimodule. We have the functorial isomorphisms:

$$\mathscr{H}om_{({}^{\mathrm{l}}\mathcal{A},{}^{\mathrm{l}}\mathcal{C})}(\mathcal{E}\otimes_{\mathcal{B}}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathscr{H}om_{({}^{\mathrm{l}}\mathcal{B},{}^{\mathrm{l}}\mathcal{C})}(\mathcal{F},\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G}))$$
$$\mathrm{Hom}_{({}^{\mathrm{l}}\mathcal{A},{}^{\mathrm{l}}\mathcal{C})}(\mathcal{E}\otimes_{\mathcal{B}}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathrm{Hom}_{({}^{\mathrm{l}}\mathcal{B},{}^{\mathrm{l}}\mathcal{C})}(\mathcal{F},\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G})). \tag{4.6.3.9.1}$$

(b) Let $\mathcal{R}$ be a commutative sheaf of rings on $\mathscr{T}$ endowed with ring morphisms $\mathcal{R}\to\mathcal{A}$, $\mathcal{R}\to\mathcal{B}$ and $\mathcal{R}\to\mathcal{C}$ whose respective images are included in the center of $\mathcal{A}$, $\mathcal{B}$ and $\mathcal{C}$. Let $\mathcal{E}$ be a left $\mathcal{A}\otimes_{\mathcal{R}}\mathcal{B}^{\mathrm{o}}$-bimodule, $\mathcal{F}$ be a left $\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C}$-bimodule and $\mathcal{G}$ be a left $\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C}$-module. We have the functorial isomorphisms:

$$\mathscr{H}om_{\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{E}\otimes_{\mathcal{B}}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathscr{H}om_{\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{F},\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G}))$$
$$\mathrm{Hom}_{\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{E}\otimes_{\mathcal{B}}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathrm{Hom}_{\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{F},\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G})). \tag{4.6.3.9.2}$$

Lemma 4.6.3.10. *Let $\mathcal{A}$, $\mathcal{B}$ be two sheaves of rings on some topos $\mathscr{T}$, $\mathcal{P}^\bullet\in K({}^{\mathrm{l}}\mathcal{A},{}^{\mathrm{r}}\mathcal{B})$, $\mathcal{I}^\bullet\in K({}^{\mathrm{l}}\mathcal{A})$. If $\mathcal{P}^\bullet$ is K-flat as an object of $K({}^{\mathrm{r}}\mathcal{B})$ and $\mathcal{I}^\bullet$ is K-injective as a complex of $K({}^{\mathrm{l}}\mathcal{A})$, then $\mathscr{H}om^\bullet_{\mathcal{A}}(\mathcal{P}^\bullet,\mathcal{I}^\bullet)$ is K-injective as an object of $K({}^{\mathrm{l}}\mathcal{B})$.*

Proof. For any acyclic complex $\mathcal{F}\in K({}^{\mathrm{l}}\mathcal{B})$, we get the isomorphisms

$$\mathrm{Hom}_{K(\mathcal{B})}\left(\mathcal{F}^\bullet,\mathscr{H}om^\bullet_{\mathcal{A}}(\mathcal{P}^\bullet,\mathcal{I}^\bullet)\right) \underset{4.6.3.1.4}{\xrightarrow{\sim}} H^0\Gamma\left(\mathscr{T},\mathscr{H}om^\bullet_{\mathcal{B}}\left(\mathcal{F}^\bullet,\mathscr{H}om^\bullet_{\mathcal{A}}(\mathcal{P}^\bullet,\mathcal{I}^\bullet)\right)\right)$$
$$\overset{4.6.3.9.1}{\xrightarrow{\sim}} H^0\Gamma\left(\mathscr{T},\mathscr{H}om^\bullet_{\mathcal{A}}\left(\mathcal{P}^\bullet\otimes_{\mathcal{B}}\mathcal{F}^\bullet,\mathcal{I}^\bullet\right)\right) \underset{4.6.3.1.4}{\xrightarrow{\sim}} \mathrm{Hom}_{\mathcal{A}}\left(\mathcal{P}^\bullet\otimes_{\mathcal{B}}\mathcal{F}^\bullet,\mathcal{I}^\bullet\right),$$

where 4.6.3.9.1 is used in the case $\mathcal{C}=\mathbb{Z}$. Since $\mathcal{P}^\bullet$ is K-flat as an object of $K({}^{\mathrm{r}}\mathcal{B})$, since $\mathcal{F}$ is acyclic, then $\mathcal{P}^\bullet\otimes_{\mathcal{B}}\mathcal{F}^\bullet$ is an acyclic object of $K({}^{\mathrm{l}}\mathcal{A})$. Since $\mathcal{I}^\bullet$ is K-injective as a complex of $K({}^{\mathrm{l}}\mathcal{A})$, then $\mathrm{Hom}_{K(\mathcal{A})}\left(\mathcal{P}^\bullet\otimes_{\mathcal{B}}\mathcal{F}^\bullet,\mathcal{I}^\bullet\right)=0$ and we are done. □

Proposition 4.6.3.11 (Cartan isomorphisms)**.** *Let $\mathcal{A}$, $\mathcal{B}$ be two sheaves of rings on some topos $\mathscr{T}$, $\mathcal{E}\in D_{\mathrm{r-sol}}({}^{\mathrm{l}}\mathcal{A},\mathcal{B}^{\mathrm{r}})$, $\mathcal{F}\in D({}^{\mathrm{l}}\mathcal{B})$ and $\mathcal{G}\in D({}^{\mathrm{l}}\mathcal{A})$. We have the functorial isomorphisms:*

$$\mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathcal{E}\otimes^{\mathbb{L}}_{\mathcal{B}}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{\mathcal{B}}(\mathcal{F},\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G}))$$
$$\mathbb{R}\mathrm{Hom}_{\mathcal{A}}(\mathcal{E}\otimes^{\mathbb{L}}_{\mathcal{B}}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\mathcal{B}}(\mathcal{F},\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G}))$$
$$\mathrm{Hom}_{D(\mathcal{A})}(\mathcal{E}\otimes^{\mathbb{L}}_{\mathcal{B}}\mathcal{F},\mathcal{G}) \xrightarrow{\sim} \mathrm{Hom}_{D(\mathcal{B})}(\mathcal{F},\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G})). \tag{4.6.3.11.1}$$

Proof. Let us choose $\mathcal{R}$, a right solving ring of $\mathcal{E}$ (see 4.6.3.2). Let $\mathcal{P}$ be a K-flat complex of left $\mathcal{A}\otimes_{\mathcal{R}}\mathcal{B}^{\mathrm{o}}$-modules representing $\mathcal{E}$ and $\mathcal{I}$ be a K-injective complex of left $\mathcal{A}$-modules representing $\mathcal{G}$. These resolutions allow us to compute the left terms of the isomorphisms of the proposition. Moreover, since $\mathcal{P}^\bullet$ is K-flat as an object of $K({}^{\mathrm{r}}\mathcal{B})$ and $\mathcal{I}^\bullet$ is K-injective as a complex of $K(\mathcal{A})$, then it follows from 4.6.3.10 that $\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{P},\mathcal{I})$ is a K-injective complex of left $\mathcal{B}$-modules. Hence, these two resolutions compute also the right terms of the isomorphisms of the proposition. □

Corollary 4.6.3.12. *Let $\mathcal{A}$, $\mathcal{B}$ be two sheaves of rings on some topos $\mathscr{T}$. Let $\mathcal{E}\in D_{\mathrm{r-sol}}({}^{\mathrm{l}}\mathcal{A},\mathcal{B}^{\mathrm{r}})$, $\mathcal{F}\in D({}^{\mathrm{l}}\mathcal{B})$ and $\mathcal{G}\in D({}^{\mathrm{l}}\mathcal{A})$. We have the functorial in $\mathcal{E}$ and $\mathcal{G}$ morphism of $D({}^{\mathrm{l}}\mathcal{A})$:*

$$\mathcal{E}\otimes^{\mathbb{L}}_{\mathcal{B}}\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G})\to\mathcal{G}. \tag{4.6.3.12.1}$$

Proof. The arrow 4.6.3.12.1 is the map associated with the identity via the bijection:

$$\mathrm{Hom}_{D({}^{\mathrm{l}}\mathcal{A})}(\mathcal{E}\otimes^{\mathbb{L}}_{\mathcal{B}}\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G}),\mathcal{G}) \xrightarrow{\sim} \mathrm{Hom}_{D({}^{\mathrm{l}}\mathcal{B})}(\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G}),\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{A}}(\mathcal{E},\mathcal{G})).$$

□

Lemma 4.6.3.13. *Let $\mathcal{A}$, $\mathcal{B}$ and $\mathcal{C}$ be three sheaves of rings on some topos $\mathscr{T}$ such that there exists a left solving ring $\mathcal{R}$ of both $(\mathcal{B}, \mathcal{A})$ and $(\mathcal{A}, \mathcal{C})$. Let $\mathcal{P}^\bullet \in K({}^1\mathcal{A}, \mathcal{R}, {}^1\mathcal{B})$, $\mathcal{I}^\bullet \in K({}^1\mathcal{A}, \mathcal{R}, {}^1\mathcal{C})$. If $\mathcal{P}^\bullet$ is K-flat as an object of $K({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{B})$ and $\mathcal{I}^\bullet$ is K-injective as a complex of $K({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C})$, then $\mathscr{H}om^\bullet_{\mathcal{A}}(\mathcal{P}^\bullet, \mathcal{I}^\bullet)$ is K-injective as an object of $K({}^1\mathcal{B} \otimes_{\mathcal{R}} \mathcal{C})$.*

Proof. For any acyclic complex $\mathcal{F} \in K({}^1\mathcal{B} \otimes_{\mathcal{R}} \mathcal{C})$, we get the isomorphisms

$$\begin{aligned} &\mathrm{Hom}_{K(\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C})}\left(\mathcal{F}^\bullet, \mathscr{H}om^\bullet_{\mathcal{A}}(\mathcal{P}^\bullet, \mathcal{I}^\bullet)\right) \underset{4.6.3.1.4}{\xrightarrow{\sim}} H^0\Gamma\left(\mathscr{T}, \mathscr{H}om^\bullet_{\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C}}\left(\mathcal{F}^\bullet, \mathscr{H}om^\bullet_{\mathcal{A}}(\mathcal{P}^\bullet, \mathcal{I}^\bullet)\right)\right) \\ &\overset{4.6.3.9.2}{\xrightarrow{\sim}} H^0\Gamma\left(\mathscr{T}, \mathscr{H}om^\bullet_{\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C}}\left(\mathcal{P}^\bullet \otimes_{\mathcal{B}} \mathcal{F}^\bullet, \mathcal{I}^\bullet\right)\right) \underset{4.6.3.1.4}{\xrightarrow{\sim}} \mathrm{Hom}_{K(\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C})}\left(\mathcal{P}^\bullet \otimes_{\mathcal{B}} \mathcal{F}^\bullet, \mathcal{I}^\bullet\right). \end{aligned}$$

Since $\mathcal{P}^\bullet$ is also K-flat as an object of $K({}^1\mathcal{B})$, since $\mathcal{F}^\bullet$ is acyclic, then $\mathcal{P}^\bullet \otimes_{\mathcal{B}} \mathcal{F}^\bullet$ is an acyclic object of $K({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C})$. Since $\mathcal{I}^\bullet$ is K-injective as a complex of $K({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C})$, then $\mathrm{Hom}_{K(\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C})}\left(\mathcal{P}^\bullet \otimes_{\mathcal{B}} \mathcal{F}^\bullet, \mathcal{I}^\bullet\right) = 0$ and we are done. □

Proposition 4.6.3.14 (Cartan isomorphisms)**.** *Let $\mathcal{A}$, $\mathcal{B}$ and $\mathcal{C}$ be three sheaves of rings on some topos $\mathscr{T}$ such that there exists a left solving ring $\mathcal{R}$ of both $(\mathcal{B}, \mathcal{A})$ and $(\mathcal{A}, \mathcal{C})$. Let $\mathcal{E} \in D({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{B}^{\mathrm{o}})$, $\mathcal{F} \in D({}^1\mathcal{B} \otimes_{\mathcal{R}} \mathcal{C})$ and $\mathcal{G} \in D({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C})$. We have the functorial isomorphisms:*

$$\begin{aligned} \mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{F}, \mathcal{G}) &\xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{{}^1\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{F}, \mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{E}, \mathcal{G})) \\ \mathbb{R}\mathrm{Hom}_{{}^1\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{F}, \mathcal{G}) &\xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{{}^1\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C}}(\mathcal{F}, \mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{E}, \mathcal{G})) \\ \mathrm{Hom}_{D({}^1\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C})}(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{F}, \mathcal{G}) &\xrightarrow{\sim} \mathrm{Hom}_{D({}^1\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C})}(\mathcal{F}, \mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{E}, \mathcal{G})). \end{aligned} \tag{4.6.3.14.1}$$

Proof. Let $\mathcal{P}$ be a K-flat complex of left $\mathcal{A} \otimes_{\mathcal{R}} \mathcal{B}^{\mathrm{o}}$-modules representing $\mathcal{E}$ and $\mathcal{I}$ be a K-injective complex of left $\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C}$-modules representing $\mathcal{G}$. These resolutions allow us to compute the left terms of the isomorphisms of the proposition. Moreover, it follows from 4.6.3.13 that $\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{P}, \mathcal{I})$ is a K-injective complex of left $\mathcal{B} \otimes_{\mathcal{R}} \mathcal{C}$-modules. Hence, these two resolutions compute also the right terms of the isomorphisms of the proposition. Hence, we conclude by using 4.6.3.9.2. □

Corollary 4.6.3.15. *Let $\mathcal{A}$, $\mathcal{B}$ and $\mathcal{C}$ be three sheaves of rings on some topos $\mathscr{T}$ such that there exists a left solving ring $\mathcal{R}$ of both $(\mathcal{B}, \mathcal{A})$ and $(\mathcal{A}, \mathcal{C})$. Let $\mathcal{E} \in D({}^1\mathcal{A}, \mathcal{R}, \mathcal{B}^{\mathrm{r}})$ (resp. $\mathcal{E} \in D(\mathcal{A} \otimes_{\mathcal{R}} \mathcal{B}^{\mathrm{o}})$), $\mathcal{F} \in D({}^1\mathcal{B}, {}^1\mathcal{C})$ (resp. $\mathcal{F} \in D({}^1\mathcal{B} \otimes_{\mathcal{R}} {}^1\mathcal{C})$) and $\mathcal{G} \in D({}^1\mathcal{A}, \mathcal{R}, {}^1\mathcal{C})$ (resp. $\mathcal{G} \in D({}^1\mathcal{A} \otimes_{\mathcal{R}} {}^1\mathcal{C})$). We have the functorial in $\mathcal{E}$ and $\mathcal{G}$ morphism of $D({}^1\mathcal{A}, \mathcal{R}, {}^1\mathcal{C})$ (resp. $D({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C})$):*

$$\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{E}, \mathcal{G}) \to \mathcal{G}. \tag{4.6.3.15.1}$$

Proof. Since the canonical functor $D({}^1\mathcal{A} \otimes_{\mathcal{R}} \mathcal{C}) \to D({}^1\mathcal{A}, \mathcal{R}, {}^1\mathcal{C})$ is essentially surjective, it is sufficient to construct the morphism in the respective case. The arrow 4.6.3.15.1 is the map associated with the identity via the bijection:

$$\mathrm{Hom}_{D({}^1\mathcal{A}\otimes_{\mathcal{R}}\mathcal{C})}(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{E}, \mathcal{G}), \mathcal{G}) \to \mathrm{Hom}_{D({}^1\mathcal{B}\otimes_{\mathcal{R}}\mathcal{C})}(\mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{E}, \mathcal{G}), \mathbb{R}\mathscr{H}om_{{}^1\mathcal{A}}(\mathcal{E}, \mathcal{G})).$$

□

4.6.4 Extension by a ring homomorphism, duality : commutation, biduality

Let $\mathcal{A} \to \mathcal{B} \to \mathcal{C}$ be two ring homomorphisms. We suppose that there exists two ring homomorphisms $\mathcal{R} \to \mathcal{R}' \to \mathcal{R}''$ so that $\mathcal{R}$ (resp. $\mathcal{R}'$, resp. $\mathcal{R}''$) is a ring of resolution $\mathcal{A}$ (resp. $\mathcal{B}$, resp. $\mathcal{C}$).

Lemma 4.6.4.1. *Let $\mathcal{E} \in D({}^1\mathcal{A})$, $\mathcal{G} \in D({}^1\mathcal{B})$. Let $f\colon \mathcal{E} \to \mathcal{G}$ be a morphism of $D({}^1\mathcal{A})$. Then, there exists a unique morphism $g\colon \mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E} \to \mathcal{G}$ of $D({}^1\mathcal{B})$ making commutative the diagram:*

$$\begin{array}{ccc} \mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E} & \overset{g}{\dashrightarrow} & \mathcal{G} \\ \uparrow & \overset{f}{\nearrow} & \\ \mathcal{E} & & \end{array} \tag{4.6.4.1.1}$$

The functor $\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} -\colon D({}^1\mathcal{A}) \to D({}^1\mathcal{B})$ is a left adjoint to the forgetful functor. Similarly, we have the left adjoint functor $- \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}\colon D({}^{\mathrm{r}}\mathcal{A}) \to D({}^{\mathrm{r}}\mathcal{B})$ is a left adjoint to the forgetful functor.

Proof. The morphism f is represented by a quasi-isomorphism $\mathcal{E}' \xrightarrow{\sim} \mathcal{E}$ of $K({}^{\mathrm{l}}\mathcal{A})$ and a morphism $\mathcal{E}' \to \mathcal{G}$ of $K({}^{\mathrm{l}}\mathcal{A})$. We can suppose that $\mathcal{E}'$ is a K-flat complex of $K({}^{\mathrm{l}}\mathcal{A})$. Hence, $\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E} = \mathcal{B} \otimes_{\mathcal{A}} \mathcal{E}'$ and $\mathcal{E} \to \mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E}$ is represented by $\mathcal{E} \xleftarrow{\sim} \mathcal{E}' \to \mathcal{B} \otimes_{\mathcal{A}} \mathcal{E}'$. Finally let $g\colon \mathcal{B} \otimes_{\mathcal{A}} \mathcal{E}' \to \mathcal{G}$ be the morphism of $K({}^{\mathrm{l}}\mathcal{B})$ induced by extension from $\mathcal{E}' \to \mathcal{G}$. This is the unique morphism making commutative the diagram 4.6.4.1.1. □

4.6.4.2. Let $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A})$, $\mathcal{G} \in D({}^{\mathrm{l}}\mathcal{B},, \mathcal{R}', {}^{\mathrm{r}}\mathcal{B})$. Let $\mathcal{I} \to \mathcal{J}$ be a quasi-isomorphism of K-injective complexes of $K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0)$. Then, the morphism $\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ \mathcal{J})$ is a quasi-isomorphism of $K({}^{\mathrm{r}}\mathcal{B})$ because it is canonically isomorphic to $\mathcal{H}om_{{}^{\mathrm{l}}\mathcal{B}}(\mathcal{B} \otimes_{\mathcal{A}} \mathcal{E},\mathcal{I}) \to \mathcal{H}om_{{}^{\mathrm{l}}\mathcal{B}}(\mathcal{B} \otimes_{\mathcal{A}} \mathcal{E},\mathcal{J})$. Hence, following [Sta22, 13.14.15], we get the functor $\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ -)\colon D({}^{\mathrm{l}}\mathcal{B},\mathcal{R}',\mathcal{B}^{\mathrm{r}}) \to D({}^{\mathrm{r}}\mathcal{B})$, i.e. the right derived functor (with respect to quasi-isomophisms of $K({}^{\mathrm{l}}\mathcal{B})$) of $\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ -)\colon K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0) \to D({}^{\mathrm{r}}\mathcal{B})$ exists and is computed by K-injective complexes. Moreover, the functor $K({}^{\mathrm{l}}\mathcal{A}) \to D({}^{\mathrm{r}}\mathcal{B})$, given by $\mathcal{E} \mapsto \mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ \mathcal{G})$ has a derived functor (with respect to quasi-isomophisms of $K({}^{\mathrm{l}}\mathcal{A})$). Indeed, following [Sta22, 13.14.15], it is sufficient to check that if $\mathcal{P} \to \mathcal{P}'$ is a quasi-isomorphism of K-flat complexes of $K({}^{\mathrm{l}}\mathcal{A})$, then $\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{P}',\ \mathcal{G}) \to \mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{P},\ \mathcal{G})$ is an isomorphism. Let $\mathcal{I}$ be a K-injective complex of $K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0)$ representing $\mathcal{G}$. Then, the map $\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{P}',\ \mathcal{G}) \to \mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{P},\ \mathcal{G})$ corresponds to the map $\mathcal{H}om_{\mathcal{A}}(\mathcal{P}',\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{A}}(\mathcal{P},\ \mathcal{I})$ induced by the quasi-isomorphism $\mathcal{P} \to \mathcal{P}'$. Moreover, this latter is canonically isomorphic to $\mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes_{\mathcal{A}} \mathcal{P}',\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes_{\mathcal{A}} \mathcal{P},\ \mathcal{I})$. Since $\mathcal{B} \otimes_{\mathcal{A}} \mathcal{P} \to \mathcal{B} \otimes_{\mathcal{A}} \mathcal{P}'$ is a quasi-isomorphism of $K({}^{\mathrm{l}}\mathcal{B})$, since $\mathcal{I}$ is a K-injective complex of $K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0)$ then $\mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes_{\mathcal{A}} \mathcal{P}',\ \mathcal{I}) \to \mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes_{\mathcal{A}} \mathcal{P},\ \mathcal{I})$ is an isomorphism. We denote by $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(-,\mathcal{G})\colon D({}^{\mathrm{l}}\mathcal{A})^{\mathrm{op}} \to D({}^{\mathrm{r}}\mathcal{B})$ the derived functor. Since this is functorial in $\mathcal{G}$, this yields the bifunctor

$$\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(-,-)\colon D({}^{\mathrm{l}}\mathcal{A})^{\mathrm{op}} \times D({}^{\mathrm{l}}\mathcal{B},\mathcal{R}',\mathcal{B}^{\mathrm{r}}) \to D({}^{\mathrm{r}}\mathcal{B}). \tag{4.6.4.2.1}$$

We remark that $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\mathcal{G})$ could have been directly defined by setting $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\mathcal{G}) = \mathcal{H}om_{\mathcal{A}}(\mathcal{P},\mathcal{I})$ where $\mathcal{P}$ is a K-flat complex representing $\mathcal{E}$ and $\mathcal{I}$ is a K-injective complex representing $\mathcal{G}$ and by checking its independence relatively to the choices (it is a way of defining analogous to the one of [Sta22, 20.38.7]). By using [Sta22, 13.14.16], we check that we have the 2-commutative diagram

$$\begin{array}{ccc} D({}^{\mathrm{l}}\mathcal{A})^{\mathrm{op}} \times D({}^{\mathrm{l}}\mathcal{B},\mathcal{R}',\mathcal{B}^{\mathrm{r}}) & \xrightarrow{\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(-,-)} & D({}^{\mathrm{r}}\mathcal{B}) \\ \uparrow & & \| \\ D({}^{\mathrm{l}}\mathcal{A})^{\mathrm{op}} \times D({}^{\mathrm{l}}\mathcal{A},\mathcal{R},\mathcal{A}^{\mathrm{r}}) & \xrightarrow{\mathbb{R}\mathcal{H}om_{\mathcal{A}}(-,-)} & D({}^{\mathrm{r}}\mathcal{A}). \end{array} \tag{4.6.4.2.2}$$

Hence, this is not confusing to simply denote by $\mathbb{R}\mathcal{H}om_{\mathcal{A}}(-,-)\colon D({}^{\mathrm{l}}\mathcal{A})^{\mathrm{op}} \times D({}^{\mathrm{l}}\mathcal{B}) \to D({}^{\mathrm{r}}\mathcal{B})$, instead of $\mathbb{R}_I\mathbb{R}_{II}\mathcal{H}om_{\mathcal{A}}(-,-)$.

Lemma 4.6.4.3. *Let $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A})$, $\mathcal{G} \in D({}^{\mathrm{l}}\mathcal{B},\mathcal{R}',{}^{\mathrm{r}}\mathcal{B})$. We have the canonical isomorphism of $D({}^{\mathrm{r}}\mathcal{B})$:*

$$\mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ \mathcal{G}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E},\ \mathcal{G}) \tag{4.6.4.3.1}$$

This isomorphism is transitive, i.e. for any $\mathcal{H} \in D({}^{\mathrm{l}}\mathcal{C},\mathcal{R}'',{}^{\mathrm{r}}\mathcal{C})$ we have the commutative diagram

$$\begin{array}{ccc} \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ \mathcal{H}) & \xrightarrow{4.6.4.3.1} & \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E},\ \mathcal{H}) \\ \downarrow{\scriptstyle 4.6.4.3.1} & & \downarrow{\scriptstyle 4.6.4.3.1} \\ \mathbb{R}\mathcal{H}om_{\mathcal{C}}(\mathcal{C} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E},\ \mathcal{H}) & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{C}}(\mathcal{C} \otimes^{\mathbb{L}}_{\mathcal{B}} (\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E}),\ \mathcal{H}) \end{array} \tag{4.6.4.3.2}$$

Proof. We construct the morphism by choosing a K-flat complex of $K({}^{\mathrm{l}}\mathcal{A})$ representing $\mathcal{E}$ and a K-injective complex of $K({}^{\mathrm{l}}\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0)$ representing $\mathcal{G}$. The transitivity is left to the reader as an easy exercice. □

Lemma 4.6.4.4. *For any $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A})$, $\mathcal{F} \in D({}^{\mathrm{l}}\mathcal{A},\mathcal{R},\mathcal{A}^{\mathrm{r}})$ such that $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}$ is "canonically" in the image of the forgetful functor $D({}^{\mathrm{l}}\mathcal{B},\mathcal{R}',\mathcal{B}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{A},\mathcal{B}^{\mathrm{r}})$ (see 4.6.4.5 for some examples). Still denoting by $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}$ the object of $D({}^{\mathrm{l}}\mathcal{B},\mathcal{R}',\mathcal{B}^{\mathrm{r}})$, we have the canonical morphism of $D({}^{\mathrm{r}}\mathcal{B})$:*

$$\mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B} \to \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\ \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}). \tag{4.6.4.4.1}$$

This one is an isomorphism if $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{A})$. Moreover, this is transitive: if $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{C}$ is canonically in the image of the forgetful functor $D({}^{\mathrm{l}}\mathcal{C}, \mathcal{R}'', \mathcal{C}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{A}, \mathcal{C}^{\mathrm{r}})$ then we have the following commutative diagram :

$$\begin{array}{ccc} (\mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}) \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{C} & \xrightarrow[\sim]{4.6.4.4.1} & \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}) \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{C} \\ \sim\downarrow & & \sim\downarrow 4.6.4.4.1 \\ \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{C} & \xrightarrow[\sim]{4.6.4.4.1} & \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{C}). \end{array}$$

Proof. It follows from (the right version of) 4.6.4.1.1 that the morphism $\mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F}) \to \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B})$ of $D({}^{\mathrm{r}}\mathcal{A})$ induces canonically 4.6.4.4.1. □

Examples 4.6.4.5. The condition "$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}$ is canonically in the image of the forgetful functor $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{R}', \mathcal{B}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{A}, \mathcal{B}^{\mathrm{r}})$" of lemma 4.6.4.4 holds

(i) if $\mathcal{F} = \mathcal{A}$;

(ii) if $\mathcal{A}$ and $\mathcal{B}$ are commutative;

(iii) if $\mathcal{B} = \mathcal{A} \otimes_{\mathcal{R}} \mathcal{R}'$. Indeed let $\mathcal{F} \in D({}^{\mathrm{l}}\mathcal{A}, \mathcal{A}^{\mathrm{r}})$ and $\mathcal{P}$ be a K-flat complex of $\mathcal{A} \otimes_{\mathcal{R}} \mathcal{A}^0$-modules representing $\mathcal{F}$. Since $\mathcal{B} \otimes_{\mathcal{A}} (\mathcal{A} \otimes_{\mathcal{R}} \mathcal{A}^0) \xrightarrow{\sim} \mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0 \xrightarrow{\sim} (\mathcal{A} \otimes_{\mathcal{R}} \mathcal{A}^0) \otimes_{\mathcal{A}} \mathcal{B} \xrightarrow{\sim}$, then we get the isomorphisms of K-flat complex of $\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0$-modules: $\mathcal{B} \otimes_{\mathcal{A}} \mathcal{P} \xrightarrow{\sim} (\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0) \otimes_{(\mathcal{A} \otimes_{\mathcal{R}} \mathcal{A}^0)} \mathcal{P}$ and $\mathcal{P} \otimes_{\mathcal{A}} \mathcal{B} \xrightarrow{\sim} \mathcal{P} \otimes_{(\mathcal{A} \otimes_{\mathcal{R}} \mathcal{A}^0)} (\mathcal{B} \otimes_{\mathcal{R}'} \mathcal{B}^0)$. This yields the isomorphism $\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{F} \xrightarrow{\sim} \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}$ of $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{R}', \mathcal{B}^{\mathrm{r}})$.

For instance with notation 3.3, $\mathcal{A} = \widehat{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ or $\mathcal{D}^{(m)}_{X^\sharp_{i+1}/S^\sharp_{i+1}}$ and $\mathcal{B} = \mathcal{D}^{(m)}_{X^\sharp_i/S^\sharp_i}$.

Proposition 4.6.4.6 (biduality)**.** *For any $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A})$, we have the morphism*

$$\mathcal{E} \to \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{A}), \mathcal{A}) \tag{4.6.4.6.1}$$

which is an isomorphism when $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{A})$.

Proof. The construction is standard: let $\mathcal{I}$ be a K-injective complex of $K({}^{\mathrm{l}}(\mathcal{A} \otimes_{\mathcal{R}} \mathcal{A}))$ representing $\mathcal{A}$. Then

$$\mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{A}), \mathcal{A}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{A}}(\mathcal{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{I}), \mathcal{I}).$$

The morphism $\mathcal{E} \to \mathbb{D}(\mathbb{D}(\mathcal{E}))$ is simply the evaluation morphism

$$\mathcal{E} \to \mathcal{H}om_{\mathcal{A}}(\mathcal{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{I}), \mathcal{I}).$$

When $\mathcal{E}$ is perfect, to check that this is an isomorphism we are reduced by dévissage to the case $\mathcal{E} = \mathcal{A}$, in which case it is clear. □

Proposition 4.6.4.7. *Let $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A})$, $\mathcal{F} \in D({}^{\mathrm{l}}\mathcal{A}, \mathcal{R}, \mathcal{A}^{\mathrm{r}})$ such that $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}$ is canonically in the image of the forgetful functor $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{R}', \mathcal{B}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{A}, \mathcal{B}^{\mathrm{r}})$ (see the examples 4.6.4.5). Still denoting by $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}$ the object of $D({}^{\mathrm{l}}\mathcal{B}, \mathcal{R}', \mathcal{B}^{\mathrm{r}})$, we have the canonical morphism of $D({}^{\mathrm{r}}\mathcal{B})$:*

$$\alpha\colon \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B} \to \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}), \tag{4.6.4.7.1}$$

which is an isomorphism when $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{A})$. Moreover, they are transitive, i.e., if $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{C}$ is canonically in the image of the forgetful functor $D({}^{\mathrm{l}}\mathcal{C}, \mathcal{R}'', \mathcal{C}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\mathcal{A}, \mathcal{C}^{\mathrm{r}})$ then we have the following commutative diagram :

$$\begin{array}{ccc} \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{C} & \xrightarrow{\alpha \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{C}} & \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}) \otimes^{\mathbb{L}}_{\mathcal{B}} \mathcal{C} \\ \sim\downarrow & & \downarrow\alpha \\ \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{C} & \xrightarrow{\alpha} & \mathbb{R}\mathcal{H}om_{\mathcal{C}}(\mathcal{C} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{C}). \end{array}$$

Proof. This follows by composition from 4.6.4.3.1 4.6.4.4.1:

$$\alpha\colon \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B} \overset{4.6.4.4.1}{\longrightarrow} \mathbb{R}\mathcal{H}om_{\mathcal{A}}(\mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}) \underset{\sim}{\overset{4.6.4.3.1}{\longrightarrow}} \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{B} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E},\,\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{B}).$$

□

4.6.5 Morphisms of ringed topoi, adjunction, internal homomorphism

In this subsection, we give some links between internal homorphism, pushforward and pullbacks induces by a ringed topoi homomorphism. Moreover, we check the acyclicity Lemma 4.6.5.2 which extends [SGA4.2, V.4.10.2)] and which will be a key ingredient (see 7.1.3.21).

4.6.5.1 (Adjunction)**.** Let $f\colon (\mathscr{T},\mathcal{A}) \to (\mathscr{T}',\mathcal{A}')$ be a morphism of ringed topoi.

(a) It follows from [Sta22, 09T5] that the functors $\mathbb{R}f_*\colon D(\mathcal{A}) \to D(\mathcal{A}')$ and $\mathbb{L}f^*\colon D(\mathcal{A}') \to D(\mathcal{A})$ are adjoint:

$$\mathrm{Hom}_{D(\mathcal{A})}(\mathbb{L}f^*(\mathcal{E}'^{\bullet}), \mathcal{E}^{\bullet}) = \mathrm{Hom}_{D(\mathcal{A}')}(\mathcal{E}'^{\bullet}, \mathbb{R}f_*(\mathcal{E}^{\bullet})) \quad (4.6.5.1.1)$$

for any $\mathcal{E}^{\bullet} \in D(\mathcal{A})$ and any $\mathcal{E}'^{\bullet} \in D(\mathcal{A}')$.

(b) Let $\mathcal{B}'$ be a sheaf of rings on $\mathscr{T}'$ such that there exists an left solving ring $\mathcal{R}'$ of $(\mathcal{A}',\mathcal{B}')$ (in the sense of 4.6.3.2.(b)) such that the image of the composition $f^{-1}\mathcal{R}' \to f^{-1}\mathcal{A}' \to \mathcal{A}$ is included in the center of $\mathcal{A}$. Then $f^{-1}\mathcal{R}'$ is a left solving ring of $(f^{-1}\mathcal{A}', f^{-1}\mathcal{B}')$ and of $(\mathcal{A}, f^{-1}\mathcal{B}')$.

We have the functor $f^* := \mathcal{A} \otimes_{f^{-1}\mathcal{A}'} f^{-1}(-)$ from the category of $(\mathcal{A}',\mathcal{B}')$-bimodules (resp. left, resp. right $(\mathcal{A}',\mathcal{B}')$-bimodules) to that of $(\mathcal{A}, f^{-1}\mathcal{B}')$-bimodules (resp. left, resp. right $(\mathcal{A}, f^{-1}\mathcal{B}')$-bimodules) which is a left adjoint of f_* (use the remark of 4.6.2.7.(d)). The derived functor $\mathbb{L}f^*\colon D(\mathcal{A}',\mathcal{R}',\mathcal{B}') \to D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}')$ is well defined: for any $\mathcal{E}' \in D(\mathcal{A}',\mathcal{R}',\mathcal{B}')$, by choosing a K-flat complex $\mathcal{P}'^{\bullet}$ of $K(\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{B}')$ representing $\mathcal{E}'$, we get $\mathbb{L}f^*(\mathcal{E}') = f^*(\mathcal{P}'^{\bullet})$. Since $\mathcal{A} \to \mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}'$ is flat, then the functor $\mathbb{L}f^*$ commutes with the forgetful functor, i.e., we have the commutative diagram (up to canonical isomorphism)

$$\begin{array}{ccccc}
D(\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{B}') & \longrightarrow & D(\mathcal{A}',\mathcal{R}',\mathcal{B}') & \longrightarrow & D(\mathcal{A}') \\
\downarrow{\scriptstyle \mathbb{L}f^*} & & \downarrow{\scriptstyle \mathbb{L}f^*} & & \downarrow{\scriptstyle \mathbb{L}f^*} \\
D(\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}') & \longrightarrow & D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}') & \longrightarrow & D(\mathcal{A}).
\end{array}$$

The derived functor $\mathbb{R}f_*\colon D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}') \to D(\mathcal{A}',\mathcal{R}',\mathcal{B}')$ is well defined: for any $\mathcal{E} \in D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}')$, by choosing a K-injective complex $\mathcal{I}^{\bullet}$ of $K(\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}')$ representing $\mathcal{E}$, we get $\mathbb{R}f_*(\mathcal{E}) = f_*(\mathcal{I}^{\bullet})$. Since $\mathcal{A} \to \mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}'$ is flat, then this functor corresponds modulo the forgetful functor to $\mathbb{R}f_*\colon D(\mathcal{A}) \to D(\mathcal{A}')$.

It follows from [Sta22, 09T5] that the above functors $\mathbb{L}f^*\colon D(\mathcal{A}',\mathcal{R}',\mathcal{B}') \to D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}')$ and $\mathbb{R}f_*\colon D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}') \to D(\mathcal{A}',\mathcal{R}',\mathcal{B}')$ are adjoint:

$$\mathrm{Hom}_{D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}')}(\mathbb{L}f^*(\mathcal{E}'^{\bullet}), \mathcal{E}^{\bullet}) = \mathrm{Hom}_{D(\mathcal{A}',\mathcal{R}',\mathcal{B}')}(\mathcal{E}'^{\bullet}, \mathbb{R}f_*(\mathcal{E}^{\bullet})) \quad (4.6.5.1.2)$$

for any $\mathcal{E}^{\bullet} \in D(\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{B}')$ and any $\mathcal{E}'^{\bullet} \in D(\mathcal{A}',\mathcal{R}',\mathcal{B}')$. Similarly, we get

$$\mathrm{Hom}_{D(\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}')}(\mathbb{L}f^*(\mathcal{E}'^{\bullet}), \mathcal{E}^{\bullet}) = \mathrm{Hom}_{D(\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{B}')}(\mathcal{E}'^{\bullet}, \mathbb{R}f_*(\mathcal{E}^{\bullet})) \quad (4.6.5.1.3)$$

for any $\mathcal{E}^{\bullet} \in D(\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}')$ and any $\mathcal{E}'^{\bullet} \in D(\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{B}')$.

Lemma 4.6.5.2. *Let $f\colon (\mathscr{T},\mathcal{A}) \to (\mathscr{T}',\mathcal{A}')$ be a morphism of ringed topoi. Let $\mathcal{P}'$ be a left $\mathcal{A}'$-module and $\mathcal{I}$ be an injective left $\mathcal{A}$-module.*

(a) The abelian sheaf $\mathscr{H}om_{\mathcal{A}'}(\mathcal{P}', f_*\mathcal{I})$ is flasque.

(b) If $\mathcal{P}'$ is a flat left $\mathcal{A}'$-module, then the left $\mathcal{A}'$-module $f_*\mathcal{I}$ is right acyclic for the functors $\mathscr{H}om_{\mathcal{A}'}(\mathcal{P}', -)$ and $\mathrm{Hom}_{\mathcal{A}'}(\mathcal{P}', -)$.

Proof. It follows from the isomorphism $\mathscr{H}om_{\mathcal{A}'}(\mathcal{P}',\mathcal{I}) = f_*\mathscr{H}om_{\mathcal{A}'}(f^*\mathcal{P}',\mathcal{I})$ that $\mathscr{H}om_{\mathcal{A}'}(\mathcal{P}',\mathcal{I})$ is flasque (use [SGA4.2, V.4.9.1 and V.4.10.2)]).

Let $\mathcal{I} \hookrightarrow \mathcal{J}$ be a monomorphism of sheaves on $\mathscr{T}$ of $\mathbb{Z}$-modules such that $\mathcal{J}$ is an injective sheaf on $\mathscr{T}$ of $\mathbb{Z}$-modules. This yields by adjointness (see [SGA4.1, IV.12.8)]) the injective morphism of $\mathcal{A}$-modules $\mathcal{I} \hookrightarrow \mathscr{H}om_{\mathbb{Z}}(\mathcal{A},\mathcal{J})$. Since $\mathscr{H}om_{\mathbb{Z}}(\mathcal{A},\mathcal{J})$ is an injective left $\mathcal{A}$-module (this follows by using the adjoint formula [SGA4.1, IV.12.8)]), since this latter injection splits (because $\mathcal{I}$ is an injective $\mathcal{A}$-module), then we reduce to check the acyclity in the case where $\mathcal{I} = \mathscr{H}om_{\mathbb{Z}}(\mathcal{A}, \mathcal{J})$ with $\mathcal{J}$ an injective sheaf on $\mathscr{T}$ of $\mathbb{Z}$-modules.

Let $\mathcal{M}^\bullet$ be a resolution of $\mathcal{A}$ by flat right $f^{-1}\mathcal{A}'$-modules. For any $n \in \mathbb{Z}$, via the adjoint formula

$$\mathrm{Hom}_{\mathbb{Z}}(\mathcal{M}^n \otimes_{f^{-1}\mathcal{A}'} \mathcal{E}, \mathcal{J}) \xrightarrow{\sim} \mathrm{Hom}_{f^{-1}\mathcal{A}'}(\mathcal{E}, \mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^n, \mathcal{J}))$$

which holds for any left $f^{-1}\mathcal{A}'$-module $\mathcal{E}$ (see [SGA4.1, IV.12.8)]), we get that $\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^n, \mathcal{J})$ is an injective right $f^{-1}\mathcal{A}'$-modules. Since $\mathcal{J}$ is an injective sheaf on $\mathscr{T}$ of $\mathbb{Z}$-modules, this yields that $\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^\bullet, \mathcal{J})$ is resolution of $\mathcal{I}$ by injective right $f^{-1}\mathcal{A}'$-modules. Since the morphism of $f\colon (\mathscr{T}, f^{-1}\mathcal{A}') \to (\mathscr{T}', \mathcal{A}')$ of ringed topos induced by f is flat, then the functor f_* from the category of right $f^{-1}\mathcal{A}'$-modules to that of right $\mathcal{A}'$-module preserves injective objects. Hence, $f_*\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^n, \mathcal{J})$ is an injective $\mathcal{A}'$-module for any $n \in \mathbb{Z}$. Since $\mathcal{I}$ and $\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^n, \mathcal{J})$ are f_*-acyclic (because $\mathcal{I}$ is an injective $\mathcal{A}$-module and $\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^n, \mathcal{J})$ is an injective $f^{-1}\mathcal{A}'$-module), this implies that $f_*\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^\bullet, \mathcal{J})$ is a resolution of $f_*\mathcal{I}$ by injective $\mathcal{A}'$-modules. Hence, $\mathcal{E}xt^n_{\mathcal{A}'}(\mathcal{P}', f_*\mathcal{I})$ is equal to the nth cohomological space of the complex

$$\mathscr{H}om_{\mathcal{A}'}(\mathcal{P}', f_*\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^\bullet, \mathcal{J})) \underset{[\mathrm{SGA4.1}, IV.13.4.2)]}{\xrightarrow{\sim}} f_*\mathscr{H}om_{f^{-1}\mathcal{A}'}(f^{-1}\mathcal{P}', \mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^\bullet, \mathcal{J}))$$
$$\xrightarrow{\sim} f_*\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^\bullet \otimes_{f^{-1}\mathcal{A}'} f^{-1}\mathcal{P}', \mathcal{J}).$$

Since $f^{-1}\mathcal{P}'$ is a flat left $f^{-1}\mathcal{A}'$-module and $\mathcal{J}$ is an injective $\mathbb{Z}$-module, then $f_*\mathscr{H}om_{\mathbb{Z}}(\mathcal{M}^\bullet \otimes_{f^{-1}\mathcal{A}'} f^{-1}\mathcal{P}', \mathcal{J})$ is acyclic in positive degree. Hence, $\mathscr{E}xt^n_{\mathcal{A}'}(\mathcal{P}', f_*\mathcal{I}) = 0$ for any $n \geq 1$, i.e. the left $\mathcal{A}'$-module $f_*\mathcal{I}$ is right acyclic for the functor $\mathscr{H}om_{\mathcal{A}'}(\mathcal{P}', -)$. By using 4.6.2.7.6, this yields $f_*\mathcal{I}$ is right acyclic for the functor $\mathrm{Hom}_{\mathcal{A}'}(\mathcal{P}', -)$. □

4.6.5.3. Let $f\colon (\mathscr{T}, \mathcal{A}) \to (\mathscr{T}', \mathcal{A}')$ be a morphism of ringed topoi. We denote by $f_{\mathrm{top}}\colon (\mathscr{T}, \mathbb{Z}_{\mathscr{T}}) \to (\mathscr{T}', \mathbb{Z}_{\mathscr{T}'})$ be the induced morphism of ringed topoi, where $\mathbb{Z}_{\mathscr{T}}$ (resp. $\mathbb{Z}_{\mathscr{T}'}$) is the constant abelian sheaf of $\mathscr{T}$ (resp. $\mathscr{T}'$) associated with $\mathbb{Z}$.

(a) Let $\mathcal{E}'^\bullet \in D^-(\mathcal{A}')$ and $\mathcal{E}^\bullet \in D^+(\mathcal{A})$. We have the canonical isomorphism:

$$\mathbb{R}f_{\mathrm{top}*}\mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathbb{L}f^*(\mathcal{E}'^\bullet), \mathcal{E}^\bullet) \xrightarrow{\sim} \mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}'^\bullet, \mathbb{R}f_*(\mathcal{E}^\bullet)). \tag{4.6.5.3.1}$$

Indeed, choose $\mathcal{I}^\bullet$ a bounded below complexe of injective left $\mathcal{A}$-modules together with a quasi-isomorphism $\mathcal{E}^\bullet \to \mathcal{I}^\bullet$ of $K^+(\mathcal{A})$, $\mathcal{P}'^\bullet$ a bounded above complexe of flat left $\mathcal{A}'$-modules together with a quasi-isomorphism $\mathcal{P}'^\bullet \to \mathcal{E}'^\bullet$ of $K^-(\mathcal{A}')$, then it follows from 4.6.5.2 that the map 4.6.5.3.1 is canonically isomorphic to the isomorphism

$$f_*\mathscr{H}om^\bullet_{\mathcal{A}}(f^*(\mathcal{P}'^\bullet), \mathcal{I}^\bullet) \underset{[\mathrm{SGA4.1}, IV.13.4.2)]}{\xrightarrow{\sim}} \mathscr{H}om^\bullet_{\mathcal{A}'}(\mathcal{P}'^\bullet, f_*(\mathcal{I}^\bullet)).$$

(b) Let $\mathcal{E}'^\bullet \in D^-(\mathcal{A}')$ and $\mathcal{F}'^\bullet \in D^+(\mathcal{A}')$. We have the canonical morphism of $D(\mathbb{Z}_{\mathscr{T}})$:

$$f^{-1}_{\mathrm{top}}\mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}'^\bullet, \mathcal{F}'^\bullet) \to \mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathbb{L}f^*(\mathcal{E}'^\bullet), \mathbb{L}f^*(\mathcal{F}'^\bullet)). \tag{4.6.5.3.2}$$

Indeed, via the adjunction equality 4.6.5.1.1, the map 4.6.5.3.2 corresponds to the composition

$$\mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}'^\bullet, \mathcal{F}'^\bullet) \xrightarrow{4.6.5.1.1} \mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}'^\bullet, \mathbb{R}f_*\mathbb{L}f^*(\mathcal{F}'^\bullet)) \overset{4.6.5.3.1}{\xrightarrow{\sim}} \mathbb{R}f_{\mathrm{top}*}\mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathbb{L}f^*(\mathcal{E}'^\bullet), \mathbb{L}f^*(\mathcal{F}'^\bullet)).$$

We have the unbounded version of 4.6.5.3.2 (but we do not know if this is the case for 4.6.5.3.1).

Lemma 4.6.5.4. *Let $f\colon (\mathscr{T}, \mathcal{A}) \to (\mathscr{T}', \mathcal{A}')$ be a morphism of topoi. Let $\mathcal{B}'$ and $\mathcal{C}'$ be two sheaves of rings on $\mathscr{T}'$. Let $*, ** \in \{l, r\}$.*

(a) Suppose there exists a solving ring $\mathcal{R}'$ of both $(\mathcal{A}', \mathcal{B}')$ and $(\mathcal{A}', \mathcal{C}')$ such that the composition $f^{-1}\mathcal{R}' \to f^{-1}\mathcal{A}' \to \mathcal{A}$ is flat and its image is included in the center of $\mathcal{A}$. Let $\mathcal{F}' \in D({}^*\mathcal{A}', \mathcal{R}', {}^1\mathcal{B}')$ (resp. $\mathcal{F}' \in D({}^1\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{B}')$) and $\mathcal{E}' \in D({}^{**}\mathcal{C}', \mathcal{R}', {}^1\mathcal{B}')$ (resp. $\mathcal{E}' \in D({}^1\mathcal{C}' \otimes_{\mathcal{R}'} \mathcal{B}')$). We have the canonical morphism of $D({}^*\mathcal{A}, f^{-1}\mathcal{R}', {}^{**}f^{-1}\mathcal{C}'^o)$ (resp. $D({}^1\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}'^o)$):

$$\mathbb{L}f^*\left(\mathbb{R}\mathscr{H}om_{\mathcal{B}'}(\mathcal{E}', \mathcal{F}')\right) \to \mathbb{R}\mathscr{H}om_{f^{-1}\mathcal{B}'}(f^{-1}(\mathcal{E}'), \mathbb{L}f^*(\mathcal{F}')). \tag{4.6.5.4.1}$$

(b) *Suppose there exists a left solving ring* $\mathcal{R}'$ *of both* $(\mathcal{A}',\mathcal{B}')$ *and* $(\mathcal{A}',\mathcal{C}')$ *such that the image of the composition* $f^{-1}\mathcal{R}' \to f^{-1}\mathcal{A}' \to \mathcal{A}$ *is included in the center of* $\mathcal{A}$. *Let* $\mathcal{E}' \in D({}^{1}\mathcal{A}',\mathcal{R}',{}^{*}\mathcal{B}')$ *(resp.* $\mathcal{E}' \in D({}^{1}\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{B}')$*) and* $\mathcal{F}' \in D({}^{1}\mathcal{A}',\mathcal{R}',{}^{**}\mathcal{C}')$ *(resp.* $\mathcal{F}' \in D({}^{1}\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{C}')$*). We have the canonical morphism of* $D({}^{*}f^{-1}\mathcal{B}'^{o}, f^{-1}\mathcal{R}', {}^{**}f^{-1}\mathcal{C}')$ *(resp.* $D({}^{1}f^{-1}\mathcal{B}'^{o} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$*):*

$$f^{-1}\mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}',\mathcal{F}') \to \mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathbb{L}f^{*}(\mathcal{E}'),\mathbb{L}f^{*}(\mathcal{F}')). \tag{4.6.5.4.2}$$

(c) *Suppose there exists a left solving ring* $\mathcal{R}'$ *of* $(\mathcal{A}',\mathcal{B}')$ *such that the image of the composition* $f^{-1}\mathcal{R}' \to f^{-1}\mathcal{A}' \to \mathcal{A}$ *is included in the center of* $\mathcal{A}$. *Let* $\mathcal{E}' \in D({}^{1}\mathcal{A}',\mathcal{R}',{}^{*}\mathcal{B}')$ *and* $\mathcal{F}' \in D({}^{1}\mathcal{A}')$. *We have the canonical morphism of* $D({}^{*}f^{-1}\mathcal{B}'^{o})$*:*

$$f^{-1}\mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}',\mathcal{F}') \to \mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathbb{L}f^{*}(\mathcal{E}'),\mathbb{L}f^{*}(\mathcal{F}')). \tag{4.6.5.4.3}$$

Proof. a) Let us check 4.6.5.4.1. It is sufficient to treat the respective case. Since $\mathcal{R}'$ is a left solving ring of $(\mathcal{B}',\mathcal{A}')$ then $\mathbb{R}\mathscr{H}om_{\mathcal{B}'}(\mathcal{E}',\mathcal{F}') \in D({}^{1}\mathcal{A}'^{o} \otimes_{\mathcal{R}'} \mathcal{C}')$ (see 4.6.3.2.3). Hence, the left term of 4.6.5.4.1 is an object of $D({}^{1}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}'^{o})$. Moreover, $f^{-1}\mathcal{R}'$ is a left solving ring of $(f^{-1}\mathcal{B}',\mathcal{A})$. Hence, the right term of 4.6.5.4.1 is also an object of $D({}^{1}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}'^{o})$. Let $\mathcal{P}'$ be a K-flat complex of $K({}^{1}\mathcal{B}' \otimes_{\mathcal{R}'} \mathcal{C}')$ representing $\mathcal{E}'$ and $\mathcal{Q}'$ be a K-flat complex of $K({}^{1}\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{C}')$ representing $\mathbb{R}\mathscr{H}om_{\mathcal{B}'}(\mathcal{E}',\mathcal{F}')$. Similarly to [Sta22, 0G7E], we check that $f^{-1}(\mathcal{P}')$ is a K-flat complex of $K({}^{1}f^{-1}\mathcal{B}' \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$. Since $\mathcal{Q}' \otimes_{\mathcal{C}'} \mathcal{P}'$ is K-flat as a complex of $K({}^{1}\mathcal{A}')$, we get therefore the canonical isomorphisms of $D({}^{1}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}')$:

$$\begin{array}{ccc} \mathbb{L}f^{*}\left(\mathbb{R}\mathscr{H}om_{\mathcal{B}'}(\mathcal{E}',\mathcal{F}')\right) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{C}'} f^{-1}\mathcal{E}' & \xrightarrow{\sim} & \mathbb{L}f^{*}\left(\mathbb{R}\mathscr{H}om_{\mathcal{B}'}(\mathcal{E}',\mathcal{F}') \otimes^{\mathbb{L}}_{\mathcal{C}'} \mathcal{E}'\right) \\ \downarrow\sim & & \downarrow\sim \\ f^{*}(\mathcal{Q}') \otimes_{f^{-1}\mathcal{C}'} f^{-1}\mathcal{P}' & \xrightarrow{\sim} & f^{*}(\mathcal{Q}' \otimes_{\mathcal{C}'} \mathcal{P}'). \end{array} \tag{4.6.5.4.4}$$

Following 4.6.3.15.1, we have the morphism $\mathbb{R}\mathscr{H}om_{\mathcal{B}'}(\mathcal{E}',\mathcal{F}') \otimes^{\mathbb{L}}_{\mathcal{C}'} \mathcal{E}' \to \mathcal{F}'$ of $D({}^{1}\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{B}')$. By applying $\mathbb{L}f^{*}$ to this latter map and by composition with 4.6.5.4.4, we get the morphism of $D({}^{1}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}')$

$$\mathbb{L}f^{*}\mathbb{R}\mathscr{H}om_{\mathcal{B}'}(\mathcal{E}',\mathcal{F}') \otimes^{\mathbb{L}}_{f^{-1}\mathcal{C}'} f^{-1}(\mathcal{E}') \to \mathbb{L}f^{*}(\mathcal{F}'). \tag{4.6.5.4.5}$$

By using the Cartan isomorphism (see 4.6.3.14.1), we can conclude.

b) The check of 4.6.5.4.2 is analogous: It is sufficient to treat the respective case. Moreover, since $f^{-1}\mathcal{R}'$ is a left solving ring of $(\mathcal{A}, f^{-1}\mathcal{C}')$ then the objects of 4.6.5.4.2 are well defined. Since $\mathcal{R}'$ is a solving ring of $(\mathcal{B}',\mathcal{C}')$ and $f^{-1}\mathcal{R}'$ is a solving ring of $(f^{-1}\mathcal{B}', f^{-1}\mathcal{C}')$, then we get the the first (iso)morphism of $D({}^{1}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$:

$$f^{-1}\mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}',\mathcal{F}') \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}'} \mathbb{L}f^{*}(\mathcal{E}') \xrightarrow{\sim} \mathbb{L}f^{*}\left(\mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}',\mathcal{F}') \otimes^{\mathbb{L}}_{\mathcal{B}'} (\mathcal{E}')\right) \xrightarrow{4.6.3.15.1} \mathbb{L}f^{*}\mathcal{F}'. \tag{4.6.5.4.6}$$

By using the Cartan isomorphism (see 4.6.3.14.1), we can conclude.

c) The proof is the same than the one of b). □

Remark 4.6.5.5. Since $(\mathcal{A}',\mathbb{Z}_{\mathscr{T}'})$ is not necessarily right solvable, then the Lemma 4.6.5.4 does not give a morphism of the form 4.6.5.3.2. However, suppose there exists a sheaf of commutative rings $\mathcal{R}'$ on $\mathscr{T}'$ endowed with a flat morphism of rings $\mathcal{R}' \to \mathcal{A}'$ whose image is included in the center of $\mathcal{A}'$ and whose composition $f^{-1}\mathcal{R}' \to f^{-1}\mathcal{A}' \to \mathcal{A}$ is included in the center of $\mathcal{A}$. Then $(\mathcal{A}',\mathcal{R}')$ is solvable by $\mathcal{R}'$. For any $\mathcal{E}',\mathcal{F}' \in D({}^{1}\mathcal{A}')$, we get therefore from 4.6.5.4.3 (in the case $\mathcal{B}' = \mathcal{R}'$) the homomorphism of $D(f^{-1}\mathcal{R}')$:

$$f^{-1}\mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathcal{E}',\mathcal{F}') \to \mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathbb{L}f^{*}(\mathcal{E}'),\mathbb{L}f^{*}(\mathcal{F}')). \tag{4.6.5.5.1}$$

Lemma 4.6.5.6. *Let* $f\colon (\mathscr{T},\mathcal{A}) \to (\mathscr{T}',\mathcal{A}')$ *be a morphism of topoi. Let* $\mathcal{B}'$, $\mathcal{C}'$ *be two sheaves of rings on* $\mathscr{T}'$. *Suppose there exists a solving ring* $\mathcal{R}'$ *of* $(\mathcal{A}',\mathcal{B}')$ *which is a left solving ring of* $(\mathcal{A}',\mathcal{C}')$ *such that the image of the composition* $f^{-1}\mathcal{R}' \to f^{-1}\mathcal{A}' \to \mathcal{A}$ *is included in the center of* $\mathcal{A}$. *Let* $*, ** \in \{l, r\}$. *For any* $\mathcal{E} \in D({}^{*}\mathcal{A}, f^{-1}\mathcal{R}', {}^{\mathrm{r}}f^{-1}\mathcal{B}')$ *(resp.* $\mathcal{E} \in D({}^{1}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}'^{o})$*) and* $\mathcal{F} \in D({}^{1}f^{-1}\mathcal{B}' \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$ *(resp.* $\mathcal{F} \in D({}^{1}f^{-1}\mathcal{B}' \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$*), there exists a canonical morphism of* $D({}^{*}\mathcal{A}',\mathcal{R}',{}^{**}\mathcal{C}')$ *(resp.* $D({}^{1}\mathcal{A}' \otimes_{\mathcal{R}'} \mathcal{C}')$*) of the form:*

$$\mathbb{R}f_{*}(\mathcal{E}) \otimes^{\mathbb{L}}_{\mathcal{B}'} \mathbb{R}f_{*}(\mathcal{F}) \to \mathbb{R}f_{*}(\mathcal{E} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}'} \mathcal{F}). \tag{4.6.5.6.1}$$

Proof. It is sufficient to treat the respective case. By adjunction (see 4.6.5.1.3), we have the map $\mathbb{L}f^*\mathbb{R}f_*(\mathcal{E}) \to \mathcal{E}$ of $D({}^{\mathrm{l}}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}'^{o})$ and the map $f^{-1}\mathbb{R}f_*(\mathcal{F})$ of $D({}^{\mathrm{l}}f^{-1}\mathcal{B}' \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$. This yields the second morphism of $D({}^{\mathrm{l}}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$:

$$\mathbb{L}f^*\left(\mathbb{R}f_*(\mathcal{E}) \otimes^{\mathbb{L}}_{\mathcal{B}'} \mathbb{R}f_*(\mathcal{F})\right) \xrightarrow{\sim} \mathbb{L}f^*\mathbb{R}f_*(\mathcal{E}) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}'} f^{-1}\mathbb{R}f_*(\mathcal{F}) \to \mathcal{E} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}'} \mathcal{F}, \qquad (4.6.5.6.2)$$

the first isomorphism being checked by choosing a K-flat representation of $\mathbb{R}f_*(\mathcal{E})$ and of $\mathbb{R}f_*(\mathcal{E})$ (similarly to 4.6.5.4.4). Again by adjunction adjunction (see 4.6.5.1.3), we get 4.6.5.6.1 from 4.6.5.6.2. □

Lemma 4.6.5.7. *Let $f\colon (\mathscr{T}, \mathcal{A}) \to (\mathscr{T}', \mathcal{A}')$ be a morphism of topoi. Let $\mathcal{B}'$, $\mathcal{C}'$ be two sheaves of rings on $\mathscr{T}'$. Suppose there exists a solving ring $\mathcal{R}'$ of $(\mathcal{A}', \mathcal{B}')$ which is a left solving ring of $(\mathcal{A}', \mathcal{C}')$ such that the image of the composition $f^{-1}\mathcal{R}' \to f^{-1}\mathcal{A}' \to \mathcal{A}$ is included in the center of $\mathcal{A}$.*

Let $*, ** \in \{l, r\}$, $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A}, f^{-1}\mathcal{R}', {}^*f^{-1}\mathcal{B}')$ (resp. $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{B}')$) and $\mathcal{F} \in D({}^{\mathrm{l}}\mathcal{A}, f^{-1}\mathcal{R}', f^{-1}\mathcal{C}')$ (resp. $\mathcal{F} \in D({}^{\mathrm{l}}\mathcal{A} \otimes_{f^{-1}\mathcal{R}'} f^{-1}\mathcal{C}')$). We have the canonical morphism of $D({}^*(\mathcal{B}')^o, \mathcal{R}', {}^{**}\mathcal{C}')$ (resp. $D({}^{\mathrm{l}}(\mathcal{B}')^o \otimes_{\mathcal{R}'} \mathcal{C}')$):

$$\mathbb{R}f_*\mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F}) \to \mathbb{R}\mathscr{H}om_{\mathcal{A}'}(\mathbb{R}f_*(\mathcal{E}), \mathbb{R}f_*(\mathcal{F})). \qquad (4.6.5.7.1)$$

Proof. It is sufficient to treat the respective case. We have the morphisms

$$\mathbb{R}f_*\mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{B}'} \mathbb{R}f_*(\mathcal{E}) \overset{4.6.5.6.1}{\longrightarrow} \mathbb{R}f_*\left(\mathbb{R}\mathscr{H}om_{\mathcal{A}}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}'} \mathcal{E}\right) \overset{4.6.3.15.1}{\longrightarrow} \mathbb{R}f_*(\mathcal{F}), \qquad (4.6.5.7.2)$$

where the first one is a symmetric version of 4.6.5.6.1. By using the Cartan isomorphism (see 4.6.3.14.1), we can conclude. □

We will need (see 7.3.1.22.1) the (non-commutative) projection formula stated as below:

Lemma 4.6.5.8. *Let $f\colon (\mathscr{T}, \mathcal{A}) \to (\mathscr{T}', \mathcal{A}')$ be a morphism of ringed topoi. Let $\mathcal{M}'^{\bullet} \in D({}^{\mathrm{r}}\mathcal{A}')$ and $\mathcal{E}^{\bullet} \in D({}^{\mathrm{l}}\mathcal{A})$. We have the projection map of $D(\mathbb{Z}_{\mathscr{T}'})$:*

$$\mathcal{M}'^{\bullet} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathbb{R}f_*(\mathcal{E}^{\bullet}) \to \mathbb{R}f_*(f^{-1}(\mathcal{M}'^{\bullet}) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{A}'} \mathcal{E}^{\bullet}) \xrightarrow{\sim} \mathbb{R}f_*(\mathbb{L}f^*(\mathcal{M}'^{\bullet}) \otimes^{\mathbb{L}}_{\mathcal{A}} \mathcal{E}^{\bullet}) \qquad (4.6.5.8.1)$$

constructed by adjointness from 4.6.5.1.1. The morphism 4.6.5.8.1 is an isomorphism if $\mathcal{M}'^{\bullet}$ is perfect. When $\mathcal{A}$ and $\mathcal{A}'$ are commutative, we construct similarly a map of the form 4.6.5.8.1 in $D(\mathcal{A}')$.

Proof. Using the ringed topoi morphism $(\mathscr{T}, \mathbb{Z}_{\mathscr{T}}) \to (\mathscr{T}', \mathbb{Z}_{\mathscr{T}'})$ induced by f, it follows by adjunction from 4.6.5.1.1 that the data of the left morphism of 4.6.5.8.1 is equivalent to the data of a morphism of the form $f^{-1}(\mathcal{M}'^{\bullet} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathbb{R}f_*(\mathcal{E}^{\bullet})) \to f^{-1}(\mathcal{M}'^{\bullet}) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{A}'} \mathcal{E}^{\bullet}$. This latter one is constructed by adjunction from 4.6.5.1.1 as follows:

$$f^{-1}(\mathcal{M}'^{\bullet} \otimes^{\mathbb{L}}_{\mathcal{A}} \mathbb{R}f_*(\mathcal{E}^{\bullet})) \xrightarrow{\sim} f^{-1}(\mathcal{M}'^{\bullet}) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{A}} f^{-1}\mathbb{R}f_*(\mathcal{E}^{\bullet}) \to f^{-1}(\mathcal{M}'^{\bullet}) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{A}'} \mathcal{E}^{\bullet}.$$

The fact that this morphism becomes an isomorphism is standard (e.g., we can copy the proof of [Sta22, 0944] which still works with non-commutative rings). □

4.6.6 Derived internal tensor products, derived internal homomorphism functors, Cartan isomorphisms, derived coefficients extensions and pullbacks for $\mathcal{D}$-modules

We keep notations and hypotheses of 4.2.

4.6.6.1. We have the canonical bifunctors

$$\mathcal{H}om_{\mathcal{B}_X}(-,-)\colon K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \times K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}), \qquad (4.6.6.1.1)$$

$$- \otimes_{\mathcal{B}_X} -\colon K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \times K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to K({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}), \qquad (4.6.6.1.2)$$

and similarly by replacing some l by r (when this has a meaning). Beware that for some authors, if $\mathcal{E}$ and $\mathcal{F}$ are complexes of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules, then $\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}$ is a bicomplex and what we denote by $\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F}$ is denoted by $Tot(\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{F})$, where Tot means the total complex induced by the commutative bicomplex.

Since $\mathcal{B}_X \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is flat, then a K-injective (resp. K-flat) complex of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules is a K-injective (resp. K-flat) complex of $\mathcal{B}_X$-modules. Hence, we obtain by derivation

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(-,-)\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \times D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}), \tag{4.6.6.1.3}$$

$$-\otimes^{\mathbb{L}}_{\mathcal{B}_X} -\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \times D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}), \tag{4.6.6.1.4}$$

and similarly by replacing l by r.

By functoriality, we have bimodule versions of theses bifunctors, for instance:

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(-,-)\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}{}^{\mathrm{r}}) \times D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}{}^{\mathrm{l}});$$

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(-,-)\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \times D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}{}^{\mathrm{r}}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}{}^{\mathrm{r}})\ etc. \tag{4.6.6.1.5}$$

Proposition 4.6.6.2 (Associativity)**.** *Let $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, $\mathcal{N} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, {}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. We have the following isomorphisms of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:*

$$\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} (\mathcal{N} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{E}) \xrightarrow{\sim} (\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{N}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{E}, \tag{4.6.6.2.1}$$

$$\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} (\mathcal{N} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}) \xrightarrow{\sim} (\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{N}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}. \tag{4.6.6.2.2}$$

Proof. It is sufficient to choose K-flat complexes representing $\mathcal{E}$ and $\mathcal{N}$ and then to use 4.2.4.3.1 and 4.2.4.3.2. ☐

Proposition 4.6.6.3 (Switching $\mathcal{B}$ and $\mathcal{D}$)**.** *Let $\mathcal{M}$ be a complex of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}{}^{\mathrm{r}})$, $\mathcal{E}$ and $\mathcal{F}$ be two complexes of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. Then we have a canonical isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:*

$$(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E} \xrightarrow{\sim} \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} (\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{E}). \tag{4.6.6.3.1}$$

Proof. This is a consequence of 4.2.6.1. ☐

Proposition 4.6.6.4. *Let $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ $\mathcal{F} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}{}^{\mathrm{r}})$ and $\mathcal{G} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. There exists a canonical morphism in $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}{}^{\mathrm{r}})$ of the form:*

$$\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{G} \to \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{G}). \tag{4.6.6.4.1}$$

The morphism 4.6.6.4.1 is an isomorphism when $\mathcal{E} \in D_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

Proof. By choosing a K-injective complex representing $\mathcal{F}$ and a K-flat complex representing $\mathcal{G}$, this is a consequence of 4.2.4.9. ☐

Proposition 4.6.6.5. *Let $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, $\mathcal{F} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathcal{G} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, {}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. We have the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear isomorphism*

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E} \overset{\mathbb{L}}{\otimes}_{\mathcal{B}_X} \mathcal{F}, \mathcal{G}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F}, \mathcal{G})).$$

Proof. Let $\mathcal{P}$ be a K-flat complex of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules representing $\mathcal{F}$ and $\mathcal{I}$ be a K-injective complex of right (resp. left if $*=\mathrm{l}$) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-bimodule representing $\mathcal{G}$. We compute in $D({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E} \overset{\mathbb{L}}{\otimes}_{\mathcal{B}_X} \mathcal{F}, \mathcal{G}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{P}, \mathcal{G}) \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E} \otimes_{\mathcal{B}_X} \mathcal{P}, \mathcal{I})$$

$$\underset{\sim}{\overset{4.2.4.5}{\longrightarrow}} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{P}, \mathcal{I})) \underset{\sim}{\overset{4.2.4.6}{\longrightarrow}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{P}, \mathcal{I})) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F}, \mathcal{G})).$$

☐

Corollary 4.6.6.6 (Cartan isomorphism)**.** *Let* $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$*,* $\mathcal{F} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ *and* $\mathcal{G} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$*. The canonical isomorphism*

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{F}, \mathcal{G}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F}, \mathcal{G})),$$

is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$*-linear.*

Proof. We choose a K-flat complex of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules representing $\mathcal{F}$ and a K-injective complex of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules representing $\mathcal{G}$. The corollary 4.2.4.6 and the proposition **??** allow us to conclude. □

Proposition 4.6.6.7. *Let* $\mathcal{E} \in D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$*,* $\mathcal{F} \in D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ *and* $\mathcal{G} \in D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$*. We have a canonical homomorphism of* $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ *of the form:*

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{G} \to \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{G}). \tag{4.6.6.7.1}$$

If $\mathcal{E}$ *is moreover in* $D_{\mathrm{perf}}(\mathcal{B}_X)$*, this morphism is an isomorphism.*

Proof. We construct the morphism 4.6.6.7.1 by choosing a K-injective complex of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules representing $\mathcal{F}$ and a K-flat complex of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules representing $\mathcal{G}$. By using 4.2.4.8, this one is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear and compatible with Frobenius.

Since a K-injective (resp. K-flat) complex of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules is a K-injective (resp. K-flat) complex of $\mathcal{B}_X$-modules, then if $\mathcal{E} \in D_{\mathrm{perf}}(\mathcal{B}_X)$, using 4.6.3.6.1 (with $\mathcal{A} = \mathcal{B} = \mathcal{C} = \mathcal{B}_X$) that 4.6.6.7.1 is an isomorphism in $D(\mathcal{B}_X)$ and then in $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. □

4.6.6.8 (Coefficient extensions)**.** Let $\rho\colon \mathcal{B}_X \to \mathcal{B}'_X$ be a homomorphism of commutative $\mathcal{O}_X$-algebras. We suppose $\mathcal{B}_X$ and $\mathcal{B}'_X$ are endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module which is compatible to its underlying $\mathcal{O}_X$-algebra structure such that $\mathcal{B}_X \to \mathcal{B}'_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is a flat $\mathcal{B}_X$-module, then for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, a K-flat complex of left $\widetilde{\mathcal{D}}$-modules representing $\mathcal{E}$ is also a K-flat complex $\mathcal{B}_X$-modules representing $\mathcal{E}$. This yields a canonical isomorphism in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$

$$\mathcal{B}'_X \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{E} \xrightarrow{\sim} (\mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}. \tag{4.6.6.8.1}$$

Moreover, if $\mathcal{M} \in D({}^{\mathrm{r}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X)$, then any K-flat complex of right $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X$-modules representing $\mathcal{M}$ is also a K-flat complex of $\mathcal{B}_X$-modules representing $\mathcal{M}$. We get therefore in $D({}^{\mathrm{r}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}'_X)$ the canonical isomorphism:

$$\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{B}'_X \xrightarrow{\sim} \mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}_X} (\mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{B}'_X). \tag{4.6.6.8.2}$$

4.6.6.9 (Pullbacks)**.** With notation 4.4.2, let $\star \in \{\emptyset, -, \mathrm{b}\}$. In the case where $\star = \mathrm{b}$, we suppose moreover $f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ has finite tor dimension, i.e. we suppose the functor $\widetilde{f}^* = \mathcal{B}_X \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}-$ from the category of $\mathcal{B}_Y$-modules to that of $\mathcal{B}_X$-modules has bounded cohomological dimension (see definition 4.6.1.4).

Since $\mathcal{B}_X \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is flat, then a K-flat complex of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules is a K-flat complex of $\mathcal{B}_X$-modules. Hence, it follows from 4.4.2.4 that the functor $\mathbb{L}\widetilde{f}^* = \mathcal{B}_X \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_Y} f^{-1}-\colon D^\star(\mathcal{B}_X) \to D^\star(\mathcal{B}_Y)$ induces the functor $\mathbb{L}\widetilde{f}^*\colon D^\star({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D^\star({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ making commutative the diagram:

$$\begin{array}{ccc} D^\star({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) & \xrightarrow{\mathbb{L}\widetilde{f}^*} & D^\star({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \\ \downarrow & & \downarrow \\ D^\star(\mathcal{B}_Y) & \xrightarrow{\mathbb{L}\widetilde{f}^*} & D^\star(\mathcal{B}_X) \end{array} \tag{4.6.6.9.1}$$

where the vertical functors are the forgetful ones. Following 4.4.2.9.1, for any $\mathcal{E} \in D^{\star}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, we get the canonical isomorphism of $D^{\star}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$\mathbb{L}\widetilde{f}^{*}\mathcal{E} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{E}. \tag{4.6.6.9.2}$$

4.6.7 Comparison between $\mathcal{B}$-linear duality and $\mathcal{D}$-linear duality

We keep notations and hypotheses of 4.2.

Proposition 4.6.7.1. *Let $\mathcal{F} \in D^{\mathrm{b}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. The following assertions hold.*

(a) There exists a canonical morphism of $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$;

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{B}_X, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \omega_X^{-1}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F}, \mathcal{B}_X) \to \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \omega_X^{-1}).$$

(b) If $\mathcal{B}_X \in D_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathcal{F} \in D_{\mathrm{perf}}(\mathcal{B}_X)$, then this one is an isomorphism.

Proof. We will write $\otimes\omega^{-1}$ for $\otimes_{\mathcal{O}_X}\omega_X^{-1}$, $\widetilde{\mathcal{D}}$ for $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ and $\mathcal{B}$ for $\mathcal{B}_X$. It follows from the proposition 4.6.6.4 (valid by replacing "r" by "l") the arrow :

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, \widetilde{\mathcal{D}} \otimes \omega^{-1}) \otimes^{\mathbb{L}}_{\mathcal{B}} \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \mathcal{B}) \to \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, \widetilde{\mathcal{D}} \otimes \omega^{-1} \otimes_{\mathcal{B}} \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \mathcal{B})). \tag{4.6.7.1.1}$$

The transposition isomorphism 4.2.5.3.1 of $\mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \mathcal{B})$ induces the isomorphism :

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, \widetilde{\mathcal{D}} \otimes \omega^{-1} \otimes_{\mathcal{B}} \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \mathcal{B})) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \mathcal{B}) \otimes_{\mathcal{B}} \widetilde{\mathcal{D}} \otimes \omega^{-1}). \tag{4.6.7.1.2}$$

Via 4.6.6.7, we have by functoriality a morphism in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}, {}^{\mathrm{l}}\widetilde{\mathcal{D}})$:

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \mathcal{B}) \otimes_{\mathcal{B}} \widetilde{\mathcal{D}} \otimes \omega^{-1} \to \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \widetilde{\mathcal{D}} \otimes \omega^{-1}). \tag{4.6.7.1.3}$$

By applying to 4.6.7.1.3 the functor $\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, -)$, we get in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}})$ the morphism :

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \mathcal{B}) \otimes_{\mathcal{B}} \widetilde{\mathcal{D}} \otimes \omega^{-1}) \to \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \widetilde{\mathcal{D}} \otimes \omega^{-1})). \tag{4.6.7.1.4}$$

We have the isomorphism of Cartan (4.6.6.5):

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{B}, \mathbb{R}\mathcal{H}om_{\mathcal{B}}(\mathcal{F}, \widetilde{\mathcal{D}} \otimes \omega^{-1})) \xleftarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}}(\mathcal{F}, \widetilde{\mathcal{D}} \otimes \omega^{-1}). \tag{4.6.7.1.5}$$

By composing 4.6.7.1.1, 4.6.7.1.2, 4.6.7.1.4 and 4.6.7.1.5, we get the morphism of 6.3.4.15.(i).

Finally, when $\mathcal{B}_X \in D_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ (resp. $\mathcal{F} \in D_{\mathrm{perf}}(\mathcal{B})$), the morphism 4.6.7.1.1 (resp. 4.6.7.1.3, and then 4.6.7.1.4) becomes an isomorphism. □

Example 4.6.7.2. In order to get the comparison isomorphism, we need the hypothesis $\mathcal{B}_X \in D_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. However, when $m = 0$, we have $\mathcal{B}_X \in D_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$ (see 4.7.3.7.4). After tensorising with $\mathbb{Q}$, see also 4.7.3.15 for other examples.

4.7 Level 0 case

We keep notations and hypotheses of 4.2.

4.7.1 Stratifications of order ≤ 1 and logarithmic connections

Definition 4.7.1.1. Let $\mathcal{E}$ be a $\mathcal{B}_X$-module. With notations 3.2.2.2, an *m-PD stratification relative to $X^\sharp/S^\sharp$ of order ≤ 1 with coefficients in $\mathcal{B}_X$* is the data of a $\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)}$-linear isomorphism $\varepsilon_1 \colon \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)}$ such that the following diagram

$$\begin{array}{ccccc}
\widetilde{\psi}^{1,0*}_{X^\sharp/S^\sharp,(m)}(\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \mathcal{E}) & \xrightarrow{\sim} & \widetilde{\mathcal{P}}^0_{X^\sharp/S^\sharp,(m)} \otimes_{\mathcal{B}_X} \mathcal{E} & \xrightarrow{\sim} & \mathcal{E}\,, \\
\downarrow{\scriptstyle \widetilde{\psi}^{1,0*}_{X^\sharp/S^\sharp,(m)}(\varepsilon_1)} & & \downarrow{\scriptstyle \sim} & & \| \\
\widetilde{\psi}^{n',n*}_{X^\sharp/S^\sharp,(m)}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)}) & \xrightarrow{\sim} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^0_{X^\sharp/S^\sharp,(m)} & \xrightarrow{\sim} & \mathcal{E}
\end{array} \tag{4.7.1.1.1}$$

whose horizontal isomorphisms are the canonical ones, is commutative. When $m = \infty$, we simply say *stratification relative to $X^\sharp/S^\sharp$ of order ≤ 1 with coefficients in $\mathcal{B}_X$*.

Remark 4.7.1.2. We have a canonical map from the set of m-PD stratifications relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$ of $\mathcal{E}$ (see 3.4.2.1) to that of m-PD stratifications relative to $X^\sharp/S^\sharp$ of order ≤ 1 with coefficients in $\mathcal{B}_X$ given by $(\varepsilon_n)_{n\in\mathbb{N}} \mapsto \varepsilon_1$.

Proposition 4.7.1.3. *Given a $\mathcal{B}_X$-module $\mathcal{E}$. The following are equivalent.*

(a) A $\mathcal{B}_X$-linear homomorphism $\theta_1 \colon \mathcal{E} \to p_{1*}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)})$ (the $\mathcal{B}_X$-module structure of this latter is induced by the right structure of $\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)}$) making commutative the diagram

$$\begin{array}{ccc}
\mathcal{E} & \xrightarrow{\sim} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^0_{X^\sharp/S^\sharp,(m)} \\
& {\scriptstyle \theta_1} \searrow & \uparrow{\scriptstyle \mathrm{id}_{\mathcal{E}} \otimes \widetilde{\psi}^{1,0}_{X^\sharp/S^\sharp,(m)}} \\
& & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)}
\end{array} \tag{4.7.1.3.1}$$

whose top isomorphism is the canonical one (recall $\widetilde{\mathcal{P}}^0_{X^\sharp/S^\sharp,(m)} = \mathcal{B}_X$).

(b) An m-PD stratification $\varepsilon = (\varepsilon^{\mathcal{E}}_n)$ of order ≤ 1 with coefficients in $\mathcal{B}_X$ on $\mathcal{E}$.

The bijection between both data is given by $\epsilon_1 \mapsto \epsilon_1 \circ \widetilde{p}^1_{1,(m),\mathcal{E}} = \theta_1$ (see notation 4.1.2.7).

Proof. This comes from the proof of 4.2.1.5. □

4.7.1.4. Thanks to the local description 4.1.2.16.1 and the local computation of 3.2.2.10.1, we can check that the homomorphism $\widetilde{\psi}^1_m := \mathrm{id}_{\mathcal{B}_X} \otimes \psi^1_m \colon \widetilde{\mathcal{P}}^{\sharp 1}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{P}}^{\sharp 1}_{X^\sharp/S^\sharp,(m)}$ is an isomorphism. Hence, the data of a stratification relative to $X^\sharp/S^\sharp$ of order ≤ 1 with coefficients in $\mathcal{B}_X$ on $\mathcal{E}$ is equivalent to that of an m-PD stratification relative to $X^\sharp/S^\sharp$ of order ≤ 1 with coefficients in $\mathcal{B}_X$ on $\mathcal{E}$. In other words, the integer m has no importance and by default we simply consider stratifications relative to $X^\sharp/S^\sharp$ of order ≤ 1 with coefficients in $\mathcal{B}_X$. Moreover, denoting by $\mathcal{I}^1_{X^\sharp/S^\sharp,(m)}$ the ideal of the closed immersion $\Delta^1_{X^\sharp/S^\sharp,(m)}$ and setting $\Omega^1_{X^\sharp/S^\sharp,(m)} := (\Delta^1_{X^\sharp/S^\sharp,(m)})^{-1}(\mathcal{I}^1_{X^\sharp/S^\sharp,(m)})$, the isomorphism ψ^1_m induces the isomorphism $\psi^1_m \colon \Omega^1_{X^\sharp/S^\sharp} \xrightarrow{\sim} \Omega^1_{X^\sharp/S^\sharp,(m)}$. We can therefore simply write $\Omega^1_{X^\sharp/S^\sharp}$ instead of $\Omega^1_{X^\sharp/S^\sharp,(m)}$.

4.7.1.5. We have the following proprieties making some links between the sheaf of relative differentials and the sheaf of principal parts of order ≤ 1 of $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$.

(a) We set $\widetilde{\Omega}^1_{X^\sharp/S^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \Omega^1_{X^\sharp/S^\sharp}$. Denoting by $\widetilde{j} := \mathrm{id}_{\mathcal{B}_X} \otimes j \colon \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \to p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}$, where j is the canonical inclusion (see notation 3.1.3.2), by applying the functor $\mathcal{B}_X \otimes_{\mathcal{O}_X} -$ to the exact sequence 3.1.3.2.1, we get the exact sequence of $\mathcal{B}_X$-modules

$$0 \to \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \xrightarrow{\widetilde{j}} p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \xrightarrow{\widetilde{\psi}^{1,0}_{X^\sharp/S^\sharp}} \mathcal{B}_X \to 0. \tag{4.7.1.5.1}$$

The exact sequence 4.7.1.5.1 splits via the section $\widetilde{p}_0^1 \colon \mathcal{B}_X \to p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}$ (see notation 4.1.2.7), which yields the isomorphism of $\mathcal{B}_X$-modules

$$(\widetilde{p}_0^1, \widetilde{j}) \colon \mathcal{B}_X \oplus \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \xrightarrow{\sim} p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}. \tag{4.7.1.5.2}$$

In particular, since $p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}$ is a locally free $\mathcal{B}_X$-module, then so is $\widetilde{\Omega}^1_{X^\sharp/S^\sharp}$.

(b) Via the isomorphism 4.7.1.5.2, we get the $\mathcal{B}_X$-linear epimorphism

$$\widetilde{\varpi}_{X^\sharp/S^\sharp} \colon p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \twoheadrightarrow \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \tag{4.7.1.5.3}$$

which is a left inverse of the inclusion $\widetilde{j} \colon \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \subset p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}$. We compute $\widetilde{\varpi}_{X^\sharp/S^\sharp} = \mathrm{id} - \widetilde{p}_0^1 \circ \widetilde{\psi}^{1,0}_{X^\sharp/S^\sharp}$.

(c) We define the map $d_{\mathcal{B}_X} : \mathcal{B}_X \to \widetilde{\Omega}^1_{X^\sharp/S^\sharp}$ by setting $d_{\mathcal{B}_X} := \widetilde{\varpi}_{X^\sharp/S^\sharp} \circ \widetilde{p}_1^n$ (see notation 4.1.2.5). Since $\widetilde{\psi}^{1,0}_{X^\sharp/S^\sharp} \circ \widetilde{p}_i^1 = \mathrm{id}$ for $i = 0, 1$ (see just after 4.1.2.12.1), then $\widetilde{p}_1^1(b) - \widetilde{p}_0^1(b) \in \widetilde{\Omega}^1_{X^\sharp/S^\sharp}$ for any section b of $\mathcal{B}_X$. Since $\widetilde{\varpi}_{X^\sharp/S^\sharp} \circ \widetilde{p}_0^n = 0$, this yields $d_{\mathcal{B}_X} = \widetilde{p}_1^1 - \widetilde{p}_0^1$.

Definition 4.7.1.6. We can extend the definition 3.1.3.3 as follows: Let $\mathcal{E}, \mathcal{F}$ be two $\mathcal{B}_X$-modules, $n \geq 0$ be an integer. We say that a $f^{-1}\mathcal{O}_S$-linear homomorphism $D \colon \mathcal{E} \to \mathcal{F}$ is a "differential operator of order $\leq n$ (relatively to $X^\sharp/S^\sharp$) with coefficient in $\mathcal{B}_X$" if there exists a homomorphism of $\mathcal{B}_X$-modules $u \colon p^n_{0*}(\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}) \to \mathcal{F}$ such that $D = u \circ \widetilde{p}^n_{1,\mathcal{E}}$ (see notation 4.1.2.7). Beware that this is not clear that such a u is unique. Hence one might prefer to call such a u (instead of D) a differential operator of order $\leq n$ relatively to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$.

4.7.1.7 (Local computation)**.** Suppose $X^\sharp/S^\sharp$ has logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,d}$. We still denote by $d\log u_\lambda$ its image in $\widetilde{\Omega}^1_{X^\sharp/S^\sharp}$ in $\widetilde{\Omega}^1_{X^\sharp/S^\sharp}$. Let $\tau_{\sharp\lambda,1} := \mu^1(u_\lambda) - 1$ in $\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}$ for $\lambda = 1, \dots, d$. It follows from 3.1.3.5 that $\tau_{\sharp\lambda,1} = d\log u_\lambda$. Moreover, following 4.1.2.16.1, $\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}$ is $\mathcal{B}_X$-free with the basis $1, \tau_{\sharp 1,1}, \dots, \tau_{\sharp d,1}$. Since $\widetilde{\psi}^{1,0}_{X^\sharp/S^\sharp}(\tau_{\sharp\lambda,1}) = 0$ and $\widetilde{\psi}^{1,0}_{X^\sharp/S^\sharp}(1) = 1$, then $\widetilde{\Omega}^1_{X^\sharp/S^\sharp}$ is $\mathcal{B}_X$-free with the basis $\tau_{\sharp 1,1}, \dots, \tau_{\sharp d,1}$, i.e. $d\log u_1, \dots, d\log u_d$. Moreover, $\widetilde{\varpi}_{X^\sharp/S^\sharp}(1) = 0$ (and $\ker \widetilde{\varpi}_{X^\sharp/S^\sharp} = \mathcal{B}_X$) and $\widetilde{\varpi}_{X^\sharp/S^\sharp}(\tau_{\sharp,\lambda,1}) = \tau_{\sharp\lambda,1}$.

Definition 4.7.1.8. Let $\mathcal{E}$ be a $\mathcal{B}_X$-module. A "(logarithmic) connection relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$" on $\mathcal{E}$ is an additive map $\nabla : \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^1_{X^\sharp/S^\sharp}$ such that for any open $U \subseteq X$, the map $\nabla_U \colon \mathcal{E}(U) \to (\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^1_{X^\sharp/S^\sharp})(U)$ satisfies the condition : for $x \in \mathcal{E}(U)$, $b \in \mathcal{B}_X(U)$ we have

$$\nabla(bx) = b\nabla(x) + x \otimes d_{\mathcal{B}_X}(b).$$

Proposition 4.7.1.9. *Let $\mathcal{E}$ be a $\mathcal{B}_X$-module. The map $\epsilon_1 \mapsto (\mathrm{id} \otimes \varpi) \circ \epsilon_1 \circ \widetilde{p}^1_{1,\mathcal{E}}$, where $\widetilde{p}^1_{1,\mathcal{E}}$ is defined at 4.1.2.7, gives a bijection between the set of connections relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$ on $\mathcal{E}$ to that of stratifications relative to $X^\sharp/S^\sharp$ of order ≤ 1 with coefficients in $\mathcal{B}_X$ on $\mathcal{E}$.*

Proof. We copy the proof of 2.3.1.6. □

4.7.2 Integrable connections and $\mathcal{D}$-modules of level 0

4.7.2.1. Let $\Omega^i_{X^\sharp/S^\sharp} = \wedge^i_{\mathcal{O}_X} \Omega_{X^\sharp/S^\sharp}$ for $i \geq 0$ be the ith exterior power. For any nonnegative integers i, j, denote by $c_{i,j} \colon \Omega^i_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \Omega^j_{X^\sharp/S^\sharp} \to \Omega^{i+j}_{X^\sharp/S^\sharp}$ the canonical projection. Recall (e.g. see [Ogu18, V.2.1.1]), for any integer $i \geq 0$, there is a unique collection of homomorphisms of $f^{-1}\mathcal{O}_S$-modules

$$d^i_{X^\sharp/S^\sharp} \colon \Omega^i_{X^\sharp/S^\sharp} \to \Omega^{i+1}_{X^\sharp/S^\sharp}$$

called the exterior derivative, such that:

(a) $d^0_{X^\sharp/S^\sharp} = d_{X^\sharp/S^\sharp}$,

(b) $d^1_{X^\sharp/S^\sharp} d\log m = 0$ if m is any section of $M_{X^\sharp}$,

(c) $d^i_{X^\sharp/S^\sharp} d^{i-1}_{X^\sharp/S^\sharp}\omega = 0$ if ω is any section of $\Omega^{i-1}_{X^\sharp/S^\sharp}$,

(d) $d^{i+j}_{X^\sharp/S^\sharp}(\omega\wedge\omega') = (d^i_{X^\sharp/S^\sharp}\omega)\wedge\omega' + (-1)^i\omega\wedge(d^j_{X^\sharp/S^\sharp}\omega')$ if $\omega\in\Omega^i_{X^\sharp/S^\sharp}$ and $\omega'\in\Omega^j_{X^\sharp/S^\sharp}$.

In particular, we get the formula: $d^i_{X^\sharp/S^\sharp}(ad\log m_1\wedge\cdots\wedge d\log m_i) = d_{X^\sharp/S^\sharp}a\wedge d\log m_1\wedge\cdots\wedge d\log m_i$ for any sections a of $\mathcal{O}_X$ and $m_1,\ldots,m_i$ of $M_{X^\sharp}$. We get the complex of $f^{-1}\mathcal{O}_S$-modules

$$0\to\Omega^0_{X^\sharp/S^\sharp}\to\Omega^1_{X^\sharp/S^\sharp}\to\Omega^2_{X^\sharp/S^\sharp}\to\ldots$$

which is called the de Rham complex of $X^\sharp/S^\sharp$.

Let $i\geq 0$ be an integer. The map $d^i_{X^\sharp/S^\sharp}$ is a differential operator of order 1 with respect to $X^\sharp/S^\sharp$ (see definition 3.1.3.3). More precisely, we construct a canonical $\mathcal{O}_X$-linear homomorphism $\varpi^i_{X^\sharp/S^\sharp}\colon\mathcal{P}^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp}\to\Omega^{i+1}_{X^\sharp/S^\sharp}$ whose composition with $p^1_{1,\Omega^i_{X^\sharp/S^\sharp}}\colon\Omega^i_{X^\sharp/S^\sharp}\to\mathcal{P}^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp}$ is equal to $d^i_{X^\sharp/S^\sharp}$ as follows. Consider the following commutative diagram:

$$\begin{array}{ccccc}
\Omega^i_{X^\sharp/S^\sharp} & \xrightarrow{p^1_{1,\Omega^i_{X^\sharp/S^\sharp}}} & \mathcal{P}^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp} & = & \mathcal{P}^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp} \\
 & & \uparrow{\scriptstyle (p^1_1,j)\otimes\mathrm{id}}\ \wr & & \\
 & & \left(\mathcal{O}_X\oplus\Omega^1_{X^\sharp/S^\sharp}\right)\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp} & & \\
\downarrow{\scriptstyle d^i_{X^\sharp/S^\sharp}} & & \downarrow\wr & & \downarrow{\scriptstyle\varpi^i_{X^\sharp/S^\sharp}} \\
 & & \Omega^i_{X^\sharp/S^\sharp}\oplus\left(\Omega^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp}\right) & & \\
 & & \downarrow{\scriptstyle (d^i_{X^\sharp/S^\sharp},c_{1,i})} & & \\
\Omega^{i+1}_{X^\sharp/S^\sharp} & = & \Omega^{i+1}_{X^\sharp/S^\sharp} & = & \Omega^{i+1}_{X^\sharp/S^\sharp}
\end{array}\qquad(4.7.2.1.1)$$

where (p^1_1,j) is the isomorphism 3.1.3.2.5, where $\varpi^i_{X^\sharp/S^\sharp}$ is by definition the map making commutative the right rectangle of the diagram 4.7.2.1.1. When $i=0$, we remark $\varpi_{X^\sharp/S^\sharp}=\varpi^0_{X^\sharp/S^\sharp}$. Let us check the $\mathcal{O}_X$-linearity of ϖ^i. For any sections a,b of $\mathcal{O}_X$, for any section ω of $\Omega^1_{X^\sharp/S^\sharp}$, for any section ω_i of $\Omega^i_{X^\sharp/S^\sharp}$, the map $\varpi^i_{X^\sharp/S^\sharp}$ sends $(p^1_1(a)+\omega)\otimes\omega_i$ to $d^i_{X^\sharp/S^\sharp}(a\omega_i)+\omega\wedge\omega_i = d_{X^\sharp/S^\sharp}(a)\wedge\omega_i + ad^i_{X^\sharp/S^\sharp}(\omega_i)+\omega\wedge\omega_i$. We compute in the ring $\mathcal{P}^1_{X^\sharp/S^\sharp}$ the equalities $p^1_0(b)(p^1_1(a)+\omega) = (p^1_1(b)-d_{X^\sharp/S^\sharp}(b))(p^1_1(a)+\omega) = p^1_1(ab)-ad_{X^\sharp/S^\sharp}(b)+b\omega$, the first one coming from 4.7.1.5.c and the second one following from the fact that $\Delta^1_{X^\sharp/S^\sharp}$ is a closed immersion of order 1. This yields $p^1_0(b)\left((p^1_1(a)+\omega)\otimes\omega_i\right)$ is sent via $\varpi^i_{X^\sharp/S^\sharp}$ to $d_{X^\sharp/S^\sharp}(ab)\wedge\omega_i+abd^i_{X^\sharp/S^\sharp}(\omega_i)+(-ad_{X^\sharp/S^\sharp}(b)+b\omega)\wedge\omega_i = bd_{X^\sharp/S^\sharp}(a)\wedge\omega_i+abd^i_{X^\sharp/S^\sharp}(\omega_i)+b\omega\wedge\omega_i$. Hence, we are done.

This implies (via the canonical morphism $\mathcal{P}^1_{X/S}\to\mathcal{P}^1_{X^\sharp/S^\sharp}$ which is $\mathcal{O}_X$-linear for both structures) that the map $d^i_{X^\sharp/S^\sharp}$ is also a differential operator of order 1 with respect to X/S (see definition 1.1.3.2). In fact, we compute $d^i_{X^\sharp/S^\sharp}(aw)-ad^i_{X^\sharp/S^\sharp}(\omega) = d_{X^\sharp/S^\sharp}a\wedge\omega$ for any section a of $\mathcal{O}_X$ and section ω of $\Omega^i_{X^\sharp/S^\sharp}$, and we retrieve the fact that $\omega\mapsto d^i_{X^\sharp/S^\sharp}(aw)-ad^i_{X^\sharp/S^\sharp}(\omega)$ is linear (see 1.1.3.4.1).

Notation 4.7.2.2. Let $\varepsilon^{\mathcal{B}_X}=(\varepsilon^{\mathcal{B}}_n)$ be the m-PD stratification on $\mathcal{B}_X$, and let $\theta^{\mathcal{B}_X}=(\varepsilon^{\mathcal{B}_X}_n)$ be the corresponding family (see notation of 3.4.2.5). We define the map $d^i_{\mathcal{B}_X}\colon\mathcal{B}_X\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp}\to\mathcal{B}\otimes_{\mathcal{O}_X}\Omega^{i+1}_{X^\sharp/S^\sharp}$ by composition as follows

$$\begin{array}{ccccc}
\mathcal{B}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp} & \xrightarrow{\theta^{\mathcal{B}_X}_1\otimes\mathrm{id}_{\Omega^i_{X^\sharp/S^\sharp}}} & \mathcal{B}\otimes_{\mathcal{O}_X}\mathcal{P}^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp} & \xrightarrow{\mathrm{id}_{\mathcal{B}}\otimes\varpi^i_{X^\sharp/S^\sharp}} & \mathcal{B}\otimes_{\mathcal{O}_X}\Omega^{i+1}_{X^\sharp/S^\sharp}. \\
 & \searrow{\scriptstyle p^1_{1,\mathcal{B}\otimes\Omega^i}} & \uparrow{\scriptstyle\epsilon^{\mathcal{B}_X}_1\otimes\mathrm{id}} & & \\
 & & \mathcal{P}^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{O}_X}\mathcal{B}\otimes_{\mathcal{O}_X}\Omega^i_{X^\sharp/S^\sharp} & &
\end{array}\qquad(4.7.2.2.1)$$

We remark $d_{\mathcal{B}_X}=d^0_{\mathcal{B}_X}$.

Notation 4.7.2.3. We set $\widetilde{\Omega}^i_{X^\sharp/S^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \Omega^i_{X^\sharp/S^\sharp}$ for any integer $i \geq 0$. When i is equal to the rank d of $\Omega_{X^\sharp/S^\sharp}$, we set $\omega_{X^\sharp/S^\sharp} := \Omega^d_{X^\sharp/S^\sharp}$ and $\widetilde{\omega}_{X^\sharp/S^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \omega_{X^\sharp/S^\sharp}$

Notation 4.7.2.4. Let $\mathcal{E}$ be a $\mathcal{B}_X$-module and $i, j \geq 0$ be two integers. Let y (resp. z) be a section of $\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp}$ (resp. $\widetilde{\Omega}^i_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$) and ω be a section of $\widetilde{\Omega}^j_{X^\sharp/S^\sharp}$. Then we denote by $y \wedge \omega$ (resp. $\omega \wedge z$) the image of $y \otimes \omega$ (resp. $\omega \otimes z$) via $\mathrm{id}_{\mathcal{E}} \otimes c_{i,j}$ (resp. $c_{i,j} \otimes \mathrm{id}_{\mathcal{E}}$). Denote by $y \mapsto {}^t y$ the canonical isomorphism $\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$. Beware ${}^t(y \wedge \omega) = (-1)^{ij} \omega \wedge {}^t y$.

4.7.2.5 (Integrable connection, de Rham complex)**.** Let $\mathcal{E}$ be a $\mathcal{B}_X$-module endowed with a connection relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$. Denote by ϵ_1 the associated relative to $X^\sharp/S^\sharp$ stratification of order ≤ 1 with coefficients in $\mathcal{B}_X$ on $\mathcal{E}$ (see 4.7.1.9). Following 4.7.1.3, let $\theta_1 \colon \mathcal{E} \to p_{1*}(\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp})$ be the corresponding $\mathcal{B}_X$-linear homomorphism making commutative the diagram 4.7.1.3.1. We get the map $\nabla^i \colon \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp}$ from θ_1 and d^i by composition as follows

$$\begin{array}{ccccc}
\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} & \xrightarrow{\theta_1 \otimes \mathrm{id}_{\widetilde{\Omega}^i_{X^\sharp/S^\sharp}}} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} & \xrightarrow{\mathrm{id}_{\mathcal{E}} \otimes \varpi^i_{X^\sharp/S^\sharp}} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp}, \\
& \searrow^{\widetilde{p}^1_{1,\mathcal{E} \otimes \widetilde{\Omega}^i}} & \uparrow{\scriptstyle \epsilon_1 \otimes \mathrm{id}} & & \\
& & \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} & &
\end{array} \qquad (4.7.2.5.1)$$

where the triangle is commutative. Beware that the terms $\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp}$ and $\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp}$ have two structures of $\mathcal{B}_X$-modules: the left one and the right one. The morphisms $\widetilde{p}^1_{1,\mathcal{E} \otimes \widetilde{\Omega}^i}$ and $\theta_1 \otimes \mathrm{id}_{\widetilde{\Omega}^i_{X^\sharp/S^\sharp}}$ are $\mathcal{B}_X$-linear for the right one, whereas $\mathrm{id}_{\mathcal{E}} \otimes \varpi^i_{X^\sharp/S^\sharp}$ is $\mathcal{B}_X$-linear for the left one. The composition ∇^i is not $\mathcal{B}_X$-linear but since $\epsilon_1 \otimes \mathrm{id}$ is $\mathcal{B}_X$-linear for both structure (an in particular for the left structure), then $\nabla^i \colon \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp}$ is a differential operator of order ≤ 1 with coefficients in $\mathcal{B}_X$.

For any sections y_i of $\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp}$ and ω_j of $\widetilde{\Omega}^j_{X^\sharp/S^\sharp}$, with notation 4.7.2.4, as for 2.3.2.3.3, we get the formula:

$$\nabla^{i+j}(y_i \wedge \omega_j) = \nabla^i(y_i) \wedge \omega_j + (-1)^i y_i \wedge d^j_{\mathcal{B}_X}(\omega_j). \qquad (4.7.2.5.2)$$

We say that the connection ∇ of $\mathcal{E}$ is integrable if $\nabla^1 \circ \nabla = 0$. In that case $\nabla^{i+1} \circ \nabla^i = 0$ for any i and we get the complex

$$0 \to \mathcal{E} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^2_{X^\sharp/S^\sharp} \to \cdots \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^d_{X^\sharp/S^\sharp} \to 0, \qquad (4.7.2.5.3)$$

which is called the de Rham complex.

4.7.2.6 (de Rham complex: exchanging the position)**.** Let $\mathcal{E}$ be a $\mathcal{B}_X$-module endowed with a connection. To define the map $\nabla^i \colon \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} \to \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp}$ (see 4.7.2.5.1), it was more natural to put $\mathcal{E}$ on the left. However, we can define $\nabla^i \colon \widetilde{\Omega}^i_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \to \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$ to be the $\mathcal{O}_S$-linear map making commutative the diagram

$$\begin{array}{ccc}
\widetilde{\Omega}^i_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} & \xrightarrow{\nabla^i} & \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \\
\downarrow{\scriptstyle \sim} & & \downarrow{\scriptstyle \sim} \\
\mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} & \xrightarrow[\text{4.7.2.5.1}]{\nabla^i} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp},
\end{array} \qquad (4.7.2.6.1)$$

where the vertical isomorphism are the canonical ones. Via the formulas given at 4.7.2.4 and 4.7.2.5.2, for any sections z_i of $\widetilde{\Omega}^i_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$ and ω_j of $\widetilde{\Omega}^j_{X^\sharp/S^\sharp}$, with notation 4.7.2.4, we get

$$\nabla^{i+j}(\omega_j \wedge z_i) = (-1)^j \omega_j \wedge \nabla^i(z_i) + d^j_{\mathcal{B}_X}(\omega_j) \wedge z_i. \qquad (4.7.2.6.2)$$

When the connection is integrable, we denote by $\mathrm{DR}(\mathcal{E})$ the de Rham complex, by convention with $\mathcal{E}$ on the right side.

4.7.2.7. Let $\mathcal{E}$ be a $\mathcal{B}_X$-module endowed with a connection relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$. Suppose $X^\sharp/S^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d$. For any section x of $\mathcal{E}$, we denote by $\partial_{\sharp 1}(x), \ldots, \partial_{\sharp d}(x)$ the elements of $\mathcal{E}$ such that

$$\nabla(x) = \sum_{i=1}^{d} \partial_{\sharp i}(x) \otimes d\log u_i. \tag{4.7.2.7.1}$$

Using 4.7.2.5.2, we compute:

$$\nabla^1 \circ \nabla(x) = \nabla^1(\sum_{i=1}^{d} \partial_{\sharp i}(x) \otimes d\log u_i) = \sum_{j=1}^{d}\sum_{i=1}^{d} \partial_{\sharp j}(\partial_{\sharp i}(x)) \otimes d\log u_j \wedge d\log u_i.$$

Hence, the connection is integral is equivalent to saying that the maps $\partial_{\sharp i} \in \mathrm{End}_{\mathcal{O}_S}(\mathcal{E})$ commute two by two, i.e., for any $i, j \in \{1, \ldots, d\}$, for any section x of $\mathcal{E}$ we have the equality:

$$\partial_{\sharp j}(\partial_{\sharp i}(x)) = \partial_{\sharp i}(\partial_{\sharp j}(x)).$$

For any $\underline{k} \in \mathbb{N}^d$, we get the $\mathcal{O}_S$-linear map $\underline{\partial}_\sharp^{\underline{k}} \colon \mathcal{E} \to \mathcal{E}$ by setting $\underline{\partial}_\sharp^{\underline{k}} = \partial_{\sharp 1}^{k_1} \circ \cdots \circ \partial_{\sharp d}^{k_d}$. When, the connection is integrable, for any $\underline{k}, \underline{l} \in \mathbb{N}^d$, we get the equality

$$\underline{\partial}_\sharp^{\underline{l}} \circ \underline{\partial}_\sharp^{\underline{k}} = \underline{\partial}_\sharp^{\underline{k}} \circ \underline{\partial}_\sharp^{\underline{l}} = \underline{\partial}_\sharp^{\underline{k}+\underline{l}}. \tag{4.7.2.7.2}$$

Theorem 4.7.2.8. *Let $\mathcal{E}$ be a $\mathcal{B}_X$-module. The following are equivalent.*

(a) An integrable connection relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$ on $\mathcal{E}$.

(b) A structure of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module on $\mathcal{E}$ extending its structure of $\mathcal{B}_X$-module.

Proof. We copy the proof of 2.3.2.6 □

The following proposition states that the equivalence of Theorem 4.7.2.8 is in fact an equivalence of categories.

Proposition 4.7.2.9. *Let $\mathcal{E}, \mathcal{F}$ be two left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules and $f \colon \mathcal{E} \to \mathcal{F}$ be a $\mathcal{B}_X$-linear homomorphism. The following are equivalent.*

(a) The morphism f is $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-linear.

(b) The square below is commutative:

$$\begin{array}{ccc} \mathcal{E} & \xrightarrow{\nabla} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \\ \downarrow f & & \downarrow f\otimes \mathrm{id} \\ \mathcal{F} & \xrightarrow{\nabla} & \mathcal{F} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^1_{X^\sharp/S^\sharp}, \end{array} \tag{4.7.2.9.1}$$

where the connections are the ones associated via 4.7.2.8 with the left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module structures.

Proof. Since the proposition is local, then we can suppose $X^\sharp/S^\sharp$ has logarithmic coordinates $u_1, \ldots, u_d$. By using the formula 4.7.2.7.1, we compute that the square 4.7.2.9.1 is commutative if and only if $\partial_{\sharp i}(f(x)) = f(\partial_{\sharp i}(x))$ for any $i = 1, \ldots, r$. Since the ring $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ is generated as $\mathcal{O}_S$-algebra by $\mathcal{B}_X$ and by $\partial_{\sharp 1}, \ldots, \partial_{\sharp d}$, then we are done. □

4.7.2.10. Let $\phi \colon \mathcal{E} \to \mathcal{F}$ be a homomorphism of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules. It follows from 4.7.2.6.2 that the commutativity of 4.7.2.9.1 implies that of

$$\begin{array}{ccc} \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} & \xrightarrow{\nabla^i} & \mathcal{E} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp} \\ \downarrow \phi\otimes \mathrm{id} & & \downarrow \phi\otimes \mathrm{id} \\ \mathcal{F} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^i_{X^\sharp/S^\sharp} & \xrightarrow{\nabla^i} & \mathcal{F} \otimes_{\mathcal{B}_X} \widetilde{\Omega}^{i+1}_{X^\sharp/S^\sharp}. \end{array} \tag{4.7.2.10.1}$$

Hence, we get the morphism of $C(f^{-1}\mathcal{O}_S)$ of the form $\mathrm{DR}(\mathcal{E}) \to \mathrm{DR}(\mathcal{F})$ (see notation 4.7.2.6).

4.7.2.11. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module. We get the integrable connection $\nabla\colon \mathcal{E} \to \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}$ (see 4.7.2.8 and 4.7.2.6). This yields (see the construction of 4.7.2.5 and 4.7.2.6) the $\mathcal{O}_S$-linear map

$$\nabla^{n-1}\colon \widetilde{\Omega}^{n-1}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \to \widetilde{\Omega}^{n}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}. \tag{4.7.2.11.1}$$

Suppose now $X^\sharp/S^\sharp$ has logarithmic coordinates $u_1, \dots, u_d$. Let $\{i_1, \dots, i_{n-1}\}$ be $n-1$ elements of $\{1, \dots, d\}$. Let $\{j_1, \dots, j_{d-n+1}\}$ be the complementary. For any section x of $\mathcal{E}$, the formula 4.7.2.6.2 yields

$$\begin{aligned}\nabla^{n-1}((d\log u_{i_1} \wedge \cdots \wedge d\log u_{i_{n-1}}) \otimes x) &= (-1)^{n-1} d\log u_{i_1} \wedge \cdots \wedge d\log u_{i_{n-1}} \wedge \nabla(x)\\ &= (-1)^{n-1} \sum_{a=1}^{d-n+1} (d\log u_{i_1} \wedge \cdots \wedge d\log u_{i_{n-1}} \wedge d\log u_{j_a}) \otimes \partial_{\sharp j_a}(x).\end{aligned} \tag{4.7.2.11.2}$$

4.7.2.12. Viewing $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ as a left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module, we get from 4.7.2.11.1 the $\mathcal{O}_S$-linear map:

$$\nabla^{n-1}\colon \widetilde{\Omega}^{n-1}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \to \widetilde{\Omega}^{n}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}. \tag{4.7.2.12.1}$$

In fact, since $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ as a $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-bimodule then we get by functoriality (see 4.7.2.9) that 4.7.2.12.1 is a homomorphism of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules.

Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module. Similarly to 2.3.2.10.3, we get the commutative diagram:

$$\begin{array}{ccc}(\widetilde{\Omega}^{n-1}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}} \mathcal{E} & \xrightarrow{\nabla^{n-1}\otimes \mathrm{id}} & (\widetilde{\Omega}^{n-1}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}} \mathcal{E} \\ \downarrow\wr & & \downarrow\wr \\ \widetilde{\Omega}^{n-1}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} & \xrightarrow{\nabla^{n-1}} & \widetilde{\Omega}^{n}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E},\end{array} \tag{4.7.2.12.2}$$

where the vertical isomorphisms are the canonical ones. Hence we have the canonical isomorphism of $C({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$ of the form $\mathrm{DR}(\mathcal{E}) \xrightarrow{\sim} \mathrm{DR}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}} \mathcal{E}$.

4.7.3 Tangent sheaf, homological dimension, Spencer resolutions

4.7.3.1 (Tangent sheaf)**.** When $\mathcal{E}$ is a $\mathcal{B}_X$-module, we write $\mathcal{E}^\vee := \mathcal{H}om_{\mathcal{B}_X}(\mathcal{E}, \mathcal{B}_X)$. We set $\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} := (\widetilde{\Omega}^1_{X^\sharp/S^\sharp})^\vee$, the tangent sheaf relative to $X^\sharp/S^\sharp$ with coefficients in $\mathcal{B}_X$. From the canonical inclusion $\widetilde{j}\colon \widetilde{\Omega}^1_{X^\sharp/S^\sharp} \hookrightarrow \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp}$, we obtain by duality the canonical epimorphism $\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp,1} \twoheadrightarrow \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$ whose kernel is $\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp,0} = \mathcal{B}_X$. From the canonical epimorphism $\widetilde{\varpi}_{X^\sharp/S^\sharp}\colon p_{0*}\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \twoheadrightarrow \widetilde{\Omega}^1_{X^\sharp/S^\sharp}$ (see 4.7.1.5.3), we get by duality the $\mathcal{B}_X$-linear monomorphism $\widetilde{\varpi}^\vee_{X^\sharp/S^\sharp}\colon \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \hookrightarrow \widetilde{\mathcal{D}}_{X^\sharp/S^\sharp,1}$ (for the left structure of $\widetilde{\mathcal{D}}_{X^\sharp/S^\sharp,1}$).

The morphisms $\widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{P}}^1_{X^\sharp/S^\sharp,(m)}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,1} \to \widetilde{\mathcal{D}}_{X^\sharp/S^\sharp,1}$ are isomorphisms for any $m \in \mathbb{N}$. This yields $\mathrm{gr}_1 \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$. Moreover, we get the $\mathcal{B}_X$-linear monomorphism

$$\iota^{(m)}\colon \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \overset{\widetilde{\varpi}^\vee_{X^\sharp/S^\sharp}}{\hookrightarrow} \widetilde{\mathcal{D}}_{X^\sharp/S^\sharp,1} \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,1} \hookrightarrow \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}. \tag{4.7.3.1.1}$$

Suppose $X^\sharp/S^\sharp$ has logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,d}$. Following the local description given at 4.7.1.7, $\iota^{(m)}(\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp})$ is equal to the free $\mathcal{B}_X$-submodule (for the left or the right structure) of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ generated by elements $\partial_{\sharp 1}, \dots, \partial_{\sharp d}$.

Proposition 4.7.3.2. *The homomorphism $\iota^{(0)}\colon \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ (see 4.7.3.1.1) induces the isomorphism of graded $\mathcal{B}_X$-algebras:*

$$\mathbb{S}(\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}) \xrightarrow{\sim} \mathrm{gr}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}.$$

Proof. Since this is local, we can suppose $X^\sharp/S^\sharp$ has logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,d}$. Following 4.7.3.1, $\iota^{(0)}$ identifies $\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$ with the free $\mathcal{B}_X$-submodule of $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ generated by elements $\partial_{\sharp 1},\dots,\partial_{\sharp d}$. Denote by $\xi_{\sharp i}$ the image of $\partial_{\sharp i}$ in $\mathrm{gr}_1\,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$. Then it follows from 4.1.2.17.a that $\mathrm{gr}\,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ is equal to the commutative polynomial $\mathcal{B}_X$-algebra with the variable $\xi_{\sharp 1},\dots,\xi_{\sharp d}$.

□

We suppose from now $\underline{f}\colon X\to S$ has pure relative dimension d.

Notation 4.7.3.3. We sometimes remove the canonical inclusion $\iota^{(0)}$ in the notation, i.e. we might canonically identify $\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$ with a sub-$\mathcal{B}_X$-module of $\mathcal{D}^{(0)}_{X^\sharp/S^\sharp}$. For any sections v_1,v_2 of $\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$, we denote by $[v_1,v_2]$ the section of $\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$ which corresponds to the section $v_1v_2-v_2v_1$ (we use the ring structure of $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ and we remark $v_1v_2-v_2v_1\in\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$). The $f^{-1}\mathcal{O}_S$-bilinear map $[-,-]\colon\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\times\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\to\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$ satisfies the Jacobi identity, i.e. we get a Lie bracket on the tangent space with coefficients in $\mathcal{B}_X$.

Definition 4.7.3.4. Let $\mathcal{E}=(\mathcal{E}_n)_{n\in\mathbb{N}}$ be a filtered left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module, i.e a left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module endowed with an exhaustive filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ by $\mathcal{B}_X$-submodules so that $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp,n'}\cdot\mathcal{E}_n\subset\mathcal{E}_{n+n'}$.

For any sections v_1,v_2 of $\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}$ and b of $\mathcal{B}_X$, we compute $v_1b-bv_1=v_1(b)$ and $[bv_1,v_2]=b[v_1,v_2]-v_2(b)v_1$. Hence, similarly to [Kas95, 1.6], we can check that the morphism of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$\delta\colon\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^i\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}_{j-1}\to\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^{i-1}\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}_j \tag{4.7.3.4.1}$$

given by

$$\begin{aligned}\delta\left(P\otimes(v_1\wedge\cdots\wedge v_i)\otimes u\right)=&\sum_{a=1}^{i}(-1)^{a-1}Pv_a\otimes(v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge v_i)\otimes u\\&-\sum_{a=1}^{i}(-1)^{a-1}P\otimes(v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge v_i)\otimes v_au\\&+\sum_{1\le a<b\le i}(-1)^{a+b}P\otimes([v_a,v_b]\wedge v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge\widehat{v_b}\wedge\cdots\wedge v_i)\otimes u\end{aligned}$$

is well defined. Moreover, we compute easily that we get the following complex of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$0\to\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^d\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}_{n-d}\cdots\xrightarrow[\delta]{}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}_{n-1}\xrightarrow[\delta]{}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}_n\to\mathcal{E}\to 0. \tag{4.7.3.4.2}$$

We call 4.7.3.4.2 the first Spencer sequence of degree n of $\mathcal{E}$ and denote it by $\mathrm{Sp}_{n,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{E})$ or $\mathrm{Sp}_n(\mathcal{E})$.

Remark 4.7.3.5. With the notations of 4.7.3.4, we put $\mathcal{M}:=\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}$ and $\mathcal{M}_s:=\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}_s$. We define a homomorphism of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules $\mathcal{M}_{s-1}\otimes_{\mathcal{B}_X}\wedge^r\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\to\mathcal{M}_s\otimes_{\mathcal{B}_X}\wedge^{r-1}\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ by applying the functor $\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}-$ to 4.7.3.4.1 and by functoriality of the transposition isomorphism $\delta_{X^\sharp}\colon\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ (see 4.2.5.5). We get therefore a complex denoted by $\mathrm{Sp}^\bullet_{s,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{M})$ and inducing by construction the isomorphism $\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\mathrm{Sp}^\bullet_{s,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{E})\xrightarrow{\sim}\mathrm{Sp}^\bullet_{s,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{M})$.

Theorem 4.7.3.6. *With the notations of 4.7.3.4, let us suppose moreover that the filtration of $\mathcal{E}$ is good. Hence, for s large enough, $\mathrm{Sp}^\bullet_{s,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{E})$ is exact.*

Proof. This is checked similarly to [Kas95, 1.6.1]. More precisely, the proof has the following two steps.

Step 1. We check by induction on the integer $s\ge 0$ that $\mathrm{Sp}^\bullet_{s,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S})$ is an exact sequence when $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S}$ is endowed with its order filtration. When $s=0$, this is straightforward since $\mathrm{Sp}^\bullet_{0,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S})$

is equal to the exact sequence

$$0 \to 0 \xrightarrow{\delta} \cdots \xrightarrow{\delta} 0 \xrightarrow{\delta} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S,0} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S} \to 0, \tag{4.7.3.6.1}$$

Suppose now $\mathrm{Sp}^{\bullet}_{s-1,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S})$ is an exact sequence for $s \geq 1$ and consider the commutative diagram where we have removed $/S$ in the notation

$$\begin{array}{ccccccccc}
 & & 0 & & 0 & & 0 & & 0 \\
 & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
0 \to & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \wedge^d \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp,s-1-d} & \cdots \xrightarrow{\delta} & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp,s-2} & \xrightarrow{\delta} & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp,s-1} & \to & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} & \to 0 \\
 & \downarrow & & \downarrow & & \downarrow & & \downarrow & \\
0 \to & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \wedge^d \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp,s-d} & \cdots \xrightarrow{\delta} & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp,s-1} & \xrightarrow{\delta} & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp,s} & \to & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} & \to 0 \\
 & \downarrow & & \downarrow & & \downarrow & & \downarrow & \\
0 \to & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \wedge^d \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \mathrm{gr}_{s-d}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} & \cdots \xrightarrow{\mathrm{id}\otimes\beta} & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \mathrm{gr}_{s-1}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} & \xrightarrow{\mathrm{id}\otimes\beta} & \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} \otimes_{\mathcal{B}_X} \mathrm{gr}_s\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp} & \to & 0 & \\
 & \downarrow & & \downarrow & & \downarrow & & & \\
 & 0 & & 0 & & 0 & & &
\end{array} \tag{4.7.3.6.2}$$

where the first row (resp. second row) is $\mathrm{Sp}^{\bullet}_{s-1,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S})$ (resp. $\mathrm{Sp}^{\bullet}_{s,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S})$), where $\beta \colon \wedge^i \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \mathrm{gr}_{j-1}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \to \wedge^{i-1} \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \mathrm{gr}_j\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ is given by the formula

$$\beta\left((v_1 \wedge \cdots \wedge v_i) \otimes \overline{u}\right) = \sum_{a=1}^{i} (-1)^a (v_1 \wedge \cdots \wedge \widehat{v_a} \wedge \cdots \wedge v_i) \otimes v_a \overline{u}.$$

The fact that the sequence

$$0 \longrightarrow \wedge^d \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \mathrm{gr}_{s-d}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \cdots \xrightarrow{\beta} \widetilde{\mathcal{T}}_{X^\sharp/S} \otimes_{\mathcal{B}_X} \mathrm{gr}_{s-1}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \xrightarrow{\beta} \mathrm{gr}_s\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \longrightarrow 0 \tag{4.7.3.6.3}$$

is exact is local. Hence, we can suppose $X^\sharp/S^\sharp$ has logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,d}$ that we fix. This yields $\mathrm{gr}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ is a ring of polynomial with coefficients over $\mathcal{B}_X$ with coordinates $\xi_{\sharp 1}, \ldots, \xi_{\sharp d}$ the elements induced by $\partial_{\sharp 1}, \ldots, \partial_{\sharp d}$ (see 4.1.2.17). Moreover, we see that the exact sequence 4.7.3.6.3 is equal to the s-graded part of the Koszul complex of $\mathrm{gr}\, \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ associated with the regular elements $\xi_{\sharp 1}, \ldots, \xi_{\sharp d}$. Hence, 4.7.3.6.3 is exact. We conclude by noticing that the forth row of the diagram 4.7.3.6.2 is equal to the image of 4.7.3.6.3 by the exact functor $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} -$.

Step 2. We conclude therefore similarly to the end of the proof of [Kas95, 1.6.1]. □

Example 4.7.3.7. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module which is $\mathcal{B}_X$-coherent. Then its trivial filtration, i.e. the filtration $(\mathcal{E}_n)_{n\in\mathbb{N}}$ with $\mathcal{E}_n = \mathcal{E}$, is a good filtration. Hence, we get the exact sequence of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$0 \to \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \wedge^d \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \cdots \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \wedge \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E} \to \mathcal{E} \to 0, \tag{4.7.3.7.1}$$

that we denote by $\mathrm{Sp}^{\bullet}_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{E})$. In particular, taking the trivial filtration of $\mathcal{B}_X$, we get the exact sequence of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$0 \to \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \wedge^d \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \cdots \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \wedge \widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \xrightarrow[\delta]{} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \to \mathcal{B}_X \to 0 \tag{4.7.3.7.2}$$

where the map
$$\delta\colon \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^i\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\to \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^{i-1}\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp} \tag{4.7.3.7.3}$$
is given by the formula
$$\begin{aligned}\delta\left(P\otimes(v_1\wedge\cdots\wedge v_i)\right)=&\sum_{a=1}^{i}(-1)^{a-1}Pv_a\otimes(v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge v_i)\\ &+\sum_{1\le a<b\le i}(-1)^{a+b}P\otimes([v_a,v_b]\wedge v_1\wedge\cdots\wedge\widehat{v_a}\wedge\cdots\wedge\widehat{v_b}\wedge\cdots\wedge v_i).\end{aligned}$$

In particular, we get
$$\mathcal{B}_X\in D^{\mathrm{b}}_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}). \tag{4.7.3.7.4}$$

Remark 4.7.3.8. Let us denote by $\widetilde{\mathrm{Sp}}^{(0)}_{X^\sharp/S^\sharp}:=\mathrm{Sp}^{\bullet}_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{B}_X)$ and $\mathrm{Sp}^{(0)}_{X^\sharp/S^\sharp}:=\mathrm{Sp}^{\bullet}_{\mathcal{D}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{O}_X)$. Then by construction we have the canonical isomorphism of $C({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$:
$$\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{D}^{(0)}_{X^\sharp/S^\sharp}}\mathrm{Sp}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\widetilde{\mathrm{Sp}}^{(0)}_{X^\sharp/S^\sharp}. \tag{4.7.3.8.1}$$

Since $\widetilde{\mathrm{Sp}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\mathcal{B}_X$ and $\mathrm{Sp}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\mathcal{O}_X$ (see 4.7.3.7.2), this yields the well known (e.g. use 4.3.4.6.1) isomorphism
$$\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{D}^{(0)}_{X^\sharp/S^\sharp}}\mathcal{O}_X\xrightarrow{\sim}\mathcal{B}_X. \tag{4.7.3.8.2}$$

Conversely, from the 4.7.3.8.2 and $\mathrm{Sp}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\mathcal{O}_X$ we get $\widetilde{\mathrm{Sp}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\mathcal{B}_X$ (i.e. Spencer resolution with constant coefficients implies Spencer resolution with coefficients, which was not obvious since $\mathcal{D}^{(0)}_{X^\sharp/S^\sharp}\to\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ is not flat).

4.7.3.9. We can construct the map 4.7.2.12.1 in a second way by duality from the Spencer morphisms as follows. Since $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ is a locally free $\mathcal{B}_X$-module for its left structure (in particular), since $\widetilde{\Omega}^i_{X^\sharp/S^\sharp}$ is locally free of finite type for any integer $0\le i\le d$, then we get the canonical isomorphism of $(\mathcal{B}_X,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$-bimodules:
$$\begin{aligned}&\widetilde{\Omega}^i_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\wedge^i(\widetilde{\mathcal{T}}^\vee_{X^\sharp/S^\sharp})\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\underset{2.3.3.7.1}{\xrightarrow{\sim}}\wedge^i(\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp})^\vee\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\sim}\\ &\xrightarrow{\sim}\mathcal{H}om_{\mathcal{B}_X}\left(\wedge^i\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp},\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\right)\xrightarrow{\sim}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}\left(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^i\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp},\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\right).\end{aligned} \tag{4.7.3.9.1}$$

Hence, for any integer $0\le n\le d$, we get the morphism of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules $\delta^\star_n$ making commutative the diagram
$$\begin{array}{ccc}\widetilde{\Omega}^{n-1}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} & \xrightarrow{\delta^\star_n} & \widetilde{\Omega}^{n}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\\ \sim\downarrow 4.7.3.9.1 & & \sim\downarrow 4.7.3.9.1\\ \mathcal{H}om_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}\left(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^{n-1}\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp},\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\right) & \xrightarrow{\delta^\vee_n} & \mathcal{H}om_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}\left(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^{n}\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp},\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\right),\end{array} \tag{4.7.3.9.2}$$
where $\delta^\vee_n$ is the image under the functor $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(-,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$ of the Spencer morphism of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules 4.7.3.7.3.

Lemma 4.7.3.10. *Both maps 4.7.2.12.1 and 4.7.3.9.2 are equal, i.e.* $\delta^\star_n=\nabla^{n-1}$.

Proof. We copy the proof of 2.3.3.9. □

4.7.3.11. By applying the functor $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(-,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$ to the complex of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^d\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\xrightarrow[\delta_d]{}\cdots\xrightarrow[\delta]{}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\xrightarrow[\delta_1]{}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \tag{4.7.3.11.1}$$

via the canonical isomorphisms 4.7.3.9.1, we get the complex of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow[\nabla^0]{}\widetilde{\Omega}^1_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow[\nabla^1]{}\cdots\xrightarrow[\nabla]{}\widetilde{\Omega}^{d-1}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow[\nabla^{d-1}]{}\widetilde{\Omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}. \tag{4.7.3.11.2}$$

It follows from 4.7.3.10 that the complex of $C({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$ defined at 4.7.3.11.2 is the de Rham complex of $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ and is denoted by $\mathrm{DR}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$ (see 4.7.2.5).

If $\mathcal{E}\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$, we define the de Rham complex of $\mathcal{E}$ to be the complex

$$\mathrm{DR}(\mathcal{E}):=\mathrm{DR}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})\otimes_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}\mathcal{E}.$$

Remark, when $\mathcal{E}$ is a left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module, following 4.7.2.12 we retrieve the usual de Rham complex (up to canonical isomorphisms) as defined at 4.7.2.5.

4.7.3.12. By applying the functor $\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}-$ to the morphism of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules 4.7.3.7.3, we get the morphism of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules:

$$\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^n\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp})\to\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^{n-1}\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}). \tag{4.7.3.12.1}$$

We have moreover the isomorphism of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$\begin{aligned}\widetilde{\Omega}^{d-n}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}&\xrightarrow[2.3.3.7.5]{\sim}(\wedge^n\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\omega}_{X^\sharp/S^\sharp})\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\\&\xrightarrow[\widetilde{\delta}_{X^\sharp/S^\sharp}\otimes\mathrm{id}_{\wedge^n\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}}]{\sim}\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^n\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}),\end{aligned} \tag{4.7.3.12.2}$$

where $\widetilde{\delta}_{X^\sharp/S^\sharp}$ is the transposition isomorphism (see 4.2.5.6.1)

Lemma 4.7.3.13. *For any integer $0\le n\le d$, the following square of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules*

$$\begin{array}{ccc}\widetilde{\Omega}^{d-n}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} & \xrightarrow[4.7.3.12.2]{\sim} & \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^n\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp})\\ {\scriptstyle (-1)^{d-n+1}\nabla^{d-n}}\big\downarrow{\scriptstyle 4.7.2.12.1} & & {\scriptstyle 4.7.3.12.1}\big\downarrow{\scriptstyle \mathrm{id}\otimes\delta_n}\\ \widetilde{\Omega}^{d-n+1}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} & \xrightarrow[4.7.3.12.2]{\sim} & \widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\wedge^{n-1}\widetilde{\mathcal{T}}_{X^\sharp/S^\sharp}),\end{array} \tag{4.7.3.13.1}$$

is commutative.

Proof. We can copy the proof of 2.3.3.12. □

Proposition 4.7.3.14. *We have the following properties.*

(i) The map $\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\xrightarrow{\beta}\widetilde{\omega}_{X^\sharp/S^\sharp}$ given by the structure of a right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module on $\widetilde{\omega}_{X^\sharp/S^\sharp}$ induces a $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-linear resolution $\mathrm{DR}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})[d]\xrightarrow{\sim}\widetilde{\omega}_{X^\sharp/S^\sharp}$ of $\widetilde{\omega}_{X^\sharp/S^\sharp}$.

(ii) $\mathcal{E}xt^i_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{B}_X,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})=0$ for $i\neq d$. There is a canonical isomorphism of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules

$$\mathcal{E}xt^d_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}}(\mathcal{B}_X,\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})\xrightarrow{\sim}\widetilde{\omega}_{X^\sharp/S^\sharp}.$$

Proof. By applying the functor $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} -$ to the exact sequence 4.7.3.7.2, with 4.7.3.13, we get that $\mathrm{DR}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})[d]$ is a resolution of $\widetilde{\omega}_{X^\sharp/S^\sharp}$. Moreover, we compute that the map $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \xrightarrow{\beta} \widetilde{\omega}_{X^\sharp/S^\sharp}$ of the resolution $\mathrm{DR}(\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})[d] \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp/S^\sharp}$ is given by the structure of a right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-module on $\widetilde{\omega}_{X^\sharp/S^\sharp}$. □

Remark 4.7.3.15 (Level m case). We get the level $m \in \mathbb{N} \cup \{\infty\}$ of the formal case when we tensor by $\mathbb{Q}$. More precisely, suppose we are of the formal case and write $X^\sharp/S^\sharp$ by $\mathfrak{X}^\sharp/\mathfrak{S}^\sharp$. Suppose that $\mathcal{B}_{\mathfrak{X}} \to \mathcal{B}_{\mathfrak{X},\mathbb{Q}}$ is an isomorphism. The extension $\mathcal{B}_{\mathfrak{X}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \to \mathcal{B}_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(0)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} \xrightarrow{\sim} \mathcal{B}_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ is therefore an isomorphism. Hence denoting $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp} := \mathcal{B}_{\mathfrak{X},\mathbb{Q}} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$, we get $\mathcal{B}_{\mathfrak{X}} \in D^{\mathrm{b}}_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp})$ and 4.7.3.6 and 4.7.3.14 are still valid by replacing 0 by m.

Corollary 4.7.3.16 (Homological dimension)**.** *Suppose S is affine, X is affine and regular, and $f\colon X^\sharp \to S^\sharp$. Let $r := \sup_{s \in f(X)} \dim \mathcal{O}_{S,s}$. Then the ring $D^{(0)}_{X^\sharp/S^\sharp} := \Gamma(X, \mathcal{D}^{(0)}_{X^\sharp/S^\sharp})$ has homological global dimension equal to $2d + r$.*

Proof. We can copy the proof of 2.3.4.5. □

Chapter 5

Operations on differential of level m of finite order modules

5.1 Definitions of the functors and first properties

This section deals with cohomological operations at fixed level $m \in \mathbb{N}$. Over $\mathbb{C}$ we have in the theory of $\mathcal{D}$-modules four operations basing on which we can deduce the others: the direct image f_+, extraordinary inverse image $f^!$, dual, external tensor product. In the arithmetic theory, it is also necessary to consider two supplementary operations:

- the base change, the base scheme is not necessarily the spectrum of a field;

- the extension of ring of differential operators via ring homomorphisms of the form $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp} \to \mathcal{B}'_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$. with $m \leq m'$ and induced by coefficient homomorphisms $\mathcal{B}_X \to \mathcal{B}'_X$.

5.1.1 Extraordinary inverse image of complexes of $\mathcal{D}$-modules, base change

Unless otherwise stated, we use in this subsection the notation of 5.1.1.1.

5.1.1.1. Let

$$\begin{array}{ccc} X^\sharp & \xrightarrow{f} & Y^\sharp \\ \downarrow{\scriptstyle p_{X^\sharp}} & & \downarrow{\scriptstyle p_{Y^\sharp}} \\ S^\sharp & \xrightarrow{\mathscr{b}} & T^\sharp, \end{array} \tag{5.1.1.1.1}$$

be a commutative diagram where $S^\sharp$ and $T^\sharp$ are nice fine log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ as defined in 3.1.1.1 with i an integer (resp. $S^\sharp$ and $T^\sharp$ are nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10), where $X^\sharp$ is a log smooth $S^\sharp$-log-scheme (resp. log smooth $S^\sharp$-log formal scheme) and $Y^\sharp$ is a log smooth $T^\sharp$-log scheme (resp. a log smooth $T^\sharp$-log formal scheme). Let $\mathcal{B}_X$ (resp. $\mathcal{B}_Y$) be a commutative $\mathcal{O}_X$-algebra (resp. $\mathcal{O}_Y$-algebra) endowed with a compatible structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module). Let us recall that the action of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $f^*\mathcal{B}_Y$ is compatible with its structure of $\mathcal{O}_X$-algebra (see 3.4.4.6). We suppose finally that we have a morphism of algebras $f^*\mathcal{B}_Y \to \mathcal{B}_X$ which is moreover $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. We will again denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$. We denote by $\widetilde{X}^\sharp$ (resp. $\widetilde{Y}^\sharp$) the ringed logarithmic ($\mathcal{V}$-formal) scheme $(X^\sharp, \mathcal{B}_X)$ (resp. $(Y^\sharp, \mathcal{B}_Y)$), and by $\tilde{f} \colon \widetilde{X}^\sharp/S^\sharp \to \widetilde{Y}^\sharp/T^\sharp$ the morphism of relative ringed logarithmic ($\mathcal{V}$-formal) schemes induced by the diagram 5.1.1.1.1 and by $f^*\mathcal{B}_Y \to \mathcal{B}_X$. When $S^\sharp \to T^\sharp$ in understood, by abuse of notation, we sometimes also denote by $\tilde{f}$ the induced morphism $\widetilde{X}^\sharp \to \widetilde{Y}^\sharp$ of ringed logarithmic ($\mathcal{V}$-formal) schemes.

Let $U := X^{\sharp *}$ be the open of X where $M_{X^\sharp}$ is trivial and $j_U \colon U \hookrightarrow X^\sharp$ be the canonical open immersion. Let $V := Y^{\sharp *}$ be the open of Y where $M_{Y^\sharp}$ is trivial and $j_V \colon V \hookrightarrow X^\sharp$ be the canonical open immersion.

Notation 5.1.1.2. We deduce by functoriality from 4.4.2.4 that we get a structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodule on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} := \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$. When $S^\sharp \to T^\sharp$ is the identity, we can simply write $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/T^\sharp}$ and when moreover there is no doubt about S we write $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp}$. When $\mathcal{B}_X = \mathcal{O}_X$ and $\mathcal{B}_Y = \mathcal{O}_Y$, we denote this bimodule by $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$, and when $\mathscr{b} = \mathrm{id}$, we simply write $\mathcal{D}^{(m)}_{X^\sharp\to Y^\sharp/T^\sharp}$ or $\mathcal{D}^{(m)}_{X^\sharp\to Y^\sharp}$.

We deduce by functoriality from 4.4.2.4 and 4.3.5.7, we get a structure of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodule on

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} := \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{f}^*_r\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}\right),$$

where the index "r" means that we have chosen the right (i.e. the twisted) structure of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$ on $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}$ to compute structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ via the functor $\widetilde{f}^*$.

When $S \to T$ is the identity, we can simply write $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow X^\sharp/S^\sharp}$ and when moreover there is no doubt about S we write $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow X^\sharp}$. When $\mathcal{B}_X = \mathcal{O}_X$ and $\mathcal{B}_Y = \mathcal{O}_Y$, we denote this bimodule by $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp}$, and when $\mathscr{b} = \mathrm{id}$, we simply write $\mathcal{D}^{(m)}_{X^\sharp\to Y^\sharp/T^\sharp}$ or $\mathcal{D}^{(m)}_{Y^\sharp\leftarrow X^\sharp}$.

We have the isomorphism of left $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodules

$$\widetilde{f}^*_r\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}\right) \underset{\widetilde{f}^*(4.2.5.6.3)}{\overset{\sim}{\longrightarrow}} \widetilde{f}^*_l\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}\right),$$

where the index "l" means that we have chosen the left structure. By tensoring this latter isomorphism with $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} -$, we get the isomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodules

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \overset{\sim}{\longrightarrow} \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}\widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}. \tag{5.1.1.2.1}$$

Lemma 5.1.1.3. *Suppose $\widetilde{f}$ is quasi-flat (see Definition 4.4.1.3). Then $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\to X^\sharp/S^\sharp}$) is solvable in the sense of 4.6.3.2.b as a complex of $C(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $C(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$).*

Proof. By definition, there exists a morphism of schemes (resp. of $\mathcal{V}$-formal schemes) of the form $T \to U$ such that both induced morphisms of ringed spaces $g\colon (X, \mathcal{B}_X) \to U$ and $h\colon (Y, \mathcal{B}_Y) \to U$ are flat. Since $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}/\mathcal{B}_Y$ is flat, since h is flat we get that $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}/h^{-1}(\mathcal{O}_U)$ is flat. Moreover, $h^{-1}(\mathcal{O}_U)$ is sent into the center of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$. Hence, $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}/g^{-1}(\mathcal{O}_U)$ is flat and $g^{-1}(\mathcal{O}_U)$ is sent in the center of $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}/\mathcal{B}_X$ is flat, since g is flat, we get that $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}/g^{-1}(\mathcal{O}_U)$ is flat. Hence, $g^{-1}(\mathcal{O}_U)$ is a solving ring of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$. Similarly, we check that $g^{-1}(\mathcal{O}_U)$ is a solving ring of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp}$. □

Definition 5.1.1.4. We keep notation 5.1.1.2. Set $d_f := \delta_{X^\sharp/S^\sharp} - \delta_{Y^\sharp/T^\sharp} \circ f$, where $\delta_{X^\sharp/S^\sharp}$, $\delta_{Y^\sharp/T^\sharp}$ are respectively the rank (as a locally constant function on X' or X respectively) of the locally free modules $\Omega_{X^\sharp/S^\sharp}$ and $\Omega_{Y^\sharp/T^\sharp}$.

(a) The (left version of the) extraordinary inverse image functor of level m by $\widetilde{f}$ is the functor $\widetilde{f}^{(m)!}\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ which is defined by setting for any $\mathcal{F} \in D(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$:

$$\widetilde{f}^{(m)!}(\mathcal{F}) := \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F}\,[d_f].$$

(b) The (right version of the) extraordinary inverse image functor of level m by $\widetilde{f}$ is the functor $\widetilde{f}^{(m)!}\colon D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ which is defined by setting

$$\widetilde{f}^{(m)!}(\mathcal{M}) := f^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp}\,[d_f],$$

where $\mathcal{M} \in D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.

5.1.1.5 (Left to right)**.** The left and the right versions of the extraordinary inverse image functors of level m by $\widetilde{f}$ of 5.1.1.4 are compatible with the quasi-inverse exact functors of 4.3.5.7 exchanging left and right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structures (resp. left and right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module structures). More precisely, for any $\mathcal{M} \in D({}^r\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, we have the isomorphisms:

$$\begin{aligned}\widetilde{f}^{(m)!}(\mathcal{M} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}) &\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \left(f^{-1}(\mathcal{M}) \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}\widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp})\right)\ [d_f]\\ &\xrightarrow{\sim} f^{-1}(\mathcal{M}) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}\widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp})\right)\ [d_f]\\ &\underset{5.1.1.2.1}{\xrightarrow{\sim}} \widetilde{f}^{(m)!}(\mathcal{M}) \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}. \end{aligned} \tag{5.1.1.5.1}$$

5.1.1.6. Let $\mathscr{P}_{Y^\sharp/T^\sharp}$ be the collection of complexes of $K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ which are K-flat as a complex of $K(\mathcal{B}_Y)$.

(a) Following 4.4.2.4, we have the functor $\widetilde{f}^* := \mathcal{B}_X \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}-\colon K({}^l\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to K({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. Moreover, for any $\mathcal{G} \in K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, it follows from 4.4.2.9.1 that the canonical morphism

$$\widetilde{f}^*(\mathcal{G}) := \mathcal{B}_X \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}\mathcal{G} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{G} \tag{5.1.1.6.1}$$

is an isomorphism of $K(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. When the coefficients are constant, i.e. $\mathcal{B}_X = \mathcal{O}_X$ and $\mathcal{B}_Y = \mathcal{O}_Y$, we simply write f^* this functor.

(b) The collection $\mathscr{P}_{Y^\sharp/T^\sharp}$ satisfies the conditions (1) and (2) of [Sta22, 13.14.15] with respect to the functor

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}-\colon K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}),$$

which implies that for any quasi-isomorphism $\mathcal{P} \xrightarrow{\sim} \mathcal{E}$ of $K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ such that $\mathcal{P}$ is an object of $\mathscr{P}$, (in that case we say that $\mathcal{P}$ is representing $\mathcal{E}$), then

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{P} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{E}.$$

Indeed, since $\mathscr{P}_{Y^\sharp/T^\sharp}$ contains the collection of K-flat complexes of $K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ then we get the condition (1). Moreover, let $u\colon \mathcal{P} \to \mathcal{P}'$ be a quasi-isomorphism between two objects of $\mathscr{P}_{Y^\sharp/T^\sharp}$. It follows from 5.1.1.6.1 that the morphism

$$id \otimes u\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{P} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{P}'$$

is canonically isomorphic to $id\otimes u\colon \mathcal{B}_X \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}\mathcal{P} \to \mathcal{B}_X \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}\mathcal{P}'$. Since $\mathcal{P}$ and $\mathcal{P}'$ are K-flat in $K(\mathcal{B}_Y)$, then it follows from [Sta22, 20.26.13] that this latter morphism is a quasi-isomorphism.

(c) Similarly, since $\mathscr{P}_{Y^\sharp/T^\sharp}$ satisfies also the condition (1) and (2) of [Sta22, 13.14.15] with respect to the functor $\widetilde{f}^*$, then $\widetilde{f}^*$ is left derivable. Let $\mathbb{L}\widetilde{f}^*\colon D({}^l\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ be the left derived functor of $\widetilde{f}^*$. For any $\mathcal{F} \in D({}^l\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, we have the canonical isomorphism of $D({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$\mathbb{L}\widetilde{f}^*(\mathcal{F})[d_f] \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{F}). \tag{5.1.1.6.2}$$

(d) Since 5.1.1.6.1 is an isomorphism then for any $\mathcal{P} \in \mathscr{P}_{Y^\sharp/T^\sharp}$, we have

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{P} \in \mathscr{P}_{X^\sharp/S^\sharp}. \tag{5.1.1.6.3}$$

Lemma 5.1.1.7. *For $\mathcal{E}$ and $\mathcal{F}$ two objects of $D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, with notation 5.1.1.6, we have the isomorphisms of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:*

$$\mathbb{L}\widetilde{f}^*(\mathcal{E}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^*(\mathcal{F}) \xrightarrow{\sim} \mathbb{L}\widetilde{f}^*(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathcal{F}), \qquad \mathbb{L}\widetilde{f}^{(m)!}(\mathcal{E}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^{(m)!}(\mathcal{F}) \xrightarrow{\sim} \mathbb{L}\widetilde{f}^{(m)!}(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathcal{F})[d_f]. \tag{5.1.1.7.1}$$

Proof. We choose a complex $\mathcal{P}$ (resp. $\mathcal{Q}$) of $\mathscr{P}_{Y^\sharp/T^\sharp}$ (see notation of 5.1.1.6) representing $\mathcal{E}$ (resp. $\mathcal{F}$). Following 4.4.5.14.1, we get an isomorphism of $C({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ of the form

$$\widetilde{f}^*(\mathcal{P}) \otimes_{\mathcal{B}_X} \widetilde{f}^*(\mathcal{Q}) \xrightarrow{\sim} \widetilde{f}^*(\mathcal{P} \otimes_{\mathcal{B}_Y} \mathcal{Q}).$$

Hence, we are done. □

Proposition 5.1.1.8. *Suppose $\mathcal{B}_X = f^*\mathcal{B}_Y$. Suppose $f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_X$ are tor independent over $f^{-1}\mathcal{B}_Y$. Let $* \in \{\mathrm{l}, \mathrm{r}\}$, let $\mathcal{F} \in D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ and $\mathrm{forg}(\mathcal{F})$ (or simply $\mathcal{F}$) be the induced object of $D({}^*\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp})$. The canonical homomorphism*

$$f^{(m)!}(\mathrm{forg}(\mathcal{F})) \to \widetilde{f}^{(m)!}(\mathcal{F}) \tag{5.1.1.8.1}$$

is an isomorphism of $D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

Proof. When $* = \mathrm{l}$, the proposition was checked at 4.4.5.2. By using 5.1.1.5.1 (and 4.3.5.4.(c)), this yields the case $* = \mathrm{r}$. □

Remark 5.1.1.9. By functoriality, it follows from 4.4.5.2 and 5.1.1.5.1 (and exactness of the functors of 4.3.5.4.(c) that the canonical top (resp. bottom) homomorphism of $(\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodules (resp. $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$-bimodules)

$$\mathcal{D}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}, \tag{5.1.1.9.1}$$

$$f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \tag{5.1.1.9.2}$$

is an isomorphism. When $f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_X$ are tor independent over $f^{-1}\mathcal{B}_Y$, then then we can replace the tensor product by the derived tensor product (e.g. this follows by functoriality from 5.1.1.8).

Proposition 5.1.1.10. *Suppose $f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ has finite tor dimension, i.e. the functor $\widetilde{f}^* = \mathcal{B}_X \otimes_{f^{-1}\mathcal{B}_Y} f^{-1}-$ from the category of $\mathcal{B}_Y$-modules to that of $\mathcal{B}_X$-modules has bounded cohomological dimension (see definition 4.6.1.4). Then the functor $\widetilde{f}^{(m)!} \colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ where $* \in \{\mathrm{r}, \mathrm{l}\}$ is way-out in both direction.*

Proof. This follows from 5.1.1.6.2. □

Lemma 5.1.1.11. *We keep notation 4.4.5.5.*

(a) We have the canonical isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, (g \circ f)^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp})$-bimodules:

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \to Z^\sharp/U^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Z^\sharp/U^\sharp}. \tag{5.1.1.11.1}$$

(b) We have the canonical isomorphism of $((g \circ f)^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodules:

$$f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp \leftarrow Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp \leftarrow X^\sharp/S^\sharp}. \tag{5.1.1.11.2}$$

Proof. a) Let us check 5.1.1.11.1. We have the isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \to Z^\sharp/U^\sharp} \xrightarrow{\sim} \widetilde{f}^*\widetilde{g}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \xrightarrow{\sim} (\widetilde{g} \circ \widetilde{f})^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}$. It follows from 4.4.5.6 that we get the canonical isomorphism of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-modules

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \to Z^\sharp/U^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Z^\sharp/U^\sharp}.$$

We get by functoriality the fact that this isomorphism is an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, (g\circ f)^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp})$-bimodules.

b) Finally, we get the isomorphism 5.1.1.11.2 from 5.1.1.11.1 by twisting. □

Lemma 5.1.1.12. *Suppose $\widetilde{f}$ is quasi-flat (see Definition 4.4.1.3). We keep notation 4.4.5.5.*

(a) We have the canonical isomorphism of $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, (g\circ f)^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\to Z^\sharp/U^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Z^\sharp/U^\sharp}. \tag{5.1.1.12.1}$$

(b) We have the canonical isomorphism of $D((g\circ f)^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp\leftarrow Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp\leftarrow X^\sharp/S^\sharp}. \tag{5.1.1.12.2}$$

Proof. a) By quasi-flatness of $\widetilde{f}$, it follows from 5.1.1.3 that the morphisms are well defined. Moreover, since $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}$ is $\mathcal{B}_Z$-flat, and $\widetilde{g}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}$ is $\mathcal{B}_Y$-flat then $\mathbb{L}\widetilde{f}^*\left(\widetilde{g}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}\right) \xrightarrow{\sim} \widetilde{f}^*\left(\widetilde{g}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp}\right)$. Hence,

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\to Z^\sharp/U^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\to Z^\sharp/U^\sharp}.$$

b) Finally, we get the isomorphism 5.1.1.12.2 from 5.1.1.12.1 by twisting (use 5.1.1.2.1 and 4.3.5.6.1). □

Proposition 5.1.1.13. *With notation 4.4.5.5, let $\mathcal{G}$ be a complex of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp})$. We have the canonical isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:*

$$\tilde{f}^{(m)!}\circ\tilde{g}^{(m)!}(\mathcal{G}) \xrightarrow{\sim} \widetilde{g\circ f}^{(m)!}(\mathcal{G}).$$

Proof. This is a consequence of 5.1.1.6.3 and 5.1.1.12. □

5.1.1.14. By functoriality, it follows from 5.1.1.13, 4.3.4.6.1 and 4.3.4.8.1 that the canonical top (resp. bottom) homomorphism of $K(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $K(f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$)

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}, \tag{5.1.1.14.1}$$

$$\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \tag{5.1.1.14.2}$$

is an isomorphism. Remark that contrary to 5.1.1.9, we do not need flatness condition with the derived tensor products version.

5.1.1.15 (Base change)**.** Suppose the diagram 5.1.1.1.1 is cartesian and the morphism $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism (such case is called the base change one). Then it follows from 4.4.4.1.a that we have the homomorphism of sheaves of rings

$$f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \tag{5.1.1.15.1}$$

such that the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$ is an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodules. Let $\mathcal{F} \in D({}^{l}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$. Since $d_{\widetilde{f}} = 0$, this yields the canonical isomorphism of $D({}^{l}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F} \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{F}). \tag{5.1.1.15.2}$$

Remark that if $p^{-1}_{X^\sharp}\mathcal{O}_S$ and $f^{-1}\mathcal{B}_Y$ are tor independent over $f^{-1}p^{-1}_{Y^\sharp}\mathcal{O}_T$, then the canonical morphism

$$p^{-1}_{X^\sharp}\mathcal{O}_S \otimes^{\mathbb{L}}_{f^{-1}p^{-1}_{Y^\sharp}\mathcal{O}_T} f^{-1}\mathcal{F} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F} \tag{5.1.1.15.3}$$

is an isomorphism. By abuse of notation, under this flatness condition we can simply denote by $\mathcal{O}_S \otimes^{\mathbb{L}}_{\mathcal{O}_T} \mathcal{F} := \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F}$.

Let $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$. It follows from 4.4.4.4.4 and 5.1.1.5.1 that we have the canonical isomorphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$f^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{f}^{(m)!}(\mathcal{M}), \qquad (5.1.1.15.4)$$

where the structure of left $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is given via 5.1.1.15.1. By functoriality, this implies that we have the canonical isomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodules of the form $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$.

As for the left case, when $p^{-1}_{X^\sharp}\mathcal{O}_S$ and $f^{-1}\mathcal{B}_Y$ are tor independent over $f^{-1}p^{-1}_{Y^\sharp}\mathcal{O}_T$, the canonical morphism

$$f^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{f^{-1}p^{-1}_{Y^\sharp}\mathcal{O}_T} p^{-1}_{X^\sharp}\mathcal{O}_T \to f^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$$

is an isomorphism and we can simply set in this case $\mathcal{O}_S \otimes^{\mathbb{L}}_{\mathcal{O}_T} \mathcal{M} := f^{-1}\mathcal{M} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$.

Remark 5.1.1.16. We can split the diagram 5.1.1.1.1 as follows

$$\begin{array}{ccccc} X^\sharp & \xrightarrow{g} & Z^\sharp & \xrightarrow{h} & Y^\sharp \\ \downarrow{\scriptstyle p_{X^\sharp}} & & \downarrow{\scriptstyle p_{Z^\sharp}} \ \square & & \downarrow{\scriptstyle p_{Y^\sharp}} \\ S^\sharp & = & S^\sharp & \longrightarrow & T^\sharp, \end{array} \qquad (5.1.1.16.1)$$

where the right square is cartesian. Let $\mathcal{B}_Z := h^*\mathcal{B}_Y$, $\widetilde{Z}^\sharp$ be the ringed logarithmic ($\mathcal{V}$-formal) scheme $(Z^\sharp, \mathcal{B}_Z)$, and $\widetilde{h}\colon \widetilde{Z}^\sharp/T^\sharp \to \widetilde{Y}^\sharp/T^\sharp$ be the morphism of relative ringed logarithmic ($\mathcal{V}$-formal) schemes induced by the cartesian square of the diagram 7.5.6.7.1 and by $\mathcal{B}_Z = h^*\mathcal{B}_Y$. Hence, since $\tilde{g}^{(m)!} \circ \tilde{h}^{(m)!} \xrightarrow{\sim} \widetilde{f}^{(m)!}$ (see 5.1.1.13), then to study the extraordinary pullback functor (for instance), we reduce to the case of the base change or to the case where the bottom morphism of 5.1.1.1.1 is the identity.

5.1.1.17. Suppose we are in the non-respective case. To highlight the "crystalline nature" of the operations such as $f^!$ and f_+, we suppose in this paragraph we are in the context of 4.4.5.10, i.e. we generalize their construction to the case where $S^\sharp$ is equipped with a quasi-coherent m-PD-ideal $(\mathfrak{a}, \mathfrak{b}, \alpha)$, which we suppose to be m-PD-nilpotent, and where the morphisms are only defined modulo $\mathfrak{a}$. According to 4.4.5.11, we get a $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodule by setting

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} := \widetilde{f}_0^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}. \qquad (5.1.1.17.1)$$

We deduce by functoriality from 4.4.2.4 and 4.3.5.7, we get a structure of $(f_0^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodule on

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} := \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{f}^{*}_{0r} \left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp} \right), \qquad (5.1.1.17.2)$$

where the index "r" means that we have chosen the right (i.e. the twisted) structure of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$ on $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}$ to compute structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ via the functor $\widetilde{f}^*$. For any $* \in \{\mathrm{l}, \mathrm{r}\}$, via these above bimodules we can define the pullback $\widetilde{f}_0^{(m)!}\colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ as in 5.1.1.4. The properties of the subsection extends to this context.

5.1.2 Quasi-coherence, projection formula as $\mathcal{B}$-modules

Suppose we are in the non-respective case of 5.1.1.1.

Definition 5.1.2.1. We extend the notion of quasi-coherence as follows.

(a) Let $\mathcal{E}$ be a $\mathcal{B}_X$-module. We say that $\mathcal{E}$ is $\mathcal{B}_X$-quasi-coherent if and only if locally in X we have an exact sequence of the form $\mathcal{B}_X^{(I)} \to \mathcal{B}_X^{(J)} \to \mathcal{E} \to 0$.

(b) Let $\mathcal{E}$ be a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. We say that $\mathcal{E}$ is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-quasi-coherent if and only if locally in X we have an exact sequence of the form $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^{(I)} \to (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})^{(J)} \to \mathcal{E} \to 0$.

Remark that since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is a locally free $\mathcal{B}_X$-module (for both structures), then the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-quasi-coherence implies the $\mathcal{B}_X$-quasi-coherence. When $\mathcal{B}_X$ is not $\mathcal{O}_X$-quasi-coherent, the converse is not clear.

Lemma 5.1.2.2. *Suppose here $\mathcal{B}_X$ is $\mathcal{O}_X$-quasi-coherent. Let $\mathcal{E}$ be a left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.*

(i) The following assertion are equivalent.

(a) $\mathcal{E}$ is $\mathcal{O}_X$-quasi-coherent ;

(b) $\mathcal{E}$ is $\mathcal{B}_X$-quasi-coherent ;

(c) $\mathcal{E}$ is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-quasi-coherent.

(ii) Suppose X is affine and $\mathcal{E}$ is quasi-coherent. Then the canonical morphism

$$\mathcal{C} \otimes_{\Gamma(X,\mathcal{C})} \Gamma(X,\mathcal{E}) \to \mathcal{E}$$

where $\mathcal{C}$ either equal to $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ or $\mathcal{B}_X$ or $\mathcal{O}_X$.

Proof. Since the notion of quasi-coherence is local, then we reduce to check the part (ii). Suppose X is affine. The case where $\mathcal{C} = \mathcal{O}_X$ is already known. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is a locally free $\mathcal{B}_X$-module (for both structures), then $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is also $\mathcal{O}_X$-quasi-coherent. Let $\mathcal{A}$ be either $\mathcal{B}_X$ or $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. Since $\mathcal{A}$ is $\mathcal{O}_X$-quasi-coherent, then the canonical morphism $\mathcal{O}_X \otimes_{\Gamma(X,\mathcal{O}_X)} \Gamma(X,\mathcal{A}) \to \mathcal{A}$ is an isomorphism. Hence, we get (ii). □

Notation 5.1.2.3. Let $\star \in \{\emptyset, \mathrm{b}, -, +\}$ and $* \in \{\mathrm{r}, \mathrm{l}\}$. We denote by $D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ (resp. $D^\star_{\mathrm{qc}}(\mathcal{B}_X)$) the full subcategory of $D^\star({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ (resp. $D^\star(\mathcal{B}_X)$) consisting of complexes $\mathcal{E}$ such that, for any $j \in \mathbb{Z}$, $H^j(\mathcal{E})$ is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-quasi-coherent. We have the fully faithful forgetful functor $D^\star_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D^\star_{\mathrm{qc}}(\mathcal{B}_X)$. Beware this is not clear that we have the factorization $D^\star_{\mathrm{qc}}(\mathcal{B}_X) \to D^\star_{\mathrm{qc}}(\mathcal{O}_X)$, except when $\mathcal{B}_X$ is $\mathcal{O}_X$-quasi-coherent.

5.1.2.4 (Properties of the functor $\mathbb{R}f_*$)**.** Assume that T is a noetherian scheme of finite Krull dimension; and f is quasi-compact and quasi-separated.

(i) Following [Gro57, 3.6.5], since Y is noetherian of finite Krull dimension d_Y, then for $i > d_Y$, for every sheaf $\mathcal{E}$ of abelian groups we have $H^i(Y,\mathcal{E}) = 0$. Then, following [Gro61, 12.2.1], we get that $R^i f_*(\mathcal{E}) = 0$ for $i > d_Y$ and every sheaf $\mathcal{E}$ of abelian groups. In particular, by definition (see [Gro61, 12.1.1] or 4.6.1.4), the functor f_* has bounded by d_Y cohomological dimension on $\mathrm{Mod}(f^{-1}\mathcal{O}_Y)$, the category of $f^{-1}\mathcal{O}_Y$-modules, or on $\mathrm{Mod}(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.

Let P be the subset of all the objects of $\mathrm{Mod}(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ which are f_*-acyclic. Remark that P contains injective $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-modules. Using the cohomological dimension finiteness of f_*, following 4.6.1.6.b if

$$\mathcal{G}^0 \to \mathcal{G}^1 \to \cdots \to \mathcal{G}^{d_Y-1} \to \mathcal{E} \to 0 \tag{5.1.2.4.1}$$

is an exact sequence of $\mathrm{Mod}(f^{-1}\mathcal{O}_Y)$, and $\mathcal{G}^0, \ldots, \mathcal{G}^{d_Y-1} \in P$, then $\mathcal{E} \in P$ (see 4.6.1.6). This implies that for any complex $\mathcal{E} \in K(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $\mathcal{E} \in K^+(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$) there exists a quasi-isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{I}$ where $\mathcal{I} \in K(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $\mathcal{I} \in K^+(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$) is a complex whose modules belong to P. This yields by truncation (and using the above property involving the exact sequence) that for any $\mathcal{E} \in K^-(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $\mathcal{E} \in K^{\mathrm{b}}(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$) there exists a quasi-isomorphism $\mathcal{E} \xrightarrow{\sim} \mathcal{I}$ where $\mathcal{I} \in K^-(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $\mathcal{I} \in K^{\mathrm{b}}(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$) is a complex whose modules belong to P. We get the functor $\mathbb{R}f_*\colon D(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $\mathbb{R}f_*\colon D^-(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D^-(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, resp. $\mathbb{R}f_*\colon D^+(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D^+(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, resp. $\mathbb{R}f_*\colon D^{\mathrm{b}}(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D^{\mathrm{b}}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$) which is computed by taking a resolution with objects in P. Moreover, following [Har66, II.2.1] $\mathbb{R}f_*$ takes $D^?_{\mathrm{qc}}(\mathcal{O}_X)$ into $D^?_{\mathrm{qc}}(\mathcal{O}_Y)$ with $? \in \{\emptyset, +, -, \mathrm{b}\}$.

(ii) Since f is quasi-compact and quasi-separated, then it follows from [SGA4.2, VI.5.1] that the functors R^if_* for any $i \geq 0$ commute with filtered inductive limits of abelian groups (or see [FK18, 0.3.1.17] for a less general reference).

Proposition 5.1.2.5. Let $\mathcal{F} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ and $\mathcal{G} \in D({}^{\mathrm{l}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.

(i) We have the canonical morphism in $D(\mathbb{Z}_Y)$:

$$\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathbb{R}f_*(\mathcal{G}) \to \mathbb{R}f_*\left(f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{G}\right). \tag{5.1.2.5.1}$$

Let $\mathcal{D}$ be a sheaf of rings such that $(\mathcal{D}, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ is right solvable and let $\mathcal{F} \in D_{\mathrm{r-sol}}(\mathcal{D}, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (see definition and notation 4.6.3.2). Then the morphism 5.1.2.5.1 can also be viewed as a morphism of $D(\mathcal{D})$.

(ii) Suppose f is quasi-compact and quasi-separated. Suppose moreover one of the following conditions:

(a) either $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, and $\mathcal{G} \in D({}^{\mathrm{l}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$,

(b) or T is a noetherian scheme of finite Krull dimension, and $\mathcal{F} \in D^-_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, and $\mathcal{G} \in D^-({}^{\mathrm{l}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.

Then the morphism 5.1.2.5.1 is an isomorphism.

Proof. In the bimodule case, let $\mathcal{R}$ be a right solving ring of $(\mathcal{D}, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ such that $\mathcal{F} \in D(\mathcal{D}, \mathcal{R}, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$. Choosing a K-flat complex $\mathcal{P}$ of $K({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{R}} \mathcal{D})$) representing $\mathcal{F}$, a K-injective complex $\mathcal{I}$ of $K(f^{-1}{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ representing $\mathcal{G}$, we get

$$\begin{aligned}\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathbb{R}f_*(\mathcal{G}) &\xrightarrow{\sim} \mathcal{P} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f_*(\mathcal{I}) \to f_*\left(f^{-1}\mathcal{P} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{I}\right) \\ &\to \mathbb{R}f_*\left(f^{-1}\mathcal{P} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{I}\right) \xrightarrow{\sim} \mathbb{R}f_*\left(f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{G}\right),\end{aligned} \tag{5.1.2.5.2}$$

the last isomorphism coming from the fact that $f^{-1}\mathcal{P}$ a K-flat complex of $K({}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ representing $f^{-1}\mathcal{F}$.

To check that this is an isomorphism, using the remark 5.1.2.1 and using [Har66, I.7.1 (ii), (iii) and (iv)] and 5.1.2.4, we reduce to the case where $\mathcal{F} = \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$, which is obvious. □

Remark 5.1.2.6. Inverting r and l, similarly to 5.1.2.5, for any $\mathcal{F} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ and $\mathcal{G} \in D({}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, we get the morphism

$$\mathbb{R}f_*(\mathcal{G}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{F} \to \mathbb{R}f_*\left(\mathcal{G} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F}\right), \tag{5.1.2.6.1}$$

which is an isomorphism under the same corresponding hypotheses.

5.1.2.7. Let $*, ** \in \{\mathrm{l}, \mathrm{r}\}$ such that both are not equal to r. Let $\mathcal{F} \in D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ and $\mathcal{G} \in D^-({}^{**}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$. Then $f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_Y} \mathcal{G} \in D^-({}^\star f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ where $\star = \mathrm{l}$ if $* = ** = \mathrm{l}$ and otherwise $\star = \mathrm{r}$. Indeed, for instance, let us treat the case $** = \mathrm{l}$. This follows from the canonical isomorphisms

$$f^{-1}(\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{G} \xrightarrow{\sim} f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_Y} \mathcal{G} \tag{5.1.2.7.1}$$

Corollary 5.1.2.8. *Let $*, ** \in \{\mathrm{l}, \mathrm{r}\}$ such that both are not equal to* r. *Suppose f is quasi-compact and quasi-separated and $\widetilde{Y}^\sharp/T^\sharp$ is quasi-flat (see Definition 4.4.1.3). Suppose moreover one of the following conditions:*

(a) either $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, and $\mathcal{G} \in D({}^{**}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$,

(b) or T is a noetherian scheme of finite Krull dimension, and $\mathcal{F} \in D^{-}_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, and $\mathcal{G} \in D^-({}^{**}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.

Then we have the following isomorphism of $D^-({}^{**}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (see 5.1.2.7 for the right term):

$$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_*(\mathcal{G}) \xrightarrow{\sim} \mathbb{R}f_*\left(f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_Y} \mathcal{G}\right). \tag{5.1.2.8.1}$$

Proof. For instance, let us treat the case $** = \mathrm{l}$. Following 4.6.3.3, since $\widetilde{Y}^\sharp/T^\sharp$ is quasi-flat then $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$ is solvable. Since $\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \in D(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, we get

$$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_*(\mathcal{G}) \xrightarrow{\sim} (\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathbb{R}f_*(\mathcal{G})$$

$$\underset{5.1.2.5.1}{\xrightarrow{\sim}} \mathbb{R}f_*\left(f^{-1}(\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{G}\right) \xrightarrow{\sim} \mathbb{R}f_*\left(f^{-1}\mathcal{F} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{B}_Y} \mathcal{G}\right).$$

□

5.1.3 Direct image

Unless otherwise stated, we keep notation and hypotheses of 5.1.2 and we suppose $\widetilde{f}$ is quasi-flat (see Definition 4.4.1.3). Assume that T is a noetherian scheme of finite Krull dimension and f is quasi-compact and quasi-separated.

Definition 5.1.3.1. We keep notation 5.1.1.2.

(a) The (left version of the) direct image functor of level m by $\widetilde{f}$ is the functor $\widetilde{f}^{(m)}_+ \colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ which is defined by setting

$$\widetilde{f}^{(m)}_+(\mathcal{E}) := \mathbb{R}f_*\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right),$$

where $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

(b) The (right version of the) direct image functor of level m by $\widetilde{f}$ is the functor $\widetilde{f}^{(m)}_+ \colon D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ which is defined by setting

$$\widetilde{f}^{(m)}_+(\mathcal{M}) := \mathbb{R}f_*\left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}\right),$$

where $\mathcal{M} \in D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

If there is no ambiguity with the level, we might simply write $\widetilde{f}^{(m)}_+$.

5.1.3.2. The left and the right versions of the direct image functor of level m by $\widetilde{f}$ of 5.1.3.1 are compatible with the quasi-inverse exact functors of 4.3.5.7 exchanging left and right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module structures (resp. left and right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-module structures). More precisely, for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ we have the canonical isomorphism

$$\widetilde{\omega}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{f}^{(m)}_+(\mathcal{E}) \xrightarrow{\sim} \widetilde{f}^{(m)}_+(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}), \tag{5.1.3.2.1}$$

which is constructed as follows:

$$\widetilde{\omega}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \mathbb{R}f_* \left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right) \underset{5.1.2.8.1}{\xrightarrow{\sim}} \mathbb{R}f_* \left(f^{-1}\widetilde{\omega}_{Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{B}_Y} (\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E})\right)$$

$$\xrightarrow{\sim} \mathbb{R}f_* \left((f^{-1}\widetilde{\omega}_{Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)$$

$$\overset{4.3.5.6.1}{\xrightarrow{\sim}} \mathbb{R}f_* \left((\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} (f^{-1}\widetilde{\omega}_{Y^\sharp/T^\sharp} \otimes_{f^{-1}\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp})\right)$$

$$\underset{5.1.1.2.1}{\xrightarrow{\sim}} \mathbb{R}f_* \left((\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}\right).$$

Proposition 5.1.3.3. *Let $* \in \{\mathrm{l}, \mathrm{r}\}$, let $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathrm{forg}(\mathcal{E})$ (or simply $\mathcal{E}$) be the induced object of $D({}^*\mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$. We have the canonical isomorphism of $D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.*

$$f^{(m)}_+(\mathrm{forg}(\mathcal{E})) \xrightarrow{\sim} \widetilde{f}^{(m)}_+(\mathcal{E}). \tag{5.1.3.3.1}$$

Proof. Since the other case is checked similarly, we can suppose $* = \mathrm{l}$.

$$f^{(m)}_+(\mathcal{E}) = \mathbb{R}f_* \left(\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right) \xrightarrow{\sim} \mathbb{R}f_* \left(\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)$$

$$\overset{5.1.1.14.2}{\xrightarrow{\sim}} \mathbb{R}f_* \left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right) = \widetilde{f}^{(m)}_+(\mathcal{E})$$

□

Proposition 5.1.3.4. *Suppose $\mathcal{B}_Y$ is $\mathcal{O}_Y$-quasi-coherent and $\mathcal{B}_X = f^*\mathcal{B}_Y$. Suppose $f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_X$ are tor independent over $f^{-1}\mathcal{B}_Y$. Let $* \in \{\mathrm{l}, \mathrm{r}\}$, let $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathrm{forg}(\mathcal{E})$ (or simply $\mathcal{E}$) be the induced object of $D({}^*\mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$. We have the canonical isomorphism of $D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$*

$$\mathcal{B}_Y \otimes^{\mathbb{L}}_{\mathcal{O}_Y} f^{(m)}_+(\mathcal{E})) \xrightarrow{\sim} \widetilde{f}^{(m)}_+(\mathcal{B}_X \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}). \tag{5.1.3.4.1}$$

Proof. Since the other proof is similar, we can suppose $* = \mathrm{l}$.

$$\mathcal{B}_Y \otimes^{\mathbb{L}}_{\mathcal{O}_Y} f^{(m)}_+(\mathcal{E})) = \mathcal{B}_Y \otimes^{\mathbb{L}}_{\mathcal{O}_Y} \mathbb{R}f_* \left(\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)$$

$$\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}} \mathbb{R}f_* \left(\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)$$

$$\overset{5.1.2.5}{\xrightarrow{\sim}} \mathbb{R}f_* \left(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)$$

$$\overset{5.1.1.9.2}{\xrightarrow{\sim}} \mathbb{R}f_* \left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right) \xrightarrow{\sim} \mathbb{R}f_* \left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)$$

$$= \widetilde{f}^{(m)}_+(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}) \xrightarrow{\sim} \widetilde{f}^{(m)}_+(\mathcal{B}_X \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathcal{E}).$$

□

Proposition 5.1.3.5. *For any $* \in \{r, l\}$, for any $\mathcal{E} \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, we have $\widetilde{f}^{(m)}_+(\mathcal{E}) \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.*

Proof. Recall that since f is quasi-compact and quasi-separated, then f_* preserves $\mathcal{O}$-quasi-coherence (see [Sta22, 26.24.1]). We conclude by using 5.1.2.2. □

5.1.3.6. Suppose the bottom square of 5.1.1.1.1 is the identity and f is log-étale. Let $(u'_\lambda)_{\lambda=1,\dots,r}$ be logarithmic coordinates of $Y^\sharp/S^\sharp$. This induces $(u_\lambda = \widetilde{f}^*(u'_\lambda))_{\lambda=1,\dots,r}$ be logarithmic coordinates of $X^\sharp/S^\sharp$. Put $\tau_{\sharp\lambda(m),\gamma,n} := \mu_{(m),\gamma}(u_\lambda) - 1$, and $\tau'_{\sharp\lambda(m),\gamma,n} := \mu_{(m),\gamma}(u'_\lambda) - 1$. The canonical morphism $\widetilde{f}^*\widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m),\gamma} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m),\gamma}$ sends $\tau'_{\sharp\lambda(m),\gamma,n}$ to $\tau_{\sharp\lambda(m),\gamma,n}$. Hence, by using the local description 3.2.2.4, we check that $\widetilde{f}^*\widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m),\gamma} \to \widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m),\gamma}$ is an isomorphism. By duality, this yields that the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ is an isomorphism. Moreover, we check (e.g. by computation in local coordinates) that the induced composition morphism $\widetilde{f}^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \to \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is a homomorphism of rings. Hence, for any $\mathcal{M} \in D({}^r\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ we get the canonical isomorphism

$$\widetilde{f}^{(m)}_+(\mathcal{M}) \xrightarrow{\sim} \mathbb{R}f_*(\mathcal{M}). \tag{5.1.3.6.1}$$

Similarly, the canonical morphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow X^\sharp/S^\sharp}$ is an isomorphism and for any $\mathcal{E} \in D({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$

$$\widetilde{f}^{(m)}_+(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}f_*(\mathcal{E}). \tag{5.1.3.6.2}$$

In both cases the functor $\widetilde{f}^{(m)}_+$ preserves the boundedness of the cohomology, i.e. we have the induced functors $\widetilde{f}^{(m)}_+ \colon D^\star({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D^\star({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ with $* \in \{r, l\}$, and $\star \in \{+, -, \mathrm{b}\}$.

5.1.3.7. It follows from 5.1.2.4.i , that we get the factorization $\widetilde{f}^{(m)}_+ \colon D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$.

Proposition 5.1.3.8. *With notation 4.4.5.5, let $\mathcal{E}$ be a complex of $D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, with $* \in \{\mathrm{r}, \mathrm{l}\}$. We have the canonical isomorphism of $D({}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp})$:*

$$\tilde{g}^{(m)}_+ \circ \widetilde{f}^{(m)}_+(\mathcal{E}) \xrightarrow{\sim} \widetilde{g \circ f}^{(m)}_+(\mathcal{E}). \tag{5.1.3.8.1}$$

Proof. We can suppose $* = \mathrm{l}$. Since $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp\leftarrow Y^\sharp/T^\sharp} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, we get the projection isomorphism

$$\begin{aligned}
&\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp\leftarrow Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \mathbb{R}f_*\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)\\
&\underset{5.1.2.5}{\xrightarrow{\sim}} \mathbb{R}f_*\left(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp\leftarrow Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right).
\end{aligned}$$

By applying $\mathbb{R}f_*$, we get the first isomorphism

$$\begin{aligned}
\tilde{g}^{(m)}_+ \circ \widetilde{f}^{(m)}_+(\mathcal{E}) &\xrightarrow{\sim} \mathbb{R}g_*\mathbb{R}f_*\left(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp\leftarrow Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)\\
&\underset{5.1.1.12.2}{\xrightarrow{\sim}} \mathbb{R}(g\circ f)_*\left(\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/U^\sharp\leftarrow X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \mathcal{E}\right)\\
&= \widetilde{g\circ f}^{(m)}_+(\mathcal{E}).
\end{aligned}$$

□

5.1.3.9 (Base change case)**.** Suppose the diagram 5.1.1.1.1 is cartesian and the morphism $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism, i.e. suppose we are in the base change case. Let $* \in \{r, l\}$. It follows from 5.1.1.15 that for any $\mathcal{E} \in D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$, we have the canonical isomorphism

$$\widetilde{f}^{(m)}_+(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}f_*(\mathcal{E}). \tag{5.1.3.9.1}$$

Following 5.1.2.4, in that case the functor $\widetilde{f}^{(m)}_+$ preserves the boundedness of the cohomology, i.e. we have the induced functors $\widetilde{f}^{(m)}_+ \colon D^\star({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D^\star({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, with $\star \in \{+, -, \mathrm{b}\}$.

5.1.3.10. We suppose in this paragraph we are in the context of the non-respective case of 4.4.5.10. Assume that T is a noetherian scheme of finite Krull dimension and f_0 is quasi-compact and quasi-separated. For any $* \in \{\mathrm{l}, \mathrm{r}\}$, via the bimodules 5.1.1.17.1 and 5.1.1.17.2, we can define the pushforward $\widetilde{f}^{(m)}_{0+} \colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ as in 5.1.3.1. The properties of the subsection extends to this context.

5.1.4 Duality

We keep notation 5.1.2. Suppose that $\mathcal{B}_X$ is quasi-flat over $\mathcal{O}_S$ (see Definition 3.1.1.5). From 4.6.3.3.b, we get the following dual functors.

Definition 5.1.4.1. The dual functor of level m on $\widetilde{X}^\sharp/S^\sharp$ is the functor $\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp} \colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ which is defined by setting for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$

$$\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}\ [\delta_{X^\sharp/S^\sharp}].$$

Recall, the functor is computed by choosing a K-injective complex of $K({}^{\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_S} \widetilde{\mathcal{D}}^{(m)\,\mathrm{op}}_{X^\sharp/S^\sharp}))$ representing $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ (copy [Sta22, 20.39]). We have the factorization $\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp} \colon D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

Similarly, we have the right version one: the dual functor of level m on $\widetilde{X}^\sharp/S^\sharp$ is the functor $\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp} \colon D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ which is defined by setting for any $\mathcal{M} \in D({}^{r}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$

$$\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\mathcal{M}) := \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{M}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\ [\delta_{X^\sharp/S^\sharp}].$$

5.1.4.2. We have for any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ the isomorphism

$$\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\mathcal{E}) \underset{4.6.6.4.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp})_{\mathrm{l}})[\delta_{X^\sharp/S^\sharp}], \tag{5.1.4.2.1}$$

where the index "l" means that we use the left structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}$ to compute $\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}$.

$$\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\mathcal{M}) \underset{4.6.6.4.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{M}, (\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_{\mathrm{r}})\ [\delta_{X^\sharp/S^\sharp}], \tag{5.1.4.2.2}$$

where the index r in $(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_{\mathrm{r}})$ means that we take the right structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module to compute $\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}$..

5.1.4.3 (Right and left dual functors)**.** We have the isomorphisms

$$\begin{gathered}\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\ [\delta_{X^\sharp/S^\sharp}] \\ \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}, (\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_{\mathrm{l}})\ [\delta_{X^\sharp/S^\sharp}] \\ \underset{4.2.5.5}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}, (\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})_{\mathrm{r}})\ [\delta_{X^\sharp/S^\sharp}] \underset{5.1.4.2.2}{\xrightarrow{\sim}} \mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}),\end{gathered} \tag{5.1.4.3.1}$$

where the index r (resp. l) added to $\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ means that we take the right structure (resp. left structure) of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module.

Lemma 5.1.4.4 (Biduality)**.** *Let $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. We have the morphism $\mathcal{E} \to \mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp} \circ \mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\mathcal{E})$, which is an isomorphism when $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{perf}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.*

Proof. We copy the proof of 4.6.4.6 : let $\mathcal{I}$ be a K-injective complex of $K({}^{\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_S} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}))$ representing $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}[\delta_{X^\sharp/S^\sharp}]$. Then

$$\mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp} \circ \mathbb{D}^{(m)}_{\widetilde{X}^\sharp/S^\sharp}(\mathcal{E}) \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{I}),\mathcal{I}).$$

The morphism $\mathcal{E} \to \mathbb{D}(\mathbb{D}(\mathcal{E}))$ is simply the evaluation morphism

$$\mathcal{E} \to \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\mathcal{I}),\mathcal{I}).$$

When $\mathcal{E}$ is perfect, to check that this is an isomorphism we are reduced, by dévissage, to the case $\mathcal{E} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$, in which case it is clear. □

5.1.5 Exterior tensor product

Let $S^\sharp$ be a nice fine log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{r+1}\mathbb{Z})$ as defined in 3.1.1.1 with $r \in \mathbb{N}$. Since the base scheme $S^\sharp$ is fixed, so we can remove it in the notation concerning relative object with base $S^\sharp$. If $p\colon X^\sharp \to S^\sharp$ is a morphism, by abuse of notation, we sometimes denote $p^{-1}\mathcal{O}_S$ simply by $\mathcal{O}_S$.

For $i = 1, \ldots, n$, let $X^\sharp_i$ is a log smooth and log integral $S^\sharp$-log-scheme. Set $X^\sharp := X^\sharp_1 \times_{S^\sharp} X^\sharp_2 \times_{S^\sharp} \cdots \times_{S^\sharp} X^\sharp_n$. For $i = 1, \ldots, n$, let $\mathrm{pr}_i\colon X^\sharp \to X^\sharp_i$, be the projections. We denote by $\varpi\colon X^\sharp \to S^\sharp$ and $\varpi_i\colon X^\sharp_i \to S^\sharp$ the structural morphisms.

For $i = 1, \ldots, n$, let $\mathcal{B}_{X_i}$ be a commutative $\mathcal{O}_{X_i}$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp_i/S^\sharp}$-module. Let us recall that the action of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module on $\mathcal{B}_i := \mathrm{pr}_i^* \mathcal{B}_{X_i}$ is compatible with its structure of $\mathcal{O}_X$-algebra (see 3.4.4.6). Following 4.1.1.6, the $\mathcal{O}_X$-algebra $\mathcal{B}_X := \mathcal{B}_1 \otimes_{\mathcal{O}_X} \cdots \otimes_{\mathcal{O}_X} \mathcal{B}_n$ is endowed with a structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module a compatible its structure of $\mathcal{O}_X$-algebra.

We will denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i} = \mathcal{B}_{X_i} \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X^\sharp_i/S^\sharp}$. We denote by $\widetilde{X}^\sharp$ (resp. $\widetilde{X}^\sharp_i$) the ringed logarithmic scheme $(X^\sharp, \mathcal{B}_X)$ (resp. $(X^\sharp_i, \mathcal{B}_{X_i})$), and by $\widetilde{\mathrm{pr}}_i\colon \widetilde{X}^\sharp/S^\sharp \to \widetilde{X_i}^\sharp/S^\sharp$ the morphism of relative ringed logarithmic schemes induced by by pr_i and by $\mathrm{pr}_i^* \mathcal{B}_{X_i} \to \mathcal{B}_X$. We also denote by $\widetilde{\mathrm{pr}}_i$ the induced morphism $\widetilde{X}^\sharp \to \widetilde{X}^\sharp_i$ of ringed logarithmic schemes.

5.1.5.1. It follows from 5.1.1.15.1 the canonical morphism $\mathrm{pr}_i^{-1}(\mathcal{B}_{X_i} \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X^\sharp_i/S^\sharp}) \to \mathcal{B}_i \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/X^\sharp_{\hat{i}}}$, where $X^\sharp_{\hat{i}} := \prod_{j\neq i} X^\sharp_j$ is a ring homomorphism. From 4.4.2.7.1, the natural morphism $\mathcal{B}_i \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/X^\sharp_{\hat{i}}} \to \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ is an isomorphism. By composition, this yields the ring homomorphism

$$\mathrm{pr}_i^{-1} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp_i} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp} \tag{5.1.5.1.1}$$

5.1.5.2. (a) For $i = 1, \ldots, n$, let $\mathcal{E}_i$ be a sheaf of $\varpi_i^{-1}\mathcal{O}_S$-module. We get the $\varpi^{-1}\mathcal{O}_S$-module by setting

$$\boxtimes_{i}{}_{\mathrm{top}}\mathcal{E}_i := \mathrm{pr}_1^{-1} \mathcal{E}_1 \otimes_{\mathcal{O}_S} \mathrm{pr}_2^{-1} \mathcal{E}_2 \otimes_{\mathcal{O}_S} \cdots \otimes_{\mathcal{O}_S} \mathrm{pr}_n^{-1} \mathcal{E}_n.$$

(b) For $i = 1, \ldots, n$, let $\mathcal{E}_i$ be an $\mathcal{B}_{X_i}$-module. The sheaf $\boxtimes_{i\,\mathrm{top}}\mathcal{E}_i$ has a canonical structure of $\boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}$-module. We put $\widetilde{\boxtimes}_i \mathcal{E}_i := \mathcal{B}_X \otimes_{\boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}} \boxtimes_{i\,\mathrm{top}}\mathcal{E}_i$. When $\mathcal{B}_{X_i} = \mathcal{O}_{X_i}$ holds for any $i = 1, \ldots, n$, we simply write $\boxtimes_i \mathcal{E}_i$. Moreover, by commutativity and associativity of tensor products, we get the canonical isomorphism of $\boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}$-modules

$$\boxtimes_{i\,\mathrm{top}}\mathcal{E}_i \xrightarrow{\sim} \left(\mathrm{pr}_1^{-1} \mathcal{E}_1 \otimes_{\mathrm{pr}_1^{-1} \mathcal{B}_{X_1}} \boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}\right) \otimes_{\boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}} \cdots \otimes_{\boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}} \left(\mathrm{pr}_n^{-1} \mathcal{E}_n \otimes_{\mathrm{pr}_n^{-1} \mathcal{B}_{X_n}} \boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}\right). \tag{5.1.5.2.1}$$

Using the isomorphism 5.1.5.2.1, we get the isomorphism of $\mathcal{B}_X$-modules

$$\widetilde{\boxtimes}_i \mathcal{E}_i \xrightarrow{\sim} \widetilde{\mathrm{pr}}_1^* \mathcal{E}_1 \otimes_{\mathcal{B}_X} \cdots \otimes_{\mathcal{B}_X} \widetilde{\mathrm{pr}}_n^* \mathcal{E}_n. \tag{5.1.5.2.2}$$

(c) Since $\mathrm{pr}_i^{-1}\,\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$ are $\mathcal{O}_S$-algebras, we get a canonical structure of $\mathcal{O}_S$-algebra on $\boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$. Using 5.1.5.1.1, we get the canonical homomorphism of $\mathcal{O}_S$-algebras $\boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$. Via a local computation, we can check that the induced morphism of $(\mathcal{B}_X, \boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$-bimodules (resp. $(\boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}, \mathcal{B}_X)$-bimodules)

$$\widetilde{\boxtimes_i}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} = \mathcal{B}_X \otimes_{\boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}} \boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}, \qquad (\text{resp. } \boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} \otimes_{\boxtimes_{i\,\mathrm{top}}\mathcal{B}_{X_i}} \mathcal{B}_X \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}) \quad (5.1.5.2.3)$$

is an isomorphism.

(d) For $i = 1, \ldots, n$, let $\mathcal{F}_i$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module (resp. $\mathcal{G}_i$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module). Then $\boxtimes_{i}{}_{\mathrm{top}}\mathcal{F}_i$ (resp. $\boxtimes_{i}{}_{\mathrm{top}}\mathcal{G}_i$) has a canonical structure of left (resp. right) $\boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module. It follows from the left (resp. right) isomophism of 5.1.5.2.3 that we get the isomorphism of $\mathcal{B}_X$-modules $\widetilde{\boxtimes_i}\mathcal{F}_i \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp} \otimes_{\boxtimes_{i\,\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \boxtimes_{i}{}_{\mathrm{top}}\mathcal{F}_i$ (resp. $\widetilde{\boxtimes_i}\mathcal{G}_i \xrightarrow{\sim} \boxtimes_{i}{}_{\mathrm{top}}\mathcal{F}_i \otimes_{\boxtimes_{i\,\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$). Via this isomorphism, we endowed $\widetilde{\boxtimes_i}\mathcal{F}_i$ (resp. $\widetilde{\boxtimes_i}\mathcal{G}_i$) with a structure of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module.

(e) For $i = 1, \ldots, n$, let $\mathcal{F}_i$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module. Then $\widetilde{\mathrm{pr}}_1^*\mathcal{F}_1 \otimes_{\mathcal{B}_X} \cdots \otimes_{\mathcal{B}_X} \widetilde{\mathrm{pr}}_n^*\mathcal{F}_n$ has a canonical structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module (see 4.2.3.1). We check that the isomorphism 5.1.5.2.2 is in fact an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-modules.

Lemma 5.1.5.3. *Let $\mathcal{R}$ be a commutative sheaf on X. By convention, $\mathcal{R}$-algebras are always unital and associative. For $i = 1, \ldots, n$, let $\mathcal{D}_i$ be $\mathcal{R}$-algebras, $\mathcal{E}_i$ be a flat left $\mathcal{D}_i$-module. Then $\mathcal{E}_1 \otimes_{\mathcal{R}} \mathcal{E}_2 \otimes_{\mathcal{R}} \cdots \otimes_{\mathcal{R}} \mathcal{E}_n$ is a flat left $\mathcal{D}_1 \otimes_{\mathcal{R}} \mathcal{D}_2 \otimes_{\mathcal{R}} \cdots \otimes_{\mathcal{R}} \mathcal{D}_n$-module.*

Proof. By proceeding by induction we reduce to the case $n = 2$. From the structure of left $\mathcal{D}_1$-module of $\mathcal{E}_1$ and of $\mathcal{D}_2$-bimodule of $\mathcal{D}_2$, we endow the sheaf $\mathcal{E}_1 \otimes_{\mathcal{R}} \mathcal{D}_2$ with a structure of $(\mathcal{D}_1 \otimes_{\mathcal{R}} \mathcal{D}_2, \mathcal{D}_2)$-bimodule. Since the canonical isomorphisme $\mathcal{E}_1 \otimes_{\mathcal{R}} \mathcal{D}_2 \xrightarrow{\sim} (\mathcal{D}_1 \otimes_{\mathcal{R}} \mathcal{D}_2) \otimes_{\mathcal{D}_1} \mathcal{E}_1$ is $\mathcal{D}_1 \otimes_{\mathcal{R}} \mathcal{D}_2$-linear, then $\mathcal{E}_1 \otimes_{\mathcal{R}} \mathcal{D}_2$ is flat as left $\mathcal{D}_1 \otimes_{\mathcal{R}} \mathcal{D}_2$-module. Since $\mathcal{E}_2$ is flat as $\mathcal{D}_2$-module, this implies that $\mathcal{E}_1 \otimes_{\mathcal{R}} \mathcal{E}_2 \xrightarrow{\sim} (\mathcal{E}_1 \otimes_{\mathcal{R}} \mathcal{D}_2) \otimes_{\mathcal{D}_2} \mathcal{E}_2$ is a flat left $\mathcal{D}_1 \otimes_{\mathcal{R}} \mathcal{D}_2$-module. □

5.1.5.4. (a) Since the extension $\boxtimes_{i}{}_{\mathrm{top}}\mathcal{O}_{X_i} \to \mathcal{O}_X$ is flat, since $\mathcal{O}_X \otimes_{\boxtimes_{i\,\mathrm{top}}\mathcal{O}_{X_i}} \boxtimes_{i}{}_{\mathrm{top}}\mathcal{B}_{X_i} \xrightarrow[5.1.5.2.2]{\sim} \mathrm{pr}_i^*\,\mathcal{B}_{X_1} \otimes_{\mathcal{O}_X} \cdots \otimes_{\mathcal{O}_X} \mathrm{pr}_n^*\,\mathcal{B}_{X_n} = \mathcal{B}_X$, then we get the flatness of the extension $\boxtimes_{i}{}_{\mathrm{top}}\mathcal{B}_{X_i} \to \mathcal{B}_X$. By using 5.1.5.2.3, this implies that $\boxtimes_{i}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$ are right and left flat.

(b) When S is the spectrum of a field, the multi-functor $\boxtimes_{i}{}_{\mathrm{top}}$ is exact. Hence, it follows from (a) that the multi-functor $\widetilde{\boxtimes_i}$ is exact.

(c) When S is not the spectrum of a field, the multi-functor $\boxtimes_{i}{}_{\mathrm{top}}$ is not necessarily exact. Set $\mathcal{B}_X^{\mathrm{top}} := \boxtimes_{i}{}_{\mathrm{top}}\mathcal{B}_{X_i}$. We get the multi-functor $\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \colon D^-(\mathcal{B}_{X_1}) \times \cdots \times D^-(\mathcal{B}_{X_n}) \to D^-(\mathcal{B}_X^{\mathrm{top}})$ by setting for any $\mathcal{E}_i \in D^-(\mathcal{B}_{X_i})$

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}\mathcal{E}_i := \left(\mathrm{pr}_1^{-1}\,\mathcal{E}_1 \otimes^{\mathbb{L}}_{\mathrm{pr}_1^{-1}\,\mathcal{B}_{X_1}} \mathcal{B}_X^{\mathrm{top}}\right) \otimes^{\mathbb{L}}_{\mathcal{B}_X^{\mathrm{top}}} \cdots \otimes^{\mathbb{L}}_{\mathcal{B}_X^{\mathrm{top}}} \left(\mathrm{pr}_n^{-1}\,\mathcal{E}_n \otimes^{\mathbb{L}}_{\mathrm{pr}_n^{-1}\,\mathcal{B}_{X_n}} \mathcal{B}_X^{\mathrm{top}}\right). \qquad (5.1.5.4.1)$$

Remark when $\mathcal{B}_i$ is flat over $\mathcal{O}_S$ for any i, then we get the isomorphism of $D^-(\mathcal{B}_X^{\mathrm{top}})$:

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}\mathcal{E}_i \xrightarrow{\sim} \mathrm{pr}_1^{-1}\,\mathcal{E}_1 \otimes^{\mathbb{L}}_{\mathcal{O}_S} \mathrm{pr}_2^{-1}\,\mathcal{E}_2 \otimes^{\mathbb{L}}_{\mathcal{O}_S} \cdots \otimes^{\mathbb{L}}_{\mathcal{O}_S} \mathrm{pr}_n^{-1}\,\mathcal{E}_n. \qquad (5.1.5.4.2)$$

(d) We have the multi-functor $\widetilde{\boxtimes}^{\mathbb{L}}_i \colon D^-(\mathcal{B}_{X_1}) \times \cdots \times D^-(\mathcal{B}_{X_n}) \to D^-(\mathcal{B}_X)$ by setting for any $\mathcal{E}_i \in D^-(\mathcal{B}_{X_i})$

$$\widetilde{\boxtimes}^{\mathbb{L}}_i\mathcal{E}_i := \mathcal{B}_X \otimes_{\mathcal{B}_X^{\mathrm{top}}} \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}\mathcal{E}_i \xrightarrow{\sim} \mathbb{L}\widetilde{\mathrm{pr}}_1^*\mathcal{E}_1 \otimes^{\mathbb{L}}_{\mathcal{B}_X} \cdots \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{\mathrm{pr}}_n^*\mathcal{E}_n, \qquad (5.1.5.4.3)$$

where the last isomorphism is, after using flat resolutions, a consequence of 5.1.5.2.2. Beware that pr_i is flat but $\widetilde{\mathrm{pr}}_i$ might not be flat.

(e) Let $* \in \{\mathrm{l}, \mathrm{r}\}$. For any $i = 1, \ldots, n$, let $\mathcal{F}_i \in D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$, $\mathcal{M}_i \in D^-({}^\mathrm{l}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$. Set $\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp} := \boxtimes_{i}{}_{\mathrm{top}} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$. Then the functor 5.1.5.4.1 induces the functor $\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \colon D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{X_1^\sharp}) \times \cdots \times D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{X_n^\sharp}) \to D^-({}^*\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp})$. Indeed, since $\mathcal{B}_{X_i} \to \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$ is flat, by using $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-flat resolution $\mathcal{P}_i$ of $\mathcal{E}_i$, by commutativity and associativity of tensor products, we get therefore the canonical isomorphism

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{E}_i \xrightarrow{\sim} \mathrm{pr}_1^{-1} \mathcal{P}_1 \otimes_{\mathcal{O}_S} \mathrm{pr}_2^{-1} \mathcal{P}_2 \otimes_{\mathcal{O}_S} \cdots \otimes_{\mathcal{O}_S} \mathrm{pr}_n^{-1} \mathcal{P}_n \in C({}^\mathrm{l}\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp}), \tag{5.1.5.4.4}$$

whose terms of the right side are even flat left $\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp}$ (see 5.1.5.3).

We set $\widetilde{\boxtimes}^{\mathbb{L}}_{i} \mathcal{F}_i := \widetilde{\mathcal{D}}^{(m)}_{X^\sharp} \otimes_{\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp}} \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{F}_i$ and $\widetilde{\boxtimes}^{\mathbb{L}}_{i} \mathcal{M}_i := \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{M}_i \otimes_{\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$, which defines the multi-functor

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i} \colon D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{X_1^\sharp}) \times \cdots \times D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{X_n^\sharp}) \to D^-({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}). \tag{5.1.5.4.5}$$

It follows from 5.1.5.2.3 that the functors 5.1.5.4.3 and 5.1.5.4.5 are compatible.

Proposition 5.1.5.5. *Let $* \in \{\mathrm{l}, \mathrm{r}\}$. Suppose $? \in \{\mathrm{tdf}, \mathrm{perf}\}$ (resp. suppose $? = \mathrm{coh}$ and S is locally noetherian).*

(a) The functor 5.1.5.4.1 induces the functor $\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \colon D^-_?({}^*\widetilde{\mathcal{D}}^{(m)}_{X_1^\sharp}) \times \cdots \times D^-_?({}^*\widetilde{\mathcal{D}}^{(m)}_{X_n^\sharp}) \to D^-_?({}^*\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp})$.

(b) The functor 5.1.5.4.5 preserves the finite tor-dimension and perfectness (resp. bounded above coherent complexes), i.e. induces

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i} \colon D^-_?({}^*\widetilde{\mathcal{D}}^{(m)}_{X_1^\sharp}) \times \cdots \times D^-_?({}^*\widetilde{\mathcal{D}}^{(m)}_{X_n^\sharp}) \to D^-_?({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}). \tag{5.1.5.5.1}$$

Proof. The first assertion is clear from the isomorphism 5.1.5.4.4. The second one is an obvious consequence. □

Lemma 5.1.5.6. *Let $\mathcal{R}$ be a commutative sheaf on X. By convention, $\mathcal{R}$-algebras are always unital and associative. For $i = 1, \ldots, n$, let $\mathcal{A}_i$, $\mathcal{B}_i$ be $\mathcal{R}$-algebras, $\mathcal{M}_i$ be a $(\mathcal{A}_i, \mathcal{B}_i)$-bimodule, $\mathcal{E}_i$ be a left $\mathcal{B}_i$-module. Set $\otimes_i \mathcal{A}_i := \mathcal{A}_1 \otimes_{\mathcal{R}} \mathcal{A}_2 \otimes_{\mathcal{R}} \cdots \otimes_{\mathcal{R}} \mathcal{A}_n$, and similarly replacing $\mathcal{A}_i$ by $\mathcal{R}$-modules. We have the canonical isomorphism of left $\otimes_i \mathcal{A}_i$-modules of the form*

$$\otimes_i (\mathcal{M}_i \otimes_{\mathcal{B}_i} \mathcal{E}_i) \xrightarrow{\sim} \otimes_i(\mathcal{M}_i) \otimes_{\otimes_i(\mathcal{B}_i)} \otimes_i(\mathcal{E}_i). \tag{5.1.5.6.1}$$

Proof. We check that the morphism 5.1.5.6.1 is well defined by the formula $\otimes_i(y_i \otimes x_i) \mapsto (\otimes_i(y_i)) \otimes (\otimes_i(x_i))$ and its inverse by the formula $(\otimes_i(y_i)) \otimes (\otimes_i(x_i)) \mapsto \otimes_i(y_i \otimes x_i)$ for any $y_i \in \mathcal{M}_i$ and $x_i \in \mathcal{E}_i$. □

Lemma 5.1.5.7. *For $i = 1, \ldots, n$, let $\mathcal{D}_i$ be a sheaf of rings such that $(\mathcal{D}_i, \mathcal{B}_{X_i})$ has the ring of resolution $\mathcal{R}$. For $i = 1, \ldots, n$, let $\mathcal{M}_i \in D^-(\mathcal{D}_i, \mathcal{R}, \mathcal{B}_{X_i})$, $\mathcal{E}_i \in D^-(\mathcal{B}_{X_i})$, $\mathcal{N}_i \in D^-(\mathcal{D}_i, \mathcal{R}, \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$ (recall our notation 4.6.3.2), $\mathcal{F}_i \in D^-(\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$.*

(a) We have the canonical isomorphism of $D^-(\boxtimes_{i\,\mathrm{top}} \mathcal{D}_i, \mathcal{R}, \mathcal{B}^{\mathrm{top}}_X)$

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} (\mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_{X_i}} \mathcal{E}_i) \xrightarrow{\sim} \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}^{\mathrm{top}}_X} \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{E}_i. \tag{5.1.5.7.1}$$

(b) We have the canonical isomorphism of $\boxtimes_{i\,\mathrm{top}} \mathcal{D}_i$-modules

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} (\mathcal{N}_i \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \mathcal{F}_i) \xrightarrow{\sim} \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{N}_i \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{\mathrm{top}}_{X^\sharp}} \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{F}_i. \tag{5.1.5.7.2}$$

Proof. By using flat resolutions, we remove $\mathbb{L}$ (use also 5.1.5.3 for 5.1.5.7.2. Then, this is a consequence of Lemma 5.1.5.6. □

Lemma 5.1.5.8. *For $i = 1, \ldots, n$, let $\mathcal{D}_i$ be a sheaf of rings such that $(\mathcal{D}_i, \mathcal{B}_{X_i})$ has the ring of resolution $\mathcal{R}$.*

(a) For $i = 1, \ldots, n$, let $\mathcal{M}_i \in D^-(\mathcal{D}_i, \mathcal{R}, \mathcal{B}_{X_i})$, $\mathcal{E}_i \in D^-(\mathcal{B}_{X_i})$. We have the isomorphism of the form $\widetilde{\boxtimes}_i^{\mathbb{L}}(\mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_{X_i}} \mathcal{E}_i) \xrightarrow{\sim} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{E}_i$ of $D^-(\boxtimes_{i\,\mathrm{top}} \mathcal{D}_i, \mathcal{R}, \mathcal{B}_X)$ fitting into the commutative up to isomorphism following diagram of $D^-(\boxtimes_{i\,\mathrm{top}} \mathcal{D}_i, \mathcal{R}, \boxtimes_{i\,\mathrm{top}} \mathcal{B}_{X_i})$:

$$\begin{array}{ccc}
\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_{X_i}} \mathcal{E}_i) & \xrightarrow[5.1.5.7.1]{\sim} & \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_X^{\mathrm{top}}} \widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}} \mathcal{E}_i \\
\downarrow & & \downarrow \\
\widetilde{\boxtimes}_i^{\mathbb{L}}(\mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_{X_i}} \mathcal{E}_i) & \xrightarrow{\sim} & \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{E}_i.
\end{array} \tag{5.1.5.8.1}$$

(b) For $i = 1, \ldots, n$, let $\mathcal{M}_i \in D^-({}^l\mathcal{D}_i, \mathcal{R}, {}^l\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$, $\mathcal{E}_i \in D^-(\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$. Then, the above isomorphism $\widetilde{\boxtimes}_i^{\mathbb{L}}(\mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_{X_i}} \mathcal{E}_i) \xrightarrow{\sim} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{E}_i$ of (a) is in fact an isomorphism of $D^-(\boxtimes_{i\,\mathrm{top}} \mathcal{D}_i, \mathcal{R}, {}^l\mathcal{D}^{(m)}_{X^\sharp})$.

Proof. We construct the isomorphism of the form $\widetilde{\boxtimes}_i^{\mathbb{L}}(\mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_{X_i}} \mathcal{E}_i) \xrightarrow{\sim} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{E}_i$ as follows:

$$\begin{aligned}
&\widetilde{\boxtimes}_i^{\mathbb{L}}(\mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_{X_i}} \mathcal{E}_i) \xrightarrow[5.1.5.4.3]{\sim} \widetilde{\mathrm{pr}}_1^*(\mathcal{M}_1 \otimes^{\mathbb{L}}_{\mathcal{B}_{X_1}} \mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \cdots \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\mathrm{pr}}_n^*(\mathcal{M}_n \otimes^{\mathbb{L}}_{\mathcal{B}_{X_n}} \mathcal{E}_n) \\
\xrightarrow{\sim}\ &\big(\widetilde{\mathrm{pr}}_1^* \mathcal{M}_1 \otimes^{\mathbb{L}}_{\mathcal{B}_X} \cdots \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\mathrm{pr}}_n^* \mathcal{M}_n\big) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \big(\widetilde{\mathrm{pr}}_1^* \mathcal{E}_1 \otimes^{\mathbb{L}}_{\mathcal{B}_X} \cdots \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\mathrm{pr}}_n^* \mathcal{E}_n\big) \xrightarrow[5.1.5.4.3]{\sim} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{M}_i \otimes^{\mathbb{L}}_{\mathcal{B}_X} \widetilde{\boxtimes}_i^{\mathbb{L}} \mathcal{E}_i.
\end{aligned} \tag{5.1.5.8.2}$$

We check by an easy computation the commutativity of the diagram 5.1.5.8.1. Finally, when $\mathcal{M}_i \in D^-(\mathcal{D}_i, \mathcal{R}, \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$, $\mathcal{E}_i \in D^-(\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$, the isomorphisms of 5.1.5.8.2 are $\mathcal{D}^{(m)}_{X^\sharp}$-linear. □

5.1.5.9. We have the splitting of $\mathcal{B}_X$-modules $\oplus_{i=1}^n \Omega^1_{X_i^\sharp} \xrightarrow{\sim} \Omega^1_{X^\sharp}$. By applying determinants, this yields the isomorphism of $\mathcal{B}_X$-modules $\widetilde{\boxtimes}_i \widetilde{\omega}_{X_i^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp}$. Using the canonical structure of right $\mathcal{D}^{(m)}_{X_i^\sharp}$-module on $\widetilde{\omega}_{X_i^\sharp}$, we get a structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module on $\widetilde{\boxtimes}_i \widetilde{\omega}_{X_i^\sharp}$. By local computations, we check the canonical isomorphism $\widetilde{\boxtimes}_i \widetilde{\omega}_{X_i^\sharp} \xrightarrow{\sim} \widetilde{\omega}_{X^\sharp}$ is in fact an isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-modules.

For $i = 1, \ldots, n$, $\mathcal{E}_i$ be left $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module, and $\mathcal{F}_i$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module. Then we have the canonical morphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-modules (resp. left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-modules) $\widetilde{\boxtimes}_i(\widetilde{\omega}_{X_i^\sharp} \otimes_{\mathcal{B}_{X_i}} \mathcal{E}_i) \xrightarrow{\sim} \omega_{X^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\boxtimes}_i \mathcal{E}_i$ (resp. $\widetilde{\boxtimes}_i(\mathcal{E}_i \otimes_{\mathcal{B}_{X_i}} \widetilde{\omega}^{-1}_{X_i^\sharp}) \xrightarrow{\sim} \widetilde{\boxtimes}_i \mathcal{E}_i \otimes_{\mathcal{B}_X} \omega^{-1}_{X^\sharp}$). Taking flat resolutions, we have similar isomorphisms in derived categories.

5.2 Exact closed immersion of log (formal) smooth schemes

The study of closed immersions is an important bootstrapping step in the proof of general results.

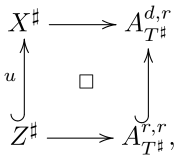
Let $T^\sharp$ be a noetherian nice (see definition 3.1.1.1) fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ with i an integer (resp. $T^\sharp$ be a p-torsion free noetherian nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10). Moreover, let $u\colon Z^\sharp \hookrightarrow X^\sharp$ be an exact closed immersion of log smooth $T^\sharp$-log schemes (resp. of p-torsion free log smooth $T^\sharp$-log formal schemes) such that the underlying closed immersion of schemes of u (resp. of u_0) is regular (for example, this is the case when $Z^\sharp$ and $X^\sharp$ are regular in the sense of log schemes: see [GR, 12.5.14], to get example of regular log schemes, recall that a log smooth fine saturated log scheme over a (log) regular log scheme is (log) regular: see [Ogu18, IV.3.5.3]). Let $\mathcal{I}$ be the ideal defining u.

The level $m \in \mathbb{N}$ is fixed. Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$-module structure which is compatible with its algebra structure. We suppose $\mathcal{O}_Z$ and $u^{-1}\mathcal{B}_X$ are tor independent over $u^{-1}\mathcal{O}_X$ and we set $\mathcal{B}_Z := u^*(\mathcal{B}_X)$. We keep similar notation than 4.1.2 (we replace S by T, and $X^\sharp$ by Z if necessary), in particular we set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} := \mathcal{B}_Z \otimes_{\mathcal{O}_Z} \mathcal{D}^{(m)}_{Z^\sharp/T^\sharp}$. We denote by $\widetilde{X}^\sharp$ (resp. $\widetilde{Z}^\sharp$) the ringed logarithmic ($\mathcal{V}$-formal) scheme $(X^\sharp, \mathcal{B}_X)$ (resp. $(Z^\sharp, \mathcal{B}_Z)$), and by $\tilde{u}\colon \widetilde{Z}^\sharp/T^\sharp \to \widetilde{X}^\sharp/T^\sharp$ the morphism of relative ringed logarithmic ($\mathcal{V}$-formal) schemes induced by the diagram 5.1.1.1.1 and by $u^*\mathcal{B}_X \xrightarrow{\sim} \mathcal{B}_Z$. We suppose $\widetilde{u}$ is quasi-flat (see Definition 4.4.1.3). We set $\widetilde{\mathcal{I}} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{I}$.

5.2.1 Charts subordinate to an exact closed immersion of log smooth schemes

We will work with the following charts subordinate to u:

Proposition 5.2.1.1. *Let z be a point of $|Z|$. Then, replacing $X^\sharp$ by an open set containing z if necessary, there exist some integers $n \geq r$ and the left (resp. right) cartesian diagram of morphisms of $T^\sharp$-log-schemes (resp. $T^\sharp$-log-formal schemes) of the form:*

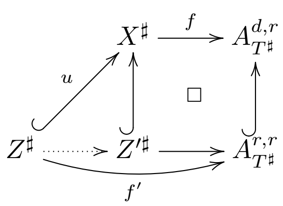


such that the horizontal morphisms are log-étale and the right morphism is the canonical exact closed immersion (see notation 4.5.1.1).

Proof. Since the respective case is a consequence of the non-respective one, let us check this latter case. The proof is analogous to that of theorem [SGA1, II.4.10]: Since u is an exact closed immersion, denoting by $\mathcal{I}$ the ideal given by u, following [Ogu18, IV.3.2.2] we get the exact sequence

$$0 \to \mathcal{I}/\mathcal{I}^2 \to u^*\Omega^1_{X^\sharp/T^\sharp} \to \Omega^1_{Z^\sharp/T^\sharp} \to 0. \tag{5.2.1.1.1}$$

Since $Z^\sharp$ and $X^\sharp$ are log-smooth over $T^\sharp$, following [Ogu18, IV.3.2.1], $\Omega^1_{X^\sharp/T^\sharp}$ and $\Omega^1_{Z^\sharp/T^\sharp}$ are locally free. Following [Ogu18, IV,1.2.11], by replacing $X^\sharp$ by an open set containing $X^\sharp$ if necessary (and $Z^\sharp$ by the trace of this open set on $Z^\sharp$), we check that $\Omega^1_{Z^\sharp/T^\sharp}$ is generated as D_Z-module by the elements of the form $d\log a$ with a a global section of $M_{Z^\sharp}$. Hence, (by replacing $X^\sharp$ by an open set containing $X^\sharp$ if necessary) we get some global sections $a_1, \ldots, a_r$ of $M_{X^\sharp}$ such that $d\log \overline{a}_1, \ldots, d\log \overline{a}_r$ is a basis of $\Omega^1_{Z^\sharp/T^\sharp}$, $\overline{a}$ means the image of a via the surjection $u^{-1}M_{X^\sharp} \to M_{Z^\sharp}$. Via the exact sequence 5.2.1.1.1, we get some global sections $a_{r+1}, \ldots, a_d$ of $\mathcal{I}$ such that $1 \otimes d\log a_1, \ldots, 1 \otimes d\log a_r, 1 \otimes da_{r+1}, \ldots, 1 \otimes da_d$ form a basis of $u^*\Omega^1_{X^\sharp/T^\sharp}$. Since $\Omega^1_{X^\sharp/T^\sharp}$ is a locally free $\mathcal{O}_X$-module, replacing $X^\sharp$ by an open set containing $X^\sharp$ if necessary, we can therefore suppose that $d\log a_1, \ldots, 1 \otimes d\log a_r, da_{r+1}, \ldots, da_d$ is a basis of $\Omega^1_{X^\sharp/T^\sharp}$. The sections $a_1, \ldots, a_d$ (resp. $\overline{a}_1, \ldots, \overline{a}_r$) induce a morphism of log smooth $T^\sharp$-log-schemes of the form $f\colon X^\sharp \to A^{d,r}_{T^\sharp}$ (resp. $f'\colon Z^\sharp \to A^{r,r}_{T^\sharp}$). Following 4.5.1.3, f and f' are log-étale. Consider the diagram



where the three closed immersions are strict and where the square is cartesian. Since f' and f are log-étale, then so is $Z^\sharp \to Z'^\sharp$. Since the closed immersions are exact, the morphism $Z^\sharp \to Z'^\sharp$ is moreover strict. The underlying morphism of schemes of $Z \to Z'$ is therefore an étale closed immersion, and therefore an open immersion. By shrinking $X^\sharp$ if necessary, we can therefore conclude. □

5.2.2 Preliminaries: some computations in local coordinates

In this subsection, with notation 4.5.1.1, we suppose $X^\sharp$ is affine and there exist some integers $r, s, d \geq 0$ such that $r + s \leq d$ and a cartesian diagram of morphisms of nice fine $T^\sharp$-log-schemes (resp. p-torsion free nice fine log smooth $T^\sharp$-log-formal schemes) of the form:

$$\begin{array}{ccc} X^\sharp & \xrightarrow{\alpha} & A^{d,r}_{T^\sharp} \\ {\scriptstyle u}\uparrow & \square & \uparrow \\ Z^\sharp & \longrightarrow & A^{r+s,r}_{T^\sharp} \end{array}$$

such that the horizontal morphisms are log-étale and the right morphism is the canonical exact closed immersion given by $t_{r+s+1}, \ldots, t_d$. Recall following 5.2.1.1, this is Zariski locally possible to suppose $s = 0$, but we will need the computation of this section when s is not necessarily 0 (see the condition $(\star)$ of 5.2.4). Moreover, without structures, we can similarly suppose $r = 0$.

Let $Y := \alpha^{-1}(B^{n,r}_{T^\sharp})$ be the open $T^\sharp$-(formal) subscheme of $X^\sharp$ with trivial log-structure (see [Ogu18, III.1.2.8]). Let $t_1, \ldots, t_r \in M_{X^\sharp}$ and $t_{r+1}, \ldots, t_d \in \Gamma(X, \mathcal{O}_X)$ be the element given by α. Then $t_{r+s+1}, \ldots, t_d$ generate $I := \Gamma(X, \mathcal{I})$, $\bar{t}_1, \ldots, \bar{t}_{r+s}$ are semi-logarithmic coordinates of $Z^\sharp$ over $T^\sharp$, and $\bar{t}_{r+s+1}, \ldots, \bar{t}_d$ is a basis of $\mathcal{I}/\mathcal{I}^2$, where $\bar{t}_1, \ldots, \bar{t}_r \in \Gamma(Z, M_{Z^\sharp})$ (resp. $\bar{t}_{r+1}, \ldots, \bar{t}_d \in \Gamma(X, \mathcal{O}_Z)$) are the images of $t_1, \ldots, t_r$ (resp. $t_{r+1}, \ldots, t_d$) via $\Gamma(X, M_{X^\sharp}) \to \Gamma(Z, M_{Z^\sharp})$ (resp. $\Gamma(X, \mathcal{I}) \to \Gamma(Z, \mathcal{O}_Z)$). Remark that since the closed immersion $\underline{u}$ is regular then it follows from [Gro67, 16.9.3] that $t_{r+s+1}, \ldots, t_d$ is a quasi-regular sequence of $I := \Gamma(X, \mathcal{I})$ and then by noetherianity (see [Gro67, 16.9.10]) is a regular sequence of I.

Since the level m is fixed, we simply write $\tau_{i\sharp} := \mu^n_{(m),\gamma}(t_i) - 1 \in \widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)}$ for $i = 1, \ldots, r$ (see notation 3.2.2.4), $\tau_j := 1 \otimes t_j - t_j \otimes 1 \in \widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)}$ for $j = r+1, \ldots, d$. We write $\overline{\tau}_{i\sharp} := \mu^n_{(m),\gamma}(\bar{t}_i) - 1 \in \widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$ for $i = 1, \ldots, r$, $\overline{\tau}_j := 1 \otimes \bar{t}_j - \bar{t}_j \otimes 1 \in \widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$ for $j = r+1, \ldots, r+s$. The sheaf of $\mathcal{B}_X$-algebras $\widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)}$ is a free $\mathcal{B}_X$-module with the basis $\{\underline{\tau}_{(r)}{}^{\{(\underline{i},\underline{j})\}_{(m)}} := \underline{\tau}_\sharp{}^{\{(\underline{i},\underline{0})\}_{(m)}} \underline{\tau}^{\{(\underline{0},\underline{j})\}_{(m)}} \mid \underline{i} \in \mathbb{N}^r,\ \underline{j} \in \mathbb{N}^{d-r}$ such that $|\underline{i}| + |\underline{j}| \leq n\}$, and $\widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$ is a free $\mathcal{B}_Z$-module with the basis $\{\underline{\overline{\tau}}_{(r)}^{\{(\underline{i},\underline{j})\}_{(m)}} := \underline{\overline{\tau}}_\sharp^{\{(\underline{i},\underline{0})\}_{(m)}} \underline{\overline{\tau}}^{\{(\underline{0},\underline{j})\}_{(m)}} \mid \underline{i} \in \mathbb{N}^r, \underline{j} \in \mathbb{N}^s$ such that $|\underline{i}| + |\underline{j}| \leq n\}$. According to 4.5.1.1, the corresponding dual basis of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp,n}$ is denoted $\{\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} \mid \underline{k} \in \mathbb{N}^d,\ |\underline{k}| \leq n\}$ and the corresponding dual basis of $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp,n}$ is denoted by $\{\underline{\partial}_{(r)}^{\langle \underline{i} \rangle_{(m)}} \mid \underline{i} \in \mathbb{N}^{r+s},\ |\underline{i}| \leq n\}$ (we hope the similar notation is not too confusing). The sheaf $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ is a free $\mathcal{B}_X$-module with the basis $\{\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}} \mid \underline{k} \in \mathbb{N}^d\}$, and $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$ is a free $\mathcal{B}_Z$-module with the basis $\{\underline{\partial}_{(r)}^{\langle \underline{i} \rangle_{(m)}} \mid \underline{i} \in \mathbb{N}^{r+s}\}$.

We denote by straight letter, the global section of a sheaf on X, e.g. $\widetilde{D}^{(m)}_{X^\sharp/T^\sharp} := \Gamma(X, \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$.

5.2.2.1. We compute the canonical homomorphism $\widetilde{u}^* \widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$ sends $\underline{\tau}_{(r)}^{\{(\underline{i},\underline{j})\}_{(m)}}$ (where $\underline{i} \in \mathbb{N}^{r+s}$, $\underline{j} \in \mathbb{N}^{d-r-s}$) to $\underline{\overline{\tau}}_{(r)}^{\{\underline{i}\}_{(m)}}$ if $\underline{j} = (0, \ldots, 0)$ and to 0 otherwise.

We denote by $\theta \colon \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \to u_* \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp \to X^\sharp/T^\sharp}$ the canonical homomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules (which is build by duality from the canonical homomorphisms $\widetilde{u}^* \widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$) and which sends 1 to $1 \otimes 1$. For any $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, we denote by $[P]_Z$ its image via the canonical morphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} / \mathcal{I} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} = u_* \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp \to X^\sharp/T^\sharp}$. We set $\underline{\xi}_{(r)}^{\langle \underline{k} \rangle_{(m)}} := [\underline{\partial}_{(r)}^{\langle \underline{k} \rangle_{(m)}}]_Z$. By duality, we compute $\theta(\underline{\partial}_{(r)}^{\langle \underline{i} \rangle_{(m)}}) = \underline{\xi}_{(r)}^{\langle (\underline{i},\underline{0}) \rangle_{(m)}}$, for any $\underline{i} \in \mathbb{N}^{r+s}$.

Notation 5.2.2.2. By abuse of notations, we write $\mathcal{O}_T$ for the sheaf deduced from $\mathcal{O}_T$ by topological inverse image (e.g. $p_X^{-1} \mathcal{O}_T$ is denoted by $\mathcal{O}_T$ where $p_X \colon X^\sharp \to T^\sharp$ is the map induced by α). We denote by $\mathcal{O}_T\{\partial_{r+s+1}, \ldots, \partial_d\}^{(m)}$ the sub-$\mathcal{O}_T$-algebra of $\mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$ generated by the elements $\{\partial_{r+s+1}^{\langle j_1 \rangle_{(m)}}, \partial_{r+s+2}^{\langle j_2 \rangle_{(m)}}, \ldots, \partial_d^{\langle j_{d-r-s} \rangle_{(m)}} \mid j_1, \ldots, j_{d-r-s} \in \mathbb{N}\}$. It is equal to the free $\mathcal{O}_T$-module whose basis is given by $\{\underline{\partial}_{(r)}^{\langle (\underline{0},\underline{j}) \rangle_{(m)}} \mid \underline{j} \in \mathbb{N}^{d-r-s}\}$, where $\underline{0} := (0, \ldots, 0) \in \mathbb{N}^{r+s}$. Beware that this commutative

$\mathcal{O}_T$-algebra has not to be confused with the partial divided powers of level m polynomial $\mathcal{O}_T$-algebra in the variables $\partial_{r+s+1},\dots,\partial_d$ of 1.3.3.6 which was denoted by $\mathcal{O}_T\langle\partial_{r+s+1},\dots,\partial_d\rangle_{(m)}$.

Notation 5.2.2.3. We denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ the free $\mathcal{B}_X$-module with the basis $\{\underline{\partial}_{(r)}^{\langle(\underline{i},\underline{0})\rangle_{(m)}} \mid \underline{i}\in\mathbb{N}^{r+s}\}$, where $\underline{0}:=(0,\dots,0)\in\mathbb{N}^{d-r-s}$. The sheaf $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ is equal to the sub-$\mathcal{O}_T$-algebra of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ which is generated by $\mathcal{B}_X$, by $\partial_{\sharp,i}^{\langle p^h\rangle_{(m)}}$ and $\partial_j^{\langle p^h\rangle_{(m)}}$ for any $1\le i\le r$, $r+1\le j\le r+s$ and $0\le h\le p^m$. Since there is no ambiguity concerning the local coordinates (resp. and $T^\sharp$), we might sometimes simply denote $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}$ (resp. $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp}$).

5.2.2.4. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ is a free left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}$-module with the basis $\{\underline{\partial}^{\langle(\underline{0},\underline{h})\rangle_{(m)}}\mid \underline{h}\in\mathbb{N}^{d-r-s}\}$, where $\underline{0}:=(0,\dots,0)\in\mathbb{N}^{r+s}$. This means that the canonical homomorphism of $\mathcal{O}_T$-algebras

$$\mu\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \tag{5.2.2.4.1}$$

given by $P\otimes Q\mapsto PQ$ is also an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules.

Since $t_{r+s+1},\dots,t_d$ generate $\mathcal{I}$ and are in the center of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$, then we compute $\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}=\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\mathcal{I}$. Hence, we get a canonical $\mathcal{O}_T$-algebra structure on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ induced by that of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$. Since $\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}=\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\cap\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, we get the inclusion

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\hookrightarrow\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}.$$

The morphism 5.2.2.4.1 induces the isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules:

$$(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp})\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}=u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}. \tag{5.2.2.4.2}$$

Notation 5.2.2.5. Let $\iota\colon\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\hookrightarrow\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$ be the canonical homomorphism of $\mathcal{O}_T$-algebra. Taking the structure of $\mathcal{B}_X$-module induced by the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ (resp. induced by the structure of left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$), we denote by

$$\sigma^{(m)}_{X^\sharp,\widetilde{t}}\colon\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\to u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \tag{5.2.2.5.1}$$

the $\mathcal{B}_X$-linear map given by $\sigma^{(m)}_{X^\sharp,\widetilde{t}}(\underline{\partial}_{(r)}^{\langle(\underline{i},\underline{0})\rangle_{(m)}})=\underline{\partial}_{(r)}^{\langle\underline{i}\rangle_{(m)}}\otimes\underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}$, for any $\underline{i}\in\mathbb{N}^{r+s}$ and $\underline{j}\in\mathbb{N}^{d-r-s}$.

Moreover, $\sigma^{(m)}_{X^\sharp,\widetilde{t}}$ is surjective with kernel equal to $\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. We write

$$\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}\colon\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\xrightarrow{\sim}u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \tag{5.2.2.5.2}$$

the induced $\mathcal{B}_Z$-linear isomorphism characterized by the formula $\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}(\underline{\xi}_{(r)}^{\langle(\underline{i},\underline{j})\rangle_{(m)}})=\underline{\partial}_{(r)}^{\langle\underline{i}\rangle_{(m)}}\otimes\underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}$, for any $\underline{i}\in\mathbb{N}^{r+s}$ and $\underline{j}\in\mathbb{N}^{d-r-s}$. In fact, we will show this isomorphism is even $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linear (see 5.2.2.9).

Taking the structure of $\mathcal{B}_X$-module induced by the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ (resp. induced by the structure of left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$), we denote by

$$\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}\colon\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\to u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, \tag{5.2.2.5.3}$$

the $\mathcal{B}_X$-linear morphism given by $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(\underline{\partial}_{(r)}^{\langle(\underline{i},\underline{0})\rangle_{(m)}})=\underline{\partial}_{(r)}^{\langle\underline{i}\rangle_{(m)}}$, for any $\underline{i}\in\mathbb{N}^{r+s}$. In other words, $\iota\circ\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ is the restriction of $\sigma^{(m)}_{X^\sharp,\widetilde{t}}$ on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$.

The kernel of $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ is $\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ and we get therefore the $\mathcal{B}_Z$-linear isomorphism (for the left structures):

$$\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\mathcal{I} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}. \tag{5.2.2.5.4}$$

which satisfies the formula $\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(\underline{\xi}_{(r)}^{\langle(\underline{i},\underline{0})\rangle_{(m)}}) = \underline{\partial}_{(r)}^{\langle\underline{i}\rangle_{(m)}}$, for any $\underline{i}\in\mathbb{N}^{r+s}$.

Moreover, for any $P\in\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}$, $Q\in\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$, we have the formula

$$\sigma^{(m)}_{X^\sharp,\widetilde{t}}(PQ) = \overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}([PQ]_Z) = \sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P)\otimes Q = \overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}([P]_Z)\otimes Q. \tag{5.2.2.5.5}$$

By construction we have the commutative diagram

$$\begin{array}{ccc}
\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} & \xrightarrow[\sim]{\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}} & u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \\
\Vert & & \uparrow{\scriptstyle \overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}\otimes\mathrm{id}}\ \wr \\
u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp} & \xleftarrow[5.2.2.4.2]{\sim} & (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp})\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}.
\end{array} \tag{5.2.2.5.6}$$

Since $\theta(\underline{\partial}_{(r)}^{\langle\underline{i}\rangle_{(m)}}) = \underline{\xi}_{(r)}^{\langle(\underline{i},\underline{0})\rangle_{(m)}}$ for any $\underline{i}\in\mathbb{N}^{r+s}$, since $\mathcal{B}_Z = u^*(\mathcal{B}_X)$, then we have the following $\mathcal{B}_Z$-linear homomorphism $\vartheta\colon u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\to\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ making commutative the diagram:

$$\begin{array}{ccccc}
\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} & \xrightarrow{[-]_Z} & \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} & \hookrightarrow & \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \\
{\scriptstyle 5.2.2.5.3}\downarrow{\scriptstyle \sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}} & \nearrow{\scriptstyle \vartheta}\ \sim & & & \Vert \\
u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} & & \xrightarrow{u_*\theta} & & u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}.
\end{array} \tag{5.2.2.5.7}$$

Hence, $\vartheta = (\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}})^{-1}$ and then $\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ do not depend on the choice of the semi logarithmic coordinates (contrary to $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ or $\sigma^{(m)}_{X^\sharp,\widetilde{t}}$).

Lemma 5.2.2.6. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module, $x\in\mathcal{E}$, $P\in\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$, $[-]_Z$ the canonical surjection $\mathcal{E}\to\mathcal{E}/\mathcal{I}\mathcal{E}$. With notation 5.2.2.5.4, the structure of left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module of $\mathcal{E}/\mathcal{I}\mathcal{E}$ is characterized by the formula:*

$$\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P)\cdot[x]_Z = \overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}([P]_Z)\cdot[x]_Z = [P\cdot x]_Z. \tag{5.2.2.6.1}$$

Proof. Let $Q := \sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P) = \overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}([P]_Z)\in\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$. Since $[P]_Z = \vartheta(Q)$ (see 5.2.2.5.7), then this is a consequence of 4.4.2.11.2. □

Lemma 5.2.2.7. *The map $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ (see 5.2.2.5.3) is a morphism of $\mathcal{O}_T$-algebras. The maps $\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ and ϑ (see 5.2.2.5.4) are isomorphisms of $\mathcal{O}_T$-algebras.*

Proof. Since the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\to\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\mathcal{I}$ is a morphism of $\mathcal{B}_X$-rings (i.e. this is $\mathcal{B}_X$-linear and this is an homomorphism of rings), since $\vartheta = (\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}})^{-1}$, then we reduce to check ϑ is an isomorphism of $\mathcal{O}_T$-algebras.

By $\mathcal{B}_Z$-linearity of this map, we reduce to check that $\vartheta(\underline{\partial}_{(r)}^{\langle\underline{k}\rangle_{(m)}}\overline{b}\underline{\partial}_{(r)}^{\langle\underline{l}\rangle_{(m)}}) = \vartheta(\underline{\partial}_{(r)}^{\langle\underline{k}\rangle_{(m)}})\vartheta(\overline{b})\vartheta(\underline{\partial}_{(r)}^{\langle\underline{l}\rangle_{(m)}})$, for any $b\in\Gamma(X,\mathcal{B}_X)$, $\underline{k},\underline{l}\in\mathbb{N}^{r+s}$. By using the formula 3.2.3.7.2 where $\underline{\partial}_\sharp$ is replaced by $\underline{\partial}_{(r)}$, we get the formula $\vartheta(\underline{\partial}_{(r)}^{\langle\underline{l}\rangle_{(m)}}) = \underline{\xi}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}$ and by $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linearity of ϑ we get the equality

$$\vartheta(\underline{\partial}_{(r)}^{\langle\underline{k}\rangle_{(m)}}[b]_Z\underline{\partial}_{(r)}^{\langle\underline{l}\rangle_{(m)}}) = \sum_{\underline{k}''+\underline{k}'=\underline{k}}\left\{\begin{matrix}\underline{k}\\ \underline{k}'\end{matrix}\right\}_{(m)}\underline{\partial}_{(r)}^{\langle\underline{k}'\rangle_{(m)}}([b]_Z)\underline{\partial}_{(r)}^{\langle\underline{k}''\rangle_{(m)}}\cdot\underline{\xi}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}$$

By using 5.2.2.6.1 in the case where $\mathcal{E} = \mathcal{B}_X$, since $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(\underline{\partial}^{\langle(\underline{k}',\underline{0})\rangle_{(m)}}_{(r)}) = \underline{\partial}^{\langle\underline{k}'\rangle_{(m)}}_{(r)}$ then we get: $\underline{\partial}^{\langle\underline{k}'\rangle_{(m)}}([b]_Z) = [\underline{\partial}^{\langle(\underline{k}',\underline{0})\rangle_{(m)}}_{(r)}(b)]_Z$. Since $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ is $\mathcal{B}_X$-linear (for the left structures), then we get $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(\underline{\partial}^{\langle(\underline{k}',\underline{0})\rangle_{(m)}}_{(r)}(b)\underline{\partial}^{\langle(\underline{k}'',\underline{0})\rangle_{(m)}}_{(r)}) = \underline{\partial}^{\langle\underline{k}'\rangle_{(m)}}([b]_Z)\underline{\partial}^{\langle\underline{k}''\rangle_{(m)}}_{(r)}$.

Since $\underline{\xi}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}_{(r)} = [\underline{\partial}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}_{(r)}]_Z$, then using 5.2.2.6.1 in the case where $\mathcal{E} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, we get the first equality:

$$\sum_{\underline{k}''+\underline{k}'=\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{k}' \end{smallmatrix} \right\}_{(m)} \underline{\partial}^{\langle\underline{k}'\rangle_{(m)}}([b]_Z)\underline{\partial}^{\langle\underline{k}''\rangle_{(m)}}_{(r)} \cdot \underline{\xi}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}_{(r)} \overset{5.2.2.6.1}{=} \sum_{\underline{k}''+\underline{k}'=\underline{k}} \left\{ \begin{smallmatrix} \underline{k} \\ \underline{k}' \end{smallmatrix} \right\}_{(m)} [\underline{\partial}^{\langle(\underline{k}',\underline{0})\rangle_{(m)}}_{(r)}(b)\underline{\partial}^{\langle(\underline{k}'',\underline{0})\rangle_{(m)}}_{(r)}\underline{\partial}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}_{(r)}]_Z$$

$$= [\underline{\partial}^{\langle(\underline{k},\underline{0})\rangle_{(m)}}_{(r)} b\underline{\partial}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}_{(r)})]_Z = [\underline{\partial}^{\langle(\underline{k},\underline{0})\rangle_{(m)}}_{(r)}]_Z[b]_Z[\underline{\partial}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}_{(r)})]_Z = \vartheta(\underline{\partial}^{\langle\underline{k}\rangle_{(m)}}_{(r)})\vartheta([b]_Z)\vartheta(\underline{\partial}^{\langle\underline{l}\rangle_{(m)}}_{(r)}),$$

the third one being a consequence of the fact that $[]_Z\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ is a ring homomorphism. □

5.2.2.8. Since $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, then $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ is a $(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$-bimodule. Using the formula 5.2.2.6.1 applied to the case $\mathcal{E} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, we compute that $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ is also a left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-submodule of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, and then a $(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp})$-sub-bimodule of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$.

Since $u_*\theta\colon u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \to u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}$ is a homomorphism of left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules, then via the commutativity of 5.2.2.5.7, this implies that the bijection $\vartheta\colon u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ (and its inverse $\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$) is an isomorphism of left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules.

Proposition 5.2.2.9. *Taking the structure of left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module induced by the $(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$-bimodule structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ (see 5.2.2.8), the isomorphism $\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}$ (see 5.2.2.5.2) is $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linear.*

Proof. Let $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. The element P can be written (uniquely) in the form $\sum_{\underline{j}\in\mathbb{N}^{d-r-s}} P_{\underline{j}}\underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}_{(r)}$, with $P_{\underline{j}} \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ zero except for a finite number of terms. Then, we compute

$$\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}([P]_Z) = \sum_{\underline{j}\in\mathbb{N}^{d-r-s}} \sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P_{\underline{j}}) \otimes \underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}}. \tag{5.2.2.9.1}$$

Hence, we compute the $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linearity of $\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ follows from the fact that $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ is a morphism of $\mathcal{O}_T$-algebras (see 5.2.2.7) and from the formula 5.2.2.6.1 applied to the case $\mathcal{E} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. □

5.2.2.10. It follows from 5.2.2.9 that $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}$ is a free left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module with the basis $\{\underline{\xi}^{\langle(\underline{0},\underline{h})\rangle_{(m)}}_{(r)} \mid \underline{h} \in \mathbb{N}^{d-r-s}\}$, where $\underline{0} := (0,\ldots,0) \in \mathbb{N}^{r+s}$.

5.2.2.11. It follows from 5.2.2.9 that via the isomorphism $\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}$ we equip $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\ldots,\partial_d\}^{(m)}$ with a structure of $(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$-bimodule extending its structure of left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module. The right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module structure is given later by the explicit formula 5.2.2.20. Remark, the morphism $\sigma^{(m)}_{X^\sharp,\widetilde{t}}$ is also $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-linear.

5.2.2.12 (Semi-logarithmic adjoint operator)**.** The semi-logarithmic adjoint automorphism ${}^\tau\colon (\widetilde{D}^{(m)}_{X^\sharp/T^\sharp})^o \to \widetilde{D}^{(m)}_{X^\sharp/T^\sharp}$ (see 4.5.1.5) induces ${}^\tau\colon \widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} \to \widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ such that ${}^\tau(I\widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}) = I\widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$. This yields the automorphism ${}^\tau\colon \widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} \to \widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$. On the other hand, via the local logarithmic coordinates $\overline{t}_1,\ldots,\overline{t}_{r+s}$ of $Z^\sharp$ over $T^\sharp$, we get the logarithmic adjoint operator automorphism ${}^\tau\colon \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp} \to \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$ given by $Q = \sum_{\underline{i}\in\mathbb{N}^{r+s}} b_{\underline{i}}\underline{\partial}^{\langle\underline{i}\rangle_{(m)}}_{(r)} \mapsto {}^\tau(Q) := \sum_{\underline{i}\in\mathbb{N}^{r+s}} {}^\tau\underline{\partial}^{\langle\underline{i}\rangle_{(m)}}_{(r)} b_{\underline{i}}$.

Since $\vartheta(\underline{\partial}_{(r)}^{\langle \underline{i} \rangle_{(m)}}) = \underline{\partial}_{(r)}^{\langle (\underline{i},\underline{0}) \rangle_{(m)}}$, $\vartheta({}^{\tau}\underline{\partial}_{(r)}^{\langle \underline{i} \rangle_{(m)}}) = {}^{\tau}\underline{\partial}_{(r)}^{\langle (\underline{i},\underline{0}) \rangle_{(m)}}$ (use the formula 3.4.1.2.2) for any $\underline{i} \in \mathbb{N}^{r+s}$, then the following diagram

$$\begin{array}{ccccc} \widetilde{D}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp} & \xrightarrow{\sigma^{(m)}_{Z^\sharp, X^\sharp, \widetilde{t}}} & \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp} & \underset{\vartheta}{\xrightarrow{\sim}} & \widetilde{D}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp} \\ \sim\downarrow\tau & & \sim\downarrow\tau & & \sim\downarrow\tau \\ \widetilde{D}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp} & \xrightarrow{\sigma^{(m)}_{Z^\sharp, X^\sharp, \widetilde{t}}} & \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}, & \underset{\vartheta}{\xrightarrow{\sim}} & \widetilde{D}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp} \end{array} \tag{5.2.2.12.1}$$

is commutative.

5.2.2.13. For any left (resp. right) $\widetilde{D}^{(m)}_{X^\sharp/T^\sharp}$-module E (resp. M), we denote by $[-]_Z \colon E \to E/IE$ (resp. $[-]'_Z \colon M \to M/MI$) the canonical surjection. Remark we add a prime to avoid some confusion in the case of a bimodule, e.g. see 5.2.2.14. We denote by $\widetilde{e}_0 := d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge dt_d$ a basis of the free $\mathcal{B}_X$-module $\widetilde{\omega}_{X^\sharp/T^\sharp}$ and by $\widetilde{e}_0^\vee$ its corresponding dual basis of the free $\mathcal{B}_X$-module $\widetilde{\omega}^{-1}_{X^\sharp/T^\sharp}$. We denote by $\widetilde{f}_0 := d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge dt_{r+s}$ the basis of the free $\mathcal{B}_Z$-module $\widetilde{\omega}_{Z^\sharp/T^\sharp}$, and by $\widetilde{f}_0^\vee$ its dual basis.

Following 4.5.1.8, the functors $\widetilde{\omega}_{Z^\sharp/T^\sharp} \otimes_{\mathcal{B}_Z} -$ and $\otimes_{\mathcal{B}_Z} \widetilde{\omega}^{-1}_{Z^\sharp/T^\sharp}$ induce quasi-inverse equivalence between the category of left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules and of right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules, with explicit computation involving the semi-logarithmic adjoint operator via the identification of $\widetilde{\omega}_{Z^\sharp/T^\sharp}$ (resp. $\widetilde{\omega}^{-1}_{Z^\sharp/T^\sharp}$) with $\mathcal{B}_Z$ via the choice of the basis $\widetilde{f}_0$ (resp. $\widetilde{f}_0^\vee$). Let $\mathcal{M}$ be a quasi-coherent right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module. We have the isomorphism of abelian groups:

$$\iota_{\widetilde{t}} \colon \Gamma(Z, \widetilde{u}^*(\mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/T^\sharp}) \otimes_{\mathcal{B}_Z} \widetilde{\omega}_{Z^\sharp/T^\sharp}) \xrightarrow{\sim} M/MI \tag{5.2.2.13.1}$$

given by $\widetilde{f}_0 \otimes [y \otimes \widetilde{e}_0^\vee]_Z \mapsto [y]'_Z$. Via this map $\iota_{\widetilde{t}}$, M/MI is equipped with a structure of right $\widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$-module. The structure of right $\widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$-module of M/MI is characterized by the formula,

$$[y]'_Z \cdot \sigma^{(m)}_{Z^\sharp, X^\sharp, \widetilde{t}}(P) = [y]'_Z \cdot \overline{\sigma}^{(m)}_{Z^\sharp, X^\sharp, \widetilde{t}}([P]_Z) = [y \cdot P]'_Z, \tag{5.2.2.13.2}$$

for any $y \in M$ and $P \in \widetilde{D}^{(m)}_{X^\sharp/T^\sharp}$. Indeed, set $Q := \sigma^{(m)}_{Z^\sharp, X^\sharp, \widetilde{t}}(P)$. Following 4.5.1.8.1, we have $\left(\widetilde{f}_0 \otimes [y \otimes \widetilde{e}_0^\vee]_Z\right) Q = \widetilde{f}_0 \otimes {}^{\tau}Q\left([y \otimes \widetilde{e}_0^\vee]_Z\right)$. Since ${}^{\tau}Q = \sigma^{(m)}_{Z^\sharp, X^\sharp, \widetilde{t}}({}^{\tau}P)$ (see 5.2.2.12.1), then following 5.2.2.6.1 we get the first equality

$${}^{\tau}Q\left([y \otimes \widetilde{e}_0^\vee]_Z\right) = [{}^{\tau}P\left(y \otimes \widetilde{e}_0^\vee\right)]_Z \overset{4.5.1.8.2}{=} [yP \otimes \widetilde{e}_0^\vee]'_Z.$$

Hence, we are done.

Since $\mathcal{M}/\mathcal{M}\mathcal{I}$ is quasi-coherent and $\Gamma(X, \mathcal{M}/\mathcal{M}\mathcal{I}) \xrightarrow{\sim} M/MI$, this yields $\mathcal{M}/\mathcal{M}\mathcal{I}$ is equipped with a structure of right $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module so that

$$\iota_{\widetilde{t}} \colon u_*\widetilde{u}^*(\mathcal{M} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/T^\sharp}) \otimes_{\mathcal{B}_Z} \widetilde{\omega}_{Z^\sharp/T^\sharp} \xrightarrow{\sim} \mathcal{M}/\mathcal{M}\mathcal{I} \tag{5.2.2.13.3}$$

is an isomorphism of right $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules.

5.2.2.14. Following 5.2.2.13.3 and with its notation, we get the isomorphism of abelian sheaves:

$$\iota_{\widetilde{t}} \colon u_*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \leftarrow Z^\sharp/T^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I}. \tag{5.2.2.14.1}$$

Via this map, we get a structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}, u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$-bimodule on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I}$. By functoriality of the construction of the structure of $(u^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$-bimodule of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \leftarrow Z^\sharp/T^\sharp}$, we check that the underlying structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I}$ is equal to its natural structure. The structure of right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module is given by the formula 5.2.2.13.2 applied to the case where $\mathcal{M} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. Moreover, we compute that $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp}$ is also a left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-submodule of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, and therefore a $(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp})$-sub-bimodule of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$.

5.2.2.15. We denote by

$$\mu' \colon \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \tag{5.2.2.15.1}$$

the canonical homomorphism of $\mathcal{O}_T$-algebras given by $Q\otimes P \mapsto QP$, which is also an isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}$-modules. The morphism 5.2.2.15.1 induces the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules:

$$\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}\mathcal{I}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I}. \tag{5.2.2.15.2}$$

Notation 5.2.2.16. Taking the $\mathcal{B}_X$-module structure induced by the structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module on $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ (resp. induced by the structure of right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module on $\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$), we denote by

$$\varsigma^{(m)}_{X^\sharp,\widetilde{t}} \colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \to \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \tag{5.2.2.16.1}$$

the $\mathcal{B}_X$-linear map given by $\varsigma^{(m)}_{X^\sharp,\widetilde{t}}(\underline{\partial}^{\langle(\underline{i},\underline{j})\rangle_{(m)}}_{(r)}) = \underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}} \otimes \underline{\partial}^{\langle\underline{i}\rangle_{(m)}}_{(r)}$, for any $\underline{i}\in\mathbb{N}^{r+s}$ and $\underline{j}\in\mathbb{N}^{d-r-s}$.

Moreover, $\varsigma^{(m)}_{X^\sharp,\widetilde{t}}$ is surjective with kernel equal to $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I}$ and we denote by

$$\overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}} \colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I} \xrightarrow{\sim} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \tag{5.2.2.16.2}$$

the induced $\mathcal{B}_Z$-linear isomorphism characterized by the formula $\overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}}(\underline{\xi}^{\langle(\underline{i},\underline{j})\rangle_{(m)}}_{(r)}) = \underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}} \otimes \underline{\partial}^{\langle\underline{i}\rangle_{(m)}}_{(r)}$, for any $\underline{i}\in\mathbb{N}^{r+s}$ and $\underline{j}\in\mathbb{N}^{d-r-s}$. For any $P\in\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}$, $Q\in\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$, we have the formula

$$\varsigma^{(m)}_{X^\sharp,\widetilde{t}}(QP) = \overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}}([QP]'_Z) = Q\otimes\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P) = Q\otimes\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}([P]_Z). \tag{5.2.2.16.3}$$

We have the commutative diagram

$$\begin{array}{ccc}
\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I} & \xrightarrow[\sim]{\overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}}} & \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \\
\Vert & & \uparrow{\scriptstyle \mathrm{id}\otimes\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}}\ \wr \\
\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I} & \xleftarrow[5.2.2.15.2]{\sim} & \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}).
\end{array} \tag{5.2.2.16.4}$$

where $\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ is the isomorphism 5.2.2.5.4.

5.2.2.17. By using the commutativity of 5.2.2.12.1, we can check that the semi-logarithmic adjoint operator (see 5.2.2.12) induces the bijection

$$\overline{\tau} \colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I},$$

making commutative the diagram

$$\begin{array}{ccc}
u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} & \xrightarrow[\alpha]{\sim} & \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \\
\uparrow{\scriptstyle \overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}}\ \wr & & \uparrow{\scriptstyle \overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}}}\ \wr \\
\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} & \xrightarrow[\sim]{\overline{\tau}} & \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I} \\
\uparrow{\scriptstyle 5.2.2.4.2}\ \wr & & \uparrow{\scriptstyle 5.2.2.15.2}\ \wr \\
(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}) \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} & \xrightarrow[\beta]{\sim} & \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp/T^\sharp}\mathcal{I}).
\end{array} \tag{5.2.2.17.1}$$

where α is given by $P_Z\otimes Q\mapsto {}^tQ\otimes{}^\tau P_Z$ and where β is given by $[P_X]_Z\otimes Q\mapsto {}^tQ\otimes[{}^\tau P_X]'_Z$.

Proposition 5.2.2.18. *Taking the structure of right $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module induced by the $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}, u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$-bimodule structure of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ (see 5.2.2.14), the isomorphism $\overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}}$ (see 5.2.2.16.2) is $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linear.*

Proof. Let $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. The element P can be written (uniquely) in the form $\sum_{\underline{j}\in\mathbb{N}^{d-r-s}} \underline{\partial}_{(r)}^{\langle(\underline{0},\underline{j})\rangle_{(m)}} P_{\underline{j}}$, with $P_{\underline{j}} \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ zero except for a finite number of terms. Then, following 5.2.2.16.3 we have the formula

$$\overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}}([P]'_Z) = \sum_{\underline{j}\in\mathbb{N}^{d-r-s}} \underline{\partial}^{\langle(\underline{0},\underline{j})\rangle_{(m)}} \otimes \sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P_{\underline{j}}). \qquad (5.2.2.18.1)$$

Hence, we compute the $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linearity of $\overline{\varsigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ follows from the fact that $\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}$ is a morphism of $\mathcal{O}_T$-algebras (see 5.2.2.7) and from the formula 5.2.2.13.2 applied to the case $\mathcal{M} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. □

5.2.2.19. It follows from 5.2.2.18 that via the isomorphism $\overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}}$ we equip $\mathcal{O}_T\{\partial_{r+s+1},\ldots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$ with a structure of $(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$-bimodule extending its structure of left $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module. The left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module structure is given below by the explicit formula 5.2.2.20. Finally, remark the morphism $\varsigma^{(m)}_{X^\sharp,\widetilde{t}}$ is also $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-linear.

Lemma 5.2.2.20. *Let $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$, $R \in \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$, and $Q, Q' \in \mathcal{O}_T\{\partial_{r+s+1},\ldots,\partial_d\}^{(m)}$. Then we get respectively in $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\ldots,\partial_d\}^{(m)}$ and $\mathcal{O}_T\{\partial_{r+s+1},\ldots,\partial_d\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$ the formulas*

$$(R\otimes Q)\cdot PQ' = R\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P)\otimes QQ', \qquad Q'P\cdot(Q\otimes R) = Q'Q\otimes\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P)R. \qquad (5.2.2.20.1)$$

Proof. Choose any $R_X \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ such that $\vartheta(R) = [R_X]_Z$ (see 5.2.2.5.7). $\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}([PQ]_Z) = \overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}([PQ]_Z)$. By using the formula 5.2.2.5.5 and the $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-linearity of $\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}$, we get $(R\otimes Q)\cdot PQ' = \overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}([R_XQ]_Z\cdot PQ')$. Since $[R_XQ]_Z\cdot PQ' = [R_XPQQ']_Z$, using again formula 5.2.2.5.5, we get $\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}([R_XQ]_Z\cdot PQ') = \overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}([R_XP]_Z)\otimes QQ' \overset{5.2.2.7}{=} \overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}([R_X]_Z)\overline{\sigma}^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}([P]_Z)\otimes QQ' = R\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P)\otimes QQ'$.

The second equality of 5.2.2.20.1 follows similar from the formula 5.2.2.16.3 and the Lemma 5.2.2.7. □

5.2.2.21 (Base change and change of level)**.** Suppose we are in the non-respective case of log-schemes of 5.2. Take an integer $m' \geq m$. Let $T'^\sharp \to T^\sharp$ be a morphism of noetherian affine nice fine log-schemes. Put $X'^\sharp := X^\sharp \times_{T^\sharp} T'^\sharp$, $Z'^\sharp := Z^\sharp \times_{T^\sharp} T'^\sharp$, and let $u' \colon Z'^\sharp \hookrightarrow X'$ be the induced closed immersion and $f\colon X'^\sharp \to X^\sharp$, $g\colon Z'^\sharp \to Z^\sharp$ be the canonical projection. We set $\mathcal{B}_{X'} := f^*(\mathcal{B}_X)$, $\mathcal{B}_{Z'} := g^*(\mathcal{B}_Z)$. We keep similar notation than 4.1.2, in particular we set $\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/T^\sharp} := \mathcal{B}_{X'} \otimes_{\mathcal{O}_X} \widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/T^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp} := \mathcal{B}_{Z'} \otimes_{\mathcal{O}_{Z'}} \widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp}$. We denote by $\widetilde{X}'^\sharp$ (resp. $\widetilde{Z}'^\sharp$) the ringed logarithmic scheme $(X'^\sharp, \mathcal{B}_{X'})$ (resp. $(Z'^\sharp, \mathcal{B}_{Z'})$), and by $\tilde{u}'\colon \widetilde{Z}'^\sharp/T'^\sharp \to \widetilde{X}'^\sharp/T'^\sharp$ the morphism of relative ringed logarithmic schemes induced by the diagram 5.1.1.1.1 and by $u'^*\mathcal{B}_{X'} \xrightarrow{\sim} \mathcal{B}_{Z'}$

We have ring homomorphisms $f^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \to f^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} \xleftarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/T'^\sharp} \to \widetilde{\mathcal{D}}^{(m')}_{X'^\sharp/T'^\sharp}$ (see 4.4.4.1). Thus we get the ring homomorphism $\widetilde{D}^{(m)}_{X^\sharp/T^\sharp} \to \widetilde{D}^{(m')}_{X'^\sharp/T'^\sharp}$. Similarly, we get $\widetilde{D}^{(m)}_{Z^\sharp/T^\sharp} \to \widetilde{D}^{(m')}_{Z'^\sharp/T'^\sharp}$.

The semi-logarithmic coordinates $t_1,\ldots,t_d$ of $X^\sharp/T^\sharp$ (see 4.5.1.4) induces canonically the semi-logarithmic coordinates $t'_1,\ldots,t'_d$ on $X'^\sharp/T'^\sharp$. Denote by $\partial_i'^{\langle k\rangle_{(m)}}$ for $i = r+1,\ldots,d$ and $k \in \mathbb{N}$ the associated operators of $\widetilde{D}^{(m')}_{X'^\sharp/T'^\sharp}$.

Write $\mathcal{O}_{T'^\sharp}\{\partial'_{r+s+1},\ldots,\partial'_d\}^{(m')}$ for the sub-$\mathcal{O}_{T'^\sharp}$-algebra of $D^{(m')}_{X'^\sharp/T'^\sharp}$ generated by the elements $\partial_i'^{\langle k\rangle_{(m')}}$ for $r+s+1 \leq i \leq r$ and $k \in \mathbb{N}$. Since the homomorphism $\widetilde{D}^{(m)}_{X^\sharp/T^\sharp} \to \widetilde{D}^{(m')}_{X'^\sharp/T'^\sharp}$ carries $\partial_i^{\langle k\rangle_{(m)}}$ to $\frac{q_k^{(m)}!}{q_k^{(m')}!}\partial_i'^{\langle k\rangle_{(m')}}$ for $r+s+1 \leq i \leq r$ and $k \in \mathbb{N}$ (use formula 1.4.2.5.2), then it induces the factorization $\mathcal{O}_T\{\partial_{r+s+1},\ldots,\partial_d\}^{(m)} \to O_{T'^\sharp}\{\partial'_{r+s+1},\ldots,\partial'_d\}^{(m')}$. We compute that the maps $\sigma^{(m)}_{X^\sharp,\widetilde{t}}$ and $\varsigma^{(m)}_{X^\sharp,\widetilde{t}}$ of

5.2.2.5.1 commute with base change and with change of level, i.e. the canonical diagram (and similarly for $\varsigma^{(m)}_{X^\sharp,\widetilde{t}}$) is commutative:

$$\begin{array}{ccc} \widetilde{D}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp} & \xrightarrow[\sim]{\sigma^{(m)}_{X^\sharp,\underline{t}}} & \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \\ \downarrow & & \downarrow \\ \widetilde{D}^{(m)}_{Z'\to X'^\sharp/T'^\sharp} & \xrightarrow[\sim]{\sigma^{(m')}_{X'^\sharp,\underline{t}'}} & \widetilde{D}^{(m')}_{Z'^\sharp/T'^\sharp}\otimes_{\mathcal{O}_{T'^\sharp}}\mathcal{O}_{T'^\sharp}\{\partial'_{r+s+1},\dots,\partial'_d\}^{(m')}. \end{array} \tag{5.2.2.21.1}$$

5.2.2.22. Suppose we are in the non-respective case of log-schemes of 5.2. Let $\mathcal{F}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module. We get the isomorphisms

$$\widetilde{u}^{(m)}_{+}(\mathcal{F}) = u_*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\hookleftarrow Z^\sharp/T^\sharp}\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} u_*\mathcal{F}) \xrightarrow[\iota_{\widetilde{t}}\otimes\mathrm{id}]{\sim} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{I})\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} u_*\mathcal{F} \xrightarrow[\varsigma^{(m)}_{X^\sharp,\widetilde{t}}\otimes\mathrm{id}]{\sim}$$
$$(\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}\otimes_{\mathcal{O}_T} u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} u_*\mathcal{F} \xrightarrow{\sim} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}\otimes_{\mathcal{O}_T} u_*\mathcal{F}. \tag{5.2.2.22.1}$$

Let $x\in\mathcal{M}$, $P\in\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$, and $Q,Q'\in\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$. By using the right formula of 5.2.2.20.1, we can check that the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module of $\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}\otimes_{\mathcal{O}_T}\mathcal{M}$ is given by the formula:

$$Q'P\cdot(Q\otimes x) = Q'Q\otimes(\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P)\cdot x). \tag{5.2.2.22.2}$$

Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module. We have the isomorphisms

$$\widetilde{u}^{(m)}_{+}(\mathcal{M}) = u_*(\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}) \xrightarrow{\sim} u_*\mathcal{M}\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$$
$$\xrightarrow[\mathrm{id}\otimes\overline{\sigma}^{(m)}_{X^\sharp,\widetilde{t}}]{\sim} u_*\mathcal{M}\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}) \xrightarrow{\sim} u_*\mathcal{M}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}. \tag{5.2.2.22.3}$$

Let $x\in\mathcal{M}$, $P\in\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$, and $Q,Q'\in\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$. By using the left formula of 5.2.2.20.1, we can check that the structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module of $\mathcal{M}\otimes_{\mathcal{O}_T}\mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$ is given by the formula:

$$(x\otimes Q)\cdot PQ' = (x\cdot\sigma^{(m)}_{Z^\sharp,X^\sharp,\widetilde{t}}(P))\otimes QQ'. \tag{5.2.2.22.4}$$

5.2.3 Exactness of the pushforward by a closed immersion

Proposition 5.2.3.1. *Suppose the hypotheses and notations of 5.1.1.1 hold. We suppose f is a (not necessarily exact) closed immersion and ℓ is the identity*

(a) The bimodule $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\hookrightarrow Y^\sharp}$ is a locally free as left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module. The bimodule $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\hookleftarrow X^\sharp}$ is a locally free as right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module.

(b) Suppose we are in the non-respective case of 5.1.1.1. For any $*\in\{r,l\}$, the functor $\widetilde{f}^{(m)}_{+}\colon D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp})\to D({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp})$ is exact.

Proof. 0) Since f is a closed immersion, then the functor f_* is exact. Hence, we reduce to check the part a). By twisting, we reduce to check that the bimodule $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\hookrightarrow Y^\sharp}$ is a locally free as left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module. Since the morphism $\tilde{f}$ is the composition $(X^\sharp,\mathcal{B}_X)\to(X^\sharp,f^*\mathcal{B}_Y)\to(Y^\sharp,\mathcal{B}_Y)$, then by transitivity (see 5.1.1.12), we reduce to the case where $f=\mathrm{id}$ and to the case where the morphism $f^*\mathcal{B}_Y\to\mathcal{B}_X$ is an isomorphism Since the first case is clear, let us suppose the morphism $f^*\mathcal{B}_Y\to\mathcal{B}_X$ is an isomorphism.

1) When f is an exact closed immersion, then following 5.2.2.10, $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \hookrightarrow Y^\sharp}$ is a locally free right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-modules.

2) Let us prove the general case. Let $\overline{x}$ be a geometric point of $X^\sharp$. Following 3.1.1.14 (resp. 3.3.3.2), there exists a commutative diagram of the form

$$\begin{array}{ccccc} \widetilde{Y}^\sharp & \xrightarrow{u} & Y'^\sharp & \xrightarrow{v} & Y^\sharp \\ & {\scriptstyle g}\nwarrow & \uparrow{\scriptstyle f'} & \square & \uparrow{\scriptstyle f} \\ & & X'^\sharp & \xrightarrow{w} & X^\sharp \end{array}$$

such that the square is cartesian, u is log étale, $\underline{u}$ is affine, v is étale, g is an exact closed $S^\sharp$-immersion and v is an étale neighborhood of $\overline{x}$ in $X^\sharp$. By étale descent, we reduce to the case where $g = \mathrm{id}$. Since f is log-étale, then it follows from 5.1.3.6 that the canonical $\widetilde{\mathcal{D}}^{(m)}_{\widetilde{Y}^\sharp}$-linear morphism $\widetilde{\mathcal{D}}^{(m)}_{\widetilde{Y}^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{\widetilde{Y}^\sharp \to Y^\sharp}$ is an isomorphim. By using 5.1.1.11.1 this yields the isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-modules of the form $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \hookrightarrow \widetilde{Y}^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp \hookrightarrow Y^\sharp}$. From the case 1), we get that $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \hookrightarrow \widetilde{Y}^\sharp}$ is a locally free as left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$-module. Hence, we are done. □

5.2.4 On some base change of an exact closed immersion by an exact closed immersion

Suppose we are in the non-respective case of log-schemes of 5.2. Let $T'^\sharp \to T^\sharp$ be a morphism of nice fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$, where i is an integer (see definition 3.1.1.1). Let $\mathcal{I}$ and $\mathcal{J}$ be two ideals of $\mathcal{O}_X$, let $a\colon X'^\sharp \hookrightarrow X^\sharp$ and $u\colon Z^\sharp \hookrightarrow X^\sharp$ be the respective associated exact closed immersions. We set $Z'^\sharp := X'^\sharp \times_{X^\sharp} Z^\sharp$. We get both cartesian squares

$$\begin{array}{ccc} Z^\sharp & \xhookrightarrow{u} & X^\sharp \\ {\scriptstyle b}\uparrow & & \uparrow{\scriptstyle a} \\ Z'^\sharp & \xhookrightarrow{u'} & X'^\sharp, \end{array} \qquad \begin{array}{ccc} Z^\sharp_{T'^\sharp} & \xhookrightarrow{u_{T'^\sharp}} & X^\sharp_{T'^\sharp} \\ {\scriptstyle b_{T'^\sharp}}\uparrow & & \uparrow{\scriptstyle a_{T'^\sharp}} \\ Z'^\sharp_{T'^\sharp} & \xhookrightarrow{u'_{T'^\sharp}} & X'_{T'^\sharp}, \end{array} \tag{5.2.4.0.1}$$

whose morphisms of the left square are the canonical exact closed immersions, and whose right square is the induced square by base change via $T'^\sharp \to T^\sharp$. We suppose Zariski locally in X the following property holds:

($\star$) There exist three integers $d, r, s \geq 1$ such that $r + s \leq d$, a log-étale homomorphism of affine $T^\sharp$-log-schemes $\alpha\colon X^\sharp \to A^{d,r}_{T^\sharp}$ such that, denoting by $t_1, \ldots, t_r \in M_{X^\sharp}$ and $t_{r+1}, \ldots, t_d \in \mathcal{O}_X$ the elements given by α, we have $X'^\sharp = V(t_{r+s+1}, \ldots, t_d)$ and $Z^\sharp = V(t_{r+1}, \ldots, t_{r+s})$.

Let $\mathcal{B}_X$ be a commutative $\mathcal{O}_X$ algebra equipped with a left $\mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$-module structure which is compatible with its algebra structure. We set $\mathcal{B}_Z := u^*(\mathcal{B}_X)$. We keep similar notation than 4.1.2 (we replace $S^\sharp$ by $T^\sharp$, and $X^\sharp$ by $Z^\sharp$ if necessary), in particular we set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/T^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} := \mathcal{B}_Z \otimes_{\mathcal{O}_Z} \mathcal{D}^{(m)}_{Z^\sharp/T^\sharp}$. We denote by $\widetilde{X}^\sharp$ (resp. $\widetilde{Z}^\sharp$) the ringed logarithmic scheme $(X^\sharp, \mathcal{B}_X)$ (resp. $(Z^\sharp, \mathcal{B}_Z)$), and by $\tilde{u}\colon \widetilde{Z}^\sharp/T^\sharp \to \widetilde{X}^\sharp/T^\sharp$. the morphism of relative ringed logarithmic schemes induced by the diagram 5.2.4.0.1. Let $f\colon X^\sharp_{T'^\sharp} \to X^\sharp$ be the projection and $\mathcal{B}_{X^\sharp_{T'^\sharp}} := f^*(\mathcal{B}_X)$. We keep similar notation by adding the index $T'^\sharp$. We suppose $\widetilde{u}$, $\widetilde{a}$, $\widetilde{b}$, $\widetilde{u}'$ are quasi-flat (see Definition 4.4.1.3).

5.2.4.1. To lighten the notation, we forget indicating the functors u_* and also u^{-1} for objects in the essential image of u_* ; and similarly for the other exact closed immersions. By applying the functor $\widetilde{b}^*$ to the canonical $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linear morphism $\theta\colon \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{J}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ (given by $1 \mapsto [1]_Z$), we get the $\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp}$-linear morphism:

$$\widetilde{b}^*(\theta)\colon \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/(\mathcal{I}+\mathcal{J})\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$$

given by $[1]_{Z'} \mapsto [1]_{Z'}$. By composing the later morphism with the $\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp}$-linear morphism $\theta \colon \widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$ we get the canonical morphism $\theta \colon \widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/(\mathcal{I}+\mathcal{J})\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. When we are in the $(\star)$ local situation, this yields the isomorphisms ϑ are transitive (see the notation 5.2.2.6.1), i.e. the composition $\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp} \xrightarrow[\vartheta]{\sim} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp,Z'^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp,Z'^\sharp/T^\sharp} \xrightarrow[\vartheta]{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z'^\sharp/T^\sharp}/(\mathcal{I}+\mathcal{J})\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z'^\sharp/T^\sharp}$ is ϑ.

Lemma 5.2.4.2. *Suppose we are in the $(\star)$ local situation. We have the equalities*

$$(\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)})\mathcal{J} = \widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}\mathcal{J} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \tag{5.2.4.2.1}$$

$$\mathcal{I}(\mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}) = \mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}. \tag{5.2.4.2.2}$$

Proof. The equality 5.2.4.2.1 (resp. 5.2.4.2.2) comes from the left (resp. right) formula 5.2.2.20.1 □

Lemma 5.2.4.3. *Let $\mathcal{F}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp}$-module. We have the canonical isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}$-modules:*

$$\widetilde{a}^* \circ \widetilde{u}^{(m)}_+(\mathcal{F}) \xrightarrow{\sim} \widetilde{u}'^{(m)}_+ \circ \widetilde{b}^*(\mathcal{F}). \tag{5.2.4.3.1}$$

Moreover, this one commutes with morphisms of change of level and of base, i.e., for any $m' \geq m$, for any $\widetilde{\mathcal{D}}^{(m')}_{Z_{T'^\sharp}/T^\sharp}$-module $\mathcal{F}'$, for any $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linear morphism of the form $\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \mathcal{F} \to \mathcal{F}'$, the canonical diagram

$$\begin{array}{ccccc}
\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} (\widetilde{a}^* \circ \widetilde{u}^{(m)}_+(\mathcal{F})) & \xrightarrow{\sim} & \widetilde{a}^*_{T'^\sharp} \circ \widetilde{u}^{(m)}_{T'^\sharp +}(\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \mathcal{F}) & \longrightarrow & \widetilde{a}^*_{T'^\sharp} \circ \widetilde{u}^{(m')}_{T'^\sharp +}(\mathcal{F}') \\
\downarrow \wr & & \downarrow \wr & & \downarrow \wr \\
\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} (\widetilde{u}'^{(m)}_+ \circ \widetilde{b}^*(\mathcal{F})) & \xrightarrow{\sim} & \widetilde{u}'^{(m)}_{T'^\sharp +} \circ \widetilde{b}^*_{T'^\sharp}(\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \mathcal{F}) & \longrightarrow & \widetilde{u}'^{(m')}_{T'^\sharp +} \circ \widetilde{b}^*_{T'^\sharp}(\mathcal{F}'),
\end{array} \tag{5.2.4.3.2}$$

where vertical isomorphisms are that of the form 5.2.4.3.1 and where the horizontal morphisms follows from 5.2.5.11.2, is commutative.

Proof. By using 5.2.2.14.1 (still valid for arbitrary exact closed immersion), we get the isomorphisms:

$$\widetilde{a}^* \circ \widetilde{u}^{(m)}_+(\mathcal{F}) \xrightarrow{\sim} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{J}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} \mathcal{F} \tag{5.2.4.3.3}$$

$$\widetilde{u}'^{(m)}_+ \circ \widetilde{b}^*(\mathcal{F}) \xrightarrow{\sim} (\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}\mathcal{J}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} \mathcal{F}. \tag{5.2.4.3.4}$$

Hence, it is sufficient to check that we have an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$-bimodules of the form

$$(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{J}) \xrightarrow{\sim} (\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}\mathcal{J}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}). \tag{5.2.4.3.5}$$

which sends $[1]_{X'} \otimes [1]'_Z$ to $[1]'_{Z'} \otimes [1]_{Z'}$. Since this is local, we can suppose we are in the $(\star)$ local situation. We denote by $\underline{t}_{X'} := (t_{r+s+1},\dots,t_d)$ and $\underline{t}_Z = (t_{r+1},\dots,t_{r+s})$. With notation 5.2.2.5.2 and 5.2.2.16.2, we get the $\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}$-linear isomorphisms:

$$\begin{aligned}
&(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{J}) \\
&\xrightarrow[\widetilde{\sigma}^{(m)}_{X^\sharp,\underline{t}_{X'}} \otimes \mathrm{id}]{\sim} (\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{J}) \\
&\xrightarrow{\sim} (\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)})/(\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)})\mathcal{J} \\
&\xrightarrow{\sim} (\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}\mathcal{J}) \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)},
\end{aligned} \tag{5.2.4.3.6}$$

the last isomorphism resulting from the equality 5.2.4.2.1. We have the $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linear isomorphisms:

$$\begin{aligned}
&(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{J}) \\
\xrightarrow[\mathrm{id}\otimes\overline{\varsigma}^{(m)}_{X^\sharp,\widetilde{t}_Z}]{\sim}\ & (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}} (\mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}) \\
\xrightarrow{\sim}\ & \mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp},
\end{aligned} \tag{5.2.4.3.7}$$

whose last isomorphism follows from the equality 5.2.4.2.2. This yields the following square:

$$\begin{array}{ccc}
(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}\mathcal{J}) & \xrightarrow[5.2.4.3.6]{\sim} & (\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}\mathcal{J}) \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \\
{\scriptstyle 5.2.4.3.7}\downarrow\wr & & {\scriptstyle \overline{\varsigma}^{(m)}_{X'^\sharp,\widetilde{t}_Z}\otimes\mathrm{id}}\downarrow\wr \\
\mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} & \xrightarrow[\mathrm{id}\otimes\overline{\sigma}^{(m)}_{Z^\sharp,\widetilde{t}_{X'}}]{\sim} & \mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}.
\end{array} \tag{5.2.4.3.8}$$

It follows by transitivity of the isomorphisms of the type ϑ (see 5.2.4.1) that the square 5.2.4.3.8 is a commutative diagram.

Let us now consider the canonical diagram:

$$\begin{array}{ccc}
(\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}\mathcal{J}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}) & \xrightarrow[\mathrm{id}\otimes\overline{\sigma}^{(m)}_{Z^\sharp,\widetilde{t}_{X'}}]{\sim} & (\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}\mathcal{J}) \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)} \\
{\scriptstyle \overline{\varsigma}^{(m)}_{X'^\sharp,\widetilde{t}_Z}\otimes\mathrm{id}}\downarrow\wr & & {\scriptstyle \overline{\varsigma}^{(m)}_{X'^\sharp,\widetilde{t}_Z}\otimes\mathrm{id}}\downarrow\wr \\
\mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp} & \xrightarrow[\mathrm{id}\otimes\overline{\sigma}^{(m)}_{Z^\sharp,\widetilde{t}_{X'}}]{\sim} & \mathcal{O}_T\{\partial_{r+1},\dots,\partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp} \otimes_{\mathcal{O}_T} \mathcal{O}_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}.
\end{array} \tag{5.2.4.3.9}$$

This square 5.2.4.3.9 is commutative diagram by functoriality.

Since the right arrows (resp. of the bottom) of the squares 5.2.4.3.8 and 5.2.4.3.9 are identical, since the left (resp. top) arrows of the squares 5.2.4.3.8 and 5.2.4.3.9 are $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-linear (resp. $\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp}$-linear), this yields the canonical isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp},\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$-bimodules of the form 5.2.4.3.5. We easily compute that it sends $[1]_{X'}\otimes[1]'_Z$ to $[1]'_{Z'}\otimes[1]_{Z'}$. Hence the isomorphism 5.2.4.3.1 is proved.

Now let us check its commutation to the change of levels, i.e. suppose $T'^\sharp\to T^\sharp$ is the identity. By functoriality of the isomorphism 5.2.4.3.1, it is a question of checking the commutativity of the diagram

$$\begin{array}{ccc}
\widetilde{a}^*\circ\widetilde{u}^{(m)}_+(\mathcal{F}) & \longrightarrow & \widetilde{a}^*\circ\widetilde{u}^{(m')}_+(\mathcal{F}) \\
\downarrow\wr & & \downarrow\wr \\
\widetilde{u}'^{(m)}_+\circ\widetilde{b}^*(\mathcal{F}) & \longrightarrow & \widetilde{u}'^{(m')}_+\circ\widetilde{b}^*(\mathcal{F}).
\end{array} \tag{5.2.4.3.10}$$

For that, it is sufficient to notice that the isomorphisms of the squares 5.2.4.3.8 and 5.2.4.3.9 commute with the change of levels. This check comes from the commutation with level change of the isomorphisms of the form $\overline{\sigma}$ (i.e., we have the commutative square 5.2.2.21.1) and of that of the form $\overline{\vartheta}$ of 5.2.2.18. Likewise, we easily compute that it commutes with base changes, i.e. we validate the commutativity of the left square of 5.2.4.3.2. □

Lemma 5.2.4.4. *Let $\mathcal{F}$ be a flat $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp}$-module. Then we have the vanishing:*

$$\forall\, n\neq 0,\ \mathcal{H}^n\mathbb{L}\widetilde{a}^*\widetilde{u}^{(m)}_+(\mathcal{F})=0. \tag{5.2.4.4.1}$$

Proof. Since this is local, we are in the $(\star)$ local situation. We proceed by induction on $N:=d-r-s$ the cardinal of the elements $t_{r+s+1},\dots,t_d$ defining $X'^\sharp$. At first, suppose $N=1$, i.e. $X'=V(t_d)$. In this case, for $n \notin \{-1, 0\}$, $\mathcal{H}^n \mathbb{L}\widetilde{a}^* \widetilde{u}_+^{(m)}(\mathcal{F}) = 0$. Moreover, $\mathcal{H}^{-1} \mathbb{L}\widetilde{a}^* \widetilde{u}_+^{(m)}(\mathcal{F}) = \ker(\widetilde{u}_+^{(m)}(\mathcal{F}) \underset{t_d}{\longrightarrow} \widetilde{u}_+^{(m)}(\mathcal{F}))$. However, following 5.2.2.22.1, $\widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \mathcal{O}_T\{\partial_{r+1}, \dots, \partial_{r+s}\}^{(m)} \otimes_{\mathcal{O}_T} \mathcal{F}$. Since $\mathcal{F}$ is t_d torsion free, the lemma 5.2.2.20 allows us to conclude (indeed t_d commutes with the elements of $\mathcal{O}_T\{\partial_{r+1}, \dots, \partial_{r+s}\}^{(m)}$.

Suppose now $N \geq 2$ and denote by $X'' = V(t_{r+s+2}, \dots, t_d)$ and $Z'^\sharp = Z \cap X''^\sharp$, $b' \colon Z''^\sharp \hookrightarrow Z$, $\widetilde{a}' \colon X''^\sharp \hookrightarrow X^\sharp$, $\widetilde{a}'' \colon X'^\sharp \hookrightarrow X''^\sharp$, $u'' \colon Z''^\sharp \hookrightarrow X''^\sharp$ the induced closed immersions. By induction hypothesis and following 5.2.4.3.1, we get: $\mathbb{L}\widetilde{a}'^* \circ \widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \widetilde{a}'^* \circ \widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \widetilde{u}''_+ \circ b'^*(\mathcal{F})$. Following the case $N = 1$ and following 5.2.4.3.1, we check also $\mathbb{L}\widetilde{a}''^* \circ \widetilde{u}''_+ \circ b'^*(\mathcal{F}) \xrightarrow{\sim} \widetilde{a}''^* \circ \widetilde{u}''_+ \circ b'^*(\mathcal{F}) \xrightarrow{\sim} \widetilde{a}''^* \circ \widetilde{a}'^* \circ \widetilde{u}_+^{(m)}(\mathcal{F})$. This yields the isomorphism $\mathbb{L}\widetilde{a}''^* \circ \mathbb{L}\widetilde{a}'^* \circ \widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \widetilde{a}''^* \circ \widetilde{a}'^* \circ \widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \widetilde{a}^* \circ \widetilde{u}_+^{(m)}(\mathcal{F})$. The isomorphism $\mathbb{L}\widetilde{a}^* \xrightarrow{\sim} \mathbb{L}\widetilde{a}''^* \circ \mathbb{L}\widetilde{a}'^*$ allows us to conclude. □

Proposition 5.2.4.5. *We have for any $\mathcal{F} \in D^-(\widetilde{\mathcal{D}}_{Z^\sharp}^{(m)})$ the isomorphism*

$$a^! \circ \widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \widetilde{u}'_+ \circ b^!(\mathcal{F}). \tag{5.2.4.5.1}$$

Proof. Let $\mathcal{P}$ be a resolution of $\mathcal{F}$ by flat $\widetilde{\mathcal{D}}_{Z^\sharp}^{(m)}$-modules. Since the functors $\widetilde{u}_+^{(m)}$ and $\widetilde{u}'_+$ are exact, by 5.2.4.4, we get $\mathbb{L}\widetilde{a}^* \widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \widetilde{a}^* \widetilde{u}_+^{(m)}(\mathcal{P})$ and $\widetilde{u}'_+ \circ \mathbb{L}\widetilde{b}^*(\mathcal{F}) \xrightarrow{\sim} \widetilde{u}'_+ \circ \widetilde{b}^*(\mathcal{P})$. The lemma 5.2.4.3 allows us to conclude. □

5.2.5 The fundamental isomorphism for schemes

In this subsection, by the local situation 5.2.1.1, we mean the local situation of 5.2.2 in the case where $s = 0$.

5.2.5.1. We can clarify 4.4.2.13 as follows in the context of an exact closed immersion. We have the commutative diagram

$$\begin{array}{ccccc}
\widetilde{\Delta}^n_{X^\sharp/T^\sharp,(m)}(2) & \overset{p_{12}}{\underset{p_{01}}{\overset{p_{02}}{\rightrightarrows}}} & \widetilde{\Delta}^n_{X^\sharp/T^\sharp,(m)} & \overset{p_1}{\underset{p_0}{\rightrightarrows}} & \widetilde{X} \\
{\scriptstyle \widetilde{\Delta}^n(u)(2)} \big\uparrow & & {\scriptstyle \widetilde{\Delta}^n(u)} \big\uparrow & & {\scriptstyle \widetilde{u}} \big\uparrow \\
\widetilde{\Delta}^n_{X^\sharp/T^\sharp,(m)}(2) & \overset{p_{12}}{\underset{p_{01}}{\overset{p_{02}}{\rightrightarrows}}} & \widetilde{\Delta}^n_{Z^\sharp/T^\sharp,(m)} & \overset{p_1}{\underset{p_0}{\rightrightarrows}} & \widetilde{Z}
\end{array} \tag{5.2.5.1.1}$$

where p_0, p_1 correspond to the homomorphisms $\mathcal{B}_X \to \widetilde{\mathcal{P}}^n_{X(m)}$ given by respectively the left and right structures of $\mathcal{B}_X$-algebra on $\widetilde{\mathcal{P}}^n_{X(m)}$. Using the local description of the homomorphism $\widetilde{u}^* \widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$ given in 5.2.2, we check that $\widetilde{u}^* \widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$.

We denote $\overline{u} \colon (Z, \mathcal{B}_Z) \to (X, u_* \mathcal{B}_Z)$ the morphism of ringed spaces induced by u. We remark that $\overline{u}$ is flat and that $\overline{u}^* = u^{-1} \colon D^+(u_* \mathcal{B}_Z) \to D^+(\mathcal{B}_Z)$. Recall that for any $\mathcal{M} \in D^+(\mathcal{B}_X)$, by definition $\widetilde{u}^\flat(\mathcal{M}) := u^{-1} \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(u_* \mathcal{B}_Z, \mathcal{M})$ (see [Har66, III.6]).

If $\mathcal{M}$ is a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module, we denote by

$$\widetilde{u}^{\flat 0}(\mathcal{M}) := u^{-1} \mathcal{H}om_{\mathcal{B}_X}(u_* \mathcal{B}_Z, \mathcal{M}).$$

To simplify notation, we will write sometimes $\widetilde{u}^{\flat 0}(\mathcal{M}) := \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z, \mathcal{M})$. By definition, the right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module structure of $\widetilde{u}^{\flat 0}(\mathcal{M})$ is given by the following m-PD-costratification $\epsilon_n^{\widetilde{u}^{\flat 0}(\mathcal{M})}$ making commutative the diagram:

$$\begin{array}{ccc}
\mathcal{H}om_{\mathcal{B}_Z}(p^n_{0*}\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M})) & \xrightarrow[\epsilon_n^{\widetilde{u}^{\flat 0}(\mathcal{M})}]{\sim} & \mathcal{H}om_{\mathcal{B}_Z}(p^n_{1*}\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M})) \\
\downarrow\wr & & \downarrow\wr \\
\mathcal{H}om_{\mathcal{B}_X}(p^n_{0*}\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{M}) & & \mathcal{H}om_{\mathcal{B}_X}(p^n_{1*}\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{M}) \\
\uparrow\wr & & \uparrow\wr \\
\mathcal{H}om_{\widetilde{\mathcal{P}}^n_{X^\sharp,(m)}}(\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(p^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp,(m)},\mathcal{M})) & \xrightarrow[\epsilon_n^{\mathcal{M}}]{\sim} & \mathcal{H}om_{\widetilde{\mathcal{P}}^n_{X^\sharp,(m)}}(\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(p^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp,(m)},\mathcal{M})) \\
\big\downarrow \mathrm{ev}_1 & & \big\downarrow \mathrm{ev}_1 \\
\mathcal{H}om_{\mathcal{B}_X}(p^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp,(m)}, \mathcal{M}) & \xrightarrow[\epsilon_n^{\mathcal{M}}]{\sim} & \mathcal{H}om_{\mathcal{B}_X}(p^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp,(m)}, \mathcal{M}).
\end{array} \tag{5.2.5.1.2}$$

Both left (resp. right) top vertical isomorphisms correspond the Cartan isomorphisms $p_0^{\flat 0}\circ\widetilde{u}^{\flat 0} \xrightarrow{\sim} (u\circ p_0)^{\flat 0} = (p_0\circ\widetilde{\Delta}^n(u))^{\flat 0} \xleftarrow{\sim} (\widetilde{\Delta}^n(u))^{\flat 0}\circ p_0^{\flat 0}$ (resp. $p_1^{\flat 0}\circ\widetilde{u}^{\flat 0} \xrightarrow{\sim} (u\circ p_1)^{\flat 0} = (p_1\circ\widetilde{\Delta}^n(u))^{\flat 0} \xleftarrow{\sim} (\widetilde{\Delta}^n(u))^{\flat 0}\circ p_1^{\flat 0}$). The bottom vertical arrows are monomorphisms because $u^{-1}\widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}$ is surjective. We check the cocycle conditions via similar isomorphisms.

Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ is a flat $\mathcal{B}_X$-module, then an injective right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module is an injective $\mathcal{B}_X$-module. Hence, taking an injective resolution of a complex of $D^+({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$, we check the functor $\widetilde{u}^\flat$ sends $D^+({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$ to $D^+({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$, i.e. it induces

$$\widetilde{u}^\flat\colon D^+({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}) \to D^+({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}). \tag{5.2.5.1.3}$$

When the level m is ambiguous, we denote it more specifically by $\widetilde{u}^{\flat(m)}$.

Since $X^\sharp$ is locally noetherian, then $\widetilde{u}^\flat$ preserves the quasi-coherence and sends $D^+_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$ to $D^+_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$.

Lemma 5.2.5.2. *Suppose we are in the local situation 5.2.1.1. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module. Let $x\in\Gamma(Z,\widetilde{u}^{\flat 0}(\mathcal{M}))$ and $Q\in\widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$. Choose any $Q_X\in\widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ such that $\vartheta(Q)=[Q_X]_Z$ (see 5.2.2.5.7). We have the formula*

$$\mathrm{ev}_1(x\cdot Q)=\mathrm{ev}_1(x)\cdot Q_X, \tag{5.2.5.2.1}$$

where $\mathrm{ev}_1\colon\Gamma(Z,\widetilde{u}^{\flat 0}(\mathcal{M}))\hookrightarrow\Gamma(X,\mathcal{M})$ *is the evaluation at* 1 *homomorphism.*

Proof. Let $\underline{l}\in\mathbb{N}^r$ and $x\in\Gamma(Z,\widetilde{u}^{\flat 0}(\mathcal{M}))$. Let us consider the case where $Q=\underline{\partial}_{(r)}^{\langle\underline{l}\rangle_{(m)}}$ and $Q_X=\underline{\partial}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}$. Consider the commutative diagram

$$\begin{array}{ccccc}
\mathcal{H}om_{\mathcal{B}_Z}(p^n_{0*}\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M})) & \xrightarrow[\epsilon_n^{\widetilde{u}^{\flat 0}(\mathcal{M})}]{\sim} & \mathcal{H}om_{\mathcal{B}_Z}(p^n_{1*}\widetilde{\mathcal{P}}^n_{Z^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M})) & \xhookrightarrow{\mathrm{ev}_1} & \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M}) \\
\downarrow & & \downarrow & & \big\downarrow \mathrm{ev}_1 \\
\mathcal{H}om_{\mathcal{B}_X}(p^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp,(m)},\mathcal{M}) & \xrightarrow[\epsilon_n^{\mathcal{M}}]{\sim} & \mathcal{H}om_{\mathcal{B}_X}(p^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp,(m)},\mathcal{M}) & \xhookrightarrow{\mathrm{ev}_1} & \mathcal{M},
\end{array} \tag{5.2.5.2.2}$$

where the right square is constructed at 5.2.5.1.2. Modulo the isomorphisms 4.2.2.4.1, we identify $x\otimes\underline{\partial}_{(r)}^{\langle\underline{l}\rangle_{(m)}}$ with a global section of $\mathcal{H}om_{\mathcal{B}_Z}(p^n_{0*}\widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M}))$ and $\mathrm{ev}_1(x)\otimes\underline{\partial}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}$ with a global section of $\mathcal{H}om_{\mathcal{B}_X}(p^n_{0*}\widetilde{\mathcal{P}}^n_{X^\sharp,(m)},\mathcal{M})$. We compute the left vertical arrows of 5.2.5.2.2 sends $x\otimes\underline{\partial}_{(r)}^{\langle\underline{l}\rangle_{(m)}}$ to $\mathrm{ev}_1(x)\otimes\underline{\partial}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}$. Using the formula 4.2.2.6.2, the image of $\mathrm{ev}_1(x)\otimes\underline{\partial}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}$ via the composition of $\epsilon_n^{\mathcal{M}}$ with the evaluation at 1 homomorphism $\mathcal{H}om_{\mathcal{B}_X}(p^n_{1*}\widetilde{\mathcal{P}}^n_{X^\sharp/T^\sharp,(m)},\mathcal{M})\to\mathcal{M}$ is equal to $\mathrm{ev}_1(x)\cdot$

$\underline{\partial}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}} \in \Gamma(X,\mathcal{M})$. Using agaof the formula 4.2.2.6.2, we compute the image of $x\otimes\underline{\partial}_{(r)}^{\langle \underline{l}\rangle_{(m)}}$ via the composition of $\epsilon_n^{\widetilde{u}^{\flat 0}\mathcal{M}}$ with the evaluation at 1 homomorphism $\mathcal{H}om_{\mathcal{B}_Z}(p_{1*}^n\widetilde{\mathcal{P}}^n_{Z^\sharp/T^\sharp,(m)}, \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M})) \to \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_Z,\mathcal{M})$ is $x\cdot\underline{\partial}_{(r)}^{\langle \underline{l}\rangle_{(m)}}$. Hence, by using the commutativity of the diagram 5.2.5.1.2 we get

$$\mathrm{ev}_1(x\cdot\underline{\partial}_{(r)}^{\langle \underline{l}\rangle_{(m)}}) = \mathrm{ev}_1(x)\cdot\underline{\partial}_{(r)}^{\langle(\underline{l},\underline{0})\rangle_{(m)}}. \tag{5.2.5.2.3}$$

Finally, we check easily the formula 5.2.5.2.1 from 5.2.5.2.3. □

5.2.5.3 (Local description of the right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module structure of $\widetilde{u}^{\flat 0}(\mathcal{M})$)**.** Suppose we are in the local situation of 5.2.1.1. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module. Since $\vartheta\colon u_*\mathcal{B}_Z\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$, we have the isomorphism

$$\widetilde{u}^{\flat 0}(\mathcal{M}) \xrightarrow{\sim} u^{-1}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp},\mathcal{M}). \tag{5.2.5.3.1}$$

Following 5.2.2.7, we have the isomorphism of $\mathcal{O}_T$-algebras $\vartheta\colon u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ (see notation 5.2.2.5.7). Hence, we get from 5.2.5.3.1 the isomorphism

$$\widetilde{u}^{\flat 0}(\mathcal{M}) \xrightarrow{\sim} u^{-1}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp},\mathcal{M}) \tag{5.2.5.3.2}$$

By using Lemma 5.2.5.2, we compute that this isomorphism 5.2.5.3.2 is an isomorphism of right $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp}$-modules, and 5.2.5.3.1 is therefore an isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules. If there is no ambiguity, we can avoid writing u^{-1} pr u_*, e.g. we can simply write $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp},\mathcal{M}) = u^{-1}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp},\mathcal{M})$.

5.2.5.4. Suppose we are in the local situation of 5.2.2. Let $\mathcal{M}$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module.

(a) By derivating 9.3.1.6.1, we get the isomorphism of $D^{\mathrm{b}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp})$ of the form

$$\widetilde{u}^{\flat}(\mathcal{M}) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp},\mathcal{M}). \tag{5.2.5.4.1}$$

Let $s := d-r$, and $f_1 = t_{r+1},\dots,f_T := t_d$. Let $K_\bullet(\underline{f})$ be the Koszul complex of $\mathcal{O}_X$-free modules given by the sequence of global section $\underline{f} = (f_1,\dots,f_s)$ of $\mathcal{O}_X$. Let $e_1,\dots,e_s$ be the canonical basis of $\mathcal{O}_X^s$. Recall $K_i(\underline{f}) = \wedge^i(\mathcal{O}_X^s)$ and $d_{i,\underline{f}}\colon K_i(\underline{f}) \to K_{i-1}(\underline{f})$ (or simply d_i) is the $\mathcal{O}_X$-linear map defined by

$$d_i(e_{n_1}\wedge\cdots\wedge e_{n_i}) = \sum_{j=1}^{i}(-1)^{j-1}f_{n_j}e_{n_1}\wedge\cdots\wedge\widehat{e}_{n_j}\wedge\cdots\wedge e_{n_i}.$$

We set $\widetilde{K}_\bullet(\underline{f}) := \mathcal{B}_X\otimes_{\mathcal{O}_X}K_\bullet(\underline{f})$.

The canonical projection $\mathcal{O}_X\to\mathcal{O}_X/\mathcal{I}$ induces the quasi-isomorphism $K_\bullet(\underline{f})\to u_*\mathcal{O}_Z = \mathcal{O}_X/\mathcal{I}$. Since $f_1,\dots,f_s$ is a regular sequence of $\mathcal{I}$, since $u_*\mathcal{O}_Z$ and $\mathcal{B}_X$ are tor independent over $\mathcal{O}_Z$, then the canonical morphism $\widetilde{K}_\bullet(\underline{f})\to\mathcal{B}_X/\mathcal{I}\mathcal{B}_X$ (given by the canonical map $\widetilde{K}_0(\underline{f}) = \mathcal{B}_X\to\mathcal{B}_X/\mathcal{I}\mathcal{B}_X$) is a quasi-isomorphism. Hence, we get the isomorphism of $D^{\mathrm{b}}(\mathcal{B}_X)$

$$\phi_{\underline{f}}\colon\widetilde{u}^{\flat}(\mathcal{M}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\widetilde{K}_\bullet(\underline{f}),\mathcal{M}).$$

Since $f_1,\dots f_s$ are in the center of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ and since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ is a flat $\mathcal{B}_X$-algebra, then the quasi-isomorphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ in the category of complexes of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-bimodules. We get the commutativity of diagram

$$\begin{array}{ccc}
\widetilde{u}^\flat(\mathcal{M}) & \xrightarrow[\sim]{\phi_{\underline{f}}} & \mathcal{H}om_{\mathcal{B}_X}(\widetilde{K}_\bullet(\underline{f}),\mathcal{M}) \\
{\scriptstyle 5.2.5.4.1}\downarrow\wr & \overset{\phi_{\underline{t}}}{\searrow} & \downarrow\wr \\
\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp},\mathcal{M}) & \xleftarrow[\sim]{} & \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}),\mathcal{M}),
\end{array}$$

(5.2.5.4.2)

where $\phi_{\underline{t}}$ is the homomorphism making commutative the upper triangle. By commutativity of 5.2.5.4.2, $\phi_{\underline{t}}$ is an isomorphism of $D^{\mathrm{b}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp})$. Hence, we get the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules

$$\phi^s_{\underline{t}} := \mathcal{H}^s(\phi_{\underline{t}})\colon R^s\widetilde{u}^{\flat 0}(\mathcal{M}) \xrightarrow{\sim} \mathcal{H}^s\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}),\mathcal{M}). \qquad (5.2.5.4.3)$$

We have the homomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_s(\underline{f}),\mathcal{M}) \to \mathcal{M}$ (the structure of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-module on $\mathcal{M}$ comes from its structure of $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$ via ϑ) given by $\phi\mapsto\phi(e_1\wedge\cdots\wedge e_s)$. Since $\mathcal{M}\to\mathcal{M}/\mathcal{I}\mathcal{M}$ is a morphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules, then this induces the morphism of complex of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules of the form $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}),\mathcal{M})\to\mathcal{M}/\mathcal{I}\mathcal{M}$. This yields the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules

$$\mathcal{H}^s\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}),\mathcal{M}) \xrightarrow{\sim} \mathcal{M}/\mathcal{I}\mathcal{M}. \qquad (5.2.5.4.4)$$

(b) *Varying the coordinates.* Make a second choice: Suppose there exist a second cartesian diagram of morphisms of $T^\sharp$-log-(formal) schemes of the form:

$$\begin{array}{ccc}
X^\sharp & \xrightarrow{\alpha'} & A^{d,r}_{T^\sharp} \\
{\scriptstyle u}\uparrow & \square & \uparrow \\
Z^\sharp & \longrightarrow & A^{r,r}_{T^\sharp}
\end{array}$$

such that the horizontal morphisms are log-étale and the right morphism is the canonical exact closed immersion. Let $t'_1,\dots,t'_r\in M_{X^\sharp}$ and $t'_{r+1},\dots,t'_d\in\Gamma(X,\mathcal{I})$ be the element given by α'. Let $A:=\Gamma(X,\mathcal{B}_X)$ and $B:=\Gamma(Z,\mathcal{B}_Z)$. Set $f'_1=t'_{r+1},\dots,f'_s:=t'_d$. Let $\widetilde{K}_\bullet(\underline{f}')$ be the Koszul complex of $\underline{f}'=(f'_1,\dots,f'_s)$. Let $M_I=(c_{ij})\in M_T(A)$ be the matrix such that $\sum_{i=1}^s f'_ic_{ij}=f_j$. Let $\varphi\colon A^s\to A^s$ be the morphism associated with M_I. It corresponds to a morphism $\varphi\colon\widetilde{K}_1(\underline{f})\to\widetilde{K}_1(\underline{f}')$. We compute that the composition of φ with $d_{1,\underline{f}}\colon\widetilde{K}_1(\underline{f}')\to\widetilde{K}_0(\underline{f}')=A$ is equal to $d_{1,\underline{f}'}\colon\widetilde{K}_1(\underline{f})\to\widetilde{K}_0(\underline{f})=A$. Since $\widetilde{K}_\bullet(\underline{f})=\wedge\widetilde{K}_1(\underline{f})$ this yields the morphism of complexes $\wedge\varphi\colon\widetilde{K}_\bullet(\underline{f})\to\widetilde{K}_\bullet(\underline{f}')$. Hence, we get the commutative diagram

$$\begin{array}{ccc}
\widetilde{u}^\flat(\mathcal{M}) & \xrightarrow[\sim]{\phi_{\underline{f}}} & \mathcal{H}om_{\mathcal{B}_X}(\widetilde{K}_\bullet(\underline{f}),\mathcal{M}) \\
& {\scriptstyle\phi_{\underline{f}'}}\searrow\sim & \uparrow{\scriptstyle\wedge\varphi} \\
& & \mathcal{H}om_{\mathcal{B}_X}(\widetilde{K}_\bullet(\underline{f}'),\mathcal{M}).
\end{array}$$

This yields the commutativity of the top square of the diagram

$$\begin{array}{ccc}
R^s\widetilde{u}^{\flat 0}(\mathcal{M}) & = = = = = & R^s\widetilde{u}^{\flat 0}(\mathcal{M}) \\
\downarrow{\scriptstyle H^s\phi_{\underline{f}}}\ \wr & & \wr\ \downarrow{\scriptstyle H^s\phi_{\underline{f}'}} \\
\mathcal{H}^s\mathcal{H}om_{\mathcal{B}_X}(\widetilde{K}_\bullet(\underline{f}),\mathcal{M}) & \xleftarrow{\det\varphi} & \mathcal{H}^s\mathcal{H}om_{\mathcal{B}_X}(\widetilde{K}_\bullet(\underline{f}'),\mathcal{M}) \\
\downarrow\wr & & \downarrow\wr \\
\mathcal{H}^s\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}),\mathcal{M}) & & \mathcal{H}^s\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}'/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}'/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}'),\mathcal{M}) \\
\wr\downarrow{\scriptstyle 5.2.5.4.4} & & \wr\downarrow{\scriptstyle 5.2.5.4.4} \\
\mathcal{M}/\mathcal{I}\mathcal{M} & \xleftarrow{\overline{\det\varphi}} & \mathcal{M}/\mathcal{I}\mathcal{M},
\end{array}$$

(5.2.5.4.5)

whose compositions of vertical morphisms are $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-linear. Hence, the diagram 5.2.5.4.5 is commutative.

Notation 5.2.5.5. Following 4.6.6.9.2, for any $\mathcal{E}\in D({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$, the canonical morphism

$$\mathbb{L}\widetilde{u}^*(\mathcal{E})\to\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}\otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}}u^{-1}\mathcal{E} \tag{5.2.5.5.1}$$

is an isomorphism, which yields $\mathbb{L}\widetilde{u}^*(\mathcal{E})[d_{Z/X}]\xrightarrow{\sim}\widetilde{u}^!(\mathcal{E})$.

Suppose now we are in the local situation of 5.2.1.1. Let $Q\in\widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$. Choose $Q_X\in\widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ such that $[Q_X]_Z=\vartheta(Q)$. From 5.2.2.6.1, for any section x of $\mathcal{E}$, we have the formula in $\widetilde{u}^*(\mathcal{E})$:

$$Q(\widetilde{u}^*(x))=\widetilde{u}^*(Q_X\cdot x). \tag{5.2.5.5.2}$$

Via the monomorphism of rings $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}}\hookrightarrow\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$, we check the canonical homorphism

$$\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp}\otimes^{\mathbb{L}}_{u^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}}}u^{-1}\mathcal{E}\to\mathbb{L}\widetilde{u}^*(\mathcal{E})$$

is an isomorphism of $D({}^l\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp})$. This yields the isomorphism of $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}})$:

$$(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}))\otimes_{u^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}}}u^{-1}\mathcal{E}\xrightarrow{\sim}\mathbb{L}\widetilde{u}^*(\mathcal{E}).$$

Proposition 5.2.5.6. *Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module (resp. a $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-bimodule). We have the canonical isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules (resp. of right $(\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp},u^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$-bimodules):*

$$R^{-d_{Z/X}}\widetilde{u}^{\flat 0}(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\xrightarrow{\sim}\widetilde{\omega}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{B}_Z}\widetilde{u}^*(\mathcal{E}). \tag{5.2.5.6.1}$$

Proof. By functoriality, we reduce to check the non-respective case. Set $r:=-d_{Z/X}\in\mathbb{N}$.

0) First, let us suppose the conditions of 5.2.1.1 are satisfied, i.e. suppose $X^\sharp$ is affine and there exist some integers $d\geq r$ and a cartesian diagram of morphisms of $T^\sharp$-log-(formal) schemes of the form:

$$\begin{array}{ccc}
X^\sharp & \xrightarrow{\alpha} & A^{d,r}_{T^\sharp} \\
{\scriptstyle u}\uparrow & \square & \uparrow \\
Z^\sharp & \longrightarrow & A^{r,r}_{T^\sharp}
\end{array}$$

such that the horizontal morphisms are log-étale and the right morphism is the canonical exact closed immersion. Let $t_1,\dots,t_r\in M_{X^\sharp}$ and $t_{r+1},\dots,t_d\in\Gamma(X,\mathcal{I})$ be the element corresponding via α to the coordinates $x_1,\dots,x_d$ of $A^{d,r}_{T^\sharp}/T^\sharp$. In that case $\widetilde{\omega}_{Z^\sharp/T^\sharp}$ is a free $\mathcal{B}_Z$-module with the basis $d\log\bar{t}_1\wedge\cdots\wedge d\log\bar{t}_r$, and $\widetilde{\omega}_{X^\sharp/T^\sharp}$ is a free $\mathcal{B}_X$-module with the basis $d\log t_1\wedge\cdots\wedge d\log t_r\wedge dt_{r+1}\wedge\cdots\wedge dt_d$.

1) Since the isomorphism $\vartheta\colon \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}\xrightarrow{\sim}\widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ commutes with the adjoint operator automorphisms (see 5.2.2.12.1), by using 4.3.5.5 and 4.5.1.8, we get the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$-modules

$$\psi_{\underline{t}}\colon(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})/(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\mathcal{I}\xrightarrow{\sim}\widetilde{\omega}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{B}_Z}(\mathcal{E}/\mathcal{I}\mathcal{E}),$$

which is given by $\widetilde{e}_0\otimes x\mod\mathcal{I}\mapsto\widetilde{f}_0\otimes(x\mod\mathcal{I})$, where $\widetilde{e}_0:=d\log t_1\wedge\cdots\wedge d\log t_r\wedge dt_{r+1}\wedge\cdots\wedge dt_d$ and $\widetilde{f}_0:=d\log\bar{t}_1\wedge\cdots\wedge d\log\bar{t}_r$.

2) Let $s:=d-r$, and $f_1=t_{r+1},\dots,f_T:=t_d$. Using the isomorphism $\phi^s_{\underline{t}}$ constructed in 5.2.5.4.3, we get by composition the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp}$-modules

$$\begin{aligned}R^s\widetilde{u}^{\flat0}(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})&\underset{\phi^s_{\underline{t}}}{\xrightarrow{\sim}}\mathcal{H}^s\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{K}_\bullet(\underline{f}),\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\\&\underset{5.2.5.4.4}{\xrightarrow{\sim}}(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})/(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\mathcal{I}\underset{\psi_{\underline{t}}}{\xrightarrow{\sim}}\widetilde{\omega}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{B}_Z}(\mathcal{E}/\mathcal{I}\mathcal{E}).\end{aligned}\tag{5.2.5.6.2}$$

3) It remains to check that the composition of the isomorphisms of 5.2.5.6.2 does not depend on the choice of the coordinates. Make some second choice: Suppose there exist a second cartesian diagram of morphisms of $T^\sharp$-log-(formal) schemes of the form:

$$\begin{array}{ccc}X^\sharp&\xrightarrow{\alpha'}&A^{d,r}_{T^\sharp}\\ {\scriptstyle u}\uparrow&\square&\uparrow\\ Z^\sharp&\longrightarrow&A^{r,r}_{T^\sharp}\end{array}$$

such that the horizontal morphisms are log-étale and the right morphism is the canonical exact closed immersion. Let $t'_1,\dots,t'_r\in M_{X^\sharp}$ and $t'_{r+1},\dots,t'_d\in\Gamma(X,\mathcal{I})$ be the element given by α'. Let $A:=\Gamma(X,\mathcal{B}_X)$, $B:=\Gamma(Z,\mathcal{B}_Z)$, $R:=\Gamma(T,\mathcal{B}_T)$. Set $f'_1=t'_{r+1},\dots,f'_s:=t'_d$. Let $(c_{ij})\in M_T(A)$ be the matrix such that $\sum_{i=1}^s f'_ic_{ij}=f_j$. We denote by $\delta_i=d\log t_i$ if $i=1,\dots,r$ and $\delta_i=d\,t_i$ if $i=r+1,\dots,d$ (resp. $\delta'_i=d\log t'_i$ if $i=1,\dots,r$ and $\delta'_i=d\,t'_i$ if $i=r+1,\dots,d$). Let $\varphi\colon A^s\to A^s$ be the morphism associated with (c_{ij}). Let $(d_{ij})\in M_d(A)$ be the matrix such that $\delta'_i=\sum_{j=1}^d d_{ij}\delta_j$. Let $D=(\bar{d}_{ij})_{1\le i,j\le d}\in M_d(B)$, $D_1=(\bar{d}_{ij})_{1\le i,j\le r}\in M_r(B)$, and $D_2=(\bar{d}_{ij})_{r+1\le i,j\le d}\in M_T(B)$. We denote by $\overline{\delta_i}$ and $\overline{\delta'_i}$ the image of δ_i and δ'_i in $\widetilde{u}^*\widetilde{\omega}_{X^\sharp/T^\sharp}$. We get $\overline{\delta'_1}\wedge\cdots\wedge\overline{\delta'_d}=(\det D)\left(\overline{\delta_1}\wedge\cdots\wedge\overline{\delta_d}\right)$.

When $i\ge r+1$, we write $d\log\overline{t_i}=0$ and $d\log\overline{t'_i}=0$. By considering the images via the canonical morphism $\widetilde{u}^*\widetilde{\omega}_{X^\sharp/T^\sharp}\to\widetilde{\omega}_{Z^\sharp/T^\sharp}$ which sends $\overline{\delta_i}$ (resp. $\overline{\delta'_i}$) to $d\log\overline{t_i}$ (resp. $d\log\overline{t'_i}$), we get the equality $d\log\overline{t'_i}=\sum_{j=1}^d\bar{d}_{ij}d\log\overline{t_j}$ for any $i=1,\dots,d$. Since $d\log\overline{t_1},\dots,d\log\overline{t_r}$ is a basis of $\widetilde{\omega}_{Z^\sharp/T^\sharp}$, then $\bar{d}_{ij}=0$ for any $i\ge r+1$ and $j\le r$ and then $d\log\overline{t'_i}=\sum_{j=1}^r\bar{d}_{ij}d\log\overline{t_j}$ for any $i=1,\dots,r$. This yields both equalities $\det D=\det D_1\det D_2$ and $d\log\overline{t'_1}\wedge\cdots\wedge d\log\overline{t'_r}=(\det D_1)d\log\overline{t_1}\wedge\cdots\wedge d\log\overline{t_r}$.

For any $i\ge r+1$, we have $\overline{dt_i}=\overline{f_{i-r}}$ and $\overline{dt'_i}=\overline{f'_{i-r}}$ in $\widetilde{\mathcal{I}}/\widetilde{\mathcal{I}}^2$. Since for any $i\ge r+1$, we have $\overline{\delta'_i}=\sum_{j=r+1}^d\overline{d_{ij}}\,\overline{\delta_j}$, this means that D_2 is the inverse of the transposition matrix of $(\bar{c}_{ij})$. Hence, $\overline{\det\varphi}=(\det D_2)^{-1}$. This implies the commutativity of the following diagram:

$$\begin{array}{ccc}(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})/(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\mathcal{I}&\underset{\sim}{\xrightarrow{\psi_{\underline{t}}}}&\widetilde{\omega}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{B}_Z}(\mathcal{E}/\mathcal{I}\mathcal{E})\\ {\scriptstyle\overline{\det\varphi}}\uparrow&&\|\\ (\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})/(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E})\mathcal{I}&\underset{\sim}{\xrightarrow{\psi_{\underline{t}'}}}&\widetilde{\omega}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{B}_Z}(\mathcal{E}/\mathcal{I}\mathcal{E}).\end{array}\tag{5.2.5.6.3}$$

By composing the commutative diagram 5.2.5.4.5 for $\mathcal{M}=\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\mathcal{E}$ with 5.2.5.6.3, we get the independence on the choice of the coordinates of the composition of the isomorphisms of 5.2.5.6.2. $\square$

Theorem 5.2.5.7. *Let $\mathcal{E} \in D({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$ (resp. $\mathcal{E} \in D({}^l\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}, {}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$). We have the canonical isomorphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$ (resp. $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, {}^{\mathrm{r}}u^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$)*

$$\widetilde{\omega}_{Z^\sharp/T^\sharp} \otimes_{\mathcal{B}_Z} \widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^\flat(\widetilde{\omega}_{X^\sharp/T^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}). \tag{5.2.5.7.1}$$

The functors $\widetilde{u}^\flat$ and $\widetilde{u}^!$ are way-out in both direction.

Proof. We already know that there exists an isomorphism of the form 5.2.5.7.1 in the category $D(\mathcal{O}_Z)$ (see [Har66, III.7.3]), i.e. after applying the forgetful functor $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}) \to D(\mathcal{O}_Z)$ we have the canonical isomorphism

$$\omega_{Z^\sharp/T^\sharp} \otimes_{\mathcal{O}_Z} u^!(\mathcal{E}) \xrightarrow{\sim} u^\flat(\omega_{X^\sharp/T^\sharp} \otimes_{\mathcal{O}_X} \mathcal{E}) \tag{5.2.5.7.2}$$

whose left (resp. right) terms are canonically isomorphic to the left (resp. right) terms of 5.2.5.7.1.This yields that if $\mathcal{E}$ is a flat left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module, then for any $i \neq s$, $\mathcal{H}^i\widetilde{u}^\flat(\widetilde{\omega}_{X^\sharp/T^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}) = 0$. Using [Har66, I.7.4], we conclude using 5.2.5.6. □

Corollary 5.2.5.8. *Let $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$. We have the canonical isomorphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$*

$$\widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^\flat(\mathcal{E}). \tag{5.2.5.8.1}$$

Proof. This is a consequence of the left to right isomorphism 5.1.1.5.1 and of Theorem 5.2.5.7. □

Corollary 5.2.5.9. *We have the canonical isomorphism of right $(\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}, u^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$-bimodules of the form*

$$\widetilde{\omega}_{Z^\sharp/T^\sharp} \otimes_{\mathcal{B}_Z} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp}[d_{Z/X}] \xrightarrow{\sim} \widetilde{u}^\flat(\widetilde{\omega}_{X^\sharp/T^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}). \tag{5.2.5.9.1}$$

Proof. We apply Theorem 5.2.5.7 in the case $\mathcal{E} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. □

5.2.5.10. Suppose we are in the local situation of 5.2.1.1. Let $\mathcal{E}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module. Following 5.2.5.7.1 we have the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-modules:

$$\widetilde{\omega}_{Z^\sharp/T^\sharp} \otimes_{\mathcal{B}_Z} H^0\widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \widetilde{u}^{\flat 0}(\widetilde{\omega}_{X^\sharp/T^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}). \tag{5.2.5.10.1}$$

The sheaf $\widetilde{\omega}_{X^\sharp/T^\sharp}$ is a free $\mathcal{B}_X$-module of rank one with the basis $d\log t_1 \wedge \cdots \wedge d\log t_r \wedge dt_{r+1} \wedge \cdots \wedge t_d$ and $\widetilde{\omega}_{Y/T^\sharp}$ is a free $\mathcal{B}_Y$-module of rank one with the basis $dt_1 \wedge \cdots \wedge dt_d$ (see 4.5.1.6). Using these bases, we get the isomorphism of $\mathcal{B}_Z$-modules:

$$u_*H^0\widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_X/\mathcal{I}\mathcal{B}_X, \mathcal{E}) = \cap_{s=r+1}^d \ker(\mathcal{E} \xrightarrow{t_s} \mathcal{E}). \tag{5.2.5.10.2}$$

This yields on $\mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_X/\mathcal{I}\mathcal{B}_X, \mathcal{E})$ a structure of left $\widetilde{\mathcal{D}}^{(m)}_{\mathfrak{Z}^\sharp}$-module extending its structure of $\mathcal{B}_X$ (beware this structure depends a priori on the choice of the semi-logarithmic coordinates). Let us denote by $\mathrm{ev}_1 \colon \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_X/\mathcal{I}\mathcal{B}_X, \mathcal{E}) \hookrightarrow \mathcal{E}$ the canonical inclusion (this is the evaluation at 1) and by $\mathrm{ev}_1 \colon H^0\widetilde{u}^!(\mathcal{E}) \hookrightarrow \mathcal{E}$ its composition with 5.2.5.10.2. Let $x \in \Gamma(Z, H^0u^!(\mathcal{E}))$, $y \in \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_X/\mathcal{I}\mathcal{B}_X, \mathcal{E})$ and $Q \in \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$. Choose any $Q_X \in \widetilde{D}^{(m)}_{X^\sharp, Z^\sharp, \underline{t}/T^\sharp}$ such that $\vartheta(Q) = [Q_X]_Z$ (see 5.2.2.5.7). It follows from 5.2.5.2.1 that we have the formula

$$\mathrm{ev}_1(Q \cdot x) = Q_X \cdot \mathrm{ev}_1(x), \qquad \mathrm{ev}_1(Q \cdot y) = Q_X \cdot \mathrm{ev}_1(y). \tag{5.2.5.10.3}$$

Let us finish the subsection with the following result.

5.2.5.11 (Commutation of pushforwards with base and level change)**.** Suppose we are in the non-respective case of log-schemes of 5.2. Take an integer $m' \geq m$. Let $T'^\sharp \to T^\sharp$ be a morphism of noetherian affine schemes. Put $X'^\sharp := X^\sharp \times_{T^\sharp} T'^\sharp$, $Z'^\sharp := Z^\sharp \times_{T^\sharp} T'^\sharp$, and let $u' \colon Z'^\sharp \hookrightarrow X'^\sharp$ be the induced closed immersion, $\mathcal{I}'$ be the underlying ideal of $\mathcal{O}_{X'}$ and $f \colon X'^\sharp \to X^\sharp$, $g \colon Z'^\sharp \to Z^\sharp$ be the canonical projection. We set $\mathcal{B}_{X'} := f^*(\mathcal{B}_X)$, $\mathcal{B}_{Z'} := g^*(\mathcal{B}_Z)$. We keep similar notation than 4.1.2, in particular we set $\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/T^\sharp} := \mathcal{B}_{X'} \otimes_{\mathcal{O}_X} \widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/T^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp} := \mathcal{B}_{Z'} \otimes_{\mathcal{O}_{Z'}} \widetilde{\mathcal{D}}^{(m)}_{Z'^\sharp/T^\sharp}$. We denote by $\widetilde{X}'^\sharp$ (resp. $\widetilde{Z}'^\sharp$) the ringed logarithmic scheme $(X'^{\sharp}, \mathcal{B}_{X'})$ (resp. $(Z'^{\sharp}, \mathcal{B}_{Z'})$), and by $\tilde{u}' \colon \widetilde{Z}'^{\sharp}/T'^{\sharp} \to \widetilde{X}'^{\sharp}/T'^{\sharp}$ the morphism of relative ringed logarithmic schemes induced by the diagram 5.1.1.1.1 and by $u'^{*}\mathcal{B}_{X'} \xrightarrow{\sim} \mathcal{B}_{Z'}$

For any right $\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}$-module $\mathcal{M}$, we have the isomorphism:

$$\begin{aligned} f^{-1}\left(u_{*}\mathcal{M} \otimes_{u_{*}\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}} \widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}\right) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}} \widetilde{\mathcal{D}}^{(m')}_{X'^{\sharp}/T'^{\sharp}} \\ \xrightarrow{\sim} f^{-1}u_{*}\mathcal{M} \otimes_{f^{-1}u_{*}\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}} \widetilde{\mathcal{D}}^{(m')}_{X'^{\sharp}/T'^{\sharp}}/\mathcal{I}'\widetilde{\mathcal{D}}^{(m')}_{X'^{\sharp}/T'^{\sharp}} \\ \xrightarrow{\sim} u'_{*}\left(g^{-1}\mathcal{M} \otimes_{g^{-1}\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}} \widetilde{\mathcal{D}}^{(m')}_{Z'^{\sharp}/T'^{\sharp}}\right) \otimes_{u_{*}\widetilde{\mathcal{D}}^{(m')}_{Z'^{\sharp}/T'^{\sharp}}} \widetilde{\mathcal{D}}^{(m')}_{X'^{\sharp}/T'^{\sharp}}/\mathcal{I}'\widetilde{\mathcal{D}}^{(m')}_{X'^{\sharp}/T'^{\sharp}}. \end{aligned} \tag{5.2.5.11.1}$$

In the case where $m' = m$, the isomorphism 5.2.5.11.1 is the commutation of pushforward with base change $\widetilde{u}^{(m)}_{+}(\mathcal{M}) \otimes_{\mathcal{O}_T} \mathcal{O}_{T'} \xrightarrow{\sim} \widetilde{u}'^{(m)}_{+}(\mathcal{M} \otimes_{\mathcal{O}_T} \mathcal{O}_{T'})$. When $T'^{\sharp} \to T^{\sharp}$ is the identity, this is the commutation of pushforward with level change $\widetilde{u}^{(m)}_{+}(\mathcal{M}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}} \widetilde{\mathcal{D}}^{(m')}_{X^{\sharp}/T^{\sharp}} \xrightarrow{\sim} \widetilde{u}'^{(m')}_{+}(\mathcal{M} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}} \widetilde{\mathcal{D}}^{(m')}_{Z^{\sharp}/T^{\sharp}})$. Similarly, for any left $\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}$-module $\mathcal{F}$, we get the isomorphisms

$$\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \widetilde{u}^{(m)}_{+}(\mathcal{F}) \xrightarrow{\sim} \widetilde{u}'^{(m)}_{+}(\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \mathcal{F}), \qquad \widetilde{\mathcal{D}}^{(m')}_{X^{\sharp}/T^{\sharp}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}} \widetilde{u}^{(m)}_{+}(\mathcal{F}) \xrightarrow{\sim} \widetilde{u}'^{(m')}_{+}(\widetilde{\mathcal{D}}^{(m')}_{Z^{\sharp}/T^{\sharp}} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}} \mathcal{F}). \tag{5.2.5.11.2}$$

One might compare with the construction of 5.3.3.3 (remark this latter needs some quasi-coherence hypotheses), but since this is useless here, this is left to the reader.

Suppose we are in the local situation of 5.2.1.1. Via an easy computation (e.g. use 5.2.2.21.1), for any $\mathcal{D}^{(m)}_{Z'^{\sharp}/T'^{\sharp}}$-linear morphism of the form $\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \mathcal{F} \to \mathcal{F}'$, we get the commutative diagram

$$\begin{array}{ccc} \mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \widetilde{u}^{(m)}_{+}(\mathcal{F}) & \xrightarrow[\sim]{5.2.2.22.1} & \mathcal{O}_{T'} \otimes_{\mathcal{O}_T} (O_T\{\partial_{r+s+1}, \ldots, \partial_d\}^{(m)} \otimes_{\mathcal{O}_T} \mathcal{F}) \\ \downarrow\sim & & \downarrow\sim \\ \widetilde{u}'^{(m)}_{+}(\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \mathcal{F}) & \xrightarrow[\sim]{5.2.2.22.1} & \mathcal{O}_{T'}\{\partial'_{r+s+1}, \ldots, \partial'_d\}^{(m)} \otimes_{\mathcal{O}_{T'}} (\mathcal{O}_{T'} \otimes_{\mathcal{O}_T} \mathcal{F}) \\ \downarrow & & \downarrow \\ \widetilde{u}'^{(m')}_{+}(\mathcal{F}') & \xrightarrow[\sim]{5.2.2.22.1} & \mathcal{O}_{T'}\{\partial'_{r+s+1}, \ldots, \partial'_d\}^{(m')} \otimes_{\mathcal{O}_{T'}} (\mathcal{F}'). \end{array} \tag{5.2.5.11.3}$$

Remark 5.2.5.12. The derived version of the base change can be found later at 5.3.3.3.

5.2.6 Adjointness, stability of the perfectness under pushforward, relative duality isomorphism for schemes

Suppose we are in the non-respective case of log-schemes of 5.2.

Proposition 5.2.6.1. *Let $\mathcal{M}$ be a right (resp. left) $\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}$-module, $\mathcal{N}$ be a right (resp. left) $\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}$-module.*

(a) There exists a canonical functorial $\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}$-linear morphism adj: $\widetilde{u}^{(m)}_{+}H^0\widetilde{u}^{!}(\mathcal{M}) \to \mathcal{M}$ *and a canonical functorial $\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}$-linear morphism* adj: $\mathcal{N} \to H^0\widetilde{u}^{!}\widetilde{u}^{(m)}_{+}(\mathcal{N})$ *so that the compositions* $H^0\widetilde{u}^{!}(\mathcal{M}) \xrightarrow{\mathrm{adj}} H^0\widetilde{u}^{!}\widetilde{u}^{(m)}_{+}H^0\widetilde{u}^{!}(\mathcal{M}) \xrightarrow{\mathrm{adj}} H^0\widetilde{u}^{!}(\mathcal{M})$ *and* $\widetilde{u}^{(m)}_{+}(\mathcal{N}) \xrightarrow{\mathrm{adj}} \widetilde{u}^{(m)}_{+}H^0\widetilde{u}^{!}\widetilde{u}^{(m)}_{+}(\mathcal{N}) \xrightarrow{\mathrm{adj}} \widetilde{u}^{(m)}_{+}(\mathcal{N})$ *are the identity.*

(b) Using the above adjoint morphisms, we construct maps

$$\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}}(\widetilde{u}^{(m)}_{+}(\mathcal{N}), \mathcal{M}) \to u_{*}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}}(\mathcal{N}, H^0\widetilde{u}^{!}(\mathcal{M})),$$
$$u_{*}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}}(\mathcal{N}, H^0\widetilde{u}^{!}(\mathcal{M})) \to \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}}(\widetilde{u}^{(m)}_{+}(\mathcal{N}), \mathcal{M}),$$

which are inverse of each other.

(c) If $\mathcal{M}$ is an injective right (resp. left) $\widetilde{\mathcal{D}}^{(m)}_{X^{\sharp}/T^{\sharp}}$-module, then $H^0\widetilde{u}^{!}(\mathcal{M})$ is an injective right (resp. left) $\widetilde{\mathcal{D}}^{(m)}_{Z^{\sharp}/T^{\sharp}}$-module.

Proof. I) Let us check the non-respective case. 0) Following 5.2.5.8.1, we reduce to check the proposition with "$H^0\widetilde{u}^!$" replaced by "$\widetilde{u}^{\flat 0}$". 1) Let us check the first assertion.

a) Since the construction of the *canonical* morphism $\mathrm{adj}\colon \widetilde{u}_+^{(m)}\widetilde{u}^{\flat 0}(\mathcal{M}) \to \mathcal{M}$ is local, then we can suppose the local conditions of 5.2.1.1 are satisfied (and we use notations 5.2.2 and 5.2.2.3). We have $\widetilde{u}_+^{(m)}\widetilde{u}^{\flat 0}(\mathcal{M}) := u_*\left(u^{-1}\mathcal{H}om_{\mathcal{B}_X}(u_*\mathcal{B}_Z,\mathcal{M}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp}\right) = \mathcal{H}om_{\mathcal{B}_X}(u_*\mathcal{B}_Z,\mathcal{M})\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}$. Let $B := \Gamma(X,\mathcal{B}_X)$. We reduce to construct a canonical morphism of the form $\mathrm{Hom}_B(B/IB, M) \otimes_{\widetilde{D}^{(m)}_{Z^\sharp}} \widetilde{D}^{(m)}_{X^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp} \to M$.

i) Let us check that the canonical map $\mathrm{adj}\colon \mathrm{Hom}_B(B/IB, M) \otimes_{\widetilde{D}^{(m)}_{Z^\sharp}} \widetilde{D}^{(m)}_{X^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp} \to M$, defined by setting $x\otimes[P]_Z \mapsto \mathrm{ev}_1(x)P$ for any $x \in \mathrm{Hom}_B(B/IB, M)$, $P \in \widetilde{D}^{(m)}_{X^\sharp}$, is well defined. The independence in the choice of P lifting $[P]_Z$ is clear. Let $x \in \mathrm{Hom}_B(B/IB, M)$, $P \in \widetilde{D}^{(m)}_{X^\sharp}$, $Q \in \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$. Choose $Q_X \in \widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ such that $\vartheta(Q) = [Q_X]_Z$. Using the formula 5.2.5.2.1, we get $\mathrm{ev}_1(x\cdot Q)P = \mathrm{ev}_1(x)\cdot Q_XP$. Following 5.2.2.6.1, we have $Q\cdot[P]_Z = [Q_XP]_Z$, and then we get the equality $x\cdot Q\otimes[P]_Z = x\otimes[Q_XP]_Z$ in $\mathrm{Hom}_B(B/IB, M) \otimes_{\widetilde{D}^{(m)}_{Z^\sharp}} \widetilde{D}^{(m)}_{X^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp}$. Hence, we have checked the map is well defined.

ii) The $\widetilde{D}^{(m)}_{X^\sharp}$-linearity of the canonical map adj of the part i) is obvious.

b) The restriction of $[-]_Z$ or $[-]'_Z$ on B induces the canonical map $B \to B/IB$ which can sometimes be denoted by $b \mapsto \bar{b}$. Similarly, to construct the morphism $\mathrm{adj}\colon \mathcal{N} \to \widetilde{u}^{\flat 0}\widetilde{u}_+^{(m)}(\mathcal{N})$, we reduce to the case where the assumptions of 5.2.2 are satisfied and to check that the morphism of the form $N \to \mathrm{Hom}_B(B/IB, N\otimes_{\widetilde{D}^{(m)}_{Z^\sharp}} \widetilde{D}^{(m)}_{X^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp})$ given by $y \mapsto (\bar{b} \mapsto y\otimes\bar{b})$ is $\widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$-linear. Let $y \in N$, $Q \in \widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$. Let x be the element of $\mathrm{Hom}_B(B/IB, N\otimes_{\widetilde{D}^{(m)}_{Z^\sharp}} \widetilde{D}^{(m)}_{X^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp})$ given by $(\bar{b}\mapsto y\otimes\bar{b})$. Choose $Q_X \in \widetilde{D}^{(m)}_{X^\sharp,Z^\sharp,\underline{t}/T^\sharp}$ such that $\vartheta(Q) = [Q_X]_Z$. Using 5.2.5.2.1, $\mathrm{ev}_1(x\cdot Q) = \mathrm{ev}_1(x)\cdot Q_X = y\otimes[Q_X]_Z \overset{5.2.2.6.1}{=} y\cdot Q\otimes\bar{1}$. This yields that the canonical map $N \to \mathrm{Hom}_B(B/IB, N\otimes_{\widetilde{D}^{(m)}_{Z^\sharp}} \widetilde{D}^{(m)}_{Z^\sharp\to X^\sharp})$ is $\widetilde{D}^{(m)}_{Z^\sharp/T^\sharp}$-linear.

c) Reducing to the local context 5.2.2, we compute easily that both compositions are the identity maps.

2) The fact that the first statement of the proposition implies the second one is standard. Finally, since the functor $\widetilde{u}_+^{(m)}$ is exact, we get the last statement from the second one.

II) By using the right to left isomorphisms 5.1.3.2.1 and 5.1.1.5.1, the respective case follows from 5.2.6.1. □

5.2.6.2 (Local computation of the adjunction morphisms in the left case)**.** Let $\mathcal{E}$ be a let $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$-module, $\mathcal{F}$ be a left $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$-module. Suppose the local conditions of 5.2.1.1 are satisfied (and we use notations 5.2.2 and 5.2.2.3). We denote by $\widetilde{e}_0 := d\log t_1\wedge\cdots\wedge d\log t_r\wedge dt_{r+1}\wedge\cdots\wedge dt_d$ a basis of the free $\mathcal{B}_X$-module and by $\widetilde{e}_0^\vee$ its corresponding dual basis of the free $\mathcal{B}_X$-module $\widetilde{\omega}^{-1}_{X^\sharp/T^\sharp}$. We denote by $\widetilde{f}_0 := d\log t_1\wedge\cdots\wedge d\log t_r\wedge dt_{r+1}\wedge\cdots\wedge dt_{r+s}$ the basis of the free $\mathcal{B}_Z$-module $\widetilde{\omega}_{Z^\sharp/T^\sharp}$, and by $\widetilde{f}_0^\vee$ its dual basis. By using these bases, we can identify $\widetilde{\omega}_{X^\sharp/T^\sharp}$ and $\widetilde{\omega}^{-1}_{X^\sharp/T^\sharp}$ with $\mathcal{B}_X$ (resp. $\widetilde{\omega}_{Z^\sharp/T^\sharp}$ and $\widetilde{\omega}^{-1}_{Z^\sharp/T^\sharp}$ with $\mathcal{B}_Z$), which yields the (non-canonical) isomorphisms (see 5.2.2.14.1 and from 5.2.5.10.2):

$$\widetilde{u}_+^{(m)}H^0\widetilde{u}^!(\mathcal{E}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}/\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}\mathcal{I}\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}} \mathcal{H}om_{\mathcal{B}_X}(u_*\mathcal{B}_Z,\mathcal{E}), \tag{5.2.6.2.1}$$

$$u_*H^0\widetilde{u}^!\widetilde{u}_+^{(m)}(\mathcal{F}) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{B}_X}(\mathcal{B}_X/\mathcal{I}\mathcal{B}_X, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp}/\mathcal{I}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}\otimes_{u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp}} u_*\mathcal{F}). \tag{5.2.6.2.2}$$

Let $B := \Gamma(X,\mathcal{B}_X)$. The restriction of $[-]_Z$ or $[-]'_Z$ on B induces the canonical map $B \to B/IB$ which can sometimes be denoted by $b \mapsto \bar{b}$.

a) The adjunction morphism $\mathrm{adj}\colon \widetilde{u}_+^{(m)}H^0\widetilde{u}^!(\mathcal{E}) \to \mathcal{E}$ of 5.2.6.1 corresponds via the bijection 5.2.6.2.1 to a canonical morphism of the form $\widetilde{D}^{(m)}_{X^\sharp}/\widetilde{D}^{(m)}_{X^\sharp}I\otimes_{\widetilde{D}^{(m)}_{Z^\sharp}} \mathrm{Hom}_B(B/IB, E) \to E$, which is given by $[P]'_Z\otimes x \mapsto P\,\mathrm{ev}_1(x)$ for any $x \in \mathrm{Hom}_B(B/IB, E)$, $P \in \widetilde{D}^{(m)}_{X^\sharp}$. Moreover, modulo this isomorphism 5.2.2.22.1, the map corresponds to a morphism of the form

$$O_T\{\partial_{r+s+1},\ldots,\partial_d\}^{(m)}\otimes_{O_T}\mathrm{Hom}_B(B/IB, E) \to E \tag{5.2.6.2.3}$$

given by $Q\otimes x\mapsto Q\cdot x$, for any $Q\in O_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}$ and $x\in \mathrm{Hom}_B(B/IB,E)$.

b) The adjunction morphism $\mathrm{adj}\colon \mathcal{F}\to H^0\widetilde{u}^!\widetilde{u}_+^{(m)}(\mathcal{F})$, corresponds to a canonical morphism of the form $F\to \mathrm{Hom}_B(B/IB,\widetilde{D}^{(m)}_{X^\sharp}/I\widetilde{D}^{(m)}_{X^\sharp}\otimes_{\widetilde{D}^{(m)}_{Z^\sharp}}F)$ which is given by $y\mapsto(\bar{b}\mapsto\bar{b}\otimes y)$, for any $y\in F$ and $b\in B$. Moreover, modulo this isomorphism 5.2.2.22.1, the map corresponds to a morphism of the form

$$F\to \mathrm{Hom}_B(B/IB,O_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}\otimes_{O_T}F)\subset O_T\{\partial_{r+s+1},\dots,\partial_d\}^{(m)}\otimes_{O_T}F \qquad (5.2.6.2.4)$$

given by $y\mapsto 1\otimes y$ for any $y\in F$.

Corollary 5.2.6.3. *Let $*\in\{\mathrm{r},\mathrm{l}\}$, $\mathcal{M}\in D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$, $\mathcal{N}\in D({}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$. We have the isomorphisms*

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}}(\widetilde{u}_+^{(m)}(\mathcal{N}),\mathcal{M})\xrightarrow{\sim}u_*\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}(\mathcal{N},\widetilde{u}^!(\mathcal{M})).$$

Proof. Taking an injective resolution of $\mathcal{M}$, this is a consequence of 5.2.6.1.(b–c). □

Before giving another corollary, let us check the stability of the perfectness as follows.

Lemma 5.2.6.4. *Let $*\in\{\mathrm{r},\mathrm{l}\}$. For any $\mathcal{N}\in D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$, we have $\widetilde{u}_+^{(m)}(\mathcal{N})\in D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$.*

Proof. By using 5.1.4.3.1 and 5.1.3.2.1, we reduce to the case $*=r$. Since the perfectness is local, then we can suppose the local conditions of 5.2.1.1 are satisfied (and we use notations 5.2.2). By devissage, we reduce to the case where $\mathcal{N}$ is a projective right $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}$ module of finite type. Since $\widetilde{u}_+^{(m)}$ is exact, we reduce to check that $\widetilde{u}_+^{(m)}(\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})=u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}$ is a projective right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$ of finite type. Let $s:=d-r$, and $f_1=t_{r+1},\dots,f_T:=t_d$ and $K_\bullet(\underline{f})$ be the Koszul complex of free $\mathcal{O}_X$-modules given by the sequence of global section $\underline{f}=(f_1,\dots,f_s)$ of $\mathcal{O}_X$. We set $\widetilde{K}_\bullet(\underline{f}):=\mathcal{B}_X\otimes_{\mathcal{O}_X}K_\bullet(\underline{f})$. We get $u_*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp/T^\sharp}\xrightarrow{\sim}\widetilde{K}_\bullet(\underline{f})\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}$. Hence, we are done. □

Remark 5.2.6.5. We will check later the a version of the stability of the perfecness under pushforward by a proper morphism (more precisely, see 5.3.2.13).

Corollary 5.2.6.6. *Let $*\in\{\mathrm{r},\mathrm{l}\}$. Let $\mathcal{N}\in D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp})$. We have the isomorphism of $D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})$:*

$$\widetilde{\mathbb{D}}^{(m)}_{X^\sharp/T^\sharp}\circ\widetilde{u}_+^{(m)}(\mathcal{N})\xrightarrow{\sim}\widetilde{u}_+^{(m)}\circ\widetilde{\mathbb{D}}^{(m)}_{Z^\sharp/T^\sharp}(\mathcal{N}). \qquad (5.2.6.6.1)$$

Proof. By using 5.1.4.3.1 and 5.1.3.2.1, we reduce to the case $*=r$. In this case, the isomorphism 5.2.6.6.1 is the composition of the following isomorphisms:

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp}}(\widetilde{u}_+^{(m)}(\mathcal{N}),\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/T^\sharp})[d_X]\overset{5.2.6.3}{\xrightarrow{\sim}}u_*\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}(\mathcal{N},\widetilde{u}^\flat(\widetilde{\omega}_{X^\sharp/T^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp T^\sharp}))[d_X]\overset{5.2.5.9}{\xrightarrow{\sim}}$$

$$u_*\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}(\mathcal{N},\widetilde{\omega}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{B}_Z}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp})[d_Z]\underset{4.6.3.6.1}{\xrightarrow{\sim}}u_*\left(\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}(\mathcal{N},\widetilde{\omega}_{Z^\sharp/T^\sharp}\otimes_{\mathcal{B}_Z}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}[d_Z])\otimes_{\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/T^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp\to X^\sharp}\right).$$

□

5.3 Commutations and relations between functors

5.3.1 Extraordinary inverse image, direct image: varying log-smoothly the basis

Let $S^\sharp$ be a nice fine log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$, where i is an integer (resp. $S^\sharp$ is a nice fine $\mathcal{V}$-log formal schemes as defined in 3.3.1.10) Let $\alpha\colon Z^\sharp\to S^\sharp$ be a log smooth morphism. Let $h\colon X^\sharp\to Y^\sharp$ be a morphism of log smooth $Z^\sharp$-log-scheme (resp. log smooth $Z^\sharp$-log formal scheme). We denote by $g\colon Y^\sharp\to Z^\sharp$ and $f\colon X^\sharp\to Z^\sharp$ the structural morphisms.

Let $\mathcal{B}_Z$ be an $\mathcal{O}_Z$-algebra endowed with a compatible structure of left $\mathcal{D}^{(m)}_{Z^\sharp/S^\sharp}$-module. Set $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}:=\mathcal{B}_Z\otimes_{\mathcal{O}_Z}\mathcal{D}^{(m)}_{Z^\sharp/S^\sharp}$, and for any $n\in\mathbb{N}$, $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp,n}:=\mathcal{B}_Z\otimes_{\mathcal{O}_Z}\mathcal{D}^{(m)}_{Z^\sharp/S^\sharp,n}$, $\widetilde{\mathcal{P}}^n_{Z^\sharp/S^\sharp,(m)}:=\mathcal{B}_Z\otimes_{\mathcal{O}_Z}\mathcal{P}^n_{Z^\sharp/S^\sharp,(m)}$.

Let $\mathcal{B}_Y$ be a $g^*(\mathcal{B}_Z)$-algebra which is endowed with a compatible structure of left $\mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}$-module such that the structural homomorphism $g^*\mathcal{B}_Z \to \mathcal{B}_Y$ is $\mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}$-linear. Since $\mathcal{D}^{(m)}_{Y^\sharp/Z^\sharp} \to \mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}$ is in fact a morphism of rings, then $\mathcal{B}_Y$ is also an $g^*(\mathcal{B}_Z)$-algebra which is endowed with a compatible structure of left $\mathcal{D}^{(m)}_{Y^\sharp/Z^\sharp}$-module. Set $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}$, and for any $n \in \mathbb{N}$, $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp,n} := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/S^\sharp,n}$, $\widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)} := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y^\sharp/S^\sharp,(m)}$. Set $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp} := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/Z^\sharp}$, and for any $n \in \mathbb{N}$, $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp,n} := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/Z^\sharp,n}$, $\widetilde{\mathcal{P}}^n_{Y^\sharp/Z^\sharp,(m)} := \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{P}^n_{Y^\sharp/Z^\sharp,(m)}$.

Let $\mathcal{B}_X$ be a $h^*(\mathcal{B}_Y)$-algebra which is endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module such that the structural homomorphism $h^*(\mathcal{B}_Y) \to \mathcal{B}_X$ is $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-linear. Set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$, and for any $n \in \mathbb{N}$, $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp,n}$, $\widetilde{\mathcal{P}}^n_{X^\sharp/S^\sharp,(m)} := \mathcal{B}_Y \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/S^\sharp,(m)}$. Set $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/Z^\sharp}$, and for any $n \in \mathbb{N}$, $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp,n} := \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/Z^\sharp,n}$, $\widetilde{\mathcal{P}}^n_{X^\sharp/Z^\sharp,(m)} := \mathcal{B}_Y \otimes_{\mathcal{O}_X} \mathcal{P}^n_{X^\sharp/Z^\sharp,(m)}$.

We denote by $\widetilde{X}^\sharp$ (resp. $\widetilde{Y}^\sharp$) the ringed logarithmic ($\mathcal{V}$-formal) scheme $(X^\sharp, \mathcal{B}_X)$ (resp. $(Y^\sharp, \mathcal{B}_Y)$), and by $\widetilde{h}_{/S^\sharp} \colon \widetilde{X}^\sharp/S^\sharp \to \widetilde{Y}^\sharp/S^\sharp$ and by $\widetilde{h}_{/Z^\sharp} \colon \widetilde{X}^\sharp/Z^\sharp \to \widetilde{Y}^\sharp/Z^\sharp$ the morphism of relative ringed logarithmic ($\mathcal{V}$-formal) schemes induced by h and by $f^*\mathcal{B}_Y \to \mathcal{B}_X$. We denote by $\widetilde{f} \colon \widetilde{X}^\sharp/S^\sharp \to Z^\sharp/S^\sharp$ (resp. $\widetilde{g} \colon \widetilde{Y}^\sharp/S^\sharp \to Z^\sharp/S^\sharp$) the morphism of relative ringed logarithmic ($\mathcal{V}$-formal) schemes induced by f (resp. g) and by $f^*\mathcal{B}_Z \to \mathcal{B}_X$ (resp. $g^*\mathcal{B}_Z \to \mathcal{B}_Y$). We suppose $\widetilde{g}$ and $\widetilde{h}_{/S^\sharp}$ (and then $\widetilde{f}$ and $\widetilde{h}_{/Z^\sharp}$) are quasi-flat (see Definition 4.4.1.3).

5.3.1.1. Following 4.4.2.7.1, the canonical homomorphism $\mathcal{D}^{(m)}_{Y^\sharp/Z^\sharp} \to \mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}$ is in fact a ring homomorphism. We denote by $\mathrm{forg}_{Y^\sharp/Z^\sharp/S^\sharp}$ the forgetful functor (via the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$) from the category of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-modules to that of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-modules ; and similarly by replacing $Y^\sharp$ by $X^\sharp$.

We have the functor $\widetilde{h}^*_{/S^\sharp} := \mathcal{B}_X \otimes_{h^{-1}\mathcal{B}_Y} h^{-1}(-)$ from the category of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-modules to that of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules and the functor $\widetilde{h}^*_{/Z^\sharp} := \mathcal{B}_X \otimes_{h^{-1}\mathcal{B}_Y} h^{-1}(-)$ from the category of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-modules to that of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}$-modules. From the commutative diagram 4.4.2.3.2 (still valid with some tildes), we get the commutation

$$\mathrm{forg}_{X^\sharp/Z^\sharp/S^\sharp} \circ \widetilde{h}^*_{/Z^\sharp} \xrightarrow{\sim} \widetilde{h}^*_{/S^\sharp} \circ \mathrm{forg}_{Y^\sharp/Z^\sharp/S^\sharp}. \tag{5.3.1.1.1}$$

By functoriality, we get the $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$-bimodule $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \to Y^\sharp/S^\sharp} := \widetilde{h}^*_{/S^\sharp}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ and the $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}, h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$-bimodule $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \to Y^\sharp/Z^\sharp} := \widetilde{h}^*_{/Z^\sharp}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$.

Lemma 5.3.1.2. *We have the isomorphism of* $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}, h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$*-bimodules*

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp \to Y^\sharp/Z^\sharp} \otimes_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp \to Y^\sharp/S^\sharp}. \tag{5.3.1.2.1}$$

Proof. By functoriality, this is a consequence of 5.3.1.1.1. □

Notation 5.3.1.3 (Local description of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$)**.** Suppose $Y^\sharp/Z^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,d}$. Since the level m is fixed (even if n is not fixed), we simply write $\tau_{\sharp\lambda} := \mu^n_{(m),\gamma}(u_\lambda) - 1 \in \widetilde{\mathcal{P}}^n_{Y^\sharp/Z^\sharp,(m)}$ for $\lambda = 1,\dots,d$. For any $\underline{i} = (i_1,\cdots,i_d) \in \mathbb{N}^d$, let $\underline{\tau}_\sharp^{\{\underline{i}\}_{(m)}} := \tau_{1\sharp}{}^{\{i_1\}_{(m)}} \cdots \tau_{d\sharp}{}^{\{i_d\}_{(m)}}$. Following 3.2.3.4 or 3.3.4.5, we get the basis of the free $\mathcal{B}_Y$-module $\widetilde{\mathcal{P}}^n_{Y^\sharp/Z^\sharp,(m)}$ given by $\underline{\tau}_\sharp{}^{\{\underline{i}\}_{(m)}}$, where $\underline{i} = (i_1,\cdots,i_d) \in \mathbb{N}^d$ satisfy $|\underline{i}| \le n$. By taking the dual basis and taking the inverse limits, we get a basis on the free (for the left or right structure) $\mathcal{B}_Y$-module $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$ (for its left structure this is by definition but this is also the case its right structure) which is denoted by $\{\underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}} \mid \underline{i} \in \mathbb{N}^d\}$. Hence, a section of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$ can uniquely be written as a *finite* sum of the form $\sum_{\underline{i}\in\mathbb{N}^d} a_{\underline{i}}\underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}}$ (resp. $\sum_{\underline{i}\in\mathbb{N}^d} \underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}} a_{\underline{i}}$) with $a_{\underline{i}} \in \mathcal{B}_Y$.

Notation 5.3.1.4 (Local description of $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$)**.** Suppose $Z^\sharp/S^\sharp$ is endowed with logarithmic coordinates $\tilde{u}_1, \cdots, \tilde{u}_r$. Since the level m is fixed (even if n is not fixed), we simply write $\widetilde{\tau}_{j\sharp} := \mu^n_{(m),\gamma}(\tilde{u}_j) - 1 \in \widetilde{\mathcal{P}}^n_{Y^\sharp/Z^\sharp,(m)}$ for $j = 1, \ldots, r$. For any $\underline{j} = (j_1, \cdots, j_r) \in \mathbb{N}^r$, let $\underline{\widetilde{\tau}}^{\{\underline{j}\}_{(m)}}_\sharp := \widetilde{\tau}^{\{j_1\}_{(m)}}_{1\sharp} \cdots \widetilde{\tau}^{\{j_r\}_{(m)}}_{r\sharp} \in \widetilde{\mathcal{P}}^n_{Z^\sharp/S^\sharp,(m)}$. We get the basis of the free $\mathcal{B}_Z$-module $\widetilde{\mathcal{P}}^n_{Z^\sharp/S^\sharp,(m)}$ given by $\underline{\widetilde{\tau}}_\sharp{}^{\{\underline{j}\}_{(m)}}$, with $|\underline{j}| \leq n$. By taking the dual basis and taking the inverse limits, we get a basis on the free (for the left or right structure) $\mathcal{B}_Z$-module $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ which is denoted by $\{\underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}} \mid \underline{j} \in \mathbb{N}^r\}$. Hence, a section of $\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ can uniquely be written as a *finite* sum of the form $\sum_{\underline{j}\in\mathbb{N}^r} a_{\underline{j}} \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}}$ (resp. $\sum_{\underline{j}\in\mathbb{N}^r} \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}} a_{\underline{j}}$) with $a_{\underline{j}} \in \mathcal{B}_Z$.

Notation 5.3.1.5 (Local description of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$)**.** Suppose $Z^\sharp/S^\sharp$ is endowed with logarithmic coordinates $\tilde{u}_1, \cdots, \tilde{u}_r$ and suppose moreover that $Y^\sharp/Z^\sharp$ is endowed with logarithmic coordinates $u_1, \cdots, u_d$. We denote by $\tilde{u}_1, \cdots, \tilde{u}_r$ the element of $\Gamma(Y, M_{Y^\sharp})$ induced by $\tilde{u}_1, \cdots, \tilde{u}_r$ via g. We get the logarithmic coordinates $\tilde{u}_1, \cdots, \tilde{u}_r, u_1, \cdots, u_d$ of $Y^\sharp/S^\sharp$.

We set $\tau_{\sharp\lambda} := \mu^n_{(m),\gamma}(u_\lambda) - 1 \in \widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)}$ for $\lambda = 1, \ldots, d$, $\widetilde{\tau}_{j\sharp} := \mu^n_{(m),\gamma}(\tilde{u}_j) - 1 \in \widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)}$ for any $j = 1, \cdots, r$. For any $\underline{i} = (i_1, \cdots, i_d) \in \mathbb{N}^d$, let $\underline{\tau}_\sharp{}^{\{\underline{i}\}_{(m)}} := \tau_{1\sharp}{}^{\{i_1\}_{(m)}} \cdots \tau_{d\sharp}{}^{\{i_d\}_{(m)}}$; for any $\underline{j} = (j_1, \cdots, j_r) \in \mathbb{N}^r$, let $\underline{\widetilde{\tau}}_\sharp{}^{\{\underline{j}\}_{(m)}} := \widetilde{\tau}_{1\sharp}{}^{\{j_1\}_{(m)}} \cdots \widetilde{\tau}_{r\sharp}{}^{\{j_r\}_{(m)}} \in \widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)}$. We get the basis of the free $\mathcal{B}_Y$-module $\widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)}$ given by $\underline{\tau}_\sharp{}^{\{\underline{i}\}_{(m)}} \underline{\widetilde{\tau}}_\sharp{}^{\{\underline{j}\}_{(m)}}$, with $|\underline{i}| + |\underline{j}| \leq n$. We denote by $\{\underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}}$, with $|\underline{i}| + |\underline{j}| \leq n\}$ the corresponding dual basis of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp,n}$. By taking the inductive limits, this yields the basis $\{\underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}}$, with $\underline{i} \in \mathbb{N}^d$ and $\underline{j} \in \mathbb{N}^r\}$ of the free $\mathcal{B}_Y$-module $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$. In other words, a section of the sheaf $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ can uniquely be written as a *finite* sum of the form $\sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r} a_{\underline{i},\underline{j}} \underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}}$ (resp. $\sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r} \underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}} a_{\underline{i},\underline{j}}$) with $a_{\underline{i},\underline{j}} \in \mathcal{B}_Y$.

We hope this is not too confusing that $\underline{\partial}_\sharp{}^{\langle \underline{i}\rangle_{(m)}}$ (resp. $\underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}}$) is either a global section of $\mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}$ or of $\mathcal{D}^{(m)}_{Y^\sharp/Z^\sharp}$ (resp. of $\mathcal{D}^{(m)}_{Z^\sharp/S^\sharp}$).

5.3.1.6. We keep notations and hypotheses of 5.3.1.5.

(a) We compute the natural ring homomorphism $\widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Y^\sharp/Z^\sharp,(m)}$ sends $\underline{\tau}_\sharp{}^{\{\underline{i}\}_{(m)}}$ to $\underline{\tau}_\sharp{}^{\{\underline{i}\}_{(m)}}$, which justifies why we took the same notation. Hence, the morphism $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ corresponds to the inclusion given by

$$\sum_{\underline{i}\in\mathbb{N}^d} a_{\underline{i}} \underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp \mapsto \sum_{\underline{i}\in\mathbb{N}^d} a_{\underline{i}} \underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp,$$

where $a_{\underline{i}}$ are global sections of $\mathcal{B}_Y$. Since $\widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Y^\sharp/Z^\sharp,(m)}$ is a homomorphism of $\mathcal{B}_Y$-algebras for the right structure (and also for the left one, but this is useless here), then the action of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$ on $\mathcal{B}_Y$ and of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ on $\mathcal{B}_Y$ are compatible with the canonical inclusion $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$. This implies the homomorphism $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ is also given by the formula

$$\sum_{\underline{i}\in\mathbb{N}^d} \underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp a_{\underline{i}} \mapsto \sum_{\underline{i}\in\mathbb{N}^d} \underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp a_{\underline{i}},$$

where $a_{\underline{i}}$ are global sections of $\mathcal{B}_Y$.

(b) Using the universal property of m-PD-envelopes, we get the homomorphisms of rings $\widetilde{g}^* \widetilde{\mathcal{P}}^n_{Z^\sharp/S^\sharp,(m)} \to \widetilde{\mathcal{P}}^n_{Y^\sharp/S^\sharp,(m)}$. We compute this map sends $1 \otimes \underline{\widetilde{\tau}}_\sharp{}^{\{\underline{j}\}_{(m)}}$ to $\underline{\widetilde{\tau}}_\sharp{}^{\{\underline{j}\}_{(m)}}$, which justifies a bit why we took the same notation. This yields that the homomorphism $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \to \widetilde{g}^* \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ is given by

$$\sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r} \alpha_{\underline{i},\underline{j}} \underline{\partial}^{\langle \underline{i}\rangle_{(m)}}_\sharp \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}} \mapsto \sum_{\underline{j}\in\mathbb{N}^r} \alpha_{\underline{0},\underline{j}} \otimes \underline{\widetilde{\partial}}_\sharp{}^{\langle \underline{j}\rangle_{(m)}},$$

where $\alpha_{\underline{i},\underline{j}} \in \mathcal{B}_Y$. In particular, $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \to \widetilde{g}^* \widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ is an epimorphism.

(c) The left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-module (resp. right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-module) $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ canonically splits as follows:

$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} = \oplus_{\underline{j}\in\mathbb{N}^r}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}\underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}},\ \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} = \oplus_{\underline{j}\in\mathbb{N}^r}\underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}, \tag{5.3.1.6.1}$$

where $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}\underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}$ (resp. $\underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$) is the left (resp. right) free $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-submodule of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ generated by $\underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}$. We get the exhausted filtration of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ by left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-submodules (resp. right $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-submodules) $F^{\mathrm{l}}_n\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} := \oplus_{|\underline{j}|\leq n}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}\underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}$ (resp. $F^{\mathrm{r}}_n\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} := \oplus_{|\underline{j}|\leq n}\underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$).

5.3.1.7. From 5.3.1.6.c, we have that $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ is a left (resp. right) flat $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}$-module. This yields from 5.3.1.2.1 the isomorphism

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp}\otimes^{\mathbb{L}}_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp}. \tag{5.3.1.7.1}$$

5.3.1.8. For any $\mathcal{E}\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$, we have the extraordinary inverse images $\widetilde{h}^{(m)!}_{/Z^\sharp}(\mathcal{E}) := \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp}\otimes^{\mathbb{L}}_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} h^{-1}\mathcal{E}[d_h]$, and for any $\mathcal{E}\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$, we will write $\widetilde{h}^{(m)!}_{/S^\sharp}(\mathcal{E}) := \widetilde{\mathcal{D}}^{(m)}_{X\to Y}\otimes^{\mathbb{L}}_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} h^{-1}\mathcal{E}[d_h]$. We denote by $\mathrm{forg}_{Y^\sharp/Z^\sharp/S^\sharp}\colon D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})\to D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$ the canonical forgetful functor (and similarly by replacing Y with X).

Proposition 5.3.1.9. For any $\mathcal{E}\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$, we get the isomorphism

$$\mathrm{forg}_{X^\sharp/Z^\sharp/S^\sharp}\circ\widetilde{h}^{(m)!}_{/S^\sharp}(\mathcal{E})\xrightarrow{\sim}\widetilde{h}^{(m)!}_{/Z^\sharp}\circ\mathrm{forg}_{Y^\sharp/Z^\sharp/S^\sharp}(\mathcal{E}). \tag{5.3.1.9.1}$$

Proof. By associativity of the tensor product, this is a consequence of 5.3.1.7.1. □

5.3.1.10. Consider the diagram of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules

$$\begin{array}{ccc}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} & \longrightarrow & \widetilde{h}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\\ \downarrow & & \downarrow\\ \widetilde{f}^{*}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp} & \underset{\sim}{\xleftarrow{4.4.5.6}} & \widetilde{h}^{*}\widetilde{g}^{*}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp},\end{array} \tag{5.3.1.10.1}$$

where except the natural bottom isomorphism, the morphisms are given by 4.4.2.6.3. We compute that both paths $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\to\widetilde{f}^{*}\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ send 1 to $1\otimes 1$. Hence, the diagram 5.3.1.10.1 is commutative.

Suppose $Z^\sharp/S^\sharp$ is endowed with logarithmic coordinates $\tilde{u}_1,\cdots,\tilde{u}_r$. Suppose moreover that $Y^\sharp/Z^\sharp$ is endowed with logarithmic coordinates $u_1,\cdots,u_d$. By abuse of notation, we denote by $\tilde{u}_1,\cdots,\tilde{u}_r$ the element of $\Gamma(Y,M_{Y^\sharp})$ induced by $\tilde{u}_1,\cdots,\tilde{u}_r$ via g. We get the logarithmic coordinates $\tilde{u}_1,\cdots,\tilde{u}_r,u_1,\cdots,u_d$ of $Y^\sharp/S^\sharp$. We keep notation 5.3.1.5: we get the basis $\{\underline{\partial}_\sharp^{\langle\underline{i}\rangle_{(m)}}\underline{\widetilde{\partial}}_\sharp^{\langle\underline{j}\rangle_{(m)}}$, with $\underline{i}\in\mathbb{N}^d$ and $\underline{j}\in\mathbb{N}^r\}$ of the free $\mathcal{B}_Y$-module $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$.

Suppose moreover that $X^\sharp/Z^\sharp$ is endowed with logarithmic coordinates $u'_1,\cdots,u'_{d'}$. We denote by $\tilde{u}'_1,\cdots,\tilde{u}'_r$ the elements of $\Gamma(X,M_{X^\sharp})$ induced by $\tilde{u}_1,\cdots,\tilde{u}_r$ via f (we add some prime to avoid any confusion). We get the logarithmic coordinates $\tilde{u}'_1,\cdots,\tilde{u}'_r,u'_1,\cdots,u'_{d'}$ of $Y^\sharp/S^\sharp$. Similarly to notation 5.3.1.5, we get the basis $\{\underline{\partial}'^{\langle\underline{i}'\rangle_{(m)}}_\sharp\underline{\widetilde{\partial}}'^{\langle\underline{j}\rangle_{(m)}}_\sharp$, with $\underline{i}'\in\mathbb{N}^{d'}$ and $\underline{j}\in\mathbb{N}^r\}$ of the free $\mathcal{B}_X$-module $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$.

Let $n\in\mathbb{N}$. Fix $\underline{l}\in\mathbb{N}^r$ such that $|\underline{l}|=n$.

i) The morphism of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\to\widetilde{h}^{*}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$ factors through $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,n}\to\widetilde{h}^{*}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp,n})$. This yields $\underline{\widetilde{\partial}}'^{\langle\underline{l}\rangle_{(m)}}_\sharp\cdot(1\otimes 1)\in\widetilde{h}^{*}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp,n})$. Hence, we can write in $\widetilde{h}^{*}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$ the equality:

$$\underline{\widetilde{\partial}}'^{\langle\underline{l}\rangle_{(m)}}_\sharp\cdot(1\otimes 1) = \sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r,|\underline{i}|+|\underline{j}|\leq n} a_{\underline{i},\underline{j}}\otimes\underline{\partial}_\sharp^{\langle\underline{i}\rangle_{(m)}}\underline{\widetilde{\partial}}_\sharp^{\langle\underline{j}\rangle_{(m)}}, \tag{5.3.1.10.2}$$

where the sum is finite and where $a_{\underline{i},\underline{j}}\in\mathcal{B}_X$ are uniquely determined.

ii) Let us denote by ψ the composition $\psi\colon \widetilde{h}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \to \widetilde{h}^*\widetilde{g}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$. By using 5.3.1.6.b we compute in $\widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ the equality:

$$\psi\left(\sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r} a_{\underline{i},\underline{j}} \otimes \underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}} \underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}\right) = \sum_{\underline{j}\in\mathbb{N}^r} a_{\underline{0},\underline{j}} \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}. \tag{5.3.1.10.3}$$

iii) The maps $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{h}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ send $\underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}}$ to $\underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}} \cdot (1\otimes 1)$. Since ψ is $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear, by commutativity of 5.3.1.10.1, we have $\psi(\underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}} \cdot (1\otimes 1)) = \underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}} \cdot \psi(1\otimes 1) = \underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}} \cdot (1\otimes 1)$. By using the computation of 5.3.1.6.b (applied to $\widetilde{X}^\sharp/S^\sharp$ instead of $\widetilde{X}^\sharp/S^\sharp$), we get $\underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}} \cdot (1\otimes 1) = 1 \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{l}\rangle_{(m)}}$. Hence, we get in $\widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ the equality:

$$\psi(\underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}} \cdot (1\otimes 1)) = 1 \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{l}\rangle_{(m)}}. \tag{5.3.1.10.4}$$

iv) It follows from 5.3.1.10.2, 5.3.1.10.3 and 5.3.1.10.4 that we have in $\widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Z^\sharp/S^\sharp}$ the formula:

$$\sum_{\underline{j}\in\mathbb{N}^r} a_{\underline{0},\underline{j}} \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}} = 1 \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{l}\rangle_{(m)}}.$$

This yields $a_{\underline{0},\underline{l}} = 1$ and $a_{\underline{0},\underline{j}} = 0$ if $\underline{j} \neq \underline{l}$. Hence, we have in $\widetilde{h}^*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp,n})$ the equality:

$$\underline{\widetilde{\partial}}_\sharp'^{\langle \underline{l}\rangle_{(m)}} \cdot (1\otimes 1) = 1 \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{l}\rangle_{(m)}} + \sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r,|\underline{i}|+|\underline{j}|\leq n,|\underline{i}|\neq 0} a_{\underline{i},\underline{j}} \otimes \underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}} \underline{\widetilde{\partial}}_\sharp^{\langle \underline{j}\rangle_{(m)}}. \tag{5.3.1.10.5}$$

Hence, we have in $\widetilde{h}^*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp,n})$ the congruence:

$$\underline{\widetilde{\partial}}_\sharp^{\langle \underline{l}\rangle_{(m)}} \cdot (1\otimes 1) \equiv 1 \otimes \underline{\widetilde{\partial}}_\sharp^{\langle \underline{l}\rangle_{(m)}} \mod \widetilde{h}^*(F^{\mathrm{l}}_{n-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}), \tag{5.3.1.10.6}$$

where $(F^{\mathrm{l}}_n\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})_n$ is the filtration defined at 5.3.1.6.c.

Lemma 5.3.1.11. *The canonical morphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$-bimodules*

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp} \tag{5.3.1.11.1}$$

is an isomorphism.

Proof. The canonical homomorphism 5.3.1.11.1 is constructed as follows. By applying the functor $\widetilde{h}^*$ to the homomorphism $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$, we get the homomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}, h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$-bimodules $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp} = \widetilde{h}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp} \to \widetilde{h}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp}$. This yields the homomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$-bimodules

$$\phi\colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp}.$$

We have to check that this is an isomorphism. Since this is local, we can suppose Suppose $Z^\sharp/S^\sharp$ is endowed with logarithmic coordinates $\tilde{u}_1, \cdots, \tilde{u}_r$, $Y^\sharp/Z^\sharp$ is endowed with logarithmic coordinates $u_1, \cdots, u_d$, $X^\sharp/Z^\sharp$ is endowed with logarithmic coordinates $u'_1, \cdots, u'_{d'}$. We follow notation 5.3.1.10.

Let $P \in \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp}$. By using 5.3.1.3 and by using 5.3.1.6.c for $X^\sharp/S^\sharp$ instead of $Y^\sharp/S^\sharp$, we can uniquely write P of the form

$$P = \sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r} \underline{\widetilde{\partial}}_\sharp'^{\langle \underline{j}\rangle_{(m)}} \otimes (a_{\underline{i},\underline{j}} \otimes \underline{\partial}_\sharp^{\langle \underline{i}\rangle_{(m)}})$$

where the sum is finite and $a_{\underline{i},\underline{j}} \in \mathcal{B}_X$. We get

$$\phi(P) = \sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r} \widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{j}\rangle_{(m)}} a_{\underline{i},\underline{j}} \cdot (1 \otimes \underline{\partial}_{\sharp}^{\langle \underline{i}\rangle_{(m)}}) = \sum_{\underline{i}\in\mathbb{N}^d,\underline{j}\in\mathbb{N}^r} \widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{j}\rangle_{(m)}} a_{\underline{i},\underline{j}} \cdot (1 \otimes 1) \cdot \underline{\partial}_{\sharp}^{\langle \underline{i}\rangle_{(m)}}.$$

Let $n := \max\{k \in \mathbb{N} \mid \exists \underline{j} \in \mathbb{N}^r, \exists \underline{i} \in \mathbb{N}^d, \text{such that } |\underline{j}| = k \text{ and } a_{\underline{i},\underline{j}} \neq 0\}$. Let $\underline{l} \in \mathbb{N}^r$ be such that $|\underline{l}| = n$. For any integer s, we denote by $\mathcal{D}^{(m)}_{X,Z^\sharp/S^\sharp,s}$ the free $\mathcal{B}_X$-submodule (for both structure) of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ whose basis is given by $\widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{j}\rangle_{(m)}}$ for any $\underline{j} \in \mathbb{N}^r$ such that $|\underline{j}| \leq s$. We remark that $\widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{l}\rangle_{(m)}} a_{\underline{i},\underline{l}} - a_{\underline{i},\underline{l}}\widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{l}\rangle_{(m)}} \in \mathcal{D}^{(m)}_{X,Z^\sharp/S^\sharp,n-1}$. Hence, by using 5.3.1.10.6, we compute

$$\widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{l}\rangle_{(m)}} a_{\underline{i},\underline{l}} \cdot (1 \otimes 1) \equiv a_{\underline{i},\underline{l}} \widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{l}\rangle_{(m)}} \cdot (1 \otimes 1) \equiv a_{\underline{i},\underline{l}} \otimes \widetilde{\underline{\partial}}_{\sharp}{}^{\langle \underline{l}\rangle_{(m)}} \mod \widetilde{h}^*(F^{\mathrm{l}}_{n-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}).$$

Since the action of $\underline{\partial}_{\sharp}^{\langle \underline{i}\rangle_{(m)}}$ via the right $h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$-module structure of $\widetilde{h}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ preserves $\widetilde{h}^*(F^{\mathrm{l}}_{n-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$ (because $\underline{\partial}_{\sharp}^{\langle \underline{i}\rangle_{(m)}}$ and $\widetilde{\underline{\partial}}_{\sharp}{}^{\langle \underline{j}\rangle_{(m)}}$ commute), we get

$$\widetilde{\underline{\partial}}'_{\sharp}{}^{\langle \underline{l}\rangle_{(m)}} a_{\underline{i},\underline{l}} \cdot (1 \otimes 1) \cdot \underline{\partial}_{\sharp}^{\langle \underline{i}\rangle_{(m)}} \equiv a_{\underline{i},\underline{l}} \otimes \widetilde{\underline{\partial}}_{\sharp}{}^{\langle \underline{l}\rangle_{(m)}} \underline{\partial}_{\sharp}^{\langle \underline{i}\rangle_{(m)}} \mod \widetilde{h}^*(F^{\mathrm{l}}_{n-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}).$$

Since $\widetilde{h}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ is a free $\mathcal{B}_X$-module with the basis $\{\underline{\partial}_{\sharp}^{\langle \underline{i}\rangle_{(m)}} \widetilde{\underline{\partial}}_{\sharp}{}^{\langle \underline{j}\rangle_{(m)}} \mid \underline{i} \in \mathbb{N}^d,\ \underline{j} \in \mathbb{N}^r\}$ then from this latter congruence, we check easily by induction on n the injectivity and the surjectivity of ϕ. □

Proposition 5.3.1.12. For any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$, we get the isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \widetilde{h}^{(m)!}_{/Z^\sharp}(\mathcal{E}) \xrightarrow{\sim} \widetilde{h}^{(m)!}_{/S^\sharp}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} \mathcal{E}). \tag{5.3.1.12.1}$$

Proof. By associativity of the tensor product, we get

$$\begin{aligned}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \widetilde{h}^{(m)!}_{/Z^\sharp}(\mathcal{E}) &= \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp} \otimes^{\mathbb{L}}_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} h^{-1}\mathcal{E}\right)[d_h] \\ &\underset{5.3.1.11.1}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} h^{-1}\mathcal{E}[d_h] \\ \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} h^{-1}&\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} \mathcal{E}\right)[d_h] = \widetilde{h}^{(m)!}_{/S^\sharp}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}} \mathcal{E}).\end{aligned}$$

□

Lemma 5.3.1.13. *Suppose we are in the non-respective case. Let $\mathcal{M} \in D^-_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. Then the canonical morphism of $D^-({}^{\mathrm{r}}h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$*

$$\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp} \to \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp} \tag{5.3.1.13.1}$$

is an isomorphism.

Proof. Since this is local, we can suppose X affine. Using the way-out left version of [Har66, I.7.1.(iv)], since the functors $\mathcal{M} \mapsto \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp}$ and $\mathcal{M} \mapsto \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp}$ are way-out left, we reduce to check the isomorphism when $\mathcal{M}$ is a free right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Hence, we come down to the case where $\mathcal{M} = \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. In that case, $\mathcal{M}$ is a flat right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module and a flat right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}$-module (see 5.3.1.6.c). Hence, we conclude using 5.3.1.11. □

Proposition 5.3.1.14. *Suppose we are in the non-respective case. Assume that S and Z are noetherian of finite Krull dimension and that (the underlying schemes morphim) h is quasi-compact and quasi-separated. We have for any $\mathcal{M} \in D^-_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ the isomorphism*

$$\mathrm{forg}_{Y^\sharp/Z^\sharp/S^\sharp} \circ \widetilde{h}^{(m)}_{/S^\sharp\,+}(\mathcal{M}) \xrightarrow{\sim} \widetilde{h}^{(m)}_{/Z^\sharp\,+} \circ \mathrm{forg}_{X^\sharp/Z^\sharp/S^\sharp}(\mathcal{M}). \tag{5.3.1.14.1}$$

Proof. Recall $\widetilde{h}^{(m)}_{/S^\sharp\,+}(\mathcal{M}) := \mathbb{R}h_*\left(\mathcal{M}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp}\right)$, $\widetilde{h}^{(m)}_{/Z^\sharp\,+}(\mathcal{M}) := \mathbb{R}h_*\left(\mathcal{M}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp}\right)$. Hence, this is straightforward from 5.3.1.13. □

Proposition 5.3.1.15. With hypotheses of 5.3.1.14, for $\mathcal{M}\in D^-_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp})$, we have the canonical isomorphism

$$\widetilde{h}^{(m)}_{/Z^\sharp+}(\mathcal{M})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\xrightarrow{\sim}\widetilde{h}^{(m)}_{/S^\sharp+}(\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}). \tag{5.3.1.15.1}$$

Proof. Using the projection isomorphism, we get

$$\widetilde{h}^{(m)}_{/Z^\sharp+}(\mathcal{M})\otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}=\mathbb{R}h_*\left(\mathcal{M}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp}\right) \tag{5.3.1.15.2}$$

$$\underset{5.1.2.6.1}{\xrightarrow{\sim}}\mathbb{R}h_*\left(\left(\mathcal{M}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Z^\sharp}\right)\otimes_{h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/Z^\sharp}}h^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\right) \tag{5.3.1.15.3}$$

$$\underset{5.3.1.2.1}{\xrightarrow{\sim}}\mathbb{R}h_*\left(\mathcal{M}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp}\right)\xrightarrow{\sim}\widetilde{h}^{(m)}_{/S^\sharp+}(\mathcal{M}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Z^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}). \tag{5.3.1.15.4}$$

□

5.3.2 Way-out properties of pushforwards and extraordinary pullbacks, stability of the coherence, tor dimension finiteness, perfectness

We keep notation and hypotheses of 5.1.1.1 and we suppose $\widetilde{f}$ is quasi-flat (see Definition 4.4.1.3).

5.3.2.1. We suppose f is log-smooth and the bottom arrow of 5.1.1.1.1 is the identity. Following 5.3.1.11.1 (applied in the case where $g=\mathrm{id}$ and therefore $f=h$), since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/Y^\sharp}=\mathcal{B}_X$, we have therefore the canonical morphism

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp}}\mathcal{B}_X\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp/S^\sharp}, \tag{5.3.2.1.1}$$

given by $P\otimes 1\mapsto P\cdot(1\otimes 1)$, is an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp},\widetilde{f}^{-1}\mathcal{B}_Y)$-bimodules Since f is log smooth, following 4.7.3.7.2 we have the exact sequence of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}$-modules

$$0\to\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}\otimes_{\mathcal{B}_X}\wedge^d\widetilde{\mathcal{T}}_{X^\sharp/Y^\sharp}\cdots\underset{\delta}{\longrightarrow}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}\otimes_{\mathcal{B}_X}\wedge\widetilde{\mathcal{T}}_{X^\sharp/Y^\sharp}\underset{\delta}{\longrightarrow}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}\to\mathcal{B}_X\to 0. \tag{5.3.2.1.2}$$

By applying the exact functor $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}}-$ to the Spencer exact sequence 5.3.2.1.2, by using the isomorphism 5.3.2.1.1, we get the exact sequence of left $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules:

$$0\to\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{B}}^{(0)}_X}\wedge^d\widetilde{\mathcal{T}}_{X^\sharp/Y^\sharp}\cdots\underset{\delta}{\longrightarrow}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{B}}^{(0)}_X}\widetilde{\mathcal{T}}_{X^\sharp/Y^\sharp}\underset{\delta}{\longrightarrow}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\to\widetilde{\mathcal{D}}^{(0)}_{X^\sharp\to Y^\sharp/S^\sharp}\to 0. \tag{5.3.2.1.3}$$

In other words, the morphism $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{B}}^{(0)}_X}\wedge^\bullet\widetilde{\mathcal{T}}_{X^\sharp/Y^\sharp}\to\widetilde{\mathcal{D}}^{(0)}_{X^\sharp\to Y^\sharp/S^\sharp}$ is a quasi-isomorphism (where $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{B}}^{(0)}_X}\wedge^0\widetilde{\mathcal{T}}_{X^\sharp/Y^\sharp}=\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ is at the 0th place.

5.3.2.2. We suppose f is log-smooth and the bottom arrow of 5.1.1.1.1 is the identity. By applying the functor $\mathscr{F}:=\widetilde{\omega}_{X^\sharp/S^\sharp}\otimes\widetilde{f}^*(-\otimes\widetilde{\omega}^{-1}_{Y^\sharp/S^\sharp})$ to the canonical ring homomorphism $\mathcal{B}_Y\to\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$, we get the canonical map of right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp}$-modules $\widetilde{\omega}_{X^\sharp/Y^\sharp}\to\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow X^\sharp/S^\sharp}$ (indeed the induced structure via $\mathscr{F}$ of the right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp}$-module of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow X^\sharp/S^\sharp}$ is given by the right structure of $\mathcal{B}_Y$-module of $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$). This yields the morphism

$$\widetilde{\omega}_{X^\sharp/Y^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\to\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow X^\sharp/S^\sharp}. \tag{5.3.2.2.1}$$

Via a local computation (recall 4.3.5.4), it follows from 5.3.2.1.1 that the map 5.3.2.2.1 is an isomorphism. Following 4.7.3.14, we have the exact sequence

$$0 \to \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp} \underset{d}{\longrightarrow} \widetilde{\Omega}^1_{X^\sharp/Y^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp} \underset{d}{\longrightarrow} \cdots \underset{d}{\longrightarrow} \widetilde{\omega}_{X^\sharp/Y^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp} \to \widetilde{\omega}_{X^\sharp/Y^\sharp} \to 0 \qquad (5.3.2.2.2)$$

given by the de Rham complex of $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}$ and for the last arrow by the right structure of $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}$ on $\widetilde{\omega}_{X^\sharp/Y^\sharp}$. By applying the exact functor $-\otimes_{\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/Y^\sharp}} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$ to the exact sequence 5.3.2.2.2, by using the isomorphism 5.3.2.2.1, we get the exact sequence of right $\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}$-modules:

$$0 \to \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \underset{d}{\longrightarrow} \widetilde{\Omega}^1_{X^\sharp/Y^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \underset{d}{\longrightarrow} \cdots \underset{d}{\longrightarrow} \widetilde{\omega}_{X^\sharp/Y^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(0)}_{Y^\sharp\leftarrow X^\sharp/S^\sharp} \to 0 \quad (5.3.2.2.3)$$

In other words, the map $\widetilde{\Omega}^\bullet_{X^\sharp/Y^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp}[d_f] \to \widetilde{\mathcal{D}}^{(0)}_{Y^\sharp\leftarrow X^\sharp/S^\sharp}$ is a quasi-isomorphism.

Proposition 5.3.2.3. *Assume we are in the non-respective case of 5.1.1.1, T is a noetherian scheme of finite Krull dimension and f is a log-smooth, quasi-compact and quasi-separated morphism and the bottom arrow of 5.1.1.1.1 is the identity. Then we have the following isomorphisms:*

1. *For any $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$, we have the isomorphism*

$$f^{(0)}_{+}(\mathcal{E}) \xrightarrow{\sim} \mathbb{R}f_*\left(\widetilde{\Omega}^\bullet_{X^\sharp/Y^\sharp} \otimes_{\mathcal{B}_X} \mathcal{E}\right)[d_f]; \qquad (5.3.2.3.1)$$

2. *For any $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(0)}_{X^\sharp/S^\sharp})$, we have the isomorphism*

$$f^{(0)}_{+}(\mathcal{M}) \xrightarrow{\sim} \mathbb{R}f_*\left(\mathcal{M} \otimes_{\mathcal{B}_X} \wedge^\bullet \widetilde{\mathcal{T}}_{X^\sharp/Y^\sharp}\right). \qquad (5.3.2.3.2)$$

Proof. The isomorphism 5.3.2.3.1 (resp. 5.3.2.3.2) is a consequence of 5.3.2.2.3 (resp. 5.3.2.1.3). □

Proposition 5.3.2.4. *Suppose one of the following conditions holds:*

(i) either $m = 0$,

(ii) or we are the non-respective case of 5.1.1.1 and log-structures are trivial.

Then the left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$ has finite tor-dimension and the right $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp}$ has finite tor-dimension.

Proof. I) Let us prove the case $m = 0$. a) Suppose the diagram 5.1.1.1.1 is cartesian and the morphism $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism, i.e. suppose we are in the base change case. Following 5.1.1.15, the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$ is an isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodules and moreover there exists a canonical isomorphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$-bimodules of the form $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp\leftarrow X^\sharp/S^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$. Hence we get done.

b) By using the splitting of 7.5.6.7.1 and 5.1.1.12.1, by using the part a) of the proof, we reduce to the case where the bottom morphism of 5.1.1.1.1 is the identity. When f is log-smooth, we can check the first (resp. second) statement is a consequence of 5.3.2.1.3 (resp. 5.3.2.2.3). By decomposing f by its graph $\gamma_f\colon X^\sharp \hookrightarrow X^\sharp \times_{S^\sharp} Y^\sharp$, which is a closed immersion, followed by the log-smooth projection $X^\sharp \times_{S^\sharp} Y^\sharp \to Y^\sharp$ this yields the first statement thanks to 5.2.3.1.

II) Let us prove the case (ii). Since p is nilpotent and log structures are trivial, we are under conditions 6.1. Hence, by Frobenius descent (see 6.1.3.6.b), this is a consequence of the case where $m = 0$. □

The following corollary completes 5.1.3.5.

Corollary 5.3.2.5. *Suppose we are the non-respective case of 5.1.1.1. Suppose one of the following conditions holds:*

(i) either $m = 0$,

(ii) or log-structures are trivial.

Then, the functor $\widetilde{f}_+^{(m)}$ is way out in both direction and for any $* \in \{\mathrm{r}, \mathrm{l}\}$, we have the factorization

$$\widetilde{f}_+^{(m)} \colon D^{\mathrm{b}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D^{\mathrm{b}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}).$$

Proof. The factorization is a consequence of Proposition 5.3.2.4. □

Corollary 5.3.2.6. *Let $* \in \{\mathrm{r}, \mathrm{l}\}$. Suppose one of the following conditions holds:*

(i) either $m = 0$,

(ii) or we are the non-respective case of 5.1.1.1 and log-structures are trivial.

Then, we have the factorization $\widetilde{f}^{(m)!} \colon D_{\mathrm{tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \to D_{\mathrm{tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

Proof. By twisting if necessary, we can suppose $* = \mathrm{l}$. Let $\mathcal{F} \in D_{\mathrm{tdf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$. In both cases, the left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}$ has finite tor-dimension (see 5.3.2.4). Hence, there exists a bounded resolution $\mathcal{P}$ of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp}$ by $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$-bimodules which are moreover flat as left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules (see the remark 4.6.3.4). Let $\mathcal{Q}$ be a bounded complex of flat left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules representing $\mathcal{F}$. Hence,

$$\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{F} \xrightarrow{\sim} \mathcal{P} \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}\mathcal{Q},$$

which is a bounded complex of flat left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-modules. □

Proposition 5.3.2.7. *Suppose f is log-smooth, the bottom arrow of 5.1.1.1.1 is the identity and both conditions of 4.1.2.17.(e) are satisfied for $\mathcal{B}_Y$ and $\mathcal{B}_X$. Let $* \in \{\mathrm{r}, \mathrm{l}\}$.*

(a) For any $\mathcal{E} \in D^-_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$, we have $\widetilde{f}^{(m)!}(\mathcal{E}) \in D^-_{\mathrm{coh}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$.

(b) Suppose either $m = 0$, or we are the non-respective case of 5.1.1.1 and log-structures are trivial. We have the factorization

$$\widetilde{f}^{(m)!} \colon D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}) \to D_{\mathrm{perf}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}).$$

Proof. Let us check the first statement. Since this is local on $X^\sharp$, using locally free resolution, we reduce to the case $\mathcal{E} = \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$. Since the map $\alpha \colon \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp} \to \mathcal{B}_X$ (given by the structure of left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp}$-module of $\mathcal{B}_X$) is surjective, since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ is flat, then it follows form 5.3.2.1.1 the canonical morphism $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ is surjective and its kernel is equal to $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp}} \ker \alpha$. Remark, when $X^\sharp/Y^\sharp$ is endowed with logarithmic coordinates $(u_\lambda)_{\lambda=1,\dots,r}$, then $\ker \alpha$ is the left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/Y^\sharp}$-submodule generated $\partial_{\sharp 1}, \dots, \partial_{\sharp r}$. In particular, the kernel of $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \to \widetilde{f}^*\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}$ is a left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module of finite type. Following [Sta22, 08G8], a complex is perfect if and only if it is pseudo-coherent and locally has finite tor dimension. Hence, the second statement is a consequence of the first one and of the propositions 4.1.2.17.(e) and 5.3.2.6. □

Proposition 5.3.2.8. *Suppose we are the non-respective case of 5.1.1.1. Let $\mathcal{C}_Y$ be a $\mathcal{B}_Y$-algebra endowed with a compatible structure of $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-module such that $\mathcal{B}_Y \to \mathcal{C}_Y$ is $\mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$-linear. Let $\mathcal{F} \in D(\mathcal{B}_Y)$ (resp. $\mathcal{F} \in D(\mathcal{C}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}, \mathcal{B}_Y)$), and $\mathcal{G} \in D(\mathcal{B}_X)$.*

(i) We have the canonical morphism of $D(\mathcal{B}_Y)$ (resp. of $D(\mathcal{C}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{B}_Y)$):

$$\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_*(\mathcal{G}) \to \mathbb{R}f_*\left(\mathbb{L}\widetilde{f}^*(\mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{G}\right). \tag{5.3.2.8.1}$$

(ii) Suppose f is quasi-compact and quasi-separated. Suppose one of the following conditions:

(a) *either* $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{B}_Y)$*, and* $\mathcal{G} \in D(\mathcal{B}_X)$*,*

(b) *or* S *and* T *are noetherian schemes of finite Krull dimension and* $\mathcal{F} \in D^{-}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{B}_Y)$*, and* $\mathcal{G} \in D^{-}(\mathcal{B}_X)$*.*

Then the morphism 5.3.2.8.1 is an isomorphism.

Proof. Choosing a K-flat complex $\mathcal{P}$ of $K(\mathcal{B}_Y)$ (resp. of $K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{B}_Y)$ representing $\mathcal{F}$, a K-injective complex $\mathcal{I}$ of $K(\mathcal{B}_X)$ representing $\mathcal{G}$, we get

$$\begin{aligned}\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_*(\mathcal{G}) &\xrightarrow{\sim} \mathcal{P} \otimes_{\mathcal{B}_Y} f_*(\mathcal{I}) \to f_*\left(\widetilde{f}^*\mathcal{P} \otimes_{\mathcal{B}_X} \mathcal{I}\right)\\ &\to \mathbb{R}f_*\left(\widetilde{f}^*\mathcal{P} \otimes_{\mathcal{B}_X} \mathcal{I}\right) \xrightarrow{\sim} \mathbb{R}f_*\left(\mathbb{L}f^*\mathcal{F} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{G}\right), \qquad (5.3.2.8.2)\end{aligned}$$

the second morphism is built by adjointness from the morphism of ringed spaces $\widetilde{f} \colon (X, \mathcal{B}_X) \to (Y, \mathcal{B}_Y)$, the last isomorphism coming from the fact that $f^*\mathcal{P}$ a K-flat complex of $K(\mathcal{B}_X)$ representing $\mathbb{L}\widetilde{f}^*\mathcal{F}$. In the respective case, since we have by functoriality $f^*\mathcal{P} \otimes_{\mathcal{B}_X} \mathcal{I} \in K(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{B}_X)$ which yields $f_*\left(\widetilde{f}^*\mathcal{P} \otimes_{\mathcal{B}_X} \mathcal{I}\right) \in K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{B}_Y)$, then the second arrow do is a morphism of $K(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{B}_Y)$.

To check that this is an isomorphism, using the remark 5.1.2.1 and using [Har66, I.7.1 (ii), (iii) and (iv)] and 5.1.2.4, we reduce to the case where $\mathcal{F} = \mathcal{B}_Y$, which is obvious. □

5.3.2.9. Suppose we are the non-respective case of 5.1.1.1, $\mathcal{B}_Y$ is quasi-coherent and the morphism $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism. Then $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}$ is endowed with a canonical structure of $(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}, \mathcal{B}_Y)$-bimodule (induced by its structure of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-bimodule) such that both underlying $\mathcal{O}_Y$-module structure are quasi-coherent. Since $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism, then $\widetilde{f}^*_{\mathrm{r}}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}\right) \xrightarrow{\sim} f^*_{\mathrm{r}}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}\right)$. Let $\widetilde{\mathcal{G}}$ be a $\mathcal{B}_X$-module. Then $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{G}}$ is endowed with a canonical structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \mathcal{B}_X)$-bimodule. We get the isomorphisms of $D(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}, \mathcal{B}_Y)$:

$$\begin{aligned}\widetilde{f}^{(m)}_{+}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{G}}) &\xrightarrow{\sim} \mathbb{R}f_*\left(\left(\widetilde{f}^*_{\mathrm{r}}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}\right) \otimes_{\mathcal{B}_X} \widetilde{\omega}_{X^\sharp/S^\sharp}\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{G}})\right)\\ &\xrightarrow{\sim} \mathbb{R}f_*\left(\widetilde{f}^*_{\mathrm{r}}\left(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}\right) \otimes_{\mathcal{B}_X} \widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{G}}\right)\\ &\underset{5.3.2.8.1}{\xleftarrow{\sim}} (\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_*\left(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{G}}\right)\\ &\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \left(\widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_*\left(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\mathcal{G}}\right)\right). \qquad (5.3.2.9.1)\end{aligned}$$

Lemma 5.3.2.10. *Suppose we are the non-respective case of 5.1.1.1. Suppose* f *is proper,* S *and* T *are noetherian schemes of finite Krull dimension and* $f^*\mathcal{B}_Y \to \mathcal{B}_X$ *is an isomorphism. Suppose* $\mathcal{B}_Y$ *is a quasi-coherent* $\mathcal{O}_Y$*-module, is an* $\mathcal{O}_Y$*-algebra of finite type and the conditions 4.1.2.17.(e) are satisfied for* $\mathcal{B}_Y$*. For any* $\star \in \{\mathrm{b}, +, -, \emptyset\}$*, the functor* $\mathbb{R}f_*$ *sends* $D^{\star}_{\mathrm{coh}}(\mathcal{B}_X)$ *to* $D^{\star}_{\mathrm{coh}}(\mathcal{B}_Y)$*.*

Proof. Recall that following 1.4.5.2, $\mathcal{B}_Y$ is a coherent sheaf of rings. We can suppose $\mathcal{B}_X = f^*\mathcal{B}_Y$. Let $\mathcal{E}$ be a coherent $\mathcal{B}_X$-module. Since $\mathbb{R}f_*$ is way-out, then by using [Har66, I.7.3.(iii)], we reduce to check $\mathbb{R}f_*(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{B}_Y)$. Since this is Zariski local in Y, we can suppose Y is affine. Let $\widetilde{Y} := \mathrm{Spec}(\Gamma(Y, \mathcal{B}_Y))$, $\widetilde{X} := \widetilde{Y} \times_Y X$, $\widetilde{f} \colon \widetilde{X} \to \widetilde{Y}$ and $\varpi \colon \widetilde{X} \to X$ be the projections. In other words, $\widetilde{X} = \mathrm{Spec}_X(\mathcal{B}_X)$ is the relative spectrum of $\mathcal{B}_X$ over X and ϖ is the natural affine projection. Since f is proper, so is $\widetilde{f}$. Since $\widetilde{Y}$ and Y are noetherian, then so are $\widetilde{X}$ and X. Hence, a $\mathcal{B}_X$-module (resp. $\mathcal{B}_{\widetilde{X}}$-module) is coherent if and only if it is both quasi-coherent and of finite type. Following [Gro61, 1.4.5], there exists therefore a coherent $\mathcal{O}_{\widetilde{X}}$-module $\widetilde{\mathcal{E}}$ such that $\varpi_*(\widetilde{\mathcal{E}}) = \mathcal{E}$. Since $\widetilde{f}$ is proper, then $\mathbb{R}\widetilde{f}_*(\widetilde{\mathcal{E}}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{B}_{\widetilde{Y}})$. This yields $\Gamma(\widetilde{Y}, \mathbb{R}\widetilde{f}_*(\widetilde{\mathcal{E}}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\Gamma(Y, \mathcal{B}_Y))$.

Since we already know $\mathbb{R}f_*(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{B}_Y)$, since Y is affine and the conditions 4.1.2.17.(e) are satisfied for $\mathcal{B}_Y$, then $\mathbb{R}f_*(\mathcal{E}) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{B}_Y)$ if and only if $\Gamma(Y, \mathbb{R}f_*(\mathcal{E})) \in D^{\mathrm{b}}_{\mathrm{coh}}(\Gamma(Y, \mathcal{B}_Y))$. Since $\mathbb{R}f_*(\mathcal{E}) \xrightarrow{\sim} \Gamma(\widetilde{Y}, \mathbb{R}\widetilde{f}_*(\widetilde{\mathcal{E}})$, then we are done. □

Proposition 5.3.2.11. *We keep notation and hypotheses of 5.3.2.10. Suppose moreover one of the following conditions hold:*

(a) either $\star = -$,

(b) or $m = 0$,

(c) or log structures are trivial.

The functor $\widetilde{f}_{+}^{(m)}$ sends $D^{\star}_{\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ to $D^{\star}_{\mathrm{coh}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, where $* \in \{\mathrm{r}, \mathrm{l}\}$.

Proof. Following 5.1.3.5 and 5.3.2.5, $\widetilde{f}_{+}^{(m)}$ is way out left (or in both direction in the second and third case). Following [Har66, I.7.3] in order to check the coherence of $\widetilde{f}_{+}^{(m)}(\mathcal{F})$ for $\mathcal{F} \in D^{\star}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ we can suppose that $\mathcal{F}$ is a coherent left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. Since $\mathcal{F}$ is the inductive limit of its coherent $\mathcal{O}_X$-submodules (see [Gro60, 9.4.9]), there exists a coherent $\mathcal{O}_X$-submodule $\mathcal{G}$ of $\mathcal{F}$ such that the canonical $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear map $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{G} \twoheadrightarrow \mathcal{F}$ is surjective. Hence, by using [Har66, I.7.3.(iv)] (in fact, a left way-out version), we reduce to the case where $\mathcal{F}$ is of the form $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{G}$ where $\mathcal{G}$ is a coherent $\mathcal{O}_X$-module.

Since f is proper and S is locally noetherian, then the functor $\mathbb{R}f_*$ preserves the $\mathcal{O}$-coherence, hence If follows from 5.3.2.10, that $\widetilde{\omega}^{-1}_{Y^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_*(\widetilde{\omega}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} (\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{G})) \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{B}_Y)$. By using the isomorphism 5.3.2.9.1 (applied to the case $\widetilde{\mathcal{G}} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{G}$, we can conclude. □

Proposition 5.3.2.12. *Suppose we are the non-respective case of 5.1.1.1, $\mathcal{B}_Y$ is quasi-coherent, $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism and the bottom arrow of 5.1.1.1.1 is the identity. Suppose $f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ has finite tor dimension, S is a noetherian scheme of finite Krull dimension, f is quasi-compact and quasi-separated. The functor $\widetilde{f}_{+}^{(m)}$ sends $D_{\mathrm{tdf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ (resp. $D_{\mathrm{qc,tdf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$) to $D_{\mathrm{tdf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$ (resp. $D_{\mathrm{qc,tdf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$), where $* \in \{\mathrm{r}, \mathrm{l}\}$.*

Proof. Let $\mathcal{M} \in D_{\mathrm{tdf}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathcal{F}$ be a quasi-coherent left $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-module. It follows from 5.1.2.6.1 that we have the canonical isomorphism

$$\mathbb{R}f_*\left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/S^\sharp}\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \mathcal{F} \xrightarrow{\sim} \mathbb{R}f_*\left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{F}\right).$$

It follows from 5.1.1.10 that $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp \to Y^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} f^{-1}\mathcal{F} = \widetilde{f}^{(m)!}(\mathcal{F})[d_f]$ is bounded. Since $\mathcal{M}$ has finite tor-dimension, since $\widetilde{f}_{+}^{(m)}(\mathcal{M}) = \mathbb{R}f_*\left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp \to Y^\sharp/S^\sharp}\right)$, then this yields that $\widetilde{f}_{+}^{(m)}(\mathcal{M}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}} \mathcal{F}$ is bounded. We conclude by using 1.4.3.3. □

Proposition 5.3.2.13. *Suppose we are the non-respective case of 5.1.1.1, $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism and the bottom arrow of 5.1.1.1.1 is the identity. Suppose $\mathcal{B}_Y$ is a quasi-coherent $\mathcal{O}_Y$-module, is an $\mathcal{O}_Y$-algebra of finite type and the conditions 4.1.2.17.(e) are satisfied for $\mathcal{B}_Y$. Suppose $f^{-1}\mathcal{B}_Y \to \mathcal{B}_X$ has finite tor dimension, S is a noetherian scheme of finite Krull dimension, f is proper. The functor $\widetilde{f}_{+}^{(m)}$ sends $D_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ to $D_{\mathrm{perf}}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp})$, where $* \in \{\mathrm{r}, \mathrm{l}\}$.*

Proof. Following [Sta22, 08G8], a complex is perfect if and only if it is pseudo-coherent and locally has finite tor dimension. Hence, this is a consequence of 5.3.2.11 and 5.3.2.12. □

Notation 5.3.2.14 (Varying m notation)**.** We keep notation and hypotheses 5.1.1.1. Fix $m \geq m' \geq 0$ a second integer. Let $\mathcal{B}'_X$ (resp. $\mathcal{B}'_Y$) be a commutative $\mathcal{O}_X$-algebra (resp. $\mathcal{O}_Y$-algebra) endowed with a compatible structure of left $\mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$-module (resp. left $\mathcal{D}^{(m')}_{Y^\sharp/T^\sharp}$-module) and satisfying the hypotheses of 7.3.2. We suppose that we have algebras morphisms $\mathcal{B}'_X \to \mathcal{B}_X$,$\mathcal{B}'_Y \to \mathcal{B}_Y$, $f^*\mathcal{B}'_Y \to \mathcal{B}'_X$ which are respectively $\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp}$-linear (resp. $\widetilde{\mathcal{D}}^{(m')}_{Y^\sharp/T^\sharp}$-linear, resp. $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$-linear) and inducing the commutative diagram

$$\begin{array}{ccc} f^*\mathcal{B}_Y & \longrightarrow & \mathcal{B}_X \\ \uparrow & & \uparrow \\ f^*\mathcal{B}'_Y & \longrightarrow & \mathcal{B}'_X. \end{array}$$

We denote by $\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp} := \mathcal{B}'_X \widehat{\otimes}_{\mathcal{O}_X} \mathcal{D}^{(m')}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m')}_{Y^\sharp/T^\sharp} := \mathcal{B}'_Y \widehat{\otimes}_{\mathcal{O}_Y} \mathcal{D}^{(m')}_{Y^\sharp/T^\sharp}$. We keep similar to 5.1.1.2 notation by replacing m by m' and $\mathcal{B}$ by $\mathcal{B}'$.

Proposition 5.3.2.15. *With notation 5.3.2.14, suppose we are the non-respective case of 5.1.1.1, S and T are noetherian schemes of finite Krull dimension, f is quasi-compact and quasi-separated, $\mathcal{B}'_Y$ is quasi-coherent and $f^*\mathcal{B}'_Y \to \mathcal{B}'_X$ is an isomorphism, $\mathcal{B}_Y$ is quasi-coherent and $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is an isomorphism. Let $\star \in \{+, -, \emptyset\}$, $* \in \{\mathrm{r}, \mathrm{l}\}$ and $\mathcal{F} \in D^\star_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp})$. Suppose moreover one of the following conditions holds:*

(a) either $\star = -$,

(b) or log structures are trivial.

Suppose moreover either $\mathcal{B}'_X \to \mathcal{B}_X$ is an isomorphism or $f^{-1}\mathcal{O}_Y$ and $\mathcal{O}_X$ are tor independent over $f^{-1}\mathcal{B}_Y$.

Then we have in $D^\star_{\mathrm{qc}}(\widetilde{\mathcal{D}}^{(m')}_{Y^\sharp/T^\sharp})$ the canonical isomorphism

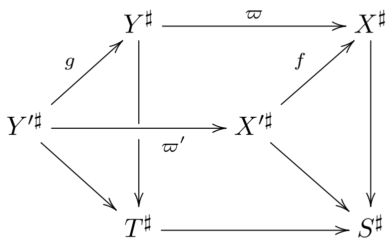
$$\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{Y^\sharp/T^\sharp}} \widetilde{f}^{(m')}_{+}(\mathcal{F}) \xrightarrow{\sim} \widetilde{f}^{(m)}_{+}\left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp}} \mathcal{F}\right). \tag{5.3.2.15.1}$$

Proof. We can suppose $* = \mathrm{l}$. It follows from 5.1.3.4 that we can suppose $\mathcal{B}'_X \to \mathcal{B}_X$ is an isomorphism. By using the canonical morphism of $(f^{-1}\widetilde{\mathcal{D}}^{(m')}_{Y^\sharp/T^\sharp}, \widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp})$-bimodules $\widetilde{\mathcal{D}}^{(m')}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp \leftarrow X^\sharp/S^\sharp}$ and the $\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp}$-linear morphism $\mathcal{F} \to \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp}} \mathcal{F}$, we get the $\widetilde{\mathcal{D}}^{(m')}_{Y^\sharp/T^\sharp}$-linear morphism $\widetilde{f}^{(m')}_{+}(\mathcal{F}) \to \widetilde{f}^{(m)}_{+}\left(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp}} \mathcal{F}\right)$, which yields 5.3.2.15.1 by extension. To check that this is an isomorphism, since $\widetilde{f}^{(m')}_{+}$ is way out left (resp. in both direction by using 3.2.4.3), following [Har66, I.7.1.(iii)], we can suppose that $\mathcal{F}$ is a quasi-coherent left $\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp}$-module. Since the canonical morphism $\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{F} \to \mathcal{F}$ is surjective, by using [Har66, I.7.3.(iv)] (in fact, a left way-out version), we reduce to the case where $\mathcal{F}$ is of the form $\widetilde{\mathcal{D}}^{(m')}_{X^\sharp/S^\sharp} \otimes_{\mathcal{O}_X} \mathcal{G}$ where $\mathcal{G}$ is a quasi-coherent $\mathcal{O}_X$-module. We conclude via the isomorphism 5.3.2.9.1. □

Remark 5.3.2.16. When $m' = m$, we get 5.1.3.4.

5.3.3 Commutation with base change

Consider the commutative diagram



(5.3.3.0.1)

where the squares are cartesian, where $S^\sharp$ and $T^\sharp$ are Noetherian nice fine log scheme over $\mathrm{Spec}(\mathbb{Z}/p^{i+1}\mathbb{Z})$ (see definition 3.1.1.1), where $X^\sharp$ and $Y^\sharp$ are log smooth $S^\sharp$-log-scheme, where morphisms are morphisms of log schemes whose underlying morphism of schemes are quasi-compact and quasi-separated. Let $\mathcal{B}_X$ (resp. $\mathcal{B}_{X'}$) be a commutative quasi-coherent $\mathcal{O}_X$-algebra (resp. $\mathcal{O}_{X'}$-algebra) endowed with of a compatible structure of $\mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$-module (resp. $\mathcal{D}^{(m)}_{X'^\sharp/S^\sharp}$-module). We suppose finally that we have a morphism of algebras $f^*\mathcal{B}_X \to \mathcal{B}_{X'}$ which is moreover $\mathcal{D}^{(m)}_{X'^\sharp/S^\sharp}$-linear. We will again denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp} = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/S^\sharp}$. We denote by $\widetilde{X}^\sharp$ (resp. $\widetilde{X'}^\sharp$) the ringed logarithmic ($\mathcal{V}$-formal) scheme $(X^\sharp, \mathcal{B}_X)$ (resp. $(X'^\sharp, \mathcal{B}_{X'})$), and by $\tilde{f} \colon \widetilde{X'}^\sharp/S^\sharp \to \widetilde{X}^\sharp/S^\sharp$ the morphism of relative ringed logarithmic ($\mathcal{V}$-formal) schemes induced by the diagram 5.3.3.0.1 and by $f^*\mathcal{B}_X \to \mathcal{B}_{X'}$. We suppose $\widetilde{f}$ is quasi-flat (see Definition 4.4.1.3).

Set $\mathcal{B}_Y := \varpi^*\mathcal{B}_X$ and $\mathcal{B}_{Y'} := \varpi'^*\mathcal{B}_{X'}$, $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp} = \mathcal{B}_{Y'} \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y^\sharp/T^\sharp}$. We denote by $\widetilde{Y}^\sharp$ (resp. $\widetilde{Y}'^\sharp$) the ringed logarithmic ($\mathcal{V}$-formal) scheme $(Y^\sharp, \mathcal{B}_Y)$ (resp. $(Y'^\sharp, \mathcal{B}_{Y'})$), and by $\tilde{g}\colon \widetilde{Y}'^\sharp/T^\sharp \to \widetilde{Y}^\sharp/T^\sharp$ the morphism of relative ringed logarithmic ($\mathcal{V}$-formal) schemes induced by the diagram 5.3.3.0.1 and by $g^*\mathcal{B}_Y \to \mathcal{B}_{Y'}$. We get moreover the morphisms $\widetilde{\varpi}\colon \widetilde{Y}^\sharp/T^\sharp \to \widetilde{X}^\sharp/S^\sharp$ and $\widetilde{\varpi}'\colon \widetilde{Y}'^\sharp/T^\sharp \to \widetilde{X}'^\sharp/S^\sharp$. Since the squares of the diagram 5.3.3.0.1 are cartesian, then the functors $\widetilde{\varpi}^{(m)!}$ and $\widetilde{\varpi}'^{(m)!}$ are the base change inverse image (see 5.1.1.15).

Proposition 5.3.3.1. Let $\mathcal{E} \in D({}^{\mathrm{l}}\mathcal{D}^{(m)}_{X^\sharp/S^\sharp})$. There exists a canonical isomorphism in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T'^\sharp})$ of the form:

$$\widetilde{\varpi}'^{(m)!} \circ \widetilde{f}^{(m)!}(\mathcal{E}) \xrightarrow{\sim} \widetilde{g}^{(m)!} \circ \widetilde{\varpi}^{(m)!}(\mathcal{E}). \tag{5.3.3.1.1}$$

Proof. Following 5.1.1.13, they both are canonically isomorphic to $\widetilde{h}^{(m)!}(\mathcal{E})$ where $\widetilde{h}\colon (Y', \mathcal{B}_{Y'})/T^\sharp \to (X, \mathcal{B}_X)/S^\sharp$ is the morphism induced by composition. □

Proposition 5.3.3.2. Tensor products commutes with base change, i.e. we have the canonical isomorphism in $D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ for any $\mathcal{M} \in D({}^*\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$\widetilde{\varpi}^{(m)!}(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathcal{E}) \xrightarrow{\sim} \widetilde{\varpi}^{(m)!}(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \widetilde{\varpi}^{(m)!}(\mathcal{E}). \tag{5.3.3.2.1}$$

Proof. Obvious. □

Theorem 5.3.3.3. *Let $\mathcal{E}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp})$. There exists a canonical homorphism in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ of the form:*

$$\widetilde{\varpi}^{(m)!} \circ \widetilde{f}^{(m)}_+(\mathcal{E}') \to \widetilde{g}^{(m)}_+ \circ \widetilde{\varpi}'^{(m)!}(\mathcal{E}'). \tag{5.3.3.3.1}$$

This morphism is an isomorphism in the following cases:

(a) either $\mathcal{E}' \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp})$;

(b) or $m = 0$, $f^{-1}\mathcal{B}_X \to \mathcal{B}_Y$ and $f^{-1}\mathcal{B}_{X'} \to \mathcal{B}_{Y'}$ have finite tor dimension and $\mathcal{E}' \in D_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp})$;

(c) or the log structures are trivial, p is nilpotent, $f^{-1}\mathcal{B}_X \to \mathcal{B}_Y$ and $f^{-1}\mathcal{B}_{X'} \to \mathcal{B}_{Y'}$ have finite tor dimension and $\mathcal{E}' \in D_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp})$.

Proof. a) By computing in local coordinates, we can check the canonical isomorphisms of $\mathcal{B}_Y$-modules (resp. of $\mathcal{B}_{Y'}$-modules) $\widetilde{\varpi}^!(\widetilde{\omega}_{X^\sharp/S^\sharp}) \xrightarrow{\sim} \widetilde{\omega}_{Y^\sharp/T^\sharp}$ (resp. $\widetilde{\varpi}'^!(\widetilde{\omega}_{X'^\sharp/S^\sharp}) \xrightarrow{\sim} \widetilde{\omega}_{Y'^\sharp/T^\sharp}$) is $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-linear (resp. $\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp}$-linear). Hence, we get the isomorphism of right $\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp}$-modules:

$$\begin{aligned} \widetilde{\varpi}'^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}) &\xrightarrow{\sim} \widetilde{\varpi}'^*(\widetilde{\omega}_{X'^\sharp/S^\sharp} \otimes_{\mathcal{B}_{X'}} \widetilde{f}^*_{\mathrm{r}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp})) \\ \xrightarrow{\sim} \widetilde{\omega}_{Y'^\sharp/T^\sharp} \otimes_{\mathcal{B}_{Y'}} \widetilde{\varpi}'^* \widetilde{f}^*_{\mathrm{r}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}) &\xrightarrow{\sim} \widetilde{\omega}_{Y'^\sharp/T^\sharp} \otimes_{\mathcal{B}_{Y'}} \widetilde{g}^*_{\mathrm{r}} \widetilde{\varpi}^*_{\mathrm{r}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}) \\ &\xrightarrow{\sim} \widetilde{\omega}_{Y'^\sharp/T^\sharp} \otimes_{\mathcal{B}_{Y'}} g^*_{\mathrm{r}}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp})) = \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp}. \end{aligned} \tag{5.3.3.3.2}$$

In fact, since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}$ is a $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S})$-bimodule, we check by functoriality that the homomorphisms of 5.3.3.3.2 are homomorphisms of $((\varpi \circ g)^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/S})$-bimodules. Let $\mathcal{P}'$ be a K-flat complex representing $\mathcal{E}'$. Hence, we get the morphism of $D((\varpi \circ g)^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$\varpi'^{-1}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}} \mathcal{P}') \to \widetilde{\varpi}'^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp}} \widetilde{\varpi}'^!(\mathcal{P}') \underset{5.3.3.3.2}{\xrightarrow{\sim}} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp}} \widetilde{\varpi}'^!(\mathcal{P}'). \tag{5.3.3.3.3}$$

b) We have the adjoint morphism (or called base change morphism which is constructed by adjointness: see [Sta22, 20.28.3]) adj: $\varpi^{-1}\mathbb{R}f_* \to \mathbb{R}g_*\varpi'^{-1}$ of functors $D(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \to D(\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$. Hence, we get the morphism of $D(\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$:

$$\varpi^{-1}\circ \mathbb{R}f_*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}}\mathcal{P}')\xrightarrow{\text{adj}}\mathbb{R}g_*\circ\varpi'^{-1}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}}\mathcal{P}')$$
$$\underset{5.3.3.3.3}{\longrightarrow}\mathbb{R}g_*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp}}\widetilde{\varpi}'^!(\mathcal{P}')). \tag{5.3.3.3.4}$$

Via the extension $\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\to\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$, this yields the morphism of $D(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$

$$\widetilde{\varpi}^!\circ\widetilde{f}^{(m)}_+(\mathcal{E}')=\widetilde{\varpi}^!\circ\mathbb{R}f_*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}}\mathcal{E}')\to\mathbb{R}g_*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp}}\widetilde{\varpi}'^!(\mathcal{E}'))=\widetilde{g}^{(m)}_+\circ\widetilde{\varpi}'^!(\mathcal{E}'). \tag{5.3.3.3.5}$$

It remains to check that this morphism is an isomorphism. In the first case (resp. in the other two cases), since the functors $\widetilde{\varpi}^!\circ\widetilde{f}^{(m)}_+$ and $\widetilde{g}^{(m)}_+\circ\varpi'^!$ are way out left (resp. way out in both directions: see 5.1.1.10 and 5.3.2.5), by using (the way out left version of) Proposition [Har66, I.7.1], we reduce to the case where $\mathcal{E}'$ is a quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}$-module. By using [Har66, I.7.1.(iv)], we reduce to the case where $\mathcal{E}'$ is of the form $\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}\otimes_{\mathcal{B}_{X'}}\mathcal{F}'$, where $\mathcal{F}'$ is a quasi-coherent $\mathcal{B}_{X'}$-module. The morphism 5.3.3.3.4 is canonically isomorphism to the composite of the top arrow of the following diagram:

$$\begin{array}{ccccc}
\varpi^{-1}\mathbb{R}f_*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}}\mathcal{E}') & \xrightarrow{\text{adj}} & \mathbb{R}g_*\varpi'^{-1}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'^\sharp/S^\sharp}}\mathcal{E}') & \to & \mathbb{R}g_*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp}\otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y'^\sharp/T^\sharp}}\widetilde{\varpi}'^!(\mathcal{E}')) \\
\downarrow\wr & & \downarrow\wr & & \downarrow\wr \\
\varpi^{-1}\circ\mathbb{R}f_*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\mathcal{B}_{X'}}\mathcal{F}') & \xrightarrow{\text{adj}} & \mathbb{R}g_*\circ\varpi'^{-1}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\mathcal{B}_{X'}}\mathcal{F}') & \longrightarrow & \mathbb{R}g_*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp}\otimes_{\mathcal{B}_{Y'}}\widetilde{\varpi}'^!(\mathcal{F}')) \\
\downarrow & & \downarrow & & \| \\
\widetilde{\varpi}^!\circ\mathbb{R}f_*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\mathcal{B}_{X'}}\mathcal{F}') & \underset{\sim}{\xrightarrow{\text{adj}}} & \mathbb{R}g_*\circ\widetilde{\varpi}'^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\mathcal{B}_{X'}}\mathcal{F}') & \xrightarrow{\sim} & \mathbb{R}g_*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp}\otimes_{\mathcal{B}_{Y'}}\widetilde{\varpi}'^!(\mathcal{F}')),
\end{array} \tag{5.3.3.3.6}$$

where, by identifying $\widetilde{\varpi}^!$ with the functor ϖ^*, the adjoint isomorphism of the bottom row can be viewed at the one constructed in the categories of $\mathcal{O}$-modules (this latter is indeed an isomorphism because Y and X' are tor-independent over X: see [Sta22, 36.22.5]). Remark that the left bottom square is indeed commutative by transitivity of the base change morphism (see [Sta22, 20.28.4]). This yields the commutative diagram:

$$\begin{array}{ccc}
\widetilde{\varpi}^!\circ\widetilde{f}^{(m)}_+(\mathcal{E}') & \longrightarrow & \widetilde{g}^{(m)}_+\circ\widetilde{\varpi}'^!(\mathcal{E}') \\
\downarrow\wr & & \downarrow\wr \\
\widetilde{\varpi}^!\circ\mathbb{R}f_*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\mathcal{B}_{X'}}\mathcal{F}')\underset{\sim}{\xrightarrow{\text{adj}}}\mathbb{R}g_*\circ\widetilde{\varpi}'^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp\leftarrow X'^\sharp/S^\sharp}\otimes_{\mathcal{B}_{X'}}\mathcal{F}') & \xrightarrow{\sim} & \mathbb{R}g_*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow Y'^\sharp/T^\sharp}\otimes_{\mathcal{B}_{U'}}\widetilde{\varpi}'^!(\mathcal{F}')).
\end{array} \tag{5.3.3.3.7}$$

□

Proposition 5.3.3.4. Let $\mathcal{E}\in D^{\mathrm{b}}_{\mathrm{perf}}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp,\mathbb{Q}})$. We have the canonical isomorphism

$$\widetilde{\varpi}^!(\mathbb{D}_{X^\sharp/S^\sharp}(\mathcal{E}))\xrightarrow{\sim}\mathbb{D}_{Y^\sharp/T^\sharp}(\widetilde{\varpi}^!(\mathcal{E})). \tag{5.3.3.4.1}$$

Proof. Since $\mathcal{E}$ is a perfect complex, then we have the last canonical isomorphism

$$\widetilde{\varpi}^!(\mathbb{D}_{X^\sharp/S^\sharp}(\mathcal{E}))=\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\otimes^{\mathbb{L}}_{\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\varpi^{-1}\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\mathcal{E},\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\omega}^{-1}_{X^\sharp/S^\sharp})[\delta^{S^\sharp}_{X^\sharp}] \tag{5.3.3.4.2}$$

$$\xrightarrow{\sim}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/S^\sharp}\otimes^{\mathbb{L}}_{\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}\mathbb{R}\mathcal{H}om_{\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\varpi^{-1}\mathcal{E},\varpi^{-1}(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}))[\delta^{S^\sharp}_{X^\sharp}] \tag{5.3.3.4.3}$$

$$\underset{4.6.3.6.1}{\xrightarrow{\sim}}\mathbb{R}\mathcal{H}om_{\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\varpi^{-1}\mathcal{E},\widetilde{\varpi}^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}\otimes_{\mathcal{B}_X}\widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}))[\delta^{S^\sharp}_{X^\sharp}]. \tag{5.3.3.4.4}$$

Using **??**, since $\widetilde{\varpi}^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) = \varpi^*(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$ and $\widetilde{\varpi}^!(\widetilde{\omega}^{(m)}_{X^\sharp/S^\sharp}) = \varpi^*(\widetilde{\omega}^{(m)}_{X^\sharp/S^\sharp}) \xrightarrow{\sim} \widetilde{\omega}^{(m)}_{Y^\sharp/T^\sharp}$, then we get the isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}$-bimodules

$$\widetilde{\varpi}^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}.$$

Using **??**, this yields the first isomorphism

$$\mathbb{R}\mathcal{H}om_{\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\varpi^{-1}\mathcal{E}, \widetilde{\varpi}^!(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \widetilde{\omega}^{-1}_{X^\sharp/S^\sharp}))[\delta^{S^\sharp}_{X^\sharp}] \quad (5.3.3.4.5)$$

$$\xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\varpi^{-1}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}}(\varpi^{-1}\mathcal{E}, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}))[\delta^{T^\sharp}_{Y^\sharp}] \quad (5.3.3.4.6)$$

$$\xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}}(\widetilde{\varpi}^!\mathcal{E}, \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \widetilde{\omega}^{-1}_{Y^\sharp/T^\sharp}))[\delta^{T^\sharp}_{Y^\sharp}] = \mathbb{D}_{Y^\sharp/T^\sharp}(\widetilde{\varpi}^!(\mathcal{E})). \quad (5.3.3.4.7)$$

□

5.3.4 Projection formula as $\mathcal{D}$-module

We keep notation 5.1.2 and we suppose $\widetilde{f}$ is quasi-flat (see Definition 4.4.1.3). Moreover, assume that T is a noetherian scheme of finite Krull dimension; and f is quasi-compact and quasi-separated. We check here a projection formula involving the pushforward as $\mathcal{D}$-module and the extraordinary inverse image as $\mathcal{D}$-module (compare 5.3.4.1 with 5.1.2.8).

Proposition 5.3.4.1 (Projection formula)**.** For $\mathcal{M} \in D^-({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathcal{E} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $\mathcal{M} \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})$ and $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$, with notation 5.1.1.4 and 5.1.3.1 we have the canonical isomorphism

$$\widetilde{f}^{(m)}_+\left(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^*(\mathcal{E})\right) \xrightarrow{\sim} \widetilde{f}^{(m)}_+(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathcal{E}. \quad (5.3.4.1.1)$$

Proof. Since $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$ are flat $\mathcal{B}_X$-modules, we have the isomorphisms of $D({}^{\mathrm{r}}f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$:

$$\left(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^*(\mathcal{E})\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \xrightarrow{\sim} \left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp} \otimes_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^*(\mathcal{E}))\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}$$
$$\underset{4.2.5.1}{\xrightarrow{\sim}} \left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} (\mathbb{L}\widetilde{f}^*(\mathcal{E}) \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp})\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \xrightarrow{\sim} \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \left(\mathbb{L}\widetilde{f}^*(\mathcal{E}) \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}\right). \quad (5.3.4.1.2)$$

We have the isomorphism of $D(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$:

$$\mathbb{L}\widetilde{f}^*(\mathcal{E}) \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \underset{5.1.1.7.1}{\xrightarrow{\sim}} \mathbb{L}\widetilde{f}^*(\mathcal{E} \otimes_{\mathcal{B}_Y} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}) \underset{4.2.5.1}{\xleftarrow{\sim}} \mathbb{L}\widetilde{f}^*(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \mathcal{E})$$
$$\xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \mathcal{E}). \quad (5.3.4.1.3)$$

By using 5.3.4.1.3 and 5.3.4.1.3, we get the isomorphism

$$\left(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^*(\mathcal{E})\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \xrightarrow{\sim} \mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathcal{E}) \quad (5.3.4.1.4)$$

Since $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \mathcal{E} \in D^-_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$ (resp. $\in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp})$), we get

$$\widetilde{f}^{(m)}_+\left(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}\widetilde{f}^*(\mathcal{E})\right) \underset{\mathbb{R}f_*(5.3.4.1.4)}{\xrightarrow{\sim}} \mathbb{R}f_*\left(\left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}\right) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} f^{-1}(\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \mathcal{E})\right)$$
$$\underset{5.1.2.6.1}{\xleftarrow{\sim}} \mathbb{R}f_*\left(\mathcal{M} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp/S^\sharp\to Y^\sharp/T^\sharp}\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp}} (\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp/T^\sharp} \otimes_{\mathcal{B}_Y} \mathcal{E}) \xrightarrow{\sim} \widetilde{f}^{(m)}_+(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathcal{E}.$$

□

5.3.5 Commutations with exterior tensor products

Let $S^\sharp$ be a nice fine log schemes over $\mathrm{Spec}(\mathbb{Z}/p^{r+1}\mathbb{Z})$ as defined in 3.1.1.1 with $r \in \mathbb{N}$. We suppose the underlying scheme S is noetherian of finite Krull dimension. Since the base scheme $S^\sharp$ is fixed, so we can remove it in the notation concerning relative object with base $S^\sharp$. If $p\colon X^\sharp \to S^\sharp$ is a morphism, by abuse of notation, we sometimes denote $p^{-1}\mathcal{O}_S$ simply by $\mathcal{O}_S$.

For $i = 1, \dots, n$, let $f_i\colon X_i^\sharp \to Y_i^\sharp$ be a quasi-separated and quasi-compact morphism of log smooth $S^\sharp$-log schemes. Set $X^\sharp := X_1^\sharp \times_{S^\sharp} X_2^\sharp \times_{S^\sharp} \cdots \times_{S^\sharp} X_n^\sharp$, $Y^\sharp := Y_1^\sharp \times_{S^\sharp} Y_2^\sharp \times_{S^\sharp} \cdots \times_{S^\sharp} Y_n^\sharp$, and $f := f_1 \times \cdots \times f_n\colon X^\sharp \to Y^\sharp$. For $i = 1, \dots, n$, let $\mathrm{pr}_i\colon X \to X_i$, $\mathrm{pr}'_i\colon Y^\sharp \to Y_i^\sharp$ be the projections. We denote by $\varpi\colon X^\sharp \to S^\sharp$ and $\varpi_i\colon X_i^\sharp \to S^\sharp$, $\varpi'\colon Y^\sharp \to S^\sharp$ and $\varpi'_i\colon Y_i^\sharp \to S^\sharp$ the structural morphisms.

For $i = 1, \dots, n$, let $\mathcal{B}_{X_i}$ (resp. $\mathcal{B}_{Y_i}$) be a commutative $\mathcal{O}_{X_i}$-algebra (resp. $\mathcal{O}_{Y_i}$-algebras) endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X_i^\sharp/S^\sharp}$-module (resp. left $\mathcal{D}^{(m)}_{Y_i^\sharp/S^\sharp}$-module). For $i = 1, \dots, n$, we suppose there exists a homomorphism of $\mathcal{O}_{Y_i}$-algebras $f_i^*\mathcal{B}_{X_i} \to \mathcal{B}_{Y_i}$ which is also $\mathcal{D}^{(m)}_{Y_i^\sharp/S^\sharp}$-linear. We set $\mathcal{B}_i := \mathrm{pr}_i^* \mathcal{B}_{X_i}$ and $\mathcal{B}'_i := \mathrm{pr}_i'^* \mathcal{B}_{Y_i}$, $\mathcal{B}_X := \mathcal{B}_1 \otimes_{\mathcal{O}_X} \cdots \otimes_{\mathcal{O}_X} \mathcal{B}_n$ and $\mathcal{B}_Y := \mathcal{B}'_1 \otimes_{\mathcal{O}_Y} \cdots \otimes_{\mathcal{O}_Y} \mathcal{B}'_n$.

We will denote by $\widetilde{\mathcal{D}}^{(m)}_{X^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} = \mathcal{B}_{X_i} \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S^\sharp}$, $\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X^\sharp/S^\sharp}$ and $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} = \mathcal{B}_{X_i} \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp/S^\sharp}$. We get the following ringed logarithmic schemes $\widetilde{X}^\sharp := (X^\sharp, \mathcal{B}_X)$, $\widetilde{X}_i^\sharp := (X_i^\sharp, \mathcal{B}_{X_i})$, $\widetilde{Y}^\sharp := (Y^\sharp, \mathcal{B}_Y)$, $\widetilde{Y}_i^\sharp := (Y_i^\sharp, \mathcal{B}_{Y_i})$. We denote by $\widetilde{\mathrm{pr}}_i\colon \widetilde{X}^\sharp/S^\sharp \to \widetilde{X_i}^\sharp/S^\sharp$, $\widetilde{\mathrm{pr}}'_i\colon \widetilde{X}'^\sharp/S^\sharp \to \widetilde{X_i'}^\sharp/S^\sharp$, $\widetilde{f}_i\colon \widetilde{X_i}^\sharp/S^\sharp \to \widetilde{Y_i}^\sharp/S^\sharp$ and $\widetilde{f}\colon \widetilde{X}^\sharp/S^\sharp \to \widetilde{Y}^\sharp/S^\sharp$ the induced morphisms of relative to $S^\sharp$ ringed logarithmic schemes and similarly the induced morphisms of ringed logarithmic schemes.

Remark 5.3.5.1. Suppose $n = 2$ and f_2 is the identity. In that case, denoting by $T^\sharp := X_2^\sharp = Y_2^\sharp$, we get the cartesian square

$$\begin{array}{ccc} X^\sharp = X_1^\sharp \times_{S^\sharp} T^\sharp & \xrightarrow{f = f_1 \times \mathrm{id}} & Y^\sharp = Y_1^\sharp \times_{S^\sharp} T^\sharp \\ \downarrow{\scriptstyle \mathrm{pr}_1} & & \downarrow{\scriptstyle \mathrm{pr}'_1} \\ X_1^\sharp & \xrightarrow{f_1} & Y_1^\sharp. \end{array} \tag{5.3.5.1.1}$$

Proposition 5.3.5.2. *For $i = 1, \dots, n$, let $\mathcal{D}_i$ be a sheaf of rings such that $(\mathcal{D}_i, \widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp})$ has the ring of resolution $\mathcal{R}$. Let $\mathcal{N}_i \in D^-(\mathcal{D}_i, \mathcal{R}, \widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp})$. With notation 5.1.5, we have the canonical isomorphism of $D^-(\boxtimes_{i\,\mathrm{top}}\mathcal{D}_i, \mathcal{R}, \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$:*

$$\mathbb{L}\widetilde{f}^*(\widetilde{\boxtimes}^{\mathbb{L}}_i \mathcal{N}_i) \xrightarrow{\sim} \widetilde{\boxtimes}^{\mathbb{L}}_i \mathbb{L}\widetilde{f}_i^*(\mathcal{N}_i).$$

Proof. This is a consequence of 5.1.5.4.3 and of the commutation of inverse images with tensor products. □

Remark 5.3.5.3. The proposition means in particular that tensor products commute with extensions of coefficients.

5.3.5.4. We recall the following fact (see [Sta22, 09T5]). Let $F\colon \mathfrak{A} \to \mathfrak{B}$ and $G\colon \mathfrak{B} \to \mathfrak{A}$ be functors of abelian categories such that F is a right adjoint to G. Let $\mathcal{M}$ be a complex of $\mathfrak{A}$ and let $\mathcal{N}$ be a complex of $\mathfrak{B}$. If $\mathbb{R}F$ is defined at $\mathcal{M}$ and $\mathbb{L}G$ is defined at $\mathcal{N}$, then there is a canonical isomorphism

$$\mathrm{Hom}_{D(\mathfrak{B})}(\mathcal{N}, \mathbb{R}F(\mathcal{M})) \xrightarrow{\sim} \mathrm{Hom}_{D(\mathfrak{A})}(\mathbb{L}G(\mathcal{N}), \mathcal{M}).$$

This isomorphism is functorial in both variables on the triangulated subcategories of $D(\mathfrak{A})$ and $D(\mathfrak{B})$ where $\mathbb{R}F$ and $\mathbb{L}G$ are defined.

5.3.5.5. Let $u\colon (U, \mathcal{O}_U) \to (V, \mathcal{O}_V)$ be a morphism of ringed spaces (or more generally ringed topoi). Let $\mathcal{M} \in \mathrm{Ob}(D(\mathcal{O}_U))$ and $\mathcal{N} \in \mathrm{Ob}(D(\mathcal{O}_V))$.

(a) Since the functors $\mathbb{R}u_*$ and $\mathbb{L}u^*$ are well defined, we get from 5.3.5.4

$$\mathrm{Hom}_{D(\mathcal{O}_V)}(\mathcal{N}, \mathbb{R}u_*(\mathcal{M})) \xrightarrow{\sim} \mathrm{Hom}_{D(\mathcal{O}_U)}(\mathbb{L}u^*(\mathcal{N}), \mathcal{M}) \tag{5.3.5.5.1}$$

bifunctorially in $\mathcal{M}$ and $\mathcal{N}$ (see [Sta22, 079W]). We get the adjunction functorial morphisms $\mathrm{adj}_{RL}(\mathcal{N})\colon \mathcal{N} \to \mathbb{R}u_*\mathbb{L}u^*(\mathcal{N})$ and $\mathrm{adj}_{LR}\colon \mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}) \to \mathcal{M}$. In fact, we can directly prove 5.3.5.5.1 and describe (which will be useful) theses adjunction morphisms as follows.

i) Let $\mathcal{P}$ be a K-flat complex of $\mathrm{Ob}(K(\mathcal{O}_V))$ endowed with a quasi-isomorphism $\mathcal{P} \to \mathcal{N}$ (we call such $\mathcal{P}$ a K-flat representation or K-flat resolution of $\mathcal{N}$). Modulo the isomorphism $Q(\mathcal{P}) \xrightarrow{\sim} \mathcal{N}$, to construct $\mathrm{adj}_{RL}(\mathcal{N})$ we reduce to build $\mathrm{adj}_{RL}(Q(\mathcal{P}))$ which is simply $Q(\mathcal{P}) \to Q(u_*u^*(\mathcal{P}) \to \mathbb{R}u_* \circ Q(u^*(\mathcal{P})) = \mathbb{R}u_* \circ \mathbb{L}u^*(Q(\mathcal{P}))$, where Q means the localisation functors $K(\mathcal{O}_U) \to D(\mathcal{O}_U)$ or $K(\mathcal{O}_V) \to D(\mathcal{O}_V)$ and where the first morphism is given by adjunction via the adjoint paire (u^*, u_*) (in the categories of complexes).

ii) Let $\mathcal{I}$ be a K-injective complex of $\mathrm{Ob}(K(\mathcal{O}_U))$ endowed with a quasi-isomorphism $\mathcal{M} \to \mathcal{I}$ (we call such $\mathcal{I}$ a K-injective representation or K-injective resolution of $\mathcal{M}$). Modulo the isomorphism $\mathcal{M} \xrightarrow{\sim} Q(\mathcal{I})$, to construct $\mathrm{adj}_{LR}(\mathcal{M})$ we reduce to build $\mathrm{adj}_{LR}(Q(\mathcal{I}))$ which is simply $\mathbb{L}u^*\mathbb{R}u_*(Q(\mathcal{I})) = \mathbb{L}u^* \circ Q(u_*(\mathcal{I})) \to Q \circ u^*(u_*(\mathcal{I})) \to Q(\mathcal{I})$ where the last morphism is given by adjunction via the adjoint paire (u^*, u_*) (in the categories of complexes).

iii) This is an easy exercice to check that check that $\mathrm{adj}_{LR}(\mathbb{L}u^*\mathcal{N}) \circ \mathbb{L}u^*(\mathrm{adj}_{RL}(\mathcal{N}))$ is the identity of $\mathbb{L}u^*\mathcal{N}$ and $\mathbb{L}u_* \,\mathrm{adj}_{LR}(\mathcal{M}) \circ \mathrm{adj}_{RL}(\mathbb{L}u_*\mathcal{M})$ is the identity of $\mathbb{L}u_*\mathcal{M}$. This yields a check of 5.3.5.5.1.

(b) For any $\mathcal{M}, \mathcal{M}' \in D(\mathcal{O}_U)$, we construct the canonical morphism of $D(\mathcal{O}_V)$:

$$\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathbb{R}u_*(\mathcal{M}') \to \mathbb{R}u_*(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathcal{M}') \tag{5.3.5.5.2}$$

bifunctorially in $\mathcal{M}, \mathcal{M}' \in \mathrm{Ob}(D(\mathcal{O}_U))$ as follows. Using 5.3.5.5.1, since tensor products commute with inverses images, we reduce to construct a canonical morphism $\mathrm{adj}_{LR} \otimes \mathrm{adj}_{LR}\colon \mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}') \to \mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathcal{M}'$, which again a consequence of 5.3.5.5.1.

(c) For any $\mathcal{M} \in D(\mathcal{O}_U)$, $\mathcal{N} \in D(\mathcal{O}_V)$, we construct the canonical morphism

$$\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathcal{N} \to \mathbb{R}u_*(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N}). \tag{5.3.5.5.3}$$

as follows. Using 5.3.5.5.1, since tensor products commute with inverses images, we reduce to construct a canonical morphism $\mathrm{adj}_{LR} \otimes \mathrm{id}\colon \mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N} \to \mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N}$, which again a consequence of 5.3.5.5.1.

(d) Let $\mathcal{M} \in D(\mathcal{O}_U)$, $\mathcal{N} \in D(\mathcal{O}_V)$, $\mathcal{I}$ be a K-injective resolution of $\mathcal{M}$, $\mathcal{Q}$ be a K-flat resolution of $\mathcal{N}$ (see [Sta22, 06YF]). Then the map 5.3.5.5.3 is equal to the composition $\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathcal{N} \xrightarrow{\sim} u_*(\mathcal{I}) \otimes_{\mathcal{O}_V} \mathcal{Q} \to u_*(\mathcal{I} \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) \to \mathbb{R}u_*(\mathcal{I} \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) \xrightarrow{\sim} \mathbb{R}u_*(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N})$. Indeed, taking $\mathcal{P}$ a K-flat object representing $u_*\mathcal{I}$, this follows from the commutativity of the diagram

$$\begin{array}{ccccccc}
\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathcal{N} & \xrightarrow{\sim} & \mathcal{P} \otimes_{\mathcal{O}_V} \mathcal{Q} & \xrightarrow{\sim} & u_*\mathcal{I} \otimes_{\mathcal{O}_V} \mathcal{Q} & \longrightarrow & u_*(\mathcal{I} \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) \\
\downarrow{\scriptstyle \mathrm{adj}_{RL}} & & \downarrow{\scriptstyle \mathrm{adj}} & & \downarrow{\scriptstyle \mathrm{adj}} & & \| \\
\mathbb{R}u_*\mathbb{L}u^*(\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathcal{N}) & \longleftarrow & u_*u^*(\mathcal{P} \otimes_{\mathcal{O}_V} \mathcal{Q}) & \longrightarrow & u_*u^*(u_*\mathcal{I} \otimes_{\mathcal{O}_V} \mathcal{Q}) & & \| \\
\downarrow & & \downarrow{\scriptstyle \sim} & & \downarrow{\scriptstyle \sim} & & \| \\
\downarrow{\scriptstyle \sim} & & u_*(u^*\mathcal{P} \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) & \longrightarrow & u_*(u^*u_*(\mathcal{I}) \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) & \xrightarrow{\mathrm{adj}} & u_*(\mathcal{I} \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) \\
\downarrow & & \downarrow & & \downarrow & & \downarrow \\
\downarrow & & \mathbb{R}u_*(u^*\mathcal{P} \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) & \longrightarrow & \mathbb{R}u_*(u^*u_*(\mathcal{I}) \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) & \xrightarrow{\mathrm{adj}} & \mathbb{R}u_*(\mathcal{I} \otimes_{\mathcal{O}_U} u^*\mathcal{Q}) \\
\downarrow & \overset{\sim}{\nearrow} & & & & & \downarrow{\scriptstyle \sim} \\
\mathbb{R}u_*(\mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N}) & & & \xrightarrow{\mathrm{adj}_{LR}} & & & \mathbb{R}u_*(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N})
\end{array} \tag{5.3.5.5.4}$$

where we have avoid writing the localisation functor of the form $Q\colon K(\mathcal{D}) \to D(\mathcal{D})$, where 5.3.5.5.3 is by definition the composition of the left and bottom arrows (to check the commutativity of the top left square or of the bottom trapeze see the explicit construction of adj_{RL} and adj_{LR} given at (a)). Hence, we get the commutativity of the canonical diagram

$$\begin{array}{ccc} \mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathcal{O}_V & \xrightarrow{5.3.5.5.3} & \mathbb{R}u_*(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{O}_V) \\ \uparrow\sim & \nearrow\sim & \\ \mathbb{R}u_*(\mathcal{M}). & & \end{array} \tag{5.3.5.5.5}$$

This yields (using standard methods) that when u is a quasi-separated and quasi-compact morphism of noetherian schemes of finite Krull dimension, the projection morphism 5.3.5.5.3 is an isomorphism for complexes with bounded above and quasi-coherent cohomology. The commutativity of 5.3.5.5.5 will be used to check the commutativity of 5.3.6.1.3.

Lemma 5.3.5.6. *Let $u\colon (U, \mathcal{O}_U) \to (V, \mathcal{O}_V)$ be a morphism of ringed spaces. For any $\mathcal{M} \in D(\mathcal{O}_U)$, the following diagram is commutative:*

$$\begin{array}{ccc} \mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathbb{R}u_*\mathbb{L}u^*(\mathcal{N}) & \xrightarrow{5.3.5.5.2} & \mathbb{R}u_*(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N}) \\ \uparrow{\scriptstyle \mathrm{id}\otimes \mathrm{adj}_{RL}} & \nearrow{\scriptstyle 5.3.5.5.3} & \\ \mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathcal{N}. & & \end{array} \tag{5.3.5.6.1}$$

Proof. Since the composition $\mathbb{L}u^*(\mathcal{N}) \stackrel{\mathrm{adj}_{RL}}{\longrightarrow} \mathbb{L}u^*\mathbb{R}u_*\mathbb{L}u^*(\mathcal{N}) \stackrel{\mathrm{adj}_{LR}}{\longrightarrow} \mathbb{L}u^*(\mathcal{N})$ is the identity, we get the commutativity of the triangle of the diagram:

$$\begin{array}{ccccc} \mathbb{L}u^*\left(\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathbb{R}u_*\mathbb{L}u^*(\mathcal{N})\right) & \xrightarrow{\sim} & \mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathbb{R}u_*\mathbb{L}u^*(\mathcal{N}) & \xrightarrow{\mathrm{adj}_{LR}\otimes \mathrm{adj}_{LR}} & \mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N} \\ \uparrow{\scriptstyle \mathrm{id}\otimes \mathrm{adj}_{RL}} & & \uparrow{\scriptstyle \mathrm{id}\otimes \mathrm{adj}_{RL}} & \nearrow{\scriptstyle \mathrm{adj}_{LR}\otimes \mathrm{id}} & \\ \mathbb{L}u^*\left(\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_V} \mathcal{N}\right) & \xrightarrow{\sim} & \mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}) \otimes^{\mathbb{L}}_{\mathcal{O}_U} \mathbb{L}u^*\mathcal{N}. & & \end{array} \tag{5.3.5.6.2}$$

By construction of both morphisms 5.3.5.5.2 and 5.3.5.5.3, from the commutative diagram 5.3.5.6.2 we get by adjointness (via 5.3.5.5.1) the commutative diagram 5.3.5.6.1. □

Lemma 5.3.5.7. *Let $u\colon (U, \mathcal{O}_U) \to (V, \mathcal{O}_V)$ be a morphism of ringed spaces. Let $\mathcal{M} \in \mathrm{Ob}(D(\mathcal{O}_U))$ and $\mathcal{N} \in \mathrm{Ob}(D(\mathcal{O}_V))$. For any $\mathcal{M} \in D(\mathcal{O}_U)$, the following commutative diagram of $D(\mathcal{O}_V)$:*

$$\begin{array}{ccc} \mathcal{N} & \xrightarrow{\mathrm{adj}_{RL}(\mathcal{N})} & \mathbb{R}u_*u^{-1}(\mathcal{N}) \\ \| & & \downarrow \\ \mathcal{N} & \xrightarrow{\mathrm{adj}_{RL}(\mathcal{N})} & \mathbb{R}u_*\mathbb{L}u^*(\mathcal{N}) \end{array}, \qquad \begin{array}{ccc} u^{-1}\mathbb{R}u_*(\mathcal{M}) & \xrightarrow{\mathrm{adj}_{LR}(\mathcal{M})} & \mathcal{M} \\ \downarrow & & \| \\ \mathbb{L}u^*\mathbb{R}u_*(\mathcal{M}) & \xrightarrow{\mathrm{adj}_{LR}(\mathcal{M})} & \mathcal{M} \end{array} \tag{5.3.5.7.1}$$

Proof. By using the explicit description of the adjunction maps adj_{RL} and adj_{LR} of 5.3.5.5.(a), this is easy. □

Lemma 5.3.5.8. *Let $u\colon (U, \mathcal{O}_U) \to (V, \mathcal{O}_V)$, $v\colon (V, \mathcal{O}_V) \to (V', \mathcal{O}_{V'})$, $v'\colon (U, \mathcal{O}_U) \to (U', \mathcal{O}_{U'})$ and $u'\colon (U', \mathcal{O}_{U'}) \to (V', \mathcal{O}_{V'})$ be some morphisms of ringed spaces such that $v \circ u = u' \circ v'$. For any $\mathcal{E}' \in D(\mathcal{O}_{U'})$, the canonical diagram*

$$\begin{array}{ccc} v^{-1}\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\mathrm{adj}} & \mathbb{R}u_*v'^{-1}(\mathcal{E}') \\ \downarrow & & \downarrow \\ \mathbb{L}v^*\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\mathrm{adj}} & \mathbb{R}u_*\mathbb{L}v'^*(\mathcal{E}') \end{array} \tag{5.3.5.8.1}$$

is commutative.

Proof. Consider the diagram

$$\begin{array}{ccccccc}
v^{-1}\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\mathrm{adj}_{RL}} & \mathbb{R}u_*u^{-1}v^{-1}\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\sim} & \mathbb{R}u_*v'^{-1}u'^{-1}\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\mathrm{adj}_{LR}} & \mathbb{R}u_*v'^{-1}(\mathcal{E}') \\
\downarrow & & \downarrow & & \downarrow & & \downarrow \\
\mathbb{L}v^*\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\mathrm{adj}_{RL}} & \mathbb{R}u_*\mathbb{L}u^*\mathbb{L}v^*\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\sim} & \mathbb{R}u_*\mathbb{L}v'^*\mathbb{L}u'^*\mathbb{R}u'_*(\mathcal{E}') & \xrightarrow{\mathrm{adj}_{LR}} & \mathbb{R}u_*\mathbb{L}v'^*(\mathcal{E}')
\end{array} \tag{5.3.5.8.2}$$

whose the composition of the top (resp. below) maps is the top (resp. below) map of the diagram 5.3.5.8.1. It follows from 5.3.5.8 that the left and right squares of 5.3.5.8.2 is commutative. The middle one is obvious. □

Lemma 5.3.5.9. *For $i = 1, \ldots, n$, we suppose $\mathcal{B}_{X_i}$ and $\mathcal{B}_{Y_i}$ are flat $\mathcal{O}_S$-algebras. For $i = 1, \ldots, n$, let $\mathcal{D}_i$ be a sheaf of $\varpi_i'^{-1}\mathcal{O}_S$-algebras.*

(a) For $i = 1, \ldots, n$, let $\mathcal{E}_i \in D^-(f_i^{-1}\mathcal{D}_i)$. Then we have the canonical morphism $\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathbb{R}f_{i*}\mathcal{E}_i) \to \mathbb{R}f_*(\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}\mathcal{E}_i)$ of $D^-(\boxtimes_{i\,\mathrm{top}}\mathcal{D}_i)$.

(b) For $i = 1, \ldots, n$, let $\mathcal{E}_i \in D^-(f_i^{-1}\mathcal{D}_i, \mathcal{B}_{X_i})$. Then the canonical morphism $\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathbb{R}f_{i*}\mathcal{E}_i) \to \mathbb{R}f_*(\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}\mathcal{E}_i)$ is also a morphism of $D^-(\boxtimes_{i\,\mathrm{top}}\mathcal{D}_i, \boxtimes_{i\,\mathrm{top}}\mathcal{B}_{Y_i})$. Moreover we have the canonical morphism $\widetilde{\boxtimes}_i^{\mathbb{L}}(\mathbb{R}f_{i*}\mathcal{E}_i) \to \mathbb{R}f_*(\widetilde{\boxtimes}_i^{\mathbb{L}}\mathcal{E}_i)$ of $D^-(\boxtimes_{i\,\mathrm{top}}\mathcal{D}_i, \mathcal{B}_Y)$ making commutative the diagram

$$\begin{array}{ccc}
\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathbb{R}f_{i*}\mathcal{E}_i) & \longrightarrow & \widetilde{\boxtimes}_i^{\mathbb{L}}(\mathbb{R}f_{i*}\mathcal{E}_i) \\
\downarrow & & \downarrow \\
\mathbb{R}f_*(\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}\mathcal{E}_i) & \longrightarrow & \mathbb{R}f_*(\widetilde{\boxtimes}_i^{\mathbb{L}}\mathcal{E}_i).
\end{array} \tag{5.3.5.9.1}$$

Proof. 0) If $\mathcal{G}_i \in D^-(\varpi_i^{-1}\mathcal{O}_S)$ (resp. $\mathcal{G}_i \in D^-(\varpi_i'^{-1}\mathcal{O}_S)$), then we set $\overset{\mathbb{L}}{\underset{i}{\otimes}}\mathcal{G}_i := \mathcal{G}_1 \otimes^{\mathbb{L}}_{\mathcal{O}_S} \mathcal{G}_2 \otimes^{\mathbb{L}}_{\mathcal{O}_S} \cdots \otimes^{\mathbb{L}}_{\mathcal{O}_S} \mathcal{G}_n$.

a) By applying 5.3.5.5.2 to the morphism of ringed spaces $(X, \varpi^{-1}\mathcal{O}_S) \to (Y, \varpi'^{-1}\mathcal{O}_S)$, we get the morphism $\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{R}f_*\,\mathrm{pr}_i^{-1}\mathcal{E}_i) \to \mathbb{R}f_*\left(\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathrm{pr}_i^{-1}\mathcal{E}_i)\right)$. By functoriality, since $\mathrm{pr}_i^{-1}\mathcal{E}_i \in D^-(f^{-1}\,\mathrm{pr}_i'^{-1}\mathcal{D}_i, \varpi^{-1}\mathcal{O}_S)$ this latter morphism belongs to $D^-(\boxtimes_{i\,\mathrm{top}}\mathcal{D}_i)$.

b) Similarly, by applying 5.3.5.5.2 we get the morphisms $\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{R}f_*\,\mathrm{pr}_i^{-1}\mathcal{E}_i) \to \mathbb{R}f_*\left(\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathrm{pr}_i^{-1}\mathcal{E}_i)\right)$ and $\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{R}f_*\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i) \to \mathbb{R}f_*\left(\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i)\right)$ of $D^-(\boxtimes_{i\,\mathrm{top}}\mathcal{D}_i, \boxtimes_{i\,\mathrm{top}}\mathcal{B}_{Y_i})$. Finally, by applying 5.3.5.5.2 to the morphism $X \to Y$, we get the morphisms $\underset{\mathcal{B}_Y}{\otimes}^{\mathbb{L}}(\mathbb{R}f_*\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i) \to \mathbb{R}f_*\left(\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i)\right)$ of $D^-(\boxtimes_{i\,\mathrm{top}}\mathcal{D}_i, \mathcal{B}_Y)$.

1) The canonical morphism $\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathbb{R}f_{i*}\mathcal{E}_i) \to \mathbb{R}f_*\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathcal{E}_i)$ (resp. $\widetilde{\boxtimes}_i^{\mathbb{L}}(\mathbb{R}f_{i*}\mathcal{E}_i) \to \mathbb{R}f_*(\widetilde{\boxtimes}_i^{\mathbb{L}}\mathcal{E}_i)$ is by definition is the one making commutative the right (resp. left) rectangle of the diagram 5.3.5.9.2 below:

$$\begin{array}{ccccccccc}
\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathbb{R}f_{i*}\mathcal{E}_i) & \xrightarrow[5.1.5.4.2]{\sim} & \overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathrm{pr}_i'^{-1}\mathbb{R}f_{i*}\mathcal{E}_i) & \longrightarrow & \overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{L}\widetilde{\mathrm{pr}}_i'^*\mathbb{R}f_{i*}\mathcal{E}_i) & \longrightarrow & \overset{\mathbb{L}}{\underset{\mathcal{B}_Y}{\otimes}}(\mathbb{L}\widetilde{\mathrm{pr}}_i'^*\mathbb{R}f_{i*}\mathcal{E}_i) & \xrightarrow{\sim} & \widetilde{\boxtimes}_i^{\mathbb{L}}(\mathbb{R}f_{i*}\mathcal{E}_i) \\
\vdots & & \downarrow{\scriptstyle \mathrm{adj}} & & \downarrow{\scriptstyle \mathrm{adj}} & & \downarrow{\scriptstyle \mathrm{adj}} & & \vdots \\
 & & \overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{R}f_*\,\mathrm{pr}_i^{-1}\mathcal{E}_i) & \longrightarrow & \overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{R}f_*\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i) & \longrightarrow & \overset{\mathbb{L}}{\underset{\mathcal{B}_Y}{\otimes}}(\mathbb{R}f_*\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i) & & \\
\vdots & & \downarrow{\scriptstyle 5.3.5.5.2} & & \downarrow{\scriptstyle 5.3.5.5.2} & & \downarrow{\scriptstyle 5.3.5.5.2} & & \vdots \\
\mathbb{R}f_*\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathcal{E}_i) & \xrightarrow[5.1.5.4.2]{\sim} & \mathbb{R}f_*\left(\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathrm{pr}_i^{-1}\mathcal{E}_i)\right) & \longrightarrow & \mathbb{R}f_*\left(\overset{\mathbb{L}}{\underset{i}{\otimes}}(\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i)\right) & \longrightarrow & \mathbb{R}f_*\left(\overset{\mathbb{L}}{\underset{\mathcal{B}_X}{\otimes}}(\mathbb{L}\widetilde{\mathrm{pr}}_i^*\mathcal{E}_i)\right) & \xrightarrow{\sim} & \widetilde{\boxtimes}_i^{\mathbb{L}}(\mathbb{R}f_{i*}\mathcal{E}_i)
\end{array} \tag{5.3.5.9.2}$$

Using 5.3.5.8, we get the commutativity of the top left square. We check the commutativity of the bottom right square by construction of both vertical arrows. The other squares are commutative by functoriality. Since the right and left rectangles are commutative by definition, then the diagram 5.3.5.9.2 is commutative. Finally, the composition of the top (resp. bottom) morphisms of 5.3.5.9.2 is the canonical morphism $\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathbb{R}f_{i*}\mathcal{E}_i) \to \widetilde{\boxtimes}_i^{\mathbb{L}}(\mathbb{R}f_{i*}\mathcal{E}_i)$ (resp. $\mathbb{R}f_*\widetilde{\boxtimes}^{\mathbb{L}}_{i\,\mathrm{top}}(\mathcal{E}_i) \to \widetilde{\boxtimes}_i^{\mathbb{L}}(\mathbb{R}f_{i*}\mathcal{E}_i)$). □

5.3.5.10. By flatness, the morphism $\widetilde{\boxtimes}_i^{\mathbb{L}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp} \to \widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp}$ is an isomorphism. We have by functoriality the canonical isomorphism of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}, f^{-1}\boxtimes_{i\,\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp})$-bimodules

$$\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp} = \widetilde{\boxtimes}_i\widetilde{f}_i^*(\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp} \underset{5.3.5.2}{\xrightarrow{\sim}} \widetilde{f}^*(\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp}, \tag{5.3.5.10.1}$$

where the last isomorphism is a consequence of the canonical isomorphism $\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp}$ (see 5.1.5.2.3). This yields a canonical structure of $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp})$-bimodule on $\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp}$ making $(\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}, f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp})$-bilinear the composite isomorphism 5.3.5.10.1.

Similarly, by flatness, the morphism $\widetilde{\boxtimes}_i^{\mathbb{L}}\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp\leftarrow X_i^\sharp} \to \widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp\leftarrow X_i^\sharp}$ is an isomorphism. Moreover, using 5.1.5.9, we get by functoriality the canonical isomorphism of $(f^{-1}\boxtimes_{i\,\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp})$-bimodules

$$\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp\leftarrow X_i^\sharp} = \widetilde{\boxtimes}_i\left(\widetilde{\omega}_{X_i^\sharp}\otimes_{\mathcal{B}_{X_i}}\widetilde{f}_i^*(\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp}\otimes_{\mathcal{B}_{Y_i}}\omega_{Y_i}^{-1})\right) \underset{5.3.5.2}{\xrightarrow{\sim}} \omega_X\otimes_{\mathcal{B}_X}\widetilde{f}^*(\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp}\otimes_{\mathcal{B}_Y}\omega_{Y^\sharp}^{-1}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp\leftarrow X^\sharp}, \tag{5.3.5.10.2}$$

where the last isomorphism is a consequence of the canonical isomorphism $\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y^\sharp}$ (see 5.1.5.2.3). This yields a canonical structure of $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp})$-bimodule on $\widetilde{\boxtimes}_i\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp\leftarrow X_i^\sharp}$ making $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y^\sharp}, \widetilde{\mathcal{D}}^{(m)}_{X^\sharp})$-bilinear the composite isomorphism 5.3.5.10.2.

Theorem 5.3.5.11. *Suppose $\mathcal{B}_{X_i} = \mathcal{O}_{X_i}$ and $\mathcal{B}_{Y_i} = \mathcal{O}_{Y_i}$ for any $i = 1, \ldots, n$ and suppose $\mathcal{E}_i \in D^-_{\mathrm{qc}}({}^*\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$. The canonical morphism of 5.3.5.9*

$$\boxtimes_i^{\mathbb{L}}\,\mathbb{R}f_{i*}(\mathcal{E}_i) \to \mathbb{R}f_*(\boxtimes_i^{\mathbb{L}}\mathcal{E}_i). \tag{5.3.5.11.1}$$

is an isomorphism.

Proof. i) By construction of the morphism 5.3.5.11.1 (i.e. the one making commutative the right rectangle of 5.3.5.9.2), we reduce to the case where $n = 2$. We have to check that the composition

$$\mathrm{pr}_1'^*\,\mathbb{R}f_{1*}(\mathcal{E}_1)\otimes^{\mathbb{L}}_{\mathcal{B}_Y}\mathrm{pr}_2'^*\,\mathbb{R}f_{2*}\mathcal{E}_2 \to \mathbb{R}f_*\,\mathrm{pr}_1^*(\mathcal{E}_1)\otimes^{\mathbb{L}}_{\mathcal{B}_Y}\mathbb{R}f_*\,\mathrm{pr}_2^*\,\mathcal{E}_2 \to \mathbb{R}f_*(\mathrm{pr}_1^*(\mathcal{E}_1)\otimes^{\mathbb{L}}_{\mathcal{B}_X}\mathrm{pr}_2^*\,\mathcal{E}_2) \tag{5.3.5.11.2}$$

is an isomorphism.

ii) We reduce to the case where $f_2 = \mathrm{id}$ as follows. Consider the commutative diagram

$$\begin{array}{ccccc}
X_1 & \xleftarrow{\mathrm{pr}_1} & X = X_1\times X_2 & \xrightarrow{\mathrm{pr}_2} & X_2 \\
\| & & \downarrow{\scriptstyle g_2:=\mathrm{id}\times f_2} & & \downarrow{\scriptstyle f_2} \\
X_1 & \xleftarrow{\mathrm{pr}_1''} & Y' := X_1\times Y_2 & \xrightarrow{\mathrm{pr}_2''} & X_2 \\
\downarrow{\scriptstyle f_1} & & \downarrow{\scriptstyle g_1:=f_1\times\mathrm{id}} & & \| \\
Y_1 & \xleftarrow{\mathrm{pr}_1'} & Y := Y_1\times Y_2 & \xrightarrow{\mathrm{pr}_2'} & X_2.
\end{array} \tag{5.3.5.11.3}$$

By adjointness with respect to the left bottom square of 5.3.5.11.3 (resp. the left top square of 5.3.5.11.3) we get the morphism $\mathrm{pr}_1'^*\,\mathbb{R}f_{1*}(\mathcal{E}_1) \xrightarrow{\mathrm{adj}} \mathbb{R}g_{1*}\,\mathrm{pr}_1''^*(\mathcal{E}_1)$ and $\mathrm{pr}_1''^*(\mathcal{E}_1) = \mathrm{pr}_1''^*\,\mathrm{id}_*(\mathcal{E}_1) \xrightarrow{\mathrm{adj}} \mathbb{R}g_{2*}\,\mathrm{pr}_1^*(\mathcal{E}_1)$. By transitivity, we get that the composition $\mathrm{pr}_1'^*\,\mathbb{R}f_{1*}(\mathcal{E}_1) \xrightarrow{\mathrm{adj}} \mathbb{R}g_{1*}\,\mathrm{pr}_1''^*(\mathcal{E}_1) \xrightarrow{\mathrm{adj}} \mathbb{R}g_{1*}\mathbb{R}g_{2*}\,\mathrm{pr}_1^*(\mathcal{E}_1) \xrightarrow{\sim} \mathbb{R}f_*\,\mathrm{pr}_1^*(\mathcal{E}_1)$ is the adjoint morphism with respect to the left rectangle of 5.3.5.11.3 (i.e. the composite of both left squares). Similarly, we get by transitivity that the composition $\mathrm{pr}_2'^*\,\mathbb{R}f_{2*}\mathcal{E}_2 \xrightarrow{\mathrm{adj}}$

$\mathbb{R}g_{1*}\,\mathrm{pr}_2''^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 \xrightarrow{\mathrm{adj}} \mathbb{R}g_{1*}\mathbb{R}g_{2*}\,\mathrm{pr}_2^{*}\,\mathcal{E}_2 \xrightarrow{\sim} \mathbb{R}f_{*}\,\mathrm{pr}_2^{*}\,\mathcal{E}_2$ is the adjoint morphism. This yields the commutativity of the top left square of the following diagram:

$$\begin{array}{ccccc}
\mathrm{pr}_1'^{*}\,\mathbb{R}f_{1*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_Y}{\otimes}} \mathrm{pr}_2'^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 & \xrightarrow{\mathrm{adj}} & \mathbb{R}g_{1*}\,\mathrm{pr}_1''^{*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_Y}{\otimes}} \mathbb{R}g_{1*}\,\mathrm{pr}_2''^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 & \xrightarrow{5.3.5.5.2} & \mathbb{R}g_{1*}\left(\mathrm{pr}_1''^{*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_{Y'}}{\otimes}} \mathrm{pr}_2''^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2\right) \\
\downarrow{\scriptstyle \mathrm{adj}} & & \downarrow{\scriptstyle \mathrm{adj}} & & \downarrow{\scriptstyle \mathrm{adj}} \\
\mathbb{R}f_{*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_Y}{\otimes}} \mathbb{R}f_{*}\,\mathrm{pr}_2^{*}\,\mathcal{E}_2 & \xrightarrow{\sim} & \mathbb{R}g_{1*}\mathbb{R}g_{2*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_Y}{\otimes}} \mathbb{R}g_{1*}\mathbb{R}g_{2*}\,\mathrm{pr}_2^{*}\,\mathcal{E}_2 & \xrightarrow{5.3.5.5.2} & \mathbb{R}g_{1*}\left(\mathbb{R}g_{2*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_{Y'}}{\otimes}} \mathbb{R}g_{2*}\,\mathrm{pr}_2^{*}\,\mathcal{E}_2\right) \\
\downarrow{\scriptstyle 5.3.5.5.2} & & & & \downarrow{\scriptstyle 5.3.5.5.2} \\
\mathbb{R}f_{*}\left(\mathrm{pr}_1^{*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_X}{\otimes}} \mathrm{pr}_2^{*}\,\mathcal{E}_2\right) & & \xrightarrow{\qquad\sim\qquad} & & \mathbb{R}g_{1*}\mathbb{R}g_{2*}\left(\mathrm{pr}_1^{*}(\mathcal{E}_1) \overset{\mathbb{L}}{\underset{\mathcal{B}_X}{\otimes}} \mathrm{pr}_2^{*}\,\mathcal{E}_2\right)
\end{array} \tag{5.3.5.11.4}$$

By transitivity of the morphism of the form 5.3.5.5.2, we get the commutativity of the bottom rectangle. The top right square is commutative by functoriality. Hence, 5.3.5.11.4 is commutative. By stability of the quasi-coherence under (topological) pushforwards, $\mathbb{R}f_{2*}\mathcal{E}_2$ is quasi-coherent. Hence, the case where f_1 or f_2 is the identity implies the general case. By symmetry, we can suppose $f_2 = \mathrm{id}$.

iii) Consider the commutative diagram

$$\begin{array}{ccccc}
\mathrm{pr}_1'^{*}\,\mathbb{R}f_{1*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathrm{pr}_2'^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 & \longrightarrow & \mathbb{R}f_{*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_{*}\,\mathrm{pr}_2^{*}\,\mathcal{E}_2 & \longrightarrow & \mathbb{R}f_{*}(\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathrm{pr}_2^{*}\,\mathcal{E}_2) \\
\downarrow{\scriptstyle \sim} & \nearrow & \uparrow & & \uparrow \\
\mathbb{R}f_{*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathrm{pr}_2'^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 & & \mathbb{R}f_{*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_{*}\,\mathrm{pr}_2^{*}\,\mathbb{L}f_2^{*}\mathbb{R}f_{2*}\mathcal{E}_2 & \longrightarrow & \mathbb{R}f_{*}(\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathrm{pr}_2^{*}\,\mathbb{L}f_2^{*}\mathbb{R}f_{2*}\mathcal{E}_2) \\
\| & & \uparrow{\scriptstyle \sim} & & \uparrow{\scriptstyle \sim} \\
\mathbb{R}f_{*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathrm{pr}_2'^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 & \xrightarrow{\mathrm{id}\otimes\mathrm{adj}} & \mathbb{R}f_{*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_Y} \mathbb{R}f_{*}\mathbb{L}f^{*}\,\mathrm{pr}_2'^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 & \xrightarrow{5.3.5.5.2} & \mathbb{R}f_{*}(\mathrm{pr}_1^{*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{L}f^{*}\,\mathrm{pr}_2'^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2)
\end{array} \tag{5.3.5.11.5}$$

where the top horizontal morphisms are 5.3.5.11.2, where the left vertical isomorphism is induced by the base change morphism $\mathrm{pr}_1'^{*}\,\mathbb{R}f_{1*}(\mathcal{E}_1) \to \mathbb{R}f_{*}\,\mathrm{pr}_1^{*}(\mathcal{E}_1)$ which is in our case an isomorphism (see [Har66, II.5.12]), where the trapeze is commutative by construction of the base change isomorphism $\mathrm{pr}_2'^{*}\,\mathbb{R}f_{2*}\mathcal{E}_2 \xrightarrow{\sim} \mathbb{R}f_{*}\,\mathrm{pr}_2^{*}\,\mathcal{E}_2$, where the composition of the bottom horizontal morphisms is the projection morphism and hence is an isomorphism (see 5.3.5.6). Since $f_2 = \mathrm{id}$, then the top middle and right vertical arrows are identity morphisms. Hence, the composition of the top arrows of the diagram 5.3.5.11.5 is an isomorphism. □

Notation 5.3.5.12. Let $\mathcal{M}_i \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$. We denote by $\mathrm{T}_{f_i} : \mathbb{R}f_{i,*}(\mathcal{M}_i) \to \mathbb{R}f_{i,*}(\mathcal{M}_i \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp \to Y_i^\sharp}) = \widetilde{f}^{(m)}_{i,+}(\mathcal{M}_i)$, the morphism induced by the canonical homomorphism $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp} \to \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp \to Y_i^\sharp}$ (see 4.4.2.6.3).

Theorem 5.3.5.13. *For $i = 1, \ldots, n$, let $\mathcal{E}_i \in D^{-}({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$, with $* = r$ or $* = l$.*

(a) We have the canonical homomorphism of $D^{-}({}^{*}\mathcal{D}^{(m)}_{Y^\sharp})$:

$$\widetilde{\boxtimes}^{\mathbb{L}}_{i}\, \widetilde{f}^{(m)}_{i+}(\mathcal{E}_i) \to \widetilde{f}^{(m)}_{+}(\widetilde{\boxtimes}^{\mathbb{L}}_{i}\, \mathcal{E}_i) \tag{5.3.5.13.1}$$

(b) Suppose $\mathcal{B}_{X_i} = \mathcal{O}_{X_i}$ and $\mathcal{B}_{Y_i} = \mathcal{O}_{Y_i}$ for any $i = 1, \ldots, n$ and suppose $\mathcal{E}_i \in D^{-}_{\mathrm{qc}}({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp})$. The homomorphism 5.3.5.13.1 is therefore an isomorphism making commutative the canonical diagram

$$\begin{array}{ccccc}
\boxtimes^{\mathbb{L}}_{\mathrm{top}\, i}(\mathbb{R}f_{i*}\mathcal{E}_i) & \longrightarrow & \boxtimes^{\mathbb{L}}_{i}\, \mathbb{R}f_{i*}(\mathcal{E}_i) & \xrightarrow[5.3.5.12]{\boxtimes^{\mathbb{L}}_{i}\mathrm{T}_{f_i}} & \boxtimes^{\mathbb{L}}_{i}\, \widetilde{f}^{(m)}_{i+}(\mathcal{E}_i) \\
\downarrow & & \downarrow{\scriptstyle 5.3.5.11.1} & & \downarrow{\scriptstyle \sim} \\
\mathbb{R}f_{*}(\boxtimes^{\mathbb{L}}_{\mathrm{top}\, i}\mathcal{E}_i) & \longrightarrow & \mathbb{R}f_{*}(\boxtimes^{\mathbb{L}}_{i}\mathcal{E}_i) & \xrightarrow[5.3.5.12]{\mathrm{T}_f} & \widetilde{f}^{(m)}_{+}(\boxtimes^{\mathbb{L}}_{i}\mathcal{E}_i).
\end{array} \tag{5.3.5.13.2}$$

Proof. 0) To get 5.3.5.13.1, since the case where $* = l$ is a consequence of the case suppose $* = r$ we can prove the whole theorem in the case where $*=$ r.

I) 1) We have the morphisms of $D^-({}^{\mathrm{r}} \underset{i}{\boxtimes}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp})$:

$$\overset{\mathbb{L}}{\underset{i}{\boxtimes}}{}_{\mathrm{top}}\mathbb{R}f_{i*}(\mathcal{E}_i \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp}) \underset{5.3.5.9.a}{\longrightarrow} \mathbb{R}f_*\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}_{\mathrm{top}}(\mathcal{E}_i \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp}) \underset{5.1.5.7.2}{\xrightarrow{\sim}} \mathbb{R}f_*\left(\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}_{\mathrm{top}}\mathcal{E}_i \otimes^{\mathbb{L}}_{\underset{i}{\boxtimes}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \underset{i}{\boxtimes}{}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp}\right)$$

$$\to \mathbb{R}f_*\left(\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}\mathcal{E}_i \otimes^{\mathbb{L}}_{\underset{i}{\widetilde{\boxtimes}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \underset{i}{\widetilde{\boxtimes}}\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp}\right) \underset{5.3.5.10.1}{\xrightarrow{\sim}} \mathbb{R}f_*\left(\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}\mathcal{E}_i \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X^\sharp\to Y^\sharp}\right) = f^{(m)}_+(\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}\mathcal{E}_i)$$

Since $f^{(m)}_+(\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}\mathcal{E}_i) \in D^-({}^{\mathrm{r}}\mathcal{D}^{(m)}_{Y^\sharp})$, this yields the morphism of $D^-({}^{\mathrm{r}}\mathcal{D}^{(m)}_{Y^\sharp})$:

$$\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}\widetilde{f}^{(m)}_{i+}(\mathcal{E}_i) = \widetilde{\mathcal{D}}^{(m)}_{Y} \otimes_{\underset{i}{\boxtimes}_{\mathrm{top}}\widetilde{\mathcal{D}}^{(m)}_{Y_i^\sharp}} \overset{\mathbb{L}}{\underset{i}{\boxtimes}}{}_{\mathrm{top}}\mathbb{R}f_{i*}(\mathcal{E}_i \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}} \widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp\to Y_i^\sharp}) \to \widetilde{f}^{(m)}_+(\underset{i}{\widetilde{\boxtimes}}{}^{\mathbb{L}}\mathcal{E}_i). \tag{5.3.5.13.3}$$

Since the left square is commutative (see 5.3.5.9.1), to check the commutativity of the diagram 5.3.5.13.2, we notice it is enough to check the commutativity of the outer. This latter fact is easy.

II) It remains to check the morphism const ructed at the step I.1) is an isomorphism. Using [Har66, I.7.1.(i)], we reduce to the case where $\mathcal{E}_i$ is a quasi-coherent $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module. We remark that such a $\mathcal{E}_i$ is a quotient of a $\widetilde{\mathcal{D}}^{(m)}_{X_i^\sharp}$-module of the form $\mathcal{L}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp}$, where $\mathcal{L}_i$ is a quasi-coherent $\mathcal{O}_{X_i}$-module (e.g. take $\mathcal{L}_i = \mathcal{E}_i$). Since both functors of 5.3.5.13.2 are way-out right, using [Har66, I.7.1.(iv)] we reduce to the case where $\mathcal{E}_i = \mathcal{L}_i \otimes_{\mathcal{O}_{X_i}} \mathcal{D}^{(m)}_{X_i^\sharp}$.

3) To simplify notation, put $\overset{\mathbb{L}}{\underset{\mathrm{top}}{\boxtimes}} := \overset{\mathbb{L}}{\underset{i}{\boxtimes}}{}^{\mathrm{top}}$, $\mathcal{M}_i := \mathcal{D}^{(m)}_{X_i^\sharp\to Y_i^\sharp}$, $\mathcal{D}_i := \mathcal{D}^{(m)}_{X_i^\sharp}$, $\mathcal{O}_{X_i} := \mathcal{O}_i$, $\mathcal{D}'_i := \mathcal{D}^{(m)}_{Y_i^\sharp}$, $\mathcal{O}'_i := \mathcal{O}_{Y_i}$. Since $\underset{i}{\boxtimes}{}^{\mathrm{top}} f_i^{-1}\mathcal{D}^{(m)}_{Y_i^\sharp} = f^{-1}\underset{i}{\boxtimes}{}^{\mathrm{top}}\mathcal{D}^{(m)}_{Y_i^\sharp}$, we get the the following diagram in the category $D^-(f^{-1}\underset{i}{\boxtimes}{}^{\mathrm{top}}\mathcal{D}^{(m)}_{Y_i^\sharp}, \mathcal{O}_X)$:

$$\begin{array}{ccccc}
\overset{\mathbb{L}}{\underset{\mathrm{top}}{\boxtimes}}\big((\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{M}_i\big) & \underset{5.1.5.7.2}{\xrightarrow{\sim}} \overset{\mathbb{L}}{\underset{\mathrm{top}}{\boxtimes}}(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\underset{\mathrm{top}}{\boxtimes}\mathcal{D}_i} \underset{\mathrm{top}}{\boxtimes}\mathcal{M}_i & \underset{5.1.5.7.1}{\xrightarrow{\sim}} & (\overset{\mathbb{L}}{\underset{\mathrm{top}}{\boxtimes}}\mathcal{L}_i \otimes_{\underset{\mathrm{top}}{\boxtimes}\mathcal{O}_i} \underset{\mathrm{top}}{\boxtimes}\mathcal{D}_i) \otimes^{\mathbb{L}}_{\underset{\mathrm{top}}{\boxtimes}\mathcal{D}_i} \underset{\mathrm{top}}{\boxtimes}\mathcal{M}_i \\
\downarrow\sim & & & \downarrow\sim \\
\overset{\mathbb{L}}{\underset{\mathrm{top}}{\boxtimes}}(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{M}_i) & \xrightarrow[5.1.5.7.1]{\sim} & & \underset{\mathrm{top}}{\boxtimes}\mathcal{L}_i \otimes_{\underset{\mathrm{top}}{\boxtimes}\mathcal{O}_i} \overset{\mathbb{L}}{\underset{\mathrm{top}}{\boxtimes}}\mathcal{M}_i \\
\downarrow & & & \downarrow \\
\overset{\mathbb{L}}{\underset{i}{\boxtimes}}(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{M}_i) & \xrightarrow[5.1.5.8.2]{\sim} & & \underset{i}{\boxtimes}\mathcal{L}_i \otimes_{\underset{i}{\boxtimes}\mathcal{O}_i} \overset{\mathbb{L}}{\underset{i}{\boxtimes}}\mathcal{M}_i.
\end{array} \tag{5.3.5.13.4}$$

Using 5.1.5.8.1, we get the commutativity of the bottom rectangle. The commutativity of the top rectangle is straightforward. Consider now the following diagram:

$$\begin{array}{ccccc}
\overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}}(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_{\mathrm{top}} \mathcal{D}_i} \boxtimes_{\mathrm{top}} \mathcal{M}_i & \longrightarrow & \overset{\mathbb{L}}{\boxtimes}_{i}(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_{\mathrm{top}} \mathcal{D}_i} \boxtimes_{\mathrm{top}} \mathcal{M}_i & \longrightarrow & \overset{\mathbb{L}}{\boxtimes}_{i}(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_i \mathcal{D}_i} \boxtimes_i \mathcal{M}_i \\
{\scriptstyle 5.1.5.7.1}\downarrow\wr & & {\scriptstyle 5.1.5.8.2}\downarrow\wr & & \downarrow\wr \\
(\boxtimes_{\mathrm{top}} \mathcal{L}_i \otimes_{\boxtimes_{\mathrm{top}} \mathcal{O}_i} \overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_{\mathrm{top}} \mathcal{D}_i} \boxtimes_{\mathrm{top}} \mathcal{M}_i & \longrightarrow & (\boxtimes_i \mathcal{L}_i \otimes_{\boxtimes_i \mathcal{O}_i} \overset{\mathbb{L}}{\boxtimes}_i \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_{\mathrm{top}} \mathcal{D}_i} \boxtimes_{\mathrm{top}} \mathcal{M}_i & \longrightarrow & (\boxtimes_i \mathcal{L}_i \otimes_{\boxtimes_i \mathcal{O}_i} \overset{\mathbb{L}}{\boxtimes}_i \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_i \mathcal{D}_i} \boxtimes_i \mathcal{M}_i \\
\downarrow\wr & & & & \downarrow\wr \\
\boxtimes_{\mathrm{top}} \mathcal{L}_i \otimes_{\boxtimes_{\mathrm{top}} \mathcal{O}_i} \overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}} \mathcal{M}_i & & \longrightarrow & & \boxtimes_i \mathcal{L}_i \otimes_{\boxtimes_i \mathcal{O}_i} \overset{\mathbb{L}}{\boxtimes}_i \mathcal{M}_i .
\end{array} \tag{5.3.5.13.5}$$

The left top square is commutative because of that of 5.1.5.8.1. The right top square is commutative by functoriality. Taking $\mathcal{O}_{X_i}$-flat resolutions of $\mathcal{L}_i$, we check the commutativity of the bottom rectangle.

Compositing both diagrams 5.3.5.13.4 and 5.3.5.13.5, we get the commutative diagram

$$\begin{array}{ccc}
\overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}} \big((\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{M}_i\big) & \longrightarrow & \overset{\mathbb{L}}{\boxtimes}_i(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_i \mathcal{D}_i} \boxtimes_i \mathcal{M}_i \\
\downarrow\wr & & \downarrow\wr \\
\overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}}(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{M}_i) & & (\boxtimes_i \mathcal{L}_i \otimes_{\boxtimes_i \mathcal{O}_i} \overset{\mathbb{L}}{\boxtimes}_i \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_i \mathcal{D}_i} \boxtimes_i \mathcal{M}_i \\
\downarrow & & \downarrow\wr \\
\overset{\mathbb{L}}{\boxtimes}_i(\mathcal{L}_i \otimes_{\mathcal{O}_i} \mathcal{M}_i) & \underset{5.1.5.8.2}{\overset{\sim}{\longrightarrow}} & \boxtimes_i \mathcal{L}_i \otimes_{\boxtimes_i \mathcal{O}_i} \overset{\mathbb{L}}{\boxtimes}_i \mathcal{M}_i ,
\end{array} \tag{5.3.5.13.6}$$

where the top arrow is the composite of the left top horizontal arrow of 5.3.5.13.4 with top horizontal arrows of 5.3.5.13.5. We get from the commutativity of 5.3.5.13.6 that of the right rectangle of the diagram 5.3.5.13.7 below:

$$\begin{array}{ccccc}
\overset{\mathbb{L}}{\boxtimes}_i f^{(m)}_{i+}(\mathcal{E}_i) & & \longrightarrow & & f^{(m)}_{+}(\overset{\mathbb{L}}{\boxtimes}_i \mathcal{E}_i) \\
\| & & & & \uparrow\wr\, {\scriptstyle 5.3.5.10.1} \\
\overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}} \mathbb{R} f_{i*}((\mathcal{L}_i \underset{\mathcal{O}_i}{\otimes} \mathcal{D}_i) \overset{\mathbb{L}}{\underset{\mathcal{D}_i}{\otimes}} \mathcal{M}_i) \underset{\boxtimes_{\mathrm{top}} \mathcal{D}'_i}{\otimes} \mathcal{D}' & \xrightarrow{5.3.5.9.a} & \mathbb{R} f_* \overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}} \left((\mathcal{L}_i \underset{\mathcal{O}_i}{\otimes} \mathcal{D}_i) \overset{\mathbb{L}}{\underset{\mathcal{D}_i}{\otimes}} \mathcal{M}_i\right) \underset{\boxtimes_{\mathrm{top}} \mathcal{D}'_i}{\otimes} \mathcal{D}' & \longrightarrow & \mathbb{R} f_* \left(\overset{\mathbb{L}}{\boxtimes}_i(\mathcal{L}_i \underset{\mathcal{O}_i}{\otimes} \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_i \mathcal{D}_i} \boxtimes_i \mathcal{M}_i\right) \\
\downarrow\wr & & \downarrow\wr & & \downarrow\wr \\
\overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}} \mathbb{R} f_{i*}(\mathcal{L}_i \underset{\mathcal{O}_i}{\otimes} \mathcal{M}_i) \underset{\boxtimes_{\mathrm{top}} \mathcal{D}'_i}{\otimes} \mathcal{D}' & \xrightarrow{5.3.5.9.a} & \mathbb{R} f_* \overset{\mathbb{L}}{\boxtimes}_{\mathrm{top}} (\mathcal{L}_i \underset{\mathcal{O}_i}{\otimes} \mathcal{M}_i) \underset{\boxtimes_{\mathrm{top}} \mathcal{D}'_i}{\otimes} \mathcal{D}' & & \mathbb{R} f_* \left((\boxtimes_i \mathcal{L}_i \underset{\boxtimes_i \mathcal{O}_i}{\otimes} \overset{\mathbb{L}}{\boxtimes}_i \mathcal{D}_i) \otimes^{\mathbb{L}}_{\boxtimes_i \mathcal{D}_i} \boxtimes_i \mathcal{M}_i\right) \\
\uparrow\wr & & \downarrow\wr & & \downarrow\wr \\
\overset{\mathbb{L}}{\boxtimes}_i \mathbb{R} f_{i*}(\mathcal{L}_i \underset{\mathcal{O}_i}{\otimes} \mathcal{M}_i) & \xrightarrow{5.3.5.9.b} & \mathbb{R} f_* \overset{\mathbb{L}}{\boxtimes}_i (\mathcal{L}_i \underset{\mathcal{O}_i}{\otimes} \mathcal{M}_i) & \xrightarrow{\sim} & \mathbb{R} f_* (\boxtimes_i \mathcal{L}_i \underset{\boxtimes_i \mathcal{O}_i}{\otimes} \overset{\mathbb{L}}{\boxtimes}_i \mathcal{M}_i).
\end{array} \tag{5.3.5.13.7}$$

The commutativity of the top rectangle is by construction of the top arrow (see 5.3.5.13.3). The commutativity of the top square is checked by functoriality. Using the commutativity of the diagram 5.3.5.9.1, we obtain the commutativity of the bottom square of 5.3.5.13.7. Hence, the diagram 5.3.5.13.7 is commutative. Following Theorem 5.3.5.11, the left bottom morphism is an isomorphism. Hence, using the commutativity of the diagram 5.3.5.13.7, this yields that the top morphism is an isomorphism. □

5.3.6 Base change in the projection case

We keep notation 5.3.5 and we suppose $n = 2$ and f_2 is the identity.

Proposition 5.3.6.1. *For any $\mathcal{E}_1 \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_{X_1})$, we have the canonical isomorphism $pr_1'^{(m)!} \circ f^{(m)}_{1,+}(\mathcal{E}_1) \xrightarrow{\sim} f^{(m)}_{+} \circ pr_1^{(m)!}(\mathcal{E}_1)$ of $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_{Y})$ making commutative the diagram*

$$\begin{array}{ccc} pr_1'^* \circ \mathbb{R}f_{1,*}(\mathcal{E}_1) & \xrightarrow{\sim} & \mathbb{R}f_* \circ pr_1^*(\mathcal{E}_1) \\ \downarrow & & \downarrow \\ pr_1'^* \circ f^{(m)}_{1,+}(\mathcal{E}_1) & \xrightarrow{\sim} & f^{(m)}_{+} \circ pr_1^*(\mathcal{E}_1), \end{array} \tag{5.3.6.1.1}$$

where the top isomorphism is the usual base change isomorphism.

Proof. This is an easy consequence of Theorem 5.3.5.13. Indeed, with notation 5.3.5.1, recall $pr_1^{(m)!} = pr_1^*[\dim T]$, $pr_1'^{(m)!} = pr_1'^*[\dim T]$. Next, consider the following diagram

$$\begin{array}{ccccccc} pr_1'^* \circ \mathbb{R}f_{1,*}(\mathcal{E}_1) & \xrightarrow{\sim} & pr_1'^*\mathbb{R}f_{1*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^*\mathcal{O}_T & \longrightarrow & \mathbb{R}f_*(pr_1^*(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_X} pr_2^*\mathcal{O}_T) & \xrightarrow{\sim} & \mathbb{R}f_* \circ pr_1^*(\mathcal{E}_1) \\ \| & & \| & & \| & & \| \\ pr_1'^* \circ \mathbb{R}f_{1,*}(\mathcal{E}_1) & \xrightarrow{\sim} & \mathbb{R}f_{1,*}(\mathcal{E}_1) \overset{\mathbb{L}}{\boxtimes} \mathcal{O}_T & \underset{\sim}{\xrightarrow{5.3.5.11.1}} & \mathbb{R}f_*(\mathcal{E}_1 \overset{\mathbb{L}}{\boxtimes} \mathcal{O}_T) & \xrightarrow{\sim} & \mathbb{R}f_* \circ pr_1^*(\mathcal{E}_1) \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ pr_1'^* \circ f^{(m)}_{1,+}(\mathcal{E}_1) & \xrightarrow{\sim} & f^{(m)}_{1,+}(\mathcal{E}_1) \overset{\mathbb{L}}{\boxtimes} \mathcal{O}_T & \underset{5.3.5.13}{\xrightarrow{\sim}} & f^{(m)}_{+}(\mathcal{E}_1 \overset{\mathbb{L}}{\boxtimes} \mathcal{O}_T) & \xrightarrow{\sim} & f^{(m)}_{+}(pr_1^*(\mathcal{E}_1)) \end{array} \tag{5.3.6.1.2}$$

Following 5.3.5.13, the middle square (of the bottom) is commutative. The left and right squares are commutative by functoriality. By compositing the bottom isomorphisms, we get $pr_1^* \circ f^{(m)}_{1,+}(\mathcal{E}_1) \xrightarrow{\sim} f^{(m)}_{+} \circ pr_1^*(\mathcal{E}_1)$. It remains to check that the composition of the top isomorphisms is the base change isomorphism.

Consider the commutative diagram

$$\begin{array}{ccccccc} pr_1'^* \circ \mathbb{R}f_{1,*}(\mathcal{E}_1) & \xrightarrow{\sim} & pr_1'^*\mathbb{R}f_{1*}(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^*\mathcal{O}_T & \xrightarrow{\sim} & \mathbb{R}f_*(pr_1^*(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_X} pr_2^*\mathcal{O}_T) & \xrightarrow{\sim} & \mathbb{R}f_* pr_1^*(\mathcal{E}_1) \\ \downarrow\sim & & \downarrow\sim & & \uparrow\sim & & \| \\ \mathbb{R}f_* pr_1^*(\mathcal{E}_1) & \xrightarrow{\sim} & \mathbb{R}f_* pr_1^*(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^*\mathcal{O}_T & \xrightarrow{5.3.5.5.3} & \mathbb{R}f_*(pr_1^*(\mathcal{E}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_X} \mathbb{L}f^* pr_2'^*\mathcal{O}_T) & \xrightarrow{\sim} & \mathbb{R}f_* pr_1^*(\mathcal{E}_1), \end{array} \tag{5.3.6.1.3}$$

where the middle square is commutative (this is the outer of the diagram 5.3.5.11.5), the top arrows are the same as that of 5.3.6.1.2, where the right and left squares are commutative by functoriality. Using 5.3.5.5.5, we get that the composition of the bottom morphisms is the identity. Hence we are done. □

Notation 5.3.6.2. Let $g \colon Z \to T$ be a smooth morphism of S-schemes. As for [Har66, III.2], we define a functor $g^\sharp \colon D(\mathcal{O}_T) \to D(\mathcal{O}_Z)$ by $g^\sharp(\mathcal{M}) := g^*(\mathcal{M}) \otimes_{\mathcal{O}_T} \omega_{Z/T}[d_{Z/T}]$. We remark that if $\mathcal{M} \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{D}^{(m)}_{T})$ then $g^\sharp(\mathcal{M}) \xrightarrow{\sim} g^{(m)!}(\mathcal{M})$.

Proposition 5.3.6.3. *We keep notation 5.3.6.2.*

(a) For any $\mathcal{M}_1 \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{X_1})$, we have the isomorphism

$$pr_1'^\sharp \circ \mathbb{R}f_{1,*}(\mathcal{M}_1) \xrightarrow{\sim} \mathbb{R}f_* \circ pr_1^\sharp(\mathcal{M}_1) \tag{5.3.6.3.1}$$

of $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_Y)$ canonically induced by the usual base change isomorphism.

(b) For any $\mathcal{M}_1 \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_{X_1})$, we have the isomorphism the canonical $pr_1'^{(m)!} \circ f^{(m)}_{1,+}(\mathcal{M}_1) \xrightarrow{\sim} f^{(m)}_+ \circ pr_1^{(m)!}(\mathcal{M}_1)$ of $D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_Y)$ making commutative the diagram

$$\begin{array}{ccc} pr_1'^{\sharp} \circ \mathbb{R}f_{1,*}(\mathcal{M}_1) & \xrightarrow[5.3.6.3.1]{\sim} & \mathbb{R}f_* \circ pr_1^{\sharp}(\mathcal{M}_1) \\ \downarrow & & \downarrow \\ pr_1'^{(m)!} \circ f^{(m)}_{1,+}(\mathcal{M}_1) & \xrightarrow{\sim} & f^{(m)}_+ \circ pr_1^{(m)!}(\mathcal{M}_1). \end{array} \tag{5.3.6.3.2}$$

Proof. Again, this is an easy consequence of Theorem 5.3.5.13. Indeed, with notation 5.3.5.1, since $pr_2'^*\omega_T \xrightarrow{\sim} \omega_{Y/T}$ and $pr_2^*\omega_T \xrightarrow{\sim} \omega_{X/T}$, we get the commutative diagram

$$\begin{array}{ccccccc} pr_1'^{\sharp} \circ \mathbb{R}f_{1,*}(\mathcal{M}_1) & \xrightarrow{\sim} & pr_1'^{*}\mathbb{R}f_{1*}(\mathcal{M}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^*\omega_T[d_T] & \xrightarrow[5.3.5.11.2]{\sim} & \mathbb{R}f_*(pr_1^*(\mathcal{M}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_X} pr_2^*\omega_T)[d_T] & \xrightarrow{\sim} & \mathbb{R}f_* \circ pr_1^{\sharp}(\mathcal{M}_1) \\ \| & & \| & & \| & & \| \\ pr_1'^{\sharp} \circ \mathbb{R}f_{1,*}(\mathcal{M}_1) & \xrightarrow{\sim} & \mathbb{R}f_{1,*}(\mathcal{M}_1) \overset{\mathbb{L}}{\boxtimes} \omega_T[d_T] & \xrightarrow[\sim]{5.3.5.11.1} & \mathbb{R}f_*(\mathcal{M}_1 \overset{\mathbb{L}}{\boxtimes} \omega_T)[d_T] & \xrightarrow{\sim} & \mathbb{R}f_* \circ pr_1^{\sharp}(\mathcal{M}_1) \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ pr_1'^{(m)!} \circ f^{(m)}_{1,+}(\mathcal{M}_1) & \xrightarrow{\sim} & f^{(m)}_{1,+}(\mathcal{M}_1) \overset{\mathbb{L}}{\boxtimes} \omega_T[d_T] & \xrightarrow[5.3.5.13]{\sim} & f^{(m)}_+(\mathcal{M}_1 \overset{\mathbb{L}}{\boxtimes} \omega_T)[d_T] & \xrightarrow{\sim} & f^{(m)}_+(pr_1^{(m)!}(\mathcal{M}_1)). \end{array} \tag{5.3.6.3.3}$$

The commutative diagram 5.3.6.3.2 corresponds to the outer of 5.3.6.3.3.

□

5.3.7 Trace map, relative duality isomorphism, adjunction for proper morphisms

We just review in this subsection the results of [Vir00], [Vir04] concerning Virrion's relative duality isomorphism and its related properties.

Let S be a smooth scheme on $\mathrm{Spec}(\mathcal{V}/\mathfrak{m}^{i+1})$ for some integer $i \in \mathbb{N}$ or a regular scheme over $\mathrm{Spec}\, \mathbb{Z}_{(p)}$. We assume that S is Noetherian and of finite Krull dimension. Let $f\colon X \to Y$ be a proper morphism of smooth S schemes.

Notation 5.3.7.1. We get a locally free $\mathcal{O}_X$-module by setting

$$\mathcal{H}^k_{X/S} := \varinjlim_{n \geq 0} \mathcal{H}om_{\mathcal{O}_X}(\mathcal{P}^n_{X/S,(m)}(k), \mathcal{O}_X).$$

where $\mathcal{P}^n_{X/S,(m)}(k)$ is the partial divided power envelope of level m and order n defined by the closed immersion $X \hookrightarrow X^{k+1}/S$.

The Čech-Alexander complex was mentioned in [Grot68, 6.2]; [Ber74, V, 1.2.3] ; [BO78, 5.29] ; [Vir04, p.1048]. Virrion proved this arithmetic analogue:

Theorem 5.3.7.2 (Čech-Alexander resolution)**.** *The following properties hold.*

(a) The complex $\mathcal{D}^{(m)}_{X/S} \otimes_{\mathcal{O}_X} \mathcal{H}^{\bullet}_{X/S}$ is a left resolution of $\mathcal{O}_X$ as a left $\mathcal{D}^{(m)}_{X/S}$-module.

(b) Let $\mathcal{F}$ be a right $\mathcal{D}^{(m)}_{X/S}$-module. Then the Čech-Alexander complex $\check{C}A^*(\mathcal{F})$ defined by

$$\check{C}A^*(\mathcal{F})^k := \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{H}^k_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X/S}$$

is a canonical left resolution of $\mathcal{F}$ by induced right $\mathcal{D}^{(m)}_{X/S}$-modules.

(c) Let $\mathcal{F}^{\bullet}$ be a bounded above complex of right $\mathcal{D}^{(m)}_{X/S}$-modules. Then $\check{C}A^*(\mathcal{F}^{\bullet})$ is a resolution of $\mathcal{F}^{\bullet}$ by induced right $\mathcal{D}^{(m)}_{X/S}$-modules.

Sketch of the proof. The part (a) is the result of a study of the $\mathcal{O}_X$-linear dual of the Čech-Alexander complex of the linearization of $\mathcal{O}_X$ - see [Vir04] pp. 1047-1061. The implications $(a) \Rightarrow (b) \Rightarrow (c)$ are much easier and can be checked as an exercice. The reader can found a complete proof at [Vir04, II.2.4, II.2.5, II.3.2, II.3.4.1]. □

5.3.7.3 (Trace map)**.** The Grothendieck-Hartshorne duality theory of [Har66] then provides an $\mathcal{O}_Y$-linear trace morphism:

$$\mathrm{Tr}_f : \mathbb{R}f_*(\omega_{X/S}[d_{X/S}]) \to \omega_{Y/S}[d_{Y/S}]. \tag{5.3.7.3.1}$$

The $\mathcal{D}^{(m)}_{X/S}$-linear canonical map $\mathcal{D}^{(m)}_{X/S} \to \mathcal{D}^{(m)}_{X\to Y/S}$ induces

$$\mathbb{R}f_*(\omega_{X/S}[d_{X/S}]) \to \mathbb{R}f_*(\omega_{X/S}[d_{X/S}] \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X/S}} \mathcal{D}^{(m)}_{X\to Y/S}) = f_+(\omega_{X/S}[d_{X/S}]). \tag{5.3.7.3.2}$$

Let $\mathcal{K}^\bullet_{X/S}$ be the Cousin complex of $\omega_{X/S}[d_{X/S}]$ (see [Har66, IV.§2,3]), which is a resolution of $\omega_{X/S}[d_{X/S}]$ by injective right $\mathcal{D}^{(m)}_{X/S}$-modules. Hence, using 5.3.7.2 , we get the isomorphisms:

$$\mathbb{R}_*(\omega_{X/S}[d_{X/S}]) \xrightarrow{\sim} \mathbb{R}f_*(\check{C}A^*(\mathcal{K}^\bullet_{X/S})) \xrightarrow{\sim} f_*(\mathcal{K}^\bullet_{Y/S} \otimes_{\mathcal{O}_Y} \mathcal{H}^\bullet_{Y/S} \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y/S})$$

$$f_+(\omega_{X/S}[d_{X/S}]) \xrightarrow{\sim} \mathbb{R}f_*(\check{C}A^*(\mathcal{K}^\bullet_{X/S}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X/S}} \mathcal{D}^{(m)}_{X\to Y/S}) \xrightarrow{\sim} f_*(\mathcal{K}^\bullet_{X/S} \otimes_{\mathcal{O}_X} \mathcal{H}^\bullet_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X\to Y/S})$$

$$\omega_{Y/S}[d_{Y/S}] \xrightarrow{\sim} \check{C}A^*(\mathcal{K}^\bullet_{Y/S}) = \mathcal{K}^\bullet_{Y/S} \otimes_{\mathcal{O}_Y} \mathcal{H}^\bullet_{Y/S} \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y/S}.$$

Virrion constructs in ([Vir04, pp. 1074-1090]) the following horizontal morphism

$$\begin{array}{ccc} f_*(\mathcal{K}^\bullet_{X/S} \otimes_{\mathcal{O}_X} \mathcal{H}^\bullet_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X\to Y/S}) & \longrightarrow & \mathcal{K}^\bullet_{Y/S} \otimes_{\mathcal{O}_Y} \mathcal{H}^\bullet_{Y/S} \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_{Y/S} \\ \uparrow & \nearrow & \\ f_*(\mathcal{K}^\bullet_{X/S} \otimes_{\mathcal{O}_X} \mathcal{H}^\bullet_{X/S} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X/S}) & & \end{array}$$

where the oblique arrow is induced by the map $f_*(\mathcal{K}^\bullet_{X/S}) \to \mathcal{K}^\bullet_{Y/S}$ which appears in the construction of 5.3.7.3.1, where the vertical arrow is induced by functoriality from $\mathcal{D}^{(m)}_{X/S} \to \mathcal{D}^{(m)}_{X\to Y/S}$, making commutative the diagram. This yields the construction of

$$\mathrm{Tr}_{+,f} : f_+(\omega_{X/S}[d_{X/S}]) \to \omega_{Y/S}[d_{Y/S}] \tag{5.3.7.3.3}$$

making commutative the diagram

$$\begin{array}{ccc} f_+(\omega_{X/S}[d_{X/S}] & \xrightarrow{\mathrm{Tr}_{+,f}} & \omega_{Y/S}[d_{Y/S}] \\ {\scriptstyle 5.3.7.3.2}\uparrow & \nearrow^{\mathrm{Tr}_f}_{5.3.7.3.1} & \\ \mathbb{R}f_*(\omega_{X/S})[d_{X/S}]. & & \end{array} \tag{5.3.7.3.4}$$

Theorem 5.3.7.4 (Virrion)**.** *Let* $* \in \{\mathrm{l}, \mathrm{r}\}$*. Let* $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^*\mathcal{D}^{(m)}_{X/S})$*. We have in* $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{Y/S})$ *the canonical isomorphism*

$$\chi\colon f^{(m)}_+ \circ \mathbb{D}^{(m)}_X(\mathcal{E}) \xrightarrow{\sim} \mathbb{D}^{(m)}_Y \circ f^{(m)}_+(\mathcal{E}) \tag{5.3.7.4.1}$$

satisfying the transitivity condition for the composition of two proper morphisms.

Proof. 1) Using the trace map, we construct the morphism 5.3.7.4.1 as follows: We can suppose $* = \mathrm{r}$. We construct the composite morphism:

$$\begin{aligned} f^{(m)}_+ \circ \mathbb{D}_X(\mathcal{E}) &\xrightarrow{\sim} \mathbb{R}f_*\left(\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X/S}}(\mathcal{E}, \omega_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X/S}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X/S}} \mathcal{D}^{(m)}_{X\to Y}\right)[d_X] \\ &\xrightarrow[4.6.3.6.1]{\sim} \mathbb{R}f_*\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X/S}}(\mathcal{E}, \omega_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X\to Y})[d_X] \\ &\to \mathbb{R}f_*\mathbb{R}\mathcal{H}om_{f^{-1}\mathcal{D}^{(m)}_Y}(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}, (\omega_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X\to Y}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y})[d_X] \\ &\xrightarrow[4.6.5.7.1]{} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_Y}\left(\mathbb{R}f_*(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}), \mathbb{R}f_*\left((\omega_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X\to Y}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}\right)\right)[d_X]. \end{aligned} \tag{5.3.7.4.2}$$

By using flat resolutions, it follows by functoriality from 4.2.6.1.1 that we have the isomorphism of complexes of right $\mathcal{D}_X^{(m)}$-bimodules:

$$\mathbb{R}f_*\left((\omega_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X\to Y}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}\right) \xrightarrow{\sim} \mathbb{R}f_*\left(\omega_X \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} (\mathcal{D}^{(m)}_{X\to Y} \otimes_{\mathcal{O}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y})\right). \tag{5.3.7.4.3}$$

We have the isomorphism of left $\mathcal{D}_X^{(m)} \otimes_{\mathcal{O}_S} f^{-1}(\mathcal{D}_X^{(m)})^{\mathrm{op}} \otimes_{\mathcal{O}_S} f^{-1}(\mathcal{D}_X^{(m)})^{\mathrm{op}}$-modules

$$\begin{aligned}\mathcal{D}^{(m)}_{X\to Y} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X\to Y} &\xrightarrow{\sim} f^*_{\mathrm{l}}(\mathcal{D}^{(m)}_Y \otimes^{\mathrm{l,l}}_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y) \underset{\gamma}{\xleftarrow{\sim}} f^*_{\mathrm{l}}(\mathcal{D}^{(m)}_Y \otimes^{\mathrm{r,l}}_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y)\\ &\xrightarrow{\sim} \mathcal{D}^{(m)}_{X\to Y} \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{D}^{(m)}_Y,\end{aligned} \tag{5.3.7.4.4}$$

where $\mathcal{D}^{(m)}_Y \otimes^{\mathrm{l,l}}_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y$ is a left, right, right $\mathcal{D}^{(m)}_Y$-trimodule whose left $\mathcal{D}^{(m)}_Y$-module structure comes from the tensor product structure given by the left $\mathcal{D}^{(m)}_Y$-module structure of both $\mathcal{D}^{(m)}_Y$ and whose the two structures of right $\mathcal{D}^{(m)}_Y$-modules are induced by functoriality (the 'second" one is given by $\mathcal{D}^{(m)}_Y$ at the right by convention), where $\mathcal{D}^{(m)}_Y \otimes^{\mathrm{r,l}}_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y$ is a left, right, right $\mathcal{D}^{(m)}_Y$-trimodules whose second right $\mathcal{D}^{(m)}_Y$-module structure comes from the right (resp. left) $\mathcal{D}^{(m)}_Y$-module structure of the left (resp. right) term $\mathcal{D}^{(m)}_Y$ (and the two other $\mathcal{D}^{(m)}_Y$-modules structures are obtained by functoriality) and where γ is the transposition isomorphism of $\mathcal{D}^{(m)}_Y$ (see 4.2.5.1.1). This yields

$$\mathbb{R}f_*\left(\omega_X \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} (\mathcal{D}^{(m)}_{X\to Y} \otimes_{\mathcal{O}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y})\right) \xrightarrow{\sim} \mathbb{R}f_*\left((\omega_X \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}) \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{D}^{(m)}_Y\right). \tag{5.3.7.4.5}$$

By applying the projection isomorphism 7.5.7.3, we get

$$\mathbb{R}f_*\left((\omega_X \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}) \otimes_{f^{-1}\mathcal{O}_Y} f^{-1}\mathcal{D}^{(m)}_Y)\right) \xrightarrow{\sim} \mathbb{R}f_*\left(\omega_X \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}\right) \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y. \tag{5.3.7.4.6}$$

By applying the functor $(-\otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y)$ to the trace map 5.3.7.3.3, we get

$$\mathbb{R}f_*\left(\omega_X \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}\right) \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y \to \omega_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y[-d_{X/Y}] \tag{5.3.7.4.7}$$

By composing 5.3.7.4.3, 5.3.7.4.5, 5.3.7.4.6, 5.3.7.4.7, we get

$$\mathbb{R}f_*\left((\omega_X \otimes_{\mathcal{O}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}\right) \to \omega_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m)}_Y[-d_{X/Y}]. \tag{5.3.7.4.8}$$

By applying the functor $\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_Y}(\mathbb{R}f_*(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}), -)$ to 5.3.7.4.8 and composing it to 5.3.7.4.2, we get the first morphism:

$$f^{(m)}_+ \circ \mathbb{D}_X(\mathcal{E}) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_Y}(\mathbb{R}f_*(\mathcal{E} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_X} \mathcal{D}^{(m)}_{X\to Y}), \omega_Y \otimes_{\mathcal{O}_Y} \mathcal{D}_Y)[d_X] \xrightarrow{\sim} \mathbb{D}_Y \circ f^{(m)}_+(\mathcal{E}). \tag{5.3.7.4.9}$$

2) Let us now sketch the fact that is an isomorphism. By applying base change we can reduce to the case when S is a regular scheme. By using [Har66, I.7.1.(i)], we reduce to the case where $\mathcal{E}$ is a coherent $\mathcal{D}^{(m)}_{X/S}$-module. And then because both functors $f^{(m)}_+ \circ \mathbb{D}^{(m)}_X$ and $\mathbb{D}^{(m)}_Y \circ f^{(m)}_+$ are way-out right, since any coherent $\mathcal{D}^{(m)}_{X/S}$-module is a quotient of a $\mathcal{D}^{(m)}_{X/S}$-module of the form $\mathcal{L} \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_{X/S}$, where $\mathcal{L}$ is a locally free $\mathcal{O}_X$-module of finite type, then following [Har66, I.7.1.(iv)] we reduce to check χ is an isomorphism for such a module. For such an induced module, using the duality for coherent $\mathcal{O}_X$-modules as given in [Har66, VII, (3.4,)c], Virrion constructed an isomorphism χ' (see [Vir04, IV.2.2.4]). The equality $\chi = \chi'$ and is a consequence of the commutativity of 5.3.7.3.4: see [Vir04, IV.2.2.5]. □

Corollary 5.3.7.5 (Virrion)**.** *Let $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{X/S})$, and $\mathcal{F} \in D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{Y/S})$. We have the isomorphisms*

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{Y/S}}(f^{(m)}_+(\mathcal{E}), \mathcal{F}) \xrightarrow{\sim} \mathbb{R}f_*\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X/S}}(\mathcal{E}, f^{(m)!}(\mathcal{F})). \tag{5.3.7.5.1}$$

$$\mathbb{R}\mathrm{Hom}_{\mathcal{D}^{(m)}_{Y/S}}(f^{(m)}_+(\mathcal{E}), \mathcal{F}) \xrightarrow{\sim} \mathbb{R}\mathrm{Hom}_{\mathcal{D}^{(m)}_{X/S}}(\mathcal{E}, f^{(m)!}(\mathcal{F})). \tag{5.3.7.5.2}$$

Proof. Since we have $D^{\mathrm{b}}_{\mathrm{coh}}(\mathcal{D}^{(m)}_{Y/S}) = D^{\mathrm{b}}_{\mathrm{perf}}(\mathcal{D}^{(m)}_{Y/S})$, then using 4.6.3.6.1, we get the canonical isomorphism:

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{Y/S}}(f^{(m)}_{+}(\mathcal{E}), \mathcal{F}) \xrightarrow{\sim} (\omega_Y \otimes_{\mathcal{O}_Y} \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{Y/S}} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{Y/S}}\left(f^{(m)}_{+}(\mathcal{E}), \mathcal{D}^{(m)}_{Y/S} \otimes_{\mathcal{O}_Y} \omega^{-1}_Y\right).$$

Via 5.3.7.4, this yields by composition the isomorphism

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{Y/S}}(f^{(m)}_{+}(\mathcal{E}), \mathcal{F}) \xrightarrow{\sim} (\omega_Y \otimes_{\mathcal{O}_Y} \mathcal{F}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{Y/S}} f^{(m)}_{+}\left(\mathbb{D}_X(\mathcal{E})\right)[-d_Y]. \tag{5.3.7.5.3}$$

Via the projection formula of 5.1.2.5.1, the right term of 5.3.7.5.3 is isomorphic to

$$\mathbb{R}f_*\left(f^{-1}\left(\omega_Y \otimes_{\mathcal{O}_Y} \mathcal{F}\right) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{(m)}_{Y/S}} \mathcal{D}^{(m)}_{Y\leftarrow X} \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X/S}} \mathbb{D}_X(\mathcal{E})\right)[-d_Y]. \tag{5.3.7.5.4}$$

Using the isomorphisms $\left(f^{-1}\left(\omega_Y \otimes_{\mathcal{O}_Y} \mathcal{F}\right) \otimes^{\mathbb{L}}_{f^{-1}\mathcal{D}^{(m)}_{Y/S}} \mathcal{D}^{(m)}_{Y\leftarrow X}\right) \otimes_{\mathcal{O}_X} \omega^{-1}_X[d_f] \xrightarrow[5.1.1.5.1]{\sim} f^{(m)!}(\mathcal{F})$ and $\omega_X \otimes_{\mathcal{O}_X} \mathbb{D}_X(\mathcal{E})[-d_X] \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X/S}}(\mathcal{E}, \mathcal{D}^{(m)}_{X/S})$, the term of 5.3.7.5.4 is isomorphic to

$$\mathbb{R}f_*\left(\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X/S}}(\mathcal{E}, \mathcal{D}^{(m)}_{X/S}) \otimes^{\mathbb{L}}_{\mathcal{D}^{(m)}_{X/S}} f^{(m)!}(\mathcal{F})\right) \xrightarrow[4.6.3.6.1]{\sim} \mathbb{R}f_*\left(\mathbb{R}\mathcal{H}om_{\mathcal{D}^{(m)}_{X/S}}(\mathcal{E}, f^{(m)!}(\mathcal{F})\right).$$

□

5.3.8 Trace map, relative duality isomorphism and adjunction for projective morphisms

We have seen at 5.3.7 that following Virrion proved the relative duality isomorphism and the adjoint pair $(f_+, f^!)$ for a proper morphism f. The key point is to construct a trace map which is compatible with that of Grothendieck for coherent $\mathcal{O}$-modules (i.e. we have a commutative diagram of the form 5.3.8.3.2). In general, this key point is highly technical and corresponds to the hard part of the proof of a relative duality isomorphism (see [Vir04]). In this subsection, we show how this is much easier to construct such a trace map in the case of projective morphisms by using base change in the projection case and by using the case of a closed immersion (see 5.2.6.6).

We keep notation 5.3.5 and we suppose $n = 2$, log structures are trivial (so we remove $\sharp$ in the notation), f_2 is the identity, $X_1 = \mathbb{P}^d_{Y_1}$, $f_1 \colon \mathbb{P}^d_{Y_1} \to Y_1$ is the canonical projection. We set $T := X_2 = Y_2$.

Lemma 5.3.8.1. *For any $\mathcal{N}_1 \in D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_{Y_1})$, we have the commutative diagram (see notation 5.3.6.2)*

$$\begin{array}{ccccc} pr'^{\sharp}_1 \circ \mathbb{R}f_{1,*} \circ f^{\sharp}_1(\mathcal{N}_1) & \xrightarrow[5.3.6.3.1]{\sim} & \mathbb{R}f_* \circ pr^{\sharp}_1 \circ f^{\sharp}_1(\mathcal{N}_1) & \xrightarrow{\sim} & \mathbb{R}f_* \circ f^{\sharp} \circ pr'^{\sharp}_1(\mathcal{N}_1) \\ \downarrow{\scriptstyle \mathrm{Tr}_{f_1}} & & & & \downarrow{\scriptstyle \mathrm{Tr}_f} \\ pr'^{\sharp}_1(\mathcal{N}_1) & = & = & = & pr'^{\sharp}_1(\mathcal{N}_1). \end{array} \tag{5.3.8.1.1}$$

Proof. Following the commutativity of the diagram 5.3.5.11.5, since $\omega_{Y/Y_1} \xrightarrow{\sim} pr'^{*}_2\omega_T$ and $\omega_{X/X_1} \xrightarrow{\sim} pr^{*}_2\omega_T$ the isomorphism $pr'^{\sharp}_1 \circ \mathbb{R}f_{1,*} \circ f^{\sharp}_1(\mathcal{N}_1) \xrightarrow[5.3.6.3.1]{\sim} \mathbb{R}f_* \circ pr^{\sharp}_1 \circ f^{\sharp}_1(\mathcal{N}_1)$ is given by the composition of the left vertical arrows of the diagram below:

$$\begin{array}{ccccc}
pr_1'^{\sharp} \circ \mathbb{R}f_{1,*} \circ f_1^{\sharp}(\mathcal{N}_1) & \xrightarrow{\mathrm{Tr}_{f_1}} & pr_1'^{\sharp}(\mathcal{N}_1) & & \\
\downarrow \wr & & \downarrow \wr & & \\
pr_1'^{*}\mathbb{R}f_{1*}f_1^{\sharp}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^{*}\omega_T[d_T] & \xrightarrow{\mathrm{Tr}_{f_1}\otimes \mathrm{id}} & pr_1'^{*}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^{*}\omega_T[d_T] & = & \\
\downarrow \wr & & \uparrow \mathrm{Tr}_f \otimes \mathrm{id} & & \\
\mathbb{R}f_* pr_1^{*} f_1^{\sharp}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^{*}\omega_T[d_T] & \xrightarrow{\sim} & \mathbb{R}f_* f^{\sharp} pr_1'^{*}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^{*}\omega_T[d_T] & \xrightarrow{\mathrm{Tr}_f\otimes \mathrm{id}} & pr_1'^{*}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^{*}\omega_T[d_T] \\
\downarrow \wr & & \downarrow \wr & & \uparrow \mathrm{Tr}_f \\
\mathbb{R}f_*(pr_1^{*} f_1^{\sharp}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} f^* pr_2'^{*}\omega_T)[d_T] & \xrightarrow{\sim} & \mathbb{R}f_*(f^{\sharp} pr_1'^{*}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} f^* pr_2'^{*}\omega_T)[d_T] & \xrightarrow{\sim} & \mathbb{R}f_* f^{\sharp}(pr_1'^{*}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2'^{*}\omega_T)[d_T] \\
\downarrow \wr & & \downarrow \wr & & \downarrow \wr \\
\mathbb{R}f_*(pr_1^{*} f_1^{\sharp}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2^{*}\omega_T)[d_T] & \xrightarrow{\sim} & \mathbb{R}f_*(f^{\sharp} pr_1'^{*}(\mathcal{N}_1) \otimes^{\mathbb{L}}_{\mathcal{O}_Y} pr_2^{*}\omega_T)[d_T] & & \\
\downarrow \wr & & & & \\
\mathbb{R}f_* \circ pr_1^{\sharp} \circ f_1^{\sharp}(\mathcal{N}_1) & & \xrightarrow{\sim} & & \mathbb{R}f_* \circ f^{\sharp} \circ pr_1'^{\sharp}(\mathcal{N}_1)
\end{array}$$

Following [Har66, III.10.5.Tra 4)], the square of the second row is commutative. Following [Har66, III.4.4], the right square of the third line is commutative. The commutativity of the other squares, of the triangle or trapeze are obvious. Hence, we are done. □

Proposition 5.3.8.2. *Let $\mathcal{N}_1 \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_{Y_1})$. Suppose we have the canonical morphism $\mathrm{Tr}_{+,f_1} \colon f^{(m)}_{1,+} \circ f_1^{(m)!}(\mathcal{N}_1) \to \mathcal{N}_1$ of $D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_{Y_1})$ making commutative the diagram*

$$\begin{array}{ccc}
\mathbb{R}f_{1,*} \circ f_1^{\sharp}(\mathcal{N}_1) & \xrightarrow{\mathrm{Tr}_{f_1}} & \mathcal{N}_1 \\
\downarrow & \nearrow_{\mathrm{Tr}_{+,f_1}} & \\
f^{(m)}_{1,+} \circ f_1^{(m)!}(\mathcal{N}_1). & &
\end{array} \tag{5.3.8.2.1}$$

Then, there exists a canonical morphism $\mathrm{Tr}_{+,f} \colon f^{(m)}_{+} \circ f^{(m)!} \circ pr_1'^{(m)!}(\mathcal{N}_1) \to pr_1'^{(m)!}(\mathcal{N}_1)$ of $D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_{Y})$ making commutative the diagram

$$\begin{array}{ccc}
\mathbb{R}f_* \circ f^{\sharp} \circ pr_1'^{\sharp}(\mathcal{N}_1) & \xrightarrow{\mathrm{Tr}_f} & pr_1'^{\sharp}(\mathcal{N}_1) \\
\downarrow & & \downarrow \wr \\
f^{(m)}_{+} \circ f^{(m)!} \circ pr_1'^{(m)!}(\mathcal{N}_1) & \xrightarrow{\mathrm{Tr}_{+,f}} & pr_1'^{(m)!}(\mathcal{N}_1).
\end{array} \tag{5.3.8.2.2}$$

Proof. By definition, we define the morphism $\mathrm{Tr}_{+,f} \colon f^{(m)}_{+} \circ f^{(m)!} \circ pr_1'^{(m)!}(\mathcal{N}_1) \to pr_1'^{(m)!}(\mathcal{N}_1)$ to be the one making commutative the bottom of the diagram:

$$\begin{array}{ccccccc}
pr_1'^{\sharp} \circ \mathbb{R}f_{1,*} \circ f_1^{\sharp}(\mathcal{N}_1) & \underset{5.3.6.3.1}{\xrightarrow{\sim}} & \mathbb{R}f_* \circ pr_1^{\sharp} \circ f_1^{\sharp}(\mathcal{N}_1) & \xrightarrow{\sim} & \mathbb{R}f_* \circ f^{\sharp} \circ pr_1'^{\sharp}(\mathcal{N}_1) & \xrightarrow{\mathrm{Tr}_f} & pr_1'^{\sharp}(\mathcal{N}_1) \\
\downarrow & & \downarrow & & \downarrow & & \downarrow \wr \\
pr_1'^{(m)!} \circ f^{(m)}_{1,+} \circ f_1^{(m)!}(\mathcal{N}_1) & \xrightarrow{\sim} & f^{(m)}_{+} \circ pr_1^{(m)!} \circ f_1^{(m)!}(\mathcal{N}_1) & \xrightarrow{\sim} & f^{(m)}_{+} \circ f^{(m)!} \circ pr_1'^{(m)!}(\mathcal{N}_1) & \xrightarrow{\mathrm{Tr}_{+,f}} & pr_1'^{(m)!}(\mathcal{N}_1).
\end{array}$$

(5.3.8.2.3)

Following 5.3.8.1.1, the top of the diagram 5.3.8.2.3 is commutative. From the commutativity of 5.3.8.2.1, we get the commutativity of the outer of 5.3.8.2.3. From the commutative diagram 5.3.6.3.2, we get the commutativity of the left square of 5.3.8.2.3. The commutativity of the middle square of 5.3.8.2.3 is easy. This yields that the right square of 5.3.8.2.3 is indeed commutative. □

5.3.8.3. Suppose $Y_1 = S$, $X_1 = \mathbb{P}^d_S$, $f_1 \colon \mathbb{P}^d_S \to S$ is the canonical projection and $\mathcal{N}_1 = \mathcal{O}_S \in D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_{Y_1/S}) = D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_S)$. We have $f_1^{(m)!}(\mathcal{O}_S) = f_1^{\sharp}(\mathcal{O}_S) = \omega_{\mathbb{P}^d_S/S}[d]$ and the trace map $\mathrm{Tr}_{f_1} : \mathbb{R}f_*(\omega_{\mathbb{P}^d_S/S})[d] \to \mathcal{O}_S$ is an isomorphism of $D^{\mathrm{b}}_{\mathrm{qc}}(\mathcal{O}_S)$. The canonical morphism $\mathbb{R}f_*(\omega_{\mathbb{P}^d_S/S})[d] \to f^{(m)}_{1,+}(\omega_{\mathbb{P}^d_S/S})[d]$ is an isomorphism after applying the truncation functor $\tau_{\geq 0}$. Indeed, $f^{(m)}_{1,+}(\omega_{\mathbb{P}^d_S/S})[d] \underset{5.1.3.2.1}{\xrightarrow{\sim}} f^{(m)}_{1,+}(\mathcal{O}_{\mathbb{P}^d_S})[d] \underset{6.2.6.2.2}{\xrightarrow{\sim}} F^{m*}_{\mathbb{P}^d_{S_0}/S_0} f^{(0)}_{1,+}(\mathcal{O}_{\mathbb{P}^d_S})[d] \underset{5.3.2.3.1}{\xrightarrow{\sim}} F^{m*}_{\mathbb{P}^d_{S_0}/S_0} \mathbb{R}f_{1*}\left(\Omega^{\bullet}_{\mathbb{P}^d_S/S}\right)[2d]$. Hence, we get the morphism $\mathrm{Tr}_{+,f_1} : f^{(m)}_{1,+}(\omega_{\mathbb{P}^d_S/S})[d] \to \mathcal{O}_S$ making commutative the diagram

$$\begin{array}{ccc} \mathbb{R}f_{1,*}(\omega_{\mathbb{P}^d_S/S})[d] & \xrightarrow{\mathrm{Tr}_{f_1}} & \mathcal{O}_S \\ \downarrow & \nearrow_{\mathrm{Tr}_{+,f_1}} & \\ f^{(m)}_{1,+}(\omega_{\mathbb{P}^d_S/S})[d]. & & \end{array} \qquad (5.3.8.3.1)$$

Hence, following Proposition 5.3.8.2 and using $pr_1'^{(m)!}(\mathcal{O}_S) = \omega_{T/S}[d_{T/S}]$, there exists a canonical morphism

$$\mathrm{Tr}_{+,f} \colon f^{(m)}_{+}(\omega_{\mathbb{P}^d_T/S})[d + d_{T/S}] \to \omega_{T/S}[d_{T/S}]$$

of $D^{\mathrm{b}}_{\mathrm{qc}}({}^{\mathrm{r}}\mathcal{D}^{(m)}_{T/S})$ making commutative the diagram

$$\begin{array}{ccc} \mathbb{R}f_* \circ (\omega_{\mathbb{P}^d_T/S})[d] & \xrightarrow{\mathrm{Tr}_{f}} & \omega_{T/S}. \\ \downarrow & \nearrow^{\mathrm{Tr}_{+,f}} & \\ f^{(m)}_{+}(\omega_{\mathbb{P}^d_T/S})[d] & & \end{array} \qquad (5.3.8.3.2)$$

Corollary 5.3.8.4. *Let $f \colon X \to Y$ be a morphism of smooth S-schemes which is the composition of a closed immersion of the form $X \hookrightarrow \mathbb{P}^d_Y$ and of the projection $\mathbb{P}^d_Y \to Y$. Let $* \in \{\mathrm{r}, \mathrm{l}\}$, $\mathcal{E} \in D^{\mathrm{b}}_{\mathrm{coh}}({}^*\mathcal{D}^{(m)}_X)$. We have the isomorphism of $D^{\mathrm{b}}_{\mathrm{coh}}({}^l\mathcal{D}^{(m)}_Y)$:*

$$\mathbb{D}^{(m)} \circ f^{(m)}_{+}(\mathcal{E}) \xrightarrow{\sim} f^{(m)}_{+} \circ \mathbb{D}^{(m)}(\mathcal{E}). \qquad (5.3.8.4.1)$$

Proof. Following 5.2.6.6, the case of a closed immersion is easily checked. Hence, we reduce to the case where f is the projection $\mathbb{P}^d_Y \to Y$. Using 5.3.8.3.2, to check such an isomorphism, we can copy Virrion's proof of 5.3.7.4. □

Chapter 6

Frobenius

6.1 Frobenius descent

Let $m \geq 0$ be an integer. Let S be a $\mathbb{Z}_{(p)}$-scheme endowed with quasi-coherent m-PD-ideal $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S))$, X be a smooth S-scheme. We denote by $S_0 = V(\mathfrak{a}_S)$ and by $X_0 := X \times_S S_0$. We suppose also that the following conditions are satisfied :

(a) p is nilpotent on S (then, thanks to 1.2.4.5.1, $|X| = |X_0|$) ;

(b) $p \in \mathfrak{a}_S$ (then we have a Frobenius on X_0).

Let $s \geq 0$ be a fixed integer, $X_0^{(s)}$ be the S_0-scheme induced from X_0 by base change via the sth power of the absolute Frobenius of T_0. We suppose there exists a smooth S-scheme X' which is a lifting of $X_0^{(s)}$ (i.e. $X' \times_S S_0 \xrightarrow{\sim} X_0^{(s)}$). We suppose moreover there exists $F\colon X \to X'$ an S-morphism lifting the relative Frobenius S_0-morphism $F^s_{X_0/S_0}\colon X_0 \to X_0^{(s)}$. Remark that such lifting exists always Zariski locally on X. Since F is an homeomorphism, then by abuse of notation we might avoid writing F^{-1} or F_* when no confusion is possible.

Beware that, even locally, this is not clear that there exists a lifting $F_S\colon S \to S$ of the absolute Frobenius $F^s_{S_0}\colon S_0 \to S_0$.

We suppose given an $\mathcal{O}_{X'}$-algebra $\mathcal{B}_{X'}$ endowed with a left action of $\mathcal{D}^{(m)}_{X'}$ compatible with its algebra structure. We set $\mathcal{B}_X := F^*\mathcal{B}_{X'}$. We will denote by $\widetilde{\mathcal{D}}^{(m+s)}_{X/S} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m+s)}_X$, $\widetilde{\mathcal{D}}^{(m)}_{X'/S} = \mathcal{B}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'/S}$ (we remove $/S$ in the notation if there is no doubt on S). and $\widetilde{F}$ the morphism of ringed spaces $(X, \mathcal{B}_X) \to (X', \mathcal{B}_{X'})$ induced by F.

We denote by p_0^n and $p_1^n\colon \Delta^n_{X/S(m)} \to X$ the left and right projections. Let $\widetilde{\Delta}^n_{X/S(m)}$ be the ringed space $(\Delta^n_{X/S(m)}, \mathcal{O}_{\widetilde{\Delta}^n_{X/S(m)}})$, with $\mathcal{O}_{\widetilde{\Delta}^n_{X/S(m)}} := p_0^{n*}(\mathcal{B}_X)$. We denote by $\tilde{p}_0^n\colon \widetilde{\Delta}^n_{X/S(m)} \to \widetilde{X}^\sharp$ the morphism induced by the continuous map p_0^n and by the morphism of rings canonical $(p_0^n)^{-1}(\mathcal{B}_X) \to \mathcal{O}_{\widetilde{\Delta}^n_{X/S(m)}}$ and $\tilde{p}_1^n\colon \widetilde{\Delta}^n_{X/S(m)} \to \widetilde{X}^\sharp$ whose morphism of topological spaces is p_1^n and whose ring homomorphism is $(p_1^n)^{-1}(\mathcal{B}_X) \to p_1^{n*}(\mathcal{B}_X) \xrightarrow{\sim} p_0^{n*}(\mathcal{B}_X) = \mathcal{O}_{\widetilde{\Delta}^n_{X/S(m)}}$. For any $\nu \geq 1$, we have similar notation by replacing respectively S and X by T and Y.

6.1.1 Frobenius descent for left $\mathcal{D}$-modules

Notation 6.1.1.1. Let $\nu \geq 1$ be an integer. If Y is a S-scheme, we will denote by $Y^{\nu+1} = Y^{\nu+1}/S$, $\mathcal{I}_\nu$ the ideal of the diagonal $\Delta_{Y/S}(\nu)\colon Y \hookrightarrow Y^{\nu+1}$ and $(\mathcal{P}_{Y/S,(m)}(\nu), \overline{\mathcal{I}}_\nu, \widetilde{\mathcal{I}}_\nu)$ the m-PD-envelope of $\mathcal{I}_\nu$, i.e. with the notation of 1.3.3.5, $(\mathcal{P}_{Y/S,(m)}(\nu), \overline{\mathcal{I}}_\nu, \widetilde{\mathcal{I}}_\nu) = (\mathcal{P}^n_{(m),\gamma}(\Delta_{Y/S}(\nu)), (\mathscr{I}_{(m),\gamma}(\Delta_{Y/S}(\nu)), \mathscr{I}_{(m),\gamma}(\Delta_{Y/S}(\nu)),^{[\,]}))$. When $\nu = 1$, we simply write $(\mathcal{P}_{Y/S,(m)}, \overline{\mathcal{I}}, \widetilde{\mathcal{I}})$.

We denote by $F_\nu\colon X^{\nu+1} \to X'^{\nu+1}$ the morphism $F \times \cdots \times F$ induced by F.

Notation 6.1.1.2 (Local coordinates)**.** Suppose we have an étale morphism of the form $g_0 \colon X_0 \to \mathbb{A}^d_{S_0}$. Since $(\mathbb{A}^d_{S_0})^{(s)} = \mathbb{A}^d_{S_0}$, then we get by definition the right cartesian squares of the diagram

$$\begin{array}{ccccc} X_0 & \xrightarrow{F^s_{X_0/S_0}} & X_0^{(s)} & \longrightarrow & X_0 \\ \downarrow{\scriptstyle g_0} & \square & \downarrow{\scriptstyle g_0^{(s)}} & \square & \downarrow{\scriptstyle g_0} \\ \mathbb{A}^d_{S_0} & \xrightarrow[F^s_{\mathbb{A}^d_{S_0}/S_0}]{} & \mathbb{A}^d_{S_0} & \longrightarrow & \mathbb{A}^d_{S_0} \\ & & \downarrow & \square & \downarrow \\ & & S_0 & \xrightarrow{F_{S_0}} & S_0. \end{array} \tag{6.1.1.2.1}$$

Since $g_0 \colon X_0 \to \mathbb{A}^d_{S_0}$ is étale, then the left square is also cartesian.

Lemma 6.1.1.3. *The morphism $F \colon X \to X'$ is finite and is locally free of finite type, i.e. $F_*\mathcal{O}_X$ is a locally free $\mathcal{O}_{X'}$-module of finite type.*

Proof. Since this is local, we come down to the local context of 6.1.1.2. Since $F^s_{\mathbb{A}^d_{S_0}/S_0}$ is locally free of rank ds, using the cartesian left square of 6.1.1.2.1, then so is $F^s_{X_0/S_0}$. Since X/S is flat, then using [Gro66, 11.3.10], we get that F is flat. By reducing to the case where S is noetherian and therefore $\mathfrak{a}_S$ is nilpotent, this yields that F is also finite and then F is free of rank ds. □

Proposition 6.1.1.4. *We have the following properties.*

(a) There exists a unique PD-morphism

$$\Phi^*_\nu \colon F_\nu^{-1}\mathcal{P}_{X',(m)}(\nu) \to \mathcal{P}_{X,(m+s)}(\nu) \tag{6.1.1.4.1}$$

sending $F_\nu^{-1}\widetilde{\mathcal{I}}'_\nu$ to $\widetilde{\mathcal{I}}_\nu + \mathfrak{b}\overline{\mathcal{I}}_\nu$. This yields the morphism $\Phi_\nu \colon \Delta_{X,(m+s)}(\nu) \to \Delta_{X',(m)}(\nu)$. When $\nu = 1$, we remove ν in the notation.

(b) For any $n \in \mathbb{N}$, we have the inclusion

$$\Phi^*_\nu(F_\nu^{-1}\overline{\mathcal{I}}'^{\{n\}_{(m)}}_\nu) \subset \overline{\mathcal{I}}^{\{n\}_{(m+s)}}_\nu.$$

Proof. See a proof in [Ber00, 2.2.2]). □

Corollary 6.1.1.5. *There exists a canonical factorization $\Phi^n_\nu \colon \widetilde{\Delta}^n_{X/S(m+s)}(\nu) \to \widetilde{\Delta}^n_{X'/S(m)}(\nu)$ making commutative the following diagram of ringed spaces*

$$\begin{array}{ccc} \widetilde{\Delta}^n_{X/S(m)}(\nu) & \longrightarrow & \widetilde{\Delta}^n_{X/S(m+s)}(\nu) \\ \downarrow{\scriptstyle \widetilde{F}^n_{\nu,(m)}} & \swarrow{\scriptstyle \Phi^n_\nu} & \downarrow{\scriptstyle \widetilde{F}^n_{\nu,(m+s)}} \\ \widetilde{\Delta}^n_{X'/S(m)}(\nu) & \longrightarrow & \widetilde{\Delta}^n_{X'/S(m+s)}(\nu). \end{array} \tag{6.1.1.5.1}$$

Proof. We have to establish that the canonical morphism $\widetilde{F}^*_{n,(m)} \colon \widetilde{\mathcal{P}}^n_{X'/T(m)} \to \widetilde{\mathcal{P}}^n_{X/T(m)}$ factors through a morphism $\widetilde{\mathcal{P}}^n_{X'/T(m)} \to \widetilde{\mathcal{P}}^n_{X/T(m+s)}$. Following the proposition 6.1.1.4, we have such a factorization without the tildes. This yields the composition morphism $\mathcal{P}^n_{X'/T(m)} \to \mathcal{P}^n_{X/T(m+s)} \to \widetilde{\mathcal{P}}^n_{X/T(m+s)}$. We get a unique factorization $\widetilde{\mathcal{P}}^n_{X'/T(m)} \to \widetilde{\mathcal{P}}^n_{X/T(m+s)}$ which is semi-linear with respect to homomorphism $\mathcal{B}_{X'} \to \mathcal{B}_X = F_*F^*\mathcal{B}_{X'}$. □

Proposition 6.1.1.6. *Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module (resp. $(\widetilde{\mathcal{D}}^{(m)}_{X'}, \mathcal{D})$-bimodule). The sheaf $\widetilde{F}^*\mathcal{E}'$ is endowed with a structure of left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-module (resp. $(\widetilde{\mathcal{D}}^{(m+s)}_X, \mathcal{D})$-bimodule). Moreover, the canonical isomorphism $\widetilde{F}^*\mathcal{E}' \xrightarrow{\sim} \widetilde{F}^*\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}'$ is an isomorphism of left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules (resp. $(\widetilde{\mathcal{D}}^{(m+s)}_X, \mathcal{D})$-bimodules).*

Proof. By taking the inverse image by the morphisms $\widetilde{\Delta}^n_{X/S(m+s)} \to \widetilde{\Delta}^n_{X'/S(m)}$ (see 6.1.1.5) of the m-PD-stratification with coefficients in $\mathcal{B}_{X'}$ of $\mathcal{E}'$, we obtain an $(m+s)$-PD-stratification with coefficients in $\mathcal{B}_X$ of $\widetilde{F}^*\mathcal{E}'$. We easily check the cocycle condition holds. The respective case is proved in a similar way. The $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-linearity is easy. □

Remark 6.1.1.7. Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module. Following [Ber00, 2.2.7], $F^*(\mathcal{E}')$ is endowed with a structure of left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-module extending its structure of left $\mathcal{D}^{(m+s)}_{X/S}$-module. We check, as for 4.4.5.2, that the isomorphism $F^*(\mathcal{E}') \xrightarrow{\sim} \widetilde{F}^*(\mathcal{E}')$ is $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-linear. In the rest of the chapter, we denote simply by F^* instead of $\widetilde{F}^*$.

Proposition 6.1.1.8. *Suppose $\mathfrak{a}_S = 0$, $F = F^s_{X/S}$, $X' = X^{(s)}$ and there exists coordinates $t_1, \ldots, t_d$ of X/S. Denotes by $t'_1, \ldots, t'_d$ the coordinates of X'/S induced by base change and by $\underline{\partial}'^{\langle \underline{k}\rangle_{(m)}}$ and $\underline{\tau}'^{\{\underline{k}\}_{(m)}}$ the associated elements.*

(a) The homomorphism $\Phi^* \colon F_\nu^{-1}\mathcal{P}_{X',(m)}(\nu) \to \mathcal{P}_{X,(m+s)}$ of 6.1.1.4.1 satisfies for all $\underline{k} \in \mathbb{N}^d$:

$$(\underline{\tau}'^{\{\underline{k}\}_{(m)}}) = \underline{\tau}^{\{p^s\underline{k}\}_{(m+s)}}. \tag{6.1.1.8.1}$$

(b) For any $n \in \mathbb{N}$, we have the inclusion

$$\Phi^*_\nu(F_\nu^{-1}\overline{\mathcal{I}}'^{\{n\}_{(m)}}_\nu) \subset \overline{\mathcal{I}}^{\{p^s n\}_{(m+s)}}_\nu. \tag{6.1.1.8.2}$$

(c) Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module. The structure of left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-module of $F^*\mathcal{E}'$ is characterized by the relations:

$$\underline{\partial}^{\langle \underline{k}\rangle_{(m+s)}}(1 \otimes e') = \begin{cases} \underline{\partial}'^{\langle \underline{k}/p^s\rangle_{(m)}}(e') & \textit{if } p^s \textit{ divides } \underline{k} \\ 0 & \textit{otherwise} \end{cases} \tag{6.1.1.8.3}$$

Proof. See [Ber00, 2.2.4]. □

Theorem 6.1.1.9 (Berthelot)**.** *The functor F^* is an equivalence between the category of left (resp. quasi-coherent) $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules and that of left (resp. quasi-coherent) $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules.*

Proof. A proof can be found in [Ber00, 2.3.6]. □

6.1.2 Frobenius descent for right $\mathcal{D}$-modules

6.1.2.1. Following 6.1.1.3, $F_*\mathcal{O}_X$ is an $\mathcal{O}_{X'}$-module of finite type. Since $\mathcal{B}_X = F^*\mathcal{B}_{X'}$, this yields that $F_*\mathcal{B}_X$ is a $\mathcal{B}_{X'}$-module of finite type. Since F is an homeomorphism, we get a structure of $\mathcal{B}_{X'}$-module on $F_*\mathcal{B}_X$ via F. Since F is supposed to be fixed, we simply write $\mathcal{B}_X$ instead of $F_*\mathcal{B}_X$. For any $\mathcal{B}_{X'}$-module $\mathcal{M}'$, this yields the isomorphism

$$\widetilde{F}^\flat\mathcal{M}' = F^{-1}\mathbb{R}\mathcal{H}om_{\mathcal{B}_{X'}}(F_*\mathcal{B}_X, \mathcal{M}') \xrightarrow{\sim} F^{-1}\mathcal{H}om_{\mathcal{B}_{X'}}(F_*\mathcal{B}_X, \mathcal{M}').$$

For simplicity, we might remove F^{-1} and F_* in the notation.

Proposition 6.1.2.2. *Let $\mathcal{M}'$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module (resp. a $(\mathcal{D}, \widetilde{\mathcal{D}}^{(m)}_{X'})$-bimodule). The sheaf $\widetilde{F}^\flat\mathcal{M}'$ is endowed with a structure of right $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-module (resp. a $(\mathcal{D}, \widetilde{\mathcal{D}}^{(m+s)}_{X})$-bimodule). Moreover, the canonical isomorphism $\widetilde{F}^\flat\mathcal{M}' \xrightarrow{\sim} \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \widetilde{F}^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}$ is an isomorphism of $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules (resp. $(\mathcal{D}, \widetilde{\mathcal{D}}^{(m+s)}_{X})$-bimodules).*

Proof. Let us check the non-respective case. Following 3.4.3.4, $\mathcal{M}'$ has a structural m-PD-costratifcation. By applying $\widetilde{F}^\flat$ and using 6.1.1.5, we get a canonical structure of $(m+s)$-PD-costratifcation on $\widetilde{F}^\flat\mathcal{M}'$, i.e. $\widetilde{F}^\flat\mathcal{M}'$ is endowed with a structure of right $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-module. By functoriality, we get the respective case from the non-respective case. □

Remark 6.1.2.3. Let $\mathcal{M}'$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module. The module $F^\flat(\mathcal{E}')$ is endowed with a structure of right $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-module extending its structure of right $\mathcal{D}^{(m+s)}_{X/S}$-module. We can check similarly that $F^\flat(\mathcal{M}') \xrightarrow{\sim} \widetilde{F}^\flat(\mathcal{M}')$ is $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-linear. So we can simply write $F^\flat$ instead of $\widetilde{F}^\flat$.

Lemma 6.1.2.4. *There exists a canonical isomorphism of right $\mathcal{D}_{X/S}$-modules*

$$\mu_X \colon F^\flat(\omega_{X'/S}) \xrightarrow{\sim} \omega_{X/S}. \tag{6.1.2.4.1}$$

Proof. See [Ber00, 2.4.2]. □

Proposition 6.1.2.5. *For any left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module $\mathcal{E}'$, we have the canonical isomorphism of right $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules of the form*

$$\omega_{X/S} \otimes_{\mathcal{O}_X} F^*(\mathcal{E}') \xrightarrow{\sim} F^\flat(\omega_{X'/S} \otimes_{\mathcal{O}_{X'}} \mathcal{E}'). \tag{6.1.2.5.1}$$

Proof. See [Ber00, 2.4.3]. □

This yields the following corollaries (see [Ber00, 2.4.4–5]):

Corollary 6.1.2.6. *For any right $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module $\mathcal{M}'$, we have the canonical isomorphism of right $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules of the form*

$$F^*(\mathcal{M}' \otimes_{\mathcal{O}_X} \omega^{-1}_{X/S}) \xrightarrow{\sim} F^\flat(\mathcal{M}') \otimes_{\mathcal{O}_{X'}} \omega^{-1}_{X'/S}. \tag{6.1.2.6.1}$$

Theorem 6.1.2.7. *The functor $F^\flat$ is an equivalence between the category of right (resp. quasi-coherent) $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules and that of right (resp. quasi-coherent) $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules.*

Proof. This is a consequence of 6.1.1.9 and of 6.1.2.5 and 6.1.2.6 which allows to switch from left to right $\mathcal{D}$-modules. □

6.1.3 Quasi-inverse functor

6.1.3.1. By functoriality, we can check that the functors F^* and $F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} -$ induce exact canonically quasi-inverse equivalences between the category of complexes of left $\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes_{\mathcal{O}_S} (\widetilde{\mathcal{D}}^{(m)}_{X'})^{\mathrm{op}}$-modules (i.e. $(\widetilde{\mathcal{D}}^{(m)}_{X'}, \widetilde{\mathcal{D}}^{(m)}_{X'})$-bimodules) and that of complexes of left $\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes_{\mathcal{O}_S} (\widetilde{\mathcal{D}}^{(m+s)}_{X/S})^{\mathrm{op}}$-modules (i.e. $(\widetilde{\mathcal{D}}^{(m)}_{X'}, \widetilde{\mathcal{D}}^{(m+s)}_{X/S})$-bimodules).

Similarly, by functoriality, we can check that the functors $F^\flat$ and $- \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}$ induce exact canonically quasi-inverse equivalences between the category of complexes of left $\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes_{\mathcal{O}_S} (\widetilde{\mathcal{D}}^{(m)}_{X'})^{\mathrm{op}}$-modules (i.e. $(\widetilde{\mathcal{D}}^{(m)}_{X'}, \widetilde{\mathcal{D}}^{(m)}_{X'})$-bimodules) and that of complexes of left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S} \otimes_{\mathcal{O}_S} (\widetilde{\mathcal{D}}^{(m)}_{X'})^{\mathrm{op}}$-modules (i.e. $(\widetilde{\mathcal{D}}^{(m+s)}_{X/S}, \widetilde{\mathcal{D}}^{(m)}_{X'})$-bimodules).

For the convenience of the reader we collect below a number of results whose proofs are given in [Ber00] section 2.5.

Proposition 6.1.3.2. *There exists an isomorphism of $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-bimodules of the form*

$$\vartheta \colon \widetilde{\mathcal{D}}^{(m+s)}_{X/S} \xrightarrow{\sim} F^* F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S}. \tag{6.1.3.2.1}$$

Corollary 6.1.3.3. *(a) The $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules $F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S}$ and $F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'/S}$ are locally projective of finite type*

(b) A left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module $\mathcal{E}'$ (resp. $\mathcal{M}'$) is coherent if and only if $F^*(\mathcal{E}')$ (resp. $F^\flat\mathcal{M}'$) is $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-coherent.

Corollary 6.1.3.4. *Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module (resp. $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodule). Let $\mathcal{M}'$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module (resp. $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodule).*

(a) *We have the functorial isomorphisms of (complexes of) left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules (resp. $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodule):*

$$F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \xrightarrow{\sim} F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \xrightarrow{\sim} \mathcal{E}'. \tag{6.1.3.4.1}$$

(b) *We have the functorial isomorphisms of (complexes of) right $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules (resp. $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodules):*

$$F^\flat \mathcal{M}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S} \xrightarrow{\sim} F^\flat \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S} \xrightarrow{\sim} \mathcal{M}'. \tag{6.1.3.4.2}$$

(c) *The functors $F^* = F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} -$ and $F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} -$ (resp. $F^\flat = - \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S}$ and $- \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S}$) induce exact quasi-inverse equivalences of categories between the category of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules and of left (resp. right) $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules.*

Remark 6.1.3.5. Let $\mathcal{D}$ be a sheaf of rings on the topological space $|X'| = |X|$.

(a) It follows by functoriality from 6.1.3.4.(c) that the functors $F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} -$ and $F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} -$ (resp. $- \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S}$ and $- \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S}$) induce exact quasi-inverse equivalences of categories between the category of left (resp. right) $(\widetilde{\mathcal{D}}^{(m)}_{X'/S}, \mathcal{D})$-bimodules and of left (resp. right) $(\widetilde{\mathcal{D}}^{(m+s)}_{X/S}, \mathcal{D})$-bimodules.

(b) Suppose $(\widetilde{\mathcal{D}}^{(m)}_{X'/S}, \mathcal{D})$ and $(\widetilde{\mathcal{D}}^{(m+s)}_{X/S}, \mathcal{D})$ are solved by $\mathcal{O}_S$ (see definition 4.6.3.2). In that case, the functors $F^* = F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} -$ and $F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} -$ (resp. $F^\flat = - \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S}$ and $- \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S}$) induce exact quasi-inverse equivalences of categories between the category of left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\mathcal{O}_S} \mathcal{D}$-modules and of left (resp. right) $\widetilde{\mathcal{D}}^{(m+s)}_{X/S} \otimes_{\mathcal{O}_S} \mathcal{D}$-modules. Let $\mathcal{I}' \in K^-({}^l\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\mathcal{O}_S} \mathcal{D})$. This yields that if $\mathcal{I}'$ is a K-injective complex of $K^-({}^l\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\mathcal{O}_S} \mathcal{D})$ if and only if $F^*\mathcal{I}'$ is a K-injective complex of $K^-({}^l\widetilde{\mathcal{D}}^{(m+s)}_{X/S} \otimes_{\mathcal{O}_S} \mathcal{D})$.

Corollary 6.1.3.6. *Let $\mathcal{E}' \in D^-({}^l\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, $\mathcal{M}' \in D^-({}^r\widetilde{\mathcal{D}}^{(m)}_{X'/S})$.*

(a) *A left (resp. right) $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module $\mathcal{E}'$ (resp. $\mathcal{M}'$) is flat if and only if $F^*\mathcal{E}'$ (resp. $F^\flat\mathcal{M}'$) is a flat left (resp. right) $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-module.*

(b) *Let $a, b \in \mathbb{Z}$ with $a \leq b$. The complex $\mathcal{E}'$ (resp. $\mathcal{M}'$) has tor-amplitude in $[a, b]$ if and only if so is $F^*\mathcal{E}' \in D^-({}^l\widetilde{\mathcal{D}}^{(m+s)}_{X/S})$ (resp. $F^\flat\mathcal{M}' \in D^-({}^r\widetilde{\mathcal{D}}^{(m+s)}_{X/S})$).*

(c) *Let $f\colon X \to S$ be the structural morphism. We have the functorial isomorphism in $D(f^{-1}\mathcal{O}_S)$*

$$F^\flat \mathcal{M}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \xrightarrow{\sim} \mathcal{M}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}'. \tag{6.1.3.6.1}$$

6.1.4 Homological dimension of the sheaf of differential operators of level m

Theorem 6.1.4.1 (Homological dimension)**.** *Suppose S is affine and regular, $f\colon X \to S$ is affine. Suppose the fibers of $f\colon X \to S$ are of dimension d. Let $r := \sup_{t \in f(X)} \mathcal{O}_{T,t}$. Then for any integer $m \in \mathbb{N}$, the ring $D^{(m)}_{X/S} := \Gamma(X, \mathcal{D}^{(m)}_{X/S})$ has homological global dimension equal to $2d + r$.*

Proof. Using the Frobenius descent Theorem 6.1.1.9, we reduce to the case $m = 0$. Then, this is 4.7.3.16. □

Theorem 6.1.4.2 (Montagnon)**.** *Let R be a regular noetherian ring of characteristic p, $S = \operatorname{Spec} R$ endowed with the trivial log structure. Let X be an affine smooth S-scheme endowed with the log structure given by a strict normal crossing divisor D relative to X/S. Then $D^{(m)}_{X/S} := \Gamma(X, \mathcal{D}^{(m)}_{X/S})$ has finite homological global dimension.*

Proof. A proof can be found at [Mon02, Proposition 5.3.1]). This is based on a sort of Frobenius descent. □

6.1.5 Glueing isomorphisms and Frobenius

Proposition 6.1.5.1. *Suppose $\mathfrak{a}_S$ is m-PD-nilpotent. Suppose there exists a second morphism $F'\colon X \to X'$ which is a lifting of $F^s_{X_0/S_0}$.*

(a) Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module. Then the glueing isomorphism $\tau_{F,F'}\colon F^*(\mathcal{E}') \xrightarrow{\sim} F'^*(\mathcal{E}')$ defined in 4.4.5.3.1 is $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-linear.

(b) Let $\mathcal{M}'$ be a right $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module. Then the glueing isomorphism $\sigma_{F,F'}\colon F^\flat(\mathcal{M}') \xrightarrow{\sim} F'^\flat(\mathcal{M}')$ defined in 4.4.5.3.2 is $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-linear.

Proof. We can copy the proof of [Ber00, 2.2.5] (replace $\mathcal{D}$ by $\widetilde{\mathcal{D}}$ for the first statement, the second one replace moreover the symbole $*$ by $\flat$). □

Corollary 6.1.5.2. *Let $S \to T$ be an m-PD-morphism of schemes endowed with m-PD-nilpotent and quasi-coherent m-PD-ideals satisfying the hypotheses (a) and (b) of 6.1, X_0 (resp. Y_0) a smooth S_0-scheme (resp. smooth T_0-scheme), $f_0\colon X_0 \to Y_0$ a T_0-morphism, X (resp. Y') a smooth S-scheme (resp. smooth T-scheme) lifting X_0 (resp. $Y_0^{(s)}$).*

(a) The functor $(F^s_{Y_0/T_0} \circ f_0)^* = (f_0^{(s)} \circ F^s_{X_0/S_0})^*$ defined in 4.4.5.10 is canonically equal (up to canonical isomorphism) to the composition of a functor from the category of left $\mathcal{D}^{(m)}_{Y'/T}$-modules to that of left $\mathcal{D}^{(m+s)}_{X/S}$-modules with the restriction functor from the category of the left $\mathcal{D}^{(m+s)}_{X/S}$-modules to that of left $\mathcal{D}^{(m)}_{X/S}$-modules. We still denote by $(F^s_{Y_0/T_0} \circ f_0)^* = (f_0^{(s)} \circ F^s_{X_0/S_0})^*$ this factorization.

(b) This isomorphism is compatible with the composition: suppose given a second m-PD-morphism $T \to U$ with m-PD-nilpotent m-PD-ideals, a morphism $g_0\colon Y_0 \to Z_0$, where Z_0 is smooth over U_0, and a smooth lifting Z'' of $Z_0^{(s+s')}$. Then there exists a canonical isomorphism of functors of the category of left $\mathcal{D}^{(m)}_{Z''/S}$-modules to that of left $\mathcal{D}^{(m+s+s')}_{X/S}$-modules for the above structures of the form

$$(F^s_{Y_0/T_0} \circ f_0)^* \circ (F^{s'}_{Z_0^{(s)}/T_0} \circ g_0^{(s)})^* \xrightarrow{\sim} (F^{s+s'}_{Z_0^{(s)}/T_0} \circ g_0 \circ f_0)^*. \tag{6.1.5.2.1}$$

6.1.5.3. With notation 6.1.5.2, when f_0 is the identity we get the functor $(F^s_{X_0/S_0})^*$ from the category of left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules to that of left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules.

The functor $(F^s_{X_0/S_0})^\flat$ defined in 4.4.5.10 is canonically equal (up to canonical isomorphism) to the composition of a functor from the category of right $\mathcal{D}^{(m)}_{X'/S}$-modules to that of left $\mathcal{D}^{(m+s)}_{X/S}$-modules with the restriction functor from the category of the right $\mathcal{D}^{(m+s)}_{X/S}$-modules to that of left $\mathcal{D}^{(m)}_{X/S}$-modules. We still denote by $(F^s_{X_0/S_0})^\flat$ this factorization.

6.1.5.4. With notation 6.1.5.2, let Z_0 be a divisor of X_0. The canonical $\mathcal{D}^{(m)}_{X/S}$-linear isomorphism

$$(F^s_{X_0/S_0})^*\mathcal{B}_{X'}(Z_0^{(s)}, r) \xrightarrow{\sim} \mathcal{B}_{X'}(p^s Z_0, r) = \mathcal{B}_{X'}(Z_0, p^s r)$$

is in fact $\mathcal{D}^{(m+s)}_{X/S}$-linear (see [Ber00, 2.2.9]).

Theorem 6.1.5.5. *Suppose $\mathfrak{a}_S$ is m-PD-nilpotent. Let $\mathcal{B}_{X'}$ be an $\mathcal{O}_{X'}$-quasi-coherent algebra endowed with a left action of $\mathcal{D}^{(m)}_{X'/S}$ compatible with is $\mathcal{O}_{X'}$-algebra structure. Let $\mathcal{B}_X := (F^s_{X_0/S_0})^*(\mathcal{B}_{X'})$.*

(a) The functor $(F^s_{X_0/S_0})^*$ is an equivalence from the category of left $\mathcal{B}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'/S}$-modules to that of left $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m+s)}_{X/S}$-modules.

(b) The functor $(F^s_{X_0/S_0})^\flat$ is an equivalence from the category of right $\mathcal{B}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'/S}$-modules to that of right $\mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m+s)}_{X/S}$-modules.

6.2 Commutation with Frobenius, first examples

First let us make precise the hypotheses and notations which we shall use systematically in the following sections and which we shall not mention explicitly in the statements.

(i) We denote by S the base scheme (resp. by $S \to T$ a morphism of base change). For each of the operations considered, we will first recall the general definition. No assumption on S is needed when $m = 0$ or $m = \infty$. If $m \in \mathbb{N}^*$, we shall assume that S is a $\mathbb{Z}_{(p)}$-scheme.

When we consider a smooth S-scheme X, we suppose given on X a sheaf $\mathcal{B}_X$ of $\mathcal{O}_X$-algebras equipped with a compatible $\mathcal{D}_X^{(m)}$ action, and we put $\widetilde{\mathcal{D}}_X^{(m)} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}_X^{(m)}$. When we consider a morphism of schemes $f : X \to Y$, we suppose that $\mathcal{B}_X = f^*\mathcal{B}_Y$, equipped with the action of $\mathcal{D}_X^{(m)}$ defined by inverse image coming from that of $\mathcal{D}_Y^{(m)}$ on $\mathcal{B}_Y$ (even, if there is the action of $\mathcal{D}_X^{(m+s)}$ obtained by applying 6.1.1.6.

(ii) To highlight the "crystalline nature" of the operations such as $f^!$ and f_+, we generalize their construction to the case where S is equipped with a quasi-coherent m-PD-ideal $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha)$, which we suppose to be m-PD-nilpotent, and where the morphisms are only defined modulo $\mathfrak{a}_S$. We write $S_0 = V(\mathfrak{a}_S)$, and, in general, the index 0 denotes the reduction of a S-scheme modulo $\mathfrak{a}_S$, or the data defined over S_0. Under these hypotheses, the inverse image functors will be the functors f_0^* defined by applying 4.4.5.11. In particular, we generalize what we have said above by supposing that, when a morphism $f_0 : X_0 \to Y_0$ is given, we have $\mathcal{B}_X = f_0^*\mathcal{B}_Y$.

(iii) To state the properties of commutation with F^*, we suppose that p is nilpotent on S, and that S is equipped with a quasi-coherent m-PD-ideal $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha)$ such that $p \in \mathfrak{a}_S$. We suppose fixed an integer s, and, if X is a smooth S-scheme, we denote by X' a smooth S-scheme lifting $X_0^{(s)}$.

These properties can be stated first in a "lifted" situation: we shall not make the hypotheses of m-PD-nilpotence on $\mathfrak{a}_S$, the morphisms of schemes considered will be smooth morphisms of S-schemes, and the diagrams will be commutative on S. We denote $F : X \to X'$ a S- morphism lifting the morphism of relative Frobenius $F^s_{X_0/S_0}$.

(iv) Finally, we will give a "crystalline" variant of the preceding statements: we suppose then that S and $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha)$ satisfy the hypotheses (ii) and (iii), therefore, in particular that $\mathfrak{a}_S$ is m-PD-nilpotent. In this case, again it suffices that the morphisms are given between the reductions on S_0. The inverse image functors will still be defined by applying 4.4.5.11, reinforced by 6.1.5.2 when, as for the functor $F^*_{X_0/S_0}$, it will be necessary to take into account the raising of the level by Frobenius.

We keep notation 6.1.

6.2.1 Definition

Definition 6.2.1.1. Let M be a family of morphisms of ringed spaces $\widetilde{f}\colon (X, \mathcal{B}_X) \to (Y, \mathcal{B}_Y)$ where the underlying map $X \to Y$, denoted by f, is a morphism of smooth S-schemes, $\mathcal{B}_X$ (resp. $\mathcal{B}_Y$) be a commutative $\mathcal{O}_X$-algebra (resp. $\mathcal{O}_Y$-algebra) endowed with a compatible structure of left $\mathcal{D}_{X/S}^{(m)}$-module (resp. $\mathcal{D}_{Y/S}^{(m)}$-module), where the underlying morphism of algebras $f^*\mathcal{B}_Y \to \mathcal{B}_X$ is moreover $\mathcal{D}_{X/S}^{(m)}$-linear (recall that the action of left $\mathcal{D}_{X/S}^{(m)}$-module on $f^*\mathcal{B}_Y$ is compatible with its structure of $\mathcal{O}_X$-algebra (see 3.4.4.6). For such a $\widetilde{f} \in M$, we set $\widetilde{\mathcal{D}}_{X/S}^{(m)} = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}_{X/S}^{(m)}$ and $\widetilde{\mathcal{D}}_{Y/S}^{(m)} = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}_{Y/S}^{(m)}$. For any integer m and every morphism $\widetilde{f}$ of M, suppose given some functors $\phi_{\widetilde{f}}^{(m)} \colon D({}^{1}\widetilde{\mathcal{D}}_{X/S}^{(m)}) \to D({}^{1}\widetilde{\mathcal{D}}_{Y/S}^{(m)})$ (resp. $\phi_{\widetilde{f}}^{(m)} \colon D(\widetilde{\mathcal{D}}_{X/S}^{(m)}{}^{d}) \to D(\widetilde{\mathcal{D}}_{Y/S}^{(m)}{}^{r})$).

We say that the family $(\phi_{\widetilde{f}}^{(m)})_{\widetilde{f} \in M}$ *commutes with Frobenius* if for any morphism $\widetilde{f}\colon (X, \mathcal{B}_X) \to (Y, \mathcal{B}_Y)$ of M, for any integer s, for any smooth lifting X'/S (resp. Y'/S) of $X_0^{(s)}/S_0$ (resp. $Y_0^{(s)}/S_0$) and $F_X \colon X \to X'$, $F_Y \colon Y \to Y'$ liftings of $F^s_{X_0/S_0}$, $F^s_{Y_0/S_0}$ for any morphism $\widetilde{f}'\colon (X', \mathcal{B}_{X'}) \to (Y', \mathcal{B}_{Y'})$ of M such that f' is a lifting of $f_0^{(s)}$, $\mathcal{B}_X = F_X^*\mathcal{B}_{X'}$, $\mathcal{B}_Y = F_Y^*\mathcal{B}_{Y'}$ and satisfying $F_Y \circ f = f' \circ F_X$, there exists for any $\mathcal{E}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ (resp. $\mathcal{M}' \in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S}{}^{\mathrm{r}})$) a functorial in $\mathcal{E}'$ (resp. $\mathcal{M}$) canonical isomorphism of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m+s)}_{Y/S})$ (resp. $D(\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}{}^{\mathrm{r}})$) of the form:

$$F_Y^* \circ \phi^{(m)}_{f'}(\mathcal{E}') \xrightarrow{\sim} \phi^{(m+s)}_{\widetilde{f}} \circ F_X^*(\mathcal{E}') \text{ (resp. } F_Y^\flat \circ \phi^{(m)}_{f'}(\mathcal{M}')) \to \phi^{(m+s)}_{\widetilde{f}} \circ F_X^\flat(\mathcal{M}'). \qquad (6.2.1.1.1)$$

This definition extends to bifunctors, to complexes of bimodules, and also to functors of the form $\phi^{(m)}_{\widetilde{f}} : D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{Y/S}) \to D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X/S})$ or of the form $\phi^{(m)}_{\widetilde{f}} : D^-(\widetilde{\mathcal{D}}^{(m)}_{Y/S}{}^{\mathrm{r}}) \to D^-(\widetilde{\mathcal{D}}^{(m)}_{X/S}{}^{\mathrm{l}})$ etc.

6.2.2 Internal tensor products, homomorphisms

Lemma 6.2.2.1. *We assume the hypotheses 6.2 (iii).*

(a) Suppose $F : X \to X'$ is a lift of $F^s_{X_0/S_0}$ and let $\mathcal{E}', \mathcal{F}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'})$, $\mathcal{M}' \in D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X'})$. There exists in $D^-(\widetilde{\mathcal{D}}^{(m+s)}_X)$ a canonical isomorphism:

$$F^*\mathcal{E}' \otimes^{\mathbb{L}}_{\mathcal{B}_X} F^*\mathcal{F}' \xrightarrow{\sim} F^*(\mathcal{E}' \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} \mathcal{F}'), \qquad (6.2.2.1.1)$$

i.e. the bifunctor $- \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} -$ commutes with Frobenius (in Definition 6.2.1.1, the morphisms $\widetilde{f} \in M$ consist in the family of identities). Moreover, we have the canonical isomorphism

$$F^\flat\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{B}_X} F^*\mathcal{E}' \xrightarrow{\sim} F^*(\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} \mathcal{E}'). \qquad (6.2.2.1.2)$$

(b) If $\mathfrak{a}_S$ is m-PD-nilpotent and if $\mathcal{E}', \mathcal{F}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'})$, there exists in $D(\widetilde{\mathcal{D}}^{(m+s)}_X)$ a canonical isomorphism:

$$F^{s*}_{X_0/S_0}\mathcal{E}' \otimes^{\mathbb{L}}_{\mathcal{B}_X} F^{s*}_{X_0/S_0}\mathcal{F}' \xrightarrow{\sim} F^{s*}_{X_0/S_0}(\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \mathcal{F}'). \qquad (6.2.2.1.3)$$

Proof. (a) i) Let $\mathcal{P}'$ be a K-flat resolution on $\widetilde{\mathcal{D}}^{(m)}_{X'}$ of $\mathcal{F}'$. As $\mathcal{P}'$ is also a K-flat complex of $\mathcal{B}_{X'}$-modules, the domain and range of (6.2.2.1.1) are complexes of $\widetilde{\mathcal{D}}^{(m+s)}_X$-modules given respectively by $F^*\mathcal{E}' \otimes_{\mathcal{B}_X} F^*\mathcal{P}'$ and $F^*(\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \mathcal{P}')$. It suffices thus to verify that the canonical $\mathcal{B}_X$-linear isomorphism between these complexes are $\widetilde{\mathcal{D}}^{(m+s)}_X$-linear. We can suppose that $\mathcal{E}'$ and $\mathcal{P}'$ are reduced to a single module, and we are reduced to check that this isomorphism is horizontal for the $(m+s)$-PD-stratifications of $F^*\mathcal{E}' \otimes F^*\mathcal{F}'$ and $F^*(\mathcal{E}' \otimes \mathcal{F}')$. If (ε'_n), (η'_n) are the (m)-PD-stratifications of $\mathcal{E}'$, $\mathcal{F}'$, those of $\mathcal{E}' \otimes \mathcal{F}'$ are then $(\varepsilon'_n \otimes \eta'_n)$, and with notation of 6.1.1.5 the assertion results from that the inverse image by the morphisms $\Phi^n : \widetilde{\Delta}^n_{X/S(m+s)} \to \widetilde{\Delta}^n_{X'/S(m)}$ commutes with tensor product.

ii) By using 4.3.5.8 and 6.1.2.5, we deduce 6.2.2.1.2 from 6.2.2.1.1.

The case (b) follows from the case (a) once we observe that the isomorphisms of the glueing $\tau_{F,F'}$ themselves commute with tensor product, since they are deduced from the m-PD-stratifications by applying an inverse image functor. □

Proposition 6.2.2.2. *Let $\mathcal{E}'$ and $\mathcal{F}'$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-modules. Let $\mathcal{M}'$ and $\mathcal{N}'$ be two right $\widetilde{\mathcal{D}}^{(m)}_{X'}$-modules. The canonical morphism*

$$F^*(\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}', \mathcal{F}')) \to \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}', F^*\mathcal{F}') \qquad (6.2.2.2.1)$$

is an isomorphism of left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules, i.e. the bifunctor $\mathcal{H}om_{\mathcal{B}_{X'}}(-,-)$ therefore commutes with Frobenius. Moreover, we have respectively the canonical isomorphisms of right and left $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules

$$F^\flat(\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}', \mathcal{M}')) \to \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}', F^\flat\mathcal{M}'),$$
$$F^*(\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{M}', \mathcal{N}')) \to \mathcal{H}om_{\mathcal{B}_X}(F^\flat\mathcal{M}', F^\flat\mathcal{N}'). \qquad (6.2.2.2.2)$$

Proof. Since $\mathcal{B}_X$ is a locally free $\mathcal{B}_{X'}$-algebra, then the canonical morphism 6.2.2.2.1 is an isomorphism of $\mathcal{B}_X$-modules. We check the $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-linearity of 6.2.2.2.1 similarly to the proof of 4.4.5.14 by replacing the morphism $\tilde{f}_n$ by the morphism $\widetilde{\Delta}^n_{X/S(m+s)} \to \widetilde{\Delta}^n_{X'/S(m)}$. By using 4.3.5.8 and 6.1.2.5, this implies 6.2.2.2.2. □

Proposition 6.2.2.3. *Let $\mathcal{E}'$ be a $\widetilde{\mathcal{D}}^{(m)}_{X'}$-bimodule and $\mathcal{F}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module. So we have the canonical isomorphism:*

$$(F^*F^\flat\mathcal{E}')\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}(F^*\mathcal{F}') \xrightarrow{\sim} F^*(\mathcal{E}'\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{F}'). \tag{6.2.2.3.1}$$

The bifunctor $-\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}-$ therefore commutes with Frobenius.

Proof. By functoriality, it follows from 6.1.3.6.1 that we have the canonical isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-modules :

$$F^\flat\mathcal{E}'\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}F^*\mathcal{F}' \xrightarrow{\sim} \mathcal{E}'\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{F}'.$$

By applying to it the functor F^*, this yields the proposition. □

Proposition 6.2.2.4. *Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module and $\mathcal{F}'$ be a $\widetilde{\mathcal{D}}^{(m)}_{X'}$-bimodule. Hence we have the canonical isomorphism of right $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-modules :*

$$F^\flat\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(\mathcal{E}',\mathcal{F}') \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(\mathcal{E}',F^\flat\mathcal{F}') \xrightarrow{\sim} \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}(F^*\mathcal{E}',F^*F^\flat\mathcal{F}'). \tag{6.2.2.4.1}$$

The bifunctor $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(-,-)$ therefore commutes with Frobenius.

Proof. Since $\widetilde{F^\flat}\widetilde{\mathcal{D}}^{(m)}_{X'}$ is a locally free left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module, then the canonical isomorphism

$$\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(\mathcal{E}',\mathcal{F}')\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\widetilde{F^\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \to \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(\mathcal{E}',\mathcal{F}'\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\widetilde{F^\flat}\widetilde{\mathcal{D}}^{(m)}_{X'})$$

is an isomorphism. Since $F^\flat$ is canonically isomorphic to the functor $-\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\widetilde{F^\flat}\widetilde{\mathcal{D}}^{(m)}_{X'}$, then we get the first isomorphism of 6.2.2.4.1. Moreover, the theorem 6.1.1.9 gives us the isomorphism $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(\mathcal{E}',F^\flat\mathcal{F}') \xrightarrow{\sim}$ $\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}(F^*\mathcal{E}',F^*F^\flat\mathcal{F}')$. Hence, we are done. □

6.2.2.5. Suppose there exists a morphism of schemes $S\to B$ such that the composition morphism $\widetilde{g}'\colon(X',\mathcal{B}_{X'})\to B$ and $\widetilde{g}\colon(X,\mathcal{B}_X)\to B$ are flat. In particular, $\mathcal{B}_X$ and $\mathcal{B}_{X'}$ are quasi-flat $\mathcal{O}_S$-algebras (see Definition 3.1.1.5). Then $\widetilde{g}^{-1}\mathcal{O}_B$ is a solving ring of $(\widetilde{\mathcal{D}}^{(m)}_{X'/S},\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, $(\widetilde{\mathcal{D}}^{(m+s)}_{X/S},\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ and $(\widetilde{\mathcal{D}}^{(m+s)}_{X/S},\widetilde{\mathcal{D}}^{(m+s)}_{X/S})$ (see definition 4.6.3.2).

Proposition 6.2.2.6. *Suppose the hypotheses of 6.2.2.5 are satisfied. Let $\mathcal{E}'\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'})$ and $\mathcal{F}'\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'}\otimes_{\mathcal{O}_S}\widetilde{\mathcal{D}}^{(m)\,\mathrm{op}}_{X'})$. Hence we have the canonical isomorphism of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m+s)}_{X/S})$:*

$$F^\flat\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(\mathcal{E}',\mathcal{F}') \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(\mathcal{E}',F^\flat\mathcal{F}') \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}(F^*\mathcal{E}',F^*F^\flat\mathcal{F}'). \tag{6.2.2.6.1}$$

The bifunctor $\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(-,-)$ therefore commutes with Frobenius.

Proof. Let $\mathcal{I}'$ be K-injective complex of $K^-({}^{l}\widetilde{\mathcal{D}}^{(m)}_{X'/S}\otimes_{\mathcal{O}_S}\widetilde{\mathcal{D}}^{(m)\,\mathrm{op}}_{X'/S})$ which represents $\mathcal{F}'$. Then following 6.1.3.5.(b), $F^\flat\mathcal{I}'$ is a K-injective complex of $K^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}\otimes_{\mathcal{O}_S}\widetilde{\mathcal{D}}^{(m+s)\,\mathrm{op}}_{X/S})$ which represents $F^\flat\mathcal{F}'$ and $F^*F^\flat\mathcal{I}'$ is a K-injective complex of $K^-({}^{l}\widetilde{\mathcal{D}}^{(m+s)}_{X/S}\otimes_{\mathcal{O}_S}\widetilde{\mathcal{D}}^{(m+s)\,\mathrm{op}}_{X/S})$ which represents $F^*F^\flat\mathcal{F}'$ Hence, we get the isomorphisms 6.2.2.6.1 from 6.2.2.4.1.

□

6.2.3 Extension of the coefficients, level rising

We assume the hypotheses 6.2 (iii) holds. Let $m'\geq m$, $\mathcal{B}_{X'}$ (resp. $\mathcal{C}_{X'}$) an $\mathcal{O}_{X'}$-algebra equipped with a compatible action of $\mathcal{D}^{(m)}_{X'}$ (resp. $\mathcal{D}^{(m')}_{X'}$), $\mathcal{B}_{X'}\to\mathcal{C}_{X'}$ a $\mathcal{D}^{(m)}_{X'}$-linear momorphism of $\mathcal{O}_{X'}$-algebras. We put $\mathcal{B}_X=F^*\mathcal{B}_{X'}$, $\mathcal{C}_X=F^*\mathcal{C}_{X'}$, and we equip these algebras with actions of $\mathcal{D}^{(m+s)}_X$, $\mathcal{D}^{(m'+s)}_X$ respectively defined thanks to 6.1.1.6. We can then consider the sheaves of differential operators with coefficients in these algebras, defined by

$$\widetilde{\mathcal{D}}^{(m)}_{X'}=\mathcal{B}_{X'}\otimes_{\mathcal{O}_{X'}}\mathcal{D}^{(m)}_{X'},\qquad \widetilde{\mathcal{D}}^{(m+s)}_{X}=\mathcal{B}_{X}\otimes_{\mathcal{O}_{X}}\mathcal{D}^{(m+s)}_{X},$$
$$\widetilde{\mathcal{D}}^{(m')}_{X'}=\mathcal{C}_{X'}\otimes_{\mathcal{O}_{X'}}\mathcal{D}^{(m')}_{X'},\qquad \widetilde{\mathcal{D}}^{(m'+s)}_{X}=\mathcal{C}_{X}\otimes_{\mathcal{O}_{X}}\mathcal{D}^{(m'+s)}_{X}.$$

6.2.3.1. The isomorphism of $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-bimodules $\vartheta\colon \widetilde{\mathcal{D}}^{(m+s)}_{X/S} \xrightarrow{\sim} F^*F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}$ (see 6.1.3.2.1) is by construction (see the proof of [Ber00, 2.5.2]) built by extension from the case where $\mathcal{B}=\mathcal{O}$, i.e. the composition

$$F^*F^\flat(\mathcal{B}_{X'}\otimes_{\mathcal{O}_{X'}}\widetilde{\mathcal{D}}^{(m)}_{X'}) \xrightarrow{\sim} F^*(\mathcal{B}_{X'}\otimes_{\mathcal{O}_{X'}} F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}) \overset{6.2.2.1.1}{\xrightarrow{\sim}} \mathcal{B}_X\otimes_{\mathcal{O}_X} F^*F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'} \xrightarrow{\vartheta} \mathcal{B}_X\otimes_{\mathcal{O}_X}\widetilde{\mathcal{D}}^{(m)}_{X/S}$$

is ϑ. This yields that ϑ is compatible with extension of the coefficients. We moreover easily check its compatibility with changes of level. To sump up the following diagram is commutative :

$$\begin{array}{ccc} F^*F^\flat(\mathcal{D}^{(m)}_{X'}) & \xrightarrow{F^*F^\flat(\rho)} & F^*F^\flat(\mathcal{D}^{(m')}_{X'}) \\ {\scriptstyle\vartheta}\uparrow{\scriptstyle\sim} & & {\scriptstyle\mathrm{id}\otimes\vartheta}\uparrow{\scriptstyle\sim} \\ \mathcal{D}^{(m+s)}_{X/S} & \xrightarrow{\rho} & \mathcal{D}^{(m'+s)}_{X/S}. \end{array} \tag{6.2.3.1.1}$$

6.2.3.2. For any left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module $\mathcal{E}'$, we get the morphism of left $\widetilde{\mathcal{D}}^{(m'+s)}_{X/S}$-modules

$$\widetilde{\mathcal{D}}^{(m'+s)}_{X/S}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \xrightarrow{\sim} F^*(\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{E}') \tag{6.2.3.2.1}$$

as being the unique $\widetilde{\mathcal{D}}^{(m'+s)}_{X/S}$-linear morphism making commutative the following diagram :

$$F^*\mathcal{E} \longrightarrow \widetilde{\mathcal{D}}^{(m'+s)}_{X/S}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \dashrightarrow F^*(\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{E}'). \tag{6.2.3.2.2}$$

On the other hand, inspired by 6.2.2.3.1, we can construct an isomorphism of the form 6.2.3.2.1 in a different way as follows: by considering $\widetilde{\mathcal{D}}^{(m')}_{X'}$ as a $(\widetilde{\mathcal{D}}^{(m')}_{X'},\widetilde{\mathcal{D}}^{(m)}_{X'})$-bimodule, we get the isomorphism of $(\widetilde{\mathcal{D}}^{(m'+s)}_{X},\widetilde{\mathcal{D}}^{(m+s)}_{X})$-bimodules:

$$F^*F^\flat\widetilde{\mathcal{D}}^{(m')}_{X'} \xrightarrow{\sim} F^*\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m')}_{X'}}\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}. \tag{6.2.3.2.3}$$

This yields the first functorial in $\mathcal{E}'$ isomorphism of left $\widetilde{\mathcal{D}}^{(m')}_{X'}$-modules:

$$\begin{aligned} &\widetilde{\mathcal{D}}^{(m'+s)}_{X/S}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \underset{\vartheta\otimes\mathrm{id}}{\overset{6.1.3.2.1}{\xrightarrow{\sim}}} F^*F^\flat\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \overset{6.2.3.2.3}{\xrightarrow{\sim}} \\ &F^*\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m')}_{X'}}\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}(F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}') \overset{6.1.3.6.1}{\xrightarrow{\sim}} F^*(\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{E}'). \end{aligned} \tag{6.2.3.2.4}$$

Proposition 6.2.3.3. *Both constructions of 6.2.3.2 of the isomorphism of left $\widetilde{\mathcal{D}}^{(m'+s)}_{X/S}$-modules of the form*

$$\widetilde{\mathcal{D}}^{(m'+s)}_{X/S}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \xrightarrow{\sim} F^*(\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{E}')$$

coincide. The functor $\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} -$ therefore commutes with Frobenius.

Proof. Let us denote by ϑ the isomorphisms of the form $\widetilde{\mathcal{D}}^{(m+s)}_{X/S} \xrightarrow{\sim} F^*F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}$ and ρ the ones of the form $\widetilde{\mathcal{D}}^{(m)}_{X'}\to\widetilde{\mathcal{D}}^{(m')}_{X'}$ or $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}\to\widetilde{\mathcal{D}}^{(m'+s)}_{X/S}$ etc. By uniqueness of the factorization of the diagram 6.2.3.2.2, it is sufficient to establish the commutativity of the diagram below:

$$\begin{array}{ccccc} F^*\mathcal{E}' & = & = & = & F^*\mathcal{E}' \\ \uparrow{\scriptstyle\sim} & & & & \uparrow{\scriptstyle\sim} \\ \widetilde{\mathcal{D}}^{(m+s)}_{X/S}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' & \underset{\sim}{\xrightarrow{\vartheta\otimes\mathrm{id}}} & F^*F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' & \underset{\sim}{\xrightarrow{6.1.3.6.1}} & F^*(\widetilde{\mathcal{D}}^{(m)}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{E}') \\ \downarrow{\scriptstyle\rho\otimes\mathrm{id}} & & \downarrow{\scriptstyle F^*F^\flat(\rho)\otimes\mathrm{id}} & & \downarrow{\scriptstyle F^*(\rho)\otimes\mathrm{id}} \\ \widetilde{\mathcal{D}}^{(m'+s)}_{X/S}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' & \underset{\sim}{\xrightarrow{\vartheta\otimes\mathrm{id}}} & F^*F^\flat\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' & \underset{\sim}{\xrightarrow{6.2.3.2.4}} & F^*(\widetilde{\mathcal{D}}^{(m')}_{X'}\otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}}\mathcal{E}'). \end{array} \tag{6.2.3.3.1}$$

By construction of 6.2.3.2.4, the right diagram is commutative. Moreover, the canonical isomorphism $F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}' \xrightarrow{\sim} \mathcal{E}'$ was constructed such that the rectangle of the top of 6.2.3.3.1 is commutative (see the proof of [Ber00, 2.5.5.(i)]). By applying to the right diagram of 6.2.3.1.1 the functor $-\otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*\mathcal{E}'$, we get the commutativity of left bottom square of 6.2.3.3.1. □

Corollary 6.2.3.4. *Let $\mathcal{E}' \in D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'})$. There exists in $D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m'+s)}_{X})$ a canonical isomorphism*

$$\widetilde{\mathcal{D}}^{(m'+s)}_{X} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X}} F^*\mathcal{E}' \xrightarrow{\sim} F^*(\widetilde{\mathcal{D}}^{(m')}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}') \tag{6.2.3.4.1}$$

Proof. Thanks to 6.1.3.6, we obtain the isomorphism (6.2.3.4.1) by applying (6.2.3.4) to a flat resolution of $\mathcal{E}'$. □

Corollary 6.2.3.5. *Under the hypotheses 6.2(iv), we put $\mathcal{B}_X = F^*_{X_0/S_0}\mathcal{B}_{X'}$, $\mathcal{C}_X = F^*_{X_0/S_0}\mathcal{C}_{X'}$. For any $\mathcal{E}' \in D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'})$, there exists in $D^-({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m'+s)}_{X})$ a canonical isomorphism*

$$\widetilde{\mathcal{D}}^{(m'+s)}_{X} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}^{(m+s)}_{X}}{\otimes}} F^{s*}_{X_0/S_0}\mathcal{E}' \simeq F^{s*}_{X_0/S_0}(\widetilde{\mathcal{D}}^{(m')}_{X'} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}^{(m)}_{X'}}{\otimes}} \mathcal{E}').$$

Proof. Let $F, F' \colon U \to X'$be two liftings of F_{X^0/S_0} on an open subset U of X. For any $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module $\mathcal{E}'$, we have isomorphisms $\tau^{(m+s)}_{F,F'} \colon F'^*\mathcal{E}' \xrightarrow{\sim} F^*\mathcal{E}'$, and

$$\tau^{(m'+s)}_{F,F'} \colon F'^*(\widetilde{\mathcal{D}}^{(m')}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}') \xrightarrow{\sim} F^*(\widetilde{\mathcal{D}}^{(m')}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}').$$

The square

$$\begin{array}{ccc}
\widetilde{\mathcal{D}}^{(m'+s)}_{X} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X}} F'^*\mathcal{E}' & \xrightarrow{\sim} & F'^*(\widetilde{\mathcal{D}}^{(m')}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}') \\
{\scriptstyle \mathrm{id}\otimes\tau^{(m+s)}_{F,F'}}\downarrow\wr & & {\scriptstyle \tau^{(m'+s)}_{F,F'}}\downarrow\wr \\
\widetilde{\mathcal{D}}^{(m'+s)}_{X} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X}} F^*\mathcal{E}' & \xrightarrow{\sim} & F^*(\widetilde{\mathcal{D}}^{(m')}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}')
\end{array}$$

formed from the isomorphisms (6.2.3.4) relative to F, F' is commutative, because it suffices to prove it before taking tensor product with $\widetilde{\mathcal{D}}^{(m'+s)}_{X}$ on the left along the columns. Then it follows from the functoriality of $\tau^{(m+s)}_{F,F'}$ applied to the homomorphism $\mathcal{E}' \to \widetilde{\mathcal{D}}^{(m')}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}'$, and from this, if $\mathcal{F}'$ is a $\widetilde{\mathcal{D}}^{(m')}_{X'}$-module, the isomorphisms $\tau^{(m+s)}_{F,F'}$, $\tau^{(m'+s)}_{F,F'}$ relative to $\mathcal{F}'$ are equal.

It follows that the isomorphisms (6.2.3.4) defined by the local liftings of Frobenius can be glued, and we obtain thus for any $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module a global isomorphism

$$\widetilde{\mathcal{D}}^{(m'+s)}_{X} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X}} F^{s*}_{X_0/S_0}\mathcal{E}' \simeq F^{s*}_{X_0/S_0}(\widetilde{\mathcal{D}}^{(m')}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'}} \mathcal{E}').$$

By taking flat resolutions on $\widetilde{\mathcal{D}}^{(m)}_{X'}$, this isomorphism extends to derived categories. □

6.2.4 Base change and extraordinary inverse image

Proposition 6.2.4.1 (Base change)**.** *Suppose that S and T are quipped with quasi-coherent m-PD ideals $(\mathfrak{a}_S, \mathfrak{b}_S, \alpha_S)$, $(\mathfrak{a}_T, \mathfrak{b}_T, \alpha_T)$ satisfying the hypotheses 6.2(iii), and such that $S \to T$ is a m-PD-morphism. Let $X' = S \times_T Y'$, $f' \colon X' \to Y'$ the projection, $\mathcal{B}_{Y'}$ an $\mathcal{O}_{Y'}$-algebra equipped with compatible action of $\mathcal{D}^{(m)}_{Y'}$, $\mathcal{B}_{X'} = f^*\mathcal{B}_{Y'}$.*

(a) If $F_Y \colon Y \to Y'$ is a lifting of $F^s_{Y_0/S_0}$, let $F_X : X \to X'$ be the morphism deduced from F_Y by base change, $\mathcal{B}_Y = F^*_Y\mathcal{B}_{Y'}$, $\mathcal{B}_X = f^*\mathcal{B}_Y \simeq F^*_X\mathcal{B}_{X'}$. For any $\mathcal{F}' \in D^-(\widetilde{\mathcal{D}}^{(m)}_{Y'})$ there exists a canonical isomorphism of $D^-(\widetilde{\mathcal{D}}^{(m+s)}_{X})$

$$\widetilde{\mathcal{D}}^{(m+s)}_{X} \overset{\mathbb{L}}{\underset{f^{-1}(\widetilde{\mathcal{D}}^{(m+s)}_{Y})}{\otimes}} f^{-1}F^*_Y\mathcal{F}' \xrightarrow{\sim} F^*_X(\widetilde{\mathcal{D}}^{(m)}_{X'} \overset{\mathbb{L}}{\underset{f^{-1}(\widetilde{\mathcal{D}}^{(m+s)}_{Y'})}{\otimes}} f^{-1}\mathcal{F}').$$

(b) *If $\mathfrak{a}_S$ and $\mathfrak{a}_T$ are m-PD nilpotent, let $\mathcal{B}_Y = F^{s*}_{Y_0/S_0}\mathcal{B}_{Y'}$, $\mathcal{B}_X = f^*\mathcal{B}_Y \simeq F^{s*}_{X_0/S_0}\mathcal{B}_{X'}$. For any $\mathcal{F}' \in D^-(\widetilde{\mathcal{D}}^{(m)}_{Y'})$, there exists a canonical isomorphism of $D^-(\widetilde{\mathcal{D}}^{(m+s)}_X)$*

$$\widetilde{\mathcal{D}}^{(m+s)}_X \overset{\mathbb{L}}{\underset{f^{-1}(\widetilde{\mathcal{D}}^{(m+s)}_Y)}{\otimes}} f^{-1}F^{s*}_{Y_0/S_0}\mathcal{F}' \xrightarrow{\sim} F^{s*}_{X_0/S_0}(\widetilde{\mathcal{D}}^{(m)}_{X'} \overset{\mathbb{L}}{\underset{f^{-1}(\widetilde{\mathcal{D}}^{(m+s)}_{Y'})}{\otimes}} f^{-1}\mathcal{F}').$$

Proof. It suffices to prove the non-derived version of these isomorphisms when $\mathcal{F}'$ reduces to a $\widetilde{\mathcal{D}}^{(m)}_{Y'}$-module, because one can calculate the derived functor by replacing $\mathcal{F}'$ with a flat resolution on $\widetilde{\mathcal{D}}^{(m)}_{Y'}$. Using the isomorphism (5.1.1.15.2), we see that we just have to define a $\widetilde{\mathcal{D}}^{(m+s)}_X$-linear isomorphism $f^*F^*_Y\mathcal{F}' \xrightarrow{\sim} F^*_X f'^*\mathcal{F}'$ (resp. $f^*F^{s*}_{Y_0/S_0}\mathcal{F}' \xrightarrow{\sim} F^{s*}_{X_0/S_0}f'^*\mathcal{F}'$). In the first case we have $f' \circ F_X = F_Y \circ f$, i suffices to apply the transitivity isomorphism. In the second case we use

$$(F^{s*}_{Y_0/S_0} \circ f_0)^* \simeq f_0^* \circ F^{s\,*}_{Y_0/S_0} \simeq F^{s\,*}_{X_0/S_0} \circ f_0^{(s)^*}.$$

□

Proposition 6.2.4.2. *Under the hypotheses 6.2 (iii), let $f_0\colon X_0 \to Y_0$ be a morphism of smooth S_0-schemes, X, Y, X', Y' are smooth S-schemes lifting X_0, Y_0, $X_0^{(s)}, Y_0^{(s)}$.*

(a) *Suppose given S-morphisms $f\colon X \to Y$, $f'\colon X' \to Y'$, $F_X : X \to X'$, $F_Y : Y \to Y'$ lifting f_0, $f_0^{(s)}$, $F^s_{X_0/S_0}$, $F^s_{Y_0/S_0}$. If $F_Y \circ f = f' \circ F_X$, there exists for any $\mathcal{F}'$ in $D^-(\widetilde{\mathcal{D}}^{(m)}_{Y'})$ a canonical isomorphism of $D^-(\widetilde{\mathcal{D}}^{(m+s)}_X)$*

$$f^{!(m+s)}F^*_Y\mathcal{F}' \xrightarrow{\sim} F^*_X(f^{!(m)}\mathcal{F}'). \tag{6.2.4.2.1}$$

(b) *Suppose $\mathfrak{a}_S$ is m-PD-nilpotent. For any $\mathcal{F}'$ in $D^-(\widetilde{\mathcal{D}}^{(m)}_{Y'})$ a canonical isomorphism of $D^-(\widetilde{\mathcal{D}}^{(m+s)}_X)$*

$$f_0^{!(m+s)}F^{s*}_{Y_0/S_0}\mathcal{F}' \xrightarrow{\sim} F^{s*}_{X_0/S_0}(f_0^{(s)!(m)}\mathcal{F}'). \tag{6.2.4.2.2}$$

Proof. Note that $d_{X'/Y'} = d_{X/Y}$. Let $\mathcal{P}'$ be a resolution of $\mathcal{F}'$ flat on $\widetilde{\mathcal{D}}^{(m)}_{Y'}$. Thanks to 6.1.3.6 we are reduced in the first case to construct a canonical $\widetilde{\mathcal{D}}^{(m+s)}_X$-linear isomorphism

$$f^*F^*_Y\mathcal{P}' \xrightarrow{\sim} F^*_X f'^*\mathcal{P}' \tag{6.2.4.2.3}$$

This isomorphism holds without hypotheses by applying 6.1.1.6 (and 6.1.1.7).

In case (b) we need the same construction of a canonical $\widetilde{\mathcal{D}}^{(m+s)}_X$-linear isomorphism

$$f_0^*F^{s*}_{Y_0/S_0}\mathcal{P}' \xrightarrow{\sim} F^{s*}_{X_0/S_0}f_0{}^{(s)*}\mathcal{P}', \tag{6.2.4.2.4}$$

and this isomorphism is furnished by 6.1.5.2.1

□

Remark 6.2.4.3. Applying the assertion (ii) to the particular case where X and Y are two lifting of X_0 and $f_0 = \mathrm{Id}_{X_0}$, the independence equivalences of 4.4.5.12 are compatible with the functors F^*.

6.2.5 External tensor products

The compatibility of the functor F^* with external tensor product (see 5.1.5) is analogous to what we have just seen for the inverse images.

Proposition 6.2.5.1. *Under the hypotheses 6.2(iii), let X, Y be smooth S schemes, with reductions X_0, Y_0 and X', Y' the smooth S-schemes lifting $X_0^{(s)}$, $Y_0^{(s)}$. Write $Z = X \times_S Y$, $Z_0 = X_0 \times_{S_0} Y_0$, $Z' = X' \times_{S'} Y'$. Let $\mathcal{B}_{X'}$ (resp. $\mathcal{B}_{Y'}$) is an $\mathcal{O}_{X'}$-algebra (resp. $\mathcal{O}_{Y'}$-algebra) equipped with a compatible action of $\mathcal{D}^{(m)}_{X'}$ (resp. $\mathcal{D}^{(m)}_{Y'}$, $\mathcal{B}_{Z'} = \mathcal{B}_{X'} \boxtimes_{\mathcal{O}_S} \mathcal{B}_{Y'}$ be the $\mathcal{O}_{Z'}$-algebra equipped with a compatible action of $\mathcal{D}^{(m)}_{Z'}$. We note as before $\widetilde{\mathcal{D}}^{(m)}_{X'} = \mathcal{B}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}$, $\widetilde{\mathcal{D}}^{(m)}_{Y'} = \mathcal{B}_{Y'} \otimes_{\mathcal{O}_{Y'}} \mathcal{D}^{(m)}_{Y'}$, $\widetilde{\mathcal{D}}^{(m)}_{Z'} = \mathcal{B}_{Z'} \otimes_{\mathcal{O}_{Z'}} \mathcal{D}^{(m)}_{Z'}$. Set $\mathcal{B}_X := F^{s*}_{X_0/S_0}$, $\mathcal{B}_Y := F^{s*}_{Y_0/S_0}$ and $\mathcal{B}_Z := F^{s*}_{Z_0/S_0}$. We note as before $\widetilde{\mathcal{D}}^{(m+s)}_X = \mathcal{B}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m+s)}_X$, $\widetilde{\mathcal{D}}^{(m+s)}_Y = \mathcal{B}_Y \otimes_{\mathcal{O}_Y} \mathcal{D}^{(m+s)}_Y$, $\widetilde{\mathcal{D}}^{(m+s)}_Z = \mathcal{B}_Z \otimes_{\mathcal{O}_Z} \mathcal{D}^{(m+s)}_Z$.*

(a) *Suppose given liftings* $F_X\colon X\to X'$, $F_Y\colon Y\to Y'$ *of* $F^s_{X_0/S_0}$, $F^s_{Y_0/S_0}$, *and put* $F_Z=F_X\times F_Y: Z\to Z'$. *If* $\mathcal{E}'\in D^-(\widetilde{\mathcal{D}}^{(m)}_{X'})$, $\mathcal{F}'\in D^-(\widetilde{\mathcal{D}}^{(m)}_{Y'})$, *there exists in* $D^-(\widetilde{\mathcal{D}}^{(m+s)}_{Z})$ *a canonical isomorphism*

$$F_X^*\mathcal{E}'\overset{\mathbb{L}}{\underset{\mathcal{O}_S}{\boxtimes}}F_Y^*\mathcal{F}'\xrightarrow{\sim}F_Z^*(\mathcal{E}'\overset{\mathbb{L}}{\underset{\mathcal{O}_S}{\boxtimes}}\mathcal{F}').$$

(b) *If* $\mathfrak{a}_S$ *is* m*-PD-nilpotent and if* $\mathcal{E}'\in D^-(\widetilde{\mathcal{D}}^{(m)}_{X'})$, $\mathcal{F}'\in D^-(\widetilde{\mathcal{D}}^{(m)}_{Y'})$, *there exists in* $D^-(\widetilde{\mathcal{D}}^{(m+s)}_{Z})$ *a canonical isomorphism:*

$$F^{s*}_{X_0/S_0}\mathcal{E}'\overset{\mathbb{L}}{\underset{\mathcal{O}_S}{\boxtimes}}F^{s*}_{Y_0/S_0}\mathcal{F}'\xrightarrow{\sim}F^{s*}_{Z_0/S_0}(\mathcal{E}'\overset{\mathbb{L}}{\underset{\mathcal{O}_S}{\boxtimes}}\mathcal{F}').$$

Proof. Let $f: Z\to X$, $g: Z\to Y$, $f': Z'\to X'$, $g': Z'\to Y'$ be projections and let $\mathcal{P}'$, $\mathcal{Q}'$ be flat resolutions of $\mathcal{E},\mathcal{F}$. For case (a) it suffices to define a $\widetilde{\mathcal{D}}^{(m+s)}_Z$-linear isomorphism

$$f^*F_X^*\mathcal{P}"\otimes_{\mathcal{O}_Z}g^*F_Y^*\mathcal{Q}'\xrightarrow{\sim}F_Z^*(f'^*\mathcal{P}'\otimes_{\mathcal{O}_{Z'}}g'^*\mathcal{Q}'),$$

and we take the composition of the isomorphisms in 6.1.1.6 (and 6.1.1.7) and (6.2.2.1.1):

$$f^*F_X^*\mathcal{P}"\otimes_{\mathcal{O}_Z}g^*F_Y^*\mathcal{Q}'\xrightarrow{\sim}F_Z^*f'^*\mathcal{P}'\otimes_{\mathcal{O}_Z}F_Z^*g'^*\mathcal{Q}'\xrightarrow{\sim}F_Z^*(f'^*\mathcal{P}'\otimes_{\mathcal{O}_{Z'}}g'^*\mathcal{Q}').$$

We treat the case (b) similarly. □

6.2.6 Direct image

We establish the commutation of f_+ with F^*.

Lemma 6.2.6.1. *Under the hypotheses 6.2(iii), let* $f\colon X\to Y$ *be a morphism of smooth* S*-schemes.*

(a) *Suppose given liftings* $F_X\colon X\to X'$, $F_Y\colon Y\to Y'$, $f'\colon X'\to Y'$ *of* $F^s_{X_0/S_0}$, $F^s_{Y_0/S_0}$, *and* $f_0^{(s)}$ *such that* $F_Y\circ f=f'\circ F_X$. *There exists canonical isomorphisms of* $(\widetilde{\mathcal{D}}^{(m+s)}_X,f^{-1}\widetilde{\mathcal{D}}^{(m+s)}_{Y/S})$*-bimodules and of* $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y/S},\widetilde{\mathcal{D}}^{(m)}_X)$*-bimodules*

$$\widetilde{\mathcal{D}}^{(m+s)}_{X\to Y/S}\xrightarrow{\sim}F_X^*F_Y^\flat\widetilde{\mathcal{D}}^{(m)}_{Y'\to X'/S}:=F_X^*(f'^*_{\mathrm{l}}(F_Y^\flat\widetilde{\mathcal{D}}^{(m)}_{Y'/S})),\tag{6.2.6.1.1}$$

$$\widetilde{\mathcal{D}}^{(m+s)}_{Y\leftarrow X/S}\xrightarrow{\sim}F_X^\flat F_Y^*\widetilde{\mathcal{D}}^{(m)}_{Y'\to X'/S}:=F^\flat_{X\mathrm{r}}\left(f'^*_{\mathrm{r}}(F^*_{Y,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S}\otimes_{\mathcal{O}_{Y'}}\omega^{-1}_{Y'/S}))\otimes_{\mathcal{O}_{X'}}\omega_{X'/S}\right).\tag{6.2.6.1.2}$$

(b) *If* $\mathfrak{a}_S$ *is* m*-PD-nilpotent, there exists canonical isomorphisms of* $(\widetilde{\mathcal{D}}^{(m+s)}_X,f^{-1}\widetilde{\mathcal{D}}^{(m+s)}_{Y/S})$*-bimodules and of* $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y/S},\widetilde{\mathcal{D}}^{(m)}_X)$*-bimodules*

$$\widetilde{\mathcal{D}}^{(m+s)}_{X\to Y/S}\xrightarrow{\sim}F^{s*}_{X_0/S_0}F^{s\flat}_{Y_0/S_0}\widetilde{\mathcal{D}}^{(m)}_{Y'\to X'/S}:=F^{s*}_{X_0/S_0}(f^{(s)*}_{0\mathrm{l}}(F^{s\flat}_{Y_0/S_0}\widetilde{\mathcal{D}}^{(m)}_{Y'/S})),\tag{6.2.6.1.3}$$

$$\widetilde{\mathcal{D}}^{(m+s)}_{Y\leftarrow X/S}\xrightarrow{\sim}F^{s\flat}_{X_0/S_0}F^{s*}_{Y_0/S_0}\widetilde{\mathcal{D}}^{(m)}_{Y'\to X'/S}\tag{6.2.6.1.4}$$

$$:=F^{s\flat}_{X_0/S_0,\mathrm{r}}\left(f^{(s)*}_{0\mathrm{r}}(F^{s*}_{Y_0/S_0,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S}\otimes_{\mathcal{O}_{Y'}}\omega^{-1}_{Y'/S}))\otimes_{\mathcal{O}_{X'}}\omega_{X'/S}\right)\tag{6.2.6.1.5}$$

Proof. According to 6.1.3.2 there exits a canonical isomorphism of $\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}$-bimodules

$$\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}\xrightarrow{\sim}F_Y^*F_Y^\flat\widetilde{\mathcal{D}}^{(m)}_{Y'/S}.\tag{6.2.6.1.6}$$

Apply to this f^* for the left structure, and use the $\widetilde{\mathcal{D}}^{(m+s)}_X$-linear isomorphism $f^*F_Y^*F_Y^\flat\widetilde{\mathcal{D}}^{(m)}_{Y'/S}\xrightarrow{\sim}F_X^*f'^*F_Y^\flat\widetilde{\mathcal{D}}^{(m)}_{Y'/S}$ furnished by (6.2.4.2.3) we get (6.2.6.1.1).

Tensor (6.2.6.1.6) on the right by $\omega_{Y/S}^{-1}$ and use 6.1.2.6.1 we get a left $\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}$-bimodule isomorphism

$$\widetilde{\mathcal{D}}_{Y/S}^{(m+s)} \otimes_{\mathcal{O}_Y} \omega_Y^{-1} \xrightarrow{\sim} F_{Y,\mathrm{l}}^*(F_{Y,\mathrm{r}}^*(\widetilde{\mathcal{D}}_{Y'/S}^{(m)} \otimes_{\mathcal{O}_{Y'}} \omega_{Y'/S}^{-1})) \xrightarrow{\sim} F_{Y,\mathrm{r}}^*(F_{Y,\mathrm{l}}^*(\widetilde{\mathcal{D}}_{Y'/S}^{(m)} \otimes_{\mathcal{O}_{Y'}} \omega_{Y'/S}^{-1})).$$

Now apply f^* for the right structure and use the isomorphism $f^*F_Y^* \simeq F_X^* f'^*$, we get an isomorphism of left $(f^{-1}\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}, \widetilde{\mathcal{D}}_X^{(m+s)})$-bimodules

$$f^*(\widetilde{\mathcal{D}}_{Y/S}^{(m+s)} \otimes_{\mathcal{O}_Y} \omega_{Y/S}^{-1}) \xrightarrow{\sim} F_{X,\mathrm{r}}^* f'^*_{\mathrm{r}}(F_{Y,\mathrm{l}}^*(\widetilde{\mathcal{D}}_{Y'/S}^{(m)} \otimes_{\mathcal{O}_{Y'}} \omega_{Y'/S}^{-1})).$$

To get (6.2.6.1.2) we tensor by $\omega_{X/S}$ on the right, and compose with the isomorphism 6.1.2.5.1 relative to the left $\widetilde{\mathcal{D}}_{X'/S}^{(m)}$-module $f'^*_{\mathrm{r}}(F_{Y,\mathrm{l}}^*(\widetilde{\mathcal{D}}_{Y'/S}^{(m)} \otimes_{\mathcal{O}_{Y'}} \omega_{Y'/S}^{-1}))$.

When $\mathfrak{a}_S$ is m-PD-nilpotent, the functors and the isomorphisms appear in the preceding construction for the local lifting of Frobenius glues to yield globally on X the isomorphisms (6.2.6.1.3) and (6.2.6.1.4). □

Theorem 6.2.6.2. *Suppose the hypotheses 6.2(iii) and the relative dimension of X on S is constant. Let X, Y be smooth S-schemes, $f_0; X_0 \to Y_0$ a S_0-morphism between their reduction modulo $\mathfrak{a}_S$, X', Y' smooth lifting on S of $X_0^{(s)}, Y_0^{(s)}$.*

(a) Let $f\colon X \to Y$, $f'\colon X' \to Y'$, $F_X : X \to X'$, $F_Y : Y \to Y'$ be lifting f_0, $f_0^{(s)}$, $F^s_{X_0/S_0}$, $F^s_{Y_0/S_0}$. If $F_Y \circ f = f' \circ F_X$, there exists for any $\mathcal{E}'$ in $D^-(\widetilde{\mathcal{D}}_{X'/S}^{(m)})$ a canonical isomorphism of $D^-(\widetilde{\mathcal{D}}_{Y/S}^{(m+s)})$

$$f_{+^{(m+s)}}(F_X^*\mathcal{E}') \xrightarrow{\sim} F_Y^*(f'^{(m)}_+\mathcal{E}'). \tag{6.2.6.2.1}$$

(b) Suppose $\mathfrak{a}_S$ is m-PD-nilpotent. For any $\mathcal{E}' \in D^-(\widetilde{\mathcal{D}}_{X'/S}^{(m)})$, there exists a canonical isomorphism of $D^-(\widetilde{\mathcal{D}}_{Y/S}^{(m+s)})$

$$f_{0+}^{(m+s)}(F^{s*}_{X_0/S_0}\mathcal{E}') \xrightarrow{\sim} F^{s*}_{Y_0/S_0}(f^{(s)})_+^{(m)}(\mathcal{E}'). \tag{6.2.6.2.2}$$

Proof. Under the hypotheses of (a), the exact functor F_Y^* induces an equivalence of categories $D^-(\widetilde{\mathcal{D}}_{Y'/S}^{(m)}) \xrightarrow{\sim} D^-(\widetilde{\mathcal{D}}_{Y/S}^{(m+s)})$, and according to 6.1.3.4.1 a quasi-inverse functor is given by $\mathcal{E} \mapsto F_Y^\flat \widetilde{\mathcal{D}}_{Y'/S}^{(m)} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}} \mathcal{E}$. To define the isomorphism (6.2.6.2.1) it suffices to define an isomorphism

$$F_Y^\flat \widetilde{\mathcal{D}}_{Y'/S}^{(m)} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}}{\otimes}} f_{+^{(m+s)}}(F_X^*\mathcal{E}') \xrightarrow{\sim} f'^{(m)}_+(\mathcal{E}')$$

in $D^-(\widetilde{\mathcal{D}}_{Y'/S}^{(m)})$. By definition, $f_{+^{(m+s)}}(F_X^*\mathcal{E}') = \mathbb{R}f_*(\mathcal{F})$, where

$$\mathcal{F} = \widetilde{\mathcal{D}}_{Y\leftarrow X}^{(m+s)} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}_{X/S}^{(m+s)}}{\otimes}} F_X^*\mathcal{E}' \in D^-(f^{-1}\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}).$$

By 6.1.3.3, $F_Y^\flat \widetilde{\mathcal{D}}_{Y'/S}^{(m)}$ is a left $\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}$-module which is locally projective of finite type, the canonical morphism

$$F_Y^\flat \widetilde{\mathcal{D}}_{Y'/S}^{(m)} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}}{\otimes}} \mathbb{R}f_*(\mathcal{F}) \to \mathbb{R}f_*\left(f^{-1}(F_Y^\flat \widetilde{\mathcal{D}}_{Y'/S}^{(m)}) \overset{\mathbb{L}}{\underset{f^{-1}\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}}{\otimes}} \mathcal{F} \right)$$

is an isomorphism in $D^-(f^{-1}\widetilde{\mathcal{D}}_{Y/S}^{(m)})$. As $f = f'$ in as much as continuous maps between topological spaces, we are reduced to defining an isomorphism

$$f^{-1}(F_Y^\flat \widetilde{\mathcal{D}}_{Y'/S}^{(m)}) \overset{\mathbb{L}}{\underset{f^{-1}\widetilde{\mathcal{D}}_{Y/S}^{(m+s)}}{\otimes}} (\widetilde{\mathcal{D}}_{Y\leftarrow X/S}^{(m+s)} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}_{X/S}^{(m+s)}}{\otimes}} F_X^*\mathcal{E}') \xrightarrow{\sim} \widetilde{\mathcal{D}}_{Y'\to X'/S}^{(m)} \overset{\mathbb{L}}{\underset{\widetilde{\mathcal{D}}_{X'/S}^{(m)}}{\otimes}} \mathcal{E}' \tag{6.2.6.2.3}$$

in $D^-(f^{-1}\widetilde{\mathcal{D}}_{Y'/S}^{(m)})$.

Thanks to (6.2.6.1.2) we have a canonical isomorphism of bimodule

$$\widetilde{\mathcal{D}}^{(m+s)}_{Y\leftarrow X/S} \xrightarrow{\sim} F^*_{X,\mathrm{r}}\left(f'^*_{\mathrm{r}}(F^*_{Y,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\mathcal{O}_{Y'}} \omega^{-1}_{Y'/S})) \otimes_{\mathcal{O}_{X'}} \omega_{X'/S}\right).$$

Apply the isomorphism of invariance of tensor product (6.1.3.6.1) we get in $D^-(f^{-1}\widetilde{\mathcal{D}}^{(m+s)}_{Y/S})$ the isomorphism

$$\widetilde{\mathcal{D}}^{(m+s)}_{Y\leftarrow X/S} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^*_X \xrightarrow{\sim} \left(f'^*_{\mathrm{r}}(F^*_{Y,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\mathcal{O}_{Y'}} \omega^{-1}_{Y'/S})) \otimes_{\mathcal{O}_{X'}} \omega_{X'/S}\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}'.$$

The left hand side of (6.2.6.2.3) can be identified with

$$f^{-1}(F^\flat_Y \widetilde{\mathcal{D}}^{(m)}_{Y'/S}) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}} \left(f'^*_{\mathrm{r}}(F^*_{Y,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\mathcal{O}_{Y'}} \omega^{-1}_{Y'/S})) \otimes_{\mathcal{O}_{X'}} \omega_{X'/S}\right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}' \qquad (6.2.6.2.4)$$

$$\simeq \left(f^{-1}(F^\flat_Y \widetilde{\mathcal{D}}^{(m)}_{Y'/S}) \otimes^{\mathbb{L}}_{f^{-1}\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}} f^{-1}(F^*_{Y,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\mathcal{O}_{Y'}} \omega^{-1}_{Y'/S})) \otimes_{\mathcal{O}_{X'}} \omega_{X'/S} \right) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}'. \qquad (6.2.6.2.5)$$

We have isomorphism of $\widetilde{\mathcal{D}}^{(m)}_{Y'/S}$-bimodules (6.1.3.4.1)

$$F^\flat_Y \widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}} F^*_{Y,\mathrm{l}} \widetilde{\mathcal{D}}^{(m)}_{Y'/S} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y'/S}$$

which we right tensor by $\omega^{-1}_{Y'/S}$ to deduce an isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{Y'/S}$-bimodules

$$F^\flat_Y \widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}} F^*_{Y,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\mathcal{O}_{Y'}} \omega^{-1}_{Y'/S}) \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\mathcal{O}_{Y'/S}} \omega^{-1}_{Y'/S}.$$

Apply f^{-1} and right tensor by $\omega_{X'/S}$ we obtain an $(f^{-1}\widetilde{\mathcal{D}}^{(m)}_{Y'/S}, \widetilde{\mathcal{D}}^{(m)}_{X'/S})$-bimodule isomorphism

$$f^{-1}(F^\flat_Y \widetilde{\mathcal{D}}^{(m)}_{Y'/S}) \otimes_{f^{-1}\widetilde{\mathcal{D}}^{(m+s)}_{Y/S}} f^{-1}(F^*_{Y,\mathrm{l}}(\widetilde{\mathcal{D}}^{(m)}_{Y'/S} \otimes_{\mathcal{O}_{Y'}} \omega^{-1}_{Y'/S})) \otimes_{f^{-1}\mathcal{O}_{Y'}} \omega_{X'/S} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{Y'\to X'/S}.$$

It suffices to tensor by $\mathcal{E}'$ to get the isomorphism (6.2.6.2.3).

If we suppose that $\mathfrak{a}_S$ is m-PD-nilpotent, we can construct the isomorphism 6.2.6.2.2 following the same method : each of the isomorphism used in the construction remains well defined without assuming the morphisms are liftable (taking into account that $f = f' = f_0$ as morphisms of topological spaces). □

6.2.7 Dual functor

Suppose there exists a morphism of schemes $S \to B$ such that the composition morphism $\widetilde{g}'\colon (X', \mathcal{B}_{X'}) \to B$ and $\widetilde{g}\colon (X, \mathcal{B}_X) \to B$ are flat.

Notation 6.2.7.1. We work under the hypotheses 6.2 (i). Set $d := \delta_{X/S}$. The $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linear and $\widetilde{\mathcal{D}}^{(m+s)}_{X/S}$-lineal duals (see 5.1.4.1) will be denoted by setting for any $\mathcal{E}' \in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ and $\mathcal{E} \in D(\widetilde{\mathcal{D}}^{(m+s)}_{X/S})$

$$\mathbb{D}^{(m)}_{\widetilde{X}'/S}(\mathcal{E}') := \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X}}(\mathcal{E}', \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \otimes_{\mathcal{O}_{X'}} \omega^{-1}_{X'/S}[d],$$
$$\mathbb{D}^{(m+s)}_{\widetilde{X}/S}(\mathcal{E}) := \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}(\mathcal{E}, \widetilde{\mathcal{D}}^{(m+s)}_{X/S}) \otimes_{\mathcal{O}_X} \omega^{-1}_{X/S}[d].$$

Theorem 6.2.7.2. *We keep notation 6.2.7.1. We assume that the hypotheses 6.2(iii) holds.*

(a) Let $F : X \to X'$ be a lifting of $F^s_{X_0/S_0}$. For any $\mathcal{E}' \in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, there exists a canonicial isomorphism of $D(\widetilde{\mathcal{D}}^{(m+s)}_{X/S})$

$$\mathbb{D}^{(m+s)}_{\widetilde{X}/S} F^* \mathcal{E}' \xrightarrow{\sim} F^* \mathbb{D}^{(m)}_{\widetilde{X}'/S}(\mathcal{E}').$$

(b) *If $\mathfrak{a}_S$ is m-PD-nilpotent, for any $\mathcal{E}' \in D^-(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, there exists a canonicial isomorphism of $D^+(\widetilde{\mathcal{D}}^{(m+s)}_{X/S})$*

$$\mathbb{D}^{(m+s)}_{\widetilde{X}/S} F^{s*}_{X_0/S_0} \mathcal{E}' \xrightarrow{\sim} F^{s*}_{X_0/S_0} \mathbb{D}^{(m)}_{\widetilde{X}/S}(\mathcal{E}').$$

Proof. For any $\mathcal{E}' \in D^{\mathrm{b}}_{\mathrm{coh}}(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, we have the isomorphisms

$$F^\flat \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X}}(\mathcal{E}', \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \underset{6.2.2.6}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widehat{\mathcal{D}}^{(m+s)}_{\mathfrak{X}}}(F^*\mathcal{E}', F^*F^\flat \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \underset{6.1.3.2.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}(F^*\mathcal{E}', \widetilde{\mathcal{D}}^{(m+s)}_{X/S}). \tag{6.2.7.2.1}$$

This yields:

$$F^*\mathbb{D}^{(m)}_{\widetilde{X}'/S}(\mathcal{E}') \overset{6.1.2.6.1}{\xrightarrow{\sim}} F^\flat \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X}}(\mathcal{E}', \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \otimes_{\mathcal{O}_X} \omega^{-1}_{X/S}[d]$$
$$\overset{6.2.7.2.1}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}}(F^*\mathcal{E}', \widetilde{\mathcal{D}}^{(m+s)}_{X/S}) \otimes_{\mathcal{O}_X} \omega^{-1}_{X/S}[d] = \mathbb{D}^{(m+s)}_{\widetilde{X}/S} F^*\mathcal{E}'.$$

The proof of (b) is analogous, the isomorphisms used remain defined without lifting hypotheses on $F^s_{X_0/S_0}$ when $\mathfrak{a}_S$ is m-PD-nilpotent. □

6.3 Compatibility with Frobenius, first examples

We keep notation 6.1.

6.3.1 Definition

Definition 6.3.1.1. We keep the hypotheses and notations of the definition 6.2.1.1. For any integer m, let $(\phi^{(m)}_{\widetilde{f}})_{\widetilde{f}\in M}$ and $(\psi^{(m)}_{\widetilde{f}}))_{\widetilde{f}\in M}$ be two families of functors commuting to Frobenius and, for any $\widetilde{f} \in M$, let $\theta^{(m)}_{\widetilde{f}} : \phi^{(m)}_{\widetilde{f}} \to \psi^{(m)}_{\widetilde{f}}$ be a morphism of functors. The family $(\theta^{(m)}_{\widetilde{f}})_{\widetilde{f}\in M}$ is said to be *compatible with Frobenius* if it induces a commutative diagram

$$\begin{array}{ccc} F^*_Y \circ \phi^{(m)}_{f'} & \longrightarrow & \phi^{(m+s)}_{\widetilde{f}} \circ F^*_X \\ \downarrow{\scriptstyle F^*_Y\circ\theta^{(m)}_{\widetilde{f}}} & & \downarrow{\scriptstyle \theta^{(m+s)}_{\widetilde{f}}\circ F^*_X} \\ F^*_Y \circ \psi^{(m)}_{f'} & \longrightarrow & \psi^{(m+s)}_{\widetilde{f}} \circ F^*_X, \end{array} \tag{6.3.1.1.1}$$

(resp. by replacing F^* by $F^\flat$).

6.3.2 Associativity, commutativity, switching left to right, compatibility with coefficients extensions of tensor products and homomorphisms

Proposition 6.3.2.1. *Let $\mathcal{E}'$ and $\mathcal{G}'$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules and $\mathcal{F}'$ be a right or left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module. The following canonical $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linear isomorphisms (see 4.2.3.9.1)*

$$\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \mathcal{G}' \xrightarrow{\sim} \mathcal{G}' \otimes_{\mathcal{B}_{X'}} \mathcal{E}', \ \mathcal{E}' \otimes_{\mathcal{B}_{X'}} (\mathcal{F}' \otimes_{\mathcal{B}_{X'}} \mathcal{G}') \xrightarrow{\sim} (\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \mathcal{F}') \otimes_{\mathcal{B}_{X'}} \mathcal{G}'. \tag{6.3.2.1.1}$$

are compatible with Frobenius.

Proof. This is an exercice. □

Proposition 6.3.2.2. *The $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linear switching left to right $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module structures isomorphisms for tensor products and internal homomorphisms of 4.3.5.8 are compatible with Frobenius.*

Proof. The compatibility with Frobenius is an exercice. ☐

Let $\mathcal{C}_{X'}$ be a $\mathcal{B}_{X'}$-algebra commutative endowed with a compatible structure of left $\mathcal{D}^{(m)}_{X'}$-module such that $\mathcal{B}_{X'} \to \mathcal{C}_{X'}$ is $\mathcal{D}^{(m)}_{X'}$-linear (and then $\widetilde{\mathcal{D}}^{(m)}_{X'}$-linear). We set $\mathcal{C}_{X'} := F^*\mathcal{C}_{X'}$. Finally, we will suppose that S is a noetherian (hypothesis useful for 4.6.3.7 and then for 6.3.4.1 etc.) scheme.

Proposition 6.3.2.3. *Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module. The functorial in $\mathcal{E}'$ canonical isomorphism*

$$\mathcal{C}_{X'} \otimes_{\mathcal{B}_{X'}} \mathcal{E}' \underset{4.3.4.6.1}{\xrightarrow{\sim}} \left(\mathcal{C}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'/S}\right) \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}' \tag{6.3.2.3.1}$$

is compatible with Frobenius.

Proof. It is about proving that the right square of the diagram

$$\begin{array}{ccccc} F^*\mathcal{E} & \longrightarrow & F^*(\mathcal{C}_{X'} \otimes_{\mathcal{B}_{X'}} \mathcal{E}') & \underset{\sim}{\longrightarrow} & F^*((\mathcal{C}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}) \otimes_{\mathcal{B}_{X'}\otimes_{\mathcal{O}_{X'}}\mathcal{D}^{(m)}_{X'}} \mathcal{E}') \\ & \searrow & \uparrow\wr & & \uparrow\wr \\ & & \mathcal{C}_X \otimes_{\mathcal{B}_X} F^*\mathcal{E}' & \underset{\sim}{\longrightarrow} & (\mathcal{C}_X \otimes_{\mathcal{O}_X} \mathcal{D}^{(m)}_X) \otimes_{\mathcal{B}_X\otimes_{\mathcal{O}_X}\mathcal{D}^{(m)}_X} F^*\mathcal{E}' \end{array}$$

is commutative. By $\mathcal{C}_X$-linearity, it is sufficient to check that the outer of the diagram is commutative, which is tautological (6.2.3.2.2). ☐

Proposition 6.3.2.4. *Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module, $\mathcal{F}'$ a left $\mathcal{C}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}$-module and $\mathcal{E}' \to \mathcal{F}'$ be a $\widetilde{\mathcal{D}}^{(m)}_{X'}$-linear morphism. The canonical $\mathcal{C}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}$-linear morphism (see 4.3.4.9)*

$$\rho\colon \mathcal{C}_{X'} \otimes_{\mathcal{B}_{X'}} \mathcal{E}' \to \mathcal{F}'$$

is compatible with Frobenius.

Proof. We have to prove that the following canonical diagram

$$\begin{array}{ccc} F^*(\mathcal{C}_{X'} \otimes_{\mathcal{B}_{X'}} \mathcal{E}') & \underset{\sim}{\longrightarrow} & \mathcal{C}_X \otimes_{\mathcal{B}_X} F^*\mathcal{E}' \\ & {\scriptstyle F^*\rho}\searrow \quad \swarrow{\scriptstyle \rho} & \\ & F^*\mathcal{F}' & \end{array}$$

is commutative, which is elementary. ☐

Proposition 6.3.2.5. *Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module, $\mathcal{F}'$ be a left $\mathcal{C}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}$-module. The canonical $\mathcal{C}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}$-linear isomorphism (see 4.3.4.12.1)*

$$\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}', \mathcal{F}') \xrightarrow{\sim} \mathcal{H}om_{\mathcal{C}_{X'}}(\mathcal{C}_{X'} \otimes_{\mathcal{B}_{X'}} \mathcal{E}', \mathcal{F}')$$

is compatible with Frobenius. We have similar compatibility replacing left by right modules.

Proof. The compatibility with Frobenius means that the canonical diagram below

$$\begin{array}{ccccc} F^*\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}', \mathcal{F}') & & \underset{\sim}{\longrightarrow} & & \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}', F^*\mathcal{F}') \\ \wr\downarrow & & & & \wr\downarrow \\ F^*\mathcal{H}om_{\mathcal{C}_{X'}}(\mathcal{C}_{X'} \otimes_{\mathcal{B}_{X'}} \mathcal{E}', \mathcal{F}') & \xrightarrow{\sim} & \mathcal{H}om_{\mathcal{C}_X}(F^*(\mathcal{C}_{X'} \otimes_{\mathcal{B}_{X'}} \mathcal{E}'), F^*\mathcal{F}') & \underset{\sim}{\longrightarrow} & \mathcal{H}om_{\mathcal{C}_X}(\mathcal{C}_X \otimes_{\mathcal{B}_X} F^*\mathcal{E}', F^*\mathcal{F}') \end{array}$$

is commutative, which is easy. ☐

Proposition 6.3.2.6. *Let $\mathcal{E}'$ be a left $\widetilde{\mathcal{D}}^{(m)}_{X'}$-module, $\mathcal{F}'$ be a left $\mathcal{C}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}$-module. The canonical $\mathcal{B}_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{D}^{(m)}_{X'}$-linear isomorphism (see 4.3.4.12.1)*

$$(\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \mathcal{C}_{X'}) \otimes_{\mathcal{C}_{X'}} \mathcal{F}' \xrightarrow{\sim} \mathcal{E}' \otimes_{\mathcal{B}_{X'}} \mathcal{F}'. \tag{6.3.2.6.1}$$

is compatible with Frobenius. We have a similar compatibility replacing left by right modules.

Proof. This is an exercice. ☐

6.3.3 Transposition isomorphisms

We keep notation 6.1.

Proposition 6.3.3.1. *Let $\mathcal{M}' \in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S}{}^{\mathrm{r}})$. The transposition isomorphism $\delta_{\mathcal{M}'} \colon \mathcal{M}' \otimes_{\mathcal{B}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S} \xrightarrow{\sim} \mathcal{M}' \otimes_{\mathcal{B}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S}$ which exchanges the two right structures of $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules (see 4.2.5.5) is compatible with Frobenius, i.e., the following diagram is commutative :*

$$\begin{array}{ccc} F^{\flat}\mathcal{M}' \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m+s)}_{X/S} & \xrightarrow[\sim]{\delta_{F^{\flat}\mathcal{M}'}} & F^{\flat}\mathcal{M}' \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m+s)}_{X/S} \\ \downarrow\wr & & \downarrow\wr \\ F^{\flat}\mathcal{M}' \otimes_{\mathcal{B}_X} F^{*}F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'/S} & \xrightarrow[\sim]{F^{\flat}_{\mathrm{l}}F^{\flat}_{\mathrm{r}}\delta_{\mathcal{M}'}} & F^{\flat}\mathcal{M}' \otimes_{\mathcal{B}_X} F^{\flat}F^{*}\widetilde{\mathcal{D}}^{(m)}_{X'/S}. \end{array} \tag{6.3.3.1.1}$$

Proof. It is sufficient to copy the proof of Virrion of [Vir00, II.1.12.1] by adding some tildes and replacing "$\omega_{X'}$" by "$\mathcal{M}'$" and "ω_X" by "$F^{\flat}\mathcal{M}'$". ☐

Proposition 6.3.3.2. *Let $\mathcal{E}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$. The transposition isomorphism of $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodules associated to $\mathcal{E}'$, $\gamma_{\mathcal{E}'} \colon \widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\mathcal{B}_{X'}} \mathcal{E}' \xrightarrow{\sim} \mathcal{E}' \otimes_{\mathcal{B}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S}$ (see 4.2.5.1), is compatible with Frobenius, i.e., the canonical diagram*

$$\begin{array}{ccc} F^{*}F^{\flat}(\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\mathcal{B}_{X'}} \mathcal{E}') & \xrightarrow[\sim]{F^{*}F^{\flat}(\gamma_{E'})} & F^{*}F^{\flat}(\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \\ \uparrow\wr & & \uparrow\wr \\ \widetilde{\mathcal{D}}^{(m+s)}_{X/S} \otimes_{\mathcal{B}_X} F^{*}\mathcal{E}' & \xrightarrow[\sim]{\gamma_{F^{*}E'}} & F^{*}\mathcal{E}' \otimes_{\mathcal{B}_X} \widetilde{\mathcal{D}}^{(m+s)}_{X/S} \end{array} \tag{6.3.3.2.1}$$

is commutative.

In the same way, we have the compatible with Frobenius isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodules

$$(\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\mathcal{O}_{X'}} \omega^{-1}_{X'/S}) \otimes_{\mathcal{B}_{X'}} \mathcal{E}' \xrightarrow{\sim} \mathcal{E}' \otimes_{\mathcal{B}_{X'}} (\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\mathcal{O}_{X'}} \omega^{-1}_{X'/S}). \tag{6.3.3.2.2}$$

Proof. First of all, it is equivalent to prove the compatibility with Frobenius of

$$\omega_{X'/S} \otimes_{\mathcal{O}_{X'}} (\gamma_{\mathcal{E}'}) \colon (\omega_{X'} \otimes_{\mathcal{O}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \otimes_{\mathcal{B}_{X'}} \mathcal{E}' \xrightarrow{\sim} (\omega_{X'/S} \otimes_{\mathcal{O}_{X'}} \mathcal{E}') \otimes_{\mathcal{B}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S}.$$

Moreover, the isomorphism

$$\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \delta_{\omega_{X'}} \colon \mathcal{E}' \otimes_{\mathcal{B}_{X'}} (\omega_{X'} \otimes_{\mathcal{O}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \xrightarrow{\sim} (\omega_{X'} \otimes_{\mathcal{O}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S}) \otimes_{\mathcal{B}_{X'}} \mathcal{E}'$$

is compatible with Frobenius (6.3.3.1.1). Moreover, thanks to 6.3.2.2 and 6.3.2.1.1, the canonical isomorphism

$$(\omega_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{E}') \otimes_{\mathcal{B}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S} \xrightarrow{\sim} \mathcal{E}' \otimes_{\mathcal{B}_{X'}} (\omega_{X'} \otimes_{\mathcal{O}_{X'}} \widetilde{\mathcal{D}}^{(m)}_{X'/S})$$

is compatible with Frobenius. Since by composing these three isomorphisms we obtain the transposition isomorphism $\delta_{\omega_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{E}'}$ (indeed, by $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linearity it is sufficient to check that for any section x of $\omega_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{E}'$ we have $\delta_{\omega_{X'} \otimes_{\mathcal{O}_{X'}} \mathcal{E}'}(x \otimes 1) = x \otimes 1$) which is compatible with Frobenius following 6.3.3.1.1. This yields the commutativity of 6.3.3.2.1.

By construction of the isomorphism 6.3.3.2.2 (see 4.2.5.3.2), its compatibility with Frobenius follows from that of $\gamma_{\mathcal{E}'}$. ☐

6.3.4 Cartan isomorphisms, relations between internal tensor products and homomorphisms, comparison between $\mathcal{B}$-linear and $\mathcal{D}$-linear dual

We keep notation 6.3.2. In order to be able to use the example 4.6.3.3 or 6.2.2.5, we suppose moreover that $\mathcal{B}_X$ is a quasi-flat $\mathcal{O}_S$-algebra (see Definition 3.1.1.5).

Proposition 6.3.4.1. *Let* $\mathcal{E} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$*,* $\mathcal{F} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}, \widetilde{\mathcal{D}}^{(m)}_{X'/S}{}^{\mathrm{r}})$*, and* $\mathcal{G} \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}, \widetilde{\mathcal{D}}^{(m)}_{X'/S}{}^{\mathrm{r}})$*. The canonical morphism of* $D(\widetilde{\mathcal{D}}^{(m)}_{X'/S}{}^{\mathrm{r}})$ *(see 4.6.3.6.1)*

$$\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{G} \xrightarrow{4.6.3.6.1} \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{G}) \tag{6.3.4.1.1}$$

is compatible with Frobenius.

Proof. By transitivity of the isomorphism 4.6.3.6.1 (see 4.6.3.6.(ii)), we have the following commutative diagram.

$$\begin{array}{ccc} F^{\flat}(\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{G}) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\mathcal{G} \\ \downarrow & & \downarrow \\ F^{\flat}\mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{G}) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{{}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\mathcal{G}). \end{array} \tag{6.3.4.1.2}$$

Moreover, via the isomorphism $F^{\flat}\mathcal{G} \xrightarrow{\sim} (F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}\widetilde{\mathcal{D}}^{(m)}_{X'}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\mathcal{G} \xrightarrow{\sim} F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G}$, we have by functoriality of the commutative diagram :

$$\begin{array}{ccc} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\mathcal{G} & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G} \\ \downarrow & & \downarrow \\ \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\mathcal{G}) & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G}). \end{array}$$

By invoking the transitivity of 4.6.3.6.ii), we obtain the commutativity of the diagram below

$$\begin{array}{ccc} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G} & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},F^{\flat}\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G} \\ \downarrow & & \downarrow \\ \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^{\flat}\widetilde{\mathcal{D}}^{(m)}_{X'} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G}) & \xrightarrow[\sim]{} & \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},F^{\flat}\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G}). \end{array} \tag{6.3.4.1.3}$$

Finally, choosing a K-flat complex representing $F^{*}F^{\flat}\mathcal{G}$ and a K-injective complex representing $F^{\flat}\mathcal{F}$, we compute that the diagram

$$\begin{array}{ccc} \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},F^{\flat}\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G} & \xrightarrow[\sim]{F^{*}\otimes\mathrm{id}} & \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X}}(F^{*}\mathcal{E},F^{*}F^{\flat}\mathcal{F}) \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G} \\ \downarrow & & \downarrow \\ \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E},F^{\flat}\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G}) & \xrightarrow[\sim]{F^{*}} & \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X}}(F^{*}\mathcal{E},F^{*}F^{\flat}\mathcal{F} \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m+s)}_{X/S}} F^{*}F^{\flat}\mathcal{G}). \end{array} \tag{6.3.4.1.4}$$

is commutative. By putting end to end these four commutative diagrams, we obtain the commutativity with Frobenius of the morphism of 4.6.3.6.1. □

Proposition 6.3.4.2. *Let* $\mathcal{M}'$ *be a right* $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$*-module,* $\mathcal{E}'$ *be a left* $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$*-module and* $\mathcal{N}'$ *be a* $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$*-bimodule. The canonical* $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$*-linear isomorphisms (see 4.2.4.3)*

$$\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} (\mathcal{N}' \otimes_{\mathcal{B}_{X'}} \mathcal{E}') \xrightarrow{\sim} (\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{N}') \otimes_{\mathcal{B}_{X'}} \mathcal{E}', \tag{6.3.4.2.1}$$

$$\mathcal{M}' \otimes_{\mathcal{B}_{X'}} (\mathcal{N}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}') \xrightarrow{\sim} (\mathcal{M}' \otimes_{\mathcal{B}_{X'}} \mathcal{N}') \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}', \tag{6.3.4.2.2}$$

are compatible with Frobenius.

Proof. To prove the compatibility with Frobenius of 6.3.4.2.1, first let us check that the following canonical diagram

$$\begin{array}{ccccc} F^\flat[\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} (\mathcal{N}' \otimes_{\mathcal{B}_{X'}} \mathcal{E}')] & \xrightarrow{\sim} & \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^\flat(\mathcal{N}' \otimes_{\mathcal{B}_{X'}} \mathcal{E}') & \underset{\sim}{\xrightarrow{6.2.2.1.2}} & \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} (F^\flat\mathcal{N}' \otimes_{\mathcal{B}_X} F^*\mathcal{E}') \\ \sim\downarrow 6.3.4.2.1 & & & & \sim\downarrow \\ F^\flat[(\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{N}') \otimes_{\mathcal{B}_{X'}} \mathcal{E}'] & \underset{\sim}{\xrightarrow{6.2.2.1.2}} & F^\flat(\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{N}') \otimes_{\mathcal{B}_X} F^*\mathcal{E}' & \xrightarrow{\sim} & (\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^\flat\mathcal{N}') \otimes_{\mathcal{B}_X} F^*\mathcal{E}', \end{array} \tag{6.3.4.2.3}$$

where the right vertical morphism is constructed similarly to 6.3.4.2.1, is commutative. For this purpose, let m' be a local section of $\mathcal{M}'$, n' of $\mathcal{N}'$, e' of $\mathcal{E}'$ and θ of $\mathcal{H}om_{\mathcal{O}_{X'}}(\mathcal{O}_X, \mathcal{O}_{X'})$. The composite morphism of the top of the diagram 6.3.4.2.3 sends the section $[m' \otimes (n' \otimes e')] \otimes \theta$ on $m' \otimes [(n' \otimes \theta) \otimes (1 \otimes e')]$; the right one sends $m' \otimes [(n' \otimes \theta) \otimes (1 \otimes e')]$ on $[m' \otimes (n' \otimes \theta)] \otimes (1 \otimes e')$; the left one sends $[m' \otimes (n' \otimes e')] \otimes \theta$ on $[(m' \otimes n') \otimes e'] \otimes \theta$ and finally that bottom sends $[(m' \otimes n') \otimes e'] \otimes \theta$ on $[m' \otimes (n' \otimes \theta)] \otimes (1 \otimes e')$. The diagram 6.3.4.2.3 is then commutative.

Next, via (the inverse of) the canonical isomorphism $\phi\colon F^\flat\widetilde{\mathcal{D}}^{(m)}_{X'/S} \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_X} F^*\widetilde{\mathcal{D}}^{(m)}_{X'/S} \xrightarrow{\sim} \widetilde{\mathcal{D}}^{(m)}_{X'/S}$, we check by a computation (we write the image of 1 by ϕ^{-1} etc.) the commutativity of the diagram below

$$\begin{array}{ccc} \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} (F^\flat\mathcal{N}' \otimes_{\mathcal{B}_X} F^*\mathcal{E}') & \xrightarrow{\sim} & F^\flat\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_X} (F^*F^\flat\mathcal{N}' \otimes_{\mathcal{B}_X} F^*\mathcal{E}') \\ \sim\downarrow & & \sim\downarrow 6.3.4.2.1 \\ (\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} F^\flat\mathcal{N}') \otimes_{\mathcal{B}_X} F^*\mathcal{E}' & \xrightarrow{\sim} & (F^\flat\mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m+s)}_X} F^*F^\flat\mathcal{N}') \otimes_{\mathcal{B}_X} F^*\mathcal{E}'. \end{array} \tag{6.3.4.2.4}$$

By composing 6.3.4.2.3 and 6.3.4.2.4, we obtain the diagram meaning that the isomorphism 6.3.4.2.1 is compatible with Frobenius.

Concerning the second isomorphism of the proposition, we proceed in a similar way □

Remark 6.3.4.3. The propositions 6.3.2.2 and 4.3.5.9 allow in the propositions of this section, to replace "left $\widetilde{\mathcal{D}}^{(m)}_X$-module(s)" by "right $\widetilde{\mathcal{D}}^{(m)}_X$-module(s)", and conversely.

Proposition 6.3.4.4. *Let $\mathcal{E}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, $\mathcal{N}' \in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}, \widetilde{\mathcal{D}}^{(m)}_{X'/S}{}^{\mathrm{r}})$, $\mathcal{M}' \in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S}{}^{\mathrm{r}})$. The following isomorphisms of $D({}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$*

$$\mathcal{M}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} (\mathcal{N}' \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} \mathcal{E}') \xrightarrow{\sim} (\mathcal{M}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{N}') \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} \mathcal{E}', \tag{6.3.4.4.1}$$

$$\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} (\mathcal{N}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}') \xrightarrow{\sim} (\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} \mathcal{N}') \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}', \tag{6.3.4.4.2}$$

are compatible with Frobenius.

Proof. By choosing K-flat complexes representing $\mathcal{E}'$ and $\mathcal{N}'$, this is a consequence of 6.3.4.2.2 and 6.3.4.2.1. □

Proposition 6.3.4.5 (Switching $\mathcal{B}$ and $\widetilde{\mathcal{D}}$)**.** *Let $\mathcal{M}'$ be a $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodule, $\mathcal{E}', \mathcal{F}'$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules. The functorial in $\mathcal{E}'$, $\mathcal{F}'$, $\mathcal{M}'$ canonical isomorphism of left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules (see 4.2.6.1):*

$$(\mathcal{M}' \otimes_{\mathcal{B}_{X'}} \mathcal{E}') \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{F}' \xrightarrow{\sim} \mathcal{M}' \otimes_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} (\mathcal{E}' \otimes_{\mathcal{B}_{X'}} \mathcal{F}'), \tag{6.3.4.5.1}$$

is compatible with Frobenius.

Proof. This is obvious by functoriality of 4.2.6.1. □

Corollary 6.3.4.6. *Let $\mathcal{M}'$ be a complex of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S}, {}^{\mathrm{r}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, $\mathcal{E}'$ and $\mathcal{F}'$ be two complexes of $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$. The canonical isomorphism in $D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ is compatible with Frobenius :*

$$(\mathcal{M}' \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} \mathcal{F}') \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} \mathcal{E}' \xrightarrow{\sim} \mathcal{M}' \otimes^{\mathbb{L}}_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}} (\mathcal{F}' \otimes^{\mathbb{L}}_{\mathcal{B}_{X'}} \mathcal{E}'). \tag{6.3.4.6.1}$$

Proof. By using K-flat resolutions, this is a consequence of 6.3.4.5. □

Proposition 6.3.4.7. *Let $\mathcal{E}'$ and $\mathcal{G}'$ be two left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules and $\mathcal{F}'$ be a $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodule. The canonical $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linear morphism (see 4.2.4.9)*

$$\mathcal{H}om_{{}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathcal{F}')\otimes_{\mathcal{B}_{X'}}\mathcal{G}'\to\mathcal{H}om_{{}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathcal{F}'\otimes_{\mathcal{B}_{X'}}\mathcal{G}'),\tag{6.3.4.7.1}$$

is compatible with Frobenius.

Proof. The morphism was constructed at 4.2.4.9. By construction, this is the composite of three morphisms. Proceeding similarly to the proof of 6.3.4.1(iii) (we remove $\mathbb{R}$ and $\mathbb{L}$), we prove that the second morphism is compatible with Frobenius. For the two other ones, this is a consequence of 6.3.4.2.1. □

Corollary 6.3.4.8. *Let $\mathcal{E}'\in D({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ $\mathcal{F}'\in D({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S},\widetilde{\mathcal{D}}^{(m)\,\mathrm{r}}_{X'/S})$ and $\mathcal{G}'\in D({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S})$. There exists a compatible with Frobenius canonical morphism in $D(\widetilde{\mathcal{D}}^{(m)\,\mathrm{r}}_{X'/S})$ of the form*

$$\mathbb{R}\mathcal{H}om_{{}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathcal{F}')\otimes^{\mathbb{L}}_{\mathcal{B}_{X'}}\mathcal{G}'\to\mathbb{R}\mathcal{H}om_{{}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathcal{F}'\otimes^{\mathbb{L}}_{\mathcal{B}_{X'}}\mathcal{G}').\tag{6.3.4.8.1}$$

The morphism 6.3.4.8.1 is an isomorphism when $\mathcal{E}'\in D_{\mathrm{perf}}({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S})$.

Proof. Choosing a K-injective complex representing $\mathcal{F}'$ and a K-flat complex representing $\mathcal{G}'$, this is a consequence of 6.3.4.7. □

Proposition 6.3.4.9. *Let $\mathcal{E}'$, $\mathcal{F}'$, $\mathcal{G}'$ be three left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules. The canonical $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linear isomorphism (see* **??***).*

$$\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}',\mathcal{G}')\xrightarrow{\sim}\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}')),\tag{6.3.4.9.1}$$

is compatible with Frobenius.

Proof. Let us denote by θ the isomorphisms of the form 6.3.4.9.1. The compatibility with Frobenius of θ means that the canonical diagram

$$\begin{array}{ccc}
F^*[\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}',\mathcal{G}')] & \xrightarrow[\sim]{F^*\theta} & F^*[\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}'))] \\
\sim\downarrow 6.2.2.2.1 & & \sim\downarrow 6.2.2.1.1 \\
\mathcal{H}om_{\mathcal{B}_X}(F^*(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}'),F^*\mathcal{G}') & & \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}',F^*\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}')) \\
\sim\downarrow 6.2.2.1.1 & & \sim\downarrow 6.2.2.2.1 \\
\mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}'\otimes_{\mathcal{B}_X}F^*\mathcal{F}',F^*\mathcal{G}') & \xrightarrow[\sim]{\theta} & \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}',\mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{F}',F^*\mathcal{G}'))
\end{array}$$

is commutative. This is checked by a computation : for any $b_0\in\mathcal{B}_X$, for any $\phi\in\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}',\mathcal{G}')$, the image of $b_0\otimes\phi$ into the right bottom term via by both possible paths is $b_1\otimes e'\mapsto(b_2\otimes f'\mapsto b_0b_1b_2\otimes\phi(e'\otimes f'))$, where $b_1,b_2\in\mathcal{B}_X$, $e'\in\mathcal{E}'$ and $f'\in\mathcal{F}'$. □

Corollary 6.3.4.10 (Cartan isomorphism)**.** *Let $\mathcal{E}'\in D({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, $\mathcal{F}'\in D({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ and $\mathcal{G}'\in D({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S})$. The canonical isomorphism of $D({}^1\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ (see 4.6.6.6)*

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}'\otimes^{\mathbb{L}}_{\mathcal{B}_{X'}}\mathcal{F}',\mathcal{G}')\xrightarrow{\sim}\mathbb{R}\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathbb{R}\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}')),$$

is compatible with Frobenius.

Proof. By construction (see the proof of 4.6.6.6), this is a consequence of 6.3.4.9. □

Proposition 6.3.4.11. *Let $\mathcal{E}'$, $\mathcal{F}'$, $\mathcal{G}'$ be three left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules. The canonical $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linear morphism (see 4.2.4.8) :*

$$\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}')\otimes_{\mathcal{B}_{X'}}\mathcal{G}'\to\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}'\otimes_{\mathcal{B}_{X'}}\mathcal{G}')\tag{6.3.4.11.1}$$

is compatible with Frobenius.

Proof. Let us denote by θ the morphisms of the form 6.3.4.11.1. We have to establish the commutativity of the diagram below

$$\begin{array}{ccccc}
F^*[\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}')\otimes_{\mathcal{B}_{X'}}\mathcal{G}'] & \xrightarrow[\sim]{6.2.2.1.1} & F^*\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}')\otimes_{\mathcal{B}_X}F^*\mathcal{G}' & \xrightarrow[\sim]{6.2.2.2.1} & \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}',F^*\mathcal{F}')\otimes_{\mathcal{B}_X}F^*\mathcal{G}' \\
\downarrow{\scriptstyle F^*(\theta)} & & & & \downarrow{\scriptstyle \theta} \\
F^*[\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}'\otimes_{\mathcal{B}_{X'}}\mathcal{G}')] & \xrightarrow[\sim]{6.2.2.2.1} & \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}',F^*(\mathcal{F}'\otimes_{\mathcal{B}_{X'}}\mathcal{G}')) & \xrightarrow[\sim]{6.2.2.1.1} & \mathcal{H}om_{\mathcal{B}_X}(F^*\mathcal{E}',F^*\mathcal{F}'\otimes_{\mathcal{B}_X}F^*\mathcal{G}').
\end{array}$$

For this purpose, we compute that for any $b_0\in\mathcal{B}_X$, $\phi\in\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}')$, $g'\in\mathcal{G}'$, the section $b_0\otimes\phi\otimes g'$ is sent for both paths on $(b_1\otimes e'\mapsto b_0b_1\otimes\phi(e')\otimes(1\otimes g'))$, with $b_1\in\mathcal{B}_X$, $e'\in\mathcal{E}'$ and $g'\in\mathcal{G}'$. □

Proposition 6.3.4.12. *Let $\mathcal{E}'\in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, $\mathcal{F}'\in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ and $\mathcal{G}'\in D(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$. The canonical homomorphism of $D(\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ (see 4.6.6.7) :*

$$\mathbb{R}\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}')\otimes^{\mathbb{L}}_{\mathcal{B}_{X'}}\mathcal{G}'\to\mathbb{R}\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{E}',\mathcal{F}'\otimes^{\mathbb{L}}_{\mathcal{B}_{X'}}\mathcal{G}'). \tag{6.3.4.12.1}$$

is compatible with Frobenius. If $\mathcal{E}'$ is moreover in $D_{\mathrm{perf}}(\mathcal{B}_{X'})$, this morphism is an isomorphism.

Proof. By construction of 6.3.4.12.1, this is a consequence of 6.3.4.11.

□

Proposition 6.3.4.13. *Let $\mathcal{E}'$, $\mathcal{F}'$ and $\mathcal{G}'$ three left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules. Suppose the structure of $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-module of $\mathcal{E}'$, $\mathcal{F}'$ or $\mathcal{G}'$ extends to a structure of $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodule or left bimodule. Then the canonical the $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-linear isomorphism (see 4.2.4.5)*

$$\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}',\mathcal{G}')\xrightarrow{\sim}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}')). \tag{6.3.4.13.1}$$

is compatible with Frobenius.

Proof. Suppose $\mathcal{G}'$ extends to a structure of $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodule. Since $\mathcal{O}_X$ is locally free on $\mathcal{O}_{X'}$, the morphism $F^\flat\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}')\to\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',F^\flat\mathcal{G}')$ is an isomorphism. We easily compute that the following diagram

$$\begin{array}{ccc}
F^\flat\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}',\mathcal{G}') & \xrightarrow{F^\flat\rho^{(m)}_{X'}} & F^\flat\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}')) \\
\sim\downarrow & & \sim\downarrow \\
\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}',F^\flat\mathcal{G}') & \xrightarrow{\rho^{(m)}_{X'}} & \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',F^\flat\mathcal{G}')) \\
\sim\downarrow{\scriptstyle F^*} & & \sim\downarrow{\scriptstyle F^*} \\
\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X}}(F^*(\mathcal{E}'\otimes_{\mathcal{B}_{X'}}\mathcal{F}'),F^*F^\flat\mathcal{G}') & \xrightarrow{\sim} & \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X}}(F^*\mathcal{E}',F^*\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',F^\flat\mathcal{G}')) \\
{\scriptstyle 6.2.2.1.1}\downarrow\sim & & \downarrow\sim \\
\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X}}(F^*\mathcal{E}'\otimes_{\mathcal{B}_X}F^*\mathcal{F}',F^*F^\flat\mathcal{G}') & \xrightarrow{\rho^{(m+s)}_{X/S}} & \mathcal{H}om_{\widetilde{\mathcal{D}}^{(m+s)}_{X}}(F^*\mathcal{E}',\mathcal{H}om_{\mathcal{B}_{X'}}(F^*\mathcal{F}',F^*F^\flat\mathcal{G}')).
\end{array} \tag{6.3.4.13.2}$$

is commutative, which yields the desired compatibility with Frobenius. The other cases are checked using similar computations. □

Corollary 6.3.4.14. *Let $*\in\{\mathrm{r},\mathrm{l}\}$, $\mathcal{E}'\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$, $\mathcal{F}'\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ and $\mathcal{G}'\in D({}^{\mathrm{l}}\widetilde{\mathcal{D}}^{(m)}_{X'/S},{}^{*}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$. The isomorphism of $D({}^{*}\widetilde{\mathcal{D}}^{(m)}_{X'/S})$ (see 4.6.6.5)*

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}'\overset{\mathbb{L}}{\otimes}_{\mathcal{B}_{X'}}\mathcal{F}',\mathcal{G}')\xrightarrow{\sim}\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_{X'/S}}(\mathcal{E}',\mathbb{R}\mathcal{H}om_{\mathcal{B}_{X'}}(\mathcal{F}',\mathcal{G}'))$$

is compatible with Frobenius

Proof. Similarly to 4.6.6.5, by using a K-flat complex of left $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-modules representing $\mathcal{F}'$ and a K-injective complex of right (resp. left if $* = \mathrm{l}$) $\widetilde{\mathcal{D}}^{(m)}_{X'/S}$-bimodules representing $\mathcal{G}'$, this follows from 6.3.4.13. □

Proposition 6.3.4.15. *Let $\mathcal{F} \in D^{\mathrm{b}}(\widetilde{\mathcal{D}}^{(m)}_X)$. The following assertions hold. The canonical morphism of $\widetilde{\mathcal{D}}^{(m)}_X$-modules (see 4.6.7.1) is compatible with Frobenius:*

$$\mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_X}(\mathcal{B}_X, \widetilde{\mathcal{D}}^{(m)}_X \otimes_{\mathcal{O}_X} \omega_X^{-1}) \otimes^{\mathbb{L}}_{\mathcal{B}_X} \mathbb{R}\mathcal{H}om_{\mathcal{B}_X}(\mathcal{F}, \mathcal{B}_X) \to \mathbb{R}\mathcal{H}om_{\widetilde{\mathcal{D}}^{(m)}_X}(\mathcal{F}, \widetilde{\mathcal{D}}^{(m)}_X \otimes_{\mathcal{O}_X} \omega_X^{-1}).$$

Proof. By construction (see the proof of 4.6.7.1), its compatibility with Frobenius follows from 6.3.4.8, 6.3.3.2.2, 6.3.4.12, 6.3.4.14 □

Chapter 7

Completed sheaves of differential operators of level m

This chapter is mostly based on the unpublished notes of Berthelot.

7.1 Derived category of projective systems

7.1.1 Projective and inductive systems, projective and inductive limits

Let us recall some terminology and notation.

Definition 7.1.1.1. Let $\mathfrak{I}$ be a small category, $\mathfrak{C}$ be a category.

1. An inductive system of objects of $\mathfrak{C}$ indexed by $\mathfrak{I}$ is a covariant functor of the form $\mathfrak{I} \to \mathfrak{C}$. We denote by $\mathfrak{C}^{\mathfrak{I}}$ the category of inductive system indexed by $\mathfrak{I}$.

2. A projective system of objects of $\mathfrak{C}$ indexed by $\mathfrak{I}$ is a contravariant functor of the form $\mathfrak{I} \to \mathfrak{C}$. In other words, a projective system indexed by $\mathfrak{I}$ is an inductive system indexed by $\mathfrak{I}^{\mathrm{op}}$, the opposite category of $\mathfrak{I}$. We denote by $\mathfrak{C}_{\mathfrak{I}}$ be the category of projective system indexed by $\mathfrak{I}$. By definition, we have the equality $\mathfrak{C}_{\mathfrak{I}} = \mathfrak{C}^{\mathfrak{I}^{\mathrm{op}}}$.

7.1.1.2. Let $\mathfrak{I}$ be a small category, $\mathfrak{C}$ be a category. We denote by $c^{\mathfrak{I}} \colon \mathfrak{C} \to \mathfrak{C}^{\mathfrak{I}}$ the functor which sends an object X of $\mathfrak{C}$ to the constant object of $\mathfrak{C}^{\mathfrak{I}}$ with value X and identity of X as transition maps. Similarly, we have the functor $c_{\mathfrak{I}} \colon \mathfrak{C} \to \mathfrak{C}_{\mathfrak{I}}$. Let $F \in \mathfrak{C}^{\mathfrak{I}}$ (resp. $G \in \mathfrak{C}_{\mathfrak{I}}$).

When the left (resp. right) covariant functors $\mathfrak{C} \to \mathit{Sets}$

$$Y \mapsto \mathrm{Hom}_{\mathfrak{C}^{\mathfrak{I}}}(F, c^{\mathfrak{I}}(Y)), \qquad Y \mapsto \mathrm{Hom}_{\mathfrak{C}_{\mathfrak{I}}}(G, c_{\mathfrak{I}}(Y)), \tag{7.1.1.2.1}$$

is representable, we say that the inductive limits of F (resp. G) exists and the object of $\mathfrak{C}$ representing this functor is denoted by $\varinjlim F$ (resp. $\varinjlim G$) or $\varinjlim_{i \in \mathfrak{I}} F(i)$ (resp. $\varinjlim_{i \in \mathfrak{I}^{\mathrm{op}}} G(i)$). Let us explain a bit why "op" appears in the respective notation. Via the equality $\mathfrak{C}^{\mathfrak{I}} = \mathfrak{C}_{\mathfrak{I}^{\mathrm{op}}}$, we can view F as on object of $\mathfrak{C}_{\mathfrak{I}^{\mathrm{op}}}$ that we will denote by $F^{\star}$ to avoid confusion. We get $\varinjlim_{i \in \mathfrak{I}} F(i) = \varinjlim_{i \in \mathfrak{I}} F^{\star}(i)$, which justifies our notations. In order to avoid confusion, we will consider inductive limits for inductive systems by default.

When the left (resp. right) contravariant functors $\mathfrak{C} \to \mathit{Sets}$

$$X \mapsto \mathrm{Hom}_{\mathfrak{C}^{\mathfrak{I}}}(c^{\mathfrak{I}}(X), F), \qquad X \mapsto \mathrm{Hom}_{\mathfrak{C}_{\mathfrak{I}}}(c_{\mathfrak{I}}(X), G), \tag{7.1.1.2.2}$$

is representable, we say that the projective limits of F (resp. G) exists and the object of $\mathfrak{C}$ representing this functor is denoted by $\varprojlim F$ (resp. $\varprojlim G$) or $\varprojlim_{i \in \mathfrak{I}^{\mathrm{op}}} F(i)$ (resp. $\varprojlim_{i \in \mathfrak{I}} G(i)$).

Via the equality $\mathfrak{C}_{\mathfrak{I}} = (\mathfrak{C}^{\mathrm{op}})_{\mathfrak{I}^{\mathrm{op}}}$, we can view G as on object of $(\mathfrak{C}^{\mathrm{op}})_{\mathfrak{I}^{\mathrm{op}}}$ that we will denote by G^{op}. Remark we get $\varprojlim G = \varinjlim G^{\mathrm{op}}$.

7.1.2 Topos of projective systems of sheaves on a topological spaces

The topoi that we will use in the book are essentially that considered in 7.1.2.1.

Notation 7.1.2.1. Let I be a partially ordered set and let X be a topological space.

1. We denote by $\mathrm{Cat}(I)$ the category defined as follows: the objects of $\mathrm{Cat}(I)$ are the elements $i \in I$ and for any $i, j \in I$, the set of homomorphisms from i to j has only one element if $i \leq j$ and is empty otherwise. We denote by $I^\natural$ the site (see definition [Sta22, 00VH-7.6.2]), whose underlying category is $\mathrm{Cat}(I)$ and whose topology is the chaotic topology (i.e. the collection of coverings of an object $i \in I$ is $\{\mathrm{id}_i : i \to i\}$). By abuse of notation, if there is no ambiguity, we might write I instead of $\mathrm{Cat}(I)$ or $I^\natural$. We denote by I° the partially ordered set equal to I as a set but equipped with the ordering opposite to that of I. We get $\mathrm{Cat}(I^\circ) = \mathrm{Cat}(I)^{\mathrm{op}}$.

2. As in [Sta22, 00VJ-7.6.4]), we denote by X_{Zar} the category whose objects consist of all the open sets U in X and whose morphisms are just the inclusion maps. That is, there is at most one morphism between any two objects in X_{Zar}. We still denote by X_{Zar} the site whose underlying category is X_{Zar} and whose covering are families of morphisms $\{U_l \to U\}_{l \in L}$ of X_{Zar} such that $\cup_{l \in L} U_l = U$ (i.e. coverings are by definition open coverings).

3. We denote by $I^\natural \times X_{Zar}$ the site whose underlying category is $\mathrm{Cat}(I) \times X_{Zar}$ and whose covering are families of morphisms $\{(i, U_\lambda) \to (i, U)\}_{\lambda \in \Lambda}$ of $\mathrm{Cat}(I) \times X_{Zar}$ such that $\cup_{\lambda \in \Lambda} U_\lambda = U$.

4. We have the equality $\mathrm{PSh}(I^\natural) = \mathrm{Sh}(I^\natural)$ and $\mathrm{PSh}(I^\natural)$ is equal to the category of projective systems in Set indexed by I, i.e. to the category of functors $\mathrm{Cat}(I)^{\mathrm{op}} \to \mathrm{Set}$. Moreover, $\mathrm{PSh}(I^\natural \times X_{Zar})$ (resp. $\mathrm{Sh}(I^\natural \times X_{Zar})$) is equal to the category of projective systems in $\mathrm{PSh}(X_{Zar})$ (resp. $\mathrm{Sh}(X_{Zar})$) indexed by I i.e. to the category of functors $\mathrm{Cat}(I)^{\mathrm{op}} \to \mathrm{PSh}(X_{Zar})$ (resp. $\mathrm{Cat}(I)^{\mathrm{op}} \to \mathrm{Sh}(X_{Zar})$). An object of $\mathrm{Sh}(I^\natural \times X_{Zar})$ is written $\mathcal{F}_\bullet$ or $(\mathcal{F}_i)_{i \in I}$. We set

$$\mathrm{Top}(X) := \mathrm{Sh}(X_{Zar}), \qquad \mathrm{Top}(X)_I := \mathrm{Sh}(I^\natural \times X_{Zar}).$$

Even if most of the results are still valid for any topos, we will restrict in this book our attention only topos of the form $\mathrm{Top}(X)_I$. Such topos can be called I-topos or I^o-topos.

Definition 7.1.2.2. Let $u \colon I \to I'$ be an increasing map of partially ordered sets. For $i' \in I'$ denote by $I_{i'}$ the ordered subset of I consisting of i such that $u(i) \leq i'$ and by $I^{i'}$ the subset of I consisting of i such that $u(i) \geq i'$.

1. We say that u is "filtered" (resp. "cofiltered") when $I_{i'}$ is directed (resp. $(I^{i'})^\circ$ is directed), i.e. $\mathrm{Cat}(I_{i'})$ is filtered (resp. $\mathrm{Cat}(I^{i'})$ is cofiltered (see definition [KS06, 3.1.1]).

2. We say u is "cofinal" if $I^{i'}$ is non-empty for all $i' \in I'$.

Remark 7.1.2.3. Let $u \colon I \to I'$ be an increasing map of partially ordered sets. By convention, if u is cofiltered then u is cofinal. Moreover, let $u^\circ \colon I^\circ \to I'^\circ$ be the increasing map induced by u. From u°, we define such as 7.1.2.2 the partially ordered sets $(I^\circ)_{i'}$ and $(I^\circ)^{i'}$ for any $i' \in I'$. For $i' \in I'$, we have the equalities

$$(I^\circ)_{i'} = (I^{i'})^\circ \qquad (I^\circ)^{i'} = (I_{i'})^\circ. \tag{7.1.2.3.1}$$

Hence, u is filtered if and only if $u^\circ \colon I^\circ \to I'^\circ$ is cofiltered. Finally, when I' has only one element, then u is filtered (resp. cofiltered) if and only if I is filtered (resp. cofiltered).

7.1.2.4 (Varying I). Let $u \colon I \to I'$ be an increasing map of partially ordered sets. The canonical functor $u_X \colon I^\natural \times X_{Zar} \to I'^\natural \times X_{Zar}$ given by $(i, U) \mapsto (u(i), U)$ is cocontinuous (see definition [Sta22, 00XJ-7.20.1]). Hence we get the morphism of topos

$$u_X = (u_X^{-1} \dashv u_{X*}) \colon \mathrm{Top}(X)_I \to \mathrm{Top}(X)_{I'} \tag{7.1.2.4.1}$$

induced by u_X (see [Sta22, 00XO-7.21.1]). For any $\mathcal{F}'_\bullet \in \mathrm{Top}(X)_{I'}$, for any $i \in I$, we have $u_X^{-1}(\mathcal{F}'_\bullet)_i = \mathcal{F}'_{u(i)}$. For any $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$, for any $i' \in I'$ we have

$$u_{X*}(\mathcal{F}_\bullet)_{i'} = \varprojlim_{u(i) \leq i'} \mathcal{F}_i,$$

where the projective limit is that of the functor $\mathrm{Cat}(I_{i'})^{\mathrm{op}} \to \mathrm{Sh}(X_{Zar})$ induced by $\mathcal{F}_\bullet$.

Since u_X is continuous we have a left adjoint $u_{X!}$ of u_X^{-1}. We compute for any $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$ that

$$u_{X!}(\mathcal{F}_\bullet)_{i'} = \varinjlim_{u(i)\geq i'} \mathcal{F}_i, \tag{7.1.2.4.2}$$

where the inductive limit is that of the inductive system $\mathrm{Cat}((I^{i'})^{\mathrm{o}}) \to \mathrm{Sh}(X_{Zar})$ induced by $\mathcal{F}_\bullet$.

Beware that $u_{X!}$ is not necessarily exact. Indeed, suppose there exists an $i' \in I'$ such that $I_{i'}$ is empty. Denoting by e and e' the final object (i.e. the projective limit indexed by the empty set) of respectively $\mathrm{Top}(X)_I$ and $\mathrm{Top}(X)_{I'}$, then we do not have $u_{X!}(e) = e'$. This means that the adjoint pair $(u_{X!} \dashv u_X^{-1})$ do not induce a morphism of topos $\mathrm{Top}(X)_{I'} \to \mathrm{Top}(X)_I$.

When u is cofiltered, it follows from [KS06, 3.1.6] that the functor $u_{X!}$ commutes with finite projective limits. Hence, $u_{X!}$ is exact and we get the morphism of topos

$$\breve{u}_X = (u_{X!} \dashv u_X^{-1})\colon \mathrm{Top}(X)_{I'} \to \mathrm{Top}(X)_I, \tag{7.1.2.4.3}$$

i.e. $\breve{u}_X^{-1} = u_{X!}, \qquad \breve{u}_{X*} = u_X^{-1}$.

Notation 7.1.2.5. Let $I' := \{*\}$ be some one element set. Let I be a partially ordered set, $u\colon I \to \{*\}$ be the map. Since $I'^{\natural} \times X_{Zar}$ is equivalent to the site X_{Zar}, by identifying $\mathrm{Top}(X)$ with $\mathrm{Top}(X)_{\{*\}}$, then the morphism of 7.1.2.4.1 is denoted in this case

$$\underleftarrow{l}_{X,I} = (\underleftarrow{l}_{X,I}^{-1} \dashv \underleftarrow{l}_{X,I*})\colon \mathrm{Top}(X)_I \to \mathrm{Top}(X). \tag{7.1.2.5.1}$$

We have $\underleftarrow{l}_{X,I}^{-1}(\mathcal{F})_i = \mathcal{F}$ for any $\mathcal{F} \in \mathrm{Top}(X)$ and any $i \in I$; transition morphisms are the identities. Moreover, for any $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$ we have

$$\underleftarrow{l}_{X,I*}(\mathcal{F}_\bullet) = \varprojlim_i \mathcal{F}_i,$$

where the projective limit is that of the functor $\mathrm{Cat}(I)^{\mathrm{op}} \to \mathrm{Sh}(X_{Zar})$ induced by the object $\mathcal{F}_\bullet$.

Remark 7.1.2.6. Suppose I is a filtered set and $J \subset I$ is a cofinal subset. Let $u\colon J \to I$ the corresponding map. Then, with notation 7.1.2.4.1 and 7.1.2.5, we get the isomorphism $\underleftarrow{l}_{X,J*} \circ u_X^{-1} \xrightarrow{\sim} \underleftarrow{l}_{X,I*}$.

Notation 7.1.2.7. Let $I' := \{*\}$ be some one element set. Let I be a partially ordered set. Fix $i \in I$ and let $i\colon I' \to I$ be the map sending $*$ to i. Since $I'^{\natural} \times X_{Zar}$ is equivalent to the site X_{Zar}, by identifying $\mathrm{Top}(X)$ with $\mathrm{Top}(X)_{\{*\}}$, then the morphism of 7.1.2.4.1 is denoted in this case

$$i_X = (i_X^{-1} \dashv i_{X*})\colon \mathrm{Top}(X) \to \mathrm{Top}(X)_I. \tag{7.1.2.7.1}$$

We have $i_X^{-1}(\mathcal{F}_\bullet) = \mathcal{F}_i$ for any $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$ and we compute

$$(i_{X*}(\mathcal{F}))_j = \begin{cases} \mathcal{F} & \text{if } j \geq i \\ e & \text{otherwise} \end{cases}, \qquad (i_{X!}(\mathcal{F}))_j = \begin{cases} \mathcal{F} & \text{otherwise} \\ \emptyset & \text{if } j > i \end{cases} \tag{7.1.2.7.2}$$

where e (resp. $\emptyset$) is the final (resp. initial) object of $\mathrm{Top}(X)$ for any $\mathcal{F} \in \mathrm{Top}(X)$.

Notation 7.1.2.8. Let I be a partially ordered set and $i \in I$. With notation 7.1.2.18, the morphism of 7.1.2.4.1 is in this case where u is the morphism $u_i\colon I_{\leq i} \to I$ induces the morphism of topos

$$u_{i,X} = (u_{i,X}^{-1} \dashv u_{i,X*})\colon \mathrm{Top}(X)_{I_{\leq i}} \to \mathrm{Top}(X)_I, \tag{7.1.2.8.1}$$

which is a localization morphism. For any $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$, $u_{i,X}^{-1}(\mathcal{F}_\bullet)$ is the projective system $(\mathcal{F}_j)_{j\leq i}$ induced by restriction. For any $\mathcal{F}'_\bullet \in \mathrm{Top}(X)_{I_{\leq i}}$, we have also

$$(u_{i,X*}(\mathcal{F}'_\bullet))_j = \begin{cases} \mathcal{F}'_j & \text{if } j \geq i \\ e & \text{otherwise} \end{cases}, \qquad (u_{i,X!}(\mathcal{F}'_\bullet))_j = \begin{cases} \mathcal{F}'_j & \text{if } j \leq i \\ \emptyset & \text{otherwise} \end{cases} \tag{7.1.2.8.2}$$

where e (resp. $\emptyset$) is the final (resp. initial) object of $\mathrm{Top}(X)$.

7.1.2.9 (Varying X)**.** Let I be partially ordered set and $f\colon X \to X'$ be a continuous map of topological spaces. We have the topos morphism

$$f_I = (f_I^{-1} \dashv f_{I*})\colon \mathrm{Top}(X)_I \to \mathrm{Top}(X')_I \tag{7.1.2.9.1}$$

defined by setting $f_I^{-1}(\mathcal{G}_\bullet)\colon I^{\mathrm{o}} \to \mathrm{Top}(X)$ is the functor $i \mapsto f^{-1}\mathcal{G}_i$ and $f_{I*}(\mathcal{F}_\bullet)\colon I^{\mathrm{o}} \to \mathrm{Top}(X)$ is the functor $i \mapsto f_*\mathcal{F}_i$.

7.1.2.10. Let $u\colon I' \to I$ be an increasing map of partially ordered sets. Let $f\colon X \to X'$ be a continuous map of topological spaces. Then we get the equality $f_I \circ u_X = u_{X'} \circ f_{I'}$ as morphism of topos $\mathrm{Top}(X)_I \to \mathrm{Top}(X')_{I'}$. In particular, for any $i \in I$, wet get $f_I \circ i_X = i_{X'} \circ f$, where $f\colon \mathrm{Top}(X) \to \mathrm{Top}(X')$ is the morphism of topos induced by f.

7.1.2.11. This is not clear that the topos $\mathrm{Sh}(I^\natural)$ is algebraic (in the sense of [SGA4.2, VI.2.3]). We will describe when this is the case in 7.1.2.15 thanks to the equivalence of topoi 7.1.2.13.1. However, in the special case below, we can check it without using the equivalence of topoi 7.1.2.13.1.

(a) Any objects of the site $I^\natural$ is quasi-compact (in the site sense of [SGA4.2, VI.1.1]). Let us denote by $\varepsilon\colon \mathrm{Cat}(I) \to \mathrm{Sh}(I^\natural)$ the canonical functor (see [SGA4.1, II.4.4.0]), which is fully faithful (because the topology of $\mathrm{Cat}(I)$ is subcanonical) and commutes with projective limits. Let $\varepsilon(I)$ be the essential image of ε. Then following [SGA4.2, VI.1.2] the objects of $\varepsilon(I)$ are quasi-compact.

(b) Suppose I satisfies one of the following equivalent properties:

  (i) For any $i, j \in I$, the set $\{k \in I \text{ such that } k \le i, k \le j\}$ has a greatest element that we denote by $\inf\{i, j\}$.

  (ii) The fibered products in $\mathrm{Cat}(I)$ exists.

  (iii) The subsets $I_{\le i}$ with $i \in I$ are closed under intersection.

  Then $\varepsilon(I)$ is stable under fiber products. Since the kernels in $\mathrm{Sh}(I^\natural)$ of two morphisms $u, v\colon A \to B$ such that A and B are objects of $\varepsilon(I)$ is an object of $\varepsilon(I)$ (because necessarily $u = v$ by full faithfulness of ε) and is therefore quasi-compact, then following the remark [SGA4.2, VI.2.2.1], we get that $\mathrm{Sh}(I^\natural)$ is an algebraic topos.

7.1.2.12 (Open subtopos of $\mathrm{Top}(X)_I$)**.** Let I be a partially ordered set and let X be a topological space. We describe here the opens of the site $I^\natural \times X_{Zar}$ defined at 7.1.2.1.

(a) Since the topology is chaotic, a sieve of $I^\natural$ is the same as a sieve of $I^\natural$ of local nature. Let J be a subset of I. Then $\mathrm{Cat}(J)$ (simply denoted by abuse of notation by J) is a sieve of $I^\natural$ if and only if the inclusion $J \to \cup_{j\in J} I_{\le j}$ is an equality. For example, the subsets $I_{\le j}$ with $j \in I$ of I are sieves.

(b) For any $(i, U) \in I^\natural \times X_{Zar}$, we set $\mathcal{U}_{\le(i,U)} := \{(j, V) \in I^\natural \times X_{Zar}\ ;\ j \le i \text{ and } V \subset U\}$. This is straightforward that $\mathcal{U}_{\le(i,U)}$ is an open of the site $I^\natural \times X_{Zar}$. It corresponds to $\mathcal{U}_{\le(i,U)}$ a subobject of the final object of $\mathrm{Sh}(I^\natural \times X_{Zar})$ (the construction is recalled in 4.6.2.1) which is equal to $h_{(i,U)} = h^\sharp_{(i,U)}$ (we remark the topology on $\mathrm{Sh}(I^\natural \times X_{Zar})$ is subcanonical).

(c) To get all the opens of the site $I^\natural \times X_{Zar}$, we need the following construction. Let $\phi\colon \mathrm{Cat}(J)^{\mathrm{op}} \to X_{Zar}$ be a functor, where J is a sieve of $I^\natural$. We set $\mathcal{U}_\phi := \cup_{j\in J} \mathcal{U}_{\le(j,\phi(j))}$. Since a union of opens is an open then $\mathcal{U}_\phi$ is an open of $I^\natural \times X_{Zar}$. We remark that for any $(i, U) \in \mathrm{Ob}(I^\natural \times X_{Zar})$, we have the property $(i, U) \in \mathcal{U}_\phi$ if and only if $i \in J$ and $U \subset \phi(i)$. Hence, for any functor $\psi\colon \mathrm{Cat}(J')^{\mathrm{op}} \to X_{Zar}$, where J' is a sieve of $I^\natural$, we have the inclusion $\mathcal{U}_\phi \subset \mathcal{U}_\psi$ if and only if $J \subset J'$ and for any $j \in J$, $\phi(j) \subset \psi(j)$. This yields that we have the equality $\mathcal{U}_\phi = \mathcal{U}_\psi$ if and only if $J = J'$ and $\phi = \psi$.

  For any $(i, U) \in I^\natural \times X_{Zar}$, we have $\mathcal{U}_{\le(i,U)} = \mathcal{U}_{c_{I_{\le i}}(U)}$, where $c_{I_{\le i}}(U)\colon \mathrm{Cat}(I_{\le i})^{\mathrm{op}} \to X_{Zar}$ is the constant object of $\mathrm{Cat}(I_{\le i})^{\mathrm{op}} \to X_{Zar}$ with value U (see 7.1.1.2).

(d) The opens of $I^\natural \times X_{Zar}$ correspond to the subsets of the form $\mathcal{U}_\phi$. Indeed, we already know that subsets of the form $\mathcal{U}_\phi$ are opens. Conversely, let $\mathcal{U}$ be an open of $I^\natural \times X_{Zar}$. For any $i \in I$, let $E_i := \{V \in X_{Zar}\ ;\ (i, V) \in \mathcal{U}\}$. Let J be the set of the elements $i \in I$ such that E_i is not empty. Since $\mathcal{U}$ is a sieve, then so is J. Since $\mathcal{U}$ is of local nature, by setting $U_i := \cup_{V\in E_i} V$ we have $U_i \in E_i$

(in other words, U_i is the greatest element of E_i). For any $i \leq j$, since $(i, U_j) \leq (j, U_j)$ and $\mathcal{U}$ is a sieve, then we get $U_j \subset U_i$. This yields the functor $\phi\colon \mathrm{Cat}(J)^{\mathrm{op}} \to X_{Zar}$ defined by setting $\phi(i) := U_i$. We have $\mathcal{U} = \mathcal{U}_\phi$.

7.1.2.13 (An equivalence of topoi)**.** Let I be a partially ordered set and let X be a topological space. We can endow I with a canonical topology as follows. We say that a subset J of I is open if $J = \cup_{j\in J} I_{\leq j}$, i.e. $\mathrm{Cat}(J)$ is a sieve of $I^\natural$. We easily check that this gives a topology on I. Moreover, we remark that the subsets $I_{\leq i}$ where $i \in I$ form a basis of open subsets on I. We endow the set $I \times X$ with the product topology. The open subsets $(I_{\leq i}, U)$ where $i \in I$ and U is a non-empty open subset of X form a basis of open subsets of $I \times X$ that we will be denoted by $\mathfrak{B}$.

(a) The opens of $I \times X$ are described as follows. Let $X'_{Zar} := X_{Zar} \setminus \{\emptyset\}$ and let $\phi\colon \mathrm{Cat}(J)^{\mathrm{op}} \to X'_{Zar}$ be a functor, where J is an open of I. We set $\mathcal{V}_\phi := \cup_{j\in J}(I_{\leq j}, \phi(j)) \subset I \times X$. For any non-empty open subset V of $I \times X$, there exists a unique functor $\phi\colon \mathrm{Cat}(J)^{\mathrm{op}} \to X'_{Zar}$ such that $V = \mathcal{V}_\phi$. Hence, we get therefore an order preserving injection from the set of opens of the topogical space $I \times X$ to the set of opens of the site $I^\natural \times X_{Zar}$ given by $\mathcal{V}_\phi \mapsto \mathcal{U}_\phi$.

    Unicity: We remark that for any $(i, x) \in I \times X$, we have the property $(i, x) \in \mathcal{V}_\phi$ if and only if $i \in J$ and $x \in \phi(i)$. Hence, for any functor $\psi\colon \mathrm{Cat}(J')^{\mathrm{op}} \to X'_{Zar}$, where J' is an open of I, we have the inclusion $\mathcal{V}_\phi \subset \mathcal{V}_\psi$ if and only if $J \subset J'$ and for any $j \in J$, $\phi(j) \subset \psi(j)$. This yields the equality $\mathcal{V}_\phi = \mathcal{V}_\psi$ if and only if $J = J'$ and $\phi = \psi$.

    Existence: Let V be a non-empty open of $I \times X$. For any $i \in I$, let $E_i := \{U \in X'_{Zar}\ ;\ (I_{\leq i}, U) \subset V\}$. Let J be the set of the elements $i \in I$ such that E_i is not empty. Then J is an open of I. By setting $U_i := \cup_{V\in E_i} V$ we have $U_i \in E_i$ (in other words, U_i is the greatest element of E_i). For any $i \leq j$, since $I_{\leq i} \leq I_{\leq j}$, then we get $U_j \subset U_i$. This yields the functor $\phi\colon \mathrm{Cat}(J)^{\mathrm{op}} \to X'_{Zar}$ defined by setting $\phi(i) := U_i$. We have $V = \mathcal{V}_\phi$.

(b) We denote by $(I \times X)_{\mathrm{Zar}}$ the site induced by the topological space $I \times X$. Let $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$. We get a presheaf $\alpha_*(\mathcal{F}_\bullet)$ on the basis of opens subsets $\mathfrak{B}$ of $I \times X$ by setting $\alpha_*(\mathcal{F}_\bullet)(I_{\leq i}, U) := \mathcal{F}_i(U)$. In fact $\alpha_*(\mathcal{F}_\bullet)$ is a sheaf on the basis $\mathfrak{B}$, i.e. satisfies the property (F_0) of [Gro60, 3.2.2]. Indeed, let $(I_{\leq i_\alpha}, U_\alpha)_{\alpha\in A}$ be an open covering of $(I_{\leq i}, U)$. We remark that $(I_{\leq i}, U_\alpha)_{\alpha\in A'}$ is also an open covering of $(I_{\leq i}, U)$, where A' is the subset of A consisting of the elements α such that $i_\alpha = i$. Hence, to check the property (F_0) of [Gro60, 3.2.2] it is sufficient to reduce to the case where the open covering of $(I_{\leq i}, U)$ is of the form $(I_{\leq i}, U_\alpha)_{\alpha\in A'}$. Then, we can check the property (F_0) by using the fact that $\mathcal{F}_i$ is a sheaf on X. We still denote by $\alpha_*(\mathcal{F}_\bullet)$ the induced sheaf on $(I \times X)_{\mathrm{Zar}}$. We get the morphism of topoi

$$\alpha\colon \mathrm{Top}(X)_I \to \mathrm{Sh}((I \times X)_{\mathrm{Zar}}) = \mathrm{Top}(I \times X), \tag{7.1.2.13.1}$$

    where α_* is the functor constructed above and for any $\mathcal{F} \in \mathrm{Sh}((I \times X)_{\mathrm{Zar}})$, we define $\alpha^{-1}(\mathcal{F}) := \mathcal{F}_\bullet$ so that $\mathcal{F}_i$ is the sheaf on X defined by setting $\mathcal{F}_i(U) := \mathcal{F}(I_{\leq i}, U)$ for any $i \in I$ and open set U of X, the transition maps $\mathcal{F}_j(U) \to \mathcal{F}_i(U)$ are given by the restriction map $\mathcal{F}(I_{\leq j}, U) \to \mathcal{F}(I_{\leq i}, U)$ for any $i \leq j$. Since $\alpha^{-1} \circ \alpha_* = \mathrm{id}$ and $\alpha_* \circ \alpha^{-1} = \mathrm{id}$, this is in fact an equivalence of topoi.

7.1.2.14 (Finiteness properties)**.** Let X be a topological space.

(a) Following [SGA4.2, VI.1.2 and 1.6.1], for any open U of X, U is quasi-compact if and only if h_U is a quasi-compact object of the topos $\mathrm{Top}(X)$, where $U \mapsto h_U$ is the canonical functor $X_{Zar} \to \mathrm{Top}(X)$. Moreover, a sheaf F of $\mathrm{Top}(X)$ is quasi-compact if and only if the étale space over X associated with F is quasi-compact (loc. cit.). Let $f\colon X \to Y$ be a continuous morphism of topological spaces. With [SGA4.1, IV.4.1.1], this yields that the topos morphism $\mathrm{Top}(f)\colon \mathrm{Top}(X) \to \mathrm{Top}(Y)$ is quasi-compact (see definition [SGA4.2, VI.3.1]) if and only if f is quasi-compact.

(b) The topological space X is said to be coherent (in the sense of [FK18, 0.2.2.1]) if X has an open basis consisting of quasi-compact open subsets and X is quasi-compact and quasi-separated. The topological space X is said to be locally coherent (in the sense of [FK18, 0.2.2.21]) if X admits an open covering by coherent subspaces. This is equivalent to saying that has an open basis $\mathfrak{B}$ consisting of quasi-compact open subsets such that fibered product of objects of $\mathfrak{B}$ are quasi-compact (the objects of $\mathfrak{B}$ are therefore coherent). Hence, following [SGA4.2, VI.2.4.7]), $\mathrm{Top}(X)$ is algebraic (in the sense of [SGA4.2, VI.2.3]) if and only if X is locally coherent.

(c) Suppose X is locally coherent. Let $\mathcal{C}(X)$ be the family of open coherent subsets of X. The family $\mathcal{C}(X)$ is a family of topological generators (in the sense of [SGA4.1, II.3.0.1]). Then, it follows from [SGA4.1, II.4.10] that the family of objects $(h_U)_{U\in\mathcal{C}(X)}$ is a family of generators of $\mathrm{Top}(X)$. Hence, we deduce from [SGA4.2, VI.1.11], that to check that a morphism from a quasi-compact object F of $\mathrm{Top}(X)$ to h_X is quasi-compact, we reduce to the case where $F = h_U$, with $U \in \mathcal{C}(X)$. Hence, h_X is quasi-separated if and only if X is quasi-separated.

(d) This yields that X is locally coherent and quasi-separated (resp. coherent) if and only if $\mathrm{Top}(X)$ is quasi-separated (resp. coherent) in the sense of [SGA4.2, VI.2.3].

(e) Suppose X is locally coherent. Let F be a sheaf of $\mathrm{Top}(X)$. Following [SGA4.2, VI.2.4.6], the sheaf F of $\mathrm{Top}(X)$ is quasi-separated (resp. coherent) if and only if the topos $\mathrm{Top}(X)_{/F}$ is quasi-separated (resp. coherent). Since $\mathrm{Top}(X)_{/F} \xrightarrow{\sim} \mathrm{Top}(F')$ where F' is the étale space associated with F (see [SGA4.1, IV.5.7]), since F' is also locally coherent, then the object F of the topos $\mathrm{Top}(X)$ is quasi-separated if and only if to the topological space F' is quasi-separated (coherent).

(f) Let $f\colon X \to Y$ be a morphism of locally coherent topological spaces. It follows from (e) (resp. and (a)) that f is quasi-separated (resp. coherent) if and only if $\mathrm{Top}(f)\colon \mathrm{Top}(X) \to \mathrm{Top}(Y)$ is quasi-separated (resp. coherent) as morphism of topoi (see definition [SGA4.2, VI.3.1]).

7.1.2.15 (Finiteness properties)**.** Let X be a topological space. Let I be a partially ordered set. Recall I can be naturally seen as a topological space so that the subsets $I_{\leq i}$ where $i \in I$ form a basis of open subsets of I (see 7.1.2.13).

(a) The subsets $I_{\leq i}$ are quasi-compact for any $i \in I$. Indeed, if $I_{\leq i} = \cup_{\alpha\in A} J_\alpha$ where J_α are opens of I, then there exists $\alpha \in A$ such that $i \in J_\alpha$. Since J_α is a open then $I_{\leq i} \subset J_\alpha$, and therefore $I_{\leq i} = J_\alpha$. This yields the quasi-compact open subsets of I are the finite union of subsets of the form $I_{\leq i}$ with $i \in I$.

(b) Suppose the topological space I is quasi-separated, i.e. suppose the intersection of two subsets of the form $I_{\leq i}$ with $i \in I$ is quasi-compact. Then the open quasi-compact subsets of I (in particular $I_{\leq i}$) are coherent (in the sense of [FK18, 0.2.2.1]) and I is therefore locally coherent as topological space (in the sense of [FK18, 0.2.2.21]). This yields that $\mathrm{Sh}(I_{\mathrm{Zar}})$ is an algebraic topos. Hence, it follows from the equivalence of topoi 7.1.2.13.1 that so is $\mathrm{Sh}(I^{\natural})$.

(c) If I is coherent, i.e., I is quasi-separated and is a finite union of subsets of the forms $I_{\leq i}$, then $\mathrm{Sh}(I_{\mathrm{Zar}})$ is a coherent topos.

(d) If I is quasi-separated and X is locally coherent, then $I \times X$ is locally coherent and $\mathrm{Top}(X)_I$ is therefore an algebraic topos (use 7.1.2.14 and the equivalence of topoi 7.1.2.13.1).

(e) If I and X are coherent, then $I \times X$ is coherent and $\mathrm{Top}(X)_I$ is therefore a coherent topos.

7.1.2.16. Let X be a locally coherent topological space. Let I be a partially ordered set which is quasi-separated for its canonical topology. Then following [SGA4.2, VI.5.3], for any integer q, for any coherent object F of $\mathrm{Top}(X)_I$ (i.e. following 7.1.2.14.(e), the étale space associated with F' is coherent), the functor $H^q(F, -)$ commutes with filtered inductive limits of abelian sheaves. In particular, when $I \times X$ is coherent, the functor $H^q(X_\bullet, -)$ commutes with filtered inductive limits of abelian sheaves.

7.1.2.17. Let $u\colon I \to I'$ be an increasing map of partially ordered sets. Let $f\colon X \to X'$ be a continuous map of topological spaces. We get the continuous morphism of topological spaces $u \times f\colon I \times X \to I' \times X'$, where the topologies on I and I' are defined at 7.1.2.13. This yields the morphism of topoi $\mathrm{Top}(u \times f)\colon \mathrm{Top}(I \times X) \to \mathrm{Top}(I' \times X')$.

(a) We have the commutative square

$$\begin{array}{ccc}
\mathrm{Top}(X)_I & \xrightarrow[f_I \circ u_X]{7.1.2.10} & \mathrm{Top}(X')_{I'} \\
{\scriptstyle \alpha}\downarrow{\scriptstyle 7.1.2.13.1} & & {\scriptstyle \alpha}\downarrow{\scriptstyle 7.1.2.13.1} \\
\mathrm{Top}(I \times X) & \xrightarrow{\mathrm{Top}(u\times f)} & \mathrm{Top}(I' \times X').
\end{array} \tag{7.1.2.17.1}$$

Indeed, we reduce to the case where either $u = \mathrm{id}$ or $f = \mathrm{id}$. When $f = \mathrm{id}$, by using the description of α of 7.1.2.13.(b) and of u_X of 7.1.2.4, we easily compute that $\mathrm{Top}(u \times \mathrm{id})_* \circ \alpha_* = \alpha_* \circ u_{X*}$ and $u_X^{-1} \circ \alpha^{-1} = \alpha^{-1} \circ \mathrm{Top}(u \times \mathrm{id})^{-1}$. Similarly using 7.1.2.9, we compute $\mathrm{Top}(\mathrm{id} \times f)_* \circ \alpha_* = \alpha_* \circ f_{I*}$ and $f_I^{-1} \circ \alpha^{-1} = \alpha^{-1} \circ \mathrm{Top}(\mathrm{id} \times f)^{-1}$.

(b) Suppose I, I' are quasi-separated and X, X' are locally coherent. Then the morphism of topoi $f_I \circ u_X \colon \mathrm{Top}(X)_I \to \mathrm{Top}(X')_{I'}$ is quasi-separated (resp. quasi-compact, resp. coherent) if and only if u and f are quasi-separated (resp. quasi-compact, resp. coherent). Indeed, this is a consequence of 7.1.2.14.(f).

7.1.2.18. Let I be a partially ordered set and let X be a topological space. Let $(i, U) \in \mathrm{Ob}(I^\natural \times X_{Zar})$. We denote by $I_{\leq i} = \{j \in I \mid j \leq i\}$ and by $u_i \colon I_{\leq i} \to I$ the canonical inclusion. Then we have the commutative diagram of sites

$$\begin{array}{ccc} I^\natural_{\leq i} \times U_{Zar} & \xrightarrow{\sim} & I^\natural \times X_{Zar}/(i,U) \\ & \searrow^{u_i \times j_U} & \downarrow{\scriptstyle j_{(i,U)}} \\ & & I^\natural \times X_{Zar} \end{array} \qquad (7.1.2.18.1)$$

where the top right term is the localization of the site $I^\natural \times X_{Zar}$ at the object (i, U), $j_{(i,U)}$ is the forgetful functor (see 4.6.2.3) and the horizontal morphism is an isomorphism of sites. Following 4.6.2.4.2 in the case where $\mathfrak{C} = I^\natural \times X_{Zar}$ and using localisation at (i, U), since $h^\sharp_{(i,U)} = \mathcal{U}_{\leq (i,U)}$, then we have the commutative diagram

$$\begin{array}{ccccc} Sh(I^\natural_{\leq i} \times U_{Zar}) & \xrightarrow{\cong} & Sh(I^\natural \times X_{Zar}/(i,U)) & \xrightarrow{\cong} & Sh(I^\natural \times X_{Zar})/\mathcal{U}_{\leq (i,U)} \\ & \searrow^{j_{(i,U)}} & \downarrow{\scriptstyle j_{(i,U)}} & \swarrow^{j_{\mathcal{U}_{\leq (i,U)}}} & \\ & & Sh(I^\natural \times X_{Zar}) & & \end{array} \qquad (7.1.2.18.2)$$

where $j_{(i,U)} \colon Sh(I^\natural_{\leq i} \times U_{Zar}) \to Sh(I^\natural \times X_{Zar})$ is by definition the composition of the functor $u_{i,X}$ of 7.1.2.8.1 with the functor $j_{U,I}$ of 7.1.2.9.1 , where $j_U \colon U \subset X$ is the inclusion. Since $j_{\mathcal{U}_{\leq (i,U)}}$ is an open of the site $I^\natural \times X_{Zar}$, then $Sh(I^\natural \times X_{Zar})/\mathcal{U}_{\leq (i,U)}$ is an open subtopos of $Sh(I^\natural \times X_{Zar})$ and we get the open immersion (see definition 4.6.2.6):

$$j_{(i,U)} \colon \mathrm{Top}(U)_{I_{\leq i}} \to \mathrm{Top}(X)_I. \qquad (7.1.2.18.3)$$

We can simply write $|_{(i,U)}$ the functor $j^{-1}_{(i,U)}$.

7.1.2.19 (Flasque sheaves)**.** We keep notation 7.1.2.12 and 7.1.2.13.

(a) Let $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$. Then the sheaf $\mathcal{F}_\bullet$ is flasque (see Definition [SGA4.2, V.4.10]) if and only if $\alpha_*(\mathcal{F}_\bullet)$ is flasque if and only if the restriction map $\alpha_*(\mathcal{F}_\bullet)(\mathcal{U}_{\leq (j,X)}) \to \alpha_*(\mathcal{F}_\bullet)(\mathcal{U}_{\leq (i,U)})$ is surjective for any $i \leq j$ and U open subset of X if and only if the map $\mathcal{F}_j(X) \to \mathcal{F}_i(U)$ is surjective for any $i \leq j$, for any open set U of X if and only if $\mathcal{F}_\bullet$ is a projective system of flasque sheaves whose transition maps are surjective in the category of presheaves. The notion of flasque sheaves is also called totally acyclic sheaves (see [Sta22, 072Y-21.13.4]) but we keep Grothendieck's terminology.

(b) Let $\mathcal{F}_\bullet \in \mathrm{Top}(X)_I$. We define the sheaf $\mathcal{G}_i$ on X by setting for any open set U of X:

$$\mathcal{G}_i(U) := \prod_{j \leq i} \prod_{x \in U} \mathcal{F}_{j,x}. \qquad (7.1.2.19.1)$$

This is clear that $\mathcal{G}_\bullet$ is flasque and we have the canonical embedding $\mathcal{F}_\bullet \hookrightarrow \mathcal{G}_\bullet$. We say that this is the canonical embedding of $\mathcal{F}_\bullet$ into a flasque sheaf of $\mathrm{Top}(X)_I$.

(c) Suppose I and X are coherent. In that case, filtered inductive limits of flasque abelian sheaves of $\mathrm{Top}(X)_I$ are flasque. Indeed, since $I \times X$ is a coherent topological space, then $\mathrm{Top}(I \times X)$ is a coherent topos and then filtered inductive limits of abelian sheaves on $I \times X$ commute with the functors $\Gamma(V, -)$ for any open coherent subset V of $I \times X$ (see 7.1.2.16). Since the equivalence of topoi 7.1.2.13.1 preserves the flasqueness and commutes with filtered inductive limits, then we are done.

7.1.2.20 (Points of the topos $\mathrm{Top}(X)_I$)**.** Let I be a partially ordered set, X be a topological space, $i \in I$ and $x \in X$. We get the continuous map of topological spaces $f_x : \{x\} \to X$. We denote by

$$p_{x,i} : \mathrm{Top}(\{x\})_{\{i\}} \to \mathrm{Top}(X)_I \tag{7.1.2.20.1}$$

the morphism of topoi defined by setting $p_{x,i} = (f_x)_I \circ i_{\{x\}} = i_{\{x\}} \circ f_{x\{i\}}$ (see notation 7.1.2.7.1 and 7.1.2.9.1). Let $\{*\}$ be some one element set. Then $\mathrm{Top}(\{x\})_{\{i\}} = \mathrm{Top}(\{*\})$ and then the morphism of topoi $p_{x,i}$ of 7.1.2.20.1 can be identified with a point of the topos $\mathrm{Top}(X)_I$ (recall definition [Sta22, 00Y4–7.32.1]). We compute that for any $\mathcal{G}_\bullet \in \mathrm{Top}(X)_I$, we have $p_{x,i}^{-1}(\mathcal{G}_\bullet) = \mathcal{G}_{i,x}$ and for any $G \in \mathrm{Top}(\{*\})$, we have

$$(p_{x,i*}(G))_j = \begin{cases} f_{x*}(G) & \text{if } j \geq i \\ e & \text{otherwise} \end{cases}. \tag{7.1.2.20.2}$$

The family of points $\{p_{x,i}\}_{x \in X, i \in I}$ is conservative (see definition [Sta22, 00YK–7.38.1]). In particular, $\mathrm{Top}(X)_I$ has enough points.

7.1.2.21. Let I be a partially ordered set, let X be a topological space and $\mathscr{T} = \mathrm{Top}(X)$. Let $(i, U) \in I^\natural \times X_{Zar}$. Let $E_\bullet, F_\bullet$ be two objects of $\mathscr{T}_I$. By applying the formula 4.6.2.7.2 (in the case where $K = h^\sharp_{(i,U)}$ and by using Yoneda lemma), with the notation of 7.1.2.18.2 we get

$$\mathrm{Hom}_{\mathscr{T}_I}((i,U), \mathscr{H}om_{\mathscr{T}_I}(E_\bullet, F_\bullet)) = \mathrm{Hom}_{\mathscr{T}_{I_{\leq i}}}(E_\bullet|_{(i,U)}, F_\bullet|_{(i,U)}). \tag{7.1.2.21.1}$$

With the notation 7.1.2.18, this yields the isomorphism of $\mathscr{T}_{I_{\leq i}}$

$$\mathscr{H}om_{\mathscr{T}_I}(E_\bullet, F_\bullet)|_{(i,U)} \xrightarrow{\sim} \mathscr{H}om_{\mathscr{T}_{I_{\leq i}}}(E_\bullet|_{(i,U)}, F_\bullet|_{(i,U)}). \tag{7.1.2.21.2}$$

7.1.3 Modules

Let I be a partially ordered set and let X be a topological space. Let $\mathscr{T} = \mathrm{Top}(X)$. Recall an abelian sheaf (resp. a ring) of $\mathscr{T}_I$ is a projective system indexed by I of abelian sheaves (resp. of rings) on X. Let $\mathcal{D}_\bullet$ be a ring of $\mathscr{T}_I$ i.e. a functor $I^\circ \to \mathrm{Top}(X)$ denoted by $i \mapsto \mathcal{D}_i$ such that the transition maps $\mathcal{D}_j \to \mathcal{D}_i$ (if $i \leq j$) are ring morphisms. We get the ringed topos $(\mathscr{T}_I, \mathcal{D}_\bullet)$.

Notation 7.1.3.1. A left (resp. right) $\mathcal{D}_\bullet$-module $\mathcal{M}_\bullet$ is a projective system $i \mapsto \mathcal{M}_i$ indexed by I of left (resp. right) $\mathcal{D}_i$-module $\mathcal{M}_i$ such that the transition maps $\mathcal{M}_j \to \mathcal{M}_i$ are $\mathcal{D}_j$-linear. We denote by $\mathrm{Mod}({}^l\mathcal{D}_\bullet)$ (resp. $\mathrm{Mod}({}^r\mathcal{D}_\bullet)$) the category of left (resp. right) $\mathcal{D}_\bullet$-modules.

Let $f^\bullet_\bullet : \mathcal{E}^\bullet_\bullet \to \mathcal{F}^\bullet_\bullet$ be a morphism in $C({}^*\mathcal{D}_\bullet)$. Then $\ker(f^n_\bullet)$ (resp. $\mathrm{Coker}(f^n_\bullet)$) is the $\mathcal{D}_\bullet$-module $i \mapsto \ker(f^n_i)$ (resp. $i \mapsto \mathrm{Coker}(f^n_i)$) with the induced by $f^\bullet_\bullet$ transition maps. Hence, $f^\bullet_\bullet$ is a quasi-isomorphism of $C({}^*\mathcal{D}_\bullet)$ if and only if for any $i \in I$ the map $f^\bullet_i$ is a quasi-isomorphism of $C({}^*\mathcal{D}_i)$.

7.1.3.2. For any $i \in I$, with the notation 7.1.2.7,since $i_X^{-1}(\mathcal{D}_\bullet) = \mathcal{D}_i$ then we get (from the morphism of topos of 7.1.2.7.1) the morphism of ringed topoi

$$i_X = (i_X^{-1} \dashv i_{X*}) : (\mathscr{T}, \mathcal{D}_i) \to (\mathscr{T}_I, \mathcal{D}_\bullet),$$

which is such that the (exact) functor $i_X^* : \mathrm{Mod}(\mathcal{D}^*_\bullet) \to \mathrm{Mod}({}^*\mathcal{D}_i)$, with $* \in \{l, r\}$ is given for any $\mathcal{E}_\bullet \in \mathrm{Mod}({}^*\mathcal{D}_\bullet)$ by $i_X^*(\mathcal{E}_\bullet) = i_X^{-1}(\mathcal{E}_\bullet) = \mathcal{E}_i$. The functor i_X^* has a left adjoint $i_{X!} : \mathrm{Mod}(\mathcal{D}^*_i) \to \mathrm{Mod}(\mathcal{D}^*_\bullet)$ which is such that for any $\mathcal{F} \in \mathrm{Mod}(\mathcal{D}^*_i)$ we have

$$(i_{X!}(\mathcal{F}))_j = \begin{cases} \mathcal{D}_j \otimes_{\mathcal{D}_i} \mathcal{F} & \text{if } j \leq i \\ 0 & \text{otherwise.} \end{cases} \tag{7.1.3.2.1}$$

7.1.3.3. Fix $i \in I$ and U an open subset of X. Using the open immersion $j_{(i,U)}$ of 7.1.2.18.3, we get the morphism of ringed topoi

$$j_{(i,U)} \colon (\mathrm{Top}(U)_{I_{\leq i}}, \mathcal{D}_\bullet|_{(i,U)}) \to (\mathrm{Top}(X)_I, \mathcal{D}_\bullet) \tag{7.1.3.3.1}$$

which is such that the (exact) functor $j^*_{(i,U)} \colon \mathrm{Mod}({}^*\mathcal{D}_\bullet) \to \mathrm{Mod}({}^*\mathcal{D}_\bullet|_{(i,U)})$, with $* \in \{l, r\}$ is given for any $\mathcal{E}_\bullet \in \mathrm{Mod}({}^*\mathcal{D}_\bullet)$ by $j^*_{(i,U)}(\mathcal{E}_\bullet) = j^{-1}_{(i,U)}(\mathcal{E}_\bullet) = (\mathcal{E}_j|_U)_{j\leq i}$. We can also simply write $\mathcal{E}_\bullet|_{(i,U)}) = j^*_{(i,U)}(\mathcal{E}_\bullet)$. By definition, we have $j_{(i,U)} = u_{i,X} \circ j_{U,I}$, were $u_{i,X}$ is the functor defined at 7.1.2.8.1 and $j_{U,I}$ is the functor defined at 7.1.2.9.1 , where $j_U \colon U \subset X$ is the inclusion. Hence, we compute that the functor $j^*_{(i,U)}$ has a left adjoint $j_{(i,U)!} \colon \mathrm{Mod}({}^*\mathcal{D}_\bullet|_{(i,U)}) \to \mathrm{Mod}({}^*\mathcal{D}_\bullet)$ which is such that for any $\mathcal{F}_\bullet \in \mathrm{Mod}({}^*\mathcal{D}_\bullet|_{(i,U)})$ we have

$$(j_{(i,U)!}(\mathcal{F}_\bullet))_j = \begin{cases} j_{U!}(\mathcal{F}_j) & \text{if } j \leq i \\ 0 & \text{otherwise.} \end{cases} \tag{7.1.3.3.2}$$

Modulo the equivalence of topoi 7.1.2.13.1, the functor $j_{(i,U)!}$ corresponds to the extension by zero via the open immersion $I_{\geq i} \times U \subset I \times X$ (for the canonical topology).

Definition 7.1.3.4. Let $\mathcal{E}^\bullet_\bullet \in K({}^l\mathcal{D}_\bullet)$. We recall the following definition in our context (see the general one at [SGA6, I.5.2] or in the commutative case at [Sta22, 08FZ-21.44.1]).

1. Let $a, b \in \mathbb{Z}$ with $a \leq b$. We say $\mathcal{E}^\bullet_\bullet$ has tor-amplitude in $[a, b]$ if $H^i(\mathcal{M}_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathcal{E}^\bullet_\bullet) = 0$ for all right $\mathcal{D}_\bullet$-modules $\mathcal{M}_\bullet$ and all $i \notin [a, b]$.
2. We say $\mathcal{E}^\bullet_\bullet$ has finite tor dimension if it has tor-amplitude in $[a, b]$ for some integers $a \leq b$. We denote by $D_{\mathrm{tdf}}(\mathcal{D}_\bullet)$ the full subcategory of $D^{\mathrm{b}}({}^l\mathcal{D}_\bullet)$ consisting of complexes having finite tor dimension on $\mathcal{D}_\bullet$.
3. We say $\mathcal{E}^\bullet_\bullet$ *locally has finite tor dimension* if for every object (i, U) of $I^\natural \times X_{Zar}$ there exists a covering $\{(i, U_\lambda) \to (i, U)\}_{\lambda\in\Lambda}$ such that $\mathcal{E}^\bullet_\bullet|_{(i,U_\lambda)}$ has finite tor dimension and for each $\lambda \in \Lambda$. Remark that when I has a greatest element and the topological space X is quasi-compact, the complex $\mathcal{E}^\bullet_\bullet$ locally has finite tor dimension if and only if $\mathcal{E}^\bullet_\bullet$ has finite tor dimension.

Lemma 7.1.3.5. *Let $\mathcal{E}^\bullet_\bullet \in K({}^l\mathcal{D}_\bullet)$. Let $a, b \in \mathbb{Z}$ with $a \leq b$. The following properties are equivalent.*

1. *The complex $\mathcal{E}^\bullet_\bullet$ has tor-amplitude in $[a, b]$.*
2. *For any $i \in I$ and $x \in X$, the complex $p^{-1}_{x,i}(\mathcal{E}^\bullet_\bullet)$ (see notation 7.1.2.20) has tor-amplitude in $[a, b]$.*

Proof. This is a consequence of the fact that $\mathrm{Top}(X)_I$ has enough points (see 7.1.2.20) and [Sta22, 0DJJ-21.44.10] □

7.1.3.6. We denote by $\mathbb{Z}_\bullet$ the sheaf of ring of $\mathscr{T}_I$ equal to the constant projective system indexed by I equal to the sheaf on X associated to $\mathbb{Z}$. Let $\mathcal{E}^\bullet_\bullet \in K({}^l\mathcal{D}_\bullet)$. By definition, the complex $\mathcal{E}^\bullet_\bullet$ is K-flat is for any acyclic complex $\mathcal{M}^\bullet_\bullet \in K({}^r\mathcal{D}_\bullet)$, the complex $\mathcal{M}^\bullet_\bullet \otimes_{\mathcal{D}_\bullet} \mathcal{E}^\bullet_\bullet$ of $K(\mathbb{Z}_\bullet)$ is acyclic.

Since a complex $\mathcal{G}^\bullet_\bullet$ of $K(\mathbb{Z}_\bullet)$ (resp. $K(\mathcal{D}_\bullet)$) is acyclic if and only if the complex $\mathcal{G}^\bullet_i$ of $K(\mathbb{Z})$ (resp. $K(\mathcal{D}_i)$) is acyclic for any $i \in I$, then a complex $\mathcal{E}^\bullet_\bullet \in K({}^l\mathcal{D}_\bullet)$ is K-flat if and only if the complexes $\mathcal{E}^\bullet_i \in K({}^l\mathcal{D}_i)$ are K-flat for any $i \in I$. Similarly, a left $\mathcal{D}_\bullet$-module $\mathcal{E}_\bullet$ is flat if and only if the left $\mathcal{D}_i$-module $\mathcal{E}_i$ are flat for any $i \in I$. Hence, for any $\mathcal{E}^\bullet_\bullet \in D({}^l\mathcal{D}_\bullet)$, $\mathcal{M}^\bullet_\bullet \in D({}^r\mathcal{D}_\bullet)$, we have

$$\left(\mathcal{M}^\bullet_\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_\bullet} \mathcal{E}^\bullet_\bullet\right)_i \xrightarrow{\sim} \mathcal{M}^\bullet_i \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i. \tag{7.1.3.6.1}$$

Let $\mathcal{E}^\bullet_\bullet \in D({}^l\mathcal{D}_\bullet)$. It follows from 7.1.3.6.1 that $\mathcal{E}^\bullet_\bullet$ has tor-amplitude in $[a, b]$ over $\mathcal{D}_\bullet$ if and only if for any $i \in I$ the complex $\mathcal{E}^\bullet_i$ has tor-amplitude in $[a, b]$ over $\mathcal{D}_i$.

7.1.3.7. Let $\mathcal{M}_\bullet$ be a left (resp. right) $\mathcal{D}_\bullet$-module. We remind the following definition (see [Sta22, 03DE-18.17.1]).

(a) $\mathcal{M}_\bullet$ is "generated by finitely many global sections" means that there exists a surjective morphism in $\mathrm{Mod}({}^*\mathcal{D}_\bullet)$ of the form

$$\mathcal{D}^N_\bullet \to \mathcal{M}_\bullet,$$

for some positive integer N.

(b) Moreover, $\mathcal{M}_\bullet$ has "a global presentation" (resp. "a global finite presentation", resp. is "free", resp. is "finite free") means that there exists an exact sequence in $\mathrm{Mod}(^*\mathcal{D}_\bullet)$ of the form

$$\oplus_{i\in I}\mathcal{D}_\bullet \to \oplus_{j\in J}\mathcal{D}_\bullet \to \mathcal{M}_\bullet \to 0,$$

for some sets I and J (resp. some finite sets I and J, resp. I is the empty set and J is a set, resp. I is the empty set and J is a finite set).

When I has a greatest element i_0, $\mathcal{M}_\bullet$ is generated by finitely many global sections (resp. has global presentation, resp. has global finite presentation, resp. is free, resp. is finite free) if and only if the $\mathcal{D}_{i_0}$-module $\mathcal{M}_{i_0}$ is generated by finitely many global sections (resp. has global presentation, resp. has global finite presentation, resp. is free, resp. is finite free) and if for any $i \in I$ the canonical homomorphism $\mathcal{D}_i \otimes_{\mathcal{D}_{i_0}} \mathcal{M}_{i_0} \to \mathcal{M}_i$ is surjective (for the other respective cases, is an isomorphism).
When I has only one element, we retrieve usual finiteness notion on sheaves on a topological space.

Except the notion of quasi-coherent which is called here "having local presentation", with 7.1.2.18.2, we follow the definitions of [Sta22, 03DL-18.23.1]) (see also [Sta22, 04IX-18.19.1] for the notation): $\mathcal{M}_\bullet$ is a $\mathcal{D}_\bullet$-module of finite type (resp. has local presentation, resp. is of finite presentation, resp. is locally free, resp. is locally finite free) if for any object $(i, U) \in I^\natural \times X_{Zar}$, there exists a covering $\{(i, U_\lambda) \to (i, U)\}_{\lambda\in\Lambda}$ such that for any $\lambda \in \Lambda$ the $\mathcal{D}_\bullet|_{(i,U_\lambda)}$-module $\mathcal{M}_\bullet|_{(i,U_\lambda)}$ on the site $I^\natural_{\leq i} \times U_{\lambda,Zar}$ is generated by finitely many global sections (resp. has global presentation, resp. has global finite presentation, resp. is free, resp. is finite free).

Proposition 7.1.3.8. *Let $\mathcal{M}_\bullet$ be a left (resp. right) $\mathcal{D}_\bullet$-module. Then $\mathcal{M}_\bullet$ is a $\mathcal{D}_\bullet$-module of finite type (resp. has local presentation, resp. is of finite presentation, resp. is locally free, resp. is locally finite free) if and only if the following two properties are satisfied:*

1. *For any $i \in I$, $\mathcal{M}_i$ is a $\mathcal{D}_i$-module of finite type (resp. has local presentation, resp. is of finite presentation, resp. is locally free , resp. is locally free of finite type)*

2. *For any $i, j \in I$ such that $j \leq i$, the canonical homomorphism $\mathcal{D}_j \otimes_{\mathcal{D}_i} \mathcal{M}_i \to \mathcal{M}_j$ is surjective (resp. is an isomorphism).*

Proof. Since the other cases are similar, let us prove the non-respective one. Let $(i, U) \in I^\natural \times X_{Zar}$. There exists a covering $\{(i, U_\lambda) \to (i, U)\}_{\lambda\in\Lambda}$ such that for any $\lambda \in \Lambda$ the $\mathcal{D}_\bullet|_{(i,U_\lambda)}$-module $\mathcal{M}_\bullet|_{(i,U_\lambda)}$ on the site $I^\natural_{\leq i} \times U_{\lambda,Zar}$ is generated by finitely many global sections. Since i is the greatest element of $I_{\leq i}$, then it follows from 7.1.3.7 that the $\mathcal{D}_\bullet$-module $\mathcal{M}_\bullet$ is of finite type if and only if for any $j \leq i$, for any open U of X, there exists an open covering $\{U_\lambda\}_{\lambda\in\Lambda}$ of U such that the canonical homomorphism $\mathcal{D}_j \otimes_{\mathcal{D}_i} \mathcal{M}_i|_{U_\lambda} \to \mathcal{M}_j|_{U_\lambda}$ is surjective. Hence, we are done. □

Notation 7.1.3.9. Let us denote by $\mathrm{Mod}_{\mathrm{lp}}(^l\mathcal{D}_\bullet)$ (resp. $\mathrm{Mod}_{\mathrm{gp}}(^l\mathcal{D}_\bullet)$, resp. $\mathrm{Mod}_{\mathrm{fp}}(^l\mathcal{D}_\bullet)$, resp. $\mathrm{Mod}_{\mathrm{gfp}}(^l\mathcal{D}_\bullet)$) the category of left $\mathcal{D}_\bullet$-modules having local presentation (resp. having global presentation, resp. of finite presentation, resp. having global finite presentation).

We recall the definition (see [Sta22, 08FL-21.42.1], [Sta22, 08FT-21.43.1] and [Sta22, 08G5-21.45.1]):

Definition 7.1.3.10. Let $\mathcal{E}^\bullet_\bullet \in C(\mathcal{D}_\bullet)$.

1. We say $\mathcal{E}^\bullet_\bullet$ is "strictly perfect" if $\mathcal{E}^i_\bullet$ is zero for all but finitely many i and $\mathcal{E}^i_\bullet$ is a direct summand of a finite free $\mathcal{D}_\bullet$-module for all i.

2. Let $n \in \mathbb{Z}$. We say $\mathcal{E}^\bullet_\bullet$ is n-pseudo-coherent if for every object (i, U) of $I^\natural \times X_{Zar}$ there exists a covering $\{(i, U_\lambda) \to (i, U)\}_{\lambda\in\Lambda}$, and for each $\lambda \in \Lambda$ there exist a strictly perfect complex of $\mathcal{D}_\bullet|_{(i,U_\lambda)}$-modules $\mathcal{E}^\bullet_{\lambda\bullet}$ and a morphism $\alpha_\lambda \colon \mathcal{E}^\bullet_{\lambda\bullet} \to \mathcal{E}^\bullet_\bullet|_{(i,U_\lambda)}$ of $C(\mathcal{D}_\bullet|_{(i,U_\lambda)})$ such that $H^j(\alpha_\lambda)$ is an isomorphism for $j > n$ and $H^n(\alpha_\lambda)$ is surjective.

3. We say $\mathcal{E}^\bullet_\bullet$ is "pseudo-coherent" if it is n-pseudo-coherent for all $n \in \mathbb{Z}$.

4. We say $\mathcal{E}^\bullet_\bullet$ is "perfect" if for every object (i, U) of $I^\natural \times X_{Zar}$ there exists a covering $\{(i, U_\lambda) \to (i, U)\}_{\lambda\in\Lambda}$ and for each $\lambda \in \Lambda$ a morphism of complexes $\alpha_\lambda \colon \mathcal{E}^\bullet_{\lambda\bullet} \to \mathcal{E}^\bullet_\bullet|_{(i,U_\lambda)}$ which is a quasi-isomorphism with $\mathcal{E}^\bullet_{\lambda\bullet}$ strictly perfect.

5. Let $n \in \mathbb{Z}$. We say an object of $D(\mathcal{D}_\bullet)$ is n-pseudo-coherent (resp. pseudo-coherent, resp. perfect) if and only if it can be represented by a n-pseudo-coherent (resp. pseudo-coherent, resp. perfect) complex of $\mathcal{D}_\bullet$-modules. We denote by $D_{n-\mathrm{coh}}(\mathcal{D}_\bullet)$ (resp. $D_{\mathrm{coh}}(\mathcal{D}_\bullet)$, resp. $D_{\mathrm{perf}}(\mathcal{D}_\bullet)$) the full subcategory of $D(\mathcal{D}_\bullet)$ consisting of n-pseudo-coherent (resp. pseudo-coherent, resp. perfect) complexes.

Remark 7.1.3.11. Let $\mathcal{E}^\bullet_\bullet \in D(\mathcal{D}_\bullet)$. Then $\mathcal{E}^\bullet_\bullet \in D_{n-\mathrm{coh}}(\mathcal{D}_\bullet)$ (resp. $\mathcal{E}^\bullet_\bullet \in D_{\mathrm{perf}}(\mathcal{D}_\bullet)$) if and only if for every object (i,U) of $I^\natural \times X_{Zar}$ there exists a covering $\{(i,U_\lambda) \to (i,U)\}_{\lambda\in\Lambda}$, and for each $\lambda \in \Lambda$ there exist a strictly perfect complex of $\mathcal{D}_\bullet|_{(i,U_\lambda)}$-modules $\mathcal{E}^\bullet_{\lambda\bullet}$ and a morphism $\alpha_\lambda \colon \mathcal{E}^\bullet_{\lambda\bullet} \to \mathcal{E}^\bullet_\bullet|_{(i,U_\lambda)}$ of $D(\mathcal{D}_\bullet|_{(i,U_\lambda)})$ which is an n-isomorphism (resp. is an isomorphism). Recall α_λ is an n-isomorphism of $D(\mathcal{D}_\bullet|_{(i,U_\lambda)})$ means that for any $j \geq n$, we have $H^j C(\alpha_\lambda) = 0$, where $C(\alpha_\lambda)$ is the cone of α_λ in $D(\mathcal{D}_\bullet)$.

7.1.3.12. Let $\mathcal{E}^\bullet_\bullet \in D(\mathcal{D}_\bullet)$. Following [SGA6, I.5.8.1] (or see [Sta22, 08G8] in the case where $\mathcal{D}_\bullet$ is commutative), $\mathcal{E}^\bullet_\bullet$ is perfect if and only if $\mathcal{E}^\bullet_\bullet$ is pseudo-coherent and locally has finite tor dimension.

Proposition 7.1.3.13. *Let $\mathcal{E}^\bullet_\bullet \in D(\mathcal{D}_\bullet)$. Then $\mathcal{E}^\bullet_\bullet \in D_{n-\mathrm{coh}}(\mathcal{D}_\bullet)$ (resp. $\mathcal{E}^\bullet_\bullet \in D_{\mathrm{coh}}(\mathcal{D}_\bullet)$, resp. $\mathcal{E}^\bullet_\bullet \in D_{\mathrm{perf}}(\mathcal{D}_\bullet)$) if and only if the following properties hold*

1. *For any $i \in I$, $\mathcal{E}^\bullet_i \in D_{n-\mathrm{coh}}(\mathcal{D}_i)$ (resp. $\mathcal{E}^\bullet_i \in D_{\mathrm{coh}}(\mathcal{D}_i)$, resp. $\mathcal{E}^\bullet_i \in D_{\mathrm{perf}}(\mathcal{D}_i)$) ;*

2. *For any $i, j \in I$ such that $j \leq i$, the canonical homomorphism $\mathcal{D}_j \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to \mathcal{E}^\bullet_j$ is an isomorphism.*

Proof. The fact that these condition are necessary is obvious. Conversely, suppose $\mathcal{E}^\bullet_\bullet$ satisfies both conditions. Since the other cases are either a straightforward consequence or are checked similarly, let us consider the non-respective one. Let $(i,U) \in I^\natural \times X_{Zar}$. From the first condition, there exists a covering $\{U_\lambda \to U\}_{\lambda\in\Lambda}$, and for each $\lambda \in \Lambda$ there exist a strictly perfect complex of $\mathcal{D}_i|_{U_\lambda}$-modules $\mathcal{E}^\bullet_\lambda$ and a morphism $\alpha_\lambda \colon \mathcal{E}^\bullet_\lambda \to \mathcal{E}^\bullet_i|_{U_\lambda}$ of $D(\mathcal{D}_i|_{U_\lambda})$ which is an n-isomorphism, i.e. for any $j \geq n$, we have $H^j C(\alpha_\lambda) = 0$, where $C(\alpha_\lambda)$ is the cone of α_λ (see remark 7.1.3.11). We get $\beta_\lambda := \mathcal{D}_\bullet|_{(i,U_\lambda)} \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_i|_{U_\lambda}} \alpha_\lambda$, which is also an n-isomorphism.

From the second condition, the canonical morphism $\gamma_\lambda \colon \mathcal{D}_\bullet|_{(i,U_\lambda)} \otimes^{\mathbb{L}}_{\mathcal{D}_i|_{U_\lambda}} \mathcal{E}^\bullet_i|_{U_\lambda} \to \mathcal{E}^\bullet_\bullet|_{(i,U_\lambda)}$ is an isomorphism. This yields the n-isomorphism $\gamma_\lambda \circ \beta_\lambda \colon \mathcal{D}_\bullet|_{(i,U_\lambda)} \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_i|_{U_\lambda}} \mathcal{E}^\bullet_\lambda \to \mathcal{E}^\bullet_\bullet|_{(i,U_\lambda)}$, where $\mathcal{D}_\bullet|_{(i,U_\lambda)} \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_i|_{U_\lambda}} \mathcal{E}^\bullet_\lambda$ is a strictly perfect complex of $\mathcal{D}_\bullet|_{(i,U_\lambda)}$-modules. Hence, we are done.

□

7.1.3.14 (Flasque resolutions)**.** Let $\mathcal{F}_\bullet$ be a left $\mathcal{D}_\bullet$-module. Let $\mathcal{F}_\bullet \hookrightarrow \mathcal{G}_\bullet$ be the canonical embedding of $\mathcal{F}_\bullet$ into a flasque sheaf of $\mathrm{Top}(X)_I$, where the flasque object $\mathcal{G}_\bullet$ of $\mathrm{Top}(X)_I$ is defined at 7.1.2.19.1. In fact, we see that $\mathcal{G}_\bullet$ is endowed with a canonical structure of left $\mathcal{D}_\bullet$-module and that the canonical embedding $\mathcal{F}_\bullet \hookrightarrow \mathcal{G}_\bullet$ is $\mathcal{D}_\bullet$-linear. We say that a $\mathcal{D}_\bullet$-module is flasque if it is flasque as sheaf of sets. Following [Sta22, 05T6], for any $\mathcal{F}^\bullet_\bullet \in K^+(\mathcal{D}_\bullet)$, there exists a quasi-isomorphism in $K^+(\mathcal{D}_\bullet)$ of the form $\mathcal{F}^\bullet_\bullet \to \mathcal{H}^\bullet_\bullet$ where $\mathcal{H}^n_\bullet$ is a flasque $\mathcal{D}_\bullet$-module for any integer n.

7.1.3.15. Let $f \colon X \to X'$ be a continuous map of topological spaces. Set $\mathscr{T}' := \mathrm{Top}(X')$. Let $\mathcal{D}_\bullet$ (resp. $\mathcal{D}'_\bullet$) be a ring of $\mathscr{T}_I$ (resp. $\mathscr{T}'_I$) and $f_I^{-1}\mathcal{D}'_\bullet \to \mathcal{D}_\bullet$ be a morphism of rings of $\mathscr{T}_I$ (see notation 7.1.2.9). This yields the ringed topos morphism

$$f_I = (f_I^{-1} \dashv f_{I*}) \colon (\mathscr{T}_I, \mathcal{D}_\bullet) \to \mathscr{T}'_I, \mathcal{D}'_\bullet).$$

We get the functor $f_I^* \colon \mathrm{Mod}(\mathcal{D}'_\bullet) \to \mathrm{Mod}(\mathcal{D}_\bullet)$ which is defined for any $\mathcal{E}'_\bullet \in \mathrm{Mod}(\mathcal{D}'_\bullet)$ by setting

$$f_I^*(\mathcal{E}'_\bullet) := \mathcal{D}_\bullet \otimes_{f_I^{-1}\mathcal{D}'_\bullet} f_I^{-1}\mathcal{E}'_\bullet.$$

We denote by

$$f_i = (f_i^{-1} \dashv f_{i*}) \colon (\mathscr{T}, \mathcal{D}_i) \to \mathscr{T}', \mathcal{D}'_i)$$

the morphism of ringed topoi (which is more precisely a morphism of ringed topological spaces here), where $f_i^{-1} = f^{-1}$ and $f_{i*} = f_*$.

For any $\mathcal{E}'^\bullet_\bullet \in D(\mathcal{D}'_\bullet)$, since the functors i_X^* and $i_{X'}^*$ are exact, we get the canonical isomorphism

$$(\mathbb{L}f_I^*(\mathcal{E}'^\bullet_\bullet))_i \xrightarrow{\sim} \mathbb{L}f_i^*(\mathcal{E}'^\bullet_i). \tag{7.1.3.15.1}$$

We have the functor $\mathbb{R}f_{I*}\colon D(\mathcal{D}_\bullet) \to D(\mathcal{D}'_\bullet)$, which is computed by using K-injective resolutions (see [Sta22, 07A5-21.19]). We have also the functor $\mathbb{R}f_{I*}\colon D^+(\mathcal{D}_\bullet) \to D^+(\mathcal{D}'_\bullet)$, which can be computed by using flasque resolutions (see 7.1.3.14). This yields by using flasque resolution [Sta22, 05TA-13.16.8] and 7.1.2.19.(a) that for any $\mathcal{E}^\bullet_\bullet \in D^+(\mathcal{D}_\bullet)$, we check that the canonical base change morphism (see [Sta22, 07A7-21.19.3])

$$(\mathbb{R}f_{I*}(\mathcal{E}^\bullet_\bullet))_i \to \mathbb{R}f_{i*}(\mathcal{E}^\bullet_i) \tag{7.1.3.15.2}$$

is an isomorphism. In particular, this implies that a left $\mathcal{D}_\bullet$-module $\mathcal{E}_\bullet$ is f_{I*}-acyclic if and only if each $\mathcal{E}_i$ is f_*-acyclic for any $i \in I$.

Recall that if $f_I^*\colon \mathrm{Mod}(\mathcal{D}'_\bullet) \to \mathrm{Mod}(\mathcal{D}_\bullet)$ is not exact then the functor $f_{I*}\colon K(\mathcal{D}_\bullet) \to K(\mathcal{D}'_\bullet)$ do not preserve K-injective complexes. But, we can still check the transitivity of the right derived of the direct image of morphism of topos (see [Sta22, 0D6E-21.19.2]). Hence, for any increasing map $u\colon I \to I'$ of partially ordered sets, with notation 7.1.2.4, we get the canonical isomorphisms

$$\mathbb{R}u_{X'*} \circ \mathbb{R}f_{I*} \xrightarrow{\sim} \mathbb{R}\left(u_{X'*} \circ f_{I*}\right) \xrightarrow{\sim} \mathbb{R}\left(f_{I'*} \circ u_{X*}\right) \xrightarrow{\sim} \mathbb{R}f_{I'*} \circ \mathbb{R}u_{X*}. \tag{7.1.3.15.3}$$

7.1.3.16 (Bounded cohomological dimension)**.** With notation 7.1.3.15, suppose moreover f_* has bounded cohomological dimension. It follows from the isomorphism 7.1.3.15.2 that f_{I*} has also bounded cohomological dimension and then the functor $\mathbb{R}f_{I*}$ is way-out in both directions. This yields that the morphism 7.1.3.15.2 is still an isomorphism for $\mathcal{E}^\bullet_\bullet \in D(\mathcal{D}_\bullet)$ (use [Har66, I.7.1.(iii)]). Following 4.6.1.6, for any $\mathcal{E}^\bullet_\bullet \in K(\mathcal{D}_\bullet)$ (resp. for any $\mathcal{E}^\bullet_\bullet \in K^-(\mathcal{D}_\bullet)$), there exist a complex $\mathcal{I}^\bullet_\bullet \in K(\mathcal{D}_\bullet)$ (resp. $\mathcal{I}^\bullet_\bullet \in K^-(\mathcal{D}_\bullet)$) of f_{I*}-acyclic $\mathcal{D}_\bullet$-modules and a quasi-isomorphism $\mathcal{E}^\bullet_\bullet \xrightarrow{\sim} \mathcal{I}^\bullet_\bullet$. It follows from [Sta22, 07K7-13.31.2] that we have the isomorphism $\mathbb{R}f_{I*}\mathcal{E}^\bullet_\bullet \xrightarrow{\sim} f_{I*}\mathcal{I}^\bullet_\bullet$.

7.1.3.17. Let $\mathcal{E}_\bullet, \mathcal{F}_\bullet$ be two left $\mathcal{D}_\bullet$-modules.

(a) Following 4.6.2.7, we have the abelian sheaf on $\mathscr{T}_I$ that we will denote by $\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet)$ which is characterized by the property: for any object $K_\bullet$ of $\mathscr{T}_I$,

$$\mathrm{Hom}_{\mathscr{T}_I}(K_\bullet, \mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet)) = \mathrm{Hom}_{\mathcal{D}_\bullet|_{K_\bullet}}(\mathcal{E}_\bullet|_{K_\bullet}, \mathcal{F}_\bullet|_{K_\bullet})).$$

In particular, for any $(i, U) \in I^\natural \times X_{Zar}$, by using 7.1.2.18.2 and Yoneda lemma we get

$$\mathrm{Hom}_{\mathscr{T}_I}((i, U), \mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet)) = \mathrm{Hom}_{\mathcal{D}_\bullet|_{(i,U)}}(\mathcal{E}_\bullet|_{(i,U)}, \mathcal{F}_\bullet|_{(i,U)})). \tag{7.1.3.17.1}$$

A morphism of this latter abelian group is a compatible family of $\mathcal{D}_j|_U$-linear homomorphisms $\mathcal{E}_j|_U \to \mathcal{F}_j|_U$ for any $j \leq i$.

(b) We have the abelian sheaf $\mathcal{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet)$ on X by setting, for any open set U of X,

$$\Gamma(U, \mathcal{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet)) = \mathrm{Hom}_{\mathcal{D}_\bullet|_U}(\mathcal{E}_\bullet|_U, \mathcal{F}_\bullet|_U).$$

With the above description of 7.1.3.17.1 and with notation 7.1.2.7.1, we get the isomorphism of abelian sheaves on X:

$$\underleftarrow{l}_{X,I*}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet) \xrightarrow{\sim} \mathcal{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet). \tag{7.1.3.17.2}$$

7.1.3.18. Let $\mathcal{E}_\bullet, \mathcal{F}_\bullet$ be two left $\mathcal{D}_\bullet$-modules. Fix $i \in I$. Suppose that for any $j \leq i$ the homomorphism $\mathcal{D}_j \otimes_{\mathcal{D}_i} \mathcal{E}_i \to \mathcal{E}_j$ is an isomorphism. Then for any $j \leq i$, for any open set U of X we get the homomorphisms

$$\mathrm{Hom}_{\mathcal{D}_i|_U}(\mathcal{E}_i|_U, \mathcal{F}_i|_U) \xleftarrow{\sim} \mathrm{Hom}_{\mathcal{D}_j|_U}(\mathcal{E}_j|_U, \mathcal{F}_i|_U) \to \mathrm{Hom}_{\mathcal{D}_j|_U}(\mathcal{E}_j|_U, \mathcal{F}_j|_U), \tag{7.1.3.18.1}$$

which induce the canonical isomorphism

$$\mathrm{Hom}_{\mathcal{D}_i|_U}(\mathcal{E}_i|_U, \mathcal{F}_i|_U) \xrightarrow{\sim} \mathrm{Hom}_{\mathcal{D}_\bullet|_{(i,U)}}(\mathcal{E}_\bullet|_{(i,U)}, \mathcal{F}_\bullet|_{(i,U)})). \tag{7.1.3.18.2}$$

Hence the abelian sheaf $\mathscr{H}om_{\mathcal{D}_\bullet|_{(i,X)}}(\mathcal{E}_\bullet|_{(i,X)}, \mathcal{F}_\bullet|_{(i,X)}))$ of $\mathscr{T}_{I_{\leq 1}}$ is the projective system $\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}_j, \mathcal{F}_j) \to \mathcal{H}om_{\mathcal{D}_{j'}}(\mathcal{E}_{j'}, \mathcal{F}_{j'})$ for any $j' \leq j \leq i$ (induced by 7.1.3.18.1). In particular, we get the commutative diagram

$$\begin{array}{ccc}
(\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet))_i & \xrightarrow{\sim} & \mathcal{H}om_{\mathcal{D}_i}(\mathcal{E}_i, \mathcal{F}_i) \\
\downarrow & & \downarrow {\scriptstyle 7.1.3.18.1} \\
(\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet))_j & \xrightarrow{\sim} & \mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}_j, \mathcal{F}_j)
\end{array} \tag{7.1.3.18.3}$$

where the horizontal isomorphisms are the natural forgetful projection.

7.1.3.19. Let $\mathcal{E}^\bullet_\bullet \in D^-(\mathcal{D}_\bullet)$, $\mathcal{F}^\bullet_\bullet \in D^+(\mathcal{D}_\bullet)$. Let $j \leq i$ in I such that the canonical morphism

$$\mathcal{D}_j \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to \mathcal{E}^\bullet_j \tag{7.1.3.19.1}$$

is an isomorphism. Then we get the morphism

$$\mathbb{R}\mathcal{H}om_{\mathcal{D}_i}(\mathcal{E}^\bullet_i, \mathcal{F}^\bullet_i) \xrightarrow[\sim]{4.6.5.3.1} \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}^\bullet_j, \mathcal{F}^\bullet_i) \to \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}^\bullet_j, \mathcal{F}^\bullet_j). \tag{7.1.3.19.2}$$

Let $\mathcal{E}^\bullet_\bullet \in C(\mathcal{D}_\bullet)$ be a stricly perfect complex (see definition 7.1.3.10) and $\mathcal{F}^\bullet_\bullet \in C(\mathcal{D}_\bullet)$. Then we construct similarly the first isomorphisms of 7.1.3.19.2 and we get therefore the composite map 7.1.3.19.2.

7.1.3.20. Let $(i, U) \in I^\natural \times X_{Zar}$. Let $\mathcal{E}_\bullet, \mathcal{F}_\bullet$ be two left $\mathcal{D}_\bullet$-modules. It follows from 7.1.3.17.1 that we have the isomorphism of abelian sheaves of $\mathscr{T}_{I_{\leq i}}$

$$\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet)|_{(i,U)} \xrightarrow{\sim} \mathscr{H}om_{\mathcal{D}_\bullet|_{(i,U)}}(\mathcal{E}_\bullet|_{(i,U)}, \mathcal{F}_\bullet|_{(i,U)}). \tag{7.1.3.20.1}$$

Since $j^{-1}_{(i,U)} = j^*_{(i,U)} \colon \mathrm{Mod}({}^*\mathcal{D}_\bullet) \to \mathrm{Mod}({}^*\mathcal{D}_\bullet|_{(i,U)})$ has an exact left adjoint functor (see 7.1.3.3.2), then it follows from [Sta22, 08BJ] that $j^{-1}_{(i,U)}$ preserves the K-injectivity. Hence, for any $\mathcal{E}^\bullet_\bullet \in D(\mathcal{D}_\bullet)$, $\mathcal{F}^\bullet_\bullet \in D(\mathcal{D}_\bullet)$, we get the isomorphism

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet, \mathcal{F}_\bullet)|_{(i,U)} \cong \mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet|_{(i,U)}}(\mathcal{E}_\bullet|_{(i,U)}, \mathcal{F}_\bullet|_{(i,U)}). \tag{7.1.3.20.2}$$

Lemma 7.1.3.21. *Let $\mathcal{I}_\bullet$ be an injective left $\mathcal{D}_\bullet$-module. Let $\mathcal{I}^\bullet_\bullet$ be a K-injective complex of $K({}^1\mathcal{D}_\bullet)$. Let $i \in I$ and let $\mathcal{P}$ be a left $\mathcal{D}_i$-module.*

(a) The abelian sheaf $\mathcal{H}om_{\mathcal{D}_i}(\mathcal{P}, \mathcal{I}_i)$ is flasque.

(b) If $\mathcal{P}$ is flat, then $\mathcal{I}_i$ is right acyclic for the functors $\mathcal{H}om_{\mathcal{D}_i}(\mathcal{P}, -)$ and $\mathrm{Hom}_{\mathcal{D}_i}(\mathcal{P}, -)$.

(c) If moreover for any $j \leq i$ the homomorphisms $\mathcal{D}_i \to \mathcal{D}_j$ are flat, then $\mathcal{I}_i$ is an injective $\mathcal{D}_i$-module.

(d) If moreover for any $j \leq i$ the homomorphisms $\mathcal{D}_i \to \mathcal{D}_j$ are flat, then $\mathcal{I}^\bullet_i$ is a K-injective complex of $K({}^1\mathcal{D}_i)$.

Proof. With notation 7.1.2.18.3, let us consider the canonical morphism of ringed topoi

$$f\colon (\mathscr{T}, \mathcal{D}_i) \to (\mathscr{T}_{I_{\leq i}}, \mathcal{D}_\bullet|_{(i,X)})$$

induced by the morphism of topos $i_X = (i_X^{-1} \dashv i_{X*})\colon \mathrm{Top}(X) \to \mathrm{Top}(X)_{I_{\leq i}}$, where $i\colon \{*\} \to I_{\leq i}$ is the map sending $*$ to i. Since $f_*(\mathcal{I}) = \mathcal{I}_i$, then the first two statements follows from 4.6.5.2. In the third and forth one, with the flatness hypotheses, the left adjoint $i_{X!}$ of the functor $i_X^*\colon \mathrm{Mod}(\mathcal{D}_\bullet|_{(i,X)}) \to \mathrm{Mod}(\mathcal{D}_i)$ is therefore exact (use the computation 7.1.3.2.1 in the case where $I = I_{\leq i}$). Hence, i_X^* preserves the injectivity (resp. the K-injectivity following [Sta22, 08BJ]) and we are done. □

Proposition 7.1.3.22. *Let $\mathcal{E}^\bullet_\bullet \in D^-(\mathcal{D}_\bullet)$, $\mathcal{F}^\bullet_\bullet \in D^+(\mathcal{D}_\bullet)$. Let $i \in I$ such that for any $j \leq i$ the canonical morphism*

$$\mathcal{D}_j \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to \mathcal{E}^\bullet_j \tag{7.1.3.22.1}$$

is an isomorphism. Then for any $j' \leq j \leq i$ we have the canonical commutative diagram of $D(\mathbb{Z}_X)$:

$$\begin{array}{ccc} (\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}^\bullet_\bullet, \mathcal{F}^\bullet_\bullet))_j & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}^\bullet_j, \mathcal{F}^\bullet_j) \\ \downarrow & & \downarrow {\scriptstyle 7.1.3.19.2} \\ (\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}^\bullet_\bullet, \mathcal{F}^\bullet_\bullet))_{j'} & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{j'}}(\mathcal{E}^\bullet_{j'}, \mathcal{F}^\bullet_{j'}) \end{array} \tag{7.1.3.22.2}$$

whose horizontal arrows are isomorphisms.

Proof. By using 7.1.3.20.2, since $i_X^{-1} \circ u_{iX}^{-1} \xrightarrow{\sim} i_X^{-1}$, then we can suppose $I_{\leq i} = I$. Let $\mathcal{P}_i^\bullet \in C(\mathcal{D}_i)$ be a complex of flat $\mathcal{D}_i$-modules and $\mathcal{P}_i^\bullet \to \mathcal{E}_i^\bullet$ be a morphism of $C(\mathcal{D}_i)$ which is a quasi-isomorphism. Set $\mathcal{P}_\bullet^\bullet := \mathcal{D}_\bullet \otimes_{\mathcal{D}_i} \mathcal{P}_i^\bullet \in C(\mathcal{D}_\bullet)$. Then $\mathcal{P}_\bullet^\bullet$ is a flat resolution of $\mathcal{E}_\bullet^\bullet$. Moreover, it follows from 7.1.3.22.1 that for any $j' \leq j$ the canonical morphism $\mathcal{D}_{j'} \otimes_{\mathcal{D}_j} \mathcal{P}_j^\bullet \to \mathcal{P}_{j'}^\bullet$ is an isomorphism of $C(\mathcal{D}_{j'})$. Let $\mathcal{I}_\bullet^\bullet$ be a resolution of $\mathcal{F}_\bullet^\bullet$ by injective $\mathcal{D}_\bullet$-modules. Then, we get the isomorphisms of $D(\mathbb{Z}_X)$:

$$\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet^\bullet, \mathcal{F}_\bullet^\bullet)_j \xrightarrow{\sim} \mathscr{H}om^\bullet_{\mathcal{D}_\bullet}(\mathcal{P}_\bullet^\bullet, \mathcal{I}_\bullet^\bullet)_j \underset{7.1.3.18.3}{\xrightarrow{\sim}} \mathcal{H}om_{\mathcal{D}_j}(\mathcal{P}_j^\bullet, \mathcal{I}_j^\bullet)$$
$$\underset{7.1.3.21b}{\xrightarrow{\sim}} \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{P}_j^\bullet, \mathcal{I}_j^\bullet) \xrightarrow{\sim} \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}_j^\bullet, \mathcal{F}_j^\bullet).$$

This yields the construction of the horizontal isomorphisms of the diagram 7.1.3.22.2. Its commutativity is easy. □

7.1.3.23. Let $\mathcal{D}_\bullet$ and $\mathcal{D}''_\bullet$ be two rings of $\mathscr{T}_I$ such that $(\mathcal{D}_\bullet, \mathcal{D}'_\bullet)$ and $(\mathcal{D}_\bullet, \mathcal{D}''_\bullet)$ are solved by some commutative ring $\mathcal{R}_\bullet$ (see definition 4.6.3.2). Following 4.6.3.2.1, we have the bifunctors:

$$\mathbb{R}\mathscr{H}om_{{}^{\mathrm{l}}\mathcal{D}_\bullet}(-,-) \colon D({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, \mathcal{D}'^{\mathrm{r}}_\bullet) \times D({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, \mathcal{D}''^{\mathrm{r}}_\bullet) \to D({}^{\mathrm{l}}\mathcal{D}'_\bullet, \mathcal{R}_\bullet, \mathcal{D}''^{\mathrm{r}}_\bullet). \qquad (7.1.3.23.1)$$

Let $\mathcal{E}_\bullet^\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, \mathcal{D}'^{\mathrm{r}}_\bullet)$, $\mathcal{F}_\bullet^\bullet \in D^+({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, \mathcal{D}''^{\mathrm{r}}_\bullet)$. Let $i \in I$ such that for any $j \leq i$ the canonical morphism

$$\mathcal{D}_j \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}_i^\bullet \to \mathcal{E}_j^\bullet \qquad (7.1.3.23.2)$$

is an isomorphism. Then for any $j' \leq j \leq i$, similarly to 7.1.3.22, we get the canonical commutative diagram of $D({}^{\mathrm{l}}\mathcal{D}'_j, \mathcal{R}_j, \mathcal{D}''^{\mathrm{r}}_j)$:

$$\begin{array}{ccc} (\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet^\bullet, \mathcal{F}_\bullet^\bullet))_j & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_j}(\mathcal{E}_j^\bullet, \mathcal{F}_j^\bullet) \\ \downarrow & & \downarrow \\ (\mathbb{R}\mathscr{H}om_{\mathcal{D}_\bullet}(\mathcal{E}_\bullet^\bullet, \mathcal{F}_\bullet^\bullet))_{j'} & \xrightarrow{\sim} & \mathbb{R}\mathcal{H}om_{\mathcal{D}_{j'}}(\mathcal{E}_{j'}^\bullet, \mathcal{F}_{j'}^\bullet) \end{array} \qquad (7.1.3.23.3)$$

whose horizontal arrows are isomorphisms and whose left morphism is built similarly than 7.1.3.19.2. We get similar diagram in the case where $\mathcal{E}_\bullet^\bullet \in C({}^*\mathcal{D}_\bullet)$ is a stricly perfect complex (see definition 7.1.3.10) and $\mathcal{F}_\bullet^\bullet \in D({}^{\mathrm{l}}\mathcal{D}_\bullet, \mathcal{R}_\bullet, \mathcal{D}''^{\mathrm{r}}_\bullet)$.

7.2 Completion on formal schemes

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. For any open $\mathfrak{U} \subseteq \mathfrak{X}$, we write

$$U_i = (|\mathfrak{U}|, \mathcal{O}_{\mathfrak{U}}/\mathcal{I}^{i+1}),\ U := U_0.$$

Denoting by $|\mathfrak{X}| = |X_i|$ the underlying topological space of $\mathcal{X}$ and X_i, we simply write by $\mathfrak{X}$ or X_i the topos $\mathrm{Top}(|\mathfrak{X}|)$. Moreover, since $\mathbb{N}$ is fixed in the subsection, we denote by $X_\bullet$ the topos $\mathrm{Top}(X)_{\mathbb{N}}$. We consider $X_\bullet$ as a ringed topos by equipping it with the sheaf of rings $\mathcal{O}_{X_\bullet} = (\mathcal{O}_{X_i})_{i\in\mathbb{N}}$. We get the morphism of ringed topoi $\underleftarrow{l}_{X,\mathbb{N}} \colon (X_\bullet, \mathcal{O}_{X_\bullet}) \to (\mathcal{X}, \mathcal{O}_{\mathfrak{X}})$ (see notation 7.1.2.5) that we shall simply write by $\underleftarrow{l}_X$. If $\mathcal{E}$ is a $\mathcal{O}_{\mathfrak{X}}$-module, $\underleftarrow{l}_X^*\mathcal{E}$ is then the projective system

$$\cdots \to \mathcal{E}/\mathcal{I}^{i+1}\mathcal{E} \to \cdots \to \mathcal{E}/\mathcal{I}^2\mathcal{E} \to \mathcal{E}/\mathcal{I}\mathcal{E}.$$

7.2.1 I-adic completion of a non-commutative ring

Unless otherwise specified, modules are left modules and the results are still valid for right modules. Moreover, "completed" will mean "separated completed". Let D be a not necessarily commutative ring, $I \subset D$ be a central ideal of finite type, i.e. I is two-sided ideal which is generated as a left (or right) ideal by a finite set of elements belonging to the center of D. We set $D_i := D/I^{i+1}$ for any $i \in \mathbb{N}$.

7.2.1.1 (Completion)**.** Let M be a left D-module. The I-adic topology on D (resp. M) is given by the two-sided ideals $(I^i)_{i\in\mathbb{N}}$ (resp. the submodules $(I^iM)_{i\in\mathbb{N}}$). The completion $\widehat{D} := \varprojlim_i D_i$ is endowed with a ring structure, and the completion $\widehat{M} := \varprojlim_i M/I^{i+1}M$ is endowed with a left $\widehat{D}$-module structure.

Lemma 7.2.1.2. *Let $(M_i)_{i\in\mathbb{N}}$ be a projective system of left D_i-modules such that the homomorphisms $M_{i+1}/I^{i+1}M_{i+1} \to M_i$ are D_i-linear isomorphisms. Put $M = \varprojlim_i M_i$.*

(a) For any $n \geq 0$, the canonical homomorphisms

$$I^n M \to \varprojlim_i I^n M_i, \qquad M/I^{n+1}M \to M_n$$

are isomorphisms.

(b) If M_0 is of finite type on D_0, then M is of finite type on $\widehat{D}$. Moreover, any family of D whose image in D_0 generates D_0 spans D.

(c) If D_0 is left (resp. right) noetherian, then so is $\widehat{D}$.

Proof. See [Ber96c, 3.2.2]. □

7.2.1.3. Suppose D is left noetherian. According to [Ber96c, 3.2.3], we have the following properties.

(a) The Artin-Rees property holds: If M is a left D-module of finite type, and $N \subset M$ is a sub D-module, there exists a positive integer n_0 such that, for any $n \geq n_0$, we have

$$I^n N \subset I^n M \cap N \subset I^{n-n_0} N. \tag{7.2.1.3.1}$$

(b) The functor $M \mapsto \widehat{M}$ is exact on the category of left D-modules of finite type.

(c) For any left D-module of finite type M, the canonical homomorphism

$$\widehat{D} \otimes_D M \to \widehat{M} \tag{7.2.1.3.2}$$

is an isomorphism.

(d) $\widehat{D}$ a right flat on D.

(e) Any left $\widehat{D}$-module of finite type is separated and complete.

(f) The ring $\widehat{D}$ is left noetherian.

(g) Let $D \to E$ be a ring homomorphism such that E is left noetherian an IE is a central ideal of E. The following properties are equivalent.

  (i) $\widehat{E}$ is right flat on $\widehat{D}$

  (ii) for any $i \in \mathbb{N}$, E/I^{i+1} is right flat on D_i.

Proposition 7.2.1.4. *Let D be a left noetherian ring, I be a central ideal, $\widehat{M}$ be its I-adic completion. Let M be a right D-module such that, M/MI^n is a flat D/DI^n for any $n \in \mathbb{N}$. Then the I-adic completion $\widehat{M}$ of M is a flat right $\widehat{D}$-module. Moreover, for any left $\widehat{D}$-module of finite type E, the abelian group $\widehat{M} \otimes_{\widehat{D}} E$ is separated and complete for the topology given by the subgroups $\widehat{M} \otimes_{\widehat{D}} I^n E$.*

Proof. See [Ber96c, 3.2.4]. □

We recall the following well known Lemma.

Lemma 7.2.1.5. *Let $R\colon \mathfrak{C} \to \mathfrak{C}'$ be a functor, (L, R) be an adjoint pair of functors such that the adjoint morphism $L \circ R \to \mathrm{id}$ is an isomorphism.*

(a) The functor R is fully faithful. Denote by $\mathfrak{D}$ its essential image.

(b) An object $\mathcal{E}' \in \mathfrak{C}'$ is an object of $\mathfrak{D}$ if and only if the canonical morphism $\mathcal{E}' \to R \circ L(\mathcal{E}')$ is an isomorphism.

(c) The functors R and L induce quasi-inverse equivalences of categories between $\mathfrak{C}$ and $\mathfrak{D}$.

Proof. For any $\mathcal{E}, \mathcal{F} \in \mathfrak{C}$, since the adjoint morphism $L \circ R \to \mathrm{id}$ is an isomorphism, then the composition $\mathrm{Hom}(\mathcal{E}, \mathcal{F}) \to \mathrm{Hom}(R(\mathcal{E}), R(\mathcal{F})) \xrightarrow{\sim} \mathrm{Hom}(L \circ R(\mathcal{E}), \mathcal{F})$ is a bijection. Hence R is fully faithful. Now, since the composition of both adjoint morphisms $R \to R \circ L \circ R \to R$ is the identity since the $R \circ L \circ R \to R$ is an isomorphism, then so is $R \to R \circ L \circ R$. The parts (b) and (c) come from the fact that the adjoint morphisms $L \circ R \to \mathrm{id}$ and $R \to R \circ L \circ R$ are isomorphisms. □

7.2.1.6. We have the following notation and properties.

(a) The ringed topos $\underleftarrow{l}_{\{*\},\mathbb{N}} \colon (\{*\}_\bullet, D_\bullet) \to (\{*\}, \widehat{D})$ will simply be denoted by $\underleftarrow{l}$. Since any left D_i-module has a (global) presentation, then by using 7.1.3.8 in the case where the topological space is $\{*\}$, we get that a left $D_\bullet$-module $E_\bullet$ has local presentation if and only if the canonical homomorphisms $E_{i+1}/I^{i+1}M_{i+1} \to E_i$ are D_i-linear isomorphisms. Hence, we can interpret the property 7.2.1.2.(a) as follows: for any left $D_\bullet$-module $E_\bullet$ having local presentation, the canonical morphism $\underleftarrow{l}^* \circ \underleftarrow{l}_*(E_\bullet) \to E_\bullet$ is an isomorphism.

A left $\widehat{D}$-module E is said to be "separated complete" if the canonical morphism

$$E \to \underleftarrow{l}_* \circ \underleftarrow{l}^* E = \varprojlim_i D_i \otimes_{\widehat{D}} E \tag{7.2.1.6.1}$$

is an isomorphism. We denote by $\mathrm{Mod}_{\mathrm{c}}({}^{1}\widehat{D})$ the category of separated complete left $\widehat{D}$-modules. With notation 7.1.3.9, it follows from 7.2.1.5 that the functors $\underleftarrow{l}_*$ and $\underleftarrow{l}^*$ induce canonically quasi-inverse equivalences of categories between $\mathrm{Mod}_{\mathrm{lp}}({}^{1}D_\bullet)$ and $\mathrm{Mod}_{\mathrm{c}}({}^{1}\widehat{D})$.

(b) We remark that any left $\widehat{D}$-module E has a (global) presentation, i.e. there exists an exact sequence in $\mathrm{Mod}({}^{1}D)$ of the form

$$\oplus_{i \in I} \widehat{D} \to \oplus_{j \in J} \widehat{D} \to E \to 0,$$

for some sets I and J. Since $\underleftarrow{l}^*$ is left exact and commutes with direct limits, it preserve a global presentation, i.e. we get the functor $\underleftarrow{l}^* \colon \mathrm{Mod}({}^{1}\widehat{D}) \to \mathrm{Mod}_{\mathrm{gp}}({}^{1}D_\bullet)$ (see definition 7.1.3.7 and notation 7.1.3.9). Hence, it follows from (a) that the inclusion $\mathrm{Mod}_{\mathrm{gp}}({}^{1}D_\bullet) \subset \mathrm{Mod}_{\mathrm{lp}}({}^{1}D_\bullet)$ is in fact an equality.

(c) Suppose D_0 is noetherian. We denote by $\mathrm{Coh}({}^{1}\widehat{D})$ the category of coherent left $\widehat{D}$-modules which is therefore that of left $\widehat{D}$-modules of finite type. It follows from 7.2.1.2 and 7.2.1.3 that the functors $\underleftarrow{l}_*$ and $\underleftarrow{l}^*$ induce canonically quasi-inverse equivalences of categories between $\mathrm{Mod}_{\mathrm{fp}}({}^{1}D_\bullet)$ and $\mathrm{Coh}({}^{1}\widehat{D})$ (see notation 7.1.3.9). Moreover, since a coherent $\widehat{D}$-module has a (global) finite presentation, we get $\mathrm{Mod}_{\mathrm{fp}}({}^{1}D_\bullet) = \mathrm{Mod}_{\mathrm{gfp}}({}^{1}D_\bullet)$.

7.2.2 Completion of sheaves of rings on formal schemes, flatness

Lemma 7.2.2.1. *Let $(\mathcal{M}_i)_{i \in \mathbb{N}}$ be a projective system of $\mathcal{O}_{X_i}$-modules satisfying both following properties*

(a) the $\mathcal{O}_{X_i}$-modules $\mathcal{M}_i$ are quasi-coherent for any $i \in \mathbb{N}$,

(b) the homomorphisms $\mathcal{M}_{i+1}/\mathcal{I}^{i+1}\mathcal{M}_{i+1} \to \mathcal{M}_i$ are isomorphisms for any $i \in \mathbb{N}$.

Then, setting $\mathcal{M} = \varprojlim_i \mathcal{M}_i$, for any $n \geq 0$, the canonical homomorphisms

$$\mathcal{I}^n \mathcal{M} \to \varprojlim_i \mathcal{I}^n \mathcal{M}_i, \qquad \mathcal{M}/\mathcal{I}^{n+1}\mathcal{M} \to \mathcal{M}_n \tag{7.2.2.1.1}$$

are isomorphisms.

Proof. This follows from Lemma 7.2.1.2. □

Lemma 7.2.2.2. *Suppose $\mathfrak{X}$ affine and put $I = \Gamma(\mathfrak{X}, \mathcal{I})$.*

(a) Let $\mathcal{M}$ be an $\mathcal{O}_{\mathfrak{X}}$-module such that $\mathcal{M} \xrightarrow{\sim} \varprojlim_i \mathcal{M}/\mathcal{I}^i\mathcal{M}$, and such that $\mathcal{M}/\mathcal{I}^i\mathcal{M}$ are $\mathcal{O}_{X_i}$-quasi-coherent. Then $\forall\, n \in \mathbb{N}$, $\forall\, q \geq 1$ we have

$$H^q(\mathfrak{X}, \mathcal{I}^n\mathcal{M}) = 0, \quad \Gamma(\mathfrak{X}, \mathcal{I}^n\mathcal{M}) = I^n\Gamma(\mathfrak{X}, \mathcal{M}). \tag{7.2.2.2.1}$$

(b) *Suppose the $\mathcal{O}_{\mathfrak{X}}$-module $\mathcal{M}$ is a filtered inductive limit of a family $(\mathcal{M}_\lambda)_{\lambda\in\Lambda}$ of $\mathcal{O}_{\mathfrak{X}}$-modules satisfying both conditions of (a). Then $\mathcal{M}$ also satisfies the preceding properties. Moreover, if $\widehat{\mathcal{M}} = \varprojlim_i \mathcal{M}/\mathcal{I}^i\mathcal{M}$, and if $\Gamma(\mathfrak{X},\mathcal{M})^\wedge$ is the I-adic completion of $\Gamma(\mathfrak{X},\mathcal{M})$, then*

$$\Gamma(\mathfrak{X},\mathcal{M})^\wedge \xrightarrow{\sim} \Gamma(\mathfrak{X},\widehat{\mathcal{M}}). \tag{7.2.2.2.2}$$

Proof. The first equality of 7.2.2.2.1 follows from [Gro61, 0.13.3.1]. The second one follows from Lemma 7.2.1.2. As the functors $\mathcal{M} \mapsto H^q(\mathfrak{X},\mathcal{I}^n\mathcal{M})$ commutes with filtered inductive limits (see 7.1.2.16), both equalities of 7.2.2.2.1 remain true under the hypothesis of (b). From these we get isomorphisms

$$\Gamma(\mathfrak{X},\mathcal{M})/I^i\Gamma(\mathfrak{X},\mathcal{M}) \xrightarrow{\sim} \Gamma(\mathfrak{X},\mathcal{M}/\mathcal{I}^i\mathcal{M}). \tag{7.2.2.2.3}$$

This yields (b). ☐

7.2.2.3. Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ satisfying the following conditions.

(a) On any affine open $\mathfrak{U} \subseteq \mathfrak{X}$, the ideal $\mathcal{I}$ has a family of generators with image in the center of $\mathcal{D}$.

(b) As $\mathcal{O}_{\mathfrak{X}}$-module for the left structure, $\mathcal{D}$ is a filtered inductive limit of $\mathcal{O}_{\mathfrak{X}}$-modules $\mathcal{D}_\lambda$ such that $\mathcal{D}_\lambda/\mathcal{I}^{i+1}\mathcal{D}_\lambda$ is a $\mathcal{O}_{X_i}$-quasi-coherent for its left structure for any $i \in \mathbb{N}$ and such that the canonical homomorphism $\mathcal{D}_\lambda \to \varprojlim_i \mathcal{D}_\lambda/\mathcal{I}^{i+1}\mathcal{D}_\lambda$ is an isomorphism.

(c) For any affine open $\mathfrak{U} \subseteq \mathfrak{X}$, the ring $\Gamma(\mathfrak{U},\mathcal{D})$ is left noetherian.

For such a ring $\mathcal{D}$, we write $\mathcal{D}_i := \mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}$ and $\widehat{\mathcal{D}} := \varprojlim_i \mathcal{D}_i$ the $\mathcal{I}$-adic completion of $\mathcal{D}$. We remark that the condition (b) implies that $\mathcal{D}_i$ are $\mathcal{O}_{X_i}$-quasi-coherent for any $i \in \mathbb{N}$. We have the ringed topos morphism: $\underset{\leftarrow}{l}_X \colon (X_\bullet,\mathcal{D}_\bullet) \to (\mathcal{X},\widehat{\mathcal{D}})$.

Example 7.2.2.4. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10. Suppose $\mathfrak{X}^\sharp$ is a log smooth $\mathfrak{S}^\sharp$-log formal scheme. Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure. We suppose the following properties hold:

(a) For any affine open $\mathfrak{U} \subseteq \mathfrak{X}$, the ring $\Gamma(\mathfrak{U},\mathcal{B})$ is noetherian.

(b) $\mathcal{B}/\mathcal{I}^{i+1}\mathcal{B}$ is $\mathcal{O}_{X_i}$-quasi-coherent and the canonical morphism $\mathcal{B} \to \varprojlim_i \mathcal{B}/\mathcal{I}^{i+1}\mathcal{B}$ is an isomorphism.

Using the order filtration and the proposition 4.1.2.17.(d), we can check that the properties 7.2.2.3 are satisfied for $\mathcal{D} = \mathcal{B} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$.

Definition 7.2.2.5. We keep the notation and hypotheses of 7.2.2.3. Let $\mathcal{E}$ be a left $\mathcal{D}$-module.

(a) The separated completion (for the $\mathcal{I}$-adic topology) of a $\mathcal{E}$ is defined to be the $\widehat{\mathcal{D}}$-module $\widehat{\mathcal{E}} = \underset{\leftarrow}{l}_{X,*} \circ \underset{\leftarrow}{l}^*_X(\mathcal{E}) = \varprojlim_i \mathcal{D}_i \otimes_{\mathcal{D}} \mathcal{E} \xrightarrow{\sim} \varprojlim_i \mathcal{E}/\mathcal{I}^{i+1}\mathcal{E}$.

(b) $\mathcal{E}$ is said to be separated complete if the canonical morphism

$$\mathcal{E} \to \underset{\leftarrow}{l}_{X,*} \circ \underset{\leftarrow}{l}^*_X(\mathcal{E}) = \varprojlim_i \mathcal{D}_i \otimes_{\mathcal{D}} \mathcal{E} \tag{7.2.2.5.1}$$

is an isomorphism. Remark that if $\mathcal{E}$ is a separated complete $\mathcal{D}$-module the both equalities of 7.2.2.2.1 are valid for $\mathcal{M} = \mathcal{E}$ and also 7.2.2.2.2. and then we have such results.

(c) We say that $\mathcal{E}$ is p-torsion free if for all open $\mathfrak{U}$ of $\mathfrak{X}$, $\Gamma(\mathfrak{U},\mathcal{E})$ is p-torsion free.

Proposition 7.2.2.6. *We keep the notation and hypotheses of 7.2.2.3.*

(a) *For any affine open $\mathcal{U} \subset \mathfrak{X}$, the ring $\Gamma(\mathcal{U},\widehat{\mathcal{D}})$ is left noetherian.*

(b) *If $\mathcal{D}$ is flat over $\mathcal{O}_{\mathfrak{X}}$ fo the right structure, then so is $\widehat{\mathcal{D}}$.*

Proof. The first statement is a consequence of 7.2.1.2.(c) and of 7.2.2.2.(b). The second one follows from 7.2.1.3.(g) and 7.2.2.2.2. ☐

7.2.3 Coherent and pseudo-quasi-coherent modules over a complete sheaf of rings on formal schemes, theorems A and B

Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ satisfying the following conditions.

(a) On any affine open $\mathfrak{U} \subseteq \mathfrak{X}$, the ideal $\mathcal{I}$ has a family of generators with image in the center of $\mathcal{D}$.

(b) The sheaf $\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}$ is $\mathcal{O}_{X_i}$-quasi-coherent for its left structure for any $i \in \mathbb{N}$;

(c) The canonical homomorphism $\mathcal{D} \to \varprojlim_i \mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}$ is an isomorphism.

(d) For any affine open $\mathfrak{U} \subseteq \mathfrak{X}$, the ring $\Gamma(\mathfrak{U}, \mathcal{D})$ is left noetherian.

We set $\mathcal{D}_i := \mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}$. Following 7.1.3.8, the property (b) means that $\mathcal{D}_\bullet$ has local presentation as an $\mathcal{O}_{X_\bullet}$-module for its left structure. It follows from 4.1.3.2, $\mathcal{D}_i$ be a sheaf of rings on X_i satisfying theorems A and B for coherent modules (see definition 1.4.3.14). We have the ringed topos morphism: $\underleftarrow{l}_X : (X_\bullet, \mathcal{D}_\bullet) \to (\mathcal{X}, \mathcal{D})$. For any left $\mathcal{D}$-module $\mathcal{E}$, we write $\widehat{\mathcal{E}} = \underleftarrow{l}_{X,*} \circ \underleftarrow{l}_X^*(\mathcal{E}) = \varprojlim_i \mathcal{E}/\mathcal{I}^{i+1}\mathcal{E}$.

Remark 7.2.3.1. The sheaf $\mathcal{D}$ of the subsection 7.2.3 satisfies the conditions of 7.2.2.3. Conversely, let $\mathscr{D}$ be a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathscr{D}$ satisfying the conditions of 7.2.2.3. It follows from 7.2.2.2 and 7.2.2.6.(a) that the sheaf $\varprojlim_i \mathscr{D}/\mathcal{I}^{i+1}\mathscr{D}$ satisfies the same properties than the sheaf $\mathcal{D}$.

Example 7.2.3.2. Let $\mathfrak{S}^\sharp$ be a nice fine $\mathcal{V}$-log formal scheme as defined in 3.3.1.10. Suppose $\mathfrak{X}^\sharp$ is a log smooth $\mathfrak{S}^\sharp$-formal log scheme. Let $\mathcal{B}$ be a commutative $\mathcal{O}_{\mathfrak{X}}$-algebra endowed with a compatible left $\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$-module structure and satisfying both extra conditions of 7.2.2.4. Then with the remark 7.2.3.1, the conditions of the section 7.2.3 are satisfied for $\mathcal{D} = \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. We call $\mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$ the sheaf of differential operators of (infinite order and) level m on $(\mathfrak{X}^\sharp, \mathcal{B})/\mathfrak{S}^\sharp$.

Suppose in this paragraph, $\mathcal{D} = \mathcal{B}\widehat{\otimes}_{\mathcal{O}_{\mathfrak{X}}}\mathcal{D}^{(m)}_{\mathfrak{X}^\sharp/\mathfrak{S}^\sharp}$. Let $\mathfrak{U} \subset \mathfrak{X}$ be an affine open on which we have logarithmic coordinates $(u_\lambda)_{\lambda=1,\ldots,n}$. Let $\underline{\tau}_{\sharp(m)}$ (resp. $\underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$) be the element constructed from $(u_\lambda)_{\lambda=1,\ldots,r}$ as defined in 3.2.2.4 (resp. 3.2.3.4). An element $P \in \Gamma(\mathfrak{U}, \mathcal{D})$ can be written as an infinite serie

$$P = \sum_{\underline{k} \in \mathbb{N}^d} b_{\underline{k}} \underline{\partial}_\sharp^{\langle \underline{k}\rangle_{(m)}}$$

with $b_{\underline{k}} \in \Gamma(\mathfrak{U}, \mathcal{B})$ and $b_{\underline{k}} \to 0$ for the p-adic topology. Note that we no longer have filtration by order on the sheaf $\mathcal{D}$.

Proposition 7.2.3.3. *We have the following properties.*

(a) For any pair of affine opens $\mathfrak{U}' \subset \mathfrak{U}$, the homomorphism

$$\Gamma(\mathfrak{U}, \mathcal{D}) \to \Gamma(\mathfrak{U}', \mathcal{D})$$

is right flat.

(b) The sheaf $\mathcal{D}$ is left coherent.

Proof. Let us check (a). Since $\mathcal{D}_i$ is quasi-coherent for the left structure, then $\Gamma(U_i, \mathcal{D}_i) \to \Gamma(U'_i, \mathcal{D}_i)$ is right flat. It follows from 7.2.1.3.g that the morphism $\varprojlim_i \Gamma(U_i, \mathcal{D}_i) \to \varprojlim_i \Gamma(U'_i, \mathcal{D}_i)$ is right flat. We get the desired result by using the condition (c) satisfied by $\mathcal{D}$ and the commutation of the local sections functors with projective limits. We get the second statement by using 1.4.5.2. $\square$

Notation 7.2.3.4. Assume $\mathfrak{X}$ is affine and set $O_{\mathfrak{X}} = \Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$, $D = \Gamma(\mathfrak{X}, \mathcal{D})$, $I = \Gamma(\mathfrak{X}, \mathcal{I})$, $D_i = \Gamma(\mathfrak{X}, \mathcal{D}_i) \xrightarrow{\sim} D/I^{i+1}D$ (see 7.2.2.2.3), $D = \Gamma(\mathfrak{X}, \mathcal{D})^\wedge \xrightarrow{\sim} \Gamma(\mathfrak{X}, \mathcal{D}^\wedge)$ (see 7.2.2.2.2) and $O_{X_i} := \Gamma(X_i, \mathcal{O}_{X_i}) \xrightarrow{\sim} O_{\mathfrak{X}}/I^{i+1}O_{\mathfrak{X}}$. We denote by $\mathrm{Mod}_{\mathrm{gp}}({}^{\mathrm{l}}\mathcal{D})$ (resp. $\mathrm{Mod}_{\mathrm{gfp}}({}^{\mathrm{l}}\mathcal{D})$) is the category of left $\mathcal{D}$-module having a global presentation (resp. a global finite presentation).

Definition 7.2.3.5. A left $\mathcal{D}$-module $\mathcal{E}$ is "pseudo-quasi-coherent" if it is separated complete (see definition 7.2.2.5) and if, for any $i \in \mathbb{N}$, $\mathcal{E}_i := \mathcal{D}_i \otimes_{\mathcal{D}} \mathcal{E}$ is a quasi-coherent $\mathcal{O}_{X_i}$-module. We denote by $\mathrm{Mod}_{\mathrm{pqc}}({}^{\mathrm{l}}\mathcal{D})$ the category of pseudo quasi-coherent left $\mathcal{D}$-modules.

7.2.3.6. We point out the fact that a left $\mathcal{D}$-module is pseudo-quasi-coherent (resp. is p-torsion free) is local on $\mathfrak{X}$.

7.2.3.7. Let $\mathcal{E}_\bullet \in \mathrm{Mod}(\mathcal{D}_\bullet)$. Since $\mathcal{D}_i$ is $\mathcal{O}_{X_i}$-quasi-coherent, then a $\mathcal{D}_i$-module is $\mathcal{O}_{X_i}$-quasi-coherent if and only if it has local presentation. Hence, following 7.1.3.8, this yields that $\mathcal{E}_\bullet \in \mathrm{Mod}_{\mathrm{lp}}(\mathcal{D}_\bullet)$ (see notation 7.1.3.9) if and only if it satisfies both conditions (a) and (b) of 7.2.2.1.

Hence, for any $\mathcal{E}_\bullet \in \mathrm{Mod}_{\mathrm{lp}}({}^{l}\mathcal{D}_\bullet)$, by using the second isomorphism of 7.2.2.1.1, we check that the adjoint morphism $\underleftarrow{l}_X^* \circ \underleftarrow{l}_{X,*}(\mathcal{E}_\bullet) \to \mathcal{E}_\bullet$ is an isomorphism. By using 7.2.1.5 and 7.2.2.1, this implies that the functor $\underleftarrow{l}_{X,*} \colon \mathrm{Mod}_{\mathrm{lp}}({}^{l}\mathcal{D}_\bullet) \to \mathrm{Mod}({}^{l}\mathcal{D})$ is fully faithful and its essential image is $\mathrm{Mod}_{\mathrm{pqc}}({}^{l}\mathcal{D})$. Moreover, the functors $\underleftarrow{l}_{X*}$ and $\underleftarrow{l}_X^*$ induce canonically quasi-inverse equivalences of categories between $\mathrm{Mod}_{\mathrm{lp}}({}^{l}\mathcal{D}_\bullet)$ and $\mathrm{Mod}_{\mathrm{pqc}}({}^{l}\mathcal{D})$.

7.2.3.8. We suppose $\mathfrak{X}$ affine and we keep notation 7.2.3.4. Let $\varpi_X \colon |\mathfrak{X}| \to \{*\}$ be the continuous morphism from the underlying topological space of $\mathfrak{X}$ to a punctual set. Taking global section of the inverse system $\mathcal{D}_\bullet$, we get the inverse system $D_\bullet$. With notation 7.1.2.9, this yields the morphism of ringed topoi $\varpi_{X,\mathbb{N}} \colon (X_\bullet, \mathcal{D}_\bullet) \to (\{*\}_\bullet, D_\bullet)$ that will we denote by $\varpi_{X_\bullet}$.

Similarly, we denote by $\varpi_{\mathfrak{X}} \to (|\mathfrak{X}|, \mathcal{D}) \to (\{*\}, D)$ the morphism of ringed topoi. We have $\varpi_{\mathfrak{X}}^* = \mathcal{D} \otimes_D -$ and $\varpi_{\mathfrak{X}*} = \Gamma(\mathfrak{X}, -)$. With notation 7.2.1.6, we get the commutative diagram of ringed topos:

$$\begin{array}{ccc} (X_\bullet, \mathcal{D}_\bullet) & \xrightarrow{\varpi_{X_\bullet}} & (\{*\}_\bullet, D_\bullet) \\ \downarrow{\scriptstyle \underleftarrow{l}_X} & & \downarrow{\scriptstyle \underleftarrow{l}} \\ (|\mathfrak{X}|, \mathcal{D}) & \xrightarrow{\varpi_{\mathfrak{X}}} & (\{*\}, D). \end{array} \tag{7.2.3.8.1}$$

Proposition 7.2.3.9. *We suppose $\mathfrak{X}$ affine and we keep notation 7.2.3.8.*

(a) The functors $\varpi_{X_\bullet *}$ and $\varpi_{X_\bullet}^*$ induce canonically quasi-inverse equivalences of categories between $\mathrm{Mod}_{\mathrm{lp}}(\mathcal{D}_\bullet)$ and $\mathrm{Mod}_{\mathrm{lp}}(D_\bullet)$ (resp. $\mathrm{Mod}_{\mathrm{fp}}(\mathcal{D}_\bullet)$ and $\mathrm{Mod}_{\mathrm{fp}}(D_\bullet)$).

(b) We have the equalities $\mathrm{Mod}_{\mathrm{lp}}(D_\bullet) = \mathrm{Mod}_{\mathrm{gp}}(D_\bullet)$, $\mathrm{Mod}_{\mathrm{fp}}(D_\bullet) = \mathrm{Mod}_{\mathrm{gfp}}(D_\bullet)$, $\mathrm{Mod}_{\mathrm{lp}}(\mathcal{D}_\bullet) = \mathrm{Mod}_{\mathrm{gp}}(\mathcal{D}_\bullet)$, $\mathrm{Mod}_{\mathrm{fp}}(\mathcal{D}_\bullet) = \mathrm{Mod}_{\mathrm{gfp}}(\mathcal{D}_\bullet)$.

Proof. a) i) Let $\mathcal{E}_\bullet \in \mathrm{Mod}_{\mathrm{lp}}(\mathcal{D}_\bullet)$. Following 7.2.3.7, this means that $\mathcal{E}_\bullet$ is a left $\mathcal{D}_\bullet$-module satisfying both conditions (a) and (b) of 7.2.2.1. Let $E_\bullet \in \mathrm{Mod}_{\mathrm{lp}}(D_\bullet)$. Following 7.2.1.6.a, $E_\bullet$ has local presentation means that the canonical homomorphisms $E_{i+1}/I^{i+1}M_{i+1} \to E_i$ are D_i-linear isomorphisms for any $i \in \mathbb{N}$. By definition, $\varpi_{X_\bullet *}(\mathcal{E}_\bullet) = (\Gamma(X_i, \mathcal{E}_i))_{i\in\mathbb{N}}$ and $\varpi_{X_\bullet}^*(E_\bullet) = (\mathcal{D}_i \otimes_{D_i} E_i)_{i\in\mathbb{N}}$ (see 7.1.3.8). Since $\mathcal{D}_i$ is a quasi-coherent $\mathcal{O}_{X_i}$-module, then $D_i \to \mathcal{D}_i$ is flat. With both above descriptions of local presentation, this implies that $\varpi_{X_\bullet}^*$ preserve modules of local presentation, i.e. induces $\varpi_{X_\bullet}^* \colon \mathrm{Mod}_{\mathrm{lp}}(D_\bullet) \to \mathrm{Mod}_{\mathrm{lp}}(\mathcal{D}_\bullet)$. Similarly, using theorems of type A and B for quasi-coherent $\mathcal{D}_{X_i}$-modules (4.1.3.2), we get the factorization $\varpi_{X_\bullet *} \colon \mathrm{Mod}_{\mathrm{lp}}(\mathcal{D}_\bullet) \to \mathrm{Mod}_{\mathrm{lp}}(D_\bullet)$ and we check that the canonical morphisms $\varpi_{X_\bullet}^* \circ \varpi_{X_\bullet *}(\mathcal{E}_\bullet) \to \mathcal{E}_\bullet$ and $E_\bullet \to \varpi_{X_\bullet *} \circ \varpi_{X_\bullet}^*(E_\bullet)$ are isomorphisms.

ii) By using the theorem A and B for coherent $\mathcal{D}_i$-modules for any $i \in \mathbb{N}$ (see 4.1.3.2), we can proceed similarly to i) to check the functors $\varpi_{X_\bullet *}$ and $\varpi_{X_\bullet}^*$ induce canonically quasi-inverse equivalences of categories between $\mathrm{Mod}_{\mathrm{fp}}(\mathcal{D}_\bullet)$ and $\mathrm{Mod}_{\mathrm{fp}}(D_\bullet)$.

b) i) We already know that $\mathrm{Mod}_{\mathrm{lp}}(D_\bullet) = \mathrm{Mod}_{\mathrm{gp}}(D_\bullet)$, $\mathrm{Mod}_{\mathrm{fp}}(D_\bullet) = \mathrm{Mod}_{\mathrm{gfp}}(D_\bullet)$, (see 7.2.1.6.(b and (c)).

ii) The functor $\varpi_{X_\bullet}^*$ preserves the (finite) global presentability. Hence, to get the equality $\mathrm{Mod}_{\mathrm{fp}}(\mathcal{D}_\bullet) = \mathrm{Mod}_{\mathrm{gfp}}(\mathcal{D}_\bullet)$, thanks to (a) it remains to check that the functor $\varpi_{X_\bullet *}$ preserves the finite global presentability. Let $\mathcal{E}_\bullet \in \mathrm{Mod}_{\mathrm{gfp}}({}^{l}\mathcal{D}_\bullet)$. By definition, $\mathcal{E}_\bullet$ is the cokernel of a morphism of the form $f \colon \oplus_{i=1}^r \mathcal{D}_\bullet \to \oplus_{j=1}^s \mathcal{D}_\bullet$. By applying the functor $\varpi_{X_\bullet *}$, we get the morphism of left $D_\bullet$-modules $g \colon \oplus_{i=1}^r D_\bullet \to \oplus_{j=1}^s D_\bullet$. Let $G_\bullet$ be its cokernel. By (right) flatness of the functor $\varpi_{X_\bullet}^* = \mathcal{D}_\bullet \otimes_{D_\bullet} -$, this yields that $\mathcal{E}_\bullet \xrightarrow{\sim} \mathcal{D}_\bullet \otimes_{D_\bullet} G_\bullet$. From the part (a), this implies $\varpi_{X_\bullet *}(\mathcal{E}_\bullet) \xrightarrow{\sim} G_\bullet$. Hence, $\varpi_{X_\bullet *}(\mathcal{E}_\bullet)$ has global finite presentation.

iii) Since $\mathbb{N}$ is quasi-separated (because $\mathbb{N}$ is totally ordered), since the topological spaces X and $\{*\}$ are coherent (and in particular locally coherent), then following 7.1.2.15.d the topoi $X_\bullet$ and $\{*\}_\bullet$ are algebraic. (Beware that $\mathbb{N}$ is not quasi-compact and the topoi $X_\bullet$ and $\{*\}_\bullet$ are not coherent.) However, since $\varpi_X \colon |\mathfrak{X}| \to \{*\}$ is a coherent morphism of locally coherent topological spaces, then it follows from

7.1.2.17.(b) that the topoi morphism $\varpi_{X,\mathbb{N}} \colon X_\bullet \to \{*\}_\bullet$ is coherent. Hence, the functor $\varpi_{X_\bullet *}$ commutes with filtered inductive limits of abelian sheaves (see [SGA4.2, VI.5.1]) and in particular with direct sums of abelian sheaves. This implies that we can proceed similarly to b.ii) replacing a global finite presentation by a global presentation. □

Proposition 7.2.3.10. *We suppose $\mathfrak{X}$ affine and we keep notation 7.2.3.8. The functors $\varpi^*_{\mathfrak{X}} = \mathcal{D} \otimes_D -$ and $\varpi_{\mathfrak{X}*} = \Gamma(\mathfrak{X}, -)$ induce canonically quasi-inverse equivalences of categories between $\mathrm{Mod}({}^l D)$ and $\mathrm{Mod}_{\mathrm{gp}}({}^l \mathcal{D})$ (resp. $\mathrm{Coh}({}^l D)$ and $\mathrm{Mod}_{\mathrm{gfp}}({}^l \mathcal{D})$). Moreover, the functor $\mathcal{D} \otimes_D -$ is exact.*

Proof. a) Since the functor $\mathcal{D} \otimes_D - \colon \mathrm{Mod}({}^l D) \to \mathrm{Mod}({}^l \mathcal{D})$ is right exact (and even exact thanks to 7.2.3.3.a), we have the factorization

$$\mathcal{D} \otimes_D - \colon \mathrm{Mod}({}^l D) \to \mathrm{Mod}_{\mathrm{gp}}({}^l \mathcal{D}), \quad \mathcal{D} \otimes_D - \colon \mathrm{Coh}({}^l D) \to \mathrm{Mod}_{\mathrm{gfp}}({}^l \mathcal{D}). \tag{7.2.3.10.1}$$

b) Since $\Gamma(\mathfrak{X}, \mathcal{D}) = D$, since $\Gamma(\mathfrak{X}, -)$ commutes with filtered inductive limits of abelian sheaves (see [SGA4.2, VI.5.2]), then the canonical homomorphism $L \to \Gamma(\mathfrak{X}, \mathcal{D} \otimes_D L)$ is an isomorphism when L is a free left D-module. By using the five lemma, this yields that the canonical homomorphism $E \to \Gamma(\mathfrak{X}, \mathcal{D} \otimes_D E)$ is an isomorphism for any left D-module E.

c) Let $\mathcal{E} \in \mathrm{Mod}_{\mathrm{gp}}({}^l \mathcal{D})$. By definition, $\mathcal{M}$ is the cokernel of a morphism of the form $f \colon \oplus_{i \in I} \mathcal{D} \to \oplus_{j \in J} \mathcal{D}$. Taking the global section we get the morphism of left D-modules $g \colon \oplus_{i \in I} D \to \oplus_{j \in J} D$. Let G be its cokernel. Since the functor $\mathcal{D} \otimes_D -$ is right exact (and is the adjoint of $\Gamma(\mathfrak{X}, -)$), this yields that $\mathcal{E} \xrightarrow{\sim} \mathcal{D} \otimes_D G$. Hence, the functor $\mathcal{D} \otimes_D - \colon \mathrm{Mod}({}^l D) \to \mathrm{Mod}_{\mathrm{gp}}({}^l \mathcal{D})$ is essentially surjective. From the part b) of the proof, this yields $\Gamma(\mathfrak{X}, \mathcal{E}) \xrightarrow{\sim} G$. When $\mathcal{E}$ has global finite presentation, this implies that $\Gamma(\mathfrak{X}, \mathcal{E})$ is a left D-module of finite type. Hence, we are done. □

7.2.3.11. We suppose $\mathfrak{X}$ affine and we keep notation and hypotheses of 7.2.3.4.

(a) We have the functor ${}^\Delta \colon \mathrm{Mod}({}^l D) \to \mathrm{Mod}_{\mathrm{pqc}}({}^l \mathcal{D})$ which associates to a left D-module E the left $\mathcal{D}$-module

$$E^\Delta := \mathcal{D} \widehat{\otimes}_D E = \underset{\leftarrow X,*}{l} \circ \underset{\leftarrow X}{l^*} \circ \varpi^*_{\mathfrak{X}}(E) \xrightarrow{\sim} \underset{\leftarrow X,*}{l} \circ \varpi^*_{X_\bullet} \circ \underset{\leftarrow}{l^*}(E) \xrightarrow{\sim} \varprojlim_i (\mathcal{D}_i \otimes_{D_i} (E/I^{i+1}E)). \tag{7.2.3.11.1}$$

where we identify a left D-module with its associated constant sheaf on $\mathfrak{X}$.

(b) If E is a left D-module of finite type, then the canonical morphism

$$\mathcal{D} \otimes_D E \to \mathcal{D} \widehat{\otimes}_D E = E^\Delta \tag{7.2.3.11.2}$$

is an isomorphism. Indeed, for any $f \in O_{\mathfrak{X}}$, it follows from 7.2.1.3 and 7.2.3.3 that the morphism $\mathcal{D}(\mathfrak{D}(f)) \otimes_D E \to \mathcal{D}(\mathfrak{D}(f)) \widehat{\otimes}_D E$ is an isomorphism.

(c) It follows from 7.2.3.10 and 7.2.3.11.2 that the functor ${}^\Delta$ factors through

$${}^\Delta \colon \mathrm{Coh}({}^l D) \to \mathrm{Mod}_{\mathrm{gfp}}({}^l \mathcal{D}). \tag{7.2.3.11.3}$$

Remark 7.2.3.12. With notation 7.2.3.11, since $\mathcal{D}_i$ is an $\mathcal{O}_{X_i}$-quasi-coherent module, then the canonical morphism

$$\mathcal{O}_{\mathfrak{X}} \widehat{\otimes}_{O_{\mathfrak{X}}} M \to M^\Delta$$

is an isomorphism.

Proposition 7.2.3.13 (Characterization of the pseudo quasi-coherence, Theorem A, Theorem B)**.** *We suppose $\mathfrak{X}$ affine and we keep notation and hypotheses of 7.2.3.4.*

(i) Let $\mathcal{E}$ is a left $\mathcal{D}$-module. The following properties are equivalent.

(a) The D-module $\Gamma(\mathfrak{X}, \mathcal{E})$ belongs to $\mathrm{Mod}_{\mathrm{c}}({}^l D)$ (see notation 7.2.1.6.a) and the canonical homomorphism

$$\Gamma(\mathfrak{X}, \mathcal{E})^\Delta = \mathcal{D} \widehat{\otimes}_D \Gamma(\mathfrak{X}, \mathcal{E}) \to \mathcal{E}$$

is an isomorphism.

(b) $\mathcal{E}$ *is a pseudo quasi-coherent* $\mathcal{D}$*-module.*

When these equivalent conditions hold, the canonical morphism

$$D_i \otimes_D \Gamma(\mathfrak{X}, \mathcal{E}) \to \Gamma(\mathfrak{X}, \mathcal{D}_i \otimes_{\mathcal{D}} \mathcal{E}) \qquad (7.2.3.13.1)$$

is an isomorphism.

(ii) *The functors* ${}^{\Delta}$ *and* $\Gamma(\mathfrak{X}, -)$ *induce canonically exact quasi-inverse equivalences of categories between* $\mathrm{Mod}_{\mathrm{c}}({}^{1}D)$ *and* $\mathrm{Mod}_{\mathrm{pqc}}({}^{1}\mathcal{D})$.

(iii) *Let* $\mathcal{E}$ *be a pseudo quasi-coherent* $\mathcal{D}$*-module. We have* $H^{q}(\mathfrak{X}, \mathcal{E}) = 0$ *for all* $q \geq 1$.

Proof. Let us check the equivalence of (i). The implication $(a) \Rightarrow (b)$ is straightforward. Conversely, let $\mathcal{E}$ be a pseudo-quasi-coherent $\mathcal{D}$-module. Following 7.2.2.2.2, we have the canonical morphism $\widehat{\Gamma(\mathfrak{X}, \mathcal{E})} \xrightarrow{\sim} \Gamma(\mathfrak{X}, \mathcal{E})$. Hence, $\Gamma(\mathfrak{X}, \mathcal{E}) \in \mathrm{Mod}_{\mathrm{c}}({}^{1}D)$. It follows from (7.2.2.2.1) that for any integers $n \geq 1$ and $i \geq 0$ we have $H^{n}(\mathfrak{X}, \mathcal{I}^{i+1}\mathcal{E}) = 0$ and $\Gamma(\mathfrak{X}, \mathcal{I}^{i}\mathcal{E}) = I^{i}\Gamma(\mathfrak{X}, \mathcal{E})$. By applying the functor $\Gamma(\mathfrak{X}, -)$ to the exact sequence $0 \to \mathcal{I}^{i+1}\mathcal{E} \to \mathcal{E} \to \mathcal{E}_i \to 0$, this yields that the canonical morphism 7.2.3.13.1 is an isomorphism. The canonical morphism $\mathcal{D}_i \otimes_D \Gamma(\mathfrak{X}, \mathcal{E}) \to \mathcal{E}_i$ of quasi-coherent $\mathcal{D}_i$-modules is therefore an isomorphism. Passing to projective limit, we get the canonical morphism $\mathcal{D}\widehat{\otimes}_D \Gamma(\mathfrak{X}, \mathcal{E}) \to \mathcal{E}$ is an isomorphism and we have therefore checked the implication $(b) \Rightarrow (a)$.

It follows from (i) that both functors ${}^{\Delta}\colon \mathrm{Mod}_{\mathrm{c}}({}^{1}D) \to \mathrm{Mod}_{\mathrm{pqc}}({}^{1}\mathcal{D})$ and $\Gamma(\mathfrak{X}, -)\colon \mathrm{Mod}_{\mathrm{pqc}}({}^{1}\mathcal{D}) \to \mathrm{Mod}_{\mathrm{c}}({}^{1}D)$ are well defined. Let $E \in \mathrm{Mod}_{\mathrm{c}}({}^{1}D)$. Since $E^{\Delta} \xrightarrow{\sim} \varprojlim_i (\mathcal{D}_i \otimes_D E)$ (see 7.2.3.11.1), since $\Gamma(X, -)$ commutes with projective limits, since E is separated complete, then we get $\Gamma(\mathfrak{X}, E^{\Delta}) \xrightarrow{\sim} \varprojlim_i \Gamma(X, \mathcal{D}_i \otimes_D E) \xrightarrow{\sim} \varprojlim_i D_i \otimes_D E \xrightarrow{\sim} E$. Hence, using (i), we get the second statement. The third one is a consequence of 7.2.2.2.1.

□

Lemma 7.2.3.14. *We assume that* $\mathfrak{X}$ *is affine. Let* $\mathcal{E}$ *be a pseudo quasi-coherent* $\mathcal{D}$*-module. The following condition are equivalent.*

1. $\mathcal{E}$ *is* $\mathcal{O}_{\mathfrak{X}}$*-flat*
2. $\Gamma(\mathfrak{X}, \mathcal{E})$ *is* $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$*-flat.*

Proof. 1) Suppose $\Gamma(\mathfrak{X}, \mathcal{E})$ is $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$-flat. For all i, for any affine open $\mathfrak{Y}$ of $\mathfrak{X}$, $\Gamma(Y_i, \mathcal{O}_{X_i}) \otimes_{\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})} \Gamma(\mathfrak{X}, \mathcal{E})$ is therefore a $\Gamma(Y_i, \mathcal{O}_{X_i})$-flat module. Now, according to 7.2.3.13.(i), the canonical homomorphism

$$\Gamma(\mathfrak{X}, \mathcal{E})^{\Delta} = \mathcal{D}\widehat{\otimes}_D \Gamma(\mathfrak{X}, \mathcal{E}) \to \mathcal{E}$$

is an isomorphism. By applying to the isomorphism 7.2.3.11.1 the functor $\Gamma(\mathfrak{Y}, -)$, which commutes to projective limits, we deduce

$$\Gamma(\mathfrak{Y}, \mathcal{E}) \xrightarrow{\sim} \Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{X}}) \widehat{\otimes}_{\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})} \Gamma(\mathfrak{X}, \mathcal{E}).$$

As $\Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{X}})$ is Noetherian, it then follows from 7.2.1.4 that $\Gamma(\mathfrak{Y}, \mathcal{E})$ is $\Gamma(\mathfrak{Y}, \mathcal{O}_{\mathfrak{X}})$-flat. Hence we have checked the flatness of $\mathcal{E}$ as $\mathcal{O}_{\mathfrak{X}}$-module.

Conversely, suppose $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{X}}$-flat. For all i, $\mathcal{E}_i := \mathcal{O}_{X_i} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$ is therefore $\mathcal{O}_{X_i}$-flat. As $\mathcal{E}_i$ is moreover quasi-coherent, then the sheaf $\Gamma(X_i, \mathcal{E}_i)$ is a flat $\Gamma(X_i, \mathcal{O}_{X_i})$-module. Following 7.2.3.13.1, $\Gamma(X, \mathcal{E})/\pi^{i+1}\Gamma(X, \mathcal{E}) \xrightarrow{\sim} \Gamma(X_i, \mathcal{E}_i)$. Hence, $\Gamma(X, \mathcal{E})/\pi^{i+1}\Gamma(X, \mathcal{E})$ is flat. However, by applying the functor $\Gamma(\mathfrak{X}, -)$ to the isomorphism 7.2.3.11.1, we obtain

$$\Gamma(\mathfrak{X}, \mathcal{E}) \xrightarrow{\sim} \varprojlim_i \Gamma(\mathfrak{X}, \mathcal{E})/\pi^{i+1}\Gamma(\mathfrak{X}, \mathcal{E}). \qquad (7.2.3.14.1)$$

According to 7.2.1.4, as $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$ is Noetherian and $\Gamma(\mathfrak{X}, \mathcal{E})/\pi^{i+1}\Gamma(\mathfrak{X}, \mathcal{E})$ is $\Gamma(X_i, \mathcal{O}_{X_i})$-flat, it follows from the isomorphism 7.2.3.14.1 that $\Gamma(\mathfrak{X}, \mathcal{E})$ is $\Gamma(\mathfrak{X}, \mathcal{O}_{\mathfrak{X}})$-flat. □

Proposition 7.2.3.15. *We have the inclusion* $\mathrm{Coh}({}^{1}\mathcal{D}) \subset \mathrm{Mod}_{\mathrm{pqc}}({}^{1}\mathcal{D})$ *and the functors* $\underleftarrow{l}^{*}_{X}$ *and* $\underleftarrow{l}_{X*}$ *induce canonically quasi-inverse equivalences of categories between* $\mathrm{Coh}({}^{1}\mathcal{D})$ *and* $\mathrm{Mod}_{\mathrm{fp}}({}^{1}\mathcal{D}_{\bullet})$*. When* $\mathfrak{X}$ *is affine, we have the equality* $\mathrm{Coh}({}^{1}\mathcal{D}) = \mathrm{Mod}_{\mathrm{gfp}}({}^{1}\mathcal{D})$.

Proof. 1) Let $\mathcal{E} \in \mathrm{Coh}({}^1\mathcal{D})$. It follows from 7.1.3.8 that $\underleftarrow{l}^*_X(\mathcal{E}) \in \mathrm{Mod}_{\mathrm{fp}}({}^1\mathcal{D}_\bullet)$. Let us check that the canonical morphism

$$\mathcal{E} \to \underleftarrow{l}_{X,*} \circ \underleftarrow{l}^*_X(\mathcal{E}) \tag{7.2.3.15.1}$$

is an isomorphism. Since this is local, we can suppose that $\mathfrak{X}$ is affine and $\mathcal{E}$ has a global finite presentation. Hence, following 7.2.3.10, $E := \Gamma(\mathfrak{X}, \mathcal{E})$ is a left D-module of finite type and the canonical morphism $\mathcal{D} \otimes_D E \to \mathcal{E}$ is an isomorphism. This implies the morphism 7.2.3.15.1 is an isomorphism if and only if so is the canonical $\mathcal{D} \otimes_D E \to \mathcal{D}\widehat{\otimes}_D E$. We conclude thanks to 7.2.3.11.2.

2) Let $\mathcal{E}_\bullet \in \mathrm{Mod}_{\mathrm{fp}}({}^1\mathcal{D}_\bullet)$. Let us check that $\underleftarrow{l}_{X,*}(\mathcal{E}_\bullet) \in \mathrm{Coh}({}^1\mathcal{D})$ and that the canonical morphism $\underleftarrow{l}^*_X \circ \underleftarrow{l}_{X,*}(\mathcal{E}_\bullet) \to \mathcal{E}_\bullet$ is an isomorphism. Since this is local, we can suppose $\mathfrak{X}$ is affine. By using the equivalence of categories of 7.2.1.6 and 7.2.3.9, there exist $E \in \mathrm{Coh}(D)$ and an isomorphism $\varpi^*_{X_\bullet} \circ \underleftarrow{l}^*(E) \xrightarrow{\sim} \mathcal{E}_\bullet$ of $\mathrm{Mod}_{\mathrm{fp}}({}^1\mathcal{D}_\bullet)$. This yields

$$E^\Delta = \underleftarrow{l}_{X,*} \circ \underleftarrow{l}^*_X \circ \varpi^*_{\mathfrak{X}}(E) \xrightarrow{\sim} \underleftarrow{l}_{X,*} \varpi^*_{X_\bullet} \circ \underleftarrow{l}^*(E) \xrightarrow{\sim} \underleftarrow{l}_{X,*}(\mathcal{E}_\bullet).$$

Since E is a left D-module of finite type, then following 7.2.3.11.3 we have $E^\Delta \in \mathrm{Mod}_{\mathrm{gfp}}({}^1\mathcal{D})$. Hence, $\underleftarrow{l}_{X,*}(\mathcal{E}_\bullet) \in \mathrm{Coh}({}^1\mathcal{D})$. Since the adjoint morphism $\underleftarrow{l}^*_X \circ \underleftarrow{l}_{X,*}(\underleftarrow{l}^*_X \circ \varpi^*_{\mathfrak{X}}(E)) \to \underleftarrow{l}^*_X \circ \varpi^*_{\mathfrak{X}}(E)$ is an isomorphism (use 1) and the fact that $\varpi^*_{\mathfrak{X}}(E) \in \mathrm{Coh}({}^1\mathcal{D})$), then so is $\underleftarrow{l}^*_X \circ \underleftarrow{l}_{X,*}(\mathcal{E}_\bullet) \to \mathcal{E}_\bullet$.

3) When $\mathfrak{X}$ is affine, it remains to check the equality $\mathrm{Coh}({}^1\mathcal{D}) = \mathrm{Mod}_{\mathrm{gfp}}({}^1\mathcal{D})$. Let $\mathcal{E} \in \mathrm{Coh}({}^1\mathcal{D})$. From 1), $\mathcal{E}_\bullet := \underleftarrow{l}^*_X(\mathcal{E}) \in \mathrm{Mod}_{\mathrm{fp}}({}^1\mathcal{D}_\bullet)$ and $\mathcal{E} \xrightarrow{\sim} \underleftarrow{l}_{X,*}(\mathcal{E}_\bullet)$. From 2), there exists $E \in \mathrm{Coh}(D)$ such that $\underleftarrow{l}_{X,*}(\mathcal{E}_\bullet) \xrightarrow{\sim} E^\Delta \in \mathrm{Mod}_{\mathrm{gfp}}({}^1\mathcal{D})$. Hence, we are done. □

Corollary 7.2.3.16 (Characterization of the $\mathcal{D}$-coherence, Theorem A, Theorem B)**.** *We suppose $\mathfrak{X}$ affine and we keep notation and hypotheses of 7.2.3.4.*

(i) Let $\mathcal{E}$ is a left $\mathcal{D}$-module. The following properties are equivalent.

(a) For any $i \in \mathbb{N}$, the $\mathcal{D}_i$-module $\mathcal{E}/\mathcal{I}^{i+1}\mathcal{E}$ is coherent, and the canonical homomorphism $\mathcal{E} \to \varprojlim_i \mathcal{E}/\mathcal{I}^{i+1}\mathcal{E}$ is an isomorphism.

(b) The D-module $\Gamma(\mathfrak{X}, \mathcal{E})$ is of finite type and the canonical homomorphism

$$\mathcal{D} \otimes_D \Gamma(\mathfrak{X}, \mathcal{E}) \to \mathcal{E}$$

is an isomorphism.

(c) $\mathcal{E}$ is a coherent $\mathcal{D}$-module.

(ii) The functors $\varpi^*_{\mathfrak{X}} = \mathcal{D} \otimes_D -$ and $\varpi_{\mathfrak{X}*} = \Gamma(\mathfrak{X}, -)$ induce canonically exact quasi-inverse equivalences of categories between $\mathrm{Coh}({}^1D)$ and $\mathrm{Coh}({}^1\mathcal{D})$.

(iii) Let $\mathcal{E}$ be a coherent left $\mathcal{D}$-module. We have $H^q(\mathfrak{X}, \mathcal{E}) = 0$ for all $q \geq 1$.

Proof. The first two statements follows from 7.2.3.10 and 7.2.3.15. Using 7.2.2.2.a, this yields the last one. □

7.2.3.17 (Support)**.** Let $\mathcal{E}$ be a coherent $\mathcal{D}$-module. By using the theorem of type A of 7.2.3.16, we easily check that the set $\mathfrak{U}$ consisting of elements $x \in \mathfrak{X}$ such that $\mathcal{E}_x = 0$ is an open subset of $\mathfrak{X}$. The *support* of $\mathcal{E}$ is by definition the complementary of $\mathcal{U}$ in $\mathcal{X}$. We have $\mathcal{E}|\mathfrak{U} = 0$.

Let Z be a closed subset of $\mathfrak{X}$ and V be the complementary. We say that $\mathcal{E}$ has his support in Z if $\mathfrak{Z}$ if $\mathcal{E}|V = 0$.

7.3 Quasi-coherent complexes on formal schemes or on inductive systems of schemes

Let $\mathfrak{X}$ be a locally noetherian formal scheme of Krull dimension d and $\mathcal{I}$ be an ideal of definition of $\mathfrak{X}$. We keep notation 7.2.

7.3.1 Definitions and first properties

Let $\mathcal{D}$ be a sheaf of rings on $\mathfrak{X}$ equipped with a homomorphism $\mathcal{O}_{\mathfrak{X}} \to \mathcal{D}$ satisfying the following conditions of 7.2.3.

7.3.1.1. With notation 7.2, we have the morphism of ringed topoi $\underleftarrow{l}_X : (X_\bullet, \mathcal{O}_{X_\bullet}) \to (|\mathcal{X}|, \mathcal{O}_{\mathfrak{X}})$. From [Sta22, 07A6] (or see 5.3.5.4), this yields the functors $\mathbb{R}\underleftarrow{l}_{X*} : D(\mathcal{O}_{X_\bullet}) \to D(\mathcal{O}_{\mathfrak{X}})$ and $\mathbb{L}\underleftarrow{l}_X^* : D(\mathcal{O}_{\mathfrak{X}}) \to D(\mathcal{O}_{X_\bullet})$ which are adjoint:

$$\mathrm{Hom}_{D(\mathcal{O}_{X_\bullet})}(\mathbb{L}\underleftarrow{l}_X^*(\mathcal{E}^\bullet), \mathcal{F}_\bullet^\bullet) = \mathrm{Hom}_{D(\mathcal{O}_{\mathfrak{X}})}(\mathcal{E}^\bullet, \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{F}_\bullet^\bullet)) \tag{7.3.1.1.1}$$

for any $\mathcal{E}^\bullet \in D(\mathcal{O}_{\mathfrak{X}})$ and any $\mathcal{F}_\bullet^\bullet \in D(\mathcal{O}_{X_\bullet})$.

7.3.1.2 (Bounded cohomological dimension)**.** Let $\mathfrak{B}$ be a basis of open sets of $|X|$. For any abelian sheaf $\mathcal{E}_\bullet$ of $X_\bullet$ and for any integer q the sheaf $R^q\underleftarrow{l}_{X*}\mathcal{E}_\bullet$ is the sheaf associated with the presheaf $\mathcal{U} \in \mathfrak{B} \mapsto H^q(U_\bullet, \mathcal{E}_\bullet)$ (see [SGA4.2, V.5.1.1]). According to notation 7.2.3.8, let $\varpi_U : |\mathfrak{U}| \to \{*\}$ be the continuous morphism for the topological space of $\mathfrak{U}$ to a punctual set. Since $\mathbb{R}\underleftarrow{l}_{\{*\}} \circ \mathbb{R}\varpi_{U,\mathbb{N}*} \xrightarrow{\sim} \mathbb{R}(\underleftarrow{l}_{\{*\}} \circ \varpi_{U,\mathbb{N}*})$ (see 7.1.3.15.3), since of $H^q(U_\bullet, \mathcal{E}_\bullet) = R^q(\underleftarrow{l}_{\{*\}} \circ \varpi_{U,\mathbb{N}*})(\mathcal{E}_\bullet|_{U_\bullet})$, since $R^q\varpi_{U,\mathbb{N}*}(\mathcal{E}_\bullet|_{U_\bullet}) = (H^q(U, \mathcal{E}_i))_{i\in\mathbb{N}}$ (see 7.1.3.15.2), then we get the spectral sequence

$$E_2^{p,q} = R^p \varprojlim_i (H^q(U, \mathcal{E}_i)) \Rightarrow H^{p+q}(U_\bullet, \mathcal{E}_\bullet). \tag{7.3.1.2.1}$$

For any $p > 1$ or $q > d$, $E_2^{p,q} = 0$. Hence, $H^n(U_\bullet, \mathcal{E}_\bullet) = 0$ for $n > d + 1$. This yields that the functor $\underleftarrow{l}_{X*}$ has cohomological dimension bounded by $d + 1$ on the category of abelian sheaves. In some special cases, we have better estimates (see 7.3.1.3.d).

Following 4.6.1.6.b, for any $\mathcal{E}_\bullet^\bullet \in K(\mathcal{D}_\bullet)$ (resp. for any $\mathcal{E}_\bullet^\bullet \in K^-(\mathcal{D}_\bullet)$), there exist a complex $\mathcal{I}_\bullet^\bullet \in K(\mathcal{D}_\bullet)$ (resp. $\mathcal{I}_\bullet^\bullet \in K^-(\mathcal{D}_\bullet)$) of $\underleftarrow{l}_{X,*}$-acyclic left $\mathcal{D}_\bullet$-modules and a quasi-isomorphism $\mathcal{E}_\bullet^\bullet \xrightarrow{\sim} \mathcal{I}_\bullet^\bullet$. Following [Sta22, 07K7–Lemma 13.31.2], Moreover, we have the isomorphism $\mathbb{R}\underleftarrow{l}_{X,*}\mathcal{E}_\bullet^\bullet \xrightarrow{\sim} \underleftarrow{l}_{X,*}\mathcal{I}_\bullet^\bullet$.

7.3.1.3. Let $\mathcal{E}_\bullet$ be a left $\mathcal{D}_\bullet$-module.

(a) Put $[\mathcal{E}]_i = \prod_{j\leq i} \mathcal{E}_j$. By composing the transition map $\mathcal{E}_{i+1} \to \mathcal{E}_i$ with the canonical inclusion $\mathcal{E}_i \to [\mathcal{E}]_i$, we get the morphism $d_i : \mathcal{E}_{i+1} \to [\mathcal{E}]_i$. This yields the transition maps $(d_i, id) : [\mathcal{E}]_{i+1} = \mathcal{E}_{i+1} \oplus [\mathcal{E}]_i \to [\mathcal{E}]_i$. We get the $\mathcal{D}_\bullet$-module $[\mathcal{E}]_\bullet$ endowed with the canonical monomorphism of $\mathcal{D}_\bullet$-modules $\mathcal{E}_\bullet \to [\mathcal{E}]_\bullet$. Remark that this is similar to the canonical embedding of $\mathcal{E}_\bullet$ into a flasque sheaf of $X_\bullet$ (see the construction 7.1.2.19.1).

Let $\mathcal{G}_\bullet := [\mathcal{E}]_\bullet/\mathcal{E}_\bullet$. Then the transition maps $\mathcal{G}_{i+1} = \prod_{j\leq i} \mathcal{E}_j \to \prod_{j\leq i-1} \mathcal{E}_j = \mathcal{G}_i$ are the canonical projections. Hence, we get the exact sequence

$$0 \to \mathcal{E}_\bullet \to [\mathcal{E}]_\bullet \to [\mathcal{E}]_\bullet/\mathcal{E}_\bullet \to 0, \tag{7.3.1.3.1}$$

where the transition maps of $[\mathcal{E}]_\bullet$ and $[\mathcal{E}]_\bullet/\mathcal{E}_\bullet$ are surjective in the category of presheaves.

(b) We say that $\mathcal{E}_\bullet$ is "locally Γ-acyclic" if there exists a basis of open sets $\mathfrak{B}$ of $|X|$ such that for any $\mathfrak{U} \in \mathfrak{B}$, $\mathcal{E}_i|_{U_i}$ is $\Gamma(U_i, -)$-acyclic for any $i \in \mathbb{N}$. For instance, if $\mathcal{E}_i$ are quasi-coherent $\mathcal{O}_{X_i}$-modules for any $i \in \mathbb{N}$, then we can choose $\mathfrak{B}$ equal to the affine open sets of $|\mathfrak{X}|$.

(c) We say that $\mathcal{E}_\bullet$ is "ML-flasque" if there exists a basis of open subsets $\mathfrak{B}$ of $|X|$ such that for any $\mathfrak{U} \in \mathfrak{B}$ and for any $i \in \mathbb{N}$ $\mathcal{E}_i|_{U_i}$ is $\Gamma(U_i, -)$-acyclic and the maps $\mathcal{E}_{i+1}(U_{i+1}) \to \mathcal{E}_i(U_i)$ induced by the transition maps are surjective. It follows from Mittag-Leffler criterion and from 7.3.1.2.1 that if $\mathcal{E}_\bullet$ is ML-flasque then it is acyclic for $\underleftarrow{l}_{X*}$. For instance, when $\mathcal{E}_i$ are quasi-coherent $\mathcal{O}_{X_i}$-modules and $\mathcal{E}_{i+1} \to \mathcal{E}_i$ are surjective as sheaves for any $i \in \mathbb{N}$ (e.g. when $\mathcal{E}_\bullet$ is of finite type : see 7.1.3.8), then we can choose $\mathfrak{B}$ equal to the affine opens of $|\mathfrak{X}|$.

(d) Suppose $\mathcal{E}_\bullet$ is locally Γ-acyclic. Hence so are $[\mathcal{E}]_\bullet$ and $[\mathcal{E}]_\bullet/\mathcal{E}_\bullet$, and they are therefore ML-flasque. Hence the exact sequence 7.3.1.3.1 gives a resolution of length 1 of $\mathcal{E}_\bullet$ with ML-flasque $\mathcal{D}_\bullet$-modules. This yields $R^n\underleftarrow{l}_{X*}\mathcal{E}_\bullet = 0$ for any $n \geq 2$.

Lemma 7.3.1.4. *Let $n \in \mathbb{N}$ and $\mathcal{E}^\bullet \in D^-(\mathcal{O}_{X_n})$. The following conditions are equivalent* *(a) The complex $\mathcal{E}^\bullet$ has $\mathcal{O}_{X_n}$-quasi-coherent cohomology.*

(b) The complex $\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} \mathcal{E}^\bullet$ has $\mathcal{O}_{X_0}$-quasi-coherent cohomology.

Proof. Since the converse is obvious, let us check $(b) \to (a)$. We proceed by induction on n. The case $n = 0$ is tautological. Suppose $n \geq 1$ and consider now the distinguished triangle

$$\mathcal{I}^n/\mathcal{I}^{n+1} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} \mathcal{E}^\bullet \to \mathcal{E}^\bullet \to \mathcal{O}_{X_{n-1}} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} \mathcal{E}^\bullet \to +1. \qquad (7.3.1.4.1)$$

By induction hypothesis, the complex $\mathcal{O}_{X_{n-1}} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} \mathcal{E}^\bullet$ has $\mathcal{O}_{X_{n-1}}$-quasi-coherent cohomology, which implies it has $\mathcal{O}_{X_n}$-quasi-coherent cohomology. Since $\mathcal{I}^n/\mathcal{I}^{n+1} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} \mathcal{E}^\bullet \xrightarrow{\sim} \mathcal{I}^n/\mathcal{I}^{n+1} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_0}} (\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} \mathcal{E}^\bullet)$, then similarly we get that the left term of the exact triangle 7.3.1.4.1 has $\mathcal{O}_{X_n}$-quasi-coherent cohomology. □

Definition 7.3.1.5. Let $\mathcal{E}^\bullet \in D^-(\mathcal{O}_{\mathfrak{X}})$ be a complex of $\mathcal{O}_{\mathfrak{X}}$-modules. We say $\mathcal{E}^\bullet$ is $\mathcal{O}_{\mathfrak{X}}$-*quasi-coherent* if the following conditions are satisfied:

(a) The complex $\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\bullet$ has $\mathcal{O}_{X_0}$-quasi-coherent cohomology.

(b) The canonical morphism

$$\mathcal{E}^\bullet \to \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{L}\underleftarrow{l}^*_X \mathcal{E}^\bullet) \qquad (7.3.1.5.1)$$

is an isomorphism.

We denote by $D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ the full subcategory of $D^-(\mathcal{O}_{\mathfrak{X}})$ consisting of quasi-coherent complexes. It follows from the Lemma 7.3.1.4 that if $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ then $\mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_n})$ for any integer $n \in \mathbb{N}$. This yields this notion of quasi-coherence does not depend on the choice of the ideal of definition of $\mathfrak{X}$. Moreover, this is straightforward by definition that $D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ is a triangulated subcategory of $D^-(\mathcal{O}_{\mathfrak{X}})$. Finally, the quasi-coherence is a local notion: 1) a complex $\mathcal{E}^\bullet$ of $D^-(\mathcal{O}_{\mathfrak{X}})$ is quasi-coherent if and only if there exists an covering $(\mathfrak{U}_i)_i$ by open subset of $\mathfrak{X}$ such that $\mathcal{E}^\bullet|_{\mathfrak{U}_i}$ is quasi-coherent for any i ; 2) if $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ then $\mathcal{E}^\bullet|_{\mathfrak{U}} \in D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{U}})$ for any open set $\mathfrak{U}$ of $\mathfrak{X}$.

Definition 7.3.1.6. Let $\mathcal{E}$ be an $\mathcal{O}_{\mathfrak{X}}$-module. We say that $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{X}}$-quasi-coherent if $\mathcal{E} \in D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$.

If $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ then this is false in general that for any $n \in \mathbb{Z}$ the $\mathcal{O}_{\mathfrak{X}}$-modules $H^n(\mathcal{E}^\bullet)$ are quasi-coherent.

The following proposition gives examples of quasi-coherent modules and will be useful to check 8.7.4.2.

Proposition 7.3.1.7. *Let $\mathcal{E}$ be an $\mathcal{O}_{\mathfrak{X}}$-module which is tor-independent with $\mathcal{O}_{X_n}$ for any $n \in \mathbb{N}$ (e.g. when $\mathcal{I} = (p)$ and $\mathcal{E}$ is p-torsion free). Then the following properties are equivalent:*

(a) The module $\mathcal{E}$ is $\mathcal{O}_{\mathfrak{X}}$-quasi-coherent ;

(b) The module $\mathcal{E}$ is pseudo-quasi-coherent (see Definition 7.2.3.5).

Proof. By hypothesis, we have the isomorphism $\mathcal{E}_\bullet := \underleftarrow{l}^*_X \mathcal{E} \xleftarrow{\sim} \mathbb{L}\underleftarrow{l}^*_X \mathcal{E}$. Suppose $\mathcal{E}$ is pseudo-quasi-coherent. Since $\mathcal{E}_\bullet$ is ML-flasque (see definition 7.3.1.3.(c)), then it is acyclic for $\underleftarrow{l}_{X*}$ and we get the canonical isomorphism $\underleftarrow{l}_{X*}(\mathcal{E}_\bullet) \xrightarrow{\sim} \mathbb{R}\underleftarrow{l}_{X*}(\mathcal{E}_\bullet)$. Hence, since the canonical morphism $\mathcal{E} \to \underleftarrow{l}_{X*}(\underleftarrow{l}^*_X \mathcal{E})$ is an isomorphism, then so is

$$\mathcal{E} \to \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{L}\underleftarrow{l}^*_X \mathcal{E}),$$

i.e. $\mathcal{E}$ is quasi-coherent. Conversely, if the morphism $\mathcal{E} \to \mathbb{R}\underleftarrow{l}_{X*}(\mathbb{L}\underleftarrow{l}^*_X \mathcal{E})$ is an isomorphism, then so is $\mathcal{E} \to \underleftarrow{l}_{X*}(\underleftarrow{l}^*_X \mathcal{E})$, and $\mathcal{E}$ is pseudo quasi-coherent.

□

Lemma 7.3.1.8. *Let A be a noetherian commutative ring, I an ideal of A, $A_i = A/I^{i+1}$, M be an A-module of finite type. Then, for any $q \geq 1$, there exists a large enough integer k such that the homomorphisms*

$$\mathrm{tor}^A_q(A_{i+k}, M) \to \mathrm{tor}^A_q(A_i, M)$$

are null for any $i \in \mathbb{N}$.

Proof. Fix $q \geq 1$. Let $L_\bullet$ a resolution of M by free A-modules of finite type, d be its differential. It follows from the Artin-Rees lemma applied to the inclusion $d(L_q) \subset L_{q-1}$ that there exists $k \in \mathbb{N}$ such that for any $i \in \mathbb{N}$ we have the inclusion

$$d(L_q) \cap I^{i+1+k} L_{q-1} \subset I^{i+1} d(L_q) = d(I^{i+1} L_q). \tag{7.3.1.8.1}$$

For such fixed k, it remains to check that the canonical homomorphisms $A_{i+k} \otimes_A L_q \to A_i \otimes_A L_q$ send $Z_q(A_{i+k} \otimes_A L_\bullet)$ to $B_q(A_i \otimes_A L_\bullet)$ for any $i \in \mathbb{N}$. Let $x \in Z_q(A_{i+k} \otimes_A L_\bullet)$. Choose $y \in L_q$ which gives x via the surjection $L_q \to A_{i+k} \otimes_A L_q$. Since $d(y) \in d(L_q) \cap I^{i+1+k} L_{q-1}$, then from 7.3.1.8.1, there exists $z \in I^{i+1} L_q$ such that $d(y) = d(z)$. Since $H^q(L_\bullet) = 0$ (recall $q \geq 1$), then there exists $t \in L_{q+1}$ such that $y = z + d(t)$. We compute $\overline{x} = d(\overline{t})$, where $\overline{x}$ (resp. $\overline{t}$) is the image of x (resp. t) in $A_i \otimes_A L_q$ (resp. $A_i \otimes_A L_{q+1}$). □

Proposition 7.3.1.9. *Let $n \in \mathbb{N}$, and $\mathcal{E}^\bullet \in D^-(\mathcal{O}_{X_n})$. Then $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ if and only if $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_n})$.*

Proof. a) Suppose $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$. Since $\mathcal{E}^\bullet \in D^-(\mathcal{O}_{X_n})$, the canonical morphism $\mathcal{E} \to \mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$ has the canonical retraction $\mathcal{O}_{X_n} \overset{\mathbb{L}}{\otimes}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \to \mathcal{E}$. Hence, $H^i(\mathcal{E})$ is a direct summand of $H^i(\mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E})$.

b) Conversely, suppose $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_n})$. Since $\mathcal{O}_{X_n} \in D^-_{\mathrm{coh}}(\mathcal{O}_{\mathfrak{X}})$, then $\mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{X_n} \in D^-_{\mathrm{coh}}(\mathcal{O}_{X_n})$. Since $\mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\sim} (\mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{O}_{X_n}) \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} \mathcal{E}$, this yields that $\mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_n})$. Hence, $\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E} \xrightarrow{\sim} \mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_n}} (\mathcal{O}_{X_n} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}) \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_0})$. It remains to check that the morphism 7.3.1.5.1 is an isomorphism. Since the fact that the homomorphism 7.3.1.5.1 is an isomorphism is local, we can suppose $\mathfrak{X}$ affine and noetherian and that $\mathcal{E}$ is a quotient of a free $\mathcal{O}_{X_n}$-module Since the functors $\mathbb{R}\underset{\leftarrow}{l}_{X*}$ and $\mathbb{L}\underset{\leftarrow}{l}^*_X$ are way-out left (see 7.3.1.2 for the first one), then we reduce to the case where the complex $\mathcal{E}^\bullet$ is in fact a quasi-coherent $\mathcal{O}_{X_n}$-module (use the left version of [Har66, I.7.1.(ii)]). and then that $\mathcal{E}^\bullet$ is a free $\mathcal{O}_{X_n}$-module (use the left version of [Har66, I.7.1.(iv)]). For any $i \geq n$, the morphism $\mathcal{E} \to \mathcal{O}_{X_i} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$ is an isomorphism. Hence the morphism $\mathcal{E} \to \varprojlim_i \mathcal{O}_{X_i} \otimes_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}$ is an isomorphism. Consider the spectral sequence

$$E_2^{p,q} = R^p \varprojlim_i (\mathcal{T}or_q^{\mathcal{O}_{\mathfrak{X}}}(\mathcal{O}_{X_i}, \mathcal{E})) = R^p \underset{\leftarrow}{l}_{X*}(L^q \underset{\leftarrow}{l}^*_X(\mathcal{E}) \Rightarrow H^n(\mathbb{R}\underset{\leftarrow}{l}_{X*}(\mathbb{L}\underset{\leftarrow}{l}^*_X \mathcal{E})).$$

Since $\underset{\leftarrow}{l}^*_X \mathcal{E}$ is ML-flasque (see definition 7.3.1.3), then $E_2^{p,0} = 0$ for any $p > 0$. Hence, since this implies that $E_2^{p,q} = 0$ for any $q \geq 1$, this is sufficient to check that the projective system $(\mathcal{T}or_q^{\mathcal{O}_{\mathfrak{X}}}(\mathcal{O}_{X_i}, \mathcal{E}))_{i \in \mathbb{N}}$ is essentially null for any $q \geq 1$. By freeness, we reduce to check it to the case where $\mathcal{E} = \mathcal{O}_{X_n}$. Since $\mathcal{T}or_q^{\mathcal{O}_{\mathfrak{X}}}(\mathcal{O}_{X_i}, \mathcal{O}_{X_n})$ are coherent $\mathcal{O}_{X_i}$-modules such that $\Gamma(X_i, \mathcal{T}or_q^{\mathcal{O}_{\mathfrak{X}}}(\mathcal{O}_{X_i}, \mathcal{O}_{X_n})) = \mathrm{tor}_q^A(A_i, A_n)$, where $\mathfrak{X} = \mathrm{Spf}\, A$ and $X_i = \mathrm{Spec}\, A_i$, this follows from Lemma 7.3.1.8. □

Definition 7.3.1.10. Let $\mathcal{E}^\bullet_\bullet \in D^-(\mathcal{O}_{X_\bullet})$ be a complex of $\mathcal{O}_{X_\bullet}$-modules. We say $\mathcal{E}^\bullet_\bullet$ is $\mathcal{O}_{X_\bullet}$-*quasi-coherent* if the following conditions hold:

(a) The complex $\mathcal{E}^\bullet_0$ is in $D^-_{\mathrm{qc}}(\mathcal{O}_{X_0})$.

(b) The canonical morphisms

$$\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_{i+1}}} \mathcal{E}^\bullet_{i+1} \to \mathcal{E}^\bullet_i \tag{7.3.1.10.1}$$

are isomorphisms for all i.

We denote by $D^-_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$ the full subcategory of $D^-(\mathcal{O}_{X_\bullet})$ consisting of quasi-coherent complexes. It follows from 7.3.1.4 that for any $\mathcal{E}^\bullet_\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$ and any $i \in \mathbb{N}$, we have $\mathcal{E}^\bullet_i \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_i})$. Moreover, this is straightforward by definition that $D^-_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$ is a triangulated subcategory of $D^-(\mathcal{O}_{X_\bullet})$. Finally, the quasi-coherence is a local notion: a complex $\mathcal{E}^\bullet$ of $D^-(\mathcal{O}_{X_\bullet})$ is quasi-coherent if and only if there exists an covering $(\mathfrak{U}_i)_i$ by open subset of $\mathfrak{X}$ such that $\mathcal{E}^\bullet|_{\mathfrak{U}_i}$ is quasi-coherent for any i ; if $\mathcal{E}^\bullet \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$ then $\mathcal{E}^\bullet|_{\mathfrak{U}} \in D^-_{\mathrm{qc}}(\mathcal{O}_{U_\bullet})$ for any open set $\mathfrak{U}$ of $\mathfrak{X}$.

Remark 7.3.1.11. Let $\mathcal{E}^\bullet_\bullet \in D^-(\mathcal{O}_{X_\bullet})$. Choose a morphism $\mathcal{P}^\bullet_\bullet \xrightarrow{\sim} \mathcal{E}^\bullet_\bullet$ in $C^-(\mathcal{O}_{X_\bullet})$ which is a quasi-isomorphism and such that $\mathcal{P}^n_\bullet$ are $\mathcal{O}_{X_\bullet}$-flat for any $n \in \mathbb{Z}$. Since $\mathcal{P}^n_i$ are $\mathcal{O}_{X_i}$-flat for any $i \in \mathbb{N}$ and $n \in \mathbb{Z}$, then the fact that the morphisms 7.3.1.10.1 are isomorphisms is equivalent to the fact that the canonical morphisms

$$\mathcal{O}_{X_i} \otimes_{\mathcal{O}_{X_{i+1}}} \mathcal{P}^\bullet_{i+1} \to \mathcal{P}^\bullet_i \tag{7.3.1.11.1}$$

are isomorphisms for all i.

7.3.1.12. Let $* \in \{\mathrm{l}, \mathrm{r}\}$. We denote by $D^-_{\mathrm{qc}}({}^*\mathcal{D})$ (resp. $D^-_{\mathrm{qc}}({}^*\mathcal{D}_\bullet)$) the full subcategory of $D^-({}^*\mathcal{D})$ (resp. $D^-({}^*\mathcal{D}_\bullet)$) consisting of complexes of $\mathcal{O}_{\mathfrak{X}}$-quasi-coherent modules (resp. $\mathcal{O}_\bullet$-quasi-coherent modules) in the sense of 7.3.1.5 (resp. 7.3.1.10). In other words, $D^-_{\mathrm{qc}}({}^*\mathcal{D}) = D^-(\mathcal{D}) \cap D^-_{\mathrm{qc}}(\mathcal{O}_{\mathfrak{X}})$ (resp. $D^-_{\mathrm{qc}}({}^*\mathcal{D}_\bullet) = D^-(\mathcal{D}_\bullet) \cap D^-_{\mathrm{qc}}(\mathcal{O}_{X_\bullet})$). The objects of $D^-_{\mathrm{qc}}({}^*\mathcal{D})$ (resp. $D^-_{\mathrm{qc}}({}^*\mathcal{D}_\bullet)$) are called quasi-coherent complexes of $D^-({}^*\mathcal{D})$ (resp. $D^-({}^*\mathcal{D}_\bullet)$). Moreover, $D^-_{\mathrm{qc}}({}^*\mathcal{D})$ is a triangulated subcategory of $D^-(\mathcal{D})$ and $D^-_{\mathrm{qc}}({}^*\mathcal{D}_\bullet)$ is a triangulated subcategory of $D^-(\mathcal{D}_\bullet)$. The full subcategory of $D^{\mathrm{b}}_{\mathrm{qc}}({}^*\mathcal{D}_\bullet)$ consisting of quasi-coherent complexes of finite tor dimension on $\mathcal{D}_\bullet$ is denoted by $D_{\mathrm{qc,tdf}}({}^*\mathcal{D}_\bullet)$.

Proposition 7.3.1.13. *Let $\mathcal{E}^\bullet_\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}_\bullet)$ be a complex such that the canonical morphisms*

$$\mathcal{D}_i \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1} \to \mathcal{E}^\bullet_i \tag{7.3.1.13.1}$$

are isomorphisms for any i. Then $\mathcal{E}^\bullet_\bullet$ has tor-amplitude in $[a,b]$ over $\mathcal{D}_\bullet$ if and only if $\mathcal{E}^\bullet_0$ has tor-amplitude in $[a,b]$ over $\mathcal{D}_0$.

Proof. From 7.1.3.6, we reduce to check that if $\mathcal{E}^\bullet_0$ has tor-amplitude in $[a,b]$ over $\mathcal{D}_0$ then $\mathcal{E}^\bullet_i$ has tor-amplitude in $[a,b]$ over $\mathcal{D}_i$ for any $i \in \mathbb{N}$. We proceed by induction on $i \in \mathbb{N}$. The case $i = 0$ is obvious. Let us suppose $i \geq 1$ and the property valid for $j < i$. Let $\mathcal{M}$ be a right $\mathcal{D}_i$-module. We have to prove that $H^n(\mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i) = 0$ for any $n \notin [a,b]$. For any $0 \leq j \leq i-1$, if $\mathcal{N}_j$ is a right $\mathcal{D}_j$-module, using the induction hypothesis we get

$$\mathcal{N}_j \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \xrightarrow{\sim} \mathcal{N}_j \otimes^{\mathbb{L}}_{\mathcal{D}_j} \left(\mathcal{D}_j \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i\right) \xrightarrow{\sim} \mathcal{N}_j \otimes^{\mathbb{L}}_{\mathcal{D}_j} \mathcal{E}^\bullet_j \in D^{[a,b]}(\mathcal{D}_i).$$

We have the exact sequence $0 \to \mathcal{M}\mathcal{I}^i \to \mathcal{M} \to \mathcal{M}/\mathcal{M}\mathcal{I}^i \to 0$, which yields the exact triangle

$$\mathcal{M}\mathcal{I}^i \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to \mathcal{M} \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to \mathcal{M}/\mathcal{M}\mathcal{I}^i \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to +1.$$

Since $\mathcal{M}/\mathcal{M}\mathcal{I}^i$ is a right $\mathcal{D}_{i-1}$-module and $\mathcal{M}\mathcal{I}^i$ is a right $\mathcal{D}_0$-module, we are done. □

7.3.1.14. Suppose that $\mathcal{D}_\bullet$ satisfied the condition 7.3.1.10.b for the left structure. For any $\mathcal{E}^\bullet_\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}_\bullet)$, the canonical homomorphisms

$$\mathcal{O}_{X_i} \otimes^{\mathbb{L}}_{\mathcal{O}_{X_{i+1}}} \mathcal{E}^\bullet_{i+1} \to \mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1} \tag{7.3.1.14.1}$$

are then isomorphisms for all $i \in \mathbb{N}$. Hence, $\mathcal{E}^\bullet_\bullet$ satisfies the isomorphisms 7.3.1.13.1 if and only if it satisfies the condition 7.3.1.10.b. Finally, choose a morphism $\mathcal{P}^\bullet_\bullet \xrightarrow{\sim} \mathcal{E}^\bullet_\bullet$ in $C^-({}^{\mathrm{l}}\mathcal{D}_\bullet)$ which is a quasi-isomorphism and such that $\mathcal{P}^n_\bullet$ are $\mathcal{D}_{X_\bullet}$-flat for any $n \in \mathbb{Z}$. Since $\mathcal{P}^n_i$ are $\mathcal{D}_i$-flat for any $i \in \mathbb{N}$ and $n \in \mathbb{Z}$, then the fact that the morphisms 7.3.1.13.1 are isomorphisms is equivalent to the fact that the canonical morphisms

$$\mathcal{D}_i \otimes_{\mathcal{D}_{i+1}} \mathcal{P}^\bullet_{i+1} \to \mathcal{P}^\bullet_i \tag{7.3.1.14.2}$$

are isomorphisms for all i. We have similar results for right $\mathcal{D}_\bullet$-modules.

Proposition 7.3.1.15. *Suppose $\mathcal{D}$ is left coherent. Let $\mathcal{E}^\bullet_\bullet$ be a complex of $D^-({}^{\mathrm{l}}\mathcal{D}_\bullet)$. Then $\mathcal{E}^\bullet_\bullet$ is an object of $D^-_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$ (resp. $D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$) if and only if the following conditions hold.*

(a) The complex $\mathcal{E}^\bullet_0$ is in $D^-_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}_0)$ (resp. $D_{\mathrm{perf}}({}^{\mathrm{l}}\mathcal{D}_0)$).

(b) $\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}_{i+1}} \mathcal{E}^\bullet_{i+1} \to \mathcal{E}^\bullet_i$ are isomorphisms for all i.

Proof. By using 7.1.3.12 and 7.3.1.13, we reduce to check the non-respective case. Suppose $\mathcal{E}^\bullet_\bullet$ satisfies both conditions (a) and (b). From 7.1.3.13, it remains to check that for any $i \in \mathbb{N}$, $\mathcal{E}^\bullet_i \in D_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}_i)$. The case $i = 0$ is obvious. Let us suppose $i \geq 1$ and the property valid for $j < i$. We have the exact sequence of $\mathcal{D}_i$-bimodules $0 \to \mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \to \mathcal{D}_i \to \mathcal{D}_{i-1} \to 0$, which yields the exact triangle of left $\mathcal{D}_i$-modules

$$\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \to \mathcal{E}^\bullet_i \to \mathcal{E}^\bullet_{i-1} \to +1. \tag{7.3.1.15.1}$$

By induction hypothesis, $\mathcal{E}^\bullet_{i-1} \in D_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}_{i-1})$ and then $\mathcal{E}^\bullet_{i-1} \subset D_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}_i)$ (use 4.1.3.2 and 4.6.1.7). Since

$$\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i \xrightarrow{\sim} \mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_0} \left(\mathcal{D}_0 \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathcal{E}^\bullet_i\right) \xrightarrow{\sim} \mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_0} \mathcal{E}^\bullet_0, \tag{7.3.1.15.2}$$

then we reduce to check that $\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D} \otimes^{\mathbb{L}}_{\mathcal{D}_0} \mathcal{E}_0^\bullet \in D_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}_0)$. By devissage, we can suppose that $\mathcal{E}_0^\bullet$ is a coherent $\mathcal{D}_0$-module denoted by $\mathcal{E}_0$. We have to check $tor_n^{\mathcal{D}_0}(\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}, \mathcal{E}_0)$ is a coherent $\mathcal{D}_0$-module for any integer n. Since this is local we can suppose there exist a resolution $\mathcal{P}_0^\bullet$ of $\mathcal{E}_0$ such that for any $l \geq -n-1$, $\mathcal{P}_0^{\mathrm{l}}$ is a finite free $\mathcal{D}_0$-module. Hence $\mathrm{tor}_n^{\mathcal{D}_0}(\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D}, \mathcal{E}_0) \xrightarrow{\sim} \operatorname{Ker}\beta/\operatorname{Im}\alpha$, where α and β are $\mathcal{D}_0$-linear (for the left structure) morphisms of the form:

$$(\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D})^r \xrightarrow{\alpha} (\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D})^s \xrightarrow{\beta} (\mathcal{I}^i\mathcal{D}/\mathcal{I}^{i+1}\mathcal{D})^t.$$

Hence, we are done. □

Proposition 7.3.1.16. *If $\mathcal{D}$ (resp. $\mathcal{D}_\bullet$) is left quasi-coherent i.e. satisfies the conditions of 7.3.1.5 (resp. 7.3.1.10 for the left structure of $\mathcal{O}_{\mathfrak{X}}$-module (resp. $\mathcal{O}_{X_\bullet}$-module), then the category $D^-_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D})$ (resp. $D^-_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$) is a triangulated subcategory $D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D})$ (resp. $D^-_{\mathrm{qc}}({}^{\mathrm{l}}\mathcal{D}_\bullet)$).*

Proof. First suppose $\mathcal{D}$ is left quasi-coherent. Let $\mathcal{E}^\bullet \in D^-_{\mathrm{coh}}({}^{\mathrm{l}}\mathcal{D})$. Let $n \in \mathbb{Z}$. Since the fact that $H^n(\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\bullet)$ is $\mathcal{O}_{X_0}$-quasi-coherent is local, we can suppose there exists a bounded complex of free $\mathcal{D}$-modules of finite type $\mathcal{L}^\bullet$ and a morphism $\mathcal{L}^\bullet \to \mathcal{E}^\bullet$ of $C^-({}^{\mathrm{l}}\mathcal{D})$ which is an $n-1$-isomorphism in $D^-({}^{\mathrm{l}}\mathcal{D})$, i.e. whose cone is acyclic in degree $\geq n-1$. This implies that the canonical morphism $H^n(\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{L}^\bullet) \to H^n(\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{E}^\bullet)$ is an isomorphism. Using the first property of quasi-coherence (see 7.3.1.5.a), we get $\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{L}^m \in D^-_{\mathrm{qc}}(\mathcal{O}_{X_0})$. By using some spectral sequence this yields the $\mathcal{O}_{X_0}$-quasi-coherence of $H^n(\mathcal{O}_{X_0} \otimes^{\mathbb{L}}_{\mathcal{O}_{\mathfrak{X}}} \mathcal{L}^\bullet)$. It remains to check that the canonical morphism

$$\mathcal{E}^\bullet \to \mathbb{R}\underset{\leftarrow}{l}_{X*}(\mathbb{L}\underset{\leftarrow}{l}^*_X \mathcal{E}^\bullet) \tag{7.3.1.16.1}$$

is an isomorphism. Since this is local, since these functors are way-out left (see 7.3.1.2 for the functor $\mathbb{R}\underset{\leftarrow}{l}_{X*}$), we reduce to the case where $\mathcal{E}^\bullet$ is a free left $\mathcal{D}$-module of finite type (use a "local left" version of [Har66, I.7.1.(iv)] i.e. replacing way-out right by way-out left and replacing the existence of an injection by the local existence of a surjection), which follows from the quasi-coherence of $\mathcal{D}$. Hence, we are done.

Let us now treat the respective case, i.e. suppose $\mathcal{D}_\bullet$ is left quasi-coherent. This is a consequence of 7.3.1.15 and 7.3.1.14. □

The non-respective cases of the following lemma 7.3.1.17 and proposition 7.3.1.18 is an erratum of [BO78, B.2.1] given to the author by Berthelot.

Lemma 7.3.1.17. *Suppose $\mathfrak{X}$ affine and set $D_i := \Gamma(\mathfrak{X}, \mathcal{D}_i)$ for any $i \in \mathbb{N}$. Let $E_\bullet^\bullet \in C^-({}^{\mathrm{l}}D_\bullet)$ such that the transition map $E_{i+1}^\bullet \to E_i^\bullet$ is an epimorphism of $C^-({}^{\mathrm{l}}D_i)$ for all $i \in \mathbb{N}$ (resp. such that $E_i^\bullet \in C^-_{\mathrm{coh}}({}^{\mathrm{l}}D_i)$ and the transition map $E_{i+1}^\bullet \to E_i^\bullet$ is an epimorphism of $C^-({}^{\mathrm{l}}D_i)$, for all $i \in \mathbb{N}$). Then there exists $F_\bullet^\bullet \in C^-(D_\bullet)$ such that each F_i^n is a free (resp. free of finite type) left D_i-module, the transition map $F_i^\bullet \to F_{i-1}^\bullet$ is an epimorphism of $C^-({}^{\mathrm{l}}D_i)$ for all $i \geq 1$ and there exists an epimorphism (resp. a morphism) $F_\bullet^\bullet \to E_\bullet^\bullet$ of $C^-(D_\bullet)$ which is a quasi-isomorphism.*

Proof. 0) It is standard (e.g. see the dual version of the proof of [Har66, I.4.6.1.(i)], or [Sta22, 0EWZ-15.62.19] or [Sta22, 066E-15.62.18] in the respective case) to find a $F_0^\bullet \in C^-(D_0)$ consisting of free left D_0-modules (resp. free left D_0-modules of finite type) and an epimorphism (resp. morphism) $F_0^\bullet \to E_0^\bullet$ of $C^-(D_0)$ which is moreover a quasi-isomorphism.

We prove the Lemma by constructing inductively on $i \geq 1$ a complex a) $F_i^\bullet \in C^-(D_i)$ consisting of free left D_i-modules (resp. free left D_i-modules of finite type), b) an epimorphism (resp. a morphism) $F_i^\bullet \to E_i^\bullet$ of $C^-(D_i)$ which is also a quasi-isomorphism and c) an epimorphism $F_i^\bullet \to F_{i-1}^\bullet$ of $C^-(D_i)$ making commutative the diagram of $C^-(D_{i-1})$

$$\begin{array}{ccc} F_i^\bullet & \longrightarrow & E_i^\bullet \\ \downarrow & & \downarrow \\ F_{i-1}^\bullet & \longrightarrow & E_{i-1}^\bullet. \end{array} \tag{7.3.1.17.1}$$

Let $i \geq 1$ and suppose constructed such a $F_j^\bullet$, $F_j^\bullet \to E_j^\bullet$, $F_j^\bullet \to F_{j-1}^\bullet$ for any $j \leq i-1$ (when $j = 0$, we forget the second map).

1) i) Let us focus in the non-respective case. As above, let $P_i^\bullet \in C^-(D_i)$ be a complex consisting of free left D_i-modules and an epimorphism $a\colon P_i^\bullet \to E_i^\bullet$ of $C^-(D_i)$ which is moreover a quasi-isomorphism.

Since P_i^n are projective for any $n \in \mathbb{Z}$, since our complexes are bounded above, since $F_{i-1}^\bullet \to E_{i-1}^\bullet$ is an epimorphism of $C^-(D_i)$, then following [Sta22, 0649-Lemma 13.19.6] there exists a morphism $b\colon P_i^\bullet \to F_{i-1}^\bullet$ of $C^-(D_i)$ making commutative in $C^-(D_i)$ the diagram

$$\begin{array}{ccc} P_i^\bullet & \xrightarrow{a} & E_i^\bullet \\ {\scriptstyle b}\downarrow & & \downarrow \\ F_{i-1}^\bullet & \longrightarrow & E_{i-1}^\bullet . \end{array} \tag{7.3.1.17.2}$$

ii) In the respective case, since $C^-(D_i)$ is an abelian category, we can consider the complex $R_i^\bullet := F_{i-1}^\bullet \times_{E_{i-1}^\bullet} E_i^\bullet$ of $C^-(D_i)$ (we do not write the forgetful functor $C^-(D_{i-1}) \to C^-(D_i)$). Let $\alpha\colon R_i^\bullet \to E_i^\bullet$ an $\beta\colon R_i^\bullet \to F_{i-1}^\bullet$ be the structural morphisms of $C^-(D_i)$. Since $E_i^\bullet \to E_{i-1}^\bullet$ is an epimorphism of $C^-(D_i)$, then this is well known (e.g., using the five lemma, consider the morphism of long exact sequences induced by the morphism of exact sequences of $C^-(D_i)$ constructed from the morphism of epimorphisms given by $(R_i^\bullet \to F_{i-1}^\bullet) \to (E_i^\bullet \to E_{i-1}^\bullet))$ that α is a quasi-isomorphism. Since $R_i^\bullet \in D^-_{\mathrm{coh}}(D_i)$, then we can choose $P_i^\bullet \in C^-(D_i)$ a complex consisting of free left D_i-modules of finite type endowed with a quasi-isomorphism $\gamma\colon P_i^\bullet \to R_i^\bullet$ of $C^-(D_i)$. Then by setting $a := \alpha \circ \gamma$ and $b := \beta \circ \gamma$, we get a commutative diagram such as 7.3.1.17.2 whose horizontal morphisms are quasi-isomorphisms.

2) We add an acyclic complex to $P_i^\bullet$ to construct $F_i^\bullet$ so that $F_i^\bullet \to F_{i-1}^\bullet$ is an epimorphism as follows.

First, let $K_{i-1}^\bullet$ be the mapping cone of the identity of $F_{i-1}^\bullet$ and $\psi\colon K_{i-1}^\bullet \to F_{i-1}^\bullet[1]$ be the canonical epimorphism of $C(D_{i-1})$. Since $K_{i-1}^\bullet$ is an acyclic complex of projective left D_{i-1}-modules and is bounded above, then by descending induction on the degree n we can check that each K_{i-1}^n is a direct sum (in the category of D_{i-1}-modules) of the form $Q_{i-1}^{n-1} \oplus Q_{i-1}^n$ and the boundary map of $K_{i-1}^n \to K_{i-1}^{n+1}$ are the maps given by the formula $d^n(q^{n-1}, q^n) = (q^n, 0)$. Now, choose for any integer n a free left D_i-module (resp. a free left D_i-module of finite type) Q_i^n such that Q_{i-1}^n is a quotient of Q_i^n (in the category of left D_i-modules) and take $K_i^n := Q_i^{n-1} \oplus Q_i^n$ with boundary maps given as above by the formula $d^n(q^{n-1}, q^n) = (q^n, 0)$. We observe that $K_i^\bullet$ is an acyclic complex of free D_i-modules (resp. free D_i-modules of finite type), still bounded above, and endowed with an epimorphism $\psi'\colon K_i^\bullet \to K_{i-1}^\bullet$ of $C(D_i)$. Now set $F_i^\bullet := P_i^\bullet \oplus K_i^\bullet[-1]$ and $\delta := (b, \psi \circ \psi'[-1])\colon F_i^\bullet \to F_{i-1}^\bullet$. Since ψ and ψ' are surjective, then so is δ.

3) We construct now the quasi-isomorphism $F_i^\bullet \to E_i^\bullet$ making commutative the diagram 7.3.1.17.1 in the next two steps.

i) We remark that, for any $G \in C(D_i)$, the map

$$\prod_n \mathrm{Hom}_{D_i}(Q_i^n, G^n) \to \mathrm{Hom}_{C(D_i)}(K_i^\bullet, G^\bullet)$$

given by $h^\bullet \mapsto \{(d_G^{n-1} \circ h^{n-1}, h^n)\colon Q_i^{n-1} \oplus Q_i^n \to G^n \ ; \ n \in \mathbb{Z}\}$ is a bijection.

ii) Since K_i^n are projective for any $n \in \mathbb{Z}$, since our complexes are bounded above, since $E_i^\bullet \to E_{i-1}^\bullet$ is surjective, then following [Sta22, 0649-Lemma 13.19.6] we can find a morphism of complexes $\phi\colon K_i^\bullet[-1] \to E_i^\bullet$ of $C^-(D_i)$ making commutative in $C^-(D_i)$ the diagram

$$\begin{array}{ccc} K_i^\bullet[-1] & \xrightarrow{\phi} & E_i^\bullet \\ {\scriptstyle \psi \circ \psi'[-1]}\downarrow & & \downarrow \\ F_{i-1}^\bullet & \longrightarrow & E_{i-1}^\bullet . \end{array}$$

Hence, we get the morphism $c := (a, \phi)\colon F_i^\bullet \to E_i^\bullet$ making commutative the diagram 7.3.1.17.1 . Finally, since a is a quasi-isomorphism and $K_i^\bullet[-1]$ is acyclic, then c is also a quasi-isomorphism.

□

Proposition 7.3.1.18. *Suppose $\mathfrak{X}$ affine and set $D_i := \Gamma(\mathfrak{X}, D_i)$ for any $i \in \mathbb{N}$. Let $E_\bullet^\bullet \in D^-({}^lD_\bullet)$ (resp. let $E_\bullet^\bullet \in D^-_{\mathrm{coh}}({}^lD_\bullet)$). Then there exists $F_\bullet^\bullet \in D^-(D_\bullet)$, such that each F_i^n is a free (resp. free of finite type) left D_i-module and each map $F_i^n \to F_{i-1}^n$ is surjective, and an isomorphism of $D^-(D_\bullet)$ of the form $E_\bullet^\bullet \xrightarrow{\sim} F_\bullet^\bullet$.*

Proof. By using ML-flasque resolution (of length 1) of 7.3.1.3.1, for each $E_n^\bullet$ and then taking the total complex, we get a morphism in $C^-({}^lD_\bullet)$ of the form $E_\bullet^\bullet \to G_\bullet^\bullet$ which is a quasi-isomorphism and $G_\bullet^\bullet$ is a complex satisfying the condition of Lemma 7.3.1.17. Hence, we are done.

□

Remark 7.3.1.19. Suppose $\mathfrak{X}$ affine. Then the functors $\Gamma(\mathfrak{X}, -)$ and $\mathcal{D}_\bullet \otimes_{D_\bullet} -$ are exact canonically quasi-inverse equivalences of categories between $C^-({}^lD_\bullet)$ and the full subcategory of $C^-({}^l\mathcal{D}_\bullet)$ consisting of complexes $\mathcal{E}_\bullet^\bullet$ such that, for all $n \in \mathbb{Z}$ and $i \in \mathbb{N}$, $\mathcal{E}_i^n$ is $\mathcal{O}_{X_i}$-quasi-coherent. Via these equivalences, we can get a sheafified version of 7.3.1.17 and 7.3.1.18.

Lemma 7.3.1.20. *Let $\mathcal{E}_\bullet^\bullet \in C^-({}^l\mathcal{D}_\bullet)$ be a complex such that $\mathcal{E}_\bullet^n$ is $\mathcal{D}_\bullet$-flat, $\mathcal{E}_i^n$ is a quasi-coherent $\mathcal{O}_{X_i}$-module and the transition maps $\mathcal{E}_i^n \to \mathcal{E}_{i-1}^n$ are surjective for any $n \in \mathbb{Z}$ and $i \in \mathbb{N}$.*

(a) The complex $\underleftarrow{l}_{X*}(\mathcal{E}_\bullet^\bullet)$ consists of flat left $\mathcal{D}$-modules.

(b) For any coherent right $\mathcal{D}$-module $\mathcal{M}$, the natural map of $C^-({}^l\mathcal{D})$:

$$\mathcal{M} \otimes_{\mathcal{D}} \underleftarrow{l}_{X*}(\mathcal{E}_\bullet^\bullet) \to \underleftarrow{l}_{X*}(\underleftarrow{l}_X^{-1}(\mathcal{M}) \otimes_{\underleftarrow{l}_X^{-1}(\mathcal{D})} \mathcal{E}_\bullet^\bullet)$$

is an isomorphism.

Proof. 0) We can suppose $\mathcal{E}_\bullet$ is a flat left $\mathcal{D}_\bullet$-module such that $\mathcal{E}_i$ is a quasi-coherent $\mathcal{O}_{X_i}$-module and the transition maps $\mathcal{E}_i \to \mathcal{E}_{i-1}$ are surjective for any $i \in \mathbb{N}$. Since the lemma is local, we can suppose $\mathfrak{X}$ is affine. Set $D_\bullet := \Gamma(\mathfrak{X}, \mathcal{D}_\bullet)$ and $D := \Gamma(\mathfrak{X}, \mathcal{D})$, $E_\bullet := \Gamma(\mathfrak{X}, \mathcal{E}_\bullet)$ and $M := \Gamma(\mathfrak{X}, \mathcal{M})$. Since the functor $\Gamma(\mathfrak{X}, -)$ commutes with inverse limits, we reduce to check that the left D-module $\underleftarrow{l}_*(E_\bullet)$ is flat and that the natural map

$$M \otimes_D \underleftarrow{l}_*(E_\bullet) \to \underleftarrow{l}_*(M \otimes_D E_\bullet), \qquad (7.3.1.20.1)$$

where by abuse of notation we removed to indicate the functor $\underleftarrow{l}^{-1}$, is an isomorphism. Since the map 7.3.1.20.1 is an isomorphism when M is free of finite type, then by using the five lemma and the right exactness of the functor $M \mapsto M \otimes_D \underleftarrow{l}_*(E_\bullet)$, it is sufficient to prove that $F\colon M \mapsto \underleftarrow{l}_*(M \otimes_D E_\bullet)$ is exact on the category of right D-modules.

1) We prove that the inverse system $\mathrm{tor}_1^D(M, E_\bullet)$ is essentially zero. Fix $i \in \mathbb{N}$.

i) Since E_i is D_i-flat, then $\mathrm{tor}_1^D(M, E_i) \xrightarrow{\sim} \mathrm{tor}_1^D(M, D_i) \otimes_{D_i} E_i$. Hence, it suffices to prove that the right $D_\bullet$-module $T_\bullet(M) := \mathrm{tor}_1^D(M, D_\bullet)$ is a an essentially zero system. By using the exact sequence of D-bimodules $0 \to I^{i+1}D \to D \to D_i \to 0$, we get the inclusion of right D-modules $T_i(M) \subset M \otimes_D I^{i+1}D$. By applying Artin-Rees with respect to the I-adic topology for this inclusion we can find an integer ν such that

$$T_i(M) \cap ((M \otimes_D I^{i+1}D)I^{m+\nu}) \subset T_i(M)I^m, \text{ for all } m \in \mathbb{N}.$$

Since $T_i(M)$ is a right D_i-module, then $T_i(M)I^{i+1} = 0$. This yields $T_i(M) \cap ((M \otimes_D I^{i+1}D)I^{m+\nu}) = 0$ for $m \rangle i + \nu$.

ii) By using the commutative diagram of D-bimodules,

$$\begin{array}{ccccccccc} 0 & \longrightarrow & I^{i+j+1}D & \longrightarrow & D & \longrightarrow & D_{i+j} & \longrightarrow & 0 \\ & & \downarrow & & \| & & \downarrow & & \\ 0 & \longrightarrow & I^{i+1}D & \longrightarrow & D & \longrightarrow & D_i & \longrightarrow & 0 \end{array}$$

whose horizontal sequences are exact, we get the commutative square

$$\begin{array}{ccc} T_{i+j}(M) & \longrightarrow & M \otimes_D I^{i+j+1}D \\ \downarrow & & \downarrow \\ T_i(M) & \longrightarrow & M \otimes_D I^{i+1}D. \end{array}$$

Hence, from the part 1.i) of the proof, the image $T_{i+j}(M) \to T_i(M)$ is zero for $j > i + \nu$.

2) Let $0 \to M' \to M \to M'' \to 0$ be an exact sequence of right D-modules. Let $S_\bullet$ be the image of $\mathrm{tor}_1^D(M'', E_\bullet) \to M' \otimes_D E_\bullet$ and $R_\bullet$ be the image of $M' \otimes_D E_\bullet \to M \otimes_D E_\bullet$. We get the exact sequence

$0 \to S_\bullet \to M' \otimes_D E_\bullet \to R_\bullet \to 0$ where $S_\bullet$ is essentially zero. Hence, $\underset{\leftarrow *}{l}(M' \otimes_D E_\bullet) \to \underset{\leftarrow *}{l}(R_\bullet)$ is an isomorphism. From the exact sequence, $0 \to R_\bullet \to M \otimes_D E_\bullet \to M'' \otimes_D E_\bullet \to 0$, since $R_\bullet$ is flasque, then using again Mittag-Leffler condition we get the exact sequence $0 \to \underset{\leftarrow *}{l}(R_\bullet) \to \underset{\leftarrow *}{l}(M \otimes_D E_\bullet) \to \underset{\leftarrow *}{l}(M'' \otimes_D E_\bullet) \to 0$. Hence, we are done. □

Notation 7.3.1.21. Let $i \in \mathbb{N}$. Let $v_i \colon \mathbb{N}_{\geq i} \to \mathbb{N}$ be the inclusion. Then, with notation 7.1.2.4.1, we get the topoi morphism $v_{i,X} \colon \mathrm{Top}(X)_{\mathbb{N}_{\geq i}} \to \mathrm{Top}(X)_{\mathbb{N}}$. This yields the ringed topoi morphisms $v_{i,X} \colon (\mathrm{Top}(X)_{\mathbb{N}_{\geq i}}, v_{i,X}^{-1}\mathcal{D}_\bullet) \to (\mathrm{Top}(X)_{\mathbb{N}}, \mathcal{D}_\bullet)$ and $\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l} \colon (\mathrm{Top}(X)_{\mathbb{N}_{\geq i}}, v_{i,X}^{-1}\mathcal{D}_\bullet) \to (\mathrm{Top}(X), \mathcal{D})$ (see notation 7.1.2.5). We have moreover the isomorphism $\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l} \circ v_{i,X}^{-1} \xrightarrow{\sim} \underset{\leftarrow X,\mathbb{N}*}{l}$. For any $\mathcal{E}_\bullet^\bullet \in D({}^{\mathrm{l}}\mathcal{D}_\bullet)$, this yields the isomorphism

$$\mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l} \circ v_{i,X}^{-1}(\mathcal{E}_\bullet^\bullet) \xrightarrow{\sim} \mathbb{R}\underset{\leftarrow X,\mathbb{N}*}{l}(\mathcal{E}_\bullet^\bullet). \tag{7.3.1.21.1}$$

7.3.1.22. Let $i \in \mathbb{N}$ and keep notation of 7.3.1.21. Recall that $\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i)$ is the inverse system of sheaves of rings whose transition maps are the identity of $\mathcal{D}_i$. By using the projection formula of 4.6.5.8 in the case of the ringed topoi morphism $\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l} \colon (\mathrm{Top}(X)_{\mathbb{N}_{\geq i}}, \underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i)) \to (\mathrm{Top}(X), \mathcal{D})$, for any $\mathcal{M}_i^\bullet \in D^-({}^{\mathrm{r}}\mathcal{D}_i)$ and $\mathcal{E}_\bullet^\bullet \in D^-({}^{\mathrm{l}}\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i))$, we get the projection morphism

$$\mathcal{M}_i^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}(\mathcal{E}_\bullet^\bullet) \to \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}\left(\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{M}_i^\bullet) \otimes^{\mathbb{L}}_{\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i)} \mathcal{E}_\bullet^\bullet\right). \tag{7.3.1.22.1}$$

The morphism 7.3.1.22.1 is an isomorphism when $\mathcal{M}_i^\bullet \in D^-_{\mathrm{coh}}({}^{\mathrm{r}}\mathcal{D}_i)$. Indeed, even if this is not contained in 4.6.5.8, this can be checked as follow. Since the functor $\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}$ has bounded cohomological dimension (this is checked similarly to 7.3.1.2), then both functors $\mathcal{M}^\bullet \mapsto \mathcal{M}_i^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}_i} \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}(\mathcal{E}_\bullet^\bullet)$ and $\mathcal{M}^\bullet \mapsto \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}\left(\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{M}_i^\bullet) \otimes^{\mathbb{L}}_{\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i)} \mathcal{E}_\bullet^\bullet\right)$ are way-out left. Then it follows from lemma [Har66, I.7.1.(ii) and (iv)] that we can reduce to the case where $\mathcal{M}^\bullet$ is a free $\mathcal{D}$-module of finite type. Since this latter case is obvious, we are done.

The following proposition 7.3.1.23 is a sheafified version of [BO78, B.2.3].

Proposition 7.3.1.23. *Let $i \in \mathbb{N}$, $\mathcal{M}_i^\bullet \in D^-({}^{\mathrm{r}}\mathcal{D}_i)$ and $\mathcal{E}_\bullet^\bullet \in D^-({}^{\mathrm{l}}\mathcal{D}_\bullet)$ such that, for all $n \in \mathbb{Z}$ and $j \in \mathbb{N}$, $\mathcal{E}_j^n$ is $\mathcal{O}_{X_j}$-quasi-coherent. With notation 7.3.1.21, there exists a natural map*

$$\mathcal{M}_i^\bullet \otimes^{\mathbb{L}}_{\mathcal{D}} \mathbb{R}\underset{\leftarrow X*}{l}(\mathcal{E}_\bullet^\bullet) \to \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}\left(\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{M}_i^\bullet) \otimes^{\mathbb{L}}_{v_{i,X}^{-1}\mathcal{D}_\bullet} v_{i,X}^{-1}\mathcal{E}_\bullet^\bullet\right), \tag{7.3.1.23.1}$$

which is an isomorphism when $\mathcal{M}_i^\bullet$ has coherent cohomology.

Proof. I) First suppose $\mathcal{M}_i^\bullet = \mathcal{D}_i$.

1) Let us construct the morphism 7.3.1.23.1. By choosing a resolution of $\mathcal{E}_\bullet^\bullet$ by flat left $\mathcal{D}_\bullet$-modules, we get the morphism $v_{i,X}^{-1}\mathcal{E}_\bullet^\bullet \to \underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i) \otimes_{v_{i,X}^{-1}\mathcal{D}_\bullet} v_{i,X}^{-1}\mathcal{E}_\bullet^\bullet$ of $D^-({}^{\mathrm{l}}v_{i,X}^{-1}\mathcal{D}_\bullet)$. This yields the morphism

$$\mathbb{R}\underset{\leftarrow X*}{l}(\mathcal{E}_\bullet^\bullet) \underset{7.3.1.21.1}{\xrightarrow{\sim}} \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l} v_{i,X}^{-1}(\mathcal{E}_\bullet^\bullet) \to \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}(\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i) \otimes^{\mathbb{L}}_{v_{i,X}^{-1}\mathcal{D}_\bullet} v_{i,X}^{-1}\mathcal{E}_\bullet^\bullet) \tag{7.3.1.23.2}$$

of $D^-({}^{\mathrm{l}}\mathcal{D})$. In fact, since $\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i) \otimes^{\mathbb{L}}_{v_{i,X}^{-1}\mathcal{D}_\bullet} v_{i,X}^{-1}\mathcal{E}_\bullet^\bullet$ is an object of $D^-({}^{\mathrm{l}}\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i))$ then the right term of 7.3.1.23.2 is an object of $D^-({}^{\mathrm{l}}\mathcal{D}_i)$. Hence, we get by extension via the ring homomorphism $\mathcal{D} \to \mathcal{D}_i$ the desired morphism

$$\mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathbb{R}\underset{\leftarrow X*}{l}(\mathcal{E}_\bullet^\bullet) \to \mathbb{R}\underset{\leftarrow X,\mathbb{N}_{\geq i}*}{l}\left(\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i) \otimes^{\mathbb{L}}_{v_{i,X}^{-1}\mathcal{D}_\bullet} v_{i,X}^{-1}\mathcal{E}_\bullet^\bullet\right). \tag{7.3.1.23.3}$$

Recall, the map 7.3.1.23.3 is constructed from 7.3.1.23.2 by solving $\mathbb{R}\underset{\leftarrow X*}{l}(\mathcal{E}_\bullet^\bullet)$ with flat left $\mathcal{D}$-modules.

2) Let us check 7.3.1.23.3 is an isomorphism. Since this is local, we can suppose $\mathfrak{X}$ is affine. Following 7.3.1.18 (and the remark 7.3.1.19), we can therefore suppose $\mathcal{E}_\bullet^\bullet$ is such that each $\mathcal{E}_i^n$ is a free left $\mathcal{D}_i$-module and each map $\mathcal{E}_i^n \to \mathcal{E}_{i-1}^n$ is surjective. By flatness of $\mathcal{E}_\bullet^\bullet$, we get $\underset{\leftarrow X,\mathbb{N}_{\geq i}}{l}^{-1}(\mathcal{D}_i) \otimes^{\mathbb{L}}_{v_{i,X}^{-1}\mathcal{D}_\bullet} v_{i,X}^{-1}\mathcal{E}_\bullet^\bullet =$

$\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet$. Moreover, since for any $n \in \mathbb{Z}$ the complexes $\mathcal{E}^n_\bullet$ and $\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet$ are complexes of quasi-coherent modules with surjective transitive maps, then the morphism 7.3.1.23.2 is the canonical morphism $\underset{\leftarrow}{l}_{X*}(\mathcal{E}^\bullet_\bullet) \to \underset{\leftarrow}{l}_{X,\mathbb{N}_{\geq i}*}(\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet)$. It follows from 7.3.1.20.a that the complex $\underset{\leftarrow}{l}_{X*}(\mathcal{E}^\bullet_\bullet)$ consist of flat $\mathcal{D}$-modules and then the morphism 7.3.1.23.3 is the natural morphism $\mathcal{D}_i\otimes_{\mathcal{D}}\underset{\leftarrow}{l}_{X*}(\mathcal{E}^\bullet_\bullet) \to \underset{\leftarrow}{l}_{X,\mathbb{N}_{\geq i}*}(\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet)$. Since $\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes_{\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D})} v^{-1}_{i,X}\mathcal{D}_\bullet \xrightarrow{\sim} \underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)$, then the morphism 7.3.1.23.3 corresponds to the natural map

$$\begin{aligned}
&\mathcal{D}_i \otimes_{\mathcal{D}} \underset{\leftarrow}{l}_{X*}(\mathcal{E}^\bullet_\bullet) \to \underset{\leftarrow}{l}_{X,\mathbb{N}_{\geq i}*}(\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes_{\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D})} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet)\\
&\xrightarrow{\sim} \underset{\leftarrow}{l}_{X,\mathbb{N}_{\geq i}*} v^{-1}_{i,X}(\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}}(\mathcal{D}_i)\otimes_{\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}}(\mathcal{D})} \mathcal{E}^\bullet_\bullet) \xrightarrow{\sim} \underset{\leftarrow}{l}_{X,\mathbb{N}*}(\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}}(\mathcal{D}_i)\otimes_{\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}}(\mathcal{D})} \mathcal{E}^\bullet_\bullet).
\end{aligned}$$

Since $\mathcal{D}_i$ is a coherent $\mathcal{D}$-module, we conclude by using 7.3.1.20.b.

II) Let us check the general case. By applying the functor $\mathcal{M}^\bullet_i \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_i} -$ to the isomorphism 7.3.1.23.3, we get the first isomorphism

$$\begin{aligned}
\mathcal{M}^\bullet_i \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_i} \mathcal{D}_i \otimes^{\mathbb{L}}_{\mathcal{D}} \mathbb{R}\underset{\leftarrow}{l}_{X*}(\mathcal{E}^\bullet_\bullet) &\xrightarrow{\sim} \mathcal{M}^\bullet_i \overset{\mathbb{L}}{\otimes}_{\mathcal{D}_i} \mathbb{R}\underset{\leftarrow}{l}_{X,\mathbb{N}_{\geq i}*}\left(\underset{\leftarrow}{l}^{-1}_{X,\mathbb{N}_{\geq i}}(\mathcal{D}_i)\otimes^{\mathbb{L}}_{v^{-1}_{i,X}\mathcal{D}_\bullet} v^{-1}_{i,X}\mathcal{E}^\bullet_\bullet\right) \qquad (7.3.1.23.4)\\
